The viewpoints of benefited receptors shall be solicited for noise abatement measures (e.g., noise barriers) determined to be feasible to achieve the noise reduction design goal and to be, cost-effective. The viewpoints of benefited receptors shall be solicited to determine the desire for implementation of the noise abatement measure. A benefited receptor includes property owners (including non-residential properties) and renters/leasers residing on the benefited property.

A common method employed for viewpoints solicitation is using voting packets mailed to each benefited receptor that may include a cover letter explaining the project and the voting process, a plan view of the proposed barrier, and a voting form with space for additional public comments. For more information regarding viewpoints solicitation methods, see the IDOT *Highway Traffic Noise Assessment Manual*.

Regardless of when the viewpoints solicitation occurs in the project development process or the method of how votes are solicited, the desire is to obtain as many vote responses as possible. The goal is to obtain responses from at least one-third of the potential number of votes for each noise abatement measure (i.e., for each noise barrier being considered). If responses from one-third of the potential votes cast for a given barrier are not received after the first attempt, a second attempt shall be made. The voting result can be determined after viewpoints from at least one-third of the potential votes have been received or after two attempts have been made to obtain the responses. If after the second attempt, there are still less than one-third of the potential votes received, the voting result will be determined based on the responses received.

Once the responses have been collected, the viewpoints must be tallied. In order for a proposed noise abatement measure to be implemented, greater than 50% of the received votes must be in favor of the proposed abatement measure. If no votes are received, the barrier will not be recommended for construction. Viewpoints will be tallied for each individual abatement measure (i.e., for each noise barrier being considered).

A response from front row benefited receptors (receptors or properties adjacent to a proposed barrier; see the IDOT *Highway Traffic Noise Assessment Manual*) will be counted and weighted as four votes. Benefited receptors not in the front row will count as two votes. In the case of front row rental properties each the tenant responding shall count as two votes and the owner shall count as two votes per unit. Non-front row rental properties' tenants shall receive one vote per unit and the owner shall count as one vote per unit. See the *IDOT Highway Traffic Noise Assessment Manual* for additional guidance and an example viewpoints evaluation.

The proposed abatement measures will be presented as likely to be implemented (provided they are deemed feasible and reasonable for noise reduction and cost-effectiveness) as part of the public involvement process.

The IDOT *Highway Traffic Noise Assessment Manual includes a letter template that districts may use as the first attempt to obtain the viewpoints from benefited receptors. If a second attempt is required due to insufficient responses from the first attempt, a modification of this letter can accomplish that effort.*

26-6.06 Noise Abatement Wall Materials

26-6.06(a) Physical Requirements

When the noise analysis, as described in Section 26-6.05(c), determines that a noise abatement evaluation is warranted and a noise wall is determined to be feasible and reasonable as described in Section 26-6.05(d), it will be constructed with a design life of 35 or more years. In addition, it will be aesthetically pleasing, consistent with any neighboring design themes, easily maintained, and replaceable, if damaged. The noise abatement wall material must be suitable for safe recycling.

26-6.06(b) Acoustical Specifications

The noise wall material must achieve a sound Transmission Loss (TL) (i.e., a reduction in sound transmitted through the material) equal to or greater than 20 dB in all one-third octave bands from 100 hertz to 5,000 hertz, inclusive. Testing for TL shall be in accordance with ASTM E90 "Standard Test Method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions." Specialty items and materials that are not covered by ASTM, AASHTO, or other Department specifications must have the prior approval of the Illinois Highway Development

Council (IHDC). Contact the Engineer of Technical and Product Studies at the Bureau of Materials and Physical Research for additional information on the IHDC process.

26-6.06(c) Aesthetic Considerations

Funding for aesthetics is assessed per individual project and may require local (municipal or county) funding, based on FHWA and IDOT discretion.

The Department generally uses standard surface textures and colors for noise abatement walls constructed for Department projects. The standard textures include brick, stone, or wood patterns. The standard colors include earth tones in shades of browns and grays.

The Regional Engineer or their designee will recommend one of the standard patterns and colors for a proposed noise abatement project unless, after evaluating existing or proposed design themes for the project area or the architectural style of the neighborhood, a different pattern or color is deemed appropriate.

The recommendation of the Regional Engineer, or their designee, may be presented at public involvement meetings. If the affected residents desire a different pattern or color, or a noise wall material that does not fully conform to this policy, the following options will apply:

- any of the other "standard" patterns or any color on their side of the wall may be accommodated without any monetary commitment from local agencies beyond that normally required for a "standard pattern" noise abatement project, as appropriate;
- any non-standard pattern or color on the side of the wall away from the highway may be accommodated upon agreement by the local agency(ies) to compensate the Department for 100 percent of the cost beyond that of a "standard pattern" for a "non-standard pattern", as appropriate; or
- proposals for construction of noise abatement walls from materials that meet the 20 dB TL requirement but that otherwise do not fully conform to this policy may be evaluated and approved by the Department on a case-by-case basis. The local agency funding participation required for engineering, construction, and maintenance costs associated with the wall also will be determined on a case-by-case basis.

For additional aesthetic considerations see the IDOT *Highway Traffic Noise Assessment Manual.*

26-6.06(d) Absorptive Material Considerations

Under the following circumstances, consider an absorptive surface[3] for noise abatement walls to be constructed pursuant to this policy:

[3] *For purposes of this policy, a noise abatement wall surface will qualify as "absorptive" provided that it achieves a composite Noise Reduction Coefficient (NRC) of at least 0.80 if on the roadway side of the wall, and a composite NRC of at least 0.65 if on the side of the wall away from the roadway. The composite NRC shall be calculated based on the individual NRC values for each of the components of the total noise abatement wall system, as determined*

- An absorptive surface should be considered for the *roadway* side of a noise abatement wall when:

  + walls (including noise abatement walls, retaining walls, or abutments) paralleling or approximately paralleling the proposed noise abatement wall are also located, or proposed for construction, on the opposite side of the roadway and the ratio of the “canyon” width (between the noise abatement wall and the opposing wall) to the height of the walls is 10:1 or less; or

  + the noise abatement wall is proposed to close a gap in a noise abatement barrier that has an absorptive surface on the roadway side.

- An absorptive surface should be considered for the side of the noise abatement wall *away* from the roadway when:

  + residences or other noise-sensitive receptors would be affected by reflected noise from industrial, commercial, or transportation sources on the side of the wall away from the roadway or noise from the roadway reflected off structures along the roadway, and it has been determined the reflected noise reduces the noise wall effectiveness below the feasibility criterion (i.e. at least 5 dB(A) for impacted receptors) or the noise reduction design goal (i.e., at least 8 dB(A) for benefited receptors); or

  + the noise abatement wall must be gapped for an access road to the residences or other noise-sensitive receptors the wall is intended to benefit; or

  + the noise abatement wall is proposed to close a gap in a noise abatement barrier that has an absorptive surface on the side away from the roadway.

Absorptive surfaces also should be considered where walls paralleling or approximately paralleling the proposed noise abatement wall are located or proposed for construction, on the opposite side of the roadway and the “canyon” width to wall height ratio is greater than 10:1 but less than 20:1. Conduct a parallel barrier analysis to determine the degradation in noise wall performance where the width to wall heights ratio is less than 20:1. If the multiple reflections created by parallel barriers reduce the noise wall effectiveness below the feasibility criterion (i.e. at least 5 dB(A) for impacted receptors) or the noise reduction design goal (i.e., at least 8 dB(A) for benefited receptors), the feasible and reasonable evaluation should be presented using both an absorptive surface and a reflective noise wall surface.

26-6.06(e) Noise Abatement Wall Maintenance

The Department will maintain the roadway side of the noise abatement wall. Where the wall is located in such close proximity to the right-of-way line that the other side of the wall cannot be maintained from the State’s right-of-way, a maintenance agreement with the appropriate local

using ASTM C423 “Standard Test Method for Sound Absorption Coefficients by the Reverberation Room Method.” For purposes of this testing, the materials must be placed in accordance with Type A Mounting as described in ASTM E795 “Standard Practices for Mounting Test Specimens During Sound Absorption Tests”.

agency will be pursued. If such an agreement is not reached, additional right-of-way or easements may be acquired to provide access for maintenance.

26-6.07 Coordination

The Districts shall furnish local officials (e.g., county or municipal officials) within whose jurisdiction the highway project is located the following information pertaining to undeveloped lands within the project limits:

- approximate generalized design year traffic noise levels (for various distances from the highway improvement) for currently undeveloped lands or properties in the immediate vicinity of the project, and
- information that may be useful to local communities to protect future land development from becoming incompatible with anticipated highway noise levels.

Design year build noise levels shall be provided to inform local officials of the possibility of traffic noise impacts should the land be developed. Distances from the edge of the nearest travel lane of the highway improvement shall be provided where the noise levels approach the exterior noise abatement criteria in Figure 26-6A. Noise contours may be used to depict the build noise levels for the design year. This information shall be included in the traffic noise analysis documentation and NEPA environmental documentation. See the *IDOT Highway Traffic Noise Assessment Manual* for further guidance.

During the NEPA environmental studies, likely abatement measures should be discussed at public meetings and hearings, regardless of when viewpoints solicitation occurs. Information to be presented shall include the preliminary form of barrier, location, height, length, cost, and predicted noise reduction. Illustrations or drawings of likely abatement can be provided, if available. Published notices advertising these meetings will identify that noise abatement measures are being investigated for potential installation and that the viewpoints of benefited receptors will be solicited either during Phase I or Phase II as a part of the proposed project. Results of the viewpoints solicitation (regardless if solicitation occurs in Phase I or Phase II) and final recommendations for proposed noise abatement will be made available to the public.

26-6.08 Construction Noise

The following general steps for addressing construction noise shall be performed for Type I projects, as appropriate:

- Identify land uses or activities affected by noise from construction of the project. This identification should be considered during the NEPA environmental studies.
- Determine the measures recommended for inclusion in the contract plans and specifications to minimize or eliminate adverse construction noise impacts on the community. This determination shall include a weighing of the benefits to be achieved and the overall adverse social, economic, and environmental effects and the costs of the abatement measures.

- Incorporate the needed abatement measures in the plans and specifications.

A construction noise evaluation should determine the following:

- if there is sufficient basis (i.e., needs or benefits) for recommending early construction of proposed noise barriers, so that they might also abate construction noise; and

- if provisions for any of the following (or other) abatement measures should be incorporated into project construction contract documents:

  + requiring special construction measures (e.g., work hour limits, equipment muffler requirements, location of haul roads, elimination of "tail gate banging," reduction of backing up for equipment with alarms, use of "sound curtains" on certain equipment such as pavement breakers, placing materials stockpiles to form temporary noise barriers, positioning equipment as far as practical from sensitive areas);

  + limiting the duration of the contract period (calendar date of completion); or

  + imposing limits on all construction during special events (e.g., outdoor concerts, athletic events).

FHWA has released the FHWA Roadway Construction Noise Model (FHWA RCNM). Use of this model is not required on Federal-aid projects; however, it is a screening tool that can be used during NEPA environmental studies for the prediction of construction noise when construction noise has been identified as a potential concern.

Construction noise should be addressed in NEPA documents and Phase I engineering reports. The following paragraph should be included:

> *Trucks and machinery used for construction produce noise that may affect some land uses and activities during the construction period. Residents along the alignment will, at some time, experience perceptible construction noise from implementation of the project. To minimize or eliminate the effect of construction noise on these receptors, mitigation measures have been incorporated into the Illinois Department of Transportation Standard Specifications for Road and Bridge Construction as Article 107.35.*

When additional abatement measures are proposed to mitigate construction noise, a brief description of the specific measures should also be included. See the *IDOT Highway Traffic Noise Assessment Manual* for additional guidance.

26-6.09 NEPA Documentation

Language to be included in the NEPA document will depend on the project type (Type I or Type III - the Department does not maintain a Type II program) the results of the noise study, and the feasibility and reasonableness determination.

26-6.09(a) Type III projects

Projects classified as Type III do not require a noise analysis and should be addressed in NEPA environmental documents or Phase I engineering reports, as appropriate. The following paragraph should be included:

> *"The types of projects that do not require a noise analysis are stated in 23 CFR Part 772. This project meets those criteria and does not require a traffic noise analysis, noise barrier, or other noise abatement measures."*

26-6.09(b) Type I projects

For those types of projects that are considered a Type I project, It is important that appropriate information from the noise study as described in the *Highway Traffic Noise Assessment Manual* be made a part of the NEPA documentation. Therefore, careful planning should be undertaken to ensure that the technical study reaches appropriate milestones in time to incorporate summaries of the noise analysis results into the NEPA documentation for circulation and comments, as appropriate.

If the result of the noise study is that there are no traffic noise impacts, state:

> "*Future noise levels for the receptors would not approach, meet, or exceed the noise abatement criteria, or substantially exceed existing noise levels*."

If there are traffic noise impacts, a statement of likelihood shall be included in the NEPA document and will typically fall into one of the three following scenarios:

1. If abatement measures are <u>NOT</u> feasible and reasonable, document why and state the following:

   > "*The proposed project is anticipated to have traffic noise impacts, but the noise barriers studied and identified in Table (reference table in NEPA documentation) do not meet IDOT's feasibility and reasonableness criteria. Due to this, traffic noise abatement measures are not likely to be implemented based on preliminary design. If the project's final design is different from the preliminary design, IDOT will determine if revisions to the traffic noise analysis are necessary. A final decision on noise abatement will not be made until the project's final design is approved and the public involvement processes is complete*."

2. If noise abatement measures are determined to be feasible and reasonable, and viewpoints solicitation is completed during Phase I, then state the following:

   > *"The noise barriers were determined to meet the feasibility and reasonableness criteria. If the project's final design characteristics is different from the preliminary design, IDOT will determine if revisions to the traffic noise analysis are necessary. A final decision on noise abatement will not be made until the project's final design is approved and the public involvement processes is complete."*

3. If abatement measures are determined to be feasible, meets the IDOT Noise Reduction Design Goal, and are cost effective, but the solicitation of viewpoints from benefitted receptors will be deferred until Phase II Design then state the following:

> "*The noise barriers were determined to meet the feasibility criteria, the noise reduction design goal, and the cost effectiveness criteria as identified in Table (reference table in NEPA documentation). In order to determine if noise barrier(s) will be implemented, viewpoints solicitation still needs to occur. Viewpoints solicitation will occur after the project's final design is approved. If the project's final design is different from the preliminary design, IDOT will determine if revisions to the traffic noise analysis are necessary. A final decision on noise abatement will not be made until the project's final design is approved and the public involvement processes is complete*."

For projects with Phase II viewpoints solicitation, a supplemental memorandum should be completed in Phase II summarizing the results of the viewpoints solicitation and clearly identifying the locations and top-of-wall elevations of the "likely to be implemented" noise barriers. This memorandum will be made available to the public so they are aware of the final barriers recommended for construction. IDOT will determine the best method to make this information available in Phase II on a project-by-project basis.

26-6.10 Validity of Noise Assessments

After approval of any Record of Decision, Finding of No Significant Impact, or Categorical Exclusion approvals, and before the districts request any subsequent approvals (e.g., approval to acquire right-of-way, final design and construction funding) from FHWA, the districts should consult with FHWA and BDE to determine if the NEPA decision, documentation, and approvals remain valid or if any additional or updated noise analysis is required.

26-7 FLOODPLAIN ENCROACHMENTSENCROACHMENTS

26-7.01 Introduction

Projects involving Federal and/or State funds will include an evaluation of all encroachments into 100-year floodplains. The results of the evaluation will be documented in the reports prepared for corridor and/or design approval and must be summarized in the projects' environmental documentation. This Section provides guidance regarding information on floodplain encroachments to include in project environmental documents.

26-7.02 Complementary Technical Manual

The *IDOT Drainage Manual* discusses hydraulic analyses for floodplain encroachments.

26-7.03 Legal Authority

The following legal authority regulates or influences the policies and procedures for floodplains:

- Exec. Order No. 11988, Floodplain Management (1977),
- U.S. Water Resources Council's Floodplain Management Guidelines for Implementing Exec. Order No. 11988,
- U.S. Department of Transportation Order 5650.2, "Floodplain Management and Protection Floodplain,"
- Federal Highway Administration regulations on "Location and Hydraulic Design of Encroachments on Floodplains" (23 CFR 650, Subpart A),
- 17 Ill. Admin. Code 3708, implementing Sections 23, 29, and 30 of the *Rivers, Lakes, and Streams Act,* 615 ILCS 5/23, 29a and 30,
- Hazard Mitigation Grant Program, 44 CFR 206.430, and
- Illinois Exec. Order No. 2006-05, "Construction Activities in Special Flood Hazard Areas."

26-7.04 Policy

In the development of Federal and/or State-funded projects, special efforts shall be made to:

- encourage a broad and unified effort to prevent uneconomic, hazardous, or incompatible use and development of floodplains;
- avoid longitudinal encroachments, where practical;
- avoid significant encroachments, where practical;

- minimize impacts of actions that adversely affect base floodplains;
- restore and preserve the natural and beneficial floodplain values that are adversely impacted by IDOT actions;
- avoid support of incompatible floodplain development; and
- be consistent with the intent of the Standards and Criteria of the National Flood Insurance Program, where appropriate.

26-7.05 Procedures

26-7.05(a) Definitions

The following definitions are included to provide *BDE Manual* users a broad understanding of terminology associated with analysis and documentation of project-related floodplain encroachments. A number of these terms are not specifically used in the text of this Section but may arise in coordination efforts with the Federal Emergency Management Agency (FEMA), Illinois Department of Natural Resources, Office of Water Resources (IDNR-OWR), and public concerning floodplain encroachments.

1. Action. Any highway project construction, reconstruction, rehabilitation, repair, or improvement.
2. Base Flood. The flood or tide having a 1-percent chance of being exceeded in any given year (i.e., the 100-year flood).
3. Base Flood Elevation (BFE). The water surface elevation of the base flood.
4. Base Floodplain. The area subject to flooding by the base flood (100-year flood).
5. Design Flood. The peak discharge (volume, if appropriate) stage or wave crest elevation of the flood associated with the probability of exceedance selected for the design of a highway encroachment. By definition, the highway will not be inundated from the stage of the design flood.
6. Encroachment. An action within the limits of the base floodplain.
7. Flood Fringe. That portion of the floodplain outside of the floodway (often referred to as "floodway fringe").
8. Floodplain. The lowland and relatively flat areas adjoining waters, including, at a minimum, that area subject to a 1% or greater chance of flooding in any given year.
9. Freeboard. The vertical clearance of the lowest structural member of a bridge superstructure above the water surface elevation of the overtopping flood. It is a factor of safety usually expressed in ft (m) above a flood level for purposes of floodplain

management. Freeboard tends to compensate for the many unknown factors that could contribute to flood heights greater than the height calculated for a flood frequency and floodway conditions (e.g., wave action, floating debris under bridge openings).

10. Longitudinal Encroachment. An encroachment on the floodplain that is parallel to the direction of flow.

11. Minimize. To reduce to the smallest practicable amount or degree.

12. Natural and Beneficial Floodplain Values. These include but are not limited to fish, wildlife, plants, open space, natural beauty, scientific study, outdoor recreation, agriculture, aquaculture, forestry, natural moderation of floods, water quality maintenance, and groundwater recharge.

13. Practicable. Capable of being done within reasonable natural, social, or economic constraints.

14. Preserve. To avoid modification to the functions of the natural floodplain environment or to maintain it as closely as practicable in its natural state.

15. Regulatory Floodway. The floodplain area that is reserved in an open manner by Federal, State, or local requirements (i.e., unconfined or unobstructed either horizontally or vertically) to provide for the discharge of the base flood so that the cumulative increase in water surface elevation is no more than a designated amount (not to exceed 1 ft (300 mm)) as established by FEMA for Administering the National Flood Insurance Program (NFIP).

16. Restore. To reestablish a setting or environment in which the functions of the natural and beneficial floodplain values adversely impacted by the highway agency action can again operate.

17. Risk. The consequences associated with the probability of flooding attributable to an encroachment. It shall include the potential for property loss and hazard to life during the service life of the highway.

18. Significant Encroachment. A highway encroachment and any direct support of likely base floodplain development that would involve one or more of the following construction or flood-related impacts:

    - a significant potential for interruption or termination of a transportation facility that is needed for emergency vehicles or provides a community’s only evacuation route,
    - a significant risk, or
    - a significant adverse impact on natural and beneficial floodplain values.

19. Special Flood Hazard Areas (SFHAs). The areas delineated on a NFIP map as being subject to inundation by the base (100-year) flood.

20. <u>Support Base Floodplain Development</u>. To encourage, allow, serve, or otherwise facilitate additional base floodplain development. Direct support results from an encroachment; indirect support results from an action out of the base floodplain.

21. <u>Transverse Encroachment</u>. An encroachment on the floodplain that is perpendicular to the direction of flow.

26-7.05(b) Applicability

These procedures shall apply to all Federal and/or State-funded projects initiated by the Department, that will entail encroachment, or which otherwise will affect base floodplains, except for repairs made with emergency funds during or immediately following a disaster. The assessment of floodplain encroachments should be incorporated into the development and analysis of corridor and design alternatives so that floodplain impacts will not be considered in isolation from other social, economic, environmental, and engineering considerations.

26-7.05(c) Floodplain Studies

For studies for evaluating proposed highway location alternatives, use the following steps for evaluating and documenting floodplain impacts:

1. Determine whether the proposed action will encroach upon the base (100-year) floodplain. Identify the geographic area of the floodplain. NFIP maps must be used if available. If NFIP maps are not available, information developed by IDOT and/or local, State, and Federal water resources and floodplain management agencies should be used for determining an encroachment.

   There are several types of NFIP maps available. The Flood Insurance Rate Map (FIRM) is the most common map and most communities have this type of map. The FIRM depicts flood hazard zones and their boundaries and may show floodways and BFEs. Use the FIRM, if available, to identify the floodplain boundaries.

   Several other NFIP maps are in circulation. The Flood Boundary and Floodway Map (FBFM) shows only the floodway and flood boundaries. The FBFM is no longer produced and is in the process of being phased out. The Flood Hazard Boundary Map (FHBM) is an older version of a flood map and is based on approximate data. Digital FIRMs (DFIRM) are being produced for Illinois. Maps are available on the Illinois Floodplain Maps website maintained by the Map Modernization Project in the Illinois State Water Survey. Use these maps if they are available for the county or counties where the project is located.

2. Determine if the project has transverse or longitudinal encroachments or both.

3. Address the following items for transverse encroachments:

   - Is there a significant potential for interruption of the roadway that is needed for emergency vehicles or provides a community’s only evacuation route?

- Are there significant impacts on natural and beneficial floodplain values?
- Is there a significant increase in the risk of flooding?
- Will the project support and/or result in incompatible floodplain development?

4. Address the following items for longitudinal encroachments:
   - Can the longitudinal encroachment be avoided? If the answer is yes, revise the project to avoid the longitudinal encroachment.
   - If the longitudinal encroachment cannot be practicably avoided; document the reasons why.

5. Determine if the project involves any significant encroachments. If an encroachment is significant, an "Only Practicable Alternative Finding" is required. A proposed action that includes a significant encroachment will not be approved unless FHWA finds that the proposed significant encroachment is the only practicable alternative.

6. Document the following in the location study report, in accordance with 23 CFR 650.111(e):
   - The determination of whether or not the project alternatives involve floodplain encroachments.
   - Evaluation and discussion of the practicability of alternatives to any longitudinal encroachments.
   - Discussion of the following items, commensurate with the significance of the risk or environmental impact, for all alternatives containing encroachments and for those actions that would support base floodplain development:
     + the risks (e.g., flooding risk) associated with implementation of the action;
     + the impacts on natural and beneficial floodplain values;
     + the support of probable incompatible floodplain development;
     + the measures to minimize floodplain impacts associated with the action; and
     + the measures to restore and preserve the natural and beneficial floodplain values impacted by the action.
   - Evaluation and discussion of the practicability of alternatives to any significant encroachments or any support of incompatible floodplain development.

Summarize the results of the floodplain studies in the project's Environmental Impact Statement (EIS) or Environmental Assessment (EA).

Section 26-7.05(d) provides guidance on the appropriate documentation to be incorporated in project environmental documents.

26-7.05(d) Environmental Documentation for Floodplain Encroachments

The environmental document should briefly summarize the results of the location hydraulic studies. The summary should identify the number of encroachments and any support of incompatible floodplain developments and their potential impacts. Where an encroachment or support of incompatible floodplain development results in substantial impacts, the environmental document should provide more detailed information on the location, impacts, and appropriate mitigation measures. In addition, if any alternative (1) results in a floodplain encroachment or supports incompatible floodplain development having significant impacts, or (2) requires a commitment to a particular structure size or type, the environmental document needs to include an evaluation and discussion of practicable alternatives to the structure or to the significant encroachment. The environmental document should include exhibits that display the alternatives, the base floodplains, and, where applicable, the regulatory floodways.

If the preferred alternative includes a significant floodplain encroachment, the final environmental document (final EIS or FONSI) must include a finding that it is the only practicable alternative, as required by 23 CFR 650.113. The finding should refer to Executive Order No. 11988 and 23 CFR 650, Subpart A. Include it in a separate subsection entitled “Only Practicable Alternative Finding” and must be supported by the following information:

- the reasons why the proposed action must be located in the floodplain,
- the alternatives considered and why they were not practicable, and
- a statement indicating whether the action conforms to applicable State or local floodplain protection standards.

For each alternative encroaching on a designated or proposed regulatory floodway, the environmental document should provide a preliminary indication of whether the encroachment would be consistent with or require a revision to the regulatory floodway. Engineering and environmental analyses should be undertaken, commensurate with level of encroachment, to permit the consistency evaluation and identify impacts. Coordination with FEMA and appropriate State and local government agencies should be undertaken for each floodway encroachment. If the preferred alternative encroaches on a regulatory floodway, the final environmental document should discuss the consistency of the action with the regulatory floodway. If a floodway revision is necessary, the environmental document should include evidence from FEMA and local or State agency indicating that such revision would be acceptable.

26-7.05(e) FEMA Buyout Properties Floodplain

The Federal government, through FEMA, administers the Hazard Mitigation Grant Program (HMGP) under the Hazard Mitigation, 42 U.S.C.42 5170c to purchase flood prone properties, rather than repeatedly providing disaster relief after each flooding episode. The Illinois Emergency Management Agency (IEMA) administers the HMGP and makes grants available to State and local governments, and eligible private, non-profit organizations to implement cost-effective and long-term mitigation measures following major disaster declarations.

There are over 3,000 flood buyout parcels throughout the State that are located in flood prone areas. These parcels are owned by the local community or a private, non-profit organization. Deed restrictions are in place so that no structures or improvements, including placement of fill material or bridge piers, may be placed or erected on these properties. These sites are restricted to open space, recreation, or wetlands in perpetuity and must be avoided. Contact the BDE or the IEMA Hazard Mitigation Specialist for the location of buyout properties.

26-7.05(f) Mitigation

In general, flood damages outside the project right-of-way are not to be increased due to increased flood heights. Absent contrary evidence, this requirement is considered met for urban bridge crossings if, for all events up to and including the 100-year event, the water surface profile increase would not exceed 0.5 ft (150 mm) at the structure, nor 0.1 ft (30 mm) at a point 1,000 ft (300 m) upstream of the structure or would be constrained within flood easements. For rural bridge crossings, the limits are 1.0 ft (300 mm) at the structure and 0.5 ft (150 mm) 1,000 ft (300 m) upstream of the structure. For other types of development (e.g., longitudinal encroachments), absent contrary evidence, this requirement is considered met if, considering cumulative effects, the water surface profile increase would not exceed 0.1 ft (30 mm) (urban); 0.5 ft (150 mm) (rural) or would be contained within flood easements.

If there are existing buildings or other uses in the 100-year floodplain that would be damaged by higher flood stages than would occur under existing conditions, this would constitute “contrary evidence” and the normally allowed water surface increases are not applicable unless all impacted property owners are compensated for the additional flood damages attributed to the project. If compensation is provided (by the purchase of the properties or flood easements), the project may be designed so that the maximum overall water surface profile increase, considering both the project alone and the combined effects of equal floodplain encroachments on other properties, would be limited to 0.5 ft (150 mm) (urban)/1.0 ft (300 mm) (rural) at the bridge and 0.1 ft (30 mm) (urban) / 0.5 ft (150 mm) (rural) 1,000 ft (300 m) upstream of the bridge and throughout the remaining impacted reach.

Also, compensatory flood storage volume would need to be provided to compensate for any floodway storage losses resulting from the project. To minimize flood easement and flood storage compensation costs, consider the following:

- purchase of adjoining flood fringe properties to compensate for lost floodway conveyance and storage. A non-construction covenant would have to be put on the property to ensure preservation of the conveyance and storage provided; and
- removal of existing floodway encroachments or construction of conveyance/storage areas to compensate for the restrictions created by the project.

26-7.05(g) Public Involvement

Executive Order No. 11988 provides that when the only practicable alternative cannot avoid encroachment into the floodplain, the public must be given the opportunity for early review and comment. A reference to encroachments on the 100-year floodplain must be included in public involvement notices and any encroachments must be identified at public meetings.

26-7.05(h) Coordination

IDOT will coordinate with the entity having land use jurisdiction, whether it is a city, county, or the State. The local community has the responsibility for enforcing NFIP regulations in that community if the community is participating in the NFIP. Most NFIP communities have established a permit requirement for all development within the base (100-year) floodplain. Consistency with NFIP standards is a requirement for Federal-aid highway actions involving regulatory floodways. The community, by necessity, is the entity that must submit proposals to FEMA for amendments to NFIP ordinances and maps in that community if it becomes necessary.

IDOT coordination with FEMA should occur in situations where administrative determinations are needed involving a regulated floodway or where flood risks in NFIP communities are significantly impacted. The circumstances that would ordinarily require coordination with FEMA include:

- a proposed crossing encroaches on a regulatory floodway and, consequently, would require an amendment to the floodway map;
- a proposed crossing encroaches on a floodplain where a detailed study has been performed, but no floodway designated, and the maximum 1-ft (300 mm) increase in the base flood elevation would be exceeded; and
- a local community is expected to enter into a regulatory program within a reasonable period and detailed floodplain studies are under way.

The IDNR-OWR is authorized to administer a permit program regulating construction within public bodies of water and within floodways of rivers, lakes, and streams. The program's jurisdiction is tied to the size of the drainage area, the project scope of work, and the level of floodplain development at the project site. An IDNR-OWR permit is not required for projects within urban or urbanizing watersheds under 1 square mile (2.6 km^2) or for rural locations draining less than 10 square miles (26 km^2).

The Bureau of Bridges and Structures (BBS) is responsible for obtaining all IDNR-OWR permits on projects that require approval of the Hydraulic Report by the BBS.

Special permits are required for actions involving construction within the regulatory (100-year) floodways, as designated by the IDNR-OWR, in Cook, DuPage, Kane, Lake, McHenry, and Will counties, except for those areas that are within the City of Chicago.

26-8 WETLANDS

26-8.01 Introduction

The Executive Order No. 11990 applies special requirements for addressing the impacts of Federal projects on wetlands. Wetlands also are subject to regulation under the Federal *Clean Water Act* as a part of the Section 404 permit process and the Section 401 Water Quality Certification requirements. In addition, the Illinois *Interagency Wetland Policy Act of 1989* and the implementing rules for the *Act* address State policy for wetlands, which is reflected in the IDOT "Wetlands Action Plan" for compliance with the *Act* and rules. This Section provides guidance and procedures for complying with applicable requirements when proposed State highway projects would impact wetlands.

26-8.02 Legal Authority

The following legal authority regulates or influences the policies and procedures for wetlands:

- Exec. Order No. 11990, 42 Fed. Reg. 26961 (May 24, 1977),
- U.S. Department of Transportation Order 5660.1A, Preservation of the Nation's Wetlands,
- Certification, 33 U.S.C. 1341 (*Clean Water Act* Section 401),
- Permits for Dredged or Fill Material, 33 U.S.C. 1344 (*Clean Water Act* Section 404),
- Regulatory Program of the Corps of Engineers, 33 CFR 320 through 331,
- Compensatory Mitigation for Losses of Aquatic Resources, 33 CFR 332,
- Section 404(b)(1) Guidelines for Specification of Disposal Sites for Dredged or Fill Material, 40 CFR 230,
- Mitigation of Impacts to Wetlands and Natural Habitat. 23 CFR 777,
- The *Interagency Wetland Policy Act of 1989,* 20 ILCS 830/1-1 *et seq*.,
- Implementation Procedures for the *Interagency Wetland Policy Act of 1989,* 17 Ill. Admin. Code 1090, and
- Illinois Department of Transportation Wetlands Action Plan.

26-8.03 Policy

In the development of proposed State highway projects, avoid impacts to wetlands unless there is no practicable alternative, and the proposed action includes all practicable measures to minimize harm to the wetlands. Further, in accordance with the *Interagency Wetland Policy Act* *of 1989*, the Department shall preserve, enhance, and create wetlands where necessary in order to increase the quality and quantity of the State's wetland resource base.

26-8.04 Procedures

26-8.04(a) Definitions

1. Adverse Wetland Impact. Any land management and construction or related project activity that directly or indirectly reduces the size of a wetland or impairs a wetland's functional value or the hydraulic and hydrologic characteristics of a wetland. Throughout this Section, the term "wetland impact" refers to an adverse impact.

2. Coefficient of Conservatism (C). An integer from 0 to 10 assigned to each plant species in the Illinois flora that is used to calculate the Floristic Quality Index. Each value reflects an estimate of a plant species' tendency to be restricted to "natural areas." Native species most successful in badly damaged habitats are given C values of 0. Species virtually restricted to natural areas receive values of 10. Non-native species or those not identified to the species level are not treated in the calculations of FQI. The C is identified on the Illinois Natural History Survey (INHS) wetland delineations provided through the Environmental Survey Process.

3. Floristic Quality Index (FQI). An index derived from floristic inventory data that is considered in determining mitigation ratios for wetland compensation in accordance with the provisions of 17 Ill. Adm. Code 1090. The FQI is calculated and identified on the INHS wetland delineations. In general, an index score below 10 suggests a site of low natural quality; below 5, a highly disturbed site. An FQI value of 20 or more suggests that a site has evidence of native character and may be considered an environmental asset.

4. Hydrologic Unit. An 8-digit number (Cataloging Unit) depicted on the Hydrologic Unit Map-1974 State of Illinois. Each of the 52 Unit Codes represents a specific watershed (drainage basin).

5. Mitigation Bank. A site where wetlands and/or natural habitats are restored, created, enhanced, or preserved, expressly for the purpose of providing compensatory mitigation in advance of authorized impacts to similar type resources.

6. National Wetlands Inventory. A mapping program administered by the US Fish and Wildlife Service (USFWS) for identifying the locations of wetlands and deepwater habitats. Quadrangle-based maps are available for Illinois that include Riverine (streams), Lacustrine (lakes), and Palustrine (wetland) systems.

7. Off-Site. Where a wetland compensation site is located within the same Hydrologic Unit boundary but more than one mile (1.6 km) from the project for which wetland compensation is required.

8. <u>On-Site</u>. When a wetland compensation site is located within the same Hydrologic Unit boundary and is within one mile (1.6 km) of the project for which wetland compensation is required.

9. <u>Out-of-Basin</u>. When a wetland compensation area is located outside the Hydrologic Unit boundary that includes the site of the proposed project for which wetland compensation is required.

10. <u>Percent Adventive</u>. The determination of the percentage of non-native species at a wetland site determined by dividing the number of non-native plant species by the total number of plant species in a wetland. The percentage is calculated from the Species List information included with INHS wetland delineations. A high percentage of adventive (invasive) plants indicates a high level of disturbance.

11. <u>Practicable</u>. Available and capable of being done after taking into consideration cost, existing technology, and logistics in light of the overall project purposes.

12. <u>Wetlands</u>. Those areas that are inundated or saturated by surface or groundwater at a frequency and duration to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. For purposes of the *Interagency Wetland Policy Act of 1989*, the term includes areas that are restored or created as the result of mitigation or planned construction projects and that function as a wetland even when all three wetland parameters (i.e., hydric soils, inundation or saturation by surface or groundwater, and prevalence of hydrophytic vegetation) are not present.

13. <u>Wetland Classification</u>. A system for designating wetlands and deepwater habitats as to type, based on vegetation and other pertinent characteristics. The Cowardin classification of wetlands and deepwater habitats is used on the National Wetland Inventory maps. Sites depicted as palustrine on these maps may be jurisdictional wetlands. On-site wetland determinations are required to confirm the jurisdictional status of the site. Classes of palustrine wetlands include emergent, scrub-shrub, and forested.

14. <u>Wetland Compensation Plan</u>. A plan developed for each individual construction project affecting wetlands that details how compensation will be provided for unavoidable adverse wetland impacts.

15. <u>Wetland Functions</u>. Benefits that wetlands provide because of their physical, chemical, and biological properties and processes. Examples of these functions include surface and subsurface water storage, nutrient cycling, particulate removal, maintenance of plant and animal communities, and groundwater discharge and recharge.

16. <u>Wetland Impact Evaluation (WIE) Form</u>. An IDOT form that identifies the amount and type of wetland impact, the measures considered to avoid and minimize the impacts, the applicable mitigation ratio, and the amount of compensation required for each wetland impacted by a project.

17. Wetland Technical Report. A report in the form of a brief Environmental Assessment (EA) used to determine the significance of wetland impacts. The significance determination is based on the analysis of wetland impacts in the Report and the results of coordination of the Report with the Corps, USFWS, US Environmental Protection Agency, FHWA, and IDNR.

26-8.04(b) Applicability

The procedures in this Section apply to all highway projects initiated by the Department that:

- involve acquisition of additional right-of-way or easements (temporary or permanent);
- require a drainage structure runaround or any in-stream work;[4]
- potentially affect a recognized natural area/nature preserve or a location where a State-listed or Federal-listed species is known to occur; or
- potentially affect a wetland within existing right-of-way, as identified through National Wetland Inventory (NWI) maps or other wetlands information source that the district possesses.

26-8.04(c) Analysis and Documentation

The following procedures address identification and description of wetlands (e.g., plant communities), avoidance and minimization of wetland impacts, identification and description of unavoidable wetland impacts, mitigation of unavoidable wetland impacts, and public involvement and agency coordination for wetland involvement.

26-8.04(c)1 Wetland Identification

The identification and characterization of wetland resources is accomplished through the Environmental Survey Process (Chapter 27). In response to the submittal of an Environmental Survey Request (ESR), BDE uses available information (e.g., National Wetland Inventory maps, aerial photos, soils maps) to determine whether wetlands are, or may be, present in the area potentially affected by the project. If the information clearly indicates that no wetlands are present in or near the project vicinity, BDE provides the district a sign-off indicating that further action under the wetland requirements will not be necessary, unless the scope or location of the project changes and it would potentially affect locations beyond the area previously reviewed for wetlands. For projects processed as a Categorical Exclusion (CE), include the BDE sign-off in

[4] *Note: For contractor-furnished borrow, waste, and use areas and for contractor-proposed drainage structure runarounds affecting areas beyond the limits of Phase I environmental surveys conducted for the project, BDE performs initial screening for wetlands as described below. For any wetlands potentially affected by these contractor-furnished facilities, the contractor is responsible for obtaining delineations of the wetlands in accordance with the current Federal Wetlands Delineation Manual. The contractor also is responsible for complying with applicable permitting and compensation requirements for any unavoidable adverse wetland impacts resulting from these contractor-furnished facilities. The procedures in this Section are not intended to cover compliance actions for contractor-furnished facilities.*

the Phase I engineering report. For projects processed with an Environmental Assessment (EA) or Environmental Impact Statement (EIS), include a statement in the environmental document indicating that the project area was reviewed for wetlands, and none were identified. Retain the BDE sign-off in the project file.

If the review indicates there are, or may be, wetlands in or near the project vicinity, BDE submits the project to the INHS for wetland delineation. The turnaround time for providing wetland delineations is six months to one year from the date the ESR is received. If the INHS delineations indicate that the sites are not wetlands, BDE provides the survey results to the district with a sign-off as described above. For CE projects, include the BDE sign-off and the INHS delineations in the Phase I engineering report. During Phase II, if the project requires a Section 404 permit from the Corps for other reasons (e.g., streams, impoundments), include the INHS delineations as a part of the permit submittal to document the absence of wetlands. For EA or EIS projects, include a statement in the environmental document indicating that the project area was reviewed and surveyed for wetland resources, and none were identified. If the surveyed locations involve wooded areas, identify and describe these areas in the upland plant community section of the environmental document or, if in a riparian corridor, in the surface water resources/aquatic habitat section of the document.

If the INHS survey results identify wetlands within the project vicinity, BDE provides the district the wetland delineations and a wetland survey report. BDE includes a request that a Wetland Impact Evaluation (WIE) Form be filled out and submitted to BDE once the extent of any unavoidable wetland impacts is determined. For CE projects, include in the Phase I engineering report a copy of the wetland delineations, the wetland survey report, the completed WIE Form, and the BDE reply to the WIE Form, if needed. For EA or EIS projects, include in the environmental document descriptions of each delineated wetland within the project vicinity. Place the descriptions in a table with the following headings:

- Wetland Site Number,
- Wetland Type (plant community/cover type),
- Wetland Size (acres (ha)),
- NWI Code (if any),
- Dominant Plant Species,
- Soil Type,
- FQI,
- Percent Adventive, and
- Wetland Functions.

This information can be obtained from the wetland delineations and the INHS wetland survey report.

26-8.04(c)2 Evaluation of Wetland Importance

Although wetlands in general are subject to protection under Federal and State directives, wetlands with a higher level of importance warrant proportionately greater efforts for avoidance of adverse impacts. In evaluating the importance of wetlands, consider factors such as uniqueness, natural quality, special designations, and habitat functions.

Unique wetland types include bog, fen, flatwoods, sedge meadow, wet prairie, seep, and forested wetland containing oak, hickory, birch, beech, black gum, eastern arborvitae, bald cypress, or black ash. These types of wetland plant communities are not common because of the unique geological and topographic conditions necessary to support their existence. Accordingly, the potential for creating or restoring wetlands of these types is extremely limited or non-existent. These types of wetlands deserve the utmost consideration for avoidance of adverse impacts.

Natural quality is a measure of the extent to which a wetland has avoided disturbance (e.g., of its wetland plant communities). A relative lack of disturbance is considered to confer high quality or Illinois Natural Area status to an area. Wetlands with unpolluted water, unaltered to slightly altered water level, and intact vegetation structure with a diversity of native plant species are considered to be of high natural quality.

Wetlands with special designations include those designated as Advanced Identification (ADID) sites and Illinois Natural Areas. These designations are made by U.S. Environmental Protection Agency (USEPA), the Corps for ADID sites, and IDNR for Illinois Natural Areas. The designations are applied based on the high quality of the resource.

Where wetlands provide habitat for Federal and/or State listed threatened and endangered species and/or contain designated critical/essential habitat for listed species, these wetlands have a high level of importance based on their habitat functions.

26-8.04(c)3 Analysis of Impact Avoidance and Minimization Alternatives

Where a project may affect wetlands, the district must consider location and design alternatives to avoid and minimize adverse wetland impacts to the extent practical. This includes consideration of the "no action" alternative, alternative alignments, and other design aspects (e.g., steepening slopes, reducing median and lane widths, overland bridges) to minimize encroachment into wetlands.

In the environmental documentation for the project, include information on any measures taken to avoid and minimize adverse wetland impacts (e.g., discussion and comparison of alternatives that avoid and minimize impacts to wetland resources). Show location alternatives on maps or other drawings that depict the wetland areas. If avoidance alternatives are not practicable, include in the environmental documentation an explanation of the reasons why (e.g., cost, impacts on highway performance, socio-economic, other environmental impacts).

26-8.04(c)4 Wetland Impact Evaluation Form

For all projects that are surveyed for wetlands and determined to have wetlands within the project vicinity, complete a WIE Form and submit it to BDE. Submit the WIE Form after completing the analysis of avoidance and minimization alternatives and determining the likely extent of unavoidable wetland impacts. The information in the WIE Form indicates whether or not the project involves unavoidable adverse wetland impacts and provides the basis for determining whether it qualifies as a Programmatic Review Action or Standard Review Action, in accordance with the IDOT Wetlands Action Plan (see Part III, Appendix A).

If the project will not impact wetlands, indicate that determination on the WIE Form and send the completed form to BDE. BDE will respond, indicating that coordination under the wetland requirements is complete. For CE projects, include a copy of the completed WIE Form in the Phase I engineering report. For EA or EIS projects, include a statement in the environmental document indicating that the project will not impact wetland resources.

If the project has wetland impacts, fill out the WIE Form and submit it to BDE for review. For Programmatic Review Actions, BDE responds to the WIE submittal to confirm the processing category and confers with the district on options for providing the necessary compensation for unavoidable adverse wetland impacts. For Standard Review Actions, BDE coordinates the WIE Form, delineations, and wetlands survey report with IDNR, as required by the IDOT Wetlands Action Plan and 17 Ill. Adm. Code 1090.50(a)(1). Upon completion of IDNR's review, BDE provides the district a copy of IDNR's response and confers with the district on options for providing the necessary compensation for unavoidable adverse wetland impacts. For CE projects, include in the Phase I engineering report the completed WIE and results of coordination with BDE and, if applicable, with IDNR, for Standard Review Actions. For EA or EIS projects, include the following information in the environmental document for each alternative that would affect wetlands:

- a brief description of the work within wetlands;
- wetland impacts, summarized in a table containing the wetland site number, its aerial exhibit sheet number, wetland type, total size of the wetland (acres(ha)), area of impact (acres(ha)), FQI, percent Adventive, and function(s) impacted;
- as applicable, identification and description of impacts to wetlands identified as important; and
- description of impacts on wetland functions (e.g., wildlife habitat, flood storage, groundwater discharge).

For Standard Review Actions, also include the results of coordination with IDNR in the environmental document.

26-8.04(c)5 Compensation Plan Development

After the processing category and amount of anticipated unavoidable adverse wetland impacts have been established for a project, the compensation process can begin. Compensation for unavoidable adverse wetland impacts will be in accordance with the "Policy on Wetlands Impacts and Compensation" in Section V of the IDOT Wetlands Action Plan (recognizing that the size of wetland impacts eligible for accumulation is now 0.1 acre (400 m^2), rather than 0.3 acre (1200 m^2) as indicated in the Wetlands Action Plan). For projects requiring compensation under a Section 404 permit, the Corps may, at its discretion, require different ratios on a case-by-case basis. The project will need to comply with the more stringent of the State or Federal compensation requirements.

If the district and BDE decide to accumulate impacts smaller than 0.1 acre (400 m^2), BDE documents the decision and records the impact amount for tracking against the maximum thresholds for total amounts that can be accumulated as set forth in Section V of the IDOT Wetlands Action Plan. For Standard Review Actions, BDE informs IDNR of the decision to accumulate the impacts when the project is coordinated for IDNR review. This decision also should be reflected in the environmental documentation for the project.

If compensation for impacts smaller than 0.1 acre (400 m^2) will be provided on-site or from an existing source of wetlands credits, preparation and processing of a compensation plan will be necessary, as described below.

The Department's preferred method of wetland compensation involves the use of pre-existing wetland credits from a commercial or Department-owned wetland mitigation bank site. This preference may be met when the project is within the service area of a bank site. Information on Department-owned wetland mitigation bank sites and service areas may be accessed at the Department's Environment webpage. For projects that are not within the service area of a mitigation bank, compensation will be provided through wetlands restoration, enhancement, and/or creation, as described below.

26-8.04(c)6 Compensation through Use of Pre-Existing Wetland Credits

Credits generated at approved commercial and Department bank sites may be used to satisfy compensation requirements for Section 404 of the *Clean Water Act* and the *Interagency Wetland Policy Act of 1989*.

If compensation will be provided from a wetland bank or other approved source of wetlands credits, a compensation plan is prepared in accordance with Section VII A. of the IDOT Wetlands Action Plan. BDE coordinates the plan in accordance with Section VI of the IDOT Wetlands Action Plan. Summarize the information from the compensation plan in the environmental documentation for the project and include evidence of IDNR concurrence in the plan for projects classified as Standard Review Actions.

For proposals to draw credits from a Department bank, BDE forwards a copy of the WIE to the District Environmental Coordinator and District Programming Engineer. Debits are considered pending until the project is awarded. Current district bank site ledger information can be obtained by contacting BDE.

Districts receive priority consideration for use of credits from their own bank(s) and BDE will only approve credit withdrawals for other districts if the bank has sufficient credits available to meet the foreseeable needs of the district that owns the bank. Each district has the option to object to an incoming WIE, in writing, within 20 working days of receipt of the WIE. The reason for the objection must be included in the written documentation.

BDE serves as the principal point of contact with wetland regulatory agencies for resolving issues regarding the use of bank credits on specific projects and for any required reporting to those agencies associated with the bank sites (e.g., concerning credit balances, credits used).

A district may want to purchase a block or surplus of credits from a commercial or Department-owned bank site. These credits would be purchased in advance of any known impacts and used to compensate for small losses (i.e., less than 0.5 acre (0.2 hectare)) from several projects. When a district purchases a block of credits, the district creates and maintains a ledger for tracking debits from that block. When coordinating with BDE, the district submits a copy of the ledger associated with the block purchase with the WIE.

A district that proposes to draw credits from a commercial bank must commit program funds to cover the purchase of credits. Where credits from a Department-owned bank are used by another district, that district must reimburse the district that owns the bank. The Office of Planning and Programming (OPP) accomplish billing and reimbursement through the re-appropriation of district program funds. Re-appropriations will occur once each year based on information provided by BDE. Each district should submit their cost for bank site development to OPP to ensure the district is adequately compensated during the re-appropriation process. Cost should be the sum of land acquisition, construction, and maintenance for each acre (ha).

26-8.04(c)7 Compensation through Wetlands Restoration, Enhancement, and/or Preservation

If compensation is provided through wetlands restoration, enhancement, and/or preservation, the district will take the lead in locating a suitable compensation site(s) and giving appropriate consideration to the effect of the applicable compensation ratios on the amount of compensation needed. The district should consider wetland resource needs within the watershed and the practicability of accomplishing ecologically self-sustaining on-site wetland restoration, enhancement, and/or preservation (i.e., at the site of the proposed project). In selecting potential sites for wetland restoration, the district should consider the need for using sites that contain a majority of hydric soils.

After the district has identified one or more potential compensation sites, it submits information to BDE to request a more detailed assessment of the suitability of the sites for wetland compensation purposes. The information provided to BDE includes a map (7.5′ topographic map or plat map) that shows the location and boundary of the site(s) and indicates their size and current ownership. In response to this submittal, BDE makes a preliminary site suitability evaluation, based on soils information. If BDE has concerns about the suitability of the site based on this preliminary evaluation, it will confer with the district before proceeding with any further studies or evaluations of the site. If BDE does not identify any immediate site suitability concerns, or if its concerns are resolved, it will forward the information to the INHS and the Illinois State Geological Survey (ISGS), as appropriate. INHS and ISGS will conduct further investigations of the hydrology, soils, vegetation, and adjacent land use for the proposed site. As necessary, BDE contacts the district to confirm that landowner permission has been obtained or that written notification has been provided to the landowner prior to having the INHS/ISGS initiate the on-site investigations. BDE forwards the results of the site assessments to the district with recommendations on the suitability of the site for wetland restoration or creation.

For sites the district wishes to continue to pursue, it submits an ESR to BDE to initiate evaluations of the site for cultural resources, and endangered and threatened species, or Illinois Natural Area Inventory sites. The district also screens the site for special waste in accordance with the procedures in Section 27-3.02. For sites on agricultural land, the district coordinates with the Natural Resources Conservation Service (NRCS) of the US Department of Agriculture to obtain certification on the status of wetlands on the site (e.g., prior-converted wetlands, farmed wetlands).

After completion of site evaluations and any necessary coordination for cultural resources, endangered species/natural areas, or special wastes, the district and BDE confer regarding the suitability of the site for use prior to preparing the conceptual compensation plan or initiating property negotiations with the landowner.

1. Conceptual Compensation Plan. After conferring with BDE and deciding to proceed with proposing use of a particular site for compensation, the district prepares a conceptual compensation plan in accordance with the outline in Section VII B. of the IDOT Wetlands Action Plan and the following:

- In the description of the proposed wetland compensation site(s), include an indication of its current vegetation characteristics.

- Include in the conceptual compensation plan a description of the monitoring plan that will be used to evaluate the success of the compensation, including the use of measures to correct identified deficiencies or problems. Monitoring of restored or created wetlands should commence the growing season after completion of the work for the restoration/creation. Compensation projects larger than one acre (0.4 ha) are monitored for five years. Compensation projects of one acre (0.4 ha) or less are monitored for three years. All monitoring is conducted by the INHS, through BDE. BDE accomplishes any required coordination of monitoring reports with IDNR and the Corps.

- Include in the conceptual compensation plan a description of the operation, management, and maintenance plan for the site. Include procedures to restrict further adverse impacts to the site (e.g., use of buffer areas, restricting highway project, other incompatible construction within the wetland compensation area).

The district submits one copy of the conceptual plan to BDE for review. As a part of the initial review, BDE may confer with the Corps or the USFWS, or both, on a case-by-case basis to obtain a preliminary reaction to the conceptual plan prior to proceeding with further reviews. Any concerns or comments from these agencies will be relayed to the district. After BDE review of the conceptual compensation plan and resolution of any concerns identified, BDE provides the plan to IDNR for concurrence in accordance with Section VI of the IDOT Wetlands Action Plan.

Summarize the details of the conceptual compensation plan as concurred in by IDNR in the environmental documentation for the project. On EIS projects, include a summary of the conceptual compensation plan information in the draft and final statement. If an EA is prepared, ensure that the summary conceptual compensation plan information is in the document when it is available for public and agency review. If the project qualifies as a CE, include a summary of the conceptual compensation plan information in the Phase I engineering report prior to Design Approval. Include a table presenting a summary of the wetland mitigation. In the table, provide the wetland site number, wetland type, impact area (acres (h)), ratio category (e.g., on-site, off-site, FQI, T&E species, natural area, essential habitat), ratio (State mitigation ratio), and compensation required (acres (ha)).

2. Compensation Design Plan. After the conceptual compensation plan has received the necessary concurrence from IDNR, include appropriate information and details for the approved compensation plan in the project design plans. Continue to analyze and incorporate, as practical, ways to avoid and minimize adverse wetland impacts as plan preparation progresses. As a part of the design-phase compensation plan work, proceed with development of any necessary agreement with the entity or entities that will assume responsibility for long-term management of the compensation wetlands. Submit the agreement to BDE as far in advance of the target letting date for the project as practical. As appropriate, include in the design documents the following details for compensation to be provided through wetland restoration, enhancement, and/or creation:

   a. Earthwork. Provide a grading plan with contours of final grading elevations, staging and method of grading, and topsoil stockpile site(s), unless at contractor's discretion.

   b. Planting Plan and Specifications. Provide species list, quantities, sizes, form (e.g., container-grown, bare root, cutting, sprig), spacing, grouping, staking requirements, timing of planting, weed control, etc.

   c. Hydrology. Indicate inflow and outflow points and water control structures.

   d. Work Schedule. Reflect the timing of each construction phase for the wetland compensation site in the plans and specifications to ensure the successful establishment of wetland hydrology, plant materials, etc. The wetlands compensation work should commence prior to or concurrent with the highway project construction work that causes the adverse wetlands impacts requiring the compensation (i.e., compensation for wetland impacts that would occur under the first contract of a project should commence prior to or concurrent with the work under that contract and should not be put off to be addressed under a subsequent contract).

   e. Special Measures. Include a description in the special provisions or plan notes for any special measures that will be implemented during construction of the wetland compensation site to avoid or minimize unnecessary construction-stage impacts to existing wetlands (e.g., designation of "no-work" areas, restrictions on utility relocation/accommodation that could affect wetlands, placement of geotextile fabric to prevent permanent compaction of wetland soils), and to correct temporary impacts that may occur (e.g., restoration of preconstruction contours, replanting or reseeding of areas in which wetlands vegetation is disturbed or destroyed). Include notations in the plans to ensure that the wetland compensation site will not be used as a construction staging area, concrete recycling site, temporary stockpile site for spoil soils or topsoil, or other such construction-related uses.

   f. Notification to BDE. Include provisions in the plans for notifying BDE to facilitate monitoring and reporting on progress in accordance with the approved conceptual compensation plan. This must include notification when the wetlands compensation site construction work begins and when it is completed. In addition, the plans must provide for contacting the BDE Natural Resources Unit regarding any field changes that would affect the approved wetlands compensation plan so the changes can be coordinated with IDNR, as necessary, prior to implementation.

Describe the information concerning hydrology in the plan notes and show the information on the plan sheets for grading work. Show planting information on plan sheets for the planting work and in appropriate specifications. Show estimates of quantities in the same way as those for highway construction to provide guidance to contractors bidding on the work. District personnel responsible for plan preparation should work closely with district personnel and others involved in the development of the wetlands compensation plan to ensure that the components of the compensation work are completely and accurately reflected in the plans.

Submit plan information for the wetlands compensation work to BDE for review at 50% completion and at 100% completion. The district should address these submittals to the attention of the BDE Natural Resources Unit or should notify the BDE Natural Resources Unit by phone or e-mail when these submittals are being sent. In one of these submittals, include an indication of the scheduled letting date for the contract that will include the compensation site work. If the scheduled letting date subsequently changes, notify the BDE Natural Resources Unit. For project tracking purposes, the district should also notify the BDE Natural Resources Unit when the contract involving the wetland compensation site work is awarded and advise that Unit of the anticipated date that construction work for the compensation site will begin.

When BDE receives the wetlands compensation plan information for review at 100% completion, it coordinates the plan with IDNR for approval in accordance with Section VI of the IDOT Wetlands Action Plan. Approval may also be required from the Corps. The Corps may want to provide the plan to the USFWS for review and comment prior to making its decision. BDE coordinates the compensation design plan to obtain all necessary approvals.

When the necessary approvals are received from IDNR and, as appropriate, the Corps, BDE provides the district documentation of the approvals. The validity period for IDNR's approval of the compensation plan will be as stipulated in Section VI.B of the IDOT Wetlands Action Plan. If the district does not commence implementation of the compensation plan (i.e., acquire the mitigation site and/or begin the earthwork, planting, or other work necessary for the wetland restoration, enhancement, and/or creation) within three years of IDNR's approval, contact BDE to request a reevaluation of site conditions. BDE will reinitiate evaluations of the site by the INHS and/or ISGS, as necessary, and confer with the district on any changes needed in the compensation plan. BDE will re-coordinate the plan with IDNR, and, as necessary, with the Corps, before implementation of the compensation plan may commence.

For projects involving wetland compensation work, it may be beneficial to provide for a pre-bid conference to afford an opportunity to answer any questions regarding the compensation plan.

26-8.04(c)8 Compensation Plan Implementation

Once the compensation plan has received any needed approvals from IDNR and the Corps, the district proceeds with actions necessary to implement the plan. Projects involving adverse wetlands impacts should not proceed to letting until the wetland compensation plan has been approved.

26-8.04(c)9 Compensation Plan for Use of Preexisting Wetland Credits

When the approved plan calls for use of credits from an IDOT bank site, the district and BDE coordinate to accomplish the necessary accounting in the bank site ledger for the application of credits on the project. When the approved plan calls for acquiring credits from a commercial bank or other outside source, the district shall proceed with the actions necessary to secure the credits for the project. Piecemeal acquisition of compensation credits for a project is discouraged. To the fullest extent practical, provide all of the compensation credits required for a project or acquired concurrently. Provide and secure the credits before the associated adverse wetland impacts occur. Once the credits are secured, provide written confirmation to BDE to verify compliance with the terms of the approved compensation plan. For purchase of credits from commercial banks, include in the written confirmation documentation from the bank owner/manager indicating that the credits have been purchased. BDE coordinates written confirmation with IDNR and the Corps, as necessary.

26-8.04(c)10 Compensation Plan for Wetlands Restoration, Enhancement, and/or Creation

When compensation is provided through wetlands restoration, enhancement, and/or creation, careful oversight will be required to ensure that the compensation plan is implemented as approved, including any long-term monitoring and reporting required. (Implementation of the wetlands compensation site construction work should commence prior to or concurrent with the contract for the highway project construction work that causes the adverse wetlands impacts requiring the compensation.) This oversight responsibility applies throughout construction of the compensation site and beyond, until successful criteria have been met and the compensation site is transferred for long-term management. Address the considerations described below as implementation of the compensation plan proceeds (e.g., through district procedures for tracking and follow-through on commitments, or other suitable means). BDE will have ongoing involvement in the oversight for monitoring activities and in the coordination of the results of those activities with IDNR and the Corps, as appropriate.

1. Land Acquisition Phase.

    a. Acquire parcels necessary for accomplishing the wetlands compensation work in a timely manner to facilitate conducting the wetlands work at the proper time in the project construction schedule.

    b. If the property is transferred to an entity other than IDNR, include suitable deed restrictions, conservation easements, or other enforceable legal mechanisms in the documents for transfer of compensation wetlands to prevent future activities at the site(s) that would be incompatible or potentially harmful to the wetlands.

2. Construction Phase.

a. It may be beneficial for the preconstruction conference on the project to include discussion of logistics and other issues relating to the wetland compensation plan to promote understanding of the objectives of the plan and to respond to any questions or concerns. Depending upon the complexity of the compensation plan, consider inviting BDE and district staff involved in the development of the compensation plan, and the planting contractor or other special subconsultants that will be involved in the wetlands work. The following topics may be appropriate for discussion:

- scheduling in relation to other project construction work;
- no-work areas (e.g., existing wetlands, other areas to be avoided);
- topsoil stockpile sites; and
- utility relocation/accommodation issues.

b. Notify BDE at key points (e.g., site work begins, when it is completed) in implementation of the wetland compensation plan to facilitate appropriate monitoring and reporting on progress in accordance with the provisions in the approved compensation plan. Notify BDE within 30 days of completion, and prior to closing out the contract, to afford time for a final check of the site and to allow for accomplishing any associated corrective measures that may be necessary. In response to this notification, BDE will provide a compensation site post-construction evaluation report to IDNR, as required by the IDOT Wetlands Action Plan and the implementing rules for the *Interagency Wetland Policy Act*.

c. Any proposed field changes that would affect components of the wetland compensation as approved by IDNR and the Corps must be coordinated with the BDE Natural Resources Unit prior to proceeding. As necessary, BDE will confer with IDNR and the Corps regarding the effect of the proposed changes on the approved wetland compensation plan.

3. Operations Phase.

a. When BDE receives notification from the district that activities for construction of the wetland compensation site have been completed, it will task the INHS and ISGS to begin monitoring the site in accordance with the monitoring plan component of the compensation plan approved by IDNR and the Corps. BDE will review the monitoring reports and transmit them to the district, with copies to IDNR and the Corps, as appropriate. The transmittals and monitoring reports will identify any needed management or maintenance measures for the wetland site and will include an assessment of the progress toward attainment of the site performance standards. The district will be responsible for accomplishing any identified management and/or maintenance measures in accordance with the site management component of the approved wetland compensation plan. BDE will be available to provide guidance as needed.

b. Districts must ensure that maintenance personnel are aware of the location and limits of wetland compensation sites that could be affected by maintenance operations. Wetland compensation sites adjacent to highway rights-of-way must be protected from mowing, weed spraying, or other operations activities where those activities would adversely affect the wetlands.

c. When the monitoring reports indicate that site performance standards have been attained, BDE will include a request for final approval of the compensation site in the transmittal of the monitoring information to IDNR and the Corps. The request will offer the option for either agency to request an on-site meeting to inspect the compensation area prior to giving approval. BDE will coordinate with the district on arrangements for on-site meetings, if requested. After IDNR and the Corps have approved the compensation site, monitoring will be terminated, and the district may begin the process of transferring the site for long-term management. District and central Land Acquisition Bureaus must ensure that transfer of wetlands compensation sites for long-term management complies with Section XI of the IDOT Wetland Action Plan and the provisions of any agreements executed with the entity that is to receive the site.

26-8.04(d) Public Involvement/Coordination

For projects being processed with an environmental document, a public notice must be given if wetlands would be affected (see Chapter 19). Include documentation of coordination with State and Federal agencies in the Appendix. The addendum for an EA or the FEIS will address any comments received from the public or State and Federal agencies concerning the wetland involvement. The response to comments may include acceptance of recommendations for practicable measures that would decrease wetland impacts.

26-8.04(e) Wetlands Finding

If the preferred alternative is located in wetlands, include in the environmental documentation the finding required by Executive Order No. 11990 that there are no practicable alternatives to construction in wetlands.

26-8.04(e)1 Categorical Exclusion

The FHWA has approved a wetland finding on a program-wide basis for transportation improvement projects classified as a categorical exclusion (CE). It satisfies the requirements of Executive Order No. 11990 and U.S. Department of Transportation Order 5660.1A. No individual wetland finding needs to be prepared for CE projects.

26-8.04(e)2 Environmental Assessment/Environmental Impact Statement

For Finding of No Significant Impact (FONSI) or Final Environmental Impact Statement, provide a separate subsection under Wetlands entitled “Only Practicable Alternative Finding.” Include the following support information:

- a reference to Executive Order No. 11990;

- an explanation why there are no practicable alternatives to the proposed action;
- an explanation why the proposed action includes all practicable measures to minimize harm to wetlands; and
- a concluding statement:

> *Based upon the above considerations, it is determined that there is no practicable alternative to the proposed construction in wetlands and that the proposed action includes all practicable measures to minimize harm to wetlands that may result from such use.*

26-8.04(f) Development of IDOT Wetland Banks

Districts may propose development of IDOT wetland banks for use in providing compensation credits for offsetting unavoidable adverse wetland impacts resulting from highway projects. The procedures in the following Sections will apply.

If the proposed IDOT wetland bank is within an area covered by an area-specific Federal or State interagency agreement or directive governing wetland banking activities (e.g., the "Interagency Coordination Agreement on Wetland Mitigation Banking Within the Regulatory Boundaries of Chicago District, Corps of Engineers"), the provisions of that agreement or directive will govern to the extent that its requirements are different from the details in this Section. BDE will be available to provide assistance as necessary for complying with applicable alternative requirements and still should be involved in review of information prepared for evaluation of potential banking sites and information for development of the bank prospectus and banking instrument/charter. In addition, BDE still should be involved in coordinating information regarding development of the prospectus and banking instrument with Mitigation Bank Review Team (MBRT) agencies as discussed in these procedures.

26-8.04(f)1 Site Identification and Evaluation

The district takes the lead in identifying proposed sites for IDOT wetland bank development. The Corps district offices and the local offices of the USFWS, NRCS, and IDNR may be able to provide useful information on potential bank sites in their area of jurisdiction. Districts should be aware that some Corps district offices may stipulate minimum sizes for banks that will be used to provide compensation credits under the Section 404 permit requirements. Districts should confer with the Corps district office(s) that have jurisdiction to determine the nature and applicability of any constraints.

After the district has identified a site it wishes to pursue for use as a wetland bank, it submits information to BDE to request a more detailed assessment of the suitability of the site for wetland compensation purposes. The information provided to BDE includes a map (7.5′ topographic map or plat map) that shows the location and boundary of the site and its size and ownership. In response to this submittal, BDE makes a preliminary site suitability evaluation based on soils information. If BDE has concerns about the suitability of the site based on this preliminary evaluation, it confers with the district before proceeding with any further studies or evaluations of the site. If BDE does not identify any immediate site suitability concerns or if concerns are resolved, it forwards the information to the INHS and ISGS, as appropriate. INHS and IGS conduct further investigations of the hydrology, soils, vegetation, and adjacent land use for the proposed site. As necessary, BDE contacts the district to confirm that landowner permission has been obtained or that written notification has been provided prior to having the INHS/ISGS initiate the on-site investigations. BDE forwards the results of the site assessments to the district with recommendations on the suitability of the site for wetland banking purposes.

For sites that the district wishes to continue to pursue, it submits an Environmental Survey Request form to BDE to initiate evaluations of the site for cultural resources, and endangered and threatened species, or Illinois Natural Area Inventory sites. The district also evaluates the site for special waste in accordance with the procedures in Section 27-3.02. For sites on agricultural land, the district coordinates with the NRCS to obtain certification on the status of wetlands on the site (e.g., prior converted wetlands, farmed wetlands).

26-8.04(f)2 Mitigation Bank Prospectus

To initiate the planning and review process with outside agencies for a proposed bank site, the district is responsible for preparing a Mitigation Bank Prospectus. Preparation of the prospectus should not begin until site evaluations and any necessary coordination for cultural resources, endangered species/natural areas, or special wastes have been completed, and the district and BDE have conferred regarding suitability of the site for banking purposes. After the district and BDE confer and decide to proceed with proposing use of a site for wetland banking purposes, BDE contacts the appropriate Corps district(s) and IDNR to obtain their preliminary views on the proposal. BDE provides the district any information or views provided by the Corps and IDNR for consideration in preparing the prospectus. BDE provides assistance, as needed.

The prospectus provides information that IDNR and the Corps will use to evaluate the need for, and technical feasibility of, a proposed mitigation bank. The prospectus should contain the following information:

- the site location, size, and legal description;
- a delineation of any wetlands or other jurisdictional areas that may exist at the proposed bank location;
- the type of real estate interest proposed for the bank site;
- the type of bank proposed (e.g., government agency bank for use in offsetting unavoidable adverse wetland impacts of highway projects);
- the method of credit production (e.g., restoration, creation, enhancement, preservation), the number of credits to be produced by each method, and the rationale for crediting;
- a general site plan showing the location of all existing and proposed wetland and upland habitats, roads, trails, structures, utilities, and any other existing or proposed site improvements;

- a preliminary bank site construction plan and schedule of completion, preliminary planting plan, and preliminary administrative, management, and monitoring plans; and

- an outline of management and maintenance responsibilities.

For bank site proposals within the Chicago Corps District, the prospectus also must include a statement regarding compliance with the "Interagency Coordination Agreement on Wetland Mitigation Banking within the Regulatory Boundaries of Chicago District, Corps of Engineers."

The district submits one copy of the prospectus to BDE for review. After BDE review of the prospectus and resolution of any concerns identified, BDE coordinates the prospectus with the Corps and IDNR. After the Corps and IDNR have responded to the prospectus, the district and BDE confer on whether to continue to pursue acquisition and development of the proposed bank site. When decision is made that a site will be acquired and established as a bank, the district will proceed with preparation of a Mitigation Banking Instrument.

26-8.04(f)3 Mitigation Banking Instrument

All mitigation banks must have mitigation banking instruments to document concurrence of all the responsible State and Federal agencies in the objectives and administration of the banks. This includes IDOT, IDNR, the Corps, the USEPA, and the USFWS. The banking instrument documents, in detail, the physical and legal characteristics of the bank and how the bank will be established and operated. The district is responsible for preparing the Mitigation Banking Instrument. BDE provides assistance, as needed.

The mitigation banking instrument should address the following items:

- bank goals and objectives;

- ownership of bank lands;

- bank size and classes of wetlands and/or other aquatic resources proposed for inclusion in the bank, including a site plan and specifications;

- description of baseline conditions at the bank site;

- geographic service area;

- wetland classes or other aquatic resource impacts suitable for compensation from the bank;

- methods for determining credits and debits;

- accounting procedures;

- performance standards for determining credit availability and bank success;

- reporting protocols and monitoring plan;

- contingency and remedial actions and responsibilities (if performance standards are not being met);
- compensation ratios; and
- provisions for long-term management and maintenance.

The district submits one copy of the Mitigation Banking Instrument to BDE for review. After BDE review of the Mitigation Banking Instrument and resolution of any concerns identified, BDE coordinates the document with the Corps, IDNR, USEPA, and USFWS. These agencies generally constitute the MBRT for mitigation banking proposals in Illinois. After review by the MBRT and resolution of any concerns identified, BDE coordinates the Mitigation Banking Instrument for final execution. The Secretary of IDOT and a representative of each of the agencies on the MBRT sign the Mitigation Banking Instrument. BDE provides the district a copy of the executed Mitigation Banking Instrument and advises that implementation of the steps to establish the bank may proceed.

26-8.04(f)4 Mitigation Bank Implementation

After approval to proceed with implementation of the mitigation bank proposal, the district may initiate property negotiations for acquiring the site and may proceed with arrangements for any site work necessary to establish wetlands credits. Careful oversight is required to ensure that the provisions of the Mitigation Banking Instrument are implemented as approved, including any long-term monitoring and reporting required. As implementation proceeds, the district involves BDE, as necessary, to accomplish monitoring, ensure consistency with the approved bank plan, and evaluate progress toward establishment of mitigation credits. BDE is also involved in reporting to the MBRT on implementation of the mitigation bank, in accordance with the reporting protocols in the Mitigation Banking Instrument.

26-9 THREATENED AND ENDANGERED SPECIES/NATURAL AREA IMPACT ASSESSMENTS

26-9.01 Introduction

In the development of a project, special studies and coordination are required when the action may affect Federally listed threatened or endangered species. Studies and coordination also are required for actions that may adversely impact State-listed species or an area included on, or published as a candidate for inclusion on, the Illinois Natural Areas Inventory. This Section addresses the reporting and processing requirements for such actions.

26-9.02 Complementary Technical Manual

Currently, there is not a complementary IDOT Technical Manual for this subject area.

26-9.03 Legal Authority

The following legal authority regulates or influences the policies and procedures for Threatened and Endangered Species/Natural Area Impact assessments:

- *Federal Endangered Species Act* of 1973, 16 U.S.C. 1536(a)(d),
- Procedures for Interagency Cooperation - Endangered Species Act of 1973, 50 CFR 402,
- *The Illinois Endangered Species Protection Act,* 520 ILCS 10/1 *et seq*.,
- *The Illinois Natural Areas Preservation Act,* 525 ILCS 30/1 *et seq*.,
- Consultation Procedures for Assessing Impacts of Agency Actions on Endangered and Threatened Species and Natural Areas, 17 Ill. Admin. Code 1075,
- Incidental Taking of Endangered or Threatened Species, 17 Ill. Admin. Code 1080,“
- Memorandum of Understanding by and between the Illinois Department of Natural Resources and the Illinois Department of Transportation, 2007.

See Appendix C for more information.

26-9.04 Policy

In the development of a project, an assessment shall be made of the likely impacts on species of plants or animals listed at the Federal and/or State level as threatened or endangered and on State-designated Natural Areas. Every effort shall be made to minimize the likelihood of jeopardizing the continued existence of listed threatened or endangered species, the destruction or adverse modification of a Natural Area, or an area of habitat that has been designated as critical habitat or essential habitat.

26-9.05 Federal Requirements

26-9.05(a) Definitions

26-9.05(a)1 From 50 CFR 402.04

1. Action Area. All areas to be affected directly or indirectly by the proposed action and not merely the immediate area involved in the action.

2. Biological Assessment. Information on listed and proposed species and designated and proposed critical habitat that may be present in the action area, and the evaluation of potential effects of the action on such species and habitat.

3. Biological Opinion. The document that states the opinion of the U.S. Fish and Wildlife Service (USFWS)as to whether an action is likely to jeopardize the continued existence of listed species or result in the destruction or adverse modification of critical habitat.

4. Conference. A process that involves informal discussions with USFWS regarding the impact of an action on proposed species or proposed critical habitat and recommendations to minimize or avoid the adverse effects.

5. Conservation Recommendations. Suggestions of the USFWS regarding discretionary measures to minimize or avoid adverse effects of a proposed action on listed species or critical habitat or regarding the development of information.

6. Critical Habitat. An area designated by USFWS as critical habitat.

7. Destruction or Adverse Modification. A direct or indirect alteration that appreciably diminishes the value of critical habitat for both the survival and recovery of listed species. Such alterations include, but are not limited to, alterations adversely modifying any of those physical or biological features that were the basis for determining the habitat to be critical.

8. Formal Consultation. A process between USFWS and the Federal agency responsible for a proposed action that commences with the Federal agency's written request for consultation and concludes with USFWS issuance of a biological opinion.

9. Informal Consultation. An optional process that includes all discussions, correspondence, etc., with USFWS prior to formal consultation, if required.

10. Jeopardize the Continued Existence. To engage in an action that reasonably would be expected, directly or indirectly, to reduce appreciably the likelihood of both the survival and recovery of a listed species in the wild by reducing the reproduction, numbers, or distribution of that species.

11. Listed Species. Any species of fish, wildlife, or plant that has been determined to be endangered or threatened pursuant to the *Federal Endangered Species Act*.

12. Major Construction Activity. A construction project (or other undertaking having similar physical impacts) that is a major Federal action significantly affecting the quality of the human environment as referred to in the *National Environmental Policy Act* (NEPA).

13. Proposed Critical Habitat. Habitat proposed in the *Federal Register* to be designated or revised as critical habitat for any listed or proposed species.

14. Proposed Species. Any species of fish, wildlife, or plant that is proposed to be listed under Section 4 of the *Federal Endangered Species Act.*

26-9.05(a)2 From the Endangered Species Act Consultation Handbook

1. Biological Assessment. Information prepared to determine whether a proposed action is likely to: (a) adversely affect listed species or designated critical habitat; (b) jeopardize the continued existence of species that are proposed for listing; or (c) adversely modify proposed critical habitat. Biological assessments must be prepared for "major construction activities." The outcome of the biological assessment determines whether formal consultation or a conference is necessary.

2. Conference. A process of early interagency cooperation involving informal or formal discussions with USFWS regarding the likely impact of an action on proposed species or proposed critical habitat. Conferences are: (a) required for proposed Federal actions likely to jeopardize proposed species or destroy or adversely modify proposed critical habitat; (b) designed to help identify and resolve potential conflicts between an action and species conservation early in a project's planning; and (c) designed to develop recommendations to minimize or avoid adverse effects to proposed species or proposed critical habitat.

3. Conservation Measures. Actions to benefit or promote the recovery of listed species that are included as an integral part of a proposed project. These actions will serve to minimize or compensate for project effects on the species under review. These may include actions taken prior to the initiation of consultation, or actions committed to in a biological assessment or similar document.

4. Conservation Recommendations. Non-binding suggestions from the USFWS resulting from formal or informal consultation that: (a) identify discretionary measures a Federal agency can take to minimize or avoid the adverse effects of a proposed action on listed or proposed species, or designated or proposed critical habitat; (b) identify studies, monitoring, or research to develop new information on listed or proposed species, or designated or proposed critical habitat; and (c) include suggestions on how an action agency can assist species conservation as part of their action.

5. Formal Consultation. A process between the Services and a Federal agency or applicant that: (a) determines whether a proposed Federal action is likely to jeopardize the continued existence of listed species or destroy or adversely modify designated critical habitat; (b) begins with a Federal agency's written request and submittal of a complete initiation package; and (3) concludes with the issuance of a biological opinion and incidental take statement by USFWS. If a proposed Federal action may affect a listed species or designated critical habitat, formal consultation is required; except when

USFWS concurs, in writing, that a proposed action “is not likely to adversely affect” listed species or designated critical habitat.

6. Incidental Take. Refers to takings that result from, but are not the purpose of, carrying out an otherwise lawful activity.

7. Is Likely to Adversely Affect. The appropriate finding in a biological assessment (or conclusion during informal consultation) if any adverse effect to listed species may occur as a direct or indirect result of the proposed action or its interrelated or interdependent actions, and the effect is not: discountable, insignificant, or beneficial (see definition of is “not likely to adversely affect”). In the event the overall effect of the proposed action is beneficial to the listed species, but is also likely to cause some adverse effects, then the proposed action “is likely to adversely affect” the listed species. If incidental take is anticipated to occur as a result of the proposed action, an "is likely to adversely affect" determination should be made. An “is likely to adversely affect” determination requires the initiation of formal consultation.

8. Is Not Likely to Adversely Affect. The appropriate conclusion when effects on listed species are expected to be discountable, insignificant, or completely beneficial. Beneficial effects are contemporaneous positive effects without any adverse effects to the species. Insignificant effects relate to the size of the impact and should never reach the scale where take occurs. Discountable effects are those extremely unlikely to occur. Based on best judgment, a person would not: (a) be able to meaningfully measure, detect, or evaluate insignificant effects; or (b) expect discountable effects to occur.

9. May Affect. The appropriate conclusion when a proposed action may pose any effects on listed species or designated critical habitat. When the Federal agency proposing the action determines that a “may affect” situation exists, they must either initiate formal consultation or seek written concurrence from the Services that the action “is not likely to adversely affect” listed species.

10. No Effect. The appropriate conclusion when the action agency determines its proposed action will not affect a listed species or designated critical habitat.

11. Take. To harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct; may include significant habitat modification or degradation if it kills or injures wildlife by significantly impairing essential behavioral patterns including breeding, feeding, or sheltering.

26-9.05(b) Applicability

The procedures in this Section apply to all projects initiated by the Department that involve funding or approvals from FHWA or another Federal agency.

The preparation of a Biological Assessment is required for any Federally funded/regulated “major construction activity” where listed species or critical habitat may be present in the action area. A Biological Assessment also may be appropriate for other actions where listed species or critical habitat may be present and it is unclear whether they may be affected. If they may be adversely affected, formal consultation is required.

For additional guidance on the Federal requirements, see the following:

- USFWS *Endangered Species Consultation Handbook*, March 1998.
- February 20, 2002, FHWA Memorandum: Management of the Endangered Species Act (ESA) Environmental Analysis and Consultation Process, February 20, 2002"; and
- February 18, 2005, FHWA Memorandum: Joint Agency Agreement on ESA's Formal Consultation Process, February 18, 2005."

26-9.05(c) Determination of Need for a Biological Assessment

To initiate the process for compliance with the Federal *Endangered Species Act* requirements, obtain information from USFWS concerning any listed or proposed species or designated or proposed critical habitat that may be present in the action area. Either request the information from USFWS during project scoping/early coordination or gather the information from websites maintained by the USFWS Rock Island and Chicago field offices.

In response to a request for information, USFWS will:

- provide information regarding listed or proposed species, or designated or proposed critical habitat that may be present in the action area, and a list of candidate species that may be present in the action area[5]; or
- advise whether, based on the best scientific and commercial data available, any listed or proposed species or designated or proposed critical habitat may be present in the action area.

If, as a result of the coordination with USFWS, a determination is made that no listed species or critical habitat may be present, a Biological Assessment is not required. In such cases, a "no effect" determination applies and further consultation with USFWS on listed species or critical habitat is not required. If it is determined that only proposed species or proposed critical habitat may be present, a Biological Assessment will not be required unless the proposed listing and/or designation become final before the action is completed.

If the coordination with USFWS results in a determination that listed species or critical habitat may be present, prepare a Biological Assessment. Where proposed species or proposed critical habitat also may be present, they should be addressed in the Biological Assessment.

[5] *Candidate species refers to any species being considered by USFWS for listing as endangered or threatened but not yet formally proposed or listed. Candidate species are accorded no protection under the Endangered Species Act. Notification concerning each species is intended to alert agencies of potential proposals or listings. These species should be identified in the environmental report for a proposed undertaking. Also, close contact should be maintained with BDE on the disposition of the candidate species during the environmental processing of a project.*

26-9.05(d) Preparation of the Biological Assessment

Biological Assessments will be prepared by or under the direction of BDE and in consultation with the IDOT district(s) responsible for the action involved. If the proposed action may involve impacts to Critical Habitat, consider the guidance provided in BLE IM 1-78 "*Endangered Species Act* of 1973, Mitigation of Critical Habitat." Any required associated specialized environmental field studies will also be conducted by or under the direction of BDE. The Biological Assessment for an action must be completed before Phase I completed.

There is no prescribed format for a Biological Assessment prepared pursuant to Federal requirements; however, the following items typically will be included:

- a description of the proposed undertaking; its location (including a map) and purpose; and, if available, anticipated dates for beginning and completing construction;
- the results of an on-site inspection of the action area to determine if listed or proposed species are present or occur seasonally;
- the views of recognized experts on the species at issue;
- a review of the literature and other information concerning species potentially involved with the action;
- an analysis of the effects of the action on the species (in terms of individuals and populations) and habitat required for its survival and propagation, including consideration of cumulative effects and the results of any related studies; and
- an analysis of alternatives considered for the proposed action.

The Biological Assessment must be completed within 180 days of its initiation unless a different time period is agreed upon in consultation with USFWS.

If preparation of the Biological Assessment for an action is not initiated within 90 days of the response from USFWS (indicating that listed species or critical habitat may be present), verification of the current accuracy of the species/habitat information must be accomplished with USFWS at the time the preparation of the Biological Assessment is initiated. BDE will make the necessary contacts for this verification, if required.

If a proposed action requiring a Biological Assessment is identical, or very similar, to a previous action for which a Biological Assessment was prepared, a separate Biological Assessment need not be prepared for the current action. The earlier Biological Assessment, plus any supporting data from other documents pertinent to the consultation, may be incorporated by reference into a written certification to USFWS indicating that:

- the proposed action involves similar impacts to the same species in the same geographic area;
- no new species have been listed or proposed or no new critical habitat designated or proposed for the action area; and

- the Biological Assessment has been supplemented with any relevant changes in information.

26-9.05(e) Processing of the Biological Assessment

The complete Biological Assessment will be coordinated with FHWA and transmitted by BDE to USFWS for review. USFWS will respond in writing within 30 days on whether it concurs with the findings of the Biological Assessment.

If the Biological Assessment indicates the action is not likely to jeopardize the continued existence of proposed species or result in the destruction or adverse modification of proposed critical habitat and USFWS concurs, then a conference is not required. If it is determined the action is likely to jeopardize the continued existence of proposed species or result in the destruction or modification of proposed critical habitat, a conference is required.

If the Biological Assessment indicates that listed species or critical habitat are not likely to be adversely affected by the action and USFWS concurs, a formal consultation will not be required.

If it is determined that listed species or critical habitat are likely to be adversely affected by the action, a formal consultation will be required. In this case, BDE will coordinate with FHWA and FHWA will submit a written request to USFWS to initiate formal consultation. This request will include:

- a description of the proposed action;
- a description of the specific area that may be affected by the action;
- a description of any listed species or critical habitat that may be affected by the action;
- a description of the manner in which the action may affect any listed species or critical habitat and an analysis of any cumulative effects;
- relevant reports including any Environmental Impact Statement, Environmental Assessment, or Biological Assessment prepared; and
- any other relevant available information on the action, the affected listed species, or critical habitat.

Formal consultation will be directed toward further analysis of the species and/or critical habitat involved and alternatives to the proposed action. The purpose of these analyses is to allow USFWS to develop its opinion concerning whether the action is likely to jeopardize the continued existence of listed species or result in the destruction or adverse modification of critical habitat.

Formal consultation will be concluded within 90 days after its initiation unless a longer period is mutually agreed to. Within 45 days after concluding formal consultation, USFWS will provide its Biological Opinion concluding that:

- the action is likely to jeopardize the continued existence of a listed species or result in the destruction or adverse modification of critical habitat (a “jeopardy” biological opinion); or
- the action is not likely to jeopardize the continued existence of a listed species or result in the destruction or adverse modification of critical habitat (a “no-jeopardy” biological opinion).

If a “jeopardy” biological opinion is issued, USFWS must be notified of the final decision on the action (i.e., whether the action will be modified and, if so, how).

If the final decision on the action will involve a likelihood of jeopardizing the continued existence of a listed species or resulting in the destruction or adverse modification of critical habitat, the action may not proceed (under Federal approvals or with Federal funds) unless, and until, an exemption from the requirements of Section 7(a)(2) of the *Endangered Species Act* (which directs Federal agencies to “ensure” that their actions are not likely to “jeopardize” listed species or destroy or adversely modify critical habitat) is obtained.

The results of coordination regarding Federal endangered and threatened species and/or critical habitat must be summarized in the environmental report or Phase I engineering report for the action.

26-9.06 State Requirements

26-9.06(a) Definitions

1. Action. Construction, land management, or other activities that are authorized, funded, or performed in whole or in part by agencies of State and local governments, and that will result in a change to the existing environmental conditions or may affect listed threatened or endangered species or their essential habitat or Natural Areas.

2. Adverse Impact. A direct or indirect alteration of the physical or biological features of the air, land, or water that may affect the survival, reproduction, or recovery of a listed species or that may diminish the viability of a Natural Area.

3. Biological Opinion. The component of the Detailed Action Report prepared by the Illinois Department of Natural Resources (IDNR) when a valid record of an occurrence for a threatened or endangered species or Natural Area exists within the vicinity of a proposed action. This opinion will conclude whether the action will jeopardize the listed species present, destroy or adversely modify their essential habitat, or adversely modify a Natural Area.

4. Cumulative Effects. Direct and indirect effects of a proposed action(s), together with the identifiable effects of actions that are interrelated or interdependent with the action. Indirect effects are those that are caused by the action but are later in time or farther in distance. Interrelated actions are those that are a part of a larger action. Interdependent actions are those that have independent utility apart from the action.

5. Detailed Action Report. A written report that is prepared by an agency when a threatened or endangered species or Natural Area has been identified within the vicinity of a proposed action. This report shall contain sufficient information to make a judgment regarding the potential adverse impacts to a listed species, its essential habitat, or a Natural Area.

6. Essential Habitat. The physical and biological environment that is required to maintain viable populations of a listed species to ensure the survival and recovery of that species.

7. Jeopardize. To engage in an action that would reduce the likelihood of the survival or recovery of a listed species, result in the destruction or adverse modification of the essential habitat of such a species, or result in the destruction or adverse modification of a Natural Area.

8. Listed Species. Any species of plant or animal that has been listed as threatened or endangered by the Illinois Endangered Species Protection Board or the USFWS.

9. Natural Area. Any area of land in public or private ownership that is registered under the Illinois *Natural Areas Preservation Act,* 525 ILCS 30/1 *et seq.* or is identified in the Illinois Natural Areas Inventory.

10. Vicinity. The area surrounding the action, as determined by the life history requirements of the species of concern or proximity to a Natural Area.

26-9.06(b) Applicability

The following procedures are applicable to all projects requiring submittal of an Environmental Survey Request (ESR) pursuant to the criteria in Section 27-1.03(d).

26-9.06(c) Determination of Need for Detailed Action Report

The district will consider information on threatened and endangered species/Natural Areas in evaluating potential environmental effects as development of the proposed project proceeds. The evaluation of effects on threatened and endangered species/Natural Areas should determine whether any of the following findings apply to the project:

- a listed species or Natural Area may be adversely affected within the right-of-way (existing or proposed), easements, or borrow/use areas the project will involve;
- construction activities within the right-of-way will adversely affect wetland areas outside the right-of-way and listed species are known to occur in the wetlands; or
- noise, air quality, or water quality aspects of a project may adversely affect a listed species or Natural Area outside the right-of-way, easements, or borrow/use areas for the action.

If any of the preceding findings are applicable, a Detailed Action Report is required unless a programmatic agreement with the IDNR is in force for the resource(s) involved that addresses measures for avoidance and mitigation of adverse impacts. An example would be the restrictions on the months in which Indiana Bat nesting trees may be cut. If the resource involved is covered by a programmatic agreement and the project will comply with the agreed terms, no further coordination with IDNR is necessary for that resource.

If the district and BDE determine that the project will not adversely affect listed species or Natural Areas, a Detailed Action Report is not required.

26-9.06(d) Preparation of the Detailed Action Report

When a Detailed Action Report is required, it will be prepared by, or under the direction of BDE in consultation with the district responsible for the action involved. Any needed associated specialized environmental studies will also be conducted by or under the direction of BDE. The Detailed Action Report typically will include the following components:

- the name and address of the contact person in BDE;
- a description of the proposed action, its location (including a map) and purpose and, if available, anticipated dates for beginning and completing construction;
- an analysis of the effects of the action on any Natural Area(s) present and on listed species (in terms of individuals and populations) and habitat required for their survival and propagation, including consideration of cumulative effects; and
- a discussion of any alternatives considered for the proposed action.

The Detailed Action Report may include the following additional components, when necessary to respond to specific issues or concerns regarding listed species:

- results of an on-site inspection of the area affected by the action to determine if listed or proposed species are present or occur seasonally;
- the views of recognized experts on species involved; and
- a review of literature and other pertinent information on species potentially involved with the action.

26-9.06(e) Processing of the Detailed Action Report

BDE will transmit the completed Detailed Action Report to the IDNR for formulation of a Biological Opinion. The Biological Opinion will address whether the action, taken with its cumulative effects, will jeopardize the listed species present, have an adverse impact on its essential habitat, or cause adverse modification of a Natural Area.

Within 90 days of the date, it receives the Detailed Action Report (unless an extension is mutually agreed to by IDOT and IDNR), IDNR will provide its Biological Opinion to the BDE. The Biological Opinion will result in one of the following findings:

- the action may promote the conservation of a listed species or its essential habitat or enhance the protection of a Natural Area, in which case the consultation process for endangered species/Natural Areas is concluded;
- the action is not likely to jeopardize a listed species or its essential habitat or cause adverse modification of a Natural Area, in which case the consultation process for endangered species/Natural Areas is concluded; or
- the proposed action is likely to jeopardize a listed species or its essential habitat or cause adverse modification of a Natural Area, in which case the consultation process will continue. In this case, IDNR generally will include recommendations in the Biological Opinion on how the impacts to the listed species/Natural Area could be avoided or minimized.

If the Biological Opinion concludes that an action is likely to jeopardize a listed species or its essential habitat or cause the adverse modification of a Natural Area, IDOT and IDNR will have 45 days, commencing on the date IDOT receives the Biological Opinion, to attempt to satisfactorily resolve the adverse effects on the listed species/Natural Area. If satisfactory resolution is reached within the 45-day period, IDNR will provide a sign-off indicating compliance with the requirements of the *Illinois Endangered Species Protection Act* and the *Illinois Natural Areas Preservation Act*. If a resolution is not reached within the 45-day period, one of the following will occur:

- the consultation process will end and will be classified as having failed or partially failed to protect the resource(s) involved;
- IDOT and IDNR may decide to elevate the matter within each agency,[6] or
- upon mutual agreement by both parties, negotiations may continue.

When agreement is reached on the satisfactory resolution of adverse impacts to listed species or Natural Areas, IDNR will provide a sign-off to IDOT indicating compliance with threatened and endangered species/Natural Area requirements. The IDNR sign-off for threatened and endangered species/Natural Area requirements is valid for three years from the date of issuance. If the project involves other resource concerns requiring further IDNR review, the IDNR will re-screen the project against the Natural Heritage Database prior to any final action confirming satisfactory disposition of the other resource issues. In such cases, the validity period will be reset to extend for three years from the date of resolution of the other issues, provided no Special Circumstances, as described in Section 26-9.06(g), apply.

26-9.06(f) Special Circumstances

[6] *It is desirable that disagreements which arise be resolved quickly and at the lowest possible level of agency involvement. For most actions, disagreements should be resolved by middle- or upper-level management of IDNR and IDOT. However, where there is failure to reach agreement, it may be necessary to refer the matter to the IDNR Director and IDOT Secretary for resolution.*

Consultation will be initiated, or a terminated consultation process will be reopened, if any of the following circumstances apply:

- new information reveals effects of the proposed action that may adversely affect a listed species or its essential habitat or a Natural Area in a manner not previously considered;
- the proposed action is subsequently modified such that it may adversely affect a listed species or its essential habitat or a Natural Area in a manner that was not considered in the consultation process; or
- additional listed species or their essential habitat or Natural Areas are identified within the vicinity of the action.

26-9.06(g) Incidental Taking Authorization

Section 11 of the *Illinois Endangered Species Protection Act,* (520 ILCS 10/11) states that where a State or local agency evaluates its actions through the *Endangered Species Act* consultation process with the IDNR, the agency shall be deemed to have complied with its obligations under the *Act*, provided the agency action shall not result in the killing or injuring of any Illinois-listed animal species, or provided that authorization for taking a listed species has been issued in accordance with Sections 4, 5, or 5.5 of the *Act*. Based on this language, the endangered species consultation process can be used to establish compliance with the *Act* for all impacts of agency actions on Illinois-listed plant species. The consultation process also can establish compliance for effects of agency actions on Illinois-listed animal species, provided the action will not result in killing or injuring of any of the species. However, if the agency action will result in killing or injuring of a listed animal species, the only way compliance with the *Act* can be established for that aspect of the action is by obtaining an authorization for “taking.” (Section 2 of the *Act* defines “take” to mean, in reference to animals,“…to harm, hunt, shoot, pursue, lure, wound, kill, destroy, harass, gig, spear, ensnare, trap, capture, collect, or to attempt to engage in such conduct.” This definition covers killing or injuring of listed animal species.)

Section 5.5 of the Act sets forth “incidental taking” provisions whereby IDNR may authorize a taking that is incidental to, and not the purpose of, carrying out of an otherwise lawful activity. IDNR has promulgated detailed procedures for the incidental taking authorization process in 17 Ill. Adm. Code 1080.

The requirements for obtaining an incidental taking authorization will apply to any project that will result in killing or injuring of Illinois-listed animal species. The need for requesting an incidental taking authorization will be based on a thorough evaluation of the likelihood that the project will result in the killing or injuring of any Illinois-listed animal species. This evaluation will consider available data and/or the results of field studies regarding the actual occurrence of Illinois-listed animal species, not just the existence of suitable habitat, within the specific area that will be affected by the project. It will also consider the potential for the undertaking to actually impact the species such that they may be killed or injured.

Recommendations for obtaining an incidental taking authorization may be included in IDNR’s coordination responses (e.g., for a Biological Resource Review or Detailed Action Report).

Another possibility is that the district and/or BDE may determine that an incidental taking authorization is needed, based on the results of field studies or other available information. If an incidental taking authorization is determined to be necessary, initiate the application process as soon as possible after the need for the authorization is confirmed. The *Endangered Species Protection Act* and the implementing rules on incidental taking provide that the authorization for incidental taking must be in place before a taking occurs. To ensure appropriate compliance with this requirement on highway projects, the incidental taking authorization must be in place prior to awarding the contract for the work that will cause the incidental taking, unless the potential incidental taking issue is not identified until after the contract has been awarded. If the potential incidental taking is identified after award, the authorization still must be in place before proceeding with the work that would result in a taking.

It is recommended that coordination with IDNR for a potential incidental taking be initiated as early as practical to afford maximum flexibility for considering and accommodating alternatives to avoid, minimize, and mitigate the taking. The avoidance alternatives and minimization and/or mitigation measures will ultimately be reflected in the conservation plan, which will provide the information IDNR will use in making its decision on approval or denial of the authorization request. Although there currently is no requirement for having the incidental taking authorization prior to design approval, coordination with IDNR on the incidental taking issues should occur prior to that point to ensure that project plans reflect decisions (e.g., regarding minimization and mitigation measures for the proposed incidental taking) that are acceptable to IDNR for purposes of approving the incidental taking authorization. Failure to do so may result in potentially costly project/plan changes and delays later in project development or implementation (e.g., if IDNR does not accept the minimization and mitigation measures as planned or it stipulates additional measures as a condition for approving the incidental taking authorization).

When the need for an incidental taking authorization is identified during Phase I, coordinate the public notice procedures required for the incidental taking authorization to coincide with other public involvement activities for the project to the extent practical.

If the district receives a recommendation from IDNR or BDE to obtain an incidental taking authorization and subsequently determines that the incidental taking authorization will not be pursued (e.g., because changes in the project have eliminated the need), the district must provide written notification of the decision to the BDE. Provide notification as soon as possible after the determination is made and include an explanation of the reason(s) for not seeking the incidental taking authorization.

When authorization for incidental taking is determined necessary, the following procedures will apply, unless the IDNR has approved special "programmatic" procedures for the category of action and species involved. In such case, the approved alternate procedures will govern:

a) The district will be responsible for preparing the required Conservation Plan[7] and newspaper notice for compliance with the incidental taking authorization rules

[7] *The State implementing rules for the incidental taking requirements provide that a Habitat Conservation Plan approved by the US Fish and Wildlife Service pursuant to Section 10 of the Endangered Species Act of 1973 may be submitted in lieu of a Conservation Plan as otherwise required under the State rules. The rules also provide that*

(17 Ill. Adm. Code 1080, distributed via BDE Information Memorandum 01-35). BDE will provide information and technical assistance, as needed, to help the district in preparing the plan and notice. This may include, for example, biological data on the affected species, recommendations for mitigation measures, data and information regarding the effect of the proposed taking on the likelihood of the survival of the listed species, and information identifying participants that will be involved in implementing portions of the Conservation Plan.

a. Conservation Plan. At a minimum, ensure the Conservation Plan contains the following:

- A description of the impact likely to result from the proposed taking of the listed animal species that would be covered by the authorization, including, but not limited to:

  + legal description, if available, or detailed description including street address and map of the area to be affected by the proposed action and information indicating the ownership or control of the affected property;

  + biological data on the affected species;

  + description of the activities that will result in taking (e.g., killing, injuring) of the endangered or threatened animal species; and

  + explanation of the anticipated adverse effects on the listed species.

- Measures that will be taken to minimize and mitigate the impact on the listed animal species and the funding that will be available to undertake those measures, including, but not limited to:

  + plans to minimize the area affected by the proposed action, the estimated number of individuals of the endangered or threatened species that will be taken, and the amount of habitat affected;

  + plans for management of the area affected by the proposed action that will enable continued use of the area by endangered or threatened species;

  + description of all measures to be implemented to minimize or mitigate the effects of the proposed action on the endangered or threatened species;

an authorization to take an endangered or threatened species under the terms of biological opinion issued by the US Fish and Wildlife Service pursuant to Section 7 of the Endangered Species Protection Act of 1973 may be submitted in lieu of a Conservation Plan.

+ plans for monitoring the effects of measures implemented to minimize or mitigate the effects of the proposed action on the endangered or threatened species;

+ adaptive management practices that will be used to deal with changed or unforeseen circumstances that affect the effectiveness of measures instituted to minimize or mitigate the effects of the proposed action on the endangered or threatened species; and

+ verification that adequate funding exists to support and implement all mitigation activities described in the Conservation Plan.

- A description of alternative actions considered that would not result in take of an Illinois-listed animal species and the reasons that each of those alternatives was not selected. A "no action" alternative shall be included in this description of alternatives.

- Data and information to indicate that the proposed taking will not reduce the likelihood of the survival of the endangered or threatened animal species in the wild within the State of Illinois, the biotic community that the species is a part, or the habitat essential to the species' existence in Illinois.

b) An implementing agreement, which includes, but is not limited to:

- the names and signatures of all participants in the execution of the Conservation Plan;

- the obligations and responsibilities of each of the identified participants with schedules and deadlines for completion of activities included in the Conservation Plan and a schedule for preparation of progress reports to be provided to the IDNR;

- certification that each participant in the execution of the Conservation Plan has the legal authority to carry out their respective obligations and responsibilities under the Conservation Plan;

- assurance of compliance with all other Federal, State and local regulations pertinent to the proposed action and to execution of the Conservation Plan; and

- copies of any final Federal authorizations already issued for the proposed taking, if any.

c. Newspaper Notice. At a minimum, the notice for publication in the newspaper, as described later, includes the following:

- the name of the district contact person and the district mailing address;

- a map or description that clearly shows or describes the precise location and boundaries of both the area to be affected by the proposed project and any areas to be affected by provisions of the Conservation Plan and is sufficient to enable local residents to readily identify the subject areas. It must include towns, bodies of water, local landmarks, or any other information that would identify the subject areas. If a map is used, indicate the north direction;

- a summary of the incidental taking for which authorization is being requested;

- a summary of the measures that will be instituted to minimize and mitigate the effects of the proposed incidental taking;

- the location where a copy of the Conservation Plan is available for inspection;

- the street and e-mail address of the IDNR office to which comments on the Conservation Plan may be submitted; and

- the closing date for receipt of written comments on the Conservation Plan. The closing date must allow at least 30 days from the last date the notice will be published in the newspaper as discussed in Item #5, below.

1) After the district, in consultation with BDE, as necessary, has prepared the Conservation Plan and proposed newspaper notice, it will submit two copies of each to BDE.

2) BDE will complete a final review of the Conservation Plan and notice. After resolving any comments with the district, BDE will forward the Conservation Plan and notice to IDNR.

3) Within 30 days of receipt of the Conservation Plan and notice, IDNR will either respond that the Conservation Plan is complete, and the newspaper notice is satisfactory or will provide an indication of any deficiencies identified in the Conservation Plan or notice.

4) If IDNR identifies deficiencies in the Conservation Plan or notice, BDE will coordinate with the district and IDNR as necessary to resolve the deficiencies. When IDNR advises that the Conservation Plan is complete and the notice is satisfactory, the district will proceed with publication of the notice. It must be placed in a newspaper of general circulation in the locality of the proposed action at least once a week for three consecutive weeks. At least 14 days must elapse between the first and last publication of the notice. Concurrent with the first publication in a local newspaper, the notice also must be published one time in the official State newspaper. Prior to, or concurrent with, publication of the first newspaper notice, the district must make one or more copies of the complete Conservation Plan available for review at the nearest public library in the county or counties in which the proposed action will occur. The district also must provide a copy of the complete Conservation Plan to the Executive Director of the Illinois Endangered Species Protection Board at IDNR headquarters.

5) The Incidental Taking rules in 17 Ill. Adm. Code 1080.30 provide that comments on the Conservation Plan may be submitted to IDNR for up to 30 days following the last publication of the newspaper notice. The rules also indicate that ""…IDNR shall, upon receipt of written comments, transmit a copy of the comments to the applicant." As comments submitted on the Conservation Plan are received from IDNR, BDE will forward them to the district. The district, in consultation with BDE, will prepare a written summary in accordance with the requirements in the Incidental Taking rules. The summary will include a list of all persons or organizations making comments, a list of the criticisms, suggestions, and issues raised, and an analysis of each comment, including a description of any revisions to the Conservation Plan made in response to public comment. Complete the written summary of comments as quickly as possible so that it can be submitted to the IDNR Office of Resource Conservation within 10 days after the close of the public comment period, as required by Section 1080.30 of the Incidental Taking rules.

6) The IDNR Office of Resource Conservation must complete its review of the Conservation Plan and issue its decision on the incidental taking authorization request within 120 days after the date of the first publication of the notice in the newspaper. IDNR may authorize the incidental taking if it finds that the taking will meet all requirements as stipulated in 17 Ill. Adm. Code 1080.40(a). If IDNR finds that the Conservation Plan does not meet all of the stipulated requirements, it may require additional terms and conditions to ensure the requirements will be met. BDE will coordinate with the district and IDNR to resolve any identified deficiencies in the Conservation Plan and to respond to any additional terms and conditions proposed by IDNR. Upon receipt of the written notice from IDNR concerning its decision on the incidental taking application, BDE will forward the notice to the district. Work that would cause the killing or injuring of an Illinois-listed animal species must not be commenced until IDNR has issued an incidental taking authorization for the work.

BDE will be available to provide technical assistance to the district, as necessary, in implementing the approved Conservation Plan and any additional terms and conditions required.

26-9.07 <u>Coordination of Federal/State Requirements</u>

Where a species involved with an action is listed at both the Federal and State level, the Biological Assessment (Federal) and Detailed Action Report (State) prepared for the action will be processed concurrently with USFWS and IDNR as practical. Although processing may be concurrent and the results of consultation with either agency may be considered by the other, the Federal and State requirements are independent; both must be satisfied when species are on both the Federal and State lists.

26-10 EVALUATIONS OF FARMLAND CONVERSION IMPACTS

26-10.01 Introduction

In the development of a project, consideration must be given to the impacts that the action will cause in the conversion of farmland to non-farm uses. Under certain circumstances, coordination must be initiated with the U.S. Department of Agriculture, Natural Resources Conservation Service (NRCS), and/or the Illinois Department of Agriculture (IDOA) to evaluate the impacts on farmland and obtain the views of those agencies on alternatives to the proposed action. This Section discusses the criteria and procedures for accomplishing the necessary coordination with NRCS and IDOA.

26-10.02 Legal Authority

The following legal authority regulates or influences the policies and procedures on farmland conversions:

- *Farmland Protection Policy Act* of 1981, 7 U.S.C. 4201-4209,
- *Farmland Protection Policy Act,* 7 CFR 658,
- *The Farmland Preservation Act*, 505 ILCS 75/1 *et seq*.,
- State Exec. Order No. 4 (1980), Preservation of Illinois Farmland,
- Illinois Department of Transportation, Agriculture Land Preservation Policy,
- Cooperative Working Agreement between the Illinois Department of Agriculture and the Illinois Department of Transportation on Farmland Preservation, and
- *Farmland Preservation Act,* 8 Ill. Admin. Code 700.

See Appendix C for more information.

26-10.03 Policy

In the development of a project, evaluate the action's effects on conversion of farmland to non-farm use. Undertake coordination with NRCS and/or IDOA, as appropriate, to obtain their views on any anticipated farmland conversion. This evaluation and coordination with NRCS and IDOA is to be accomplished in conformance with Federal and State statutes, regulations, executive orders, and IDOT agreements concerning farmland. Consider alternatives that could lessen adverse impacts to farmland. As practical, ensure proposed actions are developed to be compatible with State, local government, and private programs and policies to protect farmland.

26-10.04 Federal Requirements

26-10.04(a) Definitions

1. Farmland. Prime or unique farmlands, as defined in Section 1540(c)(1) of the *Farmland Protection Policy Act*, or farmland that is determined by the appropriate State or unit of local government agency or agencies with concurrence of the Secretary of Agriculture to be farmland of Statewide or local importance. Farmland does not include land already in or committed to urban development or water storage. Farmland "already in" urban development or water storage includes all such land with a density of 30 structures per 40 acre (16 ha) area. Farmland already in urban development also includes lands identified as urbanized area (UA) on the Census Bureau Map, as urban area mapped with a tint overprint on the USGS topographical maps, or as urban-built-up on the USDA Important Farmland Maps. Areas shown as white on the USDA Important Farmland maps are not farmland and, therefore, are not subject to the Act. Farmland committed to urban development or water storage includes all such land that receives a combined score of 160 points or less from the land evaluation and site assessment criteria.

2. Site. The location(s) that would be converted by the proposed action(s).

26-10.04(b) Applicability

A project that requires additional right-of-way outside any corporate limits must be coordinated with NRCS unless any one of the following applies:

1. There are no Federal funds involved in the project.

2. None of the acquired land is prime farmland or farmland of Statewide or local importance.

3. The land to be acquired is in urban development (i.e., has a minimum current density of 30 structures (permanently affixed to the ground) per 40 acre (16 ha) tract).

4. The project is exclusively for widening and resurfacing, and does not involve borrow areas, mitigation sites, or new alignment in which the right-of-way diverges from and is not contiguous to the existing right-of-way.

5. The project is nonlinear (e.g., bridge, intersection improvements) and requires acquisition of no more than 10 acres (4 ha) of land. This threshold applies to nonlinear projects other than new rest areas and new truck weigh stations. All new rest area and truck weigh station projects must be coordinated with NRCS, regardless of the amount of acquisition involved. Where the area of right-of-way for the project approaches the 10 acre (4 ha) threshold for coordination and the project will likely involve additional acquisition for borrow or mitigation, coordinate the project with NRCS. Anticipated sites for borrow and mitigation should be indicated if known.

6. The project is linear; requires acquisition of no more than 3 acres of land per project mile (0.75 ha of land per project kilometer) (area of acquisition divided by project length); and does not involve alternative alignment(s) in which the right-of-way diverges from, and is

not contiguous to, the existing right-of-way. Where the amount of right-of-way to be acquired approaches the 3 acres per project mile (0.75 ha per project kilometer) threshold for coordination and the project will likely involve additional acquisition for borrow or mitigation, coordinate the project with NRCS. Anticipated sites for borrow and mitigation should be indicated if known.

The categories of projects addressed by these items have been programmatically addressed in consultations with NRCS, and a general Form NRCS-CPA-106 (see Section 26-10.04(d)) has been prepared for these actions. The general form is available in the IDOT district offices or may be obtained from BDE. Further project-specific review by NRCS on these projects ordinarily will not be necessary. See Section 26-10.04(c) for further discussion of requirements for these types of actions.

If there is a question on whether any of the above conditions are met, contact BDE for a determination of applicability.

26-10.04(c) Procedures

The following will apply:

1. NRCS Coordination. For all projects requiring coordination with NRCS according to the criteria in Section 26-10.04(b), contact NRCS as early in the project development process as practical. Make the initial contact with the State Office of the NRCS in Champaign. Forward Form NRCS-CPA-106 to the NRCS Office as part of the coordination process as soon as sufficient information is available. Coordination may be initiated prior to completion of the forms, as appropriate.

2. Minor Impacts. Where a project appears to be covered by Item #'s 5 and6 in Section 26-10.04(b), care should be taken to ensure that the project does not involve more than minor impacts on farmland and that there are no unusual circumstances that would make the criteria described inapplicable to the project. If more than minor impacts on farmland are involved or if unusual circumstances are present, initiate coordination with NRCS as discussed in Item #1 above.

   If such impacts/circumstances are not involved, documentation should be included in the project file indicating the applicability of the criterion in Section 26-10.04(b) as the basis for not coordinating with NRCS. Also, include a copy of the general Form NRCS-CPA-106 for these projects in the file. A paragraph such as the following should be included in the Phase I engineering report or environmental report, as appropriate:

   > *The impact of this project on farmland conversion has been evaluated in accordance with the requirements of the U.S. Natural Resources Conservation Service (NRCS). The project will convert 3 acres or less of farmland per mile (0.75 hectares or less of farmland per kilometer) and the conversion will not result in more than minor impacts. Accordingly, the project conforms to the general Form NRCS-CPA-106 prepared by NRCS.*

Therefore, further coordination with NRCS on this project will not be necessary.

26-10.04(d) Form NRCS-CPA-106

The following will apply:

1. Districts should complete Parts I and III of Form NRCS-CPA-106 and submit it to the State NRCS office when information is submitted to IDOA in accordance with State farmland protection requirements (see Section 26-10.05(c)). NRCS will complete Parts II, IV, and V and will then send the Form to IDOA for completion of the Site Assessment portions of the Form. When completed, IDOA will return the Form to the district.

7) Form NRCS-CPA-106 is the primary means of coordination with NRCS. It may, however, be supplemented with other information. It is recommended that a copy of the information sent to IDOA (see Section 26-10.05(c)) be sent to NRCS with Form NRCS-CPA-106. The additional information will help to expedite the review and minimize turnaround time. Provide an informational copy of the completed NRCS-CPA-106 form to IDOA when it is submitted to NRCS.

8) On new construction and reconstruction projects, early contacts with the local field offices and the statewide office of NRCS are recommended. This will notify NRCS of the project and allow early comments while maximum flexibility still exists. Form NRCS-CPA-106 can follow later as project development permits. In this manner, substantive comments are discovered early and the potential for major changes in the later stages of project development will be reduced.

9) Copies of and instructions for completing Form NRCS-CPA-106 are available in the IDOT district offices and may be obtained from BDE. See Section 26-10.04(f) for an example of a completed form.

Do not send NRCS-CPA-106 forms for single-county projects to NRCS county field offices. Send NRCS-CPA-106 forms for single and multi-county projects to the State NRCS office at the following address:

United States Department of Agriculture
Natural Resources Conservation Service
Attention: State Soil Scientist
2118 West Park Court
Champaign, Illinois 61821

See the NRCS website for additional contact information.

26-10.04(e) Siting Requirements

Sites or alternatives with the highest combined scores (determined on Form NRCS-CPA-106) should be regarded as most suitable for protection from conversion to non-farm use, and sites/alternatives with the lowest scores as least suitable for such protection. Sites or alternatives receiving total scores of 175 or fewer points require only minimal consideration for protection from conversion, and no additional sites/alternatives need be evaluated. Sites or alternatives with scores of 176 to 225 points are in the moderate range for consideration of protection from conversion. For such projects, consider at least one build alternative that would involve lesser amounts of farmland conversion. Sites or alternatives receiving scores over 225 points should receive the highest priority for protection from conversion to non-farm uses. For such sites or alternatives, consider other alternatives such as rehabilitation of existing facilities and alignments that use lesser amounts of farmland.

Alternatives that adversely affect agriculture may be recommended, but only after full consideration of adverse effects and less damaging alternatives. The coordination with NRCS will ensure the adequacy of that consideration.

Summarize the results of coordination with NRCS in the environmental report or Phase I engineering report for the action.

26-10.04(f) Notification of Selected Alternative

NRCS requires that, when a Federally funded project has one or more alternatives that require acquisition of farmland subject to the FPPA and is not otherwise exempted from the requirement to submit Form NRCS-CPA-106, the project agency should provide NRCS a copy of the Form NRCS-CPA-106 indicating the project alternative selected for implementation. Upon receiving design approval for such projects, the district shall inform the State NRCS office which alternative was selected for implementation. The district should use a copy of the previously coordinated Form NRCS-CPA-106 for providing this notification. The district should complete the parts of the Form entitled “Site Selected” (enter appropriate site identification letter from the NRCS-CPA-106) and “Date of Selection” and should then send one copy to the State NRCS office at the address provided in Section 26-10.04(d). To aid NRCS in its record keeping, note on the top of the Form that it is a “Final Decision Notification.”

26-10.05 <u>State Requirements</u>

26-10.05(a) Definitions

1. <u>Agricultural Land or Farmland</u>. All land in farms including cropland, hayland, pastureland, forestland, corrals, gardens, and orchards; land used for farmsteads, buildings, barns, and machinery sheds; adjacent yards or corrals, pens, waste lagoons, feedlots, farmstead or feedlot windbreaks, grain bins, lanes for farm residences and fields, field windbreaks, ponds, commercial feedlots, greenhouses, nurseries, broiler facilities, and farm landing strips.

2. <u>Agricultural Land Conversion</u>. The taking of land directly out of agricultural production or displacing it by another use and not returning it to production.

3. Land Class. One of eight classes of land in the Land Capability Classification System (Handbook 210, issued September 1961, and approved for reprinting January 1973) as developed by the Soil Conservation Service, United States Department of Agriculture. Incorporation by reference does not include any future editions or amendments. The land capability classification shows, in a general way, the suitability of soils for most kinds of field crops. The soils are grouped according to their limitations for field crops, the risk of damage to the soil if they are used for crops, and the way they respond to management.

4. Modern Soil Survey. A document published after 1965 by SCS or NRCS containing a description of a county's soils, maps showing their distribution, and discussions concerning their behavior and adaptability.

26-10.05(b) Applicability

Coordination with the IDOA is required for State highway and bridge projects funded in whole or in part with State funds and which require additional right-of-way, unless any of the following apply:

1. The project is located within the boundaries of an incorporated municipality.

2. The project is nonlinear (e.g., bridge, intersection improvements) and requires acquisition of no more than 10 acres (4 ha) of land. When the area of right-of-way for the project approaches the 10 acre (4 ha) threshold for coordination and the project will likely involve additional acquisition for borrow or mitigation, coordinate the project with IDOA. If known, indicate anticipated sites for borrow and mitigation.

3. The project is linear; requires acquisition of no more than 3 acres of land per project mile (0.75 ha per project kilometer) (area acquisition divided by project length); and does not involve alternative alignment(s) in which the right-of-way diverges from, and is not contiguous to, the existing right-of-way. When the amount of right-of-way for the project approaches the threshold for coordination and the project will likely involve additional acquisition for borrow or mitigation, coordinate the project with the IDOA. If known, indicate anticipated sites for borrow and mitigation.

26-10.05(c) Procedures

26-10.05(c)1 General

The IDOA is especially interested in projects that consider more than one alignment, each of which has different agricultural impacts and different amounts of farmland conversion. Projects with multiple alignments can be as localized as those developed to eliminate offset intersections, or as widespread as those for a new freeway connecting distant cities. In all cases, however, only that information that is likely to influence a choice among alternatives should be gathered and considered. For 3R/spot improvements with multiple alignments, include soils information when modern soil surveys are available. If modern soil surveys are not available, forward the remaining coordination information to IDOA. If it is determined that soils information is necessary, IDOA will normally acquire such information. Studies of alternative freeway alignments between distant points should consider a multitude of factors and soil class/type should be among them because the scope of the project alternatives will likely encounter soils of varying qualities. On new construction/reconstruction projects, IDOT will acquire all soils information.

Where a proposed project will convert farmland to non-farm use, consider measures that could mitigate the scope and impacts of the conversion. In cases where coordination with IDOA is required, this coordination will assist in the identification and evaluation of possible mitigation measures. In all other instances, the IDOT district should ensure that measures to minimize farmland conversion impacts are appropriately identified and considered.

Project information being furnished to the IDOA for review should be addressed as follows:

Illinois Department of Agriculture
Bureau of Land and Water Resources
P. O. Box 19281
State Fairgrounds
Springfield, Illinois 62794-9281

When IDOA has completed its review, it will respond in writing to the agency that submitted the information. Early and complete submittals will generally result in a timely response. Should the IDOA response contain substantive comments or raise controversial issues, such comments and issues should be addressed to the extent that the information is available, and a response forwarded expeditiously to IDOA. Remaining comments should then be addressed as soon as the necessary information becomes available. Additional follow-up coordination may be required to determine if mutually satisfactory solutions exist prior to assuming a Departmental position at a hearing or in draft and final environmental documents.

Summarize the results of the evaluations of farmland conversion impacts, mitigation measures, and associated coordination with IDOA in the project's environmental report or Phase I engineering report, as appropriate.

The discussions below identify specific procedures for projects involving construction or reconstruction and for 3R projects. If coordination with IDOA is necessary and it is unclear whether the project is 3R or reconstruction, provide the information required for a 3R project to IDOA as early in project development as practical. When offered an early opportunity to review project information, IDOA can make an initial determination of its degree of interest and request follow-up information, if appropriate, without delaying the project unduly.

26-10.05(c)2 New Construction or Reconstruction Projects

When coordination with IDOA is required, the timing of the coordination and the information provided is important. When new construction or reconstruction is involved, it is appropriate, shortly after location and/or environmental studies have been initiated, to notify IDOA that a project is being studied and that more detailed information will follow as it is developed. On such major projects, it is desirable to maintain contact with IDOA so that potential problems can be identified early to minimize any delays. This may be accomplished through IDOA attendance at scheduled district coordination meetings, NEPA/404 Merger meetings and/or recurring written communications providing information contained in the list below. It is also appropriate to include IDOA on the recipient list for public hearing/meeting notices.

On new construction and reconstruction projects, the description, purpose, and scope of each proposed project shall be provided to IDOA, together with the following information for each alternative:

1. The location, including proposed right-of-way lines if scale permits, on all the following maps:

    - a general county highway map,
    - a plat map, and
    - a modern soil survey map (if available).

2. Total land area in acres (hectares) required for additional right-of-way (includes frontage and access roads).

3. The number of acres (hectares) of each USDA Land Capability Classification (Land Classes I-VIII) and Soil Type (including index number) proposed for acquisition, if applicable.

4. Identification of all soil types occurring within the proposed right-of-way and the number of acres (hectares) of each soil type, if applicable. *Note: Land class and soil type are obtainable from a county's modern soil survey that may be obtained from a local NRCS field office*.

5. Identification of the following impacts that may be associated with the implementation of the project, as applicable:

    - number of farm units and owners affected;
    - number of farm parcels severed;
    - number of farm unit operations severed;
    - number of landlocked parcels created;
    - miles (kilometers) of adverse travel created for each affected farm unit;
    - effects of the proposal upon existing farm drainage systems (surface and subsurface);
    - acres (hectares) of farmland required for borrow and location of the borrow site (depicted on a soil survey and plat map), if available; and
    - erosion control techniques to be utilized on the disturbed area during and after project construction.

6. A brief discussion of all measures included to mitigate any adverse impacts identified in Item #'s 1 through 55.

7. Indication that farmland conversion has been minimized and other appropriate mitigation included for the selected alternative consistent with the operational and safety requirements applicable to the project.

26-10.05(c)3 3R Projects

When coordination is necessary and the proposed improvement primarily involves 3R work on existing alignment, it is appropriate, shortly after location and/or environmental studies have been initiated, to notify IDOA that a project is being studied and to provide the following information:

1. Description, purpose, and scope of the proposed project.

2. Map depicting the location of the project. A county highway map is acceptable.

3. Total land area in acres (hectares) required for additional right-of-way and a brief description of its nature; for example, a 10 ft (3 m) strip on north side or a 3 acre (1 ha) parcel to flatten curve at location noted on map.

4. Indication that farmland conversion has been minimized and other appropriate mitigation included for the selected alternative consistent with the operational and safety requirements applicable to the project.

Summarize the results of coordination with IDOA in the environmental report or Phase I engineering report for the action.

26-10.05(d) Coordination

IDOA should be invited to all district coordination meetings. The invitation should include the meeting notice and agenda. IDOA also may participate in NEPA/404 Merger meetings hosted by FHWA.

26-10.06 Relationship of Federal and State Requirements

Requirements for coordination with the NRCS, although similar to those for the IDOA, are separate and distinct. Coordination with IDOA does not preclude the need to coordinate with NRCS. Projects that require coordination with NRCS will normally also require coordination with IDOA.

26-11 TRANSPORTATION AIR QUALITY CONFORMITY REQUIREMENTS AND DOCUMENTATION

26-11.01 Introduction

Section 176(c) of the *Clean Air Act* as amended in 1990 requires that transportation plans, programs, and projects that are funded or approved under Title 23 U.S.C. must be determined to conform to State or Federal air implementation plans. Such implementation plans describe how air quality standards will be achieved in those areas of a State in which standards are being exceeded. Areas where monitored air quality exceeds established National Ambient Air Quality Standards (NAAQS) are termed nonattainment areas. Areas that were once classified as nonattainment but have been re-designated as being in compliance with the NAAQS are termed maintenance areas. Conformity to an implementation plan is defined in the *Clean Air Act* as conformity to an implementation plan's purpose of eliminating or reducing the severity and number of violations of the NAAQS and achieving expeditious attainment of such standards. Federal activities may not cause or contribute to new violations of air quality standards, exacerbate existing violations, or interfere with the timely reduction of emissions as reflected in the State Implementation Plan (SIP). The implementing regulations for determining conformity of transportation projects (Determining Conformity of Federal Actions to State or Federal Implementation Plans, 40 CFR 93)") also impose requirements upon "regionally significant projects" in nonattainment or maintenance areas regardless of whether those projects involve Federal funding or approvals. Regionally significant projects are transportation projects (other than projects exempt from the conformity requirements) that are on facilities which serve regional transportation needs (e.g., access to and from the area outside of the region, major activity centers in the region, major planned developments, transportation terminals) and would normally be included in the modeling of a metropolitan area's transportation network including, at a minimum, all principal arterial highways and all fixed guideway transit facilities that offer an alternative to regional highway travel.

The US Environmental Protection Agency (USEPA) has established NAAQS for six criteria pollutants including carbon monoxide (CO), ozone (O_3), lead (Pb), sulfur dioxide (SO_2), nitrogen dioxide (NO_2), and particulate matter (PM). The PM pollutant includes both PM_{10}, which are particles with an aerodynamic diameter less than or equal to a nominal 10 microns, and $PM_{2.5}$, which are particles with an aerodynamic diameter less than or equal to a nominal 2.5 microns. Transportation-related criteria pollutants include ozone, carbon monoxide, nitrogen dioxide, and both $PM_{2.5}$ and PM_{10}. Precursors of these pollutants also are considered for regulatory purposes and in regional air quality analyses for nonattainment and maintenance areas. These precursors include volatile organic compounds (VOC) and oxides of nitrogen (NO_x) in ozone areas and NO_x in $PM_{2.5}$ areas. Illinois includes areas in which standards are being exceeded for one or more of the criteria pollutants and also includes areas that have been re-designated from nonattainment to maintenance for the PM_{10} NAAQS.

BDE disseminates information to all districts regarding the location, boundaries, and applicable criteria pollutant(s) for nonattainment and maintenance areas in Illinois. Updates to this information will be issued as changes are published in the *Federal Register*. This information also is available on the USEPA website.

26-11.02 Applicability

The following procedures are applicable to all highway projects initiated by the Department that are funded or approved by the Federal Highway Administration (FHWA) under Title 23 U.S.C. and to "regionally significant projects" in nonattainment or maintenance areas, regardless of whether such projects are Federally funded or approved under Title 23.

26-11.03 Procedures

26-11.03(a) Determining Project Involvement in Designated Nonattainment or Maintenance Areas

In the preparation of environmental documentation for projects subject to these procedures, districts should review the most recent information from BDE regarding those areas of Illinois that have been designated as nonattainment or maintenance for one or more of the criteria pollutants. If the proposed improvement is partially or completely within a designated nonattainment or maintenance area it will be subject to the conformity requirements unless the type of work involved is exempted (see the following section). *The USEPA rules do not require conformity determinations for projects outside of nonattainment or maintenance areas (i.e., within attainment areas).*

26-11.03(b) Determining Whether Project is Exempt from Conformity Requirements

The USEPA conformity rules for transportation projects exempt the project types listed below from the requirement for a conformity determination. The determination of whether a particular action is exempt from the conformity requirement, in most cases, is made during the development of the Transportation Improvement Program (TIP) by a Metropolitan Planning Organization (MPO) prior to the initiation of, or in conjunction with, Phase I planning. Note that a particular project of a type listed is not exempt if the MPO, in consultation with USEPA and FHWA, concurs that it has potentially adverse emissions impacts for any reason. The following are exempt projects:

1. Safety. The following safety projects are exempt:

   - railroad/highway crossing;
   - hazard elimination program;
   - safer non-Federal-aid system roads;
   - shoulder improvements;
   - increasing sight distance;
   - safety improvement program;
   - traffic control devices and operating assistance other than signalization projects;

- railroad/highway crossing warning devices;
- guardrails, median barriers, crash cushions;
- pavement resurfacing and/or rehabilitation;
- pavement marking demonstration;
- emergency relief (23 U.S.C.USC 125);
- fencing;
- skid treatments;
- safety roadside rest areas;
- adding medians;
- truck climbing lanes outside the urbanized area;
- lighting improvements;
- widening narrow pavements or reconstructing bridges (no additional travel lanes); and
- emergency truck pullovers.

2. Air Quality. Exempt projects include:

- continuation of ride-sharing and van-pooling promotion activities at current levels, and
- bicycle and pedestrian facilities.

3. Other. Other exempt projects include:

- specific activities that do not involve or lead directly to construction, such as:
  + planning and technical studies,
  + grants for training and research programs,
  + Federal-aid systems revisions, and
  + planning activities conducted pursuant to Titles 23 and 49 of the United States Code;
- engineering to assess social, economic, and environmental effects of a proposed action or alternatives to that action;
- noise attenuation;

- emergency or hardship advance land acquisitions (23 CFR712.204(d));
- acquisition of scenic easements;
- plantings, landscaping, etc.;
- sign removal;
- directional and informational signs;
- transportation enhancement activities (except rehabilitation and operation of historic transportation buildings, structures, or facilities); and
- repair of damage caused by natural disasters, civil unrest, or terrorist acts, except projects involving substantial changes in function, location, or capacity.

4. Exempt from Regional Emissions Analyses. The following projects are exempt:

- intersection channelization projects,
- intersection signalization projects at individual intersections,
- interchange reconfiguration projects,
- changes in vertical and horizontal alignments, and
- truck size and weight inspection stations.

26-11.03(c) Determining Highway Project Conformity

To determine conformity of non-exempt projects within designated nonattainment or maintenance areas, the district must ascertain whether the project is from a conforming transportation plan and a conforming TIP and satisfies other applicable conditions as specified in the conformity rules. As used in this procedure, the term transportation plan refers to the official intermodal metropolitan transportation plan that is developed through the metropolitan planning process for the metropolitan planning area pursuant to 23 CFR 450. TIP refers to the staged, multi-year, intermodal program of transportation projects covering a metropolitan planning area that is consistent with the metropolitan transportation plan and is developed pursuant to 23 CFR 450. The district should contact their Area Programmer or their MPO if confirmation or clarification is needed regarding whether a specific project was in a conforming plan and the latest conforming TIP.

The project conforms with the requirements of the *Clean Air Act* if the district confirms that the following statements are applicable to the action:

- The project was included in the latest conforming transportation plan and TIP in the fiscally constrained portion of the plan.
- The project design concept and scope have not changed significantly from what was reflected in the conformity analysis for the plan and TIP.

- The project will comply with $PM_{2.5}$ and/or PM_{10} control measures in the SIP.
- Hot-spot analysis requirements are satisfied.

Other criteria and procedures will apply for determining conformity of projects within CO, $PM_{2.5}$, or PM_{10} nonattainment or maintenance areas (e.g., Transportation Conformity Hot-Spot Analysis). See Section 26-12.

To determine conformity for projects in nonattainment areas or maintenance areas outside of locations served by Metropolitan Planning Organizations, the district should contact BDE. BDE will discuss and coordinate with the Office of Planning and Programming to initiate a regional emissions analysis. The purpose of this analysis is to demonstrate that the proposed project will not cause nor contribute to any new localized violations nor increase the frequency or severity of any existing violations of the NAAQS for the criteria pollutant(s) that caused the area to be designated as nonattainment. The project will be determined to conform to the requirements of the 1990 *Clean Air Act* amendments upon the concurrence of FHWA in the regional emissions analysis supporting this finding.

Projects must be found to conform before they are adopted, accepted, approved, or funded. Conformity must be re-determined if none of the following major steps has occurred within three years of the conformity determination—NEPA process completion; start of final design; acquisition of a significant portion of the right-of-way; or approval of the plans, specifications, and estimates. A new conformity determination also will be required if there is a significant change in project design concept and scope or if a supplemental environmental document for air quality purposes is initiated.

Regionally significant projects that do not involve Federal approvals or funding from FHWA do not require conformity determinations. However, under the conformity rules, IDOT may not approve these projects unless there is a currently conforming transportation plan and TIP for the area in which the project is located, and the project satisfies specific conditions regarding its potential effect on regional air quality. The district should contact BDE relative to regionally significant non-Federal projects in nonattainment and maintenance areas for guidance regarding these specific conditions.

26-11.03(d) Information for NEPA Documents or Project Reports

The environmental documentation for all projects subject to these procedures must include a statement regarding the status of the project with regard to the *Clean Air Act* conformity regulations (i.e., indicating that the project is outside of any designated nonattainment or maintenance area, that the project is of a type exempted from conformity requirements, or that the project has been determined to satisfy the conformity regulations). The following paragraphs indicate the different statements that should be used for this documentation:

Note: For those statements that include references to dates (e.g., for TIPs and plans), the district should enter the dates in effect at the time of the latest conformity determination. BDE should be contacted for guidance if questions arise regarding particular projects.

1. Projects Outside of Nonattainment or Maintenance Areas. For projects that the district determines are completely outside of any designated nonattainment or maintenance areas, the following statement should be included in the project environmental documentation:

No portion of this project is within a designated nonattainment or maintenance area for any of the air pollutants for which the USEPA has established standards. Accordingly, a conformity determination under 40 CFR Part 93 ("Determining Conformity of Federal Actions to State or Federal Implementation Plans") is not required.

a. Exempt Projects. For projects that the district determines are located within a designated nonattainment or maintenance area but have been identified by their MPO as an exempt project type as identified in Section 26-11.03(b) (which includes project types exempt from conformity and those exempt from regional emissions analyses), include the following statement in the project environmental documentation:

This project is located within a designated nonattainment or maintenance area but is a project type, which the U.S. Environmental Protection Agency (USEPA) has designated as exempt from regional emissions analyses of transportation plans and Transportation Improvement Programs for purposes of determining conformity with the State Implementation Plan (SIP). This designation is based on USEPA's determination that the nature of the project is such that it would not affect the outcome of a regional emissions analysis.

3. For project-types discussed in the following sections (i.e., projects that are within a nonattainment or maintenance area and are not exempt projects), include the following introductory paragraphs before the applicable paragraphs documenting the conformity finding for the project-type involved:

The National Ambient Air Quality Standards (NAAQS), established by the US Environmental Protection Agency, set maximum allowable concentration limits for six criteria air pollutants. Areas in which air pollution levels persistently exceed the NAAQS may be designated as "nonattainment." States where a nonattainment area is located must develop and implement a State Implementation Plan (SIP) containing policies and regulations that will bring about attainment of the NAAQS. Areas that had been designated as nonattainment, but that have attained the NAAQS for the criteria pollutant(s) associated with the nonattainment designation, will be designated as maintenance areas.

All areas of Illinois currently are in attainment of the standards for five of the six criteria pollutants: particulate matter, carbon monoxide, nitrogen dioxide, sulfur dioxide, and lead.

For the eight-hour ozone, Cook, DuPage, Kane, Lake, McHenry, and Will Counties, as well as Aux Sable and Goose Lake Townships in Grundy

County and Oswego Township in Kendall County, have been designated as marginal nonattainment areas. Jersey, Madison, Monroe, and St. Clair Counties in the St. Louis area also have been designated as marginal nonattainment areas for the eight-hour ozone standard.

a. Projects Within a Portion of a Nonattainment or Maintenance Area Where the Chicago Metropolitan Agency for Planning (CMAP) is the MPO. In addition to the introductory paragraphs above, the following paragraphs should be used to document the necessary findings for conformity of projects within a nonattainment or maintenance area for which CMAPMAP is the MPO:

This project is included in the FY [indicate years] Transportation Improvement Program (TIP) endorsed by the Metropolitan Planning Organization Policy Committee of the Chicago Metropolitan Agency for Planning (CMAP) for the region in which the project is located. Projects in the TIP are considered to be consistent with the [indicate year] regional transportation plan endorsed by CMAP. The project is within the fiscally constrained portion of the plan.

On [indicate date], the Federal Highway Administration (FHWA) and the Federal Transit Administration (FTA) determined that the [indicate year] regional transportation plan conforms with the State Implementation Plan (SIP) and the transportation-related requirements of the 1990 Clean Air Act Amendments. On [indicate date], the FHWA and the FTA determined that the TIP also conforms with the SIP and the Clean Air Act Amendments. These findings were in accordance with Determining Conformity of Federal Actions to State or Federal Implementation Plans 40 CFR Part 93.

The project's design concept and scope are consistent with the project information used for the TIP conformity analysis. Therefore, this project conforms to the existing State Implementation Plan and the transportation-related requirements of the 1990 Clean Air Act Amendments.

The TIP number for this project is __________________.

b. Projects Within a Nonattainment or Maintenance Area Served by an MPO other than CMAP. In addition to the introductory paragraphs above, use the following paragraphs to document the necessary findings for conformity of projects within a nonattainment or maintenance area served by a MPO other than CMAP:

This project is included in the [indicate date] Long-Range Transportation Plan and in the [indicate years] Transportation Improvement Program (TIP) endorsed by [indicate name of MPO], the Metropolitan Planning Organization (MPO) for the region in which the project is located. The project is within the fiscally constrained portion of the plan.

On [indicate date] the Federal Highway Administration (FHWA) and the Federal Transit Administration (FTA) determined that the Long-Range

Transportation Plan conforms with the transportation-related provisions of the Clean Air Act Amendments of 1990. The FHWA and the FTA determined on [indicate date] that the TIP conforms with the Clean Air Act Amendments. These findings were in accordance with Determining Conformity of Federal Actions to State or Federal Implementation Plans, 40 CFR Part 93.

The project's design concept and scope are consistent with the project information used for the TIP conformity analysis. Therefore, this project conforms to the existing State Implementation Plan and the transportation-related requirements of the 1990 Clean Air Act Amendments.

The TIP number for this project is __________________.

c. Projects Within a Nonattainment or Maintenance Area Not Served by an MPO. For projects that the district determines will be located within a nonattainment or maintenance area outside an area served by an MPO, in addition to the introductory paragraphs above, use the following paragraphs to document the necessary analysis and finding by FHWA for conformity:

This project is located within an area that the US Environmental Protection Agency (USEPA) has designated as nonattainment or maintenance in relation to the national ambient air quality standards for [insert name(s) of applicable criteria pollutant(s)]. The project is outside of an area served by a Metropolitan Planning Organization (MPO).

The Federal Highway Administration (FHWA) has reviewed the results of a regional emissions analysis prepared by the Illinois Department of Transportation that includes the proposed project. Based on the results of this analysis, the FHWA has determined that the project will not cause or contribute to any new localized violations of the standard[s] for [insert name(s) of applicable criteria pollutant(s)] nor increase the frequency or severity of any existing violations of the [insert name(s) of applicable criteria pollutant(s)] standard[s]. Therefore, this project conforms to the transportation-related requirements of the 1990 Clean Air Act Amendments.

d. "Regionally Significant" Non-Federal Projects Within a Nonattainment or Maintenance Area. For "regionally significant" projects located in nonattainment or maintenance areas that do not involve funding or approvals from FHWA, in addition to the introductory paragraphs above, use the following paragraphs to document compliance with the conformity regulations:

This project is located within an area that the US Environmental Protection Agency (USEPA) has designated as nonattainment or maintenance in relation to the national ambient air quality standards for [insert name(s) of applicable criteria pollutant(s)]. The project does not involve approvals or *funding from the Federal Highway Administration but has been determined to be "regionally significant" under the Determining Conformity of Federal Actions to State or Federal Implementation Plans, 40 CFR Part 93.*

The Illinois Department of Transportation has confirmed that there is a currently conforming transportation plan and transportation improvement program and has determined that the plan, transportation improvement program, and project are consistent with the 121Requirements for adoption or approval of projects by other recipients of funds designated under Title 23 USC or the Federal Transit Act, 40 CFR 93.121.

26-12 TRANSPORTATION CONFORMITY PROJECT-LEVEL QUALITATIVE HOT-SPOT ANALYSIS IN $PM_{2.5}$ AND PM_{10} NONATTAINMENT AND MAINTENANCE AREAS

26-12.01 Introduction

*Please note that on December 27, 2018, the USEPA approved Illinois's May 8, 2018 request to revise the state's designation for $PM_{2.5}$ from unclassifiable to unclassifiable/attainment. (see 83 FR 66631) Based on this final rule, transportation conformity project-level qualitative Hot-Spot analysis for $PM_{2.5}$ is not required. Illinois is also in attainment for the PM_{10} 1987 standard.

The provisions of 40 CFR 93.116 and 40 CFR 93.123 establish the transportation conformity criteria and procedures for determining which transportation projects in Particulate Matter (e.g., $PM_{2.5}$, PM_{10}), nonattainment, and maintenance areas require a transportation conformity project-level Hot-Spot analysis.

Transportation conformity is required under the *Clean Air Act*, Section 176(c) (42 U.S.C. 7506(c)) to ensure that Federally supported highway and transit project activities are consistent with the purpose of the State air-quality implementation plan (SIP). Conformity to the purpose of the SIP means that transportation activities will not cause new air quality violations, worsen existing violations, or delay timely attainment of the relevant National Ambient Air Quality Standards (NAAQS). The US Environmental Protection Agency (USEPA) transportation conformity rule (e.g., 40 CFR 51.390, 40 CFR 93) establishes the criteria and procedures for determining whether transportation activities conform to the SIP.

A Hot-Spot analysis is defined in 40 CFR 93.101 as an estimation of likely future localized $PM_{2.5}$ or PM_{10} pollutant concentrations, and a comparison of those concentrations to the relevant air quality standards. A Hot-Spot analysis assesses the air quality impacts on a scale smaller than an entire nonattainment or maintenance area. The analysis is a means of demonstrating that a transportation project meets *Clean Air Act* conformity requirements to support State and local air quality goals with respect to potential localized air quality impacts. On March 29, 2006, USEPA and FHWA issued joint guidance, *Transportation Conformity Guidance for Qualitative Hot-Spot Analysis in $PM_{2.5}$ and PM_{10} Nonattainment and Maintenance Areas*, on how to perform a qualitative Hot-Spot analysis. See FHWA's website for further guidance or the district can contact BDE for a copy of the document.

When a Hot-Spot analysis is required, it is included within the project-level conformity determination that is made by FHWA or the Federal Transit Administration.

The Chicago Metropolitan Agency for Planning, Tier 2 Consultation Team has a PM Hot-Spot analysis procedure for all transportation projects, regardless of mode. This Section describes how the IDOT will comply with the Hot-Spot analysis requirements for FHWA-Funded projects Statewide and how the IDOT process fits into the Tier 2 Consultation Team procedure. In addition to the Hot-Spot analysis, other requirements of the transportation conformity regulations (40 CFR 93) must be met prior to NEPA approval; see Section 26-11.

26-12.02 Applicability

The following procedures are applicable to all Federally funded/approved highway projects in $PM_{2.5}$ and PM_{10} nonattainment and maintenance areas. Currently, Illinois is in attainment for both $PM_{2.5}$ and PM_{10}. Therefore, no project will require a Hot-Spot analysis. It is possible for this designation to change so the procedure will remain in the BDE Manual.

26-12.03 Procedures

26-12.03(a) Exempt Projects

See Section 26-11.03(b) for a list of project-types (from the Exempt projects, 40 CFR 93.126) that are exempt from Hot-Spot analysis requirements and project-level conformity determinations. Further coordination with FHWA and BDE is not required for these project-types provided requirements in 40 CFR 93.126 are met (i.e., a particular action listed under 40 CFR 93.126 is not exempt if the MPO in consultation with other agencies, the USEPA, and FHWA concur that it has potentially adverse emissions impacts for any reason).

In addition to the project types listed in Section 26-11.03, in accordance with 40 CFR 93.128, traffic signal synchronization projects may be approved, funded, and implemented without satisfying conformity requirements.

For projects that are exempt, insert the following language into the NEPA document or project report:

> *This project is considered exempt from the requirements of conformity per 40 CFR 93.126 or 40 CFR 93.128, as applicable. USEPA has determined that such projects meet the Clean Air Act's requirements without any further Hot-Spot analysis.*

26-12.03(b) Non-Exempt Projects That Are Not an Air Quality Concern

Non-exempt projects that are not an air quality concern do not require a Hot-Spot analysis but should be discussed at the district coordination meeting and still require a project-level conformity determination that meets the remaining applicable provisions of the conformity rule.

The following are examples of non-exempt projects that are not an air quality concern under 40 CFR 93.123(b)(1)(i) and (ii):

- Projects that do not meet the criteria under 40 CFR 93.123(b)(1) (i.e., they are not new or expanded highway projects that have a significant number of, or a significant increase in, diesel vehicles, and are not projects affecting intersections that are at Level-of-Service D, E, or F with a significant number of diesel vehicles, or those that will change to Level-of-Service D, E, or F because of increased traffic volumes from a significant number of diesel vehicles related to the project).
- An intersection channelization project or interchange configuration project that involves turn lanes or slots, lanes, or movements that are physically separated. These kinds of

projects improve freeway operations by smoothing traffic flow and vehicle speeds by improving weave and merge operations, which would not be expected to create or worsen $PM_{2.5}$ or PM_{10} violations.

- Intersection channelization projects, traffic circles or roundabouts, intersection signalization projects at individual intersections, and interchange reconfiguration projects that are designed to improve traffic flow and vehicle speeds and do not involve any increases in idling.

For non-exempt projects that are not an air quality concern, insert the following language into the NEPA document or project report:

> *This project is not an air quality concern under 40 CFR 93.123(b)(1). Due to [state reason(s)], it has been determined that the project will not cause or contribute to any new localized $PM_{2.5}$ or PM_{10} violations or increase the frequency or severity of any $PM_{2.5}$ or PM_{10} violations. USEPA has determined that such projects meet the Clean Air Act's requirements without any further Hot-Spot analysis.*

26-12.03(c) Nonexempt Projects That Are an Air Quality Concern

USEPA specifies in 40 CFR 93.123(b)(1) that projects that are an air quality concern include highway and transit projects that involve significant levels of diesel vehicle traffic, or any other project that is identified in the $PM_{2.5}$ SIP as a localized concern. The following are projects of air quality concern that require a Hot-Spot analysis:

- new or expanded highway projects that have a significant number of or significant increase in diesel vehicles;
- projects affecting intersections that are at Level-of-Service D, E, or F with a significant number of diesel vehicles, or those that will change to Level-of-Service D, E, or F because of increased traffic volumes from a significant number of diesel vehicles related to the project;
- new bus and rail terminals and transfer points that have a significant number of diesel vehicles congregating at a single location;
- expanded bus and rail terminals and transfer points that significantly increase the number of diesel vehicles congregating at a single location; and
- projects in or affecting locations, areas, or categories of sites that are identified in the $PM_{2.5}$ or PM_{10} applicable implementation plan or implementation plan submission, as appropriate, as sites of violation or possible violation.

Some examples of projects of air quality concern that would be covered by 40 CFR 93.123(b)(1)(i) and (ii) include, but are not limited to:

- a project on a new highway or expressway that serves a significant volume of diesel truck traffic (e.g., facilities with greater than 125,000 annual average daily traffic (AADT) and 8% or more of such AADT is diesel truck traffic);

- new exit ramps and other highway facility improvements to connect a highway or expressway to a major freight, bus, or intermodal terminal;

- expansion of an existing highway or other facility that affects a congested intersection (operated at Level-of-Service D, E, or F) that has a significant increase in the number of diesel trucks; and

- similar highway projects that involve a significant increase in the number of diesel transit buses and diesel trucks.

Discuss all projects located in the $PM_{2.5}$ nonattainment and PM_{10} maintenance areas at district coordination meetings so BDE and FHWA can jointly determine if the project is an air quality concern. The district may also involve the air quality Tier 2 Consultation Team if FHWA and IDOT cannot conclude the project is not an air quality concern. The district should provide the following information associated with the project in a table format:

- AADT in current year, time of completion, and design year;

- diesel truck percentage (e.g., total of all categories), and diesel truck AADT, in current year, time of completion and design year;

- anticipated change of diesel truck traffic due to the project; and

- level-of-service (for intersections) in existing year, time of completion, and design year.

If a project does not clearly fit any of the examples of projects that are not an air quality concern, BDE and FHWA may recommend the district contact their Metropolitan Planning Organization (MPO) so that the project may be discussed at an interagency consultation meeting to determine if a project is an air quality concern as described in 40 CFR 93.123(b)(1).

If it is determined that the project is not an air quality concern, the basis for the determination should be included in the district coordination meeting minutes (e.g., low AADT, low percentage of diesel vehicles). Include the following paragraph in the environmental consequences section of the NEPA document or project report.

> *This project is not an air quality concern under 40 CFR 93.123(b)(1). Due to [state reason(s)], it has been determined that the project will not cause or contribute to any new localized PM_{10} violations or increase the frequency or severity of any PM_{10} violations. USEPA has determined that such projects meet the Clean Air Act's requirements without any further Hot-Spot analysis.*

If the project is determined to be an air quality concern, a qualitative Hot-Spot analysis will be required and the steps in Section 26-12.03(d) should be followed.

26-12.03(d) Hot-Spot Analysis Procedures

1. Obtain Regional Emissions PM Analysis Table. The district should contact BDE to obtain the Regional Emissions Analysis Table provided by the MPO for their region. This table will become a component of the Hot-Spot Analysis Report.

2. Draft Hot-Spot Analysis Report. BDE will provide the district with an example Hot-Spot Analysis Report. The district should use this example in conjunction with the joint guidance issued by FHWA and USEPA to complete a Hot-Spot Analysis report. The title of this guidance is *Transportation Conformity Guidance for Qualitative Hot-Spot Analysis in $PM_{2.5}$ and PM_{10} Nonattainment and Maintenance Areas*. Districts should also use the "Final PM Qualitative Guidance Clarification," issued by FHWA June 12, 2009.

   One of the two qualitative methods described below should be used until USEPA releases a quantitative model:

   d. Comparison to Another Location with Similar Characteristics. This method involves reviewing existing highway or transit facilities constructed in the past and built in locations similar to the proposed project and, whenever possible, near an air quality monitor (a surrogate) to allow a comparison of PM_{10} air quality concentrations.

      The district, in consultation with BDE, should identify proposed project(s) and air quality monitor(s) to be used for the surrogate and coordinate this with the Tier 2 Consultation Team through the appropriate MPO. The district will document in the project-level conformity determination the reasons for picking a surrogate project and air quality monitor, including similarities to and differences between the surrogate and proposed project and location, and summarize the coordination that took place with the Tier 2 Consultation Team.

   e. Air Quality Studies for the Proposed Project Location. Air quality information from many sources may be available for the proposed project's location. The State Implementation Plan (SIP) can be an important tool to be referenced when conducting qualitative Hot-Spot analysis, especially for PM_{10} maintenance areas that already have SIPs in place. The Illinois Environmental Protection Agency would be able to supply data from air quality monitors that may be useful in a given Hot-Spot analysis.

      In some cases, the USEPA or a university may have also performed an air quality study near the location of a proposed project. In addition, other scientific studies may be appropriate to understand the potential air quality impact from certain projects.

      The interagency coordination process with the appropriate MPO can be used to determine what air quality information from a SIP or other air quality study is appropriate for assessing the air quality impacts of the proposed project. The district should contact BDE for further guidance. The district would then document within the project-level conformity determination the air quality information used and why it is appropriate.

The following documentation should be included in the Hot-Spot Analysis Report:

- description of project (e.g., location, design and scope; date project is expected to be open, what part of 40 CFR 93.123(b)(1) applies);
- description of type of emissions considered in the analysis (e.g., road dust, construction emissions);
- contributing factors;
- air quality;
- transportation and traffic conditions;
- built and natural environment;
- meteorology, climate, and seasonal data;
- adopted emissions control measures;
- consideration of full timeframe of area's Long-Range Transportation Plan;
- description of existing conditions;
- description of changes resulting from project;
- description of analysis method chosen;
- description of analysis years;
- examination of year or years in which emissions are expected to peak;
- discussion of why project will not cause violation of either the annual or 24-hour standard;
- discussion of professional judgment on impact;
- discussion of any mitigation measures;
- written commitments for mitigation; and
- conclusion on how project meets 40 CFR 93.116 and 93.123.

Upon completion of the draft Hot-Spot Analysis Report, the district will provide a copy of the report to BDE. BDE will coordinate the report, as appropriate, with FHWA for comments on the draft report. BDE will provide the comments from BDE and FHWA to the district for the district to address. Once all BDE and FHWA comments have been addressed, the Hot-Spot Analysis Report will be summarized in the NEPA document, and the full version included in the NEPA document appendix. If the project is a CE, a copy of the report will be retained in the project files.

11. Public Involvement. The documents and information supporting the project level conformity determination, including the qualitative Hot-Spot analysis must be made available to the public for comment prior to a project-level conformity determination being issued by FHWA. The public involvement process typically used by the districts to satisfy NEPA requirements can be used to satisfy the public involvement requirements for the project-level conformity determination, because project-level conformity determinations are usually conducted as part of the NEPA process. Therefore, the Hot-Spot analysis, and documentation for other project-level conformity requirements should be summarized in the Draft EIS or in the EA.

However, if a CE project requires a qualitative Hot-Spot analysis, and the CE does not require public involvement, then the analysis must be made publicly available prior to determining project-level conformity and concluding the NEPA process. The district should coordinate with BDE/FHWA to determine the appropriate public involvement activity.

For projects of air quality concern that completed the NEPA process before April 5, 2006, and an FHWA approval is still required, a Hot-Spot analysis must be completed. A public comment opportunity must be provided prior to FHWA issuing a project-level conformity determination if the NEPA public involvement process cannot be used to coordinate the Hot-Spot analysis with the public.

This may be accomplished by posting an advertisement in the local newspaper, posting the notice on the MPO's or IDOT's website, and having a copy of the announcement placed at a library or libraries closest to the project corridor.

The following language is suggested for the advertisement/notice:

> *The Illinois Department of Transportation (IDOT) is currently proposing improvements from _______to_______. The project scope includes ____. On March 10, 2006, the US Environmental Protection Agency issued new regulations on Particulate Matter (PM_{10}) Hot-Spot Analysis in Project-Level Transportation Conformity Determinations. A Hot-Spot analysis is defined in 40 CFR 93.101 as an estimation of likely future localized PM_{10} concentrations and a comparison of those concentrations to the relevant air quality standards.*
>
> *The proposed project has been identified as a project of air quality concern requiring a Hot-Spot analysis as part of the project level conformity determination. IDOT has completed a Hot-Spot analysis for the proposed improvement that is available for public comment. The Hot-Spot analysis is available for review on _________ or at _________. A hard copy of this*

analysis can be obtained by contacting _____________ at __________. Comments should be received no later than _________. (Thirty days is recommended. For shorter time-periods consult BDE and FHWA.) Written correspondence related to this Hot-Spot analysis should be addressed to __________________________.

12. Final Approval. The district should provide BDE and FHWA a summary of any public comments received and the district's response to those comments. If necessary, the district may need to revise the Hot-Spot Analysis Report based on comments received from the public involvement process. The district will provide BDE with the revised report who will then coordinate it with FHWA. FHWA and BDE will review the revised report and provide the district with comments, if any, through BDE.

    If the qualitative analysis demonstrates the project does not create or increase the existing PM_{10} violations, include the following statement in the NEPA document:

    > *The qualitative analysis demonstrates the project will not create new local PM_{10} violations. Furthermore, the analysis demonstrates the project will not increase the severity or number of existing PM_{10} violations. The FHWA has, therefore, determined that the project satisfies the Clean Air Act project-level conformity requirements for PM_{10}.*

    If mitigation measures are necessary to demonstrate conformity, include the mitigation measures in the NEPA document, along with enforceable written Environmental Commitments to implement them. The following statement must be included in the NEPA document:

    > *The qualitative analysis demonstrates the project may create new local PM_{10} violations or it may increase the severity or number of existing PM_{10} violations. Implementation of the following air quality mitigation measures will allow this project to meet the conformity Hot-Spot requirements [list mitigation measure(s) here]. The FHWA has, therefore, determined that the project satisfies the Clean Air Act project-level conformity requirements for PM_{10}.*

    Final approval of the conformity determination is made upon approval of the NEPA document (FONSI, ROD or CE determination).

26-13 MOBILE SOURCE AIR TOXICS

26-13.01 Introduction

On January 18, 2023, the US Department of Transportation and FHWA issued an updated interim guidance on when and how to analyze Mobile Source Air Toxics (MSAT) in the NEPA process for highway project (See *Memorandum: Updated Interim Guidance Update on Mobile Source on Air Toxic Analysis in NEPA Documents* for additional guidance). This guidance and a document of Frequently Asked Questions (FAQ) is available by the following link:

http://www.fhwa.dot.gov/environment/air_quality/air_toxics/policy_and_guidance/msat/index.cfm

The *Clean Air Act Amendments (CAAA) of 1990* identified 188 air toxics, also known as hazardous air pollutants. The US Environmental Protection Agency (USEPA) has assessed this expansive list of toxics and identified a group of 93 compounds emitted from mobile sources, listed in the USEPA Integrated Risk Information System (IRIS). From this list, USEPA also identified a subset of nine compounds that are of greatest priority due to associated health risks. These nine "priority" MSATs are 1,3-butadiene, acetaldehyde, acrolein, benzene, diesel particulate matter (diesel PM), ethylbenzene, formaldehyde, naphthalene, and polycyclic organic matter. While FHWA considered these to be the priority MSATs, USEPA stresses that the list is subject to change and may be revised in future rules.

FHWA developed a tiered approach for analyzing MSATs in NEPA documents, depending on the specific project circumstances. FHWA has identified three levels of analysis:

- no analysis for projects with no potential for meaningful MSAT effects,
- qualitative analysis for projects with low potential MSAT effects, or
- quantitative analysis to differentiate alternatives for projects with higher potential MSAT effects.

For projects warranting MSAT analysis, all nine priority MSATs should be analyzed. Project sponsors who are uncertain about which level of analysis is appropriate for a particular project should consult the BDE Project Coordination Unit staff for additional guidance.

26-13.02 Applicability

The following procedures apply to all proposed highway projects initiated by the Department.

26-13.03 Procedures

26-13.03(a) Projects with No Meaningful Potential MSAT Effects or Exempt Projects

The types of projects in this category include:

- Projects qualifying as a categorical exclusion under 23 CFR 771.117;

- Projects exempt under the *Clean Air Act* conformity rule in 40 CFR 93.126 (see Section 26-11.03(b) (Items #1-#3) for a complete list of exempt project types); or
- Other projects with no meaningful impacts on traffic volumes or vehicle mix.

For project types qualifying as a categorical exclusion or for projects that are exempt under the *Clean Air Act* conformity rule under 40 CFR 93.126, no analysis or discussion of MSATs is necessary. Documentation that the project qualifies as a categorical exclusion and/or exempt project is sufficient.

For other projects with no meaningful impacts on traffic volumes or vehicle mix, regardless of the class of NEPA environmental document, no MSAT analysis is recommended. A list of project types that may meet these criteria can be found in Section 26-11.03(b), Item #4.

The project record should document the basis for determination of no meaningful potential impacts with a brief description of the factors considered. Include the following text in the Phase I engineering report and, as applicable, the associated environmental document:

Mobile Source Air Toxics

> *The purpose of this project is to [insert major deficiency that the project is meant to address] by constructing [insert major elements of the project]. This project has been determined to generate minimal air quality impacts for Clean Air Act criteria pollutants and has not been linked with any special Mobile Source Air Toxic (MSAT) concerns. As such, this project will not result in changes in traffic volumes, vehicle mix, basic project location, or any other factor that would cause an increase in MSAT impacts of the project from that of the no-build alternative.*
>
> *Moreover, USEPA regulations for vehicle engines and fuels will cause overall MSATs emissions to decline significantly over the next several decades. Based on regulations now in effect, an analysis of national trends with USEPA's MOVES3 model forecasts a combined reduction of more than 76 percent in the total annual emission rate for the priority MSAT from 2020 to 2060 while vehicle-miles of travel are projected to increase by 31 percent (Updated Interim Guidance on Mobile Source Air Toxic Analysis in NEPA Documents, Federal Highway Administration, January 18, 2023). This will both reduce the background level of MSAT as well as the possibility of even minor MSAT emissions from this project.*

26-13.03(b) Projects with Low Potential MSAT Effects

The types of projects included in this category are those that serve to improve operations of highway, transit, or freight without adding substantial new capacity or without creating a facility that is likely to meaningfully increase MSAT emissions. This category covers a broad range of projects.

Any projects not meeting the criteria in Sections 26-13.03(a) or 26-13.03(c), should be included in this category. Examples of these types of projects are minor widening projects; new interchanges, replacing a signalized intersection on a surface street; or projects where design year traffic is projected to be less than 140,000 to 150,000 annual average daily traffic (AADT).

For project types that have a low potential for MSAT effects, conduct a qualitative assessment of emissions projections. This qualitative assessment should compare, in narrative form, the expected effect of the project on traffic volumes, vehicle mix, or routing of traffic and the associated changes in MSAT for the project alternatives, including no-build, based on VMT, vehicle mix, and speed. It should also discuss national trend data projecting substantial overall reductions in emissions due to stricter engine and fuel regulations issued by EPA. Because the emission effects of these projects typically are low, it is expected that there would be no appreciable difference in overall MSAT emissions among the various alternatives.

To aid project sponsors and promote uniformity in NEPA documents, example project documentation is offered for four commonly encountered project types:

1. a minor widening project,
2. a new interchange connecting an existing roadway with a new roadway,
3. a new interchange connecting new roadways, and
4. minor improvements or expansions to intermodal centers or other projects that affect truck traffic.

In addition to the qualitative assessment, the NEPA document for this category of projects must include a discussion of information that is incomplete or unavailable for a project specific assessment of MSAT impacts, in compliance with Council on Environmental Quality (CEQ) regulations 40 CFR 1502.21(b). This discussion should explain how current scientific techniques, tools, and data are not sufficient to accurately estimate human health impacts that could result from a transportation project in a way that would be useful to decision-makers. Recommended prototype language for this discussion is included in Section 26-13.03(e).

Following are some examples of qualitative MSAT analyses for different types of projects. Each project is different, and some projects may contain elements covered in more than one of the examples below. Project sponsors can use the example language as a starting point but should tailor it to reflect the unique circumstances of the project being considered. Consider the following factors when crafting a qualitative analysis:

- For projects on an existing alignment, MSATs are expected to decline due to the effect of new USEPA engine and fuel standards.
- Projects that result in increased travel speeds will reduce MSAT emissions per vehicle miles traveled (VMT) basis. MOVES3 provides an estimation of speed changes on diesel particulate matter and should be accounted for accordingly. This speed benefit may be offset somewhat by increased VMT if the more efficient facility attracts additional vehicle trips.
- Projects that facilitate new development may generate additional MSAT emissions from new trips, truck deliveries, and parked vehicles (due to evaporative emissions). However,

these may also be activities that are attracted from elsewhere in the metro region; thus, on a regional scale there may be no net change in emissions.

- Projects that create new travel lanes, relocate lanes, or relocate economic activity closer to homes, schools, businesses, and other populated areas may increase concentrations of MSAT at those locations relative to No Build. Other elements related to a qualitative analysis are a discussion of information that is incomplete or unavailable for a project-specific assessment of MSAT impacts and a discussion of any MSAT mitigation measures that may be associated with the project.

A qualitative analysis provides a basis for identifying and comparing the potential differences among MSAT emissions, if any, from the various alternatives. The qualitative assessment presented below is derived in part from a study conducted by FHWA entitled "A Methodology for Evaluating Mobile Source Air Toxic Emissions Among Transportation Project Alternatives." The study is available through the FHWA website at the following link.

https://www.fhwa.dot.gov/environment/air_quality/air_toxics/research_and_analysis/mobile_source_air_toxics/msatemissions.cfm

Consider the following introduction language for qualitative assessments:

1. Minor Widening Project. For purposes of this scenario, minor highway widening projects are those in which the design year traffic level is predicted to be less than 150,000 AADT. Widening projects that surpass these criteria are subject to a quantitative analysis.

For minor widening projects, include wording similar to the following:

> *For each build alternative carried forward in this [identify NEPA document], the amount of mobile source air toxics (MSAT) emitted would be proportional to the vehicle miles traveled, or VMT, assuming that other variables (e.g., fleet mix) are the same for each alternative. The VMT estimated for each of the Build Alternatives carried forward is slightly higher than that for the No Build Alternative, because the additional capacity increases the efficiency of the roadway and attracts rerouted trips from elsewhere in the transportation network. [as applicable, Refer to Table XX for more details.] This increase in VMT would lead to higher MSAT emissions for the preferred action alternative along the highway corridor, along with a corresponding decrease in MSAT emissions along the parallel routes. The emissions increase is offset somewhat by lower MSAT emission rates due to increased speeds; according to USEPA's MOVES3 model, emissions of all of the priority MSAT decrease as speed increases.*
>
> *Because the estimated VMT under each of the Build Alternatives carried forward are nearly the same, varying by less than [specify] percent, it is expected there would be no appreciable difference in overall MSAT emissions among the various alternatives. Also, regardless of the alternative chosen, emissions will likely be lower than present levels in the design year as a result of USEPA's national control programs that are*

projected to reduce annual MSAT emissions by more than 76 percent between 2020 and 2060 (Updated Interim Guidance on Mobile Source Air Toxic Analysis in NEPA Documents, Federal Highway Administration, January 18, 2023). Local conditions may differ from these national projections in terms of fleet mix and turnover, VMT growth rates, and local control measures. However, the magnitude of the USEPA-projected reductions is so great, even after accounting for VMT growth, that MSAT emissions in the study area are likely to be lower in the future in nearly all cases.

If the project includes plans to construct travel lanes closer to populated areas, include this paragraph:

The additional travel lanes contemplated as part of the project alternatives will have the effect of moving some traffic closer to nearby homes, schools and businesses; therefore, under each Build Alternative carried forward there may be localized areas where ambient concentrations of MSAT could be higher under certain Build Alternatives than the No Build Alternative. The localized increases in MSAT concentrations would likely be most pronounced along the expanded roadway sections that would be built at [specify location], under Alternatives [specify], and along [specify route] under Alternatives [specify alternatives]. However, the magnitude and the duration of these potential increases compared to the No-build alternative cannot be reliably quantified due to incomplete or unavailable information in forecasting project-specific MSAT health impacts.

Conclude with this summary:

In summary, where a highway is widened, the localized level of MSAT emissions for the Build Alternative carried forward could be higher relative to the No Build Alternative, but this could be offset due to increases in speeds and reductions in congestion, which are associated with lower MSAT emissions. Also, MSAT will be lower in other locations when traffic shifts away from them. However, on a regional basis, USEPA's vehicle and fuel regulations, coupled with fleet turnover, will over time cause substantial reductions that, in almost all cases, will cause region-wide MSAT levels to be significantly lower than today.

2. <u>New Interchange Connecting an Existing Roadway with a New Roadway</u>. This example is oriented toward projects where a new roadway section connects to an existing limited access highway. The purpose of the roadway is primarily to meet regional travel needs (e.g., by providing a more direct route between locations). Include wording similar to the following:

For each build alternative carried forward in this [identify NEPA document type], the amount of mobile source air toxics (MSAT) emitted would be proportional to the vehicle miles traveled, or VMT, assuming that other variables (e.g., fleet mix) are the same for each alternative. Because the

VMT estimated for the No Build Alternative is higher than for any of the Build Alternatives carried forward, higher levels of regional MSAT are not expected from any of the Build Alternatives carried forward compared to the No Build Alternative. [as applicable, Refer to Table XX for more details.] In addition, because the estimated VMT under each of the Build Alternatives carried forward are nearly the same, varying by less than [specify] percent, it is expected there would be no appreciable difference in overall MSAT emissions among the various alternatives. Also, regardless of the alternative chosen, emissions will likely be lower than present levels in the design year as a result of USEPA's national control programs that are projected to reduce annual MSAT emissions by more than 76 percent between 2020 and 2060 (Updated Interim Guidance on Mobile Source Air Toxic Analysis in NEPA Documents, Federal Highway Administration, January 18, 2023). . Local conditions may differ from these national projections in terms of fleet mix and turnover, VMT growth rates, and local control measures. However, the magnitude of the USEPA-projected reductions is so great, even after accounting for VMT growth, that MSAT emissions in the study area are likely to be lower in the future in virtually all locations.

Under each alternative carried forward, there may be localized areas where VMT would increase, and other areas where VMT would decrease. Therefore, it is possible that localized increases and decreases in MSAT emissions may occur. The localized increases in MSAT emissions would likely be most pronounced along the new roadway sections that would be built at [specify location], under Alternatives [specify alternatives], and along [specify route] under Alternatives [specify]. However, even if these increases do occur, they too will be substantially reduced in the future due to implementation of USEPA's vehicle and fuel regulations.

In summary, under all Build Alternatives carried forward in the design year it is expected there would be reduced MSAT emissions in the immediate area of the project, relative to the No Build Alternative, due to the reduced VMT associated with more direct routing, and due to USEPA's MSAT reduction programs.

3. New Interchange Connecting New Roadways. This example is oriented toward interchange projects developed in response to or in anticipation of economic development (e.g., a new interchange to serve a new shopping/residential development). Projects from the previous example may also have economic development associated with them, so some of this language may also apply. Include wording similar to the following:

For each build alternative carried forward in this [identify NEPA document type], the amount of mobile source air toxics (MSAT) emitted would be proportional to the vehicle miles traveled, or VMT, assuming that other variables (e.g., fleet mix) are the same for each alternative. The VMT estimated for each of the Build Alternatives carried forward is slightly higher than that for the No Build Alternative, because the interchange facilitates *new development that attracts trips that would not otherwise occur in the area. [as applicable, Refer to Table XX for more details.] This increase in VMT means MSAT under the Build Alternatives carried forward would probably be higher than the No Build Alternative in the study area. There could also be localized differences in MSAT from indirect effects of the project such as associated access traffic, emissions of evaporative MSAT (e.g., benzene) from parked cars, and emissions of diesel particulate matter from delivery trucks [modify depending on the type and extent of the associated development]. Travel to other destinations would be reduced with subsequent decreases in emissions at those locations.*

Because the estimated VMT under each of the Build Alternatives carried forward are nearly the same, varying by less than [specify] percent, it is expected there would be no appreciable difference in overall MSAT emissions among the various Build Alternatives. For all Alternatives carried forward, emissions are virtually certain to be lower than present levels in the design year as a result of USEPA's national control programs that are projected to reduce annual MSAT emissions by more than 76 percent between 2020 and 2060 (Updated Interim Guidance on Mobile Source Air Toxic Analysis in NEPA Documents, Federal Highway Administration, January 18, 2023). Local conditions may differ from these national projections in terms of fleet mix and turnover, VMT growth rates, and local control measures. However, the magnitude of the USEPA-projected reductions is so great, even after accounting for VMT growth, that MSAT emissions in the study area are likely to be lower in the future than they are today.

Use the following discussion for new interchanges in areas already developed to some degree. For new construction in anticipation of economic development in rural or largely undeveloped areas, this discussion would be applicable only to populated areas (e.g., residences, schools, or businesses).

The travel lanes contemplated as part of the project alternatives carried forward will have the effect of moving some traffic closer to nearby homes, schools and businesses; therefore, under each alternative carried forward there may be localized areas where ambient concentrations of mobile source air toxics (MSAT) would be higher under certain Alternatives than others. The localized differences in MSAT concentrations would likely be most pronounced along the new/expanded roadway sections that would be built at [specify location], under Alternatives [specify alternatives], and along [specify route] under Alternatives [specify]. However, the magnitude and the duration of these potential increases cannot be reliably quantified due to incomplete or unavailable information in forecasting project-specific MSAT health impacts. Further, under all Alternatives carried forward, overall future MSAT are expected to be substantially lower than today due to implementation of USEPA's vehicle and fuel regulations.

Then include this summary:

In summary, under all Build Alternatives carried forward in the design year, it is expected there would be slightly higher MSAT emissions in the study area, relative to the No Build Alternative, due to increased VMT. There also could be increases in MSAT levels in a few localized areas where VMT increases. However, USEPA's vehicle and fuel regulations will bring about significantly lower MSAT levels for the area in the future than today.

4. <u>Minor Improvements or Expansions to Intermodal Centers or Other Projects that Affect Truck Traffic</u>. The description for these types of projects depends on the nature of the project. The key factor from an MSAT standpoint is the change in truck and rail activity and the resulting change in MSAT emissions patterns. Include wording similar to the following:

For each build alternative carried forward in this [identify NEPA document type], the amount of mobile source air toxics (MSAT) emitted would be proportional to the amount of truck vehicle miles traveled (VMT) and rail activity, assuming that other variables (e.g., travel not associated with the intermodal center) are the same for each alternative. The truck VMT and rail activity estimated for each of the Build Alternatives carried forward are higher than that for the No Build Alternative, because of the additional activity associated with the expanded intermodal center. [as applicable, Refer to Table XX for more details.] This increase in truck VMT and rail activity associated with the Build Alternatives carried forward would lead to higher MSAT emissions (particularly diesel particulate matter) in the vicinity of the intermodal center. The higher emissions could be offset somewhat by two factors: 1) the decrease in regional truck traffic due to increased use of rail for inbound and outbound freight; and 2) increased speeds on area highways due to the decrease in truck traffic. The extent to which these emissions decreases will offset intermodal center-related emissions increases is not known.

Because the estimated truck VMT and rail activity under each of the Build Alternatives carried forward are nearly the same, varying by less than [specify] percent, it is expected there would be no appreciable difference in overall MSAT emissions among the various alternatives. Also, regardless of the alternative chosen, emissions will likely be lower than present levels in the design year as a result of USEPA's national control programs that are projected to reduce annual MSAT emissions by more than 76 percent between 2020 and 2060 (Updated Interim Guidance on Mobile Source Air Toxic Analysis in NEPA Documents, Federal Highway Administration, January 18, 2023). . Local conditions may differ from these national projections in terms of fleet mix and turnover, VMT growth rates, and local control measures. However, the USEPA-projected reductions are so significant, even after accounting for VMT growth, that MSAT emissions in the study area are likely to be lower in the future as well.

The following discussion may apply if the intermodal center is close to other development:

The additional freight activity contemplated as part of the project alternatives carried forward will have the effect of increasing diesel emissions in the vicinity of nearby homes, schools and businesses; therefore, under each alternative carried forward there may be localized areas where ambient concentrations of MSAT would be higher than under the No Build alternative. The localized differences in MSAT concentrations would likely be most pronounced under Alternatives [specify]. However, the magnitude and the duration of these potential differences cannot be reliably quantified due to incomplete or unavailable information in forecasting project-specific health impacts. Even though there may be differences among the Alternatives carried forward, on a region-wide basis, USEPA's vehicle and fuel regulations, coupled with fleet turnover, will cause substantial reductions over time so that in almost all cases, the MSAT levels in the future will be significantly lower than today.

[Insert a description of any emissions-reduction activities that are associated with the project (e.g., truck and train idling limitations or technologies, auxiliary power units, alternative fuels, engine retrofits for container-handling equipment)].

In summary, all Build Alternatives carried forward in the design year are expected to be associated with higher levels of MSAT emissions in the study area, relative to the No Build Alternative, along with some benefit from improvements in speeds and reductions in region-wide truck traffic. There also could be slightly higher differences in MSAT levels among Alternatives carried forward in a few localized areas where freight activity occurs closer to homes, schools and businesses. Under all alternatives carried forward, MSAT levels are likely to decrease over time due to nationally mandated cleaner vehicles and fuel.

26-13.03(c) Projects with Higher Potential MSAT Effects

This category includes projects that have the potential for meaningful differences in MSAT emissions among project alternatives. A two-prong test is used to determine if projects fall into this category. Projects included in this category must be proposed to be located in proximity to populated areas, and either:

- create or significantly alter a major intermodal freight facility that has the potential to concentrate high levels of diesel particulate matter in a single location, involving a significant number of diesel vehicles for new projects or accommodating with a significant increase in the number of diesel vehicles for expansion projects; or
- create or add significant capacity to urban highways (e.g., Interstates, urban arterials, urban collector-distributor routes) with traffic volumes where the AADT is projected to be in the range of 140,000 to 150,000 or greater by the design year.

Projects meeting the criteria for higher potential MSAT effects will be more rigorously assessed for impacts. It is possible that some projects do not meet the criteria listed above but may still have the potential to substantially increase future MSAT emissions. In this case, project sponsors should contact the BDE Project Coordination Unit staff to determine the appropriate course of action for the subject project.

For any project with higher potential MSAT effects, the specific approach for assessing impacts will be developed by the project sponsor in conjunction with the BDE Project Coordination Unit staff, in consultation with the FHWA Illinois Division Office. Assistance may also be sought from the Office of Natural Environment (HEPN) and the Office of Project Development and Environmental Review (HEPE) in FHWA Headquarters as warranted.

At a minimum, impact assessment for projects in this category shall include a quantitative analysis to forecast local-specific emissions trends of the priority MSAT for each build alternative carried forward, to use as a basis of comparison. This analysis also may address the potential for cumulative impacts, where appropriate, based on local conditions. Consider how and when cumulative impacts would be addressed as part of FHWA assistance outlined above. The NEPA document should also include relevant language on unavailable information as outlined below. Project sponsors should consult with the BDE Project Coordination Unit staff on documenting this information in NEPA documents.

If the analysis for a project in this category indicates meaningful differences in levels of MSAT emissions, mitigation options as outlined below should be identified and considered.

26-13.03(d) MSAT Mitigation Strategies

Lessening the effects of mobile source air toxics should be considered for projects with substantial construction-related MSAT emissions that are likely to occur over an extended building period, and for post-construction scenarios where the NEPA analysis indicates potentially meaningful MSAT levels. Such mitigation efforts should be evaluated based on the circumstances associated with individual projects, and they may not be appropriate in all cases. There are a number of available mitigation strategies and solutions for countering the effects of MSAT emissions.

Mitigating for Construction MSAT Emissions. Construction activity may generate a temporary increase in MSAT emissions. Project-level assessments that render a decision to pursue construction emission mitigation will benefit from a number of technologies and operational practices that should help lower short-term MSAT. In addition, the FHWA has supported a host of diesel retrofit technologies in the Congestion Mitigation and Air Quality (CMAQ) Improvement Program provisions – technologies that may lessen a number of MSAT emissions.

Construction mitigation includes strategies that reduce engine activity or reduce emissions per unit of operating time (e.g., reducing the numbers of trips and decreased idling). Operational agreements that reduce or redirect work or shift times to avoid community exposures can have positive benefits when sites are near populated areas. For example, agreements that stress work activity outside normal hours of an adjacent school campus would be operations-oriented mitigation. Verified emissions control technology retrofits or fleet modernization of engines for construction equipment could be appropriate mitigation strategies. Technology retrofits could include particulate matter traps, oxidation catalysts, and other devices that provide an after-treatment of exhaust emissions. Implementing maintenance programs per manufacturers' specifications to ensure engines perform at USEPA certification levels, as applicable, and to ensure retrofit technologies perform at verified standards could also be deemed appropriate. The use of clean fuels (e.g., ultra-low sulfur diesel, biodiesel, natural gas) can be a very cost-beneficial strategy.

USEPA has listed a number of approved diesel retrofit technologies. Many of these can be deployed as emissions mitigation measures for equipment used in construction. The following USEPA website contains more information about these technologies:

https://www.epa.gov/verified-diesel-tech/clean-diesel-technology

Post-Construction Mitigation for Projects with Potentially Significant MSAT Levels. Travel demand management strategies and techniques that reduce overall vehicle-mile of travel (vehicle-km of travel); reduce a particular type of travel (e.g., long-haul freight, commuter travel) or improve the transportation systems' efficiency will mitigate MSAT emissions. Examples of such strategies include congestion pricing, commuter incentive programs, and increases in truck weight or length limits. Operational strategies that focus on speed limit enforcement or traffic management policies may help reduce MSAT emissions even beyond the benefits of fleet turnover. Well-traveled highways with high proportions of heavy-duty diesel truck activity may benefit from active Intelligent Transportation System programs (e.g., traffic management centers or incident management systems). Similarly, anti-idling strategies (e.g., truck-stop electrification) can complement projects that focus on new or increased freight activity.

Planners also may want to consider the benefits of establishing buffer zones between new or expanded highway alignments and populated areas. Modifications of local zoning or the development of guidelines that are more protective may also be useful in separating emissions and receptors.

The initial decision to pursue MSAT emissions mitigation strategies should be made in consultation with BDE Project Coordination Unit staff. It is desirable for project sponsors to identify potential options for MSAT mitigation at the earliest juncture to ensure sufficient time for interagency coordination if warranted.

26-13.03(e) Prototype Language for Compliance with 40 CFR 1502.21

For projects that require a quantitative or a qualitative analysis, include wording similar to the following for compliance with 40 CFR 1502.21. This language should precede the specific qualitative or quantitative analysis in the environmental document.

INCOMPLETE OR UNAVAILABLE INFORMATION FOR PROJECT-SPECIFIC MSAT HEALTH IMPACTS ANALYSIS

In FHWA's view, information is incomplete or unavailable to credibly predict the project-specific health impacts due to changes in mobile source air toxics (MSAT) emissions associated with a proposed set of highway alternatives. The outcome *of such an assessment, adverse or not, would be influenced more by the uncertainty introduced into the process through assumption and speculation rather than any genuine insight into the actual health impacts directly attributable to MSAT exposure associated with a proposed action.*

USEPA Role

The US Environmental Protection Agency (USEPA) is responsible for protecting the public health and welfare from any known or anticipated effect of an air pollutant. They are the lead authority for administering the Clean Air Act and its amendments and have specific statutory obligations with respect to hazardous air pollutants and MSAT. USEPA is in the continual process of assessing human health effects, exposures, and risks posed by air pollutants. They maintain the Integrated Risk Information System (IRIS), which is "a compilation of electronic reports on specific substances found in the environment and their potential to cause human health effects." IRIS can be accessed through the USEPA website (https://www.epa.gov/iris). Each report contains assessments of non-cancerous and cancerous effects for individual compounds and quantitative estimates of risk levels from lifetime oral and inhalation exposures with uncertainty spanning perhaps an order of magnitude.

Role of Other Organizations

Other organizations are also active in the research and analyses of the human health effects of MSAT, including the Health Effects Institute (HEI). Several HEI studies are summarized in Appendix D of FHWA's Interim Guidance Update on Mobile Source Air Toxic Analysis in NEPA Documents, the link to which is provided at the beginning of this section. Among the adverse health effects linked to MSAT compounds at high exposures are cancer in humans in occupational settings; cancer in animals; and irritation to the respiratory tract, including the exacerbation of asthma. Less obvious is the adverse human health effects of MSAT compounds at current environmental concentrations or in the future as vehicle emissions substantially decrease.

Problems with Modeling Methodologies

The methodologies for forecasting health impacts include emissions modeling, dispersion modeling, exposure modeling, and then final determination of health impacts; each step in the process building on the model predictions obtained in the previous step. All are encumbered by technical shortcomings or uncertain science that prevents a more complete differentiation of the MSAT health impacts among a set of project alternatives. These difficulties are magnified for lifetime (i.e., 70 year) assessments, particularly because unsupportable assumptions would have to be made regarding changes in travel patterns and vehicle technology, which affects emissions rates over that time frame, because such information is unavailable.

It is particularly difficult to reliably forecast 70-year lifetime MSAT concentrations and exposures near roadways; to determine the portion of time that people are actually exposed at a specific location; and to establish the extent attributable to a proposed action, especially given that some of the information needed is unavailable.

MSAT Toxicity Estimates

There are considerable uncertainties associated with the existing estimates of toxicity of the various MSAT, because of factors such as low-dose extrapolation and translation of occupational exposure data to the general population, a concern expressed by HEI. As a result, there is no national consensus on air dose-response values assumed to protect the public health and welfare for MSAT compounds, and in particular for diesel PM.

Level of Risk

There is also the lack of a national consensus on an acceptable level of risk. The current context is the process used by USEPA, as provided by the Clean Air Act, to determine whether more stringent controls are required in order to provide an ample margin of safety to protect public health or to prevent an adverse environmental effect for industrial sources subject to the maximum achievable control technology standards (e.g., benzene emissions from refineries). The decision framework is a two-step process. The first step requires USEPA to determine an "acceptable" level of risk due to emissions from a source, which is generally no greater than approximately 100 in a million. Additional factors are considered in the second step, the goal of which is to maximize the number of people with risks less than 1 in a million due to emissions from a source. The results of this statutory two-step process do not guarantee that cancer risks from exposure to air toxics are less than 1 in a million; in some cases, the residual risk determination could result in maximum individual cancer risks that are as high as approximately 100 in a million. In a June 2008 decision, the US Court of Appeals for the District of Columbia Circuit upheld USEPA's approach to addressing risk in its two-step decision framework. Information is incomplete or unavailable to establish that even the largest of highway projects would result in levels of risk greater than safe or acceptable.

Conclusions

Because of the limitations in the methodologies for forecasting health impacts described, any predicted difference in health impacts between alternatives is likely to be much smaller than the uncertainties associated with predicting the impacts. Consequently, the results of such assessments would not be useful to decision makers, who would need to weigh this information against project benefits (e.g., reducing traffic congestion, crash rates, and fatalities plus improved access for emergency response) that are better suited for quantitative analysis.

26-14 MICROSCALE ANALYSIS

26-14.01 Introduction

The Clean Air Act requires the USEPA to set National Ambient Air Quality Standards (NAAQS, see 40 CFR Part 50) for six principal pollutants considered harmful to public health and the environment, one of these pollutants is Carbon Monoxide (CO). Additionally, the FHWA issued Technical Advisory T 6640.8A which recognizes that carbon monoxide (CO) is a highway project-related concern and should be evaluated as a part of the environmental analyses for proposed projects and as such should be based on the 1- and 8-hour NAAQS.

IDOT and Illinois Environmental Protection Agency (IEPA) have executed an agreement on Microscale Air Quality Assessments for Department projects (Illinois Department of Transportation and Illinois Environmental Protection Agency Agreement on Microscale Air Quality Assessment for Illinois Department of Transportation-Sponsored Transportation Projects, See Appendix A). This agreement establishes requirements for determining when a microscale analysis is necessary and the methodology to be used for accomplishing the analysis. BDE has developed a *Carbon Monoxide Screen for Intersection Modeling (COSIM) Air Quality Manual* (referred to as *Air Quality Manual* henceforth) that discusses procedures for implementing the IDOT-IEPA agreement. The procedures in this Section provide guidance on documenting microscale analysis results in accordance with the IDOT-IEPA agreement and the *Air Quality Manual.*

26-14.02 Applicability

The following procedures apply to all proposed highway projects initiated by the Department.

26-14.03 Procedures

26-14.03(a) Exempt Projects

Under the terms of the IDOT-IEPA Agreement, projects that are exempt under the Clean Air Act conformity rule in 40 CFR 93.126 are also exempt from a CO microscale analysis. A complete list of exempt project types can be found in Section 26-11.03(b) (Items #1-#3) of this manual. For projects that are a project type identified in 40 CFR Part 93.126, project sponsors should include the following text in the environmental document or project report:

In accordance with the IDOT-IEPA "Agreement on Microscale Air Quality Assessments for IDOT Sponsored Transportation Projects," this project is exempt from a project-level carbon monoxide air quality analysis because it is a project type identified in 40 CFR Part 93.126.

The IDOT-IEPA Agreement requires that all IDOT-sponsored intersection projects that increase capacity and are in the vicinity of a sensitive receptor be subject to a CO microscale analysis, if such projects are not otherwise exempt under 40 CFR 93.126. Examples of projects that increase capacity include the addition of through lanes, auxiliary turn lanes, or installation of traffic signals at an intersection.

There are three additional exemptions included in the IDOT-IEPA Agreement which are described below.

1) Minimum Volume Threshold: An intersection project is exempt from a CO microscale analysis if the highest design-year approach-volume on the busiest leg of the intersection is less than 5,000 vph or 62,500 ADT, even if sensitive receptors are nearby. For such projects, project sponsors should include the following text in the environmental document or project report:

In accordance with the IDOT-IEPA "Agreement on Microscale Air Quality Assessments for IDOT Sponsored Transportation Projects," this project is exempt from a project-level carbon monoxide air quality analysis because the highest design-year approach volume on the busiest leg of the intersection is less than 5,000 vph or 62,500 ADT. [Insert reference to section of project report that describes design-year approach volumes, if desired.]

2) No Sensitive Receptors: Intersection projects which include one or more legs that exceed the minimum volume threshold described above may still be exempt from a CO microscale analysis if there are no sensitive receptors within 1,000 feet of the project location. Sensitive receptors are defined as any building or location (e.g., residence, school, or nursing home) where the general public may be expected to remain for longer than eight consecutive hours. For such projects, project sponsors should include the following text in the environmental document or project report:

In accordance with the IDOT-IEPA "Agreement on Microscale Air Quality Assessments for IDOT Sponsored Transportation Projects," this project is exempt from a project-level carbon monoxide air quality analysis because there are no sensitive receptors within the project area.

3) Modern Roundabout: An intersection project that consists of the installation of a modern roundabout is exempt from a CO microscale analysis. For modern roundabout projects, project sponsors should include the following text in the environmental document or project report:

In accordance with the IDOT-IEPA "Agreement on Microscale Air Quality Assessments for IDOT Sponsored Transportation Projects," this project is exempt from a project-level carbon monoxide air quality analysis because the project consists of the installation of a modern roundabout.

If a project does not meet the criteria for exemption, a CO microscale analysis must be performed as described in the following sections. Project sponsors should consult with the BDE Project Coordination Unit staff to clarify the appropriate analysis and documentation requirements for non-exempt projects.

26-14.03(b) Projects Not Suitable for Use of COSIM 4.0

The COSIM software program is not suitable for projects where the vehicle fleet mix at the project intersection differs greatly from the default fleet mix used by IDOT (e.g., modeling an intersection near a truck stop) or if nearby receptors are located in or near a tunnel or other enclosed area. COSIM is also not suitable for projects that will add through lanes or auxiliary turning lanes and have sensitive receptors, but no intersection work. In such cases, project sponsors should contact the BDE Project Coordination Unit staff regarding CO microscale analysis and environmental documentation requirements.

26-14.03(c) COSIM Pre-Screen Documentation

The COSIM Pre-Screen feature may be used by project sponsors to provide documentation that a project is exempt from a project-level CO air quality analysis. The COSIM Pre-Screen output is not required but may be included in the environmental document or project report at the discretion of the project sponsor.

26-14.03(d) Projects Subject to COSIM Screening Analysis

Non-exempt projects will be subject to a complete COSIM analysis. The COSIM analysis will indicate whether further detailed air quality analysis is needed. If the COSIM analysis indicates that the project "passes" (i.e., does not have the potential for causing a violation of the NAAQS for CO for any affected receptors), additional detailed air quality analysis is not required. Complete and include the following in the environmental document:

> *The air quality effects of the proposed project were analyzed using the Illinois Carbon Monoxide Screen for Intersection Modeling (COSIM). The "worst case" analysis provided by the COSIM model indicated that the proposed undertaking does not have the potential for contributing to a violation of the National Ambient Air Quality Standards for CO. CO concentrations for the worst case receptor (i.e., residence) located [___________________] (see Exhibit [__]) were as follows:*
>
> *Existing ([year]) - ___ ppm; Build – Time of Completion (TOC) ([year]) - ___ ppm, TOC + 10 years ([year]) - ___ ppm, and Design Year ([year]) - ___ ppm; No Action - ___ ppm in [TOC year], ___ ppm in [TOC + 10 year], and ___ ppm in [design year].*

26-14.03(e) Projects Subject to Detailed Project-Level CO Analysis

If the COSIM screening analysis indicates the project "fails" (i.e., it has potential for contributing to a violation of the NAAQS for CO) or if the project does not fit the assumptions for use of the COSIM screening analysis, perform and document a detailed project-level CO analysis. Districts should use the latest US Environmental Protection Agency (USEPA) emission factors and air quality dispersion models; contact BDE for guidance on the latest inputs and modeling information.

Analysis results greater than the eight-hour CO NAAQS will indicate impacts that will require discussion of mitigation measures with FHWA, USEPA, and IEPA. Describe any such mitigation measures in the Environmental Resources, Impacts, and Mitigation discussion.

26-15 MIGRATORY BIRDS

26-15.01 Introduction

The *Migratory Bird Treaty Act* affords protection to migratory bird species native to the United States or its territories and makes it unlawful (unless and except as permitted by regulation) at any time, by any means or in any manner to pursue, hunt, take, capture, kill, attempt to take, capture or kill, possess, sell, import or export any migratory bird, any part, nest, or eggs of any such bird or any product that includes any such bird or any part, nest, or egg thereof. The *Act* prohibits the direct take of birds and their young, eggs, and nests. A take does not include habitat destruction or alteration, as long as there are no birds, nests, or eggs occupying the habitat being removed or altered.

Bald and golden eagles are migratory birds that are also protected under the *Bald and Golden Eagle Protection Act*. Special conditions apply when projects intrude on eagle nesting and winter roosting areas.

In the development of a proposed highway project, an environmental screening must be done to identify and evaluate the potential for impacts to migratory birds, their nests, eggs, and young. This Section prescribes procedures for these analyses, related coordination, mitigation, and documentation.

26-15.02 Legal Authority

The following legal authorities influence policies and procedures for migratory birds:

- Migratory Bird Treaty Act, 16 U.S.C. 703-712,
- *Bald and Golden Eagle Protection Act,* 16 U.S.C. 668a through 668d,
- Exec. Order No. 13186, 66 Fed. Reg. 3853 (January 17, 2001), Responsibilities of Federal Agencies to Protect Migratory Birds, and
- U.S. Fish and Wildlife Service (USFWS), “National Bald Eagle Management Guidelines,” May 2007.

26-15.03 Policy

Make special effort to avoid construction-related impacts to migratory birds, their nests, eggs, and young.

26-15.04 Procedures

26-15.04(a) Definitions

2. Area-Sensitive Birds. Species of birds requiring a relatively large forest or grassland patch within which to reproduce successfully.

3. Disturb. To agitate or bother a bald eagle or golden eagle to a degree that causes, or is likely to cause, based on the best scientific information available, injury to an eagle; a decrease in its productivity by substantially interfering with normal breeding, feeding, or sheltering behavior; or nest abandonment, by substantially interfering with normal breeding, feeding, or sheltering behavior.

4. Fragmentation. The degree to which forested or grassland areas are being broken into smaller patches and interspersed with habitat areas of different vegetative composition.

5. Forest-Interior Birds. Neotropical migrants that nest in large, contiguous forest areas and are affected by fragmentation.

6. Migratory Bird. Any bird species listed in 50 CFR 10.13 "List of Migratory Birds."

7. Neotropical Migrant. Birds that nest in the United States and Canada and spend the winter months in tropical Mexico, Central and South America, and the Caribbean.

8. Take. To pursue, hunt, shoot, wound, kill, trap, capture or collect, or attempt to carry out any of these activities. Take does not include habitat destruction or alteration, as long as there are no birds, nests, or eggs occupying the habitat being removed or altered.

26-15.04(b) Applicability

The following procedures apply to proposed projects initiated by the Department involving tree removal or destruction of grassland habitat.

26-15.04(c) Analysis and Documentation

To assess the presence of nesting migratory birds within a project area, a determination of breeding birds within the project area to be disturbed by construction will need to be made. Information on Illinois birds can be obtained from the USFWS *Breeding Bird Survey* (BBS), which is available on the USFWS, Division of Migratory Bird Management *Bird Monitoring* website. The BBS is a roadside survey designed to monitor population trends of land birds. A total of 103 routes are run annually throughout Illinois. Each BBS route includes species presence, abundance, and land cover data. Though most projects will not involve BBS routes, the BBS data can be applied to most project areas by extrapolation. Match a BBS route close to the project area that contains land cover types similar to those within the project area. If appropriate information cannot be obtained from these sources, initiate an individual breeding bird survey. Projects reviewed through the Environmental Survey Process (see Chapter 27) will be evaluated for the presence of migratory birds. Results of the evaluation will be sent to the district for evaluation of the project's impact on migratory birds.

Projects processed with an EA or EIS should identify the species potentially present within the project area, the habitat(s) they occupy, their abundance in the region, the likely mechanisms of take (e.g., vegetation removal, habitat loss, fragmentation), and mitigation measures to avoid a take (e.g., restricting tree removal during the breeding season).

Identify the fragmentation of a forested parcel or woody riparian corridor larger than 20 acres (8 ha) and discuss the potential for impacts to forest interior species. For those neotropical migrants that could be affected by the project, include a table within the EA or EIS identifying the species, the species' habitat, and the nesting season dates. This information can be obtained from *The Illinois Breeding Bird Atlas* and *The Birds of Illinois*. *The Illinois Breeding Bird Atlas* (Kleen, Cordle, and Montgomery, 2004) provides information on distribution, abundance, breeding habitats, and fledgling times. *The Birds of Illinois* (Bohlen and Zimmerman, 1989) provides arrival and departure dates on a geographical basis. Discuss the mitigation measures and the actions to avoid a take.

Projects Involving Bald Eagles

Projects involving bald eagles will follow the USFWS *National Bald Eagle Management Guidelines*, available on the USFWS, Division of Migratory Bird Management *Bald and Golden Eagle* website. The EA or EIS will document the results of application of the USFWS guidelines.

In Illinois, bald eagle habitat consists of wintering habitat, winter night roosts, and nesting habitat. During the winter (October through March) migrating bald eagles (and some golden eagles) are present along the Mississippi and Illinois Rivers, and adjacent lakes and sloughs. They also occur around large impoundments. Winter night roosts generally consist of wooded ravines along the bluffs of the Mississippi and Illinois Rivers. These ravines are used annually and offer protection from cold winds and seclusion from human disturbance. The locations of winter night roosts can be obtained through coordination with the Illinois Department of Natural Resources (IDNR). Eagles build large nests in the upper branches of the tallest trees, usually cottonwoods. Edges and openings in forests, fencerows, and other type areas are used for nesting. Impact analysis for nesting and winter night roosts follows the USFWS guidelines. A circle with a radius of 1,320 ft (400 m) is established around a nest/winter night roost. The circle is broken into three zones, as follows:

- The first zone extends out from the nest/winter night roost 330 ft (100 m). No human use is allowed year-round within this zone.
- The second zone extends from 330 ft to 660 ft (100 m to 200 m). Land-use activities involving clear cutting, land clearing, or major construction are prohibited within this zone.
- The third zone extends from 660 ft to 1,320 ft (200 m to 400 m) and is the least restrictive. Most activities are permissible within this zone except during the nesting period (generally late February to mid- July).

Projects processed as CEs should receive either a biological signoff or a Biological Resource Review (BRR) Memorandum. A biological signoff indicates the likelihood of migratory bird impacts is remote. If potential migratory bird habitat and/or impacts are present, the BRR Memorandum will contain the results of the migratory bird evaluation. Projects involving bald eagles will follow the USFWS guidelines as described above. Include this documentation in the Phase I engineering report.

26-15.04(d) Coordination

Coordination with the USFWS is required for all actions that are likely to take a migratory bird(s). In general, EIS projects will be coordinated with the USFWS, IDNR, and US Environmental Protection Agency through the circulation of the Draft and Final EIS. EA and CE projects will be coordinated with the IDNR and USFWS (if appropriate) through the Environmental Survey Process. Agency comments, if any, should be addressed by the district with a copy to the BDE. Construction plans must include identification of sensitive areas and measures to be used to avoid a take of a migratory bird or its nest, eggs, or young.

The construction contractor should be made aware through the use of a General Note in the project plans if the action is likely to take a migratory bird(s). The construction contractor is personally liable for violations of the *Migratory Bird Treaty Act*. Mitigation options include avoiding impacts to migratory birds, their nest, eggs, or young; performing tree removal outside the critical stage for the species involved; or performing a specific bird survey to confirm that migratory birds are not using the area.

26-16 WILDLIFE RESOURCES

26-16.01 Introduction

Wildlife resources are of ecological, educational, aesthetic, cultural, recreational, economic, and scientific value to Illinois. In the development of projects, it may be necessary to undertake special technical analyses, coordination, and mitigation to reduce and minimize impacts to wildlife species and their habitats.

26-16.02 Legal Authority/Guidance

- Fish and Wildlife Coordination Act, 16 U.S.C. 661-667e,
- Mitigation of Impacts to Wetlands and Natural Habitats, 23 CFR 777,
- Environmental Mitigation, 23 CFR 710.513,
- Section 404(b)(1) Guidelines for Specification of Disposal Sites for Dredged or Fill Material, 40 CFR 230,
- Memorandum of Understanding to Foster the Ecosystem Approach between all Federal Agencies, December 15, 1995,
- Illinois Comprehensive Wildlife Conservation Plan and Strategy (Illinois Wildlife Action Plan), 2005,
- Eco-Logical: An Ecosystem Approach to Developing Infrastructure Projects, 2006,
- *Critter Crossings: Linking Habitats and Reducing Roadkill* (FHWA-EP-004) (available on FHWA website), and
- *Wildlife Vehicle Collision Reduction Study: Best Practices Manual* (FHWA-HEP-09-022), 2008 (available on FHWA website).

26-16.03 Policy

In the development of major highway projects, project impacts to wildlife resources will be identified and evaluated and consideration will be given to implementing practical measures for avoiding, minimizing, and mitigating adverse impacts to those resources.

26-16.04 Procedures

26-16.04(a) Definitions

9. Cover Types. This term refers to the plant communities (predominant vegetation types) for a particular area of land. The cover types used in evaluating proposed highway

projects are derived from the Natural Areas Inventory and US Fish and Wildlife Service (USFWS) Habitat Evaluation Procedure, and have been modified to fit the Department's need for consistent field survey results. Cover types include forest, cropland, urban/built-up lands, and other plant community types. These cover types are further described in Section 26-17.06(b).

10. Important Use Areas. Specific areas (e.g., pond, marsh, or similar features) containing amphibians and reptiles having a high species diversity relative to other areas in the region.

11. Species in Greatest Need of Conservation in Illinois. This term refers to those species of fish and wildlife listed in Appendix I of the Illinois Wildlife Action Plan.

12. Wildlife Action Plan. This is a statewide plan for Illinois that addresses conservation of a broad range of wildlife species by identifying their associated habitats and the actions needed to protect and restore the viability of those habitats. The strategies for habitat protection and restoration focus on the species in greatest need of conservation while also addressing the needs of the full array of wildlife in the State.

13. Wildlife Resources. In the context of this Section, this term refers to terrestrial insects, amphibians, reptiles, birds, mammals and their habitats.

14. Wildlife Habitat. This term refers to areas of land that provide food, water, cover, and space required to meet the biological needs of one or more wildlife species.

26-16.04(b) Applicability

The following procedures are applicable to highway projects initiated by the Department that are being processed as an EA or EIS where the project would result in destruction or modification of forested, grassland, including pasture and hayland, and/or wetland (marsh) wildlife habitat.

26-16.04(c) Analysis and Documentation

In response to submittal of an Environmental Survey Request, BDE will determine the need for and the type of wildlife studies for the proposed project. In making this determination, BDE will consider the environmental class of action, the scope of the project, the potential wildlife resources in the project area, and the potential for adverse impacts to wildlife and their habitats. If biological surveys are determined necessary for gathering information on wildlife resources, BDE will task the Illinois Natural History Survey (INHS) to perform the surveys. BDE will provide a scope of work for the survey work to the INHS and the district. The biological surveys generally are conducted over a yearlong period that covers the spring, summer, and fall seasons. Surveys that do not start at the beginning of a year may take 15 months or more to complete. BDE will provide the results of the biological surveys conducted for the project to the district and to Federal, State, and local agencies and the public, as appropriate.

The district will summarize the information on wildlife resources in the project area from the INHS biological survey report and from the appropriate sections of the Illinois Wildlife Action Plan. This summary will include the identification and brief characterization of the Illinois Natural Division, major habitat types, wildlife species and groups of species and their habitats, wildlife impacts, and a discussion of measures to minimize and mitigate adverse impacts to wildlife species and their habitats.

Identify the Natural Division(s) and characterize the features relevant to the project area based on information in the Wildlife Action Plan.

Characterize wildlife habitats in the project areas as wooded, non-wooded, or transitional areas between the two primary habitat divisions. Provide a brief summary regarding the distribution of habitats in the project area and the general wildlife species that occupy these habitats and transitional areas.

Identify species with the greatest need of conservation that are known to occur within or adjacent to a project area and characterize their habitats. The discussion also should address the distribution and abundance of these habitat-types in the project area.

Identify wildlife species or groups of wildlife species that require more specialized habitats and characterize their habitats (e.g., important use areas for amphibians, reptiles). Identify the population size for these species and describe linkages between their habitats.

Many groups of avian species are subject to national plans and are of ecological or economic importance. These groups include neotropical migrants, shorebirds, raptors, wading birds, waterfowl, and upland game bird species. Their importance for consideration in project development varies by season and their habitat preferences. If these types of avian species groups do not use and/or are not present in the project area, they do not need to be discussed in the environmental document.

Neotropical migrants occupy a variety of habitat types and breed from late March to mid-July, depending upon the location within the State. Breeding habitat and species' susceptibility to habitat fragmentation should be identified and characterized. Shorebirds (e.g., yellowlegs, sandpipers) are long-distance migrants that pass through Illinois during the spring or fall migration. These birds often migrate through in large numbers and use lake shorelines, river floodplains, and flooded agricultural fields. Shorebird species, their numbers, and the habitats used during the spring migration should be identified and characterized. Important migration routes for raptors (e.g., hawks, falcons, eagles, vultures, owls) are along the bluffs of major river systems. Raptors generally breed from February to mid-July and use wooded habitats for breeding. The location of a raptor's breeding area and/or the presence of migration routes should be identified and characterized. See Section 26-15 for additional guidance regarding migratory birds.

Wading birds include bitterns, herons, egrets, and cranes. Some wading birds are communal species (e.g., herons, egrets). They nest together in a cluster called a rookery. These colonies can be made up of a single species of bird or may include two or more species. The species forage outward for miles (km) from these rookeries. Identify the location, species, and population size of the rookery and the major foraging areas within the project area.

Waterfowl (e.g., ducks, geese) are of economic importance. Major habitats for these species include lakes, ponds, streams, and open water wetlands. Identify the species that are known to breed in the project area, location of important habitat areas, and economic importance of these species within the project area.

Upland game bird species include both native (e.g., American crow, mourning dove) and introduced (e.g., wild turkey, ring-necked pheasant) species. These species would be considered recreationally important on public lands and some private lands. Where a project will affect these types of lands on which upland game bird species are recreationally important, identify the lands and species.

Identify the areas of high deer/vehicle collisions based on information obtained from the IDOT Division of Traffic Safety. If the project traverses large areas of public and private lands under wildlife management and wildlife mortality is a concern, the district should conduct a roadkill survey. This survey is meant to supplement the deer/vehicle collision data with information on small and medium size mammals, birds, amphibians, and reptiles. The purpose of the survey is to identify areas where wildlife mortality is high and where such features as overpasses, underpasses, or culvert/bridge modifications may be appropriate to reduce the incidence of wildlife/vehicle collisions. Discuss the study protocols for specific roadkill surveys with BDE and the INHS. Generally, the following protocols will apply:

- Drive the survey route during the morning on the first working day of each week from March through September.
- Identify each individual specimen by species and location (e.g., stationing, mile marker, or other identifier). Species identification can be accomplished by photographing the specimen and sending the photo to the INHS for identification.

The environmental documentation should identify and characterize the project impacts on wildlife (e.g., habitat loss, impacts to species in greatest need of conservation, impacts to wildlife species or groups of species). In addition to habitat loss, other impacts to wildlife include construction mortality, barriers to movement, habitat fragmentation, and operational mortality. Identify and evaluate measures to minimize and mitigate adverse wildlife impacts. Possible impact minimization measures include reducing the roadway footprint, fencing, preserving wildlife habitat, restricting vegetation removal during critical times in the life cycle of a potentially impacted affected species, and incorporating wildlife underpasses or overpasses into the project. Possible mitigation measures include habitat banking; restoration of degraded forest, prairie or savanna areas; planting trees to fill gaps within forested areas on public land or restoring woody vegetation along stream banks within and adjacent to highway rights-of-way. Some of these alternatives may require the purchase of conservation easements. For areas involving high incidence of vehicle/deer collisions, consider alternative locations, design modifications, and/or habitat modifications for reducing the likelihood of these collisions.

In evaluating potential mitigation measures and strategies for addressing wildlife impacts, consider the needs identified in the Illinois Wildlife Action Plan for the Natural Division(s) where the project is located. Coordination should be initiated with IDNR and BDE to evaluate proposals for addressing the identified needs. All proposed mitigation measures for wildlife impacts should be coordinated with BDE.

26-16.04(d) Coordination

For projects processed as EAs or CEs, coordination regarding wildlife resources is done through the ESR process. Coordinate the biological survey reports with the IDNR and the USFWS, as appropriate. Coordination with the public will be done when the EA is made available at the public meeting. Address comments received in the FONSI.

For projects processed as an EIS, coordination with IDNR and USFWS will occur through the NEPA/404 Merger Process; see Section 22-4. The biological survey reports will be made available on the IDOT website and the link to the documents will be provided to IDNR, USFWS, and other agencies involved in the Merger Process. Discuss the potential project impacts on wildlife resources and measures to minimize and mitigate these impacts at NEPA/404 Concurrence Point meetings and include a summary of these discussions in the draft EIS.

For projects the Regional Engineer determines will use the principles of Context Sensitive Solutions (CSS), the link to the biological survey documents also will be made available to the community resource council and/or appropriate Technical Advisory Group(s) (TAG), as applicable; see Section 19-5. The district will consider any comments submitted by the TAG(s) regarding wildlife resource issues in preparing the draft EIS or EA.

26-17 TREE/VEGETATION ASSESSMENTS

26-17.01 Introduction

As reflected in Departmental Policy D&E-18, the Department acknowledges the beneficial functions that trees can perform and the importance of considering effects on these functions in project development. Project effects on functions performed by other types of vegetation also should be considered as a part of the project development process. Tree and vegetation assessments provide information for determining overall quality of the vegetation in the project area, for identifying important plant communities (e.g., that provide wildlife habitat) and for inventorying and evaluating trees in the area the project may affect (e.g., type, size, health, functions).

This Section provides policy and procedures for conducting and documenting tree and vegetation assessments for proposed projects.

26-17.02 Legal Authority

- *The Illinois Highway Code*, 605 ILCS 5/2-220, Forestation of Department Controlled Property,
- D&E-18, Preservation and Replacement of Trees,
- Federal Participation for Use of Native Wildflowers, 23 CFR 752.11(b),
- *Context Sensitivity*, 605 ILCS 5/4-219, and
- Memorandum of Understanding by and between the Illinois Department of Natural Resources and the Illinois Department of Transportation, 2007.

26-17.03 Policy

Tree/vegetation assessments will be conducted as necessary to ensure full compliance with Departmental Policy D&E-18 and to support the identification and appropriate consideration of project effects on other types of vegetation and their respective functions.

26-17.04 Procedures

26-17.04(a) Definitions

15. District Tree Evaluation Team. A team within each district that is responsible for conducting evaluations in accordance with Departmental Policy D&E-18 for trees being considered for removal. The team must include expertise in roadside safety, landscape architecture, and environmental impact analysis.

16. Diameter at Breast Height (DBH). The diameter of a tree measured (in inches (mm)) at a point 4.5 ft (1.35 m) above ground level.

17. Specimen Tree. A notable and valued tree, based on consideration of species, size, condition, age, longevity, visual quality, and genetic attributes, as determined by the public and/or resource agencies and the district.

18. Tree. For purposes of the Department's *Standard Specifications for Road and Bridge Construction,* a tree is a woody perennial plant having a single main stem (trunk), the diameter of which is 6 in. (150 mm) or more at a point 4.5 ft (1.35 m) above the highest ground level at the base of the tree. The term "tree" also includes woody perennial plants having a single trunk of less than 6 in. (150 mm) in diameter where such plants have been intentionally planted for landscaping, environmental mitigation, or habitat preservation/enhancement. For purposes of biological surveys conducted for proposed projects, the criteria for identifying "trees" are essentially the same as in the first sentence above, except that the diameter used is 4 in. (100 mm) or more at a point 4.5 ft (1.35 m) above the highest ground level at the base of the plant.

19. Trees with Special Functions. Woody vegetation that is a buffer between a highway and a State-listed Natural Area, Nature Preserve, or Land and Water Reserve are considered trees with special functions.

20. Vegetation. The plants of an area.

26-17.05 Applicability

These procedures apply to all proposed highway projects initiated by the Department.

26-17.06 Analysis and Documentation

26-17.06(a) Tree Surveys

For most projects needing tree surveys, the district Tree Evaluation Team accomplishes the surveys. On some projects in rural areas being processed with an Environmental Assessment (EA) or an Environmental Impact Statement (EIS), the Illinois Natural History Survey (INHS) accomplishes the surveys. The purpose of the tree surveys is to obtain information on the health and diversity of trees and shrubs in a project area. Tree surveys are recommended for projects that involve:

- residential areas containing numerous trees of various sizes, particularly if the project is one on which CSS principles are being applied or if the community has an established urban tree program;
- removal of trees from public land;
- rest area construction in wooded locations;

- new interchange construction in wooded locations;
- impacts to wooded areas 20 acres (8 ha) or larger in agricultural locations;
- wooded areas along scenic routes and/or in existing and potential scenic easement areas;
- need to establish an inventory of trees and their condition on existing highway rights-of-way for management purposes;
- need to identify targeted woody species in USDA Quarantine areas (see Section 26-18); and
- wooded areas along streams with special designations (see Section 26-19) or streams for which the Corps could request mitigation for impacts to the riparian corridor.

Tree surveys should be initiated for projects in urban areas that will involve the removal of trees along streets and/or removal of associated landscape elements from residential areas, public lands, and open lands including fence rows. Before doing a tree survey in a community that has an established urban tree program, contact the community's urban forester or other appropriate official to discuss the information to be collected and its relationship to the community's program, as appropriate. Likewise, contact the appropriate official(s) responsible for public lands prior to initiating tree surveys on those lands. Provide the results of the surveys to a community's urban forester or other designated official and to the appropriate official(s) responsible for public lands, as applicable. If a project is one on which principles of Context Sensitive Solutions (CSS) are being applied, provide the survey results to the project study group and the appropriate Technical Advisory Group(s).

The methods for conducting tree surveys involve either direct counting or sampling. The particular method used is determined by the distribution of trees within the project area and the purpose of the survey.

26-17.06(a)1 *Direct Counting Method*

Tree surveys in residential areas, on public lands, in scenic areas, along stream corridors, or for projects that will affect a relatively small area (e.g., interchanges, rest areas) are accomplished using the direct counting method. In this method, each individual tree within the project limits is inventoried. For each tree, information is collected on its species, size (DBH), station, offset, health, structure, and impact status. Collected field data is incorporated into the project files. If coordination with the public and/or agencies will be undertaken, prepare a tree survey report. The data should be in table format and the table headings should include tree species, size (DBH), station, offset, health, structure, impact status, and suitability for preservation.

The report should categorize "health" and "structure" as good, fair, poor, or dead. The report should explain that ratings for "health" are based on the extent to which a tree is reasonably free of signs and symptoms of disease, and ratings for "structure" are based on the extent to which a tree has structure and form typical of the species.

The report should categorize “suitability for preservation” as good, fair, or poor. Suitability for preservation considers the health, age, and structural condition of the tree and its potential to remain an asset into the future. A rating of good applies to trees with good health and structural stability that have the potential for longevity at the site. A rating of fair applies to trees with somewhat declining health and/or structural defects that can be abated with treatment. These trees will require more intense management and monitoring and may have a shorter life span. A rating of poor applies to trees in poor health or with significant structural defects that cannot be mitigated. They should be removed.

The information on impact status and suitability for preservation will be coordinated with project designers in making final decisions on whether specific trees along the project should be removed or preserved and protected (e.g., trees outside project right-of-way that are given suitability for preservation ratings of poor due to significant structural defects and which, therefore, pose a hazard, should be identified for removal).

Coordinate the tree survey report with the community’s urban forester or other designated official, as applicable and affected landowner(s), as appropriate. During Phase II, coordinate tree trimming or removal with the landowner and offer replacement trees and/or shrubs.

26-17.06(a)2 *Sampling Method*

Tree surveys can be done in spot locations or for projects on new alignments. Instead of inventorying each tree, quantitative or qualitative sampling can be employed. The ecological literature has a number of methods for the quantitative sampling of trees. Two of these are the circular plot and point-center quarter methods. When using either of these survey methods, document the quality, disturbance, and presence of specimen trees, or other noteworthy features within the area being sampled.

Either method yields information on density (number of trees per acre (ha)), size (basal area per acre (ha)), and distribution within the stand (frequency of occurrence for each species sampled). Using these results, generate a table for inclusion in the tree survey report summarizing the information for the wooded stands that were sampled. The table should include headings for the stand location, species composition, structure (density, basal area, and frequency of occurrence) and potential project impact (acreage (ha) or number of trees lost). The tree report also should include a discussion of specimen trees, trees with special functions and other features of the stand, as well as mitigation options for the project’s anticipated impacts to trees. If the project is being processed as an Environmental Assessment (EA) or Environmental Impact Statement (EIS), include a summary of the report into the environmental document. If the project is a CE, the report and the results of coordination with Illinois Department of Natural Resources (IDNR) should be in the appendix of the Phase I engineering report.

26-17.06(b) Cover Type and Vegetation Surveys

Cover type surveys are done for some EA projects and most EIS projects. BDE tasks the Illinois Natural History Survey (INHS) to survey the project area for the purpose of classifying plant communities according to cover type and characterizing the vegetation in the area. Cover type surveys are done to determine the distribution and composition of plant communities (e.g., vegetation/habitat types) within a project area. The survey is usually based on the review of aerial photography and topographic maps with field checks to determine the adequacy of the cover typing and to identify the species composition, quality, and disturbance history of the delineated plant communities. Cover type surveys are usually done for projects on new alignments or in areas where the project will affect a diverse number of plant communities.

The vegetation cover types used for INHS cover type mapping are derived from the Natural Areas Inventory and the USFWS Habitat Evaluation Procedure and have been modified to fit IDOT projects. The definitions of the vegetation cover types used by the INHS are provided below:

21. Forbland. Abandoned pastures and successional fields dominated by disturbance adapted and disturbance tolerant forbs. Shrub or tree cover should not exceed 25% of the overall cover.

22. Pasture and Hayland. Dominated by perennial grasses or forbs, native or introduced, that are planted primarily for livestock grazing or are mowed at least once a year. Both pasture and hayland should have no more than 5 percent areal cover from woody vegetation.

23. Cropland. Agricultural field planted to annual crops of grains, vegetables, or silage.

24. Urban/Built-Up Lands. Includes any land that has been modified or has structures built on it. Examples include residential, commercial, and industrial areas, vacant urban lots, farm buildings, feedlots, parking lots, roadways, and cemeteries.

25. Shrubland. Abandoned pastures, successional fields, railroad and highway rights-of-way dominated by dense to open stands of shrubs and young trees, with at least 25% shrub cover.

26. Grassland (Prairie). Native grasses dominated communities found as remnant communities along roadsides, in pastures, abandoned rights-of-way, and cemeteries. Also includes prairie restoration areas.

27. Non-Native Grassland. Open land dominated by exotic cool-season grasses, especially brome, blue grass, and fescue. The areas are periodically mowed. This cover type includes mowed roadsides and grass ways within cropland.

28. Upland Forest. Forests that normally are not flooded by stream overflow.

29. Floodplain Forest. Forests that occur on the 100-year floodplain. These forests may or may not meet the regulatory requirements of a wetland. When they do, they also qualify as forested wetland.

30. Forested Wetland. Forests that meet the regulatory requirements of a wetland.

31. Wet Shrubland. Includes areas dominated by woody vegetation (e.g., greater than 25% areal cover) less than 20 ft (6 m) in height.

32. Marsh. Includes areas dominated by tall graminoid plants and that have water near or above the surface for most of the year.

33. Sedge Meadow. Includes areas dominated by sedges on peat, muck, or wet sand.

34. Wet Meadow. Includes areas dominated by grasses, where the soils are hydric.

35. Pond. Natural or man-made impoundments that support wetland vegetation around the periphery of the pond (regulated wetland) or maintained ponds that are actively used farm ponds, sewage lagoons, ornamental ponds, active quarry ponds, or retention/detention facilities not containing hydrophytic vegetation (non-wetland areas).

36. Lacustrine. Deepwater habitats that are situated in a topographic depression or dammed river channel. Their total area exceeds 20 acres (8 ha).

37. Riverine. Includes habitats contained within a channel. Refers to a stream, creek, or river.

38. Barren Land. Land having less than 1% total vegetation cover. Includes rock outcrops, recently mined areas, and recently scraped areas.

Vegetation surveys are done by the district to characterize existing conditions in potential mitigation sites and managed roadside areas. The results of these surveys are depicted on maps. Proposed modifications in the vegetation can be overlaid on these maps to delineate the nature and extent of the changes.

26-17.07 Coordination

Coordinate tree surveys done in an urban area with the community's urban forester, if applicable, and the appropriate property owners. Coordinate tree surveys in other venues with the IDNR. For project processed with an EIS, summarize tree and vegetation surveys in the draft EIS and coordinated through the circulation of the document. Coordinate tree and vegetation survey reports on EA processed projects with the IDNR. Summarize these reports and the results of coordination with IDNR in the EA.

Vegetation surveys accomplished by the district for mitigation purposes will be coordinated with BDE and IDNR.

26-18 INVASIVE SPECIES AND NOXIOUS WEEDS

26-18.01 Introduction

Non-native flora and fauna can cause significant changes to ecosystems, upset the ecological balance, and cause economic harm to the agricultural and recreational sectors. Transportation systems can facilitate the spread of plant and animal species outside their natural range. Those species that are likely to harm the environment, human health, or economy, including species designated as noxious weeds, are of particular concern.

Highway corridors provide opportunities for the movement of invasive species and noxious weeds through the landscape. Invasive plants can be moved from site to site during spraying and mowing operations. Weed seed can be inadvertently introduced into the corridor during construction, on equipment, and through the use of mulch, imported soil or gravel, and sod. Some invasive plant species might be deliberately planted in erosion control, landscape, or wildflower projects. Highway rights-of-way traverse public and private lands and many of these adjacent lands have weed problems. The highway rights-of-way provide corridors for further spread of the weeds.

Federal and State requirements are in place for controlling and/or eliminating noxious weeds and invasive species. The procedures in this Section provide guidance for evaluating and documenting invasive species and noxious weed issues in the environmental documentation for proposed highway projects.

26-18.02 Legal Authority

- Exec. Order No.13112, 64 Fed. Reg. 6183, February 8, 1999, Invasive Species,
- Management of Undesirable Plants on Federal Lands, 7 U.S.C. 2814,
- Definitions, 7 U.S.C. 7702,
- Noxious Weed Regulations, 7 CFR 360,
- FHWA Guidance on Invasive Species, August 10, 1999,
- Illinois Noxious Weed Law, 8 Ill. Admin*,* Code 220, ,
- The Illinois Noxious Weed Law, 505 ILCS 100/1 *et seq*./,
- The Illinois Exotic Weed Act*,* 525 ILCS 10/1 *et seq, and*
- The Insect Pest and Plant Disease Act*,* 505 ILCS 90/1 *et seq*.

26-18.03 Policy

The environmental analyses and documentation for proposed highway projects initiated by the Department will include determinations of the likelihood of introducing or spreading invasive species and/or noxious weeds. When invasive species and/or noxious weed are identified as a potential concern, include in the environmental documentation a description of measures to be taken to avoid introducing or spreading the species and to minimize their potential for causing harm.

26-18.04 Procedures

For projects being processed with an Environmental Impact Statement, the Environmental Survey Process will include identification of invasive species and/or noxious weeds in the area the project potentially may affect. Biological survey reports and wetland determinations produced by the Illinois Natural History Survey for these projects will include information on these species. For projects processed as Categorical Exclusions or with an Environmental Assessment, obtain information on invasive species and/or noxious weeds the project may involve from the Illinois Department of Agriculture website.

26-18.04(a) Definitions

39. Alien Species. Any species with respect to a particular ecosystem including its seeds, eggs, spores, or other biological material capable of propagating that species that is not native to that ecosystem.

40. Control. As appropriate, eradicating, suppressing, reducing, or managing invasive species populations, preventing spread of invasive species from areas where they are present, and taking steps such as restoration of native species and habitats to reduce the effects of invasive species and to prevent further invasions. Control as applied to weed control, means to prevent weeds from spreading or being spread by dissemination of seed or other propagating parts.

41. Ecosystem. The complex of a community of organisms and its environment.

42. Eradicate. The complete killing or destruction of weeds, seeds, or other propagating parts of weeds by the use of cutting, chemicals, tillage, cropping systems, pasturing, livestock or crops, or any one or all of these in effective combination.

43. Exotic Weeds. Plants not native to North America, which, when planted, either spread vegetatively or naturalize and degrade natural communities, reduce the value of fish and wildlife habitat, or threaten an Illinois endangered or threatened species.

44. Introduction. The intentional or unintentional escape, release, dissemination, or placement of a species into an ecosystem as a result of human activity.

45. Invasive Species. An alien species whose introduction does or is likely to cause economic or environmental harm or harm to human health.

46. Native Species. With respect to a particular ecosystem, a species that, other than a result of an introduction, historically occurred or currently occurs in that ecosystem.

47. Noxious Weed. For Federal requirements, any plant or plant product that can directly or indirectly injure or cause damage to crops, including nursery stock or plant products, livestock, poultry, or other interests of agriculture, irrigation, navigation, natural resources of the United States, public health, or environment. For the State of Illinois requirements,

this means an annual, biennial, or perennial plant propagated by seed or vegetative parts that is designated in 8 Ill. Admin. Code 220.60 as being a noxious weed, in accordance with Section 2(5) and Section 4 of the *Illinois Noxious Weed Act*.

26-18.04(b) Applicability

These procedures apply to all proposed highway projects initiated by the Department.

26-18.05 Analysis and Documentation

During early coordination and/or scoping, discussions with agencies and stakeholders should identify the potential for the introduction and/or spread of invasive species and/or noxious weeds and should address possible prevention and control measures.

The project environmental documentation should identify and quantify any existing plant and animal invasive species populations and/or noxious weeds occurring within the project area. In addition, if a project is in the vicinity of a designated US Department of Agriculture quarantine zone for an invasive species and/or noxious weed, identify and briefly discuss the quarantine zone. Information regarding these quarantine zones is available through the Illinois Department of Agriculture website.

The environmental documentation should discuss the potential of the project to promote or inhibit the spread of invasive species and/or noxious weeds that were identified in the project area.

The environmental documentation also should include a discussion of any preventative measures or eradication measures that will be taken on the project. Examples include the inspection and cleaning of construction equipment, commitments to ensure the use of invasive-free mulches, top soils and seed mixes, and eradication strategies.

The discussion should indicate that landscaping and erosion control included in the project will not use species listed as noxious weeds. It also should state that in sensitive areas (e.g., Natural Areas, Nature Preserves, parks), if noxious weeds and/or invasive species are found in or adjacent to construction areas, precautions will be taken to ensure the project does not result in noxious weed and/or invasive species impacts to the sensitive areas.

If it is anticipated that noxious weeds and/or invasive species will be a problem during construction, the discussion should acknowledge that concern. It should also identify and assess potential impacts associated with clearing and grading operations, borrow/fill areas, disposal sites, and in-stream work, as appropriate, and measures for avoiding and/or minimizing those impacts.

26-18.06 IDOT List of Species Under Management

This list represents the primary plant and animal species that IDOT targets for eradication. It is based on Departmental experience with trying to control exotic species on highway rights-of-way or that are associated with other resource issue areas (e.g., wetlands, incidental take authorizations). Individual districts may have targeted other plant and animal species for eradication in addition to those in the following list.

Plants:

Purple Loosestrife (Lythrum salicaria)	Wetlands, roadside ditches
Canada Thistle (Cirsium arvense)	Open areas, roadsides
Teasel (Dipsacus spp.)	Open areas, roadsides
Johnson Grass (Sorghum halepense)	Open areas, roadsides
Musk Thistle (Carduus nutans)	Open areas, roadsides

Animals:

Zebra Mussel (Dreissena polymorpha)	Large rivers
Emerald Ash Borer (Agrilus planipennis)	Ash trees

26-19 SURFACE WATER RESOURCES AND AQUATIC HABITAT

26-19.01 Introduction

Surface water resources are of ecological, economic, educational, aesthetic, cultural, recreational, and scientific value to Illinois. In the development of highway projects, it may be necessary to undertake biological surveys, special technical analyses, and coordination to comply with Federal, State, and local laws and regulations applicable to surface water resources and aquatic habitat. This Section provides guidance and procedures regarding these surveys, analyses, and related coordination. The surface water resources that highway projects most commonly encounter are streams (including rivers and creeks). Where other types of surface waters (e.g., drainage ditches, lakes, ponds) are involved, identify and analyze in a manner similar to streams.

In addition to this Section, Section 26-9, Section 26-20, Section 26-21, Chapter 28, Chapter 40, and Chapter 41 also contain guidance and procedures applicable to surface water resources/aquatic habitat.

26-19.02 Complementary Technical Manuals

The *IDOT Drainage Manual* provides additional information to assist in fulfilling the requirements of this Section.

26-19.03 Legal Authority

- Fish and Wildlife Coordination Act, 16 U.S.C. 661-667e,
- Mitigation of Impacts to Wetlands and Natural Habitat, 23 CFR 777,
- Environmental Mitigation, 23 CFR 710.513,
- FHWA (2005) Memorandum: Federal-aid Eligibility of Wetland and Natural Habitat Mitigation,
- Section 404(b)(1), Guidelines for Specification of Disposal Sites for Dredged or Fill Material, 40 CFR 230,
- Exec. Order No. 11990, 42 Fed. Reg. 26961, May 24, 1977, Protection of Wetlands,
- Exec. Order No. 11988, 42 Fed. Reg. 26951, May 24, 1977, Floodplain Management,
- Statewide Implementation Agreement for the *National Environmental Policy Act* and *Clean Water Act* Section 404 Concurrent NEPA/404 Process for Transportation Projects in Illinois,
- Memorandum of Understanding by and between the Illinois Department of Natural Resources and the Illinois Department of Transportation, 2007, and

- Antidegradation, 35 Ill. Admin. Code 302.105.

26-19.04 Policy

In the development of proposed State highway projects, potential project impacts to surface water resources and aquatic habitat will be identified and evaluated. Consideration will be given to implementing practical measures for avoiding, minimizing, and mitigating adverse project impacts to those resources.

26-19.05 Procedures

Surface water resources within a project's area of potential effects are identified through the Environmental Survey Process; see Chapter 27. BDE determines the need for aquatic habitat surveys and/or agency coordination based on consideration of the following:

- results of preliminary coordination with Illinois Department of Natural Resources (IDNR);
- presence of listed threatened or endangered aquatic species (see Section 26-9) or natural areas;
- presence of a stream included in the Nationwide Rivers Inventory (see Section 26-20);
- presence of a stream that is involved in an Advanced Identification (ADID) study (i.e., for identifying high quality aquatic resources that should be protected);
- presence of a biologically significant stream;
- presence of a stream with a Biological Stream Rating of "A" or "B" for diversity or integrity;
- project scope of work; and
- environmental Class of Action (i.e., Categorical Exclusion (CE), Environmental Assessment (EA), or Environmental Impact Statement (EIS)).

For major actions (i.e., EIS projects and some EA projects), BDE requests the Illinois Natural History Survey (INHS) to provide an assessment of biological resources. The resulting report contains information on the existing aquatic habitat in the project area. Summarize this information in the environmental document. The following Section provides guidance on the various physical, biological, and chemical parameters evaluated for surface water resources and aquatic habitat.

26-19.05(a) Definitions

48. Aquatic Habitat. Places where aquatic plants and animals interact with the physical and chemical components of their environment.

49. Biologically Significant Stream. A stream that has a Biological Stream Rating System score of "A" either for Diversity or Integrity based on data from at least two taxonomic

groups. These streams are unique resources in the State and are considered to be the highest quality streams.

50. Biological Stream Rating System (BSRS). A system administered by the IDNR that identifies Illinois stream segments possessing exceptional quality, based on data concerning the populations of fish, mussels, macroinvertebrates, crayfish, and threatened and endangered species they support. The system provides a stream segment rating for three areas: integrity, diversity, and biological significance. Ratings for each area range from "A" (excellent) to "E" (very poor). BSRS ratings are available only for small to medium size streams. They are not available for rivers.

51. Diversity. The variety of taxa from several important aquatic groups (e.g., mussels, fish, macroinvertebrates, crayfish) present within a stream segment.

52. Dominant Fish Species. Those species of fish that make up 20% or more of the total catch at a sampling site.

53. Ephemeral Stream. A stream that has flowing water only during, and for a short duration after, precipitation events in a typical year. Ephemeral streambeds are located above the water table year-round. Groundwater is not a source of water for the stream. Runoff from rainfall is the primary source of water for stream flow.

54. EPT Richness. The total number of different kinds of aquatic organisms in a collection belonging to the insect groups Ephemeroptera (mayflies), Plecoptera (stoneflies), and Trichoptera (caddis flies).

55. In-Stream Work. Any work or other activity within the stream banks that modifies or otherwise affects the streambed or stream banks (e.g., cofferdams, riprap, construction haul roads, work pads, abutment construction, pier removal and construction, bank clearing and excavation, channel excavation, channel change, weir construction).

56. Integrity. The wholeness of a stream system and its ability to support organisms and processes comparable to the natural habitat of the region, based on BSRS data.

57. Intermittent Stream. A stream that has flowing waters during certain times of the year, where groundwater provides water for stream flow. During dry periods, intermittent streams may not have flowing water. Runoff from rainfall is a supplemental source of water for stream flow.

58. Intolerant Species. Species of fish sensitive to various environmental perturbations as identified by the IDNR or Illinois Environmental Protection Agency (IEPA).

59. Mean Habitat Score. An index used to rate the habitat structure of a stream segment based on the physical aspects of the stream. A score greater than 130 indicates excellent habitat characteristics. A score below 80 indicates poor habitat characteristics.

60. Perennial Stream. A stream that has flowing water year-round during a typical year. The water table is located above the streambed for most of the year. Groundwater is the

primary source of water for stream flow. Runoff from rainfall is a supplemental source of water for stream flow.

61. Pollutant. For surface water resources and aquatic habitat, this is any substance that, due to its characteristics and/or quantity, if introduced into the aquatic environment has a degrading effect that impairs the usefulness of the aquatic environment or renders it offensive.

62. Substrate. The mineral and organic material that forms the bed of the stream on which aquatic organisms live. Mineral materials may include sand, gravel, cobble, silt, bedrock, etc. Organic material may include algae, macrophytes, dead leaves, woody debris, etc.

63. Tolerant Species. Species of fish tolerant of various environmental perturbations as identified by the IDNR/IEPA.

64. Woody Riparian Habitat. An area predominantly covered by trees and/or shrubs located adjacent to and up-gradient from streams and lakes.

26-19.05(b) Applicability

These procedures apply to all proposed highway projects initiated by the Department that may have an effect on surface water resources.

26-19.05(c) Analysis and Documentation

The analysis and documentation required for addressing surface water resources and aquatic habitat will vary according to the scope of work and environmental class of action for a proposed project and the presence of streams with special designations. Bridge replacement projects often involve minor in-stream work that requires minimal analysis and documentation (see BDE 1210 Phase I Checklist). Projects that involve more extensive in-stream work and/or that occur within or adjacent to a stream with a special designation will require more analysis, documentation, and coordination. Projects requiring an EIS generally will require extensive analysis and coordination. The coordination typically is accomplished through the NEPA/404 Merger Process; see Section 22-4.

The following guidance discusses the various factors that may need to be considered in analyzing project effects on surface water resources and aquatic habitat. For projects processed with an EIS, all of the factors generally will apply. For other projects, evaluate the range of factors and address those that are determined applicable.

For EIS projects, BDE provides the district information for analysis of effects on surface water resources and aquatic habitat in an Assessment of Biological Resources Report prepared by the INHS. The Report also contains additional information that may be useful in preparing the environmental document (e.g., information that describes and characterizes potentially affected resources and that provides a basis for discussing potential project impacts). As needed, the district should contact BDE for assistance in determining which items of additional information may be relevant for inclusion in the EIS.

65. *Clean Water Act* Section 404(b)(1). The alternative analysis for NEPA and the *Clean Water Act* differs substantially. During project development for projects that will require an individual Section 404 permit, it is essential that these differences are understood and are reflected in the environmental documentation. NEPA requires that all reasonable alternatives be evaluated in detail. Section 404(b)(1) of the *Clean Water Act*, and the associated implementing guidelines in 40 CFR 230, provide that the US Army Corps of Engineers (Corps) can approve only the Least Environmentally Damaging Practicable Alternative (LEDPA). The guidelines are binding regulations that the Corps uses in determining a project's impact on aquatic resources from discharges of dredged and/or fill material. The LEDPA requirement means that no discharge of dredged or fill material will be permitted if there is a practicable alternative to the proposed discharge that would have less adverse impact on the aquatic ecosystem, so long as the alternative does not have other significant adverse environmental consequences. Noncompliance with this requirement is a sufficient basis for the Corps to deny a permit. If the project does comply with the guidelines, the Corps still may deny the permit if it is determined to be contrary to the public interest.

The following guidance is based on the requirements of the Section 404(b)(1) "Guidelines for Specification of Disposal Sites for Dredged or Fill Material, 40 CFR 230. The guidance is applicable to all projects that will involve in-stream work or anticipated impacts from operation and maintenance of the roadway. For EA and EIS projects, include the information prepared in accordance with this guidance in the environmental document. For CE projects, incorporate the information in the Phase I engineering report and associated appendices.

66. Physical Parameters. Identify the physical attributes that characterize streams. Examples of these attributes include upstream drainage area, flow regime, substrate, stream width and depth, mean habitat quality, woody riparian habitat, highly erodible soils, and watershed cover types. List the attributes for each stream. For projects with a number of stream crossings, present the information in a table to allow for comparisons between streams and/or stream reaches. Identify attributes the project may affect and include discussion of the nature and extent of the potential effects in the text of the document. Physical parameters are further described below:

- Upstream drainage area is one of the measures of stream size and provides an indication of the size of a stream's watershed. The district determines upstream drainage area.
- Illinois streams have either a perennial, intermittent, or ephemeral flow regime. Perennial and intermittent flow regimes are depicted on US Geological Survey (USGS) topographic quadrangles (7.5 minutes). Ephemeral flow regimes can be identified from aerial photography and/or field observations. A perennial flow regime is required to support fish and mussels. An intermittent flow regime may support a limited assemblage of fish species during seasonal high water periods. Flow regimes identified in INHS reports are based on field observations.

- Stream width is another measure of stream size. Stream depth refers to the depth of water in a stream when measured during biological surveys. It does not necessarily correlate with the stream flow regime as depicted on USGS topographic maps.

- Substrates in Illinois streams consist of varying percentages of cobble, gravel, sand, silt, or bedrock. Excessive sand and silt in the stream substrate can diminish habitat quality for fish and aquatic macroinvertebrates. Other substrate types (e.g., gravel, cobble, detritus) can contribute to a diverse fish and aquatic macroinvertebrate assemblage. In-stream work can result in varying degrees of change in the physical, biological, and chemical characteristics of the substrate. In addition, discharge of sediment from the adjacent construction site can affect bottom-dwelling organisms at the site by smothering immobile forms and by changing the habitat.

- Mean habitat quality scores are based on a modification of a standard US Environmental Protection Agency (USEPA) method. They are used by the INHS to rate the habitat structure of a stream reach and to identify need for more accurate assessment methods (e.g., aquatic resource surveys for fishes, mussels, aquatic macroinvertebrates). The scores are derived from 12 physical characteristics (e.g., channel structure, flow, bank vegetation, substrate) of a stream. Two people complete the evaluation and numerical values are given to each characteristic and are averaged and summed. The sum of the values is called the mean habitat score. A score greater than 130 receives a rating of "excellent," a score of 129.9 to 110 is considered "good," a score of 109.9 to 80 is "fair," and a score below 80 is "poor." These scores indicate the presence of degraded habitat and/or the presence of pollutants.

- Woody riparian habitat provides cover for fish and other wildlife, keeps streams cool, slows erosion and stream flow, and adds organic material to the aquatic food chain. Woody riparian habitat is a key requirement for healthy streams and aquatic communities. Where a project will remove woody riparian habitat, describe the composition, length, and width of this habitat, along each bank, in the environmental documentation. Mitigation for the loss of this habitat may be required. Consider replacing the habitat on-site and working with landowners to extend it to adjacent areas that do not currently have that habitat-type.

- Highly erodible soils have slopes of 4% or greater. The district should identify these soils from appropriate County Soil Maps. These soil types are usually associated with changes in topography and can occur along streams. When these soils are cleared of vegetation during construction, they become a source of sediment pollution for the adjacent stream.

- Watershed cover types are those that dominate the area through which a stream flows. In Illinois, these would mainly be residential/urban areas, agricultural, upland and bottomland forests/woodlands, and non-native grasslands. These cover types are discussed further in Section 26-17. Drainage from these cover types has a bearing on the potential sediment and chemical makeup of the stream.

- Other factors to be considered include the identification of upstream dischargers of pollutants (e.g., industrial facilities, wastewater treatment plants) and the downstream receivers (e.g., water supply intakes). Districts should obtain this information, based on their knowledge of the project area. Information on the locations of pollutant discharge sources also can be found on Illinois State Water Survey maps (7-Day 10-Year Flow Maps). Locations of water supply intake structures can be obtained through coordination with IEPA or the IDNR Natural Heritage Database.

67. Biological Parameters. Biological parameters include fish, mussels, and aquatic macroinvertebrates. Fish are important and dominant organisms in streams and have ecological, economic, and recreational values. Several parameters of the fish population should be characterized (e.g., dominant species, total number of species sampled, number of tolerant and intolerant species, percentage of tolerant and intolerant individuals). This information is best depicted in a table.

Identify the presence of species listed as endangered and threatened and discuss the species in the part of the environmental documentation that addresses that subject.

In the environmental documentation, identify and discuss potential project impacts on the fish populations and habitat in the stream from construction, operation, and maintenance of the roadway. Address the following items, as appropriate:

- If species of fish identified in the *Illinois Wildlife Action Plan* as Species in Greatest Need of Conservation are found in the area a project will affect, include discussion of the species, their habitat requirements, and possible measures to minimize impacts and provide improved habitat conditions for the species.

- If a project involves a river that supports recreational and/or commercial fishing and other water-related recreation, identify and discuss the nature and extent of these activities in the project area. IDNR can provide this type of information. Also, discuss potential project impacts on these activities and measures to minimize the impacts.

Mussels occur in most permanent flow streams. Their occurrence in beds (e.g., dense, natural aggregations of mussels, which can support a diverse variety of benthic fauna) is generally restricted to large rivers and high quality streams. IDNR has designated some of these beds as Natural Areas. The environmental document should indicate the number of live individuals per species at a particular site. This material can be presented in a table that also includes fish data.

Aquatic macroinvertebrates are useful in determining the health of a water resource with regard to the presence of organic pollution. Indices that can be used are the mean Family-Level Biotic Index and EPT Richness. This information can also be presented in a table, along with fish and mussel data.

The Biological Stream Ratings (BSR) process includes data from 1997 through 2007. It is anticipated that the ratings will be updated on a regular basis; see the IDNR website for more information. The Ratings score the streams on three parameters: Diversity, Integrity, and Biologically Significant Streams. Letter ratings of A to E are used for the Diversity and Integrity Ratings. The following biotic resource quality descriptors apply to these Letter Ratings: A (excellent), B (good), C (fair), D (poor), and E (very poor). The Biologically Significant Streams are unique (high quality) stream resources. The biological communities present in these streams must be protected at the stream reach and at the upstream reach. Identify and discuss streams that have been rated.

68. Chemical Parameters (Water Quality). For EIS projects, water quality sampling is done in the spring, summer, and fall by the INHS and tabulated results are included as appendices to their reports. The INHS does not include a water quality analysis in the reports. The district is responsible for conducting this analysis. The tabulated results include many different parameters. For most projects, only a select group of the parameters needs to be analyzed. These parameters include the following:

- air and water temperature;
- dissolved oxygen;
- pH;
- sulfate;
- total potassium;
- chloride;
- total dissolved solids;
- hardness; and
- dissolved copper, lead, and zinc.

Present the information on these parameters in a table in the EIS, labeled "Measured Levels of Water Quality Constituents vs. the Numeric Water Quality Standards within the Project Area." The values in the table are the average of the three seasonal values for each parameter. For those parameters that have a water quality standard, compare the summarized values and the individual values from the INHS Report to the numeric Illinois water quality standard from the most recent issue of the *Integrated Water Quality Report and Section 303(d) List*, available on the IEPA website. Use the individual values to determine whether there is an exceedance of the standards. If a value exceeds the applicable standard, include information in the environmental document identifying the parameter, its concentration as sampled, and the date of the sample. Also, include discussion of the possible reason(s) for the exceedance of the water quality standard.

In areas where the use of road salt (sodium chloride) for winter maintenance is an issue, conduct an analysis to determine chloride concentrations in highway storm water runoff. Use the methodology from the FHWA publication "Evaluation and Management of Highway Runoff Water Quality" to predict the chloride concentrations. Compare the predicted chloride concentrations with the existing chloride levels indicated in the INHS Report. Summarize the results of the analysis, including existing and predicted chloride levels, in the environmental document. If the sum of the predicted chloride value and the existing chloride value exceeds the 500 ppm water quality standard for chloride, measures must be implemented to reduce the use of road salt in the area of the potential violation of the standard.

In addition to numeric water quality standards, the *Integrated Water Quality Report and Section 303(d) List* contains narrative water quality standards. These are based on designated use methodology. Under the State's general use water quality standards, designated uses have been identified for many Illinois streams. These designated uses include aquatic life, fish consumption, primary contact, secondary contact, and aesthetic quality. Streams are either in full support or nonsupport of their designated uses. Streams that are in nonsupport of the designated use are considered impaired; see Section 26-21. Include information in the environmental document identifying designated uses for each stream in the area of a project.

Another way to judge a stream's water quality is by using Hilsenhoff's Family-Level Biotic Index. This Index is based on the sensitivity of aquatic macroinvertebrates to organic pollution. Scores range from 0 to 10, where 0.00 to 3.75 = Excellent; 3.76 to 4.25 = Very good; 4.26 to 5.00 = Good; 5.01 to 5.75 = Fair; 5.76 to 6.5 = Fairly poor; 6.51 to 7.25 = Poor; and 7.26 to 10.00 = Very poor. Low scores indicate good water quality with negligible organic pollution; high scores indicate bad water quality with serious organic pollution. This information can be obtained from INHS Reports and should be incorporated in the environmental document.

69. Special Designations. Identify streams in the area of a proposed project that have a special designation. The special designation may impose additional requirements that must be addressed (e.g., impact analysis, coordination with specific Federal, State, local agencies). The following discuss various special designations that may apply:

a. Navigable Waters. The *IDOT Drainage Manual* and includes a listing of navigable streams in Illinois. In addition to being subject to other surface water permit requirements (e.g., Section 404 of the *Clean Water Act*), navigable streams are subject to specific permit requirements under Section 9 and Section 10 of the *Rivers and Harbors Act of 1899*. Section 9 requires a permit from the US Coast Guard (USCG) for construction of bridges or causeways over or in a navigable stream. Section 10 requires a permit from the Corps for construction of any structure other than a bridge or causeway in or over a navigable stream, for the excavation/dredging or deposition of material in a navigable stream, or for any obstruction or alteration in a navigable stream. When a project requires a Section 9 or a Section 10 permit, include discussion in the environmental document concerning need for the permit(s) and the project's effects on navigational use of the stream. Identify the presence of barge terminals and the number of commercial and recreational vessels passing through the project area. Also, identify and discuss any existing navigational deficiencies in and adjacent to the navigational channel. Incorporate this discussion in the environmental document in a subsection on Navigation in the part of the document that addresses land use. Include a summary of coordination with USCG and/or the Corps. Discuss the physical, biological, and chemical aspects of the stream in the Water Resources and Aquatic Habitat section of the environmental document.

The USCG and Corps are signatories to the agreement for the "Concurrent NEPA/404 Process for Transportation Projects in Illinois." For EIS and EA projects requiring a Section 9 permit and/or a Section 10 permit, invite the USCG and the Corps to be Cooperating Agencies (and Participating Agencies for EIS projects, pursuant to 23 U.S.C. 139 "Efficient environmental reviews for project decision-making").

For CE projects, identify the Section 9 permit and/or Section 10 permit involvement(s) in the Phase I engineering report and include copies of correspondence with USCG and/or the Corps in an appendix to the report.

See Chapter 28 for additional guidance concerning Section 9 and Section 10 permits.

b. Nationwide Rivers Inventory. The list of streams included in the Inventory is available on the National Park Service "Conservation and Outdoor Recreation" website. Potential involvement with streams on the Inventory is identified as a part of the Environmental Survey Process when an Environmental Survey Request (ESR) form is submitted for a project. Potential involvement with a stream included in the Inventory may require coordination with the National Park Service. See Section 26-20 for further guidance on the Nationwide Rivers Inventory.

c. Illinois Natural Area. Approximately 110 stream segments in Illinois are listed by IDNR as aquatic Natural Areas. When an ESR form is submitted for a proposed project, the Environmental Survey Process identifies potential involvements with streams designated as Illinois Natural Areas. Information on these stream segments also is available from IDNR. For EA and EIS projects, identify these potential involvements in the part of the environmental document that addresses surface water resources and aquatic habitat. Include detailed discussion of the involvements, including results of coordination with IDNR, in the part of the document that deals with State-designated lands. For CE projects, document the involvement and results of coordination with IDNR in the BDE 1210 Phase I Checklist. See Section 26-9 for guidance on the requirements associated with designated Illinois Natural Areas.

d. Advanced Identification of Water Resources (ADID) Streams. These are streams that the USEPA and Corps have determined contain high quality aquatic habitat that is generally unsuitable for discharges of dredged or fill material. Under the ADID process, identification of a stream as generally unsuitable for discharges of dredged or fill material is an advisory designation. It alerts potential permit applicants that a discharge into the stream is not likely to be consistent with the Section 404(b)(1) "Guidelines for Specification of Disposal Sites for Dredged or Fill Material" and that the USEPA could request denial of the permit. These streams may also be subject to local ordinances based on the ADID study that identified the area as containing high quality aquatic habitat. When an ESR form is submitted for a proposed project, the Environmental Survey Process identifies potential involvements with ADID streams. Information on these streams also is available on site maps for those counties that have completed ADID studies. The site maps are accessible via the Internet.

Where a proposed project may affect an ADID stream, include information in the environmental documentation identifying the stream and describing its physical, biological, and chemical attributes. Determine and document potential impacts on stream functions (e.g., aquatic habitat value, shoreline/stream bank stabilization, hydrologic stabilization) and summarize the results of coordination with the USEPA and U.S. Fish and Wildlife Service. If a stream is subject to local requirements, identify the requirements and the actions necessary for compliance.

e. BSRS High Quality Streams. These include stream segments designated as Biologically Significant Streams and stream segments rated as “A” or “B” for Diversity or Integrity. When an ESR request is submitted for a proposed project, the Environmental Survey Process identifies high quality stream segments.

For Biologically Significant Streams, the biological communities present must be protected at the stream reach (i.e., project site) and in-stream work in these areas should be prohibited. In addition, the scientific literature documents findings that the physical and chemical properties of water at a stream site reflect upstream influences. Accordingly, consider the potential effects of work in the upstream reach of Biologically Significant Streams and coordinate projects affecting the upstream reach with IDNR.

For potential project involvements with stream segments rated as “A” or “B” for Diversity or Integrity, identify and evaluate the potential project impacts on the features of the stream that were the basis for the “A” or “B” ratings.

Include information on potential involvements with high quality stream segments in the part of the environmental documentation that addresses surface water resources and aquatic habitat. Include discussion of potential project impacts, measures for reducing or mitigating the impacts, and the results of coordination with IDNR regarding the potential impacts and mitigation measures.

f. Impaired Streams. These are streams that are included on the *Clean Water Act* Section 303(d) list of impaired waters in Illinois. The list is included in the *Integrated Water Quality Report and Section 303(d) List*, available on the IEPA website. The “impaired” designation is based on a determination that the streams are sufficiently polluted that they are unable to support their designated uses (e.g., aquatic life, indigenous aquatic life, primary contact (swimming), public and food processing water supply (drinking water), secondary contact, aesthetic quality, fish consumption). Streams on the Section 303(d) may be subject to Total Maximum Daily Load (TMDL) restrictions that limit the quantity of specific pollutants that may be introduced into the streams.

For projects involved with a stream on the Section 303(d) list, identify the pollutant(s) causing the impairment and determine if the project may contribute to the impairment. If the project may contribute pollutants causing the impairment, evaluate measures to reduce the contribution to an acceptable level, consistent with TMDL requirements, if applicable. Identify the impaired stream(s) and summarize the results of the analysis of impacts and mitigation measures in the part of the environmental documentation that addresses surface water resources and aquatic habitat. For CE projects, place the documentation of the analyses in an appendix to the Phase I engineering report. See Section 26-21 for additional guidance on Impaired Waters/TMDLs.

26-19.06 Antidegradation Assessment

In accordance with the requirements set forth in 35 Ill. Adm. Code 302.105, the IEPA must conduct an antidegradation assessment for any proposed action involving an increase in pollutant loading that necessitates the issuance of a new, renewed, or modified National Pollutant Discharge Elimination System (NPDES) permit or a Section 401 water quality certification. The purpose of the antidegradation requirements is to protect existing uses of all waters of the State of Illinois, maintain the quality of these waters with a quality that is better than the water quality standards, and to prevent the unnecessary deterioration of waters of the State.

In conducting antidegradation assessments, IEPA must consider the following provisions of 35 Ill. Adm. Code 302.105 regarding existing uses, outstanding resource waters, and high quality waters.

26-19.06(a) Existing Uses

Existing uses actually attained in a surface water body or water body segment, whether or not they are included in the water quality standards, must be maintained and protected. Examples of degradation of existing uses of the waters of the State include:

- an action that would result in the deterioration of the existing aquatic community (e.g., a shift from a community of predominantly pollutant-sensitive species to pollutant tolerant species or a loss of species diversity);
- an action that would result in a loss of a resident or indigenous species whose presence is necessary to sustain commercial or recreational activities; or
- an action that would preclude continued use of a surface water body or water body segment for a public water supply or for recreational or commercial fishing, swimming, paddling, or boating.

26-19.06(b) Outstanding Resource Waters

A surface water body or water body segment that is of exceptional ecological or recreational significance as designated by the Illinois Pollution Control Board (i.e., an Outstanding Resource Water (ORW)) must not be lowered in quality except as provided below:

- activities that result in short-term, temporary (e.g., weeks, months) lowering of water quality in an ORW; or
- existing site storm water discharges that comply with applicable Federal and State storm water management regulations and do not result in a violation of any water quality standards.

As of the date of publication of this edition of the *BDE Manual*, the Pollution Control Board had not designated any Illinois waters as Outstanding Resource Waters. However, the Biologically Significant Streams discussed in Section 26-19.07 would qualify as exceptional ecological resources.

26-19.06(c) High Quality Waters

High quality waters are waters of the State whose existing quality is better than any of the established standards. These waters must be maintained in their present high quality, unless the lowering of water quality is necessary to accommodate important economic or social development.

26-19.06(d) Information Requirements

To ensure that IEPA has the information needed for conducting antidegradation assessments, when required, include the following information in submittals for NPDES permits, individual Section 404 permits, and nationwide permits that require an individual 401 water quality certification (e.g., nationwide permit 23 for approved categorical exclusions):

- Identification and characterization of the water body affected by the proposed load increase or proposed activity and the existing water body's uses. Characterization must address physical, biological, and chemical conditions of the water body.
- Identification and quantification of the proposed load increases for the applicable parameters and of the potential impacts of the proposed activity on the affected waters.
- The purpose and anticipated benefits of the proposed activity.
- Assessments of alternatives to proposed increases in pollutant loading or activities subject to IEPA certification pursuant to Section 401 that result in less of a load increase, no load increase, or minimal environmental degradation.
- Any additional information IEPA may request.
- Proof that a copy of the application has been provided to the IDNR.

26-19.07 Coordination

The EIS projects will be coordinated with the Corps, USEPA, USFWS, and IDNR through the circulation of the draft EIS and some or all of these agencies may serve as Cooperating Agencies. Where the project is being processed under the NEPA/404 Merger Process, BDE and the district must provide the agencies the information and analysis required under the Section 404(b)(1) guidelines. Coordination with the Corps, USEPA, and USFWS will be through the Merger Process. EA and CE projects will be coordinated with the USFWS and IDNR through the Environmental Survey Process. Address any agency comments, including any concerning consideration of measures for minimization and mitigation of impacts.

26-20 NATIONWIDE RIVERS INVENTORY

26-20.01 Introduction

The Nationwide Rivers Inventory (NRI) is managed by the National Park Service Rivers, Trails, and Conservation Assistance Program. It is a compilation of rivers and river segments that appear to have one or more qualities that could qualify them for inclusion in the National Wild and Scenic Rivers System. The NRI contains a number of Illinois streams or stream segments. The list of Illinois NRI streams is maintained on the National Park Service NRI website. The list includes the river name, county or counties of occurrence, reach, length (miles), year listed/updated, potential classification, Outstandingly Remarkable Values (ORVs), and description. In accordance with a 1979 Presidential Directive and associated Council on Environmental Quality procedures, Federal agencies, as part of their normal planning and environmental review process, must take care to avoid or mitigate adverse effects on rivers included in the NRI. This Section provides guidance and procedures for complying with these requirements and for documenting compliance in project environmental documentation.

26-20.02 Legal Authority

- Wild and Scenic Rivers, 16 U.S.C. 1271-1287,
- Presidential Memorandum for the Heads of Departments and Agencies, dated August 2, 1979, requiring each Federal agency, as part of its normal planning and environmental review process, to take care to avoid or mitigate adverse effects on rivers identified in the Nationwide Rivers Inventory,
- Council on Environmental Quality, “Interagency Consultation to Avoid or Mitigate Adverse Effects on Rivers in the Nationwide Inventory”, August 10, 1980, and
- FHWA, “Policy Guidance for Wild and Scenic Rivers”, dated October 3, 1980, transmitting the Council on Environmental Quality procedures for Interagency Consultation to Avoid or Mitigate Adverse Effects on Rivers in the Nationwide Inventory.

26-20.03 Policy

In the development of Federally funded or regulated State highway projects, take care to avoid or mitigate adverse effects on rivers identified in the NRI. The evaluation of potential project impacts on these streams or stream segments will be coordinated with the NPS prior to taking actions that could effectively foreclose wild, scenic, or recreational river status for rivers in the Inventory.

26-20.04 Procedures

The identification of NRI streams within the project area will be done through the Environmental Survey Process. BDE will determine the need for coordination with the NPS based on the project's scope of work. See Section 26-20.05(d) for information on coordination requirements and procedures.

26-20.04(a) Definitions

70. Adverse Effect. An impact to a listed stream or stream segment that alters the free-flowing characteristics, causes the deterioration of water quality, or has the potential to impair the ORV(s) that qualified the stream for listing in the NRI.

71. Nationwide Rivers Inventory (NRI). A registry of streams compiled and maintained by the National Park Service consisting of stream and stream segments that potentially qualify as national wild, scenic, or recreational river areas.

72. Outstandingly Remarkable Value (ORV). A characteristic that a river must possess, in addition to being free-flowing, to be listed on the NRI. ORVs include scenery, recreation, fish, wildlife, geology, prehistory, history, cultural, and other similar values.

26-20.04(b) Applicability

These procedures apply to all Federally funded/regulated projects that have the potential for an adverse effect on a NRI stream or stream segment.

26-20.04(c) Analysis and Documentation

For projects that affect a stream listed on the NRI, the analysis of potential impacts to the stream's free-flowing characteristics, water quality, and ORV(s) that qualified it for listing, should be sufficient to determine whether the impacts would be adverse. Adverse effects should be avoided or mitigated, in accordance with the Presidential directive and Council on Environmental Quality procedures regarding the NRI.

As applicable, incorporation documentation of project impacts on NRI streams, and NPS recommendations regarding those impacts into Phase I engineering reports, Environmental Assessments (EAs), and Environmental Impact Statements (EISs) discussed in the following Sections.

26-20.04(c)1 *Categorical Exclusion (CE) Projects*

A project being processed as a CE that affects an NRI stream is considered to have potential for "unusual circumstances" and, therefore, requires FHWA approval of the CE classification; see Section 23-1.04(bb). In accordance with the CEQ procedures for "Interagency Consultation to Avoid or Mitigate Adverse Effects on Rivers in the Nationwide Inventory," an adverse effect on a listed stream will require processing the project as an EA or EIS.

For NRI streams that BDE has determined will not be affected, the Phase I engineering report should contain documentation of the BDE determination.

For NRI streams that BDE has determined will be affected, the Phase I engineering report should contain documentation of the BDE determination and the NPS response regarding the effect(s), the results of any further coordination with the NPS, and the response to NPS recommendations for addressing the effects.

26-20.04(c)2 EA/EIS Projects

Because the NRI consists of streams, include the main discussion of this topic in a subsection of the Surface Water Resources and Aquatic Habitat Section entitled “Nationwide Rivers Inventory”. However, include the data on the physical, biological, and water quality aspects of the NRI stream in the physical, biological, and water quality subsections of the Surface Water Resources and Aquatic Habitat Section.

The environmental document should identify the stream and include the ORV(s) and stream description from the NRI website. Describe the stream’s free-flow nature and water quality. The document should identify the potential impacts caused by each construction activity and briefly discuss the effects on the stream’s ORV(s), free flowing characteristics, and water quality.

A determination of the magnitude of the impact on water quality, free-flow, and each listed ORV should be made and documented. The coordination response from the NPS should help in determining the magnitude of the impacts.

Include a summary of the coordination effort with the NPS and describe impact avoidance, minimization, and mitigation measures, as appropriate. The discussion of these measures should center on the listed ORV(s).

The appendix of the EA or EIS must contain the results of the coordination with the NPS. The FONSI (EA) or the ROD (EIS) will summarize the coordination, list the measures to minimize harm and proposed mitigation, as appropriate, and include a commitment to ensure the stream’s eligibility for the NRI and/or the Wild and Scenic Rivers System is not diminished.

If the ORV of a listed stream is scenery, the Visual Resources Section of the environmental document should identify the stream and refer to the discussions in the Nationwide Rivers Inventory subsection of the Surface Water Resources and Aquatic Habitat Section.

26-20.04(d) Coordination

Coordination with the NPS is required for projects that may affect NRI streams. BDE will initiate early coordination with the NPS, when required, through the Environmental Survey Process and will provide the district the results of the coordination. Additional coordination, if required, will be the responsibility of the district, with input from BDE.

26-21 IMPAIRED WATERS/TMDLS

26-21.01 Introduction

Pursuant to Section 303(d) of the *Clean Water Act*, the Illinois Environmental Protection Agency (IEPA) identifies and prioritizes waters in the State that do not meet the applicable water quality standards or do not fully support their designated uses. These waters are referred to as impaired waters. Section 303(d) also requires that a Total Maximum Daily Load (TMDL) be established for each pollutant of an impaired water body. The TMDL is then used to allocate pollutant loads among the identified pollution sources in a watershed, including highway facilities, thereby supporting attainment of applicable water quality standards and designated uses.

Information on impaired waters can be obtained from the "Illinois Integrated Water Quality Report and Section 303(d) List" available on the IEPA website. This Report is revised and updated every two years.

Information on TMDLs can be obtained from the "TMDL Watersheds Map," "TMDL Report Status," and "TMDL Implementation Projects" web pages on the IEPA website. TMDL Reports will identify the waters affected and the source(s) and cause(s) of the impairment(s). The Final TMDL Report will provide Implementation Actions and Management Measures for each identified pollutant.

26-21.02 Legal Authority

- Identification of areas with insufficient controls; maximum daily load; certain effluent limitations revision, 33 U.S.C. 1313(d) (*Clean Water Act*, Section 303(d)), and

- Water Quality Planning and Management, 40 CFR 130.

26-21.03 Policy

In the development of proposed State highway projects, impaired waters, and waters subject to TMDLs will be identified within the areas the projects may affect. Where projects have potential to increase levels of a pollutant that is a cause of impairment, measures will be implemented to reduce the discharge of that pollutant from the project to ensure it does not contribute to the impairment and is consistent with any applicable TMDL.

26-21.04 Procedures

The district will check the most recent "Integrated Illinois Water Quality Report and Section 303(d) List" to determine if a proposed project may affect an impaired water resource. Appendices B-2 (Specific Assessment Information for Streams) and B-3 (Specific Assessment Information for Inland Lakes) contain the information required for Phase I engineering reports and environmental documents. Larger streams (e.g., Illinois, Rock, Fox, and Sangamon Rivers) are divided into assessment units. To determine the applicable assessment unit, use the Illinois Water Quality

Mapping Tool on the IEPA website. The project's contribution to the cause of the impairment should be determined and discussed, as appropriate.

For involvements with water bodies involving a draft or final TMDL, the district should determine if construction, operation, or maintenance of the transportation facility would contribute to an increase in the pollutant(s) of concern addressed in the TMDL. If a project contributes to an increase in the pollutant(s) of concern, the district will evaluate practicable measures to reduce or eliminate that contribution.

26-21.05 Definitions

5. Impaired Waters. Waters listed on the IEPA Section 303(d) List due to nonattainment of applicable water quality standards and/or designated uses.

6. Total Maximum Daily Load (TMDL). The greatest amount of a given pollutant that a water body can receive without violating water quality standards and designated uses.

   TMDLs set pollution reduction goals that are necessary to improve the quality of impaired waters. A TMDL takes a watershed approach in determining the pollutant load that can be allowed in a given lake or stream. By taking a watershed approach, a TMDL considers all potential sources of pollutants, both point and non-point sources. It also takes into account a margin of safety, which reflects scientific uncertainty and future growth. The effects of seasonal variation are also included.

26-21.06 Applicability

These procedures apply to all proposed highway projects initiated by the Department that may affect a water resource listed by IEPA as impaired and/or that is subject to a TMDL.

26-21.06(a) Analysis and Documentation

For projects that may affect a water resource listed as impaired and/or subject to a TMDL, the Phase I engineering report (for projects processed as CEs) or environmental document (EA or EIS) should contain the following impaired waters information:

73. Section 303(d) Impaired Waters List. If the proposed project may affect a listed water body or water body segment, include the following information from the list for each affected water body or segment:

    a. Water Body Identification. Indicate the Name and Assessment Unit ID of the water body as shown on the list.

    b. Use Attainment. Identify designated use(s) classified as non-supporting.

c. Causes. Identify the cause(s) of the impairment listed for the water body (use the word descriptors rather than the numeric codes) on the Section 303(d) List.

d. Sources. Identify the source(s) of the impairment listed for the water body (use the word descriptors rather than the numeric codes) on the Section 303(d) List.

74. Total Maximum Daily Load. For each affected water body or segment on the Section 303(d) list, also indicate whether a TMDL is under development or has been finalized.

75. Analysis and Discussion. The analysis and discussion of the project's effects on waters listed as impaired should address how those effects relate to the "Causes" that resulted in the impaired waters designation. Indicate whether the project may contribute to an increase or decrease in any of the constituent(s) causing the impairment. If the project would potentially contribute to an increase in those constituent(s), identify the specific constituent(s), describe the anticipated increase, and discuss practicable mitigation measures that can be implemented to reduce or eliminate that contribution. If none of the listed constituent(s) causing the impairment are generated by the project, document that finding and how it was determined.

76. Pollutant Load. If a project contributes to the pollutant load identified in a final TMDL, identify and discuss those aspects that would apply to the construction, operation, or maintenance of the highway project and discuss how the project will respond to the TMDL provisions.

26-21.06(b) Coordination

Coordination with IEPA for impaired waters is not required. However, for projects that have potential to contribute to an increase in a pollutant identified in a final TMDL, coordination with IEPA is recommended. The coordination should address the potential pollutant contribution from the project and the measures proposed for implementation to reduce or eliminate the contribution to the pollutant load. The district should initiate the coordination with guidance from the BDE.

IEPA considers impaired waters as a component of antidegradation assessments; see Section 26-19.06.

26-22 GROUNDWATER

26-22.01 Introduction

The *Illinois Environmental Protection Act*, the *Illinois Groundwater Protection Act*, and parts of the *Illinois Administrative Code* impose requirements for protection of the State's groundwater resources to ensure their availability for beneficial purposes. This Section provides guidance and procedures for considering and addressing these requirements as part of the environmental impact evaluation process for proposed State highway projects. The topics covered in this Section include potable water supply wells, special resource groundwaters, karst topography, groundwater discharge areas (seeps), and sole source aquifers.

26-22.02 Legal Authority

- *The Illinois Environmental Protection Act,* 415 ILCS 5/1 *et seq.*,
- *The Illinois Groundwater Protection Act,* 415 ILCS 55/1 *et seq.,*
- Existing Activities in a Setback Zone or Regulated Recharge Area, 35 Ill. Admin. Code 615, ,
- New Activities in a Setback Zone or Regulated Recharge Area, 35 Ill. Admin. Code 616,
- Regulated Recharge Areas, 35 Ill. Admin. Code 617,
- Maximum Setback Zones, 35 Ill. Admin. Code 618,
- Groundwater Quality, 35 Ill. Admin. Code 620, and
- Sole Source Aquifers, 40 CFR 149.

26-22.03 Policy

In the development of proposed highway projects initiated by the Department, potential impacts to groundwater resources will be identified and consideration will be given to implementing practical measures for avoiding, minimizing, and mitigating adverse project impacts to those resources.

26-22.04 Procedures

The information and requirements for evaluating groundwater resources in the vicinity of the project area, and for identifying and addressing potential adverse environmental impacts of project alternatives on these resources are described below. In general, proposed projects must be designed to avoid adverse impacts to groundwater resources, to the fullest extent practical and to mitigate any unavoidable adverse impacts (e.g., through use of Best Management Practices (BMPs)).

26-22.04(a) Definitions

7. Aquifer. Saturated (with groundwater) soils and geologic materials that are sufficiently permeable to readily yield economically useful quantities of water to wells, springs, or streams under ordinary hydraulic gradients.

8. Groundwater. Underground water that occurs within the saturated zone and geologic materials where the fluid pressure in the pore space is equal to or greater than atmospheric pressure.

9. Potable. Generally fit for human consumption in accordance with accepted water supply principles and practices.

10. Potential Primary Source. Any unit at a facility or site not currently subject to a removal or remedial action that:

    - is used for the treatment, storage, or disposal of any hazardous or special waste not generated at the site;
    - is used for the disposal of municipal waste not generated at the site, other than landscape waste, and construction and demolition debris;
    - is used for the landfilling, land treating, surface impounding, or piling of any hazardous or special waste that is generated on the site or at other sites owned, controlled, or operated by the same person; or
    - stores or accumulates at any time more than 75,000 lbs (3400 kg) above ground, or more than 7,500 lbs (3400 kg) below ground, of any hazardous substances.

11. Potential Route. Abandoned and improperly plugged wells of all kinds, drainage wells, all injection wells, including closed loop heat pump wells, and any excavation for the discovery, development, or production of stone, sand, or gravel.

12. Potential Secondary Source. Any unit at a facility or a site not currently subject to a removal or remedial action, other than a potential primary source, that:

    - is used for the landfilling, land treating, or surface impounding of waste that is generated on the site or at other sites owned, controlled, or operated by the same person, other than livestock and landscape waste, and construction and demolition debris;
    - stores or accumulates at any time more than 25,000 lbs (11.4 Mg) but not more than 75,000 lbs (34 Mg) above ground, or more than 2,500 lbs (11.4 Mg) but not more than 7,500 lbs (34 Mg) below ground, of any hazardous substance;
    - stores or accumulates at any time more than 25,000 gallons (94 ML) above ground, or more than 500 gallons (2 ML) below ground, of petroleum, including

crude oil or any fraction thereof that is not otherwise specifically listed or designated as a hazardous substance;

- stores or accumulates pesticides, fertilizers, or road oils for purposes of commercial application or for distribution to retail sales outlets;
- stores or accumulates at any time more than 50,000 lbs (22.8 Mg) of any de-icing agent; or
- is used for handling livestock waste or for treating domestic wastewaters other than private sewage disposal systems as defined in the *Private Sewage Disposal Licensing Act.*

13. Regulated Recharge Area. A compact geographic area, as determined by the Pollution Control Board, the geology of which renders a potable resource groundwater particularly susceptible to contamination.

14. Resource Groundwater. Groundwater that is presently being, or in the future is capable of being, put to beneficial use by reason of being of suitable quality.

15. Setback Zone. A designated geographic area containing a potable water supply well or a potential source or potential route having a continuous boundary, and within which certain prohibitions or regulations are applicable in order to protect groundwaters.

16. Sole Source Aquifer. An underground water supply designated by the US Environmental Protection Agency as the sole or principal source of drinking water for an area.

17. Special Resource Groundwater. Groundwater that is determined by the Illinois Pollution Control Board to be 1) demonstrably unique (e.g., irreplaceable sources of groundwater) and suitable for application of a water quality standard more stringent than the otherwise applicable water quality standard, or 2) vital for a particularly sensitive ecological system; or groundwater that contributes to a dedicated Nature Preserve listed by the Illinois Environmental Protection Agency (IEPA) in accordance with 35 Ill. Admin. Code 620.230(b).

18. Wellhead Protection Area. The surface and subsurface recharge area surrounding a community water supply well or well field, delineated outside of any applicable setback zones pursuant to Illinois' Wellhead Protection Program, through which contaminants are reasonably likely to move toward such well or well field.

26-22.04(b) Analysis and Documentation

Nearly all surface water features (e.g., streams, lakes, wetlands) interact with groundwater resources to some extent. Consequently, pollution of surface waters can cause degradation of groundwater quality and vice versa. It is important to recognize and consider these interactions in analyzing and documenting the full extent of a proposed project's potential effects on groundwater resources. The following Sections provide guidance for addressing groundwater-related issues in project environmental documentation.

26-22.04(b)1 Groundwater Resource Identification

In areas where groundwater is determined to be the primary source of potable water, identify and characterize wellhead and groundwater protection areas, potable water supply wells, groundwater recharge zones, special resource groundwater, areas of karst topography, and the potential for contamination of shallow aquifers. If a Preliminary Environmental Site Assessment (PESA) is conducted for the project, the PESA report will identify these items. If a PESA is not conducted, the district should obtain this information through coordination with the IEPA and from Illinois State Geological Survey maps (e.g., potential for aquifer recharge and for contamination of shallow aquifers).

In areas where groundwater supports specialized biotic communities (e.g., seeps, bogs, fe ns, sedge meadows, spring runs, obligate cave inhabitants) the Environmental Survey Process will identify these features.

Karst topography is a landscape characterized by sinkholes, depressions, caves, and underground drainage, generally underlain by soluble rocks (e.g., limestone, dolomite). Most karst topography is restricted to northwestern Illinois (Jo Daviess and Carroll Counties), western Illinois (Adams, Pike, and Calhoun Counties), and southwestern Illinois (Madison, St. Clair, Monroe, and Randolph Counties). Projects occurring within these counties should be surveyed for karst features.

For groundwater resources identified in the area a project may affect, apply the guidance in the following sections to evaluate and document potential project impacts and measures for avoiding, minimizing, and mitigating adverse impacts.

26-22.04(b)2 Potable Water Supply Wells

If the project is in the vicinity of a potable water supply well, the district must determine whether or not the project will create any new potential routes for groundwater pollution (e.g., dry wells, borrow pits) or any new potential sources of groundwater pollution (e.g., storage facilities for bulk road oil or de-icing salt). If the project will not create any new potential routes for groundwater pollution or any new potential sources of groundwater pollution, include the following statement in the project environmental documentation:

> *This project will not create any new potential "routes" for groundwater pollution or any new potential "sources" of groundwater pollution as defined in the Illinois Environmental Protection Act, 415 ILCS 5/1 et seq.). Accordingly, the project is not subject to compliance with the minimum setback requirements for community water supply wells or other potable water supply wells as set forth in the Act.*

If the project will create a new potential route or source for groundwater pollution, describe the nature of the route or source and indicate whether it will be within a setback zone (minimum or maximum) for a potable water supply well. Indicate the type of well (i.e., community water supply or private water supply) and discuss any permits or mitigation measures that may be needed for the route or source to protect groundwater resources. For new community water supply wells, indicate if the new route or source of groundwater pollution will be within a wellhead protection area. The minimum setback distance for a potable water supply well is 200 ft (60 m) or 400 ft (130 m) for a community water supply well with high to moderate geologic susceptibility. Maximum setback zones for community water supply wells may be up to 1000 ft (300 m) from the wellhead or, in rare cases, up to 2500 ft (760 m). Indicate whether the project is within a regulated recharge area established through Illinois Pollution Control Board rulemaking and describe the extent of the regulated area.

26-22.04(b)3 Groundwater Quality

IEPA monitors groundwater quality from community water supplies in the State. This information is available in the IEPA "Integrated Water Quality Report and Section 303(d) List." For wells in the project area, identify the name of the facility, groundwater pollutant(s) and their concentrations, type of aquifer, and level of use support. Use support levels include the following:

77. Full Support. Water quality is Good. This rating indicates that no detections occurred in organic chemical monitoring data and inorganic constituents assessed were at or below background levels for the groundwater source being used.

78. Nonsupport.

    a. Water Quality is Fair. This rating indicates that organic chemicals were detected and, therefore, exceed the non-degradation standard. However, measured levels are less than the numerical Class I Groundwater Quality Standard and inorganic constituents assessed were above background level (non-degradation standard), but less than the numerical Class I Groundwater Quality Standard.

    b. Water Quality is Poor. This rating indicates that organic chemical monitoring data detections were greater than the Class I Groundwater Quality Standard and inorganic chemicals assessed were greater than both the background concentration and Class I Groundwater Quality Standard.

26-22.04(b)4 Special Resource Groundwater

These resources will be identified through the Environmental Survey Process. Projects with in the groundwater recharge area of a designated Special Resource Groundwater must be coordinated with the IDNR.

The Phase I engineering report, EA, or EIS will contain a map showing the recharge area in relation to the project. The project environmental documentation will also identify and describe the potential project impacts, describe the proposed mitigation measures and document the associated coordination with the IDNR and the Nature Preserves Commission.

26-22.04(b)5 Karst Topography

Karst areas are highly vulnerable to groundwater contamination. For projects that are processed as CEs, the Phase I engineering report should indicate if karst surface features (e.g., sinkholes, depressions) are within or adjacent to the highway right-of-way. If these features are present, construction BMPs for storm water pollution prevention should be strictly adhered to. Also, identify the features on the NPDES construction permit, as applicable.

For projects that are processed as environmental documents, the Groundwater Section should identify and depict the karst features (e.g., caves, sinkholes, springs) on an environmental inventory map. The sensitivity of the aquifer should be briefly discussed.

During the alternative analysis, consider the potential for hitting karst features in the underlying carbonate rocks. These potential impacts include instability from the increased loading on existing rock cavities or the removal of structurally sound overburden and rock cover over existing cavities. In addition, construction-related changes in the water table can induce subsidence and undermine the highway.

The environmental document should identify and discuss project impacts to karst features and the potential for groundwater contamination. Avoidance of the karst features and the use of storm water pollution prevention BMPs during construction and operation of the roadway should be discussed.

Karst areas may be protected under the Class III groundwater standards, may contain Federal and/or State listed endangered and threatened species, or may be listed as special lands (e.g., Natural Areas, Nature Preserves, Land and Water Reserves). If any of these attributes apply they should be identified in this Section. Further description and assessment of impacts to these features will occur under the appropriate resource headings of the environmental document.

26-22.04(b)6 Seeps

Seeps are areas found in sloping terrain where the groundwater is discharged to the surface. The groundwater typically flows year-round and has a relatively constant temperature. Seeps are essentially groundwater discharge wetlands. As wetlands, discuss in the wetlands section of an environmental document. Seeps are generally small in size, but may contain a high diversity of species including those that are endangered and/or threatened. Seeps are also habitats of preference for amphibians.

Generally, the discharge area (seep) can be avoided; however, construction and operation of the roadway may intersect the groundwater flow causing a decrease of water to the seep surface. In addition, operation of the roadway may allow surface runoff containing pollutants (including de-icing salts) to contaminate the discharge water. Analyzed and discuss the potential for these types of impacts in the environmental documentation, along with alternatives for avoiding, minimizing, and mitigating the impacts.

26-22.04(b)7 Sole Source Aquifers

On March 11, 2015 the U.S. Environmental Protection Agency (USEPA) designated a portion of the Mahomet Aquifer system as a sole source aquifer (SSA) for Illinois. The Safe Drinking Water Act of 1974 gives the USEPA authority to designate all or part of an aquifer as a "sole source" if contamination of the aquifer would create a significant hazard to public health and there are no physically available or economically feasible alternative sources of drinking water to serve the population that relies on the aquifer. A significant hazard to public health is defined as the level of contaminants in an aquifer would exceed National Primary Drinking Water Standards or exceed Federal, Tribal or state public health advisory levels for currently unregulated contaminants, or violate the intent of EO 12088, “Federal Compliance with Pollution Control Standards.” This designation authorizes USEPA review of federally funded projects to assess potential for contamination of the aquifer system. A memorandum of understanding (MOU) (See Appendix A) between the Department, FHWA and USEPA was developed which discusses which categories of proposed projects are exempt or nonexempt and must therefore be evaluated for impacts to the Mahomet SSA.

Exempt Projects

Categorical Exclusions are considered to not pose a significant hazard to public health when they occur in the project review area (Figure 26-22.A) as they do not typically require excavation greater than 10 feet or use chemicals listed in the National Primary Drinking Water Regulations (40 CFR 141). However, per the MOU, “*the USEPA reserves the right to review an exempt project upon written notice to FHWA and IDOT should new information lead it to conclude the project may contaminate an SSA so as to create a significant hazard to public health*.”

For EAs or EISs that do not occur in the project review area, state the following in the *Groundwater* section:

> *There are no Sole Source Aquifers, as designated under Section 1424(e) of the Safe Drinking Water Act, within the project area.”*

Nonexempt Projects

For EAs or EISs that occur in the Mahomet SSA project review area, these projects will need to be evaluated for impacts according to the following evaluation criteria by determining if the project involves:

- substantial excavation (greater than 10 feet in depth);
- addition of drainage wells, or stormwater infiltration facilities that do not meet IDOT treatment requirements ;
- adding Pollution Generating Impervious Surface (PGIS) of more than 5,000 square feet without applying pollution prevention BMPs;
- opening of new material sources that could result in potential contamination;
- replacement of drywells or other injection wells that do not meet IDOT treatment requirements or Underground Injection Control regulations;
- drilled shafts or pile-driving, for bridge or other foundations that penetrate, or come close to penetrating the SSA;
- installation, repair, or abandonment of a public or private water supply well that accesses the SSA;
- construction or upgrading of sewage disposal stations at rest areas, weigh stations, scenic overlooks, or other locations;
- use of pesticides, herbicides, and fertilizers that contain any of the chemicals listed in the National Primary Drinking Water Regulations, 40 CFR Part 141;

- project located within the boundaries of a site listed on the USEPA National Priorities List (i.e., a Superfund site); or
- removal of underground storage tanks that are known to have leaked (i.e., a Leaking Underground Storage Tank as listed in the Office of the Illinois State Fire Marshal (OSFM) website.

If the project does <u>not</u> involve any of the evaluation criteria discussed above and will not cause a significant hazard to public health, state the following in the EA or EIS:

> *"On March 11, 2015 the U.S. Environmental Protection Agency (USEPA) designated a portion of the Mahomet Aquifer system as a sole source aquifer (SSA) under Section 1424(e) of the Safe Drinking Water Act, as shown in the attached map. The Safe Drinking Water Act gives USEPA authority to designate all or part of an aquifer as a "sole source" if contamination of the aquifer would create a significant hazard to public health and there are no physically available or economically feasible alternative sources of drinking water to serve the population that relies on the aquifer. The designation authorizes USEPA review of projects that receive Federal financial assistance to assess potential for contamination of the aquifer system that would create a significant hazard to public health.*
>
> *Since the project is within the review area of the Mahomet SSA, the Department and FHWA evaluated impacts to the Mahomet SSA as established by the Memorandum of Understanding (MOU) between IDOT, FHWA, and USEPA Region 5. The MOU is based upon procedures that ensure compliances with requirements of Section 1424(e) of the Safe Drinking Water Act.*
>
> *Based upon the evaluation criteria set forth in the in the Mahomet SSA Memorandum of Understanding, the proposed project will not cause any risks to the Mahomet Aquifer that could create a significant hazard to public health."*

If the project does involve the evaluation criteria discussed earlier, state the following along with a summary of impacts.

> *"On March 11, 2015 the U.S. Environmental Protection Agency (USEPA) designated a portion of the Mahomet Aquifer system as a sole source aquifer (SSA) under Section 1424(e) of the Safe Drinking Water Act, as shown in the attached map. The Safe Drinking Water Act gives USEPA authority to designate all or part of an aquifer as a "sole source" if contamination of the aquifer would create a significant hazard to public health and there are no physically available or economically feasible alternative sources of drinking water to serve the population that relies on the aquifer. The designation authorizes USEPA review of projects that receive Federal financial assistance to assess potential for contamination of the aquifer system that would create a significant hazard to public health.*
>
> *This project is within the review area of the Mahomet SSA. The potential to impact the SSA and create a significant hazard to public health has been evaluated as established by the Memorandum of Understanding (MOU) between IDOT, FHWA, and USEPA Region 5. The MOU is based upon procedures that ensure compliances with requirements of Section 1424(e) of the Safe Drinking Water Act."*

ENVIRONMENTAL SURVEYS

27-1 INTEGRATED SURVEY PROCESS FOR HIGHWAY PROJECTS

27-1.01 Background

Section 27-1 provides procedures for the Department's integrated survey process to determine the need for screening, environmental surveys, and coordination for state and Federally-funded highway projects that may involve the following:

- cultural resources (e.g., archaeological, historical, or architectural resources);
- natural resources (e.g., threatened or endangered species, Illinois Natural Areas Inventory sites, Nature Preserves, streams, wetlands, and floodplains); and
- presence of regulated substances (i.e., special and non-special waste).

27-1.02 Definitions

1. Actions. Actions are activities the Department undertakes that can potentially affect the environment.
2. Environmental Survey Limits. The outermost limits of an area that have the potential to be included in the associated Department actions.
3. Excavation. See definition as listed under Section 27-3.01.
4. Facility. A facility is a Department-owned or operated building in addition to other roadway infrastructure.
5. In-stream work. Work or activity within the stream banks that modifies or otherwise affects the stream bed or stream banks. This includes the need for a drainage structure runaround. In-stream work includes but is not limited to drainage ditches which may be classified as Waters of the US (WOTUS) and would require permitting for disturbance below the Ordinary High-Water Mark (OHWM).
6. Resources. Resources mean listed species, protected or regulated site(s), property(ies), or area(s), etc., and require the Department to develop measures to avoid, minimize, or mitigate impacts or manage these resources.
7. Structure. A structure is defined as bridge, culvert or building.

27-1.03 Regulatory Framework

Due to an agreement with a Federal or state agency, potential involvement with a Federal or state regulation or law (and potential permit), the Department is required to screen actions for the presence of resources and may require surveys to determine the extent and nature of these resources that include the following:

- a historic district or historic property listed on, eligible for listing on, or potentially eligible for listing on the National Register of Historic Places;

- a state of Federally listed threatened and endangered species;
- Illinois Natural Area Inventory (INAI) site or dedicated Nature Preserve (NP);
- floodplain;
- prairie(s);and/or
- wetland(s) and/or stream(s).

In addition to the above resources, the Department must review projects which have the potential to affect property containing regulated substances. This includes existing Department right-of-way as well as properties under consideration for state highway project use.

27-1.04 Department Actions

Certain types of Department actions have the potential to impact the resources or properties containing regulated substances described above and include the following:

- acquisition of additional right-of-way or easement(s) (temporary or permanent)
- excavation or subsurface utility relocation
- construction and maintenance activities such as:
  + demolition of an existing structure;
  + building a new highway system, bridge or culvert and associated in-stream work (when applicable);
  + removal and replacement of existing sidewalks and ramps to Americans with Disabilities Act (ADA) standards;
  + removal and replacement of an existing bridge or culvert and associated in-stream work;
  + widening of an existing highway system;
  + new facility construction or reconstruction (e.g., district offices, facility yards, rest areas, and Department- owned utilities);
  + tree clearing;
  + land disturbance greater than 1 acre;
  + installation of scour protection;
  + repairs to bridge and culverts; and/or
  + vegetation management

27-1.05 Procedures

If project associated actions do apply, initiate the screening process as follows:

1. For the district environmental screening process, see Section 27-1.05(a):
    a. natural resources, see Section 27-1.05(a)1
    b. cultural resources, see Section 27-1.05(a)2
    c. regulated substances, see Section 27-1.05(a)3

2. For the local roads environmental screening process. See Section 27-1.05(b)
    a. natural resources, see Section 27-1.05(b)1
    b. cultural resources, see Section 27-1.05(b)2
    c. regulated substances, see Section 27-1.05(b)3

27-1.05(a) District Environmental Screening Process

27-1.05(a)1 *Natural Resource Screening (BDE 2710)*

The District Natural Resource Screening consists of a Level 1 and Level 2 screening utilizing BDE 2710.

Note: For projects where a Section 404 permit is anticipated, BDE 2710 is not sufficient to satisfy Section 7 of the Endangered Species Act for the Corps; therefore, an ESR shall be submitted (See Section 27-1.06).

Part I of BDE 2710 (Level 1 District Natural Resource Screening)

A Level 1 Natural Resources Screening is required for all projects for those actions described in Section 27-1.04.

Part I.A of BDE 2710 has five questions about project activities, which are:

1. Require any acquisition of additional right-of-way or easements (temporary or permanent), other rights of access, OR has new alignment even if no new right-of-way is necessary (new alignment includes trails/sidewalks)?

    If temporary or permanent construction easements are unknown, it should be assumed that any widening, ditching, or utility work will result in at least a minimal amount of temporary access. Temporary access includes construction staging areas. In order to select “no”, the district should be fully confident all work can be contained within the existing right-of-way.

2. Require a drainage structure runaround or any in-stream work (i.e., any work or other activity within the stream banks that modifies or otherwise affects the stream bed or stream banks?

    Please see the definition for In-stream work in Section 27-1.02. If the district is unclear whether a waterway/ditch impacted would be classified as WOTUS, “unknown” should be selected.

3. Require tree removal (if yes or unknown selected, the project description must identify whether the project has the potential to remove trees at a distance greater than 100 feet from the existing edge of road pavement or railroad surface)?

   Note: this is commonly unknown at the start of a project. Also, the district should avoid selecting “No” unless confident trees will not be removed.

4. Require an ILR10 NPDES permit (i.e., will the project disturb greater than one acre of land within existing ROW?

5. Require bridge deck or culvert surface work will occur either from the underside or from above the deck surface and bore down to the underside (this includes any activities that could impact expansion joints, deck removal on bridges, or structure demolition for bridges, culverts, and/or other structures)?

   This includes the following:

   - any activities that could impact expansion joints, deck removal on bridges, or structure demolition for bridges, culverts, and/or other structures.
   - Drainage structures include bridges and culverts with openings taller than four feet.
   - work is defined as any activity that could cause disturbance to bat species using the underside of the structure. This may include activities occurring from the deck surface such as boring.
   - A project may include work on multiple structures. “Yes” must be selected if the disturbance activities occur to any of the structures.

   If “Yes” or “Unknown” is selected, the district must complete Part I-B Bridge Deck and Culvert Activities.

Part I.B of BDE 2710 is only related to question #5 of Part 1.A (above) and is only applicable when there is work below the bridge deck or culvert surface. This section asks the following two questions.

1. Is there suitable bat habitat within 1,000 feet of a bridge or culvert within the project limits?

   The district must evaluate the area surrounding each structure potentially disturbed (within 1,000 ft radius) for suitable bat habitat. Suitable habitat is considered woodland corridors surrounding tributaries or open water bodies. If suitable habitat is present within the surrounding area of any structure, “Yes” must be selected.

2. Did any of the Bridge/Structures Bat assessments find evidence of bats?

   For each structure with suitable habitat present, a Bridge/Structure Bat Assessment must be completed. Based on the outcome of the assessment(s), it must be identified whether any of the assessments identified evidence of bat use: “Yes” or “No”.

Note: Copies of the Bridge/Structure Bat Assessment form are available from BDE.

If the project passes the Level 1 screening, the district representative shall sign BDE 2710 and place it in the project file or report for documentation of clearance for natural resources.

If the project fails the Level 1 screening, a Level 2 screen must be conducted as described below.

Part II of BDE 2710 (Level 2 District Natural Resource Screening)

To complete a Level 2 screening, the district will conduct a review using the Transportation Review for Ecological Compliance (TREC) tool for the following resources.

- State or Federally listed threatened or endangered species
- Illinois Natural Area Inventory Sites (INAI)
- Nature Preserves
- Prairies
- Rusty Patched Bumblebee High Potential Zone
- National Wetland Inventory
- Hydric Soils
- Within 0.5 miles from a Northern Long-eared bat or Indiana bat hibernaculum
- National River Inventory

Note: In the TREC Report, Nature Preserves, Natural Heritage Landmarks, and Land and Water Reserves are included under the same title of “Nature Preserve”.

If the TREC Report indicates none of the above resources are present, the project passes the Level I Natural Resource Screening and the district environmental coordinator shall sign BDE 2710. Include both the TREC Report and the form in the project file/ report for documentation of clearance for natural resources. Include this documentation with any permit application.

If the TREC report indicates any of the above resources are present, then the project will fail the Level 2 screening and the project will be submitted as an ESR requiring Natural Resource Unit review. Include both the TREC Report and BDE 2710 with the ESR submittal.

27-1.05(a)2 *Cultural Resource Screening*

Per the Programmatic Agreement (PA) among the FHWA, IDOT, SHPO, and the Advisory Council on Historic Preservation Regarding Section 106 Implementation for Federal-Aid Transportation Projects in Illinois (see Appendix A), district staff who are considered trained staff, may screen and approve projects as discussed in the PA., otherwise an ESR should be submitted (See Section 27-1.06.

Screening for projects within existing ROW that require an ILR10 NPDES permit

For projects that disturb greater than one acre of land and occur within existing ROW, an ILR10 NPDES Permit is required. With the deployment of the IEPA’s online Notice of Intent portal (NeT system), documentation of Section 106 compliance is required. Many types of work within existing ROW can be addressed in the Programmatic Agreement referenced above.

Per BDE Cultural Unit, Figure 27-1.A can be used as a template and uploaded into the NeT system to satisfy the Section 106 determination requirement.

Illinois Department of Transportation

To: Attn:

From:

Subject: Cultural Clearance

Date:

<Insert Project Information here>

The above reference project has been reviewed by the District's Environmental Studies Unit. This project is excluded from further review for cultural resources under the FHWA/SHPO/IDOT Section 106 Programmatic Agreement because the scope of work falls under Activity (X) as described below.

The following activities have no potential to affect historic properties, whether there may be historic properties in the area of the undertaking.

(1) Activities which do not involve or lead directly to construction, such as planning and research activities; grants for training; engineering to define the elements of a proposed action or alternatives so that social, economic, and environmental effects can be assessed.

(2) General highway maintenance and repair, including but not limited to filling potholes, crack sealing, joint grinding, milling, resurfacing in kind, shoulder reconstruction, erosion control, ditch cleaning, storm sewer repair, and debris removal.

(3) Removal and replacement of existing sidewalks and ADA ramps with in-kind materials.

(4) Repair and replacement of highway signs or other traffic control devices.

(5) General pavement marking activities that include, but are not limited to, installation of raised pavement markers, striping, or installation of sensors in existing pavements.

(6) Repair and replacement of appurtenances such as glare screens, median barriers, fencing, guardrails, safety barriers, crash attenuators, safety cable, or lighting.

(7) Repair, rehabilitation, or removal of railroad grade crossings, separations or grade crossing protection.

Figure 27-1.A

Section 106 Documentation for ILR10

(8) Roadway surface treatments such as pavement repair, median repair, seal coating, and pavement grinding.

(9) Improvements and repairs to Interstate Highway System including bridges, weigh and inspection stations, toll facilities, and rest areas.

(10) Establishment, replacement, or removal of landscaping or other vegetation on the interstate.

(11) Installation of interstate surveillance, changeable message signs, ramp metering equipment, appurtenances such as glare screens, median barriers, fencing, guardrails, safety barriers, crash attenuators, safety cable, or lighting.

Figure 27-1.A(cont'd)

Section 106 Documentation for ILR10

27-1.05(a)3 ***Regulated Substances Screening***

See section 27-3.02.

27-1.05(b) Local Roads Environmental Screening Process

Local Roads Natural Resource Screening form BDE 2715 is applicable for most projects that use Federal, state, or Motor Fuel Tax (MFT) funds, and any locally funded project that require Department review and approval.

However, for projects that do not meet the above requirement, compliance with Federal and state environmental laws and regulations still apply. In addition, for projects where a Section 404 permit is anticipated, BDE 2715 is not sufficient to satisfy Section 7 of the Endangered Species Act for the Corps; therefore, an ESR shall be submitted (See Section 27-1.06).

27-1.05(b)1 ***Natural Resource Screening (BDE 2715)***

Level 1 Natural Resource Screening

The Local Public Agency (LPA) portion of the screening form will contain the following five questions with the options to answer Yes/No/Unknown in Part I.A. Does the project:

1. Require any acquisition of additional right-of-way or easements (temporary or permanent), other rights of access, OR has new alignment even if no new right-of-way is necessary (new alignment includes trails/sidewalks)?

   If temporary or permanent construction easements are unknown, it should be assumed that any widening, ditching, or utility work will result in at least a minimal amount of temporary access. Temporary access includes construction staging areas. In order to select "no", the LPA should be fully confident all work can be contained within the existing right-of-way. Moreover, new alignment includes trails and sidewalks in addition to roadways.

2. Require a drainage structure runaround or any in-stream work (i.e., any work or other activity within the stream banks that modifies or otherwise affects the stream bed or stream banks?

   Please see the definition for In-stream work in Section 27-1.02. If the LPA is unclear whether a waterway/ditch impacted would be classified as WOTUS, "unknown" should be selected.

3. Require tree removal (if yes or unknown selected, the project description must identify whether the project has the potential to remove trees at a distance greater than 100 feet from the existing edge of road pavement or railroad surface)?

   Note: this is commonly unknown at the start of a project. Also, the LPA should avoid selecting "No" unless confident trees will not be removed.

4. Require an ILR10 NPDES Permit ((i.e., will the project disturb greater than one acre of land within existing ROW)?

   Note: LPAs that are covered under the ILR40 MS4 permit are exempt from this requirement, see Section 41-1.04(b) for more information.

5. Require bridge deck or culvert surface work will occur either from the underside or from above the deck surface and bore down to the underside?

   This includes the following:

   - any activities that could impact expansion joints, deck removal on bridges, or structure demolition for bridges, culverts, and/or other structures.
   - drainage structures include bridges and culverts with openings taller than four feet.
   - work is defined as any activity that could cause disturbance to bat species using the underside of the structure. This may include activities occurring from the deck surface such as boring.
   - a project may include work on multiple structures. "Yes" must be selected if the disturbance activities occur to any of the structures.

Part I.B of BDE 2715 is only related to question #5 of Part 1.A (above) and is only applicable when there is work below the bridge deck or culvert surface. This section asks the following two questions.

1. Is there suitable bat habitat within 1,000 feet of a bridge or culvert within the project limits?

   The district must evaluate the area surrounding each structure potentially disturbed (within 1,000 ft radius) for suitable bat habitat. Suitable habitat is considered woodland corridors surrounding tributaries or open water bodies. If suitable habitat is present within the surrounding area of any structure, "Yes" must be selected.

2. Did any of the Bridge/Structures Bat assessments find evidence of bats?

   +For each structure with suitable habitat present, a Bridge/Structure Bat Assessment must be completed. Based on the outcome of the assessment(s), it must be identified whether any of the assessments identified evidence of bat use: "Yes" or "No".

Note: Copies of the Bridge/Structure Bat Assessment form are available from BDE.

The district representative will review and then certify the Level I Natural Resource Screening. Projects that fail the Level 1 Natural Resource Screening shall be subject to a Level 2 Natural Resource Screening which will be conducted by the Central Bureau of Local Roads.

Level 2 Natural Resource Screening

To complete a Level 2 screening, CBLRS will conduct a review using the Transportation Review for

Ecological Compliance (TREC) tool for the following resources.

- State or Federally listed threatened or endangered species
- Illinois Natural Area Inventory Sites (INAI)
- Nature Preserves
- Prairies
- Rusty Patched Bumblebee High Potential Zone
- National Wetland Inventory
- Hydric Soils
- Within 0.5 miles from a Northern Long-eared bat or Indiana bat hibernaculum
- National River Inventory

If the TREC report indicates no resources are present, then the project will pass the Level 2 screening and CBLRS will certify the results, submit the documentation to the project film, and notify the LPA.

This documentation shall be included with any permit application. If the TREC report indicates any of the above resources are present, then the project will fail the Level 2 screening and the project will be submitted as ESR requiring Natural Resource Unit review . Include both the TREC Report and BDE 2715 with the ESR submittal.

27-1.05(b)2 ***Cultural Resource Screening***

In accordance with the Programmatic Agreement (PA) among the FHWA, IDOT, SHPO, and the Advisory Council on Historic Preservation Regarding Section 106 Implementation for Federal-Aid Transportation Projects in Illinois (see Appendix A), certain types of activities are exempt from an ESR submittal (these activities are listed in the Appendix of the PA) when reviewed by Trained Staff.

27-1.05(b)3 ***Regulated Substance***

See Section 27-3 for the types of LPA projects that must be screened for regulated substance.

27-1.06 Submittal of Environmental Survey Request (ESR)

When a project fails a Level 2 screening or a Section 404 permit is required, an ESR shall be submitted to the appropriate BDE unit. The ESR forms to be used in conjunction with the procedures described herein are electronic documents. For all survey request submittals, use the electronic forms and associated instructions in effect at the time of the submittal.

The Environmental Survey Request (ESR) form may be accessed through the Project Monitoring Application (PMA) by district staff that has obtained rights to use the application. Page 2 of the ESR form is used for regulated substances screening formerly referred to as special waste screening. Instructions for using these forms may be found under the "Help" menu in PMA. Consultants and Local Public Agencies should use the web version of the forms and instructions found at:

http://apps.dot.illinois.gov/environment/envsrvyrqst.asp

Note: Submittal of the ESR initiates the Phase I environmental survey process, which takes a minimum of 6 months to complete. Results of the environmental surveys and consultation with appropriate resource agencies must be completed in advance of the desired design approval and/or construction letting, as appropriate.

27-1.07 BDE Response to Environmental Survey Request

27-1.07(a) Review of Natural Resources

BDE will review the ESR based upon regulatory requirements of the Department to determine if the project could have an adverse effect or other impacts that require avoidance, minimization, or mitigation. BDE will review the ESR and may task the Illinois Natural History Survey (INHS) to perform biological and/or wetland surveys, as necessary, to gather additional information on natural resources.

For all proposed projects that BDE determines to have the potential for an adverse effect on a T/E species or impact to nature preserves, wetlands, or other natural resources, BDE will coordinate as necessary with the appropriate resource agencies and will coordinate the information with the district for evaluation of alternatives for avoiding or minimizing adverse impacts to the identified resources.

27-1.07(b) Natural Resource Review (NRR)

The result of the ESR will be the preparation of an NRR that will discuss any applicable survey results and required commitments as part of environmental clearance for natural resources. The NRR will be included in the project report for documentation of clearance for natural resources. All commitments contained within the NRR shall be incorporated into the project at the appropriate project phase (e.g., in the design plans, activities during construction, or post-construction monitoring). Clearance for natural resources will be valid for two years unless:

- new information becomes available that was not previously considered;
- the proposed project is modified; or
- additional species, essential habitat, Natural Areas, or wetlands are identified in the project area.

An updated/validated NRR must be requested prior to construction letting. Documentation must be included for those projects with commitments occurring between design approval and construction letting (e.g., completion of an ITA, wetland mitigation and revised wetland impacts, etc.).

27-1.07(b)1 ***Biological Review Validation***

Pursuant to 17 Ill. Admin. Code 1075, IDNR approval of the proposed project is valid for a period of two years. Districts are responsible for ensuring valid compliance documentation is in effect prior to when the project is advertised for bid letting.

District validation

This can be accomplished by the completion of an updated Level 1 and 2 natural resource screening. The results of that screening shall be included in the project file. If any resources appear that are not present during the initial screening, then submit for BDE validation.

BDE validation:

This can be accomplished through a validation request to BDE. Submittal of the biological review validation takes a minimum of 3 months to complete, provided no additional coordination or surveys are required.

27-1.07(b)2 ***Review of Cultural Resources***

Projects Exempt from an ESR

In accordance with the Programmatic Agreement (PA) among the FHWA, IDOT, SHPO, and the Advisory Council on Historic Preservation Regarding Section 106 Implementation for Federal-Aid Transportation Projects in Illinois (see Appendix A), certain types of activities are exempt from an ESR submittal (these activities are listed in the Appendix of PA).

However, to fully implement all types of activities district Environmental Coordinator will have to be considered Trained Staff as defined in PA. This aspect has yet to be completed statewide. While this training component is ongoing, FHWA has agreed that the removal and replacement of existing sidewalks and ADA ramps with in-kind material will not require an ESR as long as in-kind materials are used, and the project is not completely or partially located within the limits of a National Historic Landmark (NHL).

In-kind material is defined as the same type of material that currently exists, such as replacing brick with brick, stone with stone, asphalt with asphalt, and concrete with concrete. Please contact BDE Qualified Cultural Resources staff for guidance.

Projects Requiring an ESR

The BDE Qualified Cultural Resources staff will review the information provided with each ESR to determine if field reconnaissance surveys or detailed studies are needed for identification or evaluation of cultural resources. Qualified Cultural Resources staff will consider a variety of factors in making this determination, including but not limited to the project setting, results of previous field investigations, likelihood of prior ground disturbance, integrity, and likely age of potentially affected structures (buildings and bridge) based on photographs (photo log) submitted with the ESR.

If Qualified Cultural Resources staff determines additional studies are not warranted, it will use the information submitted with the ESR to make a preliminary assessment of whether there are potentially significant cultural resources in the area that the project may potentially affect. In evaluating buildings and bridges, BDE uses the photo log submitted with the ESR to make a preliminary determination of their eligibility for the NRHP. Qualified Cultural Resources staff may request additional information not included in the ESR to help in their determination.

In certain cases, projects can be cleared for cultural resources by Qualified Cultural Resources staff provided the projects meet criteria outlined in the Programmatic Agreement Among the FHWA, IDOT, the SHPO, and the Advisory Council on Historic Preservation Regarding Section 106 Implementation for Federal Aid Transportation Projects in Illinois. In other cases, Qualified Cultural Resources staff will coordinate determinations with the Illinois State Historic Preservation Officer (SHPO). If SHPO agrees with determination whether the cultural resources are or are not eligible for the NRHP, Qualified Cultural Resources staff will provide the information to the district.

If Qualified Cultural Resources staff determines reconnaissance surveys or other studies are warranted, or if coordination with SHPO identifies a need for surveys or studies, through an Intergovernmental Agreement, the Qualified Cultural Resources staff will initiate arrangements with the Illinois State Archaeological Survey (ISAS) for archaeological and/or architectural studies, if needed, and with other qualified entities for surveys and/or studies regarding historic buildings and bridges. Qualified Cultural Resources staff will review the survey and/or study results and coordinate the information with SHPO. Qualified Cultural Resources staff will provide these results and the results of coordination with SHPO to the district.

The district considers the cultural resource information in further development of the project and, for archaeological sites and historical buildings and bridges eligible for NRHP, the district, in coordination Qualified Cultural Resources staff, evaluates options for avoiding and minimizing the project’s effects on the resources.

If adverse effects to the resources eligible for the NRHP cannot be avoided, Qualified Cultural Resources staff will evaluate whether any further studies of the resources are necessary. If further studies are needed, Qualified Cultural Resources staff will advise the district and will initiate action to accomplish the studies, considering program priority and project scheduling.

Qualified Cultural Resources staff will coordinate the results of any further studies and the determination of the project’s anticipated impacts with SHPO. Qualified Cultural Resources staff will provide information to the district regarding study findings, results of coordination with SHPO, and any recommendations for further coordination or actions by the district, as outlined in Chapter 26.

27-1.03(b)3 *Review of Regulated Substances*

Please refer to the regulated substances procedures discussed in Section 27-3.

27-1.07(c) Environmental Survey Request Addenda

When providing the results of reconnaissance surveys conducted on a project, BDE will include information to indicate the extent of the area that was surveyed. Submittal of a survey request addendum will only be necessary when changes in the project will affect areas outside the limits of the surveyed areas or when a change in the scope of work for the project would invoke a different criterion in Section 27-1.02 than shown in the original survey request. If questions arise on the need for submitting addenda to survey requests for specific projects, contact the BDE Project Coordinator for the district involved.

The Addendum Environmental Survey Request (AESR) form may be accessed through PMA by IDOT staff that has obtained rights to use the application. Form instructions may be found under the "Help" menu in PMA. Consultants should use the web version of the form, and instructions can be found at http://apps.dot.illinois.gov/environment/envsrvyrqstaddm.asp.

27-1.08 Application of Findings

The district will ensure that the results and recommendations it receives in response to the ESR are fully integrated into the development and implementation of the project or action. The documentation of the Phase I environmental investigations, associated coordination, and any commitments made will become part of the environmental information included in or with the Environmental Impact Statement, Environmental Assessment, or Phase I Engineering Report, as appropriate.

27-1.09 Reporting Requirements

If a project passes the Level 1 or 2 Natural Resource screening but must still be submitted to another unit in BDE for an ESR review, please include the Level 1 and 2 screening documentation (BDE 2710/BDE 2715 and associated TREC Report) in the ESR submittal. The Natural Resource Unit will keep a record of these Level 1 and 2 signoffs to be included in an annual report required by the Department's MOU with IDNR.

If a project passes the Level 1 or 2 Natural Resource Screening but does not require an ESR submittal to another unit in BDE, a record shall be kept at the district or Bureau of Local Roads level. An annual report shall be provided to the Natural Resource Unit by January 10th of these additional Level 1 and 2 signoffs conducted and documented at the district or Local level for the previous calendar year to be included with the above-mentioned report.

27-2 SURVEY PROCESS FOR CONTRACTOR SUPPLIED BORROW, USE, AND WASTE SITES

27-2.01 Background

Article 107.22 of the *Standard Specifications for Road and Bridge Construction* requires contractors to seek the Department's approval of borrow, use and waste sites prior to their use in a construction project. The following procedures are intended to establish the appropriate amount of documentation for review and approval of such sites.

27-2.02 Applicability

The procedures that follow apply to contractor-proposed borrow, use, and waste sites located within the State of Illinois for all projects on which IDOT is the awarding authority.

27-2.03 Procedures

27-2.03(a) Definitions

1. BDE 2289. "Borrow Site Review" form, BDE 2289, including map(s) and necessary drawings indicating the exact location of the proposed site and ground level photographs. This form includes the Landowner Agreement, which must be filled out and signed by appropriate landowner(s).

2. BDE 2290. "Waste/Use Site Review" form, BDE 2290, including map(s) and necessary drawings indicating the exact location of the proposed site and ground level photographs. This form includes the Landowner Agreement, which must be filled out and signed by appropriate landowner(s).

3. Borrow Site. A borrow site includes any source of items paid as borrow excavation or furnished excavation, as well as any source of excavated materials not paid for separately but included in the costs of other items of work.

4. Contractor Letter. A signed letter on the contractor's letterhead indicating intended use of the proposed site.

5. IEPA Permit or List. For sites accepting clean construction and demolition debris (CCDD) under the Illinois Environmental Protection Agency (IEPA) Interim Authorization list or IEPA CCDD Fill Operation Permit and commercial landfills permitted to accept anticipated materials, the site must be on the IEPA approved CCDD or Solid Waste sites list or possess the appropriate permit prior to its use.

6. Quarry/Mines. Quarry or mines include current and former mines and quarries operating in accordance with the Illinois Environmental Protection Act (the Act).

7. Use Site. A use site is any disturbed location outside of the limits of construction where the contractor intends to receive, stage, or temporarily store material, equipment, or personnel necessary for the satisfactory completion of the project or subsequent disposition at another location.

8. Waste Site. A waste site is any location where excess material from the project is taken without the expressed intent of returning the material either to the project from where it was generated, or to the economic mainstream (recycled). As used by the Department, the term "waste site" is not the same as "waste" defined by the Illinois Environmental Protection Act, 415 ILCS 5.

27-2.03(b) Contractor's Site Request

The contractor's site request (BDE 2289 and BDE 2290) for borrow, use and waste sites will be submitted to the Resident Engineer/Technician (Resident) who will fill out the appropriate information and then forward it to the district environmental staff . The request shall include sufficient documentation for the Department to determine if the site can be approved for the intended use.

If a site has been previously approved by the Department, the request shall include documentation indicating the previous use, limits and approvals.

See Figure 27-2.A for a list of required documentation and which form is required based on the type of work.

27-2.03(c) Site Review Process

27-2.03(c)1 *No Site Review Needed*

For the following types of sites, a natural resource and cultural review is not required:

a. currently permitted CCDD facilities;

b. currently permitted commercial land fill operations; and

c. commercial operations intended to return excess material to the economic mainstream such as recycling facilities.

For other types of sites, the review process is discussed below:

27-2.03(c)2 *Cultural Resources Review of a Site*

1. New Borrow Sites and New Use Sites Where the Depth of Disturbance is greater than six Inches.

   These sites must be reviewed by the BDE Cultural Unit as they have the potential to affect cultural resources. The district shall ensure the appropriate form is completed before forwarding the request to BDE, who will then conduct a review and respond back to the district.

2. New Waste Sites and New Use Sites Where the Depth of Disturbance is less than six inches;

   These sites do not require a cultural review as the level of disturbance is not deep enough to affect cultural resources.

3. Previously Approved Borrow, Waste, and Use Sites.

   For previously approved borrow, waste, and use sites, the district may determine further cultural reviews are not required where it is documented that the contractor will restrict activities to areas that were previously approved for such use, the contingencies of the previous approval continue to be met, and the site was cleared by BDE Cultural Unit within the past 5 years.

27-2.03(c)3 ***Natural Resources Review of Site***

Note: these procedures apply to locations within existing ROW and outside existing ROW.

1. New Borrow, Waste, and Use Sites (without tree removal).

   The district shall review the site for natural resources impacts (i.e., threatened and endangered species, wetlands, floodplains, etc.) utilizing Part II of BDE 2710. Sites where resources occur may be approved when the site meets the Situational Site Exemptions (See #4) or receive a response letter from BDE indicating the site has been approved.

2. Previously Approved Borrow, Waste, and Use Sites (without tree removal)

   For previously approved borrow, waste, and use sites, the district may determine further natural resource reviews are not required where it is documented that the contractor will restrict activities to areas that were previously approved for such use. If the site is to be expanded or material deposited in a different location on the property, then a new natural resource review is required.

   If the Level II Natural Resource screening indicated no resources of concern present, sign and complete Part II of BDE 2710, the site is now cleared for natural resources for two years.

   If the Level II Natural Resource Screening indicated resources are present but meets the criteria for a Situational Site Exemption, sign and complete Part II of BDE 2710. The site is now clear for natural resources for two years.

   If the Level II Natural Resource Screening indicated resources area present but does not meet the criteria for a Situational Site Exemption, the district has two options:

   a) reject the site; or;

   b) submit the site to BDE for further review (See #5 below)

Per Section 27-1.05(e), natural resource clearances are valid for two years. Sites in use more than two years must be re-evaluated for natural resources screening by completing Part II of BDE 2710.

3. New and Previously Approved Borrow, Waste, and Use Sites (with tree removal).

For sites where tree removal is required, it is preferable to select an alternate site where tree removal is not required. If tree removal cannot be avoided, submit the site to BDE along with Part II of BDE 2710.

4. Situational Site Exemptions:

The following may be approved by the district following a review under Part II of BDE 2710 and include the following situations:

a) Sites where the land use is marked Row Crops or Pasture and the only resource is hydric soils.

b) Sites where there is no tree removal, but the Level II screening identified listed bats in the site vicinity and no other resources are present.

c) Sites where the Level II screening identified listed fish and/or mussels in the site vicinity, there are no additional resources present, and there is no stream on or adjacent to the site/property.

5. Sites reviewed by BDE

If the site does not pass the Level II screening or does not meet the Situational Site Exemptions (#4), the district may submit the site to BDE for further review. The following shall be submitted:

- Part II of BDE 2710 (including TREC Report), and;
- BDE 2289/BDE 2290

Once these forms are received by BDE. A determination will be made on whether site can be approved or denied. BDE will send approval//denial response letter to the district

27-2.03(d) Close-Out Photos.

Close-out photos of waste/use sites should be sent to the district. Close-out photos of borrow and discussed use sites are not needed.

27-2.03(e) Site Response Letter

The district will give written notice to the Resident if the site has been approved or if the site has been rejected and include the reason(s) why. The Resident will be responsible for ensuring the written notice is forwarded to the contractor. The district is responsible for retaining information concerning the site review on file.

REVIEW OF CONTRACTOR PROPOSED BORROW, USE, AND WASTE SITES

Figure 27-2.A

27-3 REGULATED SUBSTANCES EVALUATION PROCEDURES

The procedures in Section 27-3 are applicable to all of the following types of projects regardless of funding source:

1. State highway projects;
2. local project or portion of the project affecting right-of-way or a road under Department jurisdiction;
3. Local project or portion of the project acquiring right-of-way in the name of the State for Department transportation purposes;
4. Local project or portion of the project involving temporary or permanent easement in the name of the state for Department transportation purposes; and,
5. Other transportation projects (e.g., railroad or aeronautics projects) affecting right-of-way or roads under Department jurisdiction.

This section is designed to supplement Departmental Policy D&E-11, "Identifying and Responding to Regulated Substances in Highway Project Development, Implementation and Operations."

27-3.01 Definitions

1. Adjoining Property. Any property or properties of which the border is contiguous with that of the subject property (project limits), or that would be contiguous with that of the property but for a street, road, or other public thoroughfare separating them.

2. Agriculture Property. Any real property for which the present or post-remediation use is growing agricultural crops for food or feed, either as harvested crops, cover crops, or as pasture. This definition includes but is not limited to, properties used for confinement or grazing of livestock or poultry and for forestry operations. Excluded from this definition are farm residences, farm outbuildings, and agrochemical facilities.

3. All Appropriate Inquiries (AAI). AAI refers to the requirements for assessing the environmental conditions of a property prior to its acquisition. The US Environmental Protection Agency (EPA) published a final rule setting Federal standards for the conduct of AAI. The final rule became effective November 1, 2006. As of November 1, 2006, parties must comply with the requirements of the AAI Final Rule or follow the standards set forth in the American Society for Testing and Materials (ASTM) E1527 Phase I Environmental Site Assessment Process, to satisfy the statutory requirements for conducting AAI. The AAI must be conducted in compliance with either of these standards to obtain protection from potential liability under the *Comprehensive Environmental Response, Compensation, and Liability Act* (CERCLA) as an innocent landowner, a contiguous property owner, or a bona fide prospective purchaser.

4. Area Background. Area background refers to concentrations of regulated substances that are consistently present in the environment near a site and are the result of natural conditions or human activities, and not the result solely of releases at the site (415 ILCS 5/58.2).

5. Bona Fide Prospective Purchaser. The 2002 Brownfield Amendments to the Superfund Law (CERCLA) provide a Superfund liability defense for property owners who qualify as "Bona Fide Prospective Purchasers (BFPP)" of known contaminated property, if the property transaction occurred after January 11, 2002. If able to obtain BFPP status, EPA's recourse for unrecovered response cost is limited to a lien on property for the lesser of the unrecovered response costs or increase in fair market value attributable to EPA's response action. A BFPP may purchase property with knowledge of contamination after performing AAI, provided the property owner meets or complies with all of the other statutory requirements set forth in CERCLA Section 101(40).

6. CERCLA. CERCLA stands for the *Comprehensive Environmental Response, Compensation, and Liability Act*.

7. Conservation Property. Any real property for which the present or post-remediation use is primarily for wildlife habitat.

8. Contaminant of Concern. See Regulated Substance of Concern.

9. Contamination. The presence of any regulated substance on the land or in the waters of the State in quantities that are, or may be, harmful or injurious to human health or welfare, or animal or plant life.

10. Contiguous Property Owner. The 2002 Brownfield Amendments to the Superfund Law (CERCLA) provide a Superfund liability defense for property owners who qualify as a "Contiguous Property Owner" and excludes from the definition of "owner" or "operator" under CERCLA Section 107(a)(1) and (2) a person who owns property that is "contiguous to, or otherwise similarly situated with respect to, and that is or may be contaminated by a release or threatened release of a hazardous substance from" property owned by someone else. To qualify as a contiguous property owner, a landowner must have no knowledge or reason to know the contamination at the time of acquisition, have conducted AAI, and meet all criteria set forth in CERCLA Section 107(q)(1)(A).

11. Design Approval. An environmental approval by the department and the FHWA of the design recommended as a result of a Phase I design study and a design public hearing. Phase I design approval is a necessary step for a project to move to Phase II.

12. District Environmental Studies Unit (DESU). The district personnel primarily responsible for screening projects for the possible presence of regulated substances and administering responsibilities as described in this chapter.

13. Engineered Barrier. A barrier designed or verified using engineering practices that limits exposure to or controls migration of the contaminants of concern.

14. Excavation. For the purposes of this chapter, excavation is the digging or grading of any soil sediment or fill material, including underground utility works such as installation of fiber optic cabling, and in-stream work or underwater work, except for aggregate fills, subbase or pavement, which are not considered a soil or fill material of concern for the purpose of transportation projects and regulated substances evaluation.

15. Exposure Route. The transportation mechanism whereby a contaminant of concern reaches or may reach a receptor.

16. Hazard. A set of inherent properties known to be dangerous to the environment.

17. Hazardous Substance. Hazardous substance means:

a. any substance designated pursuant to Section 311(b)(2)(A) of the *Clean Water Act of 1972,* 33 U.S.C. 1321 *et seq.,* (P.L. 92-500), as amended;

b. any element, compound, mixture, solution, or substance designated pursuant to Section 102 of the *Comprehensive Environmental Response, Compensation, and Liability Act of 1980*, 42 U.S.C. 9601 *et seq.*, (P.L. 96-510), as amended;

c. any hazardous waste;

d. any toxic pollutant listed under Section 307(a) of the *Clean Water Act*, 33 U.S.C. 1321 *et seq.,* (P.L. 92-500), as amended;

e. any hazardous air pollutant listed under Section 112 of the *Clean Air Act*, 42 U.S.C. 7401 *et seq.,* (P.L. 95- 95), as amended; and

f. any imminently hazardous chemical substance or mixture with respect to which the Administrator of the EPA has taken action pursuant to Section 7 of the *Toxic Substances Control Act*, 15 U.S.C. 2601 *et seq.*, (P.L. 94-469), as amended.

The term does not include petroleum, including crude oil or any fraction thereof, that is not otherwise specifically listed or designated as a hazardous substance under the criteria described above, and the term does not include natural gas, natural gas liquids, liquefied natural gas, or synthetic gas usable for fuel or mixtures of natural gas and such synthetic gas; see 415 ILCS 5/3.215.

18. Hazardous Waste. A waste, or combination of wastes, that because of its quantity, concentration, or physical, chemical, or infectious characteristics may cause or significantly contribute to an increase in mortality or an increase in serious, irreversible, or incapacitating reversible, illness; or pose a substantial present or potential hazard to human health or the environment when improperly treated, stored, transported, or disposed of, or otherwise managed, and has been identified by characteristics or listing, as hazardous pursuant to Section 3001 of the *Resource Conservation and Recovery Act* of 1976, 42 U.S.C. 6901 *et seq*., the Environmental Protection Act, 415 ILCS 5/22.4, or pursuant to the Pollution Control Board regulations, 35 Ill. Admin. Code 721.103. Potentially infectious medical waste is not a hazardous waste, except for those potentially infectious medical wastes identified by characteristics or listing as hazardous under Section 3001 of the *Resource Conservation and Recovery Act* of 1976, the Environmental Protection Act, 415 ILCS 5/3.220, or pursuant to the Pollution Control Board regulations, 35 Ill. Admin. Code 229.102.

19. Industrial/Commercial Property. Any real property not meeting the definition of residential property, conservation property, or agriculture property. For the purposes of regulated substances evaluation, the term also includes real property used historically or previously for industrial, manufacturing, commercial, or retail purposes.

20. Industrial Process Waste. Any liquid, solid, semi-solid, or gaseous waste generated as a direct or indirect result of the manufacture of a product or the performance of a service.

Any such waste that would pose a present or potential threat to human health or the environment or with inherent properties that make the disposal of such waste in a landfill difficult to manage by normal means is an industrial process waste. Industrial process waste includes, but is not limited to:

a. spent pickling liquors,
b. cutting oils,
c. chemical catalysts,
d. distillation bottoms,
e. etching acids,
f. equipment cleanings,
g. paint sludge,
h. incinerator ashes (including but not limited to ash resulting from the incineration of potentially infectious medical waste),
i. core sands,
j. metallic dust sweepings,
k. asbestos dust, and
l. off-specification, contaminated, or recalled wholesale or retail products.

Specifically excluded are:

a. uncontaminated packaging materials,
b. uncontaminated machinery components,
c. general household waste,
d. landscape waste, and
e. construction or demolition debris; see 415 ILCS 5/3.235.

21. Innocent Landowner. The 1986 *Superfund Amendments and Reauthorization Act* (SARA) provides a Superfund liability defense for property owners who qualify as an "Innocent Landowner." To qualify, the landowner must show "that they did not know and had no reason to know" that prior to the purchase of a property there was a release or threatened release of any hazardous substances. To qualify as an innocent landowner, a person must conduct AAI and meet all statutory requirements.

22. Institutional Control. A legal mechanism for imposing a restriction on land use.

23. ISATS (IDOT Site Assessment Tracking System). A secure webpage maintained by the Bureau of Design and Environment containing environmental survey documents prepared for and by the Location and Environment Section of BDE for use by district Environmental Studies Unit personnel and other interested parties. ISATS was also commonly referred to as "the extranet" or "frostycap," and the terms are interchangeable for purposes of this chapter.

24. Leaking Underground Storage Tank (LUST). An underground storage tank where the contents have leaked into the environment.

25. Maximum Allowable Concentration (MAC). Maximum allowable concentrations of chemical constituents in uncontaminated soil used as fill material at regulated fill operations, as determined by 35 Ill. Admin. Code 1100.Subpart F.

26. Municipal Waste. Garbage, general household and commercial waste, industrial lunchroom or office waste, landscape waste, and construction or demolition debris.

27. No Further Remediation (NFR) Letter. A letter issued by the IEPA acknowledging that a person is released from further responsibility under the *Illinois Environmental Protection Act* at a site. An NFR letter may have conditions attached to it, including institutional controls.

28. Non-Hazardous Special Waste. Special waste found not to be hazardous (e.g., industrial process waste, pollution control waste).

29. PESA Response form. A form in PMA completed by the District Environmental Studies Unit (DESU) indicating the district's desired response to the PESA.

30. PESA Response/Work Order (PR/WO) form. A form completed by the District Environmental Studies Unit (DESU) indicating the district's request to complete a Preliminary Site Investigation (PSI). The basic information for the PR/WO form is populated in PMA and prepared using BDE 2735, PESA Response/PSI Work Order Request.

31. PESA Validation. The re-evaluation of the project area to check for the possibility of new reported releases or incidents and determine if land uses have changed within the project area.

32. Pollution Control Waste. Any liquid, solid, semi-solid, or gaseous waste generated as a direct or indirect result of the removal of contaminants from the air, water, or land, and poses a present or potential threat to human health or to the environment or with inherent properties that make the disposal of such waste in a landfill difficult to manage by normal means. Pollution control waste includes, but is not limited to, water and wastewater treatment plant sludge, bag house dusts, landfill waste, scrubber sludge, and chemical spill cleanings; see 415 ILCS 5/3.335.

33. Preliminary Environmental Site Assessment (PESA). A detailed evaluation of available records dealing with site history, including site reconnaissance to visually inspect and investigate conditions.

34. Preliminary Site Investigation (PSI). A preliminary investigation of the site, including sampling, testing, and analysis of soil or groundwater, as necessary, and an estimate of the cost of cleanup by parcel, if possible, for the Department's project.

35. Project Monitoring Application (PMA). The electronic database used by BDE to manage Environmental Survey Requests (ESR). Each project in PMA is assigned a unique BDE sequence number and is also referenced to a construction job number and contract number, when available. The database is accessible to designated IDOT central office personnel and district environmental personnel.

36. Property. The buildings, fixtures, and improvements within existing or proposed right-of- way that are subject to the site reconnaissance.

37. Property Owner. The individual or legal entity holding the fee title to a parcel or parcels that the Department is seeking to acquire or from whom the Department has acquired title. In the case of multiple individuals or entities jointly holding title, the term will apply to all holders collectively.

38. Recognized Environmental Condition (REC). The presence or likely presence of any regulated substances on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any regulated substances into structures on the property or into the ground, groundwater, or surface water of the property. The term includes regulated substances even under conditions in compliance with laws. The term is not intended to include *de minimis* conditions that generally do not present a material risk of harm to public health or the environment, and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

39. Regulated Substances. Any hazardous substances, as defined by the *Comprehensive, Environmental Response, Compensation, and Liability Act* of 1980, 42 U.S.C. 9601, and petroleum products including crude oil or any fraction thereof, natural gas, natural gas liquids, liquefied natural gas, or synthetic gas usable for fuel or mixtures or natural gas and such synthetic gas, as defined by the Environmental Protection Act, 415 ILCS 5/58.2.

40. Regulated Substance of Concern. Any contaminant that is expected to be present at the site based upon past and current land uses and associated releases that are known to the person conducting remediation based upon reasonable inquiry; see 415 ILCS 5/58.2.

41. Remedial Investigation/Feasibility Study (RI/FS). An investigation/study to assess site conditions and evaluate alternatives to the extent necessary to select a remedy. The RI is designed to assess the nature and extent of releases of regulated substances and determine those areas of a site where releases have created damage or the threat of damage to public health or the environment. The FS develops a range of remedies for the site, considering the findings of the RI.

42. Remedial Action. Action consistent with permanent remedy taken instead of or in addition to removal actions in the event of a release or threatened release of a regulated substance into the environment to prevent or minimize the release of regulated substances so that they do not migrate to cause substantial danger to present or future public health or welfare or the environment. The term includes off-site transport of regulated substances, or the storage, treatment, destruction, or secure disposition off-site of such regulated substances or contaminated material.

43. Removal. The cleanup or removal of released regulated substances from the environment. It includes:

    a. actions that may be necessary in the event of the threat of release of regulated substances into the environment;

    b. actions that may be necessary to monitor, assess, and evaluate the release or threat of release of regulated substances;

    c. the disposal of removed material; and

d. other actions as may be necessary to prevent, minimize, or mitigate damage to the public health or welfare or the environment, that may otherwise result from a release or threat of release.

44. Residential Property. Any real property used for habitation by individuals, or where children have the opportunity for exposure to contaminants through soil ingestion or inhalation at educational facilities, health care facilities, childcare facilities, or outdoor recreational areas.

45. Resource Conservation and Recovery Act (RCRA). The RCRA governs the management of hazardous wastes. The process for identifying a hazardous waste involves many steps. There is no single, comprehensive list of hazardous wastes that is regularly updated. To be considered a hazardous waste, a material first must be classified as a solid waste (40 CFR 261.2 "Definition of Solid Waste"). The EPA defines solid waste as garbage, refuse, sludge, or other discarded material (including solids, semisolids, liquids and contained gaseous materials). If a waste is considered solid waste, it must then be evaluated to determine if it is a hazardous waste (40 CFR 262.11 "Hazardous Waste Determination"). The EPA defines wastes as hazardous, if they are specifically named on one of four lists of hazardous wastes included in Subpart D of 40 CFR 261 "Lists of Hazardous Wastes" (see 40 CFR 261.30 through 261.35), or if they exhibit any of the four characteristics discussed in Subpart C of 40 CFR 261 "Characteristics of Hazardous Waste"; see 40 CFR 261.20 through 261.24.

46. Right-of-Way (ROW). Land, or interests therein, acquired for or devoted to highways, waterways, railroads, bicycle paths, and other public or private transportation purposes.

47. Risk Assessment. A determination of the kind and degree of hazard posed by regulated substances, the extent to which a particular group of people has been or may be exposed to the contamination and the health risk that exists due to the contamination.

48. Risk Managed Project (RMP). A project that impacts a property with REC for which PSI is not conducted. The BDE will provide the district with a special provision for monitoring and/or managing potentially any contaminated soil and/or groundwater that is expected to be encountered during construction. The use of RMP approach in lieu of PSI is determined on a case-by-case basis and at the discretion of BDE's staff based on the results of the PESA and other technical facts about the project.

49. Site. Any single location, place, tract of land or parcel of property, or portion thereof, including contiguous property separated by a public or private right-of-way; see 415 ILCS 5/58.2.

50. Site Reconnaissance. A visit to the project site and adjoining properties during which observations are made. The objective of site reconnaissance is to obtain information indicating the possible presence of environmental conditions within the minimum search distances listed in Figure 27-3.B. Environmental conditions include current or historical situations that may negatively affect the property including the presence of, for example, railroad crossings, illegal dumping, unknown containers and vessels, waste associated with 'crack' and methamphetamine houses (e.g., discarded hazardous material on the outside of a property), battery piles, paint spills, abandoned transformers, surface staining, and vegetative damage. This level of inspection generally does not require the investigator to enter onto a property and may be done from the existing ROW. During the site

reconnaissance, observations are documented, and photographic evidence is obtained to assist in completing the Environmental Survey Request (ESR).

51. Special Provision for the Removal and Disposal of Regulated Substances. A special provision written by the Geologic and Waste Assessment Unit within BDE and issued to the district for inclusion in the contract documents. In the case of RMP, the special provision requires the contractor to hire an environmental firm for monitoring a specified area for soil and groundwater contamination and worker protection. In the case of a project where a PSI was conducted, the special provision requires the contractor to conduct regulated substances monitoring in specified areas for soil and groundwater contamination, and worker protection and management of the affected area for site disposal.

52. Special Waste. Special waste means any of the following:

a. potentially infectious medical waste;

b. hazardous waste, as determined in conformance with RCRA hazardous waste determination requirements set forth in 35 Ill. Admin. Code 722.111, including a residue from burning or processing hazardous waste in a boiler or industrial furnace unless the residue has been tested in accordance with 35 Ill. Admin. Code 726.212 and proven to be non-hazardous;

c. industrial process waste or pollution control waste, except:

I. any such waste certified by its generator, pursuant to Section 22.48 of the *Illinois Environmental Protection Act*, not to be any of the following:

i. a liquid, as determined using the paint filter test set forth in subdivision (3)(A) of subsection (m) of 35 Ill. Admin. Code 811.107;

ii. regulated asbestos-containing waste materials, as defined in 40 CFR61.141, under the National Emission Standards for Hazardous Air Pollutants;

iii. polychlorinated biphenyls (PCBs) regulated pursuant to 40 CFR 761;

iv. an industrial process waste or pollution control waste subject to the waste analysis and recordkeeping requirements of 35 Ill. Admin. Code 728.107 under the land disposal restrictions of 35 Ill. Admin. Code 728; and

v. a waste material generated by processing recyclable metals by shredding and required to be managed as a special waste under Section 22.29 of the *Illinois Environmental Protection Act*.

II. any empty portable device or container, including but not limited to a drum where a special waste has been stored, transported, treated, disposed of, or otherwise handled, provided that the generator has certified that the device or container is empty and does not contain a liquid, as determined using the paint filter test set forth in subdivision (3)(A) of subsection (m) of 35 Ill. Admin. Code 811.107. For purposes of this definition, "empty portable device or container" means a device or container where removal of special waste, except for a residue not to exceed one inch (25 mm) in thickness, has been accomplished by a practice commonly employed to remove materials of that type. An inner liner used to prevent contact between the special waste and the container shall be removed and managed as a special waste; or

III. as may otherwise be determined under Section 2.9 of the *Illinois Environmental Protection Act*.

Special waste does not mean fluorescent and high-intensity discharge lamps as defined in subsection (a) of Section 22.23a of the *Illinois Environmental Protection Act*, waste that is managed in accordance with the universal waste requirements set forth in 35 Ill. Admin. Code 733, or waste that is subject to rules adopted pursuant to subsection (c)(2) of Section 22.23a of the *Illinois Environmental Protection Act,* 415 ILCS 5/3.475.

53. Survey Target Date. The date established by the district by which the completed survey report (e.g., the PESA) is desired. This target date is used by BDE for internal scheduling purposes for all the requested environmental surveys and does not necessarily represent the completion date of the respective survey(s). The size, length, and complexity of the proposed project, along with seasonal field conditions and minimum timing required by policy, should be considered when establishing the date.

54. Tiered Approach to Corrective Action Objectives (TACO). A method for developing remediation objectives for contaminated soil and groundwater in accordance with 35 Ill. Adm. Code 742. These remediation objectives protect human health and consider site conditions and land use. Remediation objectives generated by TACO are risk based and site specific, and can be based on area background, the use of engineered barriers, and elimination of exposure routes.

55. Underground Storage Tank (UST). Any single tank or combination of tanks (including underground pipes connected to the tank(s) used to contain an accumulation of regulated substances, and that has 10% or more of its volume (including the volume of associated underground pipes) beneath the surface of the ground. The term does not include any of the following facilities or associated pipes:

a. farm or residential tank with a capacity of 1100 gallons or less, used for storing motor fuel for noncommercial purposes;

b. septic tank;

c. pipeline facility (including gathering lines) regulated under the *Natural Gas Pipeline Safety Act* of 1968 or the *Hazardous Liquid Pipeline Safety Act* of 1979 (both codified in 49 U.S.C. 60101, *et seq.*), or that is an intrastate pipeline facility regulated under State laws as provided in either of the aforementioned statutes, and that is determined by the Secretary of Energy to be connected to a pipeline or to be operated or intended to be capable of operating at pipeline pressure or as an integral part of a pipeline;

d. surface impoundment, pit, pond, or lagoon;

e. storm water or waste water collection system;

f. flow-through process tank;

g. liquid trap or associated gathering lines directly related to oil or gas production and gathering operations; or

h. storage tank situated in an underground area (e.g., basement, cellar, mine working, drift, shaft, tunnel) if the storage tank is situated upon or above the surface of the floor.

The term also means an underground storage tank used exclusively to store heating oil for consumptive use on the premises where stored and that serves other than a farm or residential unit; see 415 ILCS 5/57.2.

27-3.02 Regulated Substances Evaluation

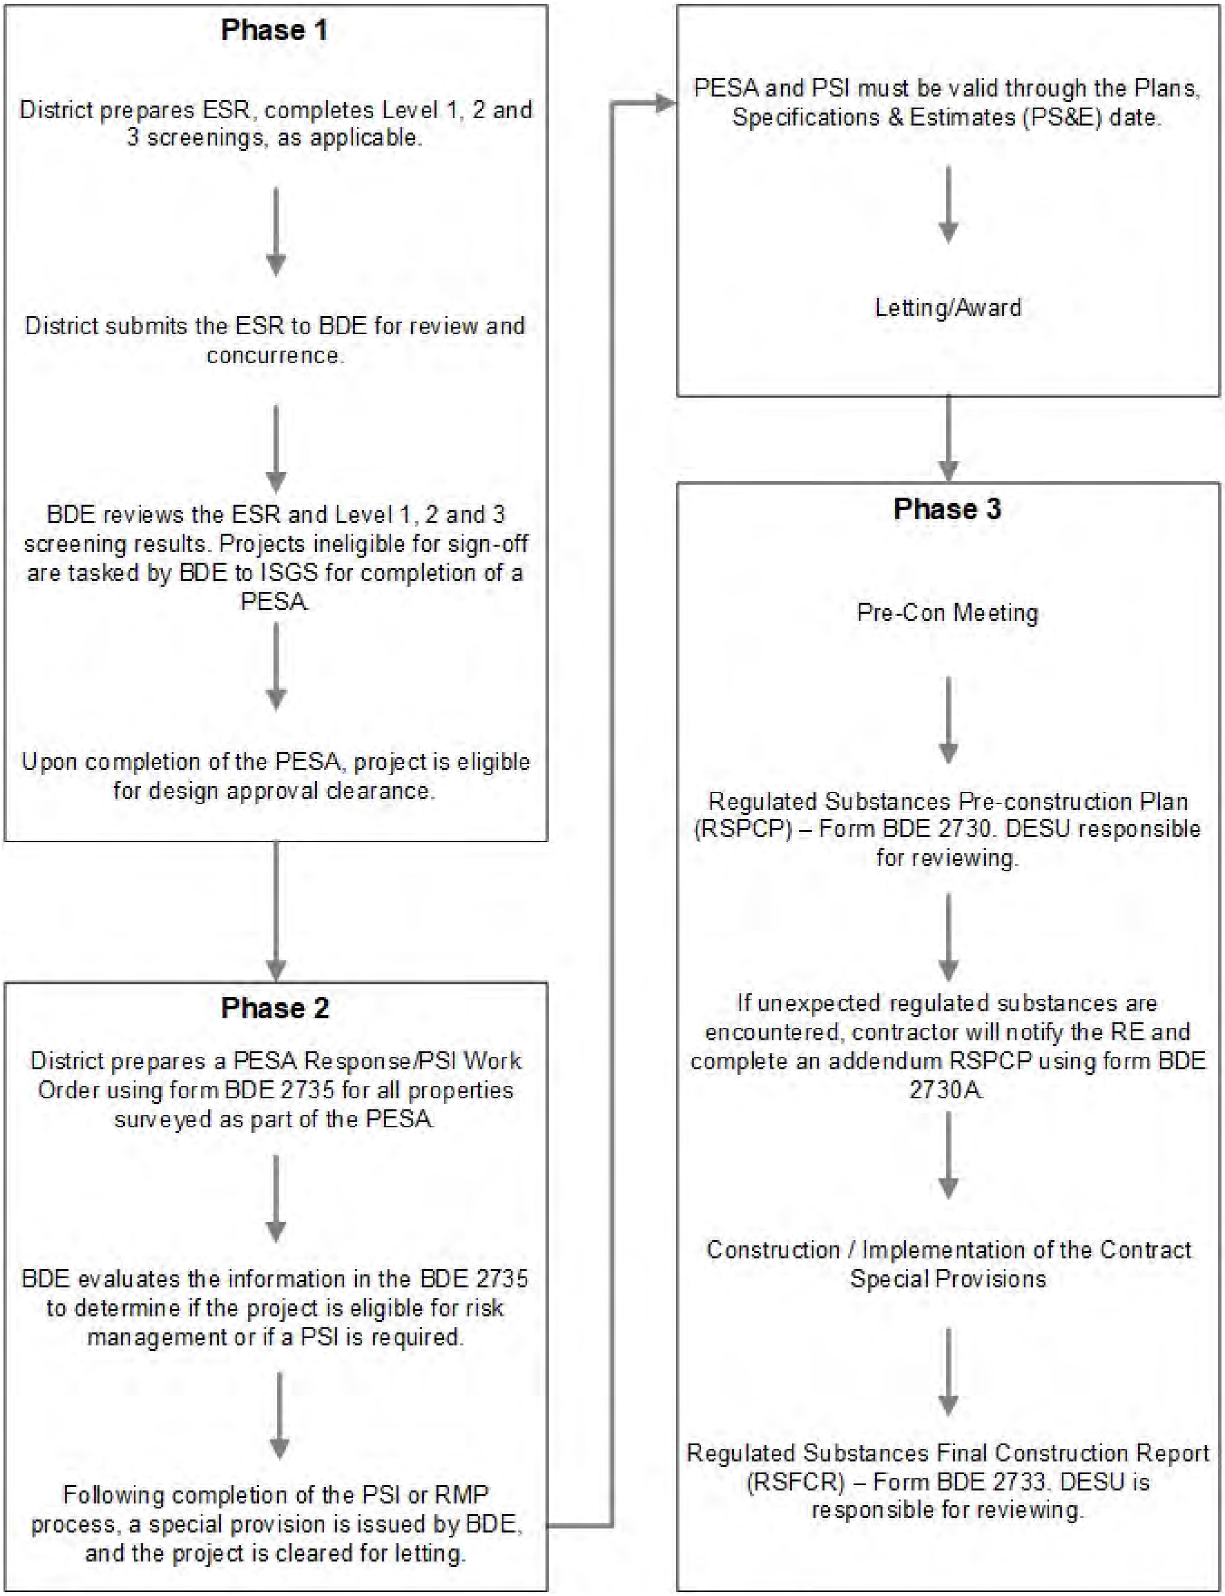
Taking title (or lesser interest) to property containing regulated substances or moving soil impacted with regulated substances exposes the Department to potential liability for associated investigation and cleanup costs. To limit such liability, projects must be evaluated/assessed for the potential presence of special waste or other regulated substances, as described in the following sections, and as flowcharted in Figures 27-3.A through 27-3.D. Successfully following the screening process and documenting the results limit the Department's potential environmental liability, protects our workers and the public, and demonstrates adherence to Departmental Policy D&E-11, "Identifying and Responding to Regulated Substances in Highway Project Development, Implementation and Operations." D&E-11 policy states, among other items, that "due care shall be exercised to determine whether regulated substances may be present on or located adjacent to property being considered for use for state highway project purposes and supporting highway operations and maintenance. Acquisition of an interest in a property determined to contain regulated substances shall be avoided unless the risks and liabilities of such acquisition can be justified, documented, and appropriately managed."

To determine whether regulated substances may be present on property under state control for state highway project purposes, properties on and adjoining the project area shall be evaluated using the processes outlined in Section 27-3. A regulated substances evaluation must be conducted on every applicable project. A Preliminary Environmental Site Assessment (PESA) is the Department's fundamental method of demonstrating "due care." Thus, PESA is required on every applicable project, as listed in the opening paragraph of Section 27-3. Nevertheless, there are some select circumstances where the need for PESA can be avoided and due care demonstrated based on successful performance and documentation by the project developer of a Level 1, 2, or 3 screening or similar due diligence evaluation. The screening criteria have been carefully crafted and apply in project situations where they pose minimal risk and potential liability to the project developer entity, environment, and the public and road workers. It is the project developer's responsibility to properly conduct the screening, document the results, and submit the documented results for concurrence to BDE. The project shall be submitted to BDE for completion of PESA, if the project developer chooses not to conduct a Level 1, 2, or 3 screening.

Screening of projects for regulated substances in Phase I and Phase II should be conducted by the DESU for project types listed at the beginning of Section 27-3. The DESU is responsible for, for example, coordinating and preparing the Environmental Survey Request (ESR) and the PESA

Response/PSI Work Order (PR/WO) form. Additional responsibilities include participating in pre-construction meetings, reviewing and documenting pre-construction plans and post-construction environmental reports, and interacting with resident engineers before, during and after construction to coordinate and document management of contaminated soils, including unexpected situations concerning regulate substances and underground storage tanks.

Environmental Assessment (EA), Environmental Impact Statement (EIS), or large Categorical Exclusion (CE) projects may require special handling due to size, complexity, and/or long project development periods and should be discussed with BDE staff. Refer to Section 27-3.03(b) of this Manual for additional information on the regulated substances evaluation process for these types of projects. Included in this list of projects requiring special handling are river crossing projects requiring sediment management.



SPECIAL WASTE ASSESSMENT PROCESS

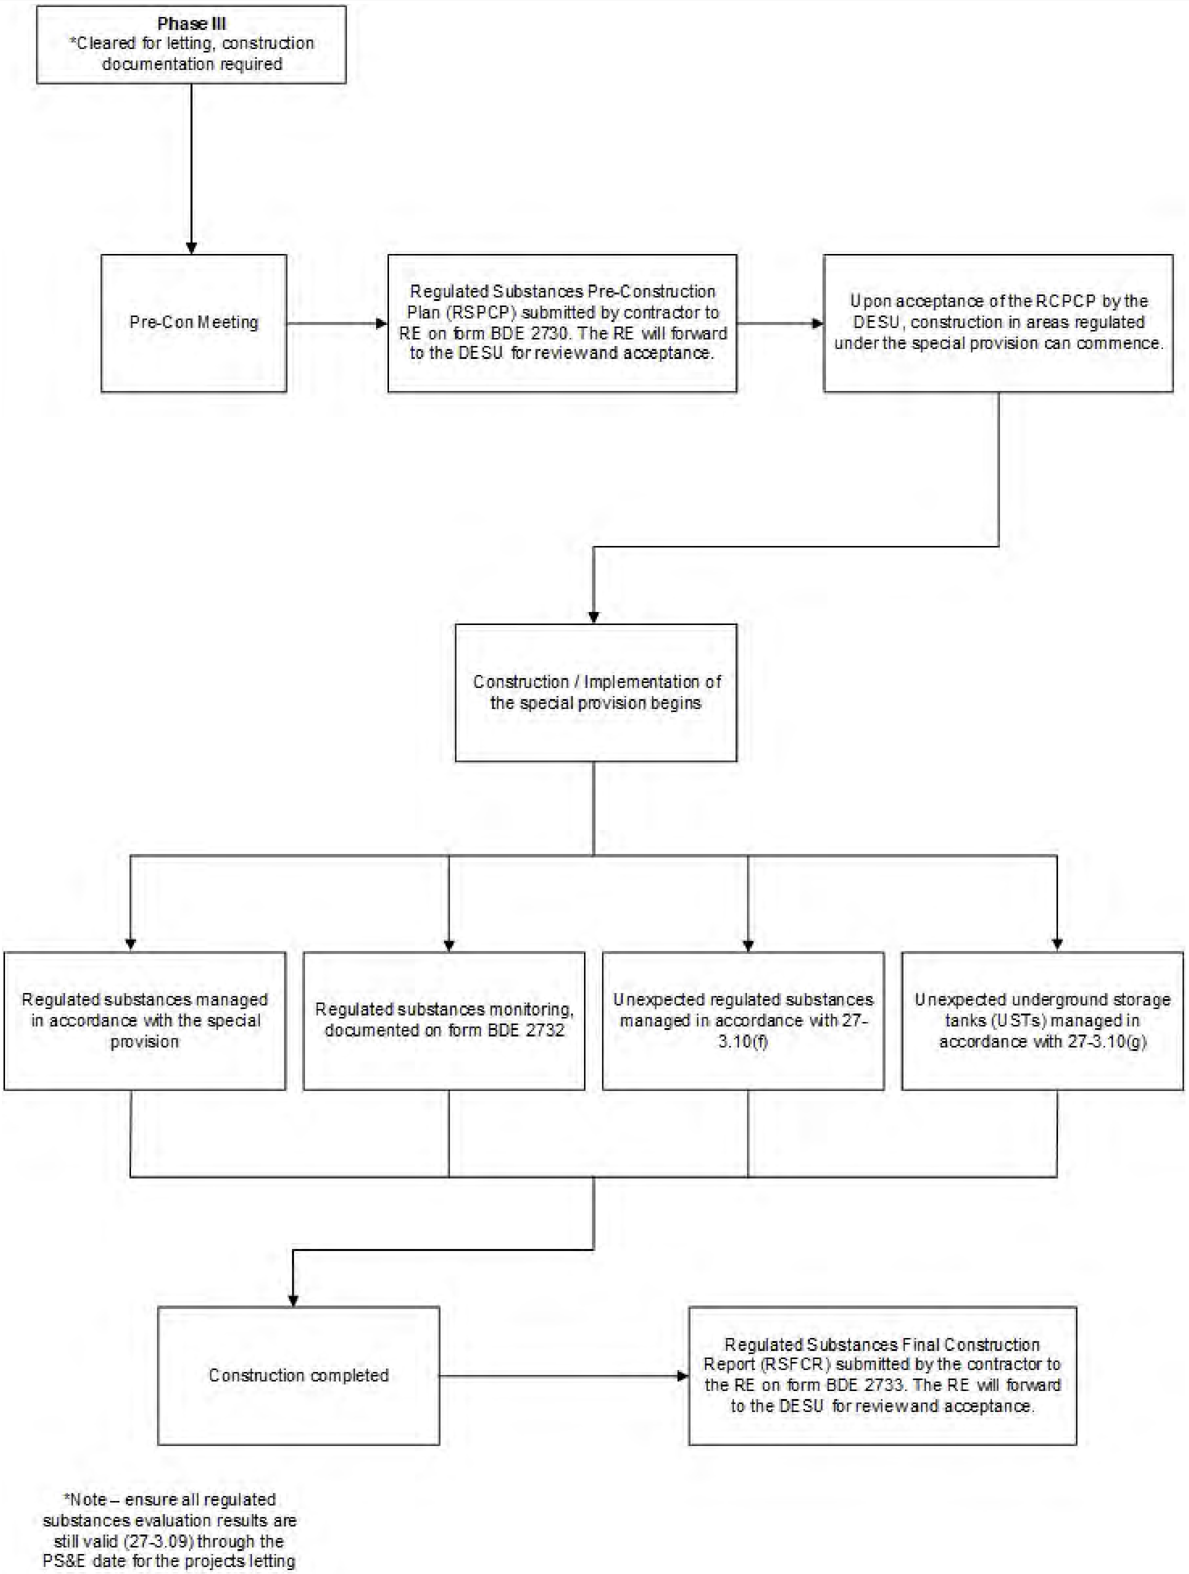
REGULATED SUBSTANCES EVALUATION PROCESS – PHASE II

FIGURE 27-3.C



REGULATED SUBSTANCES EVALUATION PROCESS – PHASE III

FIGURE 27-3.D

27-3.02(a) Level 1 Screening

The District Environmental Studies Unit (DESU) may sign-off the project and not undertake further action to identify and assess regulated substances, if the project does not involve either:

1. acquisition of additional right-of-way or easements (temporary or permanent) in the name of the State for IDOT transportation purposes; or

2. excavation (see definition of excavation) or subsurface utility relocation on State right-of-way.

The DESU shall complete the applicable portion of the ESR form and BDE 2737, Regulated Substances Screening form, sign and date them, and send the results to BDE. After BDE receives the ESR and concurs, the design approval and letting clearance dates can be entered into PMA. The district shall retain the fully completed Level 1 screening form and BDE 2737 in the district project file and shall include them in the project's environmental documentation for the project to support the finding that proper due diligence was performed, and further investigations are unwarranted.

27-3.02(b) Level 2 Screening

Projects failing Level 1 screening can be further screened by the DESU using Level 2 criteria to determine if the project may be eligible for a district sign-off or can be submitted for initiation of PESA. To be eligible for the Level 2 sign-off, the following conditions must be met:

1. there are no conditions or database occurrence within the minimum search distances shown in Figure 27-3.E;

2. a site reconnaissance was conducted, and no concerns were identified, and

3. the ESR form and BDE 2737 were thoroughly completed and processed through BDE.

Environmental Condition	Minimum Search Distance (miles)	Database (See form BDE 2737 for web hyperlink to each database)
Industrial / commercial property	0.25	Identified during Site Reconnaissance
Other Environmental Conditions[1]	Property & Adjoining Property	See footnote below
Crosses or otherwise involves railroad ROW[2]	Property & Adjoining Property	See footnote below
State UST	Property & Adjoining Property	The Office of State Fire Marshall UST database
State LUST	0.5	IEPA Bureau of Land, LUST Incident Tracking database
State Voluntary Cleanup	0.5	IEPA Bureau of Land, Site Remediation Program database (includes Voluntary Cleanup sites)
State Brownfield	0.5	IEPA Bureau of Land, Office of Brownfields database
State Landfills	0.5	I EPA Bureau of Land Inventory database (landfills are included but not flagged separately)
Federal NPL site	1.0	U.S. EPA CERCLIS database (includes NPL, Active, and Delisted sites)
Federal NPL site - Delisted	0.5	
Federal	0.5	

[1] Other environmental conditions are identified through in-person site reconnaissance and any other research method not otherwise listed in the table above. The DESU shall evaluate any situations where a sign-off may be inappropriate because of scenarios of concern for which they may be aware.

[2] Crosses or otherwise involves railroad ROW, other than a single rail rural ROW with no maintenance facilities.

ENVIRONMENTAL CONDITIONS AND MINIMUM SEARCH DISTANCE TABLE

FIGURE 27-3.E
(Continued)

[3] The CERCLIS Public Access Database, which contained a selected set of publicly releasable Superfund program data was retired in 2015. The USEPA has transitioned to the Superfund Enterprise Management System (SEMS), which includes the same data fields and contents as the former CERCLIS database

For purposes of the screening process, the project and project area shall include the area encompassing the current right of way or easements (temporary or permanent) plus the outer most limits of the proposed right of way or easements. Furthermore, the minimum search distance when conducting the screening is measured from the outermost edges of the project area.

For a successful Level 2 screening, the DESU shall complete the entire ESR form and BDE 2737, sign and date the forms, and send the results to BDE. After BDE receives the ESR and concurs, the design approval and letting clearance dates can be entered into PMA. The district shall retain the fully competed Level 2 screening form and BDE 2737 in the district project file and include them in the environmental documentation for the project to support the finding that proper due diligence was conducted, and further investigations are unwarranted.

If the Level 2 screening fails, PESA for the entire project shall be requested by the district, unless the project is eligible for and the district chooses to perform a Level 3 screening.

27-3.02(c) Level 3 Screening

Projects failing Level 1 and Level 2 screenings may be submitted for PESA or may be further screened by the DESU using the criteria listed below to determine the project's eligibility for a Level 3 sign-off. To be eligible for a Level 3 sign-off, the following conditions must be met.

1. If the project involves excavation for only the following types of work, proceed to step 2 to conduct the screening. Otherwise, a PESA for the entire project is required.

    a. Sidewalks/bike paths;

    b. Sidewalk ramps;

    c. Curb & gutter;

    d. Mast arm/light pole installation;

    e. Sign post/truss installation;

    f. Traffic signal foundation work/hand holes;

    g. Ditch cleaning;

    h. Guardrails/median cables; or

    i. A project type specifically listed on form BDE 2737 under Level 3 screening criteria.

2. If there are no conditions or database occurrence(s) shown in Figure 27-3.F on or adjoining the project area, proceed to step 3. Otherwise, PESA for the entire project is required.

Environmental Condition	Minimum Search Distance	Database and Search Site (see form BDE 2737 for web hyperlink to each database)
State Landfills	Property & Adjoining Property	IEPA Bureau of Land Inventory database (landfills are included but not flagged separately)
Federal NPL site	Property & Adjoining Property	U.S. EPA SEMS database (includes NPL, Active, and Delisted sites)
Federal NPL site - Delisted	Property & Adjoining Property	
Federal SEMS site	Property & Adjoining Property	
Federal SEMS site -NFRAP site	Property & Adjoining Property	
Federal RCRA CORRACTS facilities list	Property & Adjoining Property	U.S. EPA RCRA database (includes CORRACTS, TSD RCRA, and other RCRA)
Federal RCRA non-CORRACTS TSD facilities list	Property & Adjoining Property	
State Brownfield	Property & Adjoining Property	IEPA Bureau of Land, Office of Brownfields database
Federal Brownfield sites	Property & Adjoining Property	U.S. EPA Federal Brownfields & Land Revitalization database
Other Environmental Conditions	Property & Adjoining Property	Other environmental conditions identified through in-person site reconnaissance and any other research method not otherwise listed in the table above.
Full Take Property Acquisition	On project	Full take properties by the Department must be evaluated via the PESA process and are ineligible for a Level 3 screening.

ENVIRONMENTAL CONDITIONS AND MINIMUM SEARCH DISTANCE TABLE

FIGURE 27-3.F

3. If there are no database occurrences shown in Figure 27-3.G on or adjoining the project area, proceed to step 4 to document the screening results. If there are database occurrences shown in Figure 27-3.G on or adjoining the project area, BDE 2738 Regulated Substances Level 3 Screening should be completed for the property(ies) on which the below database occurrences were identified. Then proceed to step 4.

Environmental Condition	Minimum Search Distance	Database and Search Site
State Voluntary Cleanup	Property & Adjoining Property	IEPA Bureau of Land, Site Remediation Program database (includes Voluntary Cleanup sites)
State LUST	Property & Adjoining Property	IEPA Bureau of Land, LUST Incident Tracking database
State UST	Property & Adjoining Property	The Office of State Fire Marshall UST database

ENVIRONMENTAL CONDITIONS AND MINIMUM SEARCH DISTANCE TABLE

FIGURE 27-3.G

4. The ESR form and Level 3 screening documentation must be thoroughly completed and submitted to BDE for review and concurrence.

For purposes of the screening process, the project and project area shall include the area encompassing the current right of way or easements (temporary or permanent) plus properties along the outer most limits of the proposed right of way or easements.

For a successful Level 3 screening not requiring BDE 2738, the DESU shall complete the entire ESR form and BDE 2737, sign and date the forms, and send the results to BDE. After BDE receives the ESR and concurs, the design approval and letting clearance dates can be entered into PMA. The district shall ensure the forms are retained in the district project file and included in the environmental documentation for the project to support the finding that proper due diligence was performed, and further investigations are unwarranted.

If BDE 2738 was required as part of step 3 above, the DESU shall complete the entire ESR form, BDE 2737, and BDE 2738, sign and date the forms, and send the results to BDE. BDE will review to determine the necessary course of action. This may include completion of PESA for the project, or issuance of a special provision without requiring PESA.

27-3.03 Preliminary Environmental Site Assessment

27-3.03(a) PESA Requested Through BDE

To request a PESA, the DESU completes the ESR form in PMA and forwards it to BDE along with plan sheets, a location map, and other pertinent project details. BDE then tasks the Illinois State Geological Survey (ISGS) with completion of a PESA or similar environmental due diligence, as appropriate, using information provided in the ESR and associated supporting documents. Districts with more than one PESA under way should advise BDE of their priorities.

It is critical for efficient execution of the PESA for the district to carefully choose a Survey Target Date considering project complexity, seasonal field conditions, and the minimum time frame for completion of the PESA stated in this section.

After receiving a PESA tasking from BDE, ISGS will review file information and conduct appropriate investigations to determine if recognized environmental conditions exist or assess the potential of the project area for involving other natural hazards and concerns. The target[4] for completion of the PESA report for most projects will be within six months from the date ISGS receives the survey request from BDE. The target for completion of the PESA report for spot projects, considered to be a single parcel, will generally be within three months from the date ISGS receives the survey request.

The ISGS will send the final report to BDE and also upload the document to the Illinois Site Assessment Tracking System (ISATS) for use by the DESU and other interested parties. The BDE will forward the report to the district, to IEPA, and to the Office of State Fire Marshal, as appropriate. The transmittal memorandum from BDE will specify conditions for complying with Departmental Policy D&E-11, "Identifying and Responding to Regulated Substances in Highway Project Development, Implementation, and Operations."

27-3.03(b) Regulated Substances Evaluation for EA, EIS, and Other Special Projects

For EA and EIS projects with large geographic footprints or long project development periods, it can often be time consuming and inefficient to conduct a full PESA on the initial study area. In these cases, and in coordination with the district, BDE will consider completing a more pertinent due diligence assessment for the project. For example, a Site Assessment Letter Report (SALR) is an evaluation that includes a site reconnaissance over the entire project area (which usually includes several corridor alternatives and a large footprint), associated database searches, and an extended hydrogeology discussion. The SALR will usually not contain individual property historical research or FOIA requests and thus, can be done more efficiently while still providing the necessary minimal information needed to prepare the NEPA document. SALR results should be used by the project

[4] The target time frames are the anticipated minimums. Factors contributing to longer time frames could include size, length and complexity of the project, the number and complexity of other project studies in progress, and the number of calls for emergency investigations, which compete for the attention of the regulated substances survey staff. For larger or more complex projects, ISGS will inform BDE of the estimated target time for the final report when it receives the survey request.

developer through the Phase 1 completion cycle. It is unnecessary for the district to request a new regulated substances survey at each milestone of the NEPA 404 Merger process (i.e., Purpose and Need, Alternatives to be Carried Forward, Preferred Alternative). Once the district initiates Phase II (which may or may not happen for several years after Phase I), the district should then request a full PESA on the selected alternative or alignment (typically a significantly smaller and focused geographic footprint than the original study area). The full PESA document will subsequently be used to prepare the PSI and eventually the special provision for letting, which is typical for the department's Phase II and III processes.

Projects involving river crossings and management of sediment require additional coordination between the DESU and BDE due to complications and additional costs associated with management of sediment. In these cases, BDE may desire to conduct river sediment sampling in conjunction with the planned geotechnical sampling completed by the district, which typically occurs early in project development and much earlier than the DESU would normally submit an ESR. When the DESU becomes aware of a project which has the potential to involve river sediments, an ESR should be prepared, and BDE should be alerted as soon as possible in the project cycle to coordinate this sampling effort with the district geotechnical staff or the district Phase 1 consultant.

27-3.03(c) PESA Findings and Response

The following procedures will apply:

1. No "Recognized Environmental Condition" (REC) Finding. If the PESA report indicates that the property(ies) investigated within the project limits have no RECs (other than de minimis), the district shall document this finding in the environmental documentation for the project. The documentation should be a copy of the memorandum from BDE transmitting the PESA report. The PESA report should not be included. The district need not take any further action regarding property(ies) that do not contain any REC unless a re-evaluation for regulated substances becomes necessary (see Section 27-3.09) or a previously unidentified property is encountered. If such a property is encountered, work affecting the property should immediately cease until the district, in consultation with BDE, the Central Bureau of Construction, and the Office of Chief Counsel, has assessed the situation and determined an appropriate course of action.

2. "Recognized Environmental Condition" (REC) Finding. If the PESA report indicates that the property(ies) investigated within the project limits has a REC, BDE will consult with the Office of Chief Counsel in developing conditions for non-routine situations. BDE will forward the property(ies) with a REC to the district Bureau of Program Development/Environmental Unit via a PESA review Transmittal Memorandum and will send a copy of the correspondence to the district Land Acquisition Engineer, the Central Bureau of Land Acquisition, if requested, BDE Project Control and Implementation Section, and the Office of Chief Counsel for their respective action.

   The district shall prepare and submit to BDE a PESA Response with supporting documentation indicating the project will or will not avoid the property(ies) with a REC or the project will not avoid the property(ies) with a REC. The PESA Response shall be sent to BDE after the PESA is reviewed by the district; it does not necessarily have to include the PSI Work Order request, for example, if avoidance is possible.

a. Avoidance Possible. If the district determines the project can avoid the purchase of additional right-of-way/easement from any property containing a REC and any excavation or subsurface utility relocation adjacent to property containing a REC, it shall indicate this on the PESA Response form and send it to BDE. The district also shall provide a copy of the completed PESA Response form to the Central Bureau of Land Acquisition. The district shall retain a copy of the PESA Response form in the project file and includes it in the environmental documentation for the project. The district should not take any further action regarding properties containing a REC that were avoided unless a validation of the regulated substances results becomes necessary; see Section 27-3.09.

b. Avoidance Not Possible. If the district cannot avoid the purchase of additional right-of-way/easement from any property containing a REC or avoid any excavation or subsurface utility relocation adjacent to property containing a REC, it shall indicate this on BDE 3735 PESA Response / PSI Work Order form and send it to BDE. This process requests BDE to initiate the services of the Statewide Regulated Substances Investigation Consultant to perform a PSI to determine the nature and extent of contamination (i.e., above or below the cleanup objectives). Additionally, the district shall provide a copy of BDE 2735 to the Central Bureau of Land Acquisition, if requested.

27-3.03(d) PSI Work Order Request

To submit a PSI request, the district completes both the top half (PESA Response) and the bottom half (Work Order) of the PMA form and associated form BDE 2735 at which time the PSI will be tasked by BDE to a pre-qualified regulated substances environmental consultant. The district shall include supporting documentation including plan sheets for the REC sites involving any of the situations listed in Section 27-3.02(a) or subsurface utility relation adjacent to a property with a REC, in other words, the sites that are deemed to require a PSI. The plan sheet should show the specific location and stationing of planned soil excavation and acquisition or easements in the name of the State. The district should also identify, for each location referenced in Table 1 of the PESA, the REC identification number, maximum excavation depth per site location, the type of excavation per site investigated, and the soil excavation volume per site, and other pertinent information such as possible presence of underground storage tanks (USTs) and whether it is anticipated the project will be a net importer or exporter of soils. This information is prepared using BDE 2735. Additionally, cross-section figures are also helpful to determine the depth of the proposed construction elements.

For properties containing a REC classified as a hazardous substance (non-petroleum), BDE and the Office of the Chief Counsel will determine if acquisition of the property requires additional liability protection under CERCLA. If additional liability protection is necessary, BDE will task ISGS to conduct an “All Appropriate Inquiry” (AAI) on those properties.

27-3.04 <u>All Appropriate Inquiries (AAI)</u>

In some cases, proposed land acquisition at, or excavation adjacent to property(ies) with potential significant contamination may require the PESA to be re-conducted under the “All Appropriate Inquiry”

(AAI) standard to provide the Department the appropriate CERCLA liability protection. A Preliminary Site Investigation (PSI) may also be necessary, depending upon the results of the PESA and/or AAI. Moreover, BDE will determine the need for AAI in consultation with the Office of Chief Counsel.

On November 1, 2006, 40 CFR 312 became effective; this rule defined AAI on what is required for due diligence to avoid Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) liability (Superfund liability). The AAI rule implements the 2002 Small Business Liability Relief and Brownfields Revitalization Act (2002 Brownfield Act), which aimed to clarify and expand the potential defenses to strict liability under CERCLA. To qualify for CERCLA's defenses to strict liability (i.e., as an innocent purchaser, a bona fide prospective purchaser, or a contiguous property owner), a defendant must show it conducted AAI prior to taking title to the property. Following the AAI procedures affords IDOT CERCLA liability protection as an innocent purchaser, bona fide prospective purchaser, or a contiguous property landowner.

27-3.05 Site Investigations

27-3.05(a) Preliminary Site Investigation (PSI)

BDE uses the information provided in the PESA Response / Work Order (concerning the volume and cost of material for excavation) and information from the PESA to determine whether the REC can be addressed during construction without a PSI. In these cases, if BDE determines, through this "risk management" evaluation procedure, a PSI is not warranted, it will notify the district the project is eligible to be a Risk Managed Project (RMP). Projects involving acquisition of parcels with REC that are full takes or have potential uneconomic remnants are ineligible for "risk management." For a project deemed eligible by BDE to be an RMP, BDE will provide the district with a regulated substances special provision consistent with Section 669 of the Standard Specifications for Road and Bridge Construction for inclusion in the construction documents.

For actions that do not qualify as RMPs, BDE will contact the Statewide Regulated Substances Investigation Consultant and request an investigatory work plan and estimated budget for the PSI. BDE will review the work plan and budget and provide the district with an opportunity for review prior to approval.

PSI budgets of up to $100,000 generally will be paid from funds for the pre-qualified regulated substances investigation consultant agreement. If the estimated cost is more than $100,000, BDE will discuss funding options with the district. If the estimated budget is more than $200,000, the district will be required to fund the PSI. Upon receiving approval of the work plan and budget, the statewide consultant will proceed with the investigations of the property(ies).

After completing the investigations, the consultant will provide a draft PSI report to BDE. BDE, in consultation with the Office of Chief Counsel, as appropriate, will review the report for adequacy and provide it to the district for review. Generally, the draft PSI report will be completed within 75 calendar days from authorization of the PSI work plan, unless completion is delayed to meet target letting dates for other projects. After all comments on the draft PSI report have been addressed, BDE issues a revised final PSI report. At various milestones in the PSI process, the DESU will be alerted of the anticipated cost, schedule, technical details and results. The DESU can and should actively participate in the process by providing comments about the proposed actions and communicate this information as necessary with others, for example, district land acquisition.

BDE forwards to the district a final PSI report with the appropriate special provision for management and monitoring of the contaminated areas. BDE also forwards a copy of the report to the Central Bureau of Land Acquisition, if requested, the Office of Chief Counsel (to consider if any legal actions may be necessary), the Illinois State Geological Survey, and the appropriate State agencies (e.g., Office of State Fire Marshal, IEPA), as appropriate. If the district accepts BDE recommendations, it so advises BDE. If the recommendations are accepted prior to design approval, the district should summarize the proposal for management and monitoring of the property(ies) in the environmental documentation for the project. Estimated cleanup costs should be included in project environmental documents and must be included when the costs of property involvement vary for different alternatives under study.

The target for completion of the final PSI report for most projects will be within six months of the district's request to conduct the PSI, unless completion is delayed to meet target letting dates for other projects. The PSI report will identify areas impacted by special waste or regulated substances, recommend actions to be taken, and provide estimated costs for excavating, transporting, and disposing of materials exceeding IEPAs:

1. Tiered Approach to Corrective Action Objectives (TACO) Tier 1 Soil Remediation Objectives for Residential Properties (35 Ill. Admin. Code 742), and/or
2. Most stringent maximum allowable concentration (MAC) for chemical constituents in uncontaminated soil established pursuant to the proposed Subpart F of 35 Ill. Admin. Code 1100.605.
3. Other regulatory thresholds applicable and appropriate to the scope of the investigations.

The cost information will include a soil management estimate for each proposed right-of-way/temporary easement parcel based upon proposed construction excavation. In some cases, a second estimate is included for land acquisition and full take situations based on cleanup of the parcel to be obtained without regard to the proposed construction excavation. The district will review the cost estimates for excavation, transportation, and disposal of the material containing regulated substances and advise whether they are acceptable. If the district determines the costs are unacceptable, the district will further investigate alternatives to avoid involvement with the impacted property(ies).

Following completion of the PSI, BDE will provide the district with a regulated substances special provision consistent with Section 669 of the Standard Specifications for Road and Bridge Construction for inclusion in the construction documents.

27-3.05(b) Remedial Investigation/Feasibility Study and Risk Assessment

Following completion of the IDOT internal reviews of the draft PSI and prior to incorporation of any necessary revisions in the PSI report, BDE, in consultation with the Office of Chief Counsel as appropriate and the Statewide Regulated Substances Investigation Consultant, will evaluate whether sufficient information is available to determine the total extent of special waste/regulated substance contamination for which the Department would be liable relative to the project and the estimated cost and method for cleanup or whether a Remedial Investigation/Feasibility Study (RI/FS) is needed.

If BDE, in consultation with the Office of Chief Counsel as appropriate, determines additional information is needed for determining the extent of contamination and method(s) and cost for cleanup of the property(ies), it will advise the district. The district will be required to fund the additional studies. Accordingly, BDE will not proceed with arrangements until the district has confirmed it will provide the necessary funding. If the district re-examines the project and identifies a strategy to avoid the property(ies), the need for the additional studies may be eliminated. Upon receiving confirmation from the district for funding the additional studies, BDE will initiate a request to the Statewide Regulated Substances Consultant for a RI/FS and, if appropriate, a Risk Assessment. The purpose of the RI will be to precisely determine the extent of the soil and/or groundwater contamination exceeding IEPA's TACO Tier 1 Soil Remediation Objectives for Residential Properties (35 Ill. Admin. Code 742). The purpose of an FS will be to identify options for addressing the property(ies) and the estimated costs of each. The purpose of a Risk Assessment will be to determine the potential of the contamination for coming into contact with people (e.g., directly or through water supplies), or otherwise posing a threat during or after construction, if left in place. A Risk Assessment will be prepared only when the Statewide Regulated Substances Investigation Consultant determines in the FS that the levels of contamination and their location are such that leaving the waste in place may be an option.

Upon its completion, BDE reviews the results of the RI/FS. After incorporation of any necessary changes, BDE forwards the results to the district with a request for the district to advise which option for addressing the property(ies) it wishes to select (normally based on cost). Upon receipt of the district's response, BDE forwards the recommendation to IEPA for acceptance of the selected Remedial Action Plan (in the case of a cleanup option) or Risk Assessment (in the case of a proposal to leave the contamination in place). If IEPA accepts the recommended course of action, BDE will advise the district. BDE and the Statewide Regulated Substances Investigation Consultant, as necessary, will continue to be involved to assist the district in the preparation of plans and specifications for implementing the Remedial Action Plan. Also, if IEPA objects to the proposed course of action, BDE will continue to be involved in coordination to assist the district in responding to the objections. As practical, the selected method of addressing the property(ies) and the results of coordination with IEPA should be discussed in project environmental documents.

Note: For properties on the National Priorities List, the nationwide list of hazardous waste sites maintained by the USEPA for purposes of assigning priorities for cleanup (National Priorities List sites are identified in the SEMS list), the public must be afforded an opportunity to comment on the analysis of alternatives for addressing the property(ies). As practical, the district should address this requirement as a part of the normal public involvement activities for the project. Estimated costs for addressing the sites should be indicated, particularly when the costs of site involvement vary for different alternatives under study.

27-3.06 Relationship of Regulated Substances Evaluation Process Results to Design Approval

Since regulated substances evaluation is required for every applicable project, design approval clearance for regulated substances is obtained, when results of the evaluation support one of the following scenarios:

1. The project clears a Level 1 screening as described in Section 27-3.02(a). The request for design approval clearance must include a copy of the fully completed Level 1 Screening form and BDE 2737.

2. The project clears a Level 2 screening as described in Section 27-3.02(b). The request for design approval clearance must include a copy of the fully completed Level 2 Screening form and BDE 2737.

3. The project clears a Level 3 screening, as described in Section 27-3.02(c). The request for design approval clearance must include a copy of the fully completed Level 3 screening form, BDE 2737 and BDE 2738, if required.

4. The PESA indicates that the project has no property(ies) with a REC (other than de minimis). The request for design approval clearance must include a copy of the BDE PESA Review memorandum confirming the no REC determination.

5. The PESA indicates that the project has property(ies) containing a REC(s) and the district has determined that the property(ies) can be avoided. The request for design approval clearance must include a copy of the memorandum from BDE transmitting the PESA report and the district's avoidance determination, documented on the PESA Response form. The information regarding the avoidance determination must be included in the commitment file for the project to ensure follow-through in subsequent stages of project development and implementation.

6. The PESA indicates that the project has property(ies) containing a REC(s) and the district has determined the property(ies) cannot be avoided. The request for design approval must include a copy of the memorandum from BDE transmitting the PESA report. Design approval can be given subject to the condition that subsequent studies (e.g., PSI), if needed, will be completed before the district may acquire any additional ROW/easements or underground storage tanks from any property containing a REC and before the PS&E date associated with a project letting.

The following documentation, if required for the project, must be included in the district project file and the Phase I Engineering Report:

1. BDE 2737 showing the results of the Level 1, 2 and 3 screenings, and
2. PESA (or equivalent ISGS report) Review Memo from BDE.

The district must reflect in the commitment file for the project the requirement for completing the PSI and other related studies, if needed, prior to completing acquisition of any contaminated parcel and/or the project letting date and must ensure follow-through on the commitment. If the district intends to request the PSI, it should initiate arrangements with BDE well in advance (a minimum of six months) before the projected date(s) for acquisition of the affected property(ies) and the PS&E letting milestone to allow sufficient time for completion of the PSI and inclusion of the special provision into the plans and letting documents.

27-3.07 Relationship of Regulated Substances Evaluation Process Results to Land Acquisition

The Bureau of Design and Environment (BDE) recommends an environmental review of any property, including donated land, prior to taking ownership or relinquishing ownership. The goal is to proactively obtain environmental information about a property(ies) so that a reasoned decision can be made whether or not to proceed with the property transfer, determine what type of contract language may be appropriate, and thereby minimize the potential environmental liability to the Department, in adherence to Departmental Policy D&E-11, “Identifying and Responding to Regulated Substances in Project Development, Implementation and Operations.” The D&E-11 policy states, among other items, that “Due care shall be exercised to determine whether regulated substances may be present on property being considered for use for state highway project purposes and supporting highway operations and maintenance. Acquisition of an interest in a property determined to contain regulated substances shall be avoided unless the risks and liabilities of such acquisition can be justified, documented, and appropriately managed.” As such, and in accordance with the Section 10.1.2 of the Land Acquisition Policies and Procedures Manual, the regulated substance evaluations (PESA and PSI) must be completed, and the results must be considered by district Land Acquisition, prior to completing acquisition of a property.

The following sections provide additional information for situations involving property acquisition, donation of land to the Department, divestiture of excess land by the Department, and acquisition of parcels with existing underground storage tanks (USTs).

27-3.07(a) Acquisitions

For property acquisitions associated with projects to which the opening paragraph of Section 27-3 does not apply (i.e., maintenance yard expansions), the district shall follow Chapter 10 of the Land Acquisition Policies and Procedures Manual and coordinate the proposed acquisition with the District Environmental Studies Unit (DESU). Prior to acquiring a new property, the DESU should submit an Environmental Survey Request (ESR) for the proposed subject parcel. The BDE will review the information and will typically task ISGS to complete an All Appropriate Inquiries (AAI) on the subject property. This report type includes a more detailed evaluation of the property than a typical PESA and provides liability protection under CERCLA. The AAI is typically tasked to ISGS with a 3-month desired turnaround time.

Based on the results of the AAI, BDE may need to complete additional work (e.g., PSI, geophysical survey) to determine environmental site conditions prior to acquisition. Once the evaluation process is completed by BDE, the results will be forwarded to the district via the DESU.

27-3.07(b) Donations to the Department and Divestitures by the Department

For information on property donations to the Department or divestitures by the Department, refer to the Land Acquisition Manual Section 3.6.14, Valuation of Contaminated Property and Chapter 10, Special Waste.

27-3.07(c) Underground Storage (UST) Parcels

Land acquisition of properties with a UST or LUST containing petroleum or other chemicals poses additional hazards and potential significant liability to the department requiring careful evaluation and coordination. The acquisition of such properties shall not be completed until the Phase I and Phase II regulated substances evaluation process is complete, thus allowing land acquisition proceedings to consider and incorporate results of the regulated substances assessment.

When considering land acquisition at a property with potential or known UST(s), the district shall follow Chapter 10 of the Land Acquisition Manual titled Special Waste, specifically, Section 10.1.3. The acquisition of a property shall be pursued in a manner that will not cause the department to be classified as an "owner/operator" as defined in the Leaking Underground Storage Tank Program (415 ILCS 5/57.2), unless due care has been conducted to assess and measure the presence of regulated substances in the environment caused by the target property, and sufficient district resources have been allocated by the district to fulfill subsequent assessment and remediation costs associated with environmental corrective action.

27-3.08 Relationship of Regulated Substances Evaluation Process Results to Contract Letting

The district should ensure a PSI is completed, when applicable, and to ensure all commitments in the environmental document regarding the monitoring and management of regulated substances are included in the contract prior to letting. The district will provide BDE with written notification (i.e., Certification Acceptance/Project Status form) that all required regulated substances studies have been completed and are current (valid).

Regulated Substances clearance for letting is achieved when results of the regulated substances process support one of the following:

1. The project clears a Level 1 screening as described in Section 27-3.02(a);
2. The project clears a Level 2 screening as described in Section 27-3.02(b);
3. The project clears a Level 3 screening as described in Section 27-3.02(c). If BDE 2738 is required as part of the successful Level 3 screening, a regulated substances special provision is prepared by BDE for inclusion in the contract;
4. The PESA indicates that the project has no property(ies) with a REC (other than de minimis)
5. The PESA indicates that the project has properties with a REC and the district has determined the property(ies) can be avoided and the district will not need right-of-way from the REC property, if applicable; or
6. A regulated substance special provision is prepared by BDE for inclusion in the contract resulting from successful completion of a PSI or an RMP.

27-3.09 Validity of Regulated Substances Evaluation Assessment Results

Standards issued by the American Society for Testing and Materials (ASTM) and AAI indicate property assessments for special waste/regulated substance contamination shall only be considered valid for a period of six months. This reflects the realization that special wastes and other regulated substance contamination often may be introduced (through illegal disposal, off-site migration, spills, or generation from new or different land uses) into areas previously evaluated for contamination. Before proceeding with arrangements for a PSI, Remedial Investigation/Feasibility Study (RI/FS), and/or before completing land acquisition or receiving NEPA approval, the DESU should re-evaluate the project area to check for new reported releases and determine if land uses have changed within the project area, including site reconnaissance, a process called "validation." The DESU will also demonstrate the PESA will be current through the anticipated PS&E date associated with the desired letting.

Validation should be conducted in the following scenarios:

1. For projects that were signed-off under a Level 2 screening, if six months or more have elapsed since the last Level 2 screening of the project area, the DESU should validate the project area using the Level 2 regulated substances waste screening criteria methodology.

2. For projects that were signed-off under a Level 3 screening, if six months or more have elapsed since the last Level 3 screening of the project area, the DESU should validate the project area using the Level 3 regulated substances screening criteria methodology.

3. For projects that a PESA was conducted:

    a. if six months or more have elapsed since the PESA report was completed for the project area (identified by the date of the PESA report), the DESU should validate the project area using the Level II special waste screening criteria methodology. If land use changes or new releases are identified, the entire project should be re-evaluated as a new PESA prior to proceeding with arrangements for further special waste/regulated substances investigations or before finalizing land acquisition. If no land use changes or new releases are identified as a result of the validation process, the district DESU can sign-off the project by checking and dating the "Validation – Level 2" screen in PMA and maintain documentation for the project file.

    b. If three years or more have elapsed since the last PESA report was prepared (identified by the date on the PESA report), then the entire project should be evaluated as a new project and, if necessary, a new PESA should be requested.

4. Projects for which a Site Assessment Letter Report (SALR) for an EA/EIS was conducted, a full PESA should be initiated in Phase II once the district chooses to move toward construction with the preferred alternative. At this point, the PESA and PSI process is similar to a CE project.

5. If a PSI was conducted for a project and five years or more have elapsed since it was completed, the entire project should be evaluated for land-uses with a REC and a new PESA must be conducted prior to proceeding with the aforementioned project actions.

When re-evaluation of a PESA or PSI is necessary to verify its validity, the re-evaluation should consider any changes in the proposed action, the affected environment, anticipated special waste/regulated substance involvement, and proposed measures for addressing the special waste(s)/regulated substance(s). Sufficient detail must be provided to support a decision on whether a PESA or PSI addendum is necessary.

27-3.10 Phase III Construction Requirements

During Phase III construction, the DESU and BDE have various responsibilities for demonstrating proper management of regulated substances. Section 669 of the Standard Specifications for Road and Bridge Construction and the regulated substances special provision outline these requirements. BDE provides supplementary information below on the following Phase III construction topics:

1. Regulated Substances Pre-Construction Plan
2. Pre-Construction Meeting
3. Regulated Substances Monitoring
4. Regulated Substances Management and Disposal
5. Temporary Staging
6. Unexpected Regulated Substances
7. Underground Storage Tanks Encountered During Construction
8. Regulated Substances Final Construction Report

27-3.10(a) Regulated Substances Pre-Construction Plan

Prior to commencement of construction activities in areas regulated under the special provision, i.e., the contract specific work areas, the contractor will submit BDE 2730, Regulated Substances Pre-Construction Plan (RSPCP) to the Resident Engineer (RE) no later than 21 calendar days prior to commencement of construction activities. The RE will delegate review of the form to the DESU, which will have 10 calendar days to review and return the form to the RE. BDE 2731 serves as a checklist to assist the DESU in review of BDE 2730. This checklist includes all required information the DESU must verify as part of their review of the RSPCP.

If information on BDE 2730 is missing or insufficient, the DESU will reject the form and provide a thorough explanation on BDE 2731 why the RSPCP was rejected. The DESU will sign BDE 2730, and provide BDE 2730 and BDE 2731 to RE. The RE will sign both forms and will send them back to the contractor for revisions. Once a revised BDE 2730 is provided to the RE, additional 21 calendar days will be required for review by IDOT prior to commencement of construction activities.

Upon approval of BDE 2730, the DESU signs the form, provides BDE 2730 and BDE 2731 to the RE, and the RE will accept the form on behalf of the district. Only after the form is approved by the DESU and accepted by the RE can the contractor begin construction activities in areas regulated under the special provision.

27-3.10(b) Pre-Construction Meeting

The DESU should attend the Bureau of Construction pre-construction (pre-con) meetings to review the RCPSP requirements and answer questions regarding regulated substances management. The pre-con meetings provide an opportunity to discuss issues or questions prior to the commencement of construction activities when they can be more easily addressed.

27-3.10(c) Regulated Substances Monitoring

Regulated substances monitoring entails a systematic approach to observing, responding to, and documenting conditions in the environment (e.g., construction site). It is required during regulated substances management activities at the contract specific work areas. These work areas are identified in the regulated substances special provision for the contract. The Construction Manual and Sections 669.03 and 669.04 of the Standard Specifications for Road and Bridge Construction provide more details about this topic.

27-3.10(d) Regulated Substances Management and Disposal

A regulated substances special provision identifies contaminated soil, sediment, and groundwater restrictions for an IDOT project and dictates proper management of that material during construction. The Construction Manual and Section 669.05 of the Standard Specifications for Road and Bridge Construction provide more information for the various methods of managing regulated substances encountered during construction.

27-3.10(e) Temporary Staging

If circumstances require the contractor to use temporary staging for soil, groundwater, or material other than those specified above, the contractor will request written approval from the Resident Engineer in consultation with the DESU and BDE. The Construction Manual and Section 669.07 of the Standard Specifications for Road and Bridge Construction list the general requirements for temporarily staged material containing known or suspected regulated substances.

27-3.10(f) Unexpected Regulated Substances

When unexpected regulated substances are encountered during construction, the contractor shall follow Sections 107.19 and 669.04 of the Standard Specifications for Road and Bridge Construction, and work in the affected area will immediately stop. The contractor will notify the Resident Engineer (RE) who will consult with the DESU, as necessary.

The contractor will prepare an amended RSPCP (BDE 2730A) and additional information including:

1. A description of the circumstances and type of unexpected conditions encountered;

2. An estimate of the extent of regulated substances within the work area;

3. The sampling methods and parameters to be used based on contaminants of concern and property's land use history and the encountered abnormality;

4. The sample preservation and chain-of-custody methods; and

5. A cost estimate of materials, labor, equipment, etc. necessary for the DESU to determine how potential regulated substance(s) shall be managed. The cost estimate should be listed in terms of applicable construction pay items.

The contractor will submit BDE 2730A to the RE who will then delegate review of the form to the DESU. The DESU shall review BDE 2730A as described above in Section 27-3.10(a). Once the DESU approves BDE 2730A, they will submit it to the RE for acceptance. Only after BDE 2730A is approved by the DESU and accepted by the RE shall work resume in the affected area. The contractor will follow requirements of BDE 2730A, and all activities completed to address the unexpected regulated substances will be documented in the Regulated Substances Final Construction Report (RSFCR) in accordance with Section 669.09.

Examples of unexpected regulated substances occurrences include encountering:

1. Railroad ties. In such cases, Technical Environmental Memorandum TEM I-6-94 (Waste Classification of Railroad Ties) shall be followed.

2. Underground storage tanks (USTs). In such cases, refer to Section 27-3.10(g) for information on handling unexpected USTs.

27-3.10(g) USTs Encountered During Construction

Once the department becomes aware of the presence of an undocumented/orphan UST on highway right-of-way (ROW) under the department's jurisdiction, the tanks system shall be removed or abandoned in-place as necessary in accordance with D&E-15, Removal of Orphan Underground Storage Tanks procedures and the Office of the Illinois State Fire Marshall (OSFM) regulations, whether or not will be affected by planned construction activities.

UST removal activities must be completed in conformance with Section 669.08 of the Standard Specifications for Road and Bridge Construction. The UST removal activities, including moving or opening UST, shall not begin until a completed OSFM UST removal permit has been obtained. Upon discovery of an undocumented/orphan UST, the DESU shall be responsible for coordinating the following process between the contractor, RE and BDE:

1. The contractor will notify the Resident Engineer (RE). The RE will notify the DESU who will coordinate with BDE.

2. Activities must be completed by a licensed UST removal contractor meeting the qualifications for regulated substances and UST work as detailed in Section 669.03 of the Standard Specifications for Road and Bridge Construction.

3. The removal contractor must complete an online draft UST removal application on the OSFM website. The removal contractor must check the box indicating that the removal is related to an IDOT project. The draft application must include supporting documentation, such as a site plan with the UST location, aerial images of the site and surrounding area, a description of

the work, etc. These documents must be uploaded to the OSFM website with the permit application. Although the UST may be an orphan tank, the IDOT district office shall be listed as the owner of the UST on the permit application and the district environmental studies unit chief shall be listed as the contact person. Once the draft permit is submitted online, BDE will be automatically alerted via email by the OSFM tank permit system. Paper applications are not acceptable. Online applications are required so BDE can modify them, as necessary.

4. The BDE will review and edit the online draft application and compose a cover letter stating the UST is an orphan tank, and IDOT has never been the owner or operator of that UST. If the UST is deemed to be pre-1974, it will be addressed in the cover letter.

5. The BDE will submit the draft application to the IDOT Office of Chief Council (OCC). Following OCC approval, BDE will approve the OSFM online draft application.

6. The OSFM will review the application and, after approval, will issue a UST removal permit to the licensed contractor. The BDE and the tank removal contractor will be alerted via email, and the removal contractor can download the permit from the OSFM website.

7. The removal contractor and District Environmental Studies Unit will schedule the UST removal with the OSFM and inform BDE of the proposed removal date.

8. Once the UST has been removed, the licensed removal contractor's environmental consultant must conduct a Site Assessment in accordance with 41 Ill. Admin. Code 176.360(a) consisting of soil sample collection from the excavation floor and sidewalls. A ground water sample shall also be collected if water is encountered. A Site Assessment is always required; it is not dependent on a release being confirmed or not by the OSFM on-site inspector.

9. In accordance with 41 Ill. Admin. Code 176.330, a Site Assessment Report must be completed by the removal contractor within 45 days of the UST removal, regardless of whether or not a release is reported for the site. The report is uploaded to the OSFM website by the removal contractor.

27-3.10(h) Regulated Substances Final Construction Report (BDE 2733)

Following completion of construction activities, the contractor will submit BDE 2733, Regulated Substances Final Construction Report (RSFCR) to the Resident Engineer (RE) in conformance with Section 669.09 of the Standard Specifications for Road and Bridge Construction. Information provided in the document details the regulated substances activities conducted during the project and describes the methods and manners in which materials were managed to document compliance with Section 669 and the regulated substances special provision.

The contractor will prepare BDE 2733 no later than 90 calendar days after the completion of construction activities as follows:

1. One hard copy and one electronic copy must be submitted to the RE;

2. One hard copy and one electronic copy must be submitted to the DESU; and

3. One electronic copy must be submitted to BDE.

The DESU shall review the form within 60 calendar days of receiving it from the contractor. BDE 2734 is a checklist to assist the DESU in review of BDE 2733 and includes all required information the DESU must verify as part of their review of the RSFCR.

If information on BDE 2733 is missing or insufficient, the DESU will reject the form and provide a thorough explanation on BDE 2734 why the RSFCR was rejected. The DESU will sign BDE 2733, and both BDE 2733 and 2734 will be sent to the RE. The RE will sign both forms and will send them back to the contractor for revisions. Once a revised BDE 2733 is provided to the RE, an additional 60 calendar days will be required for review by IDOT.

Upon approval of BDE 2733, the DESU shall sign the form indicating it has been approved. The DESU will provide BDE 2733 and 2734 to the RE, and the RE will accept the form on behalf of the district. Upon approval by the DESU and acceptance by the RE, the RSFCR pay item can be processed.

27-3.11 Recovery of Costs

For property(ies) involving transportation and disposal costs for regulated substances, the Department may pursue cost recovery from responsible parties. For all property(ies), BDE will provide a special provision regarding proper record-keeping for the costs associated with the property(ies). Compliance with the special provision will ensure that appropriate expenditure records are available for any cost-recovery action. When the Department pursues cost recovery for property(ies) involving hazardous substances, the Office of Chief Counsel will advise if the public must be afforded an opportunity to comment on the analysis of alternatives for addressing the property(ies).

When the opportunity for public comment must be afforded, the district should address this requirement, as practical, as a part of the normal public involvement activities for the project. An opportunity to comment may be announced through public notice(s) or can be addressed by making information regarding the alternatives for addressing the hazardous substance property(ies) available at public meetings/hearings.

27-3.12 Responding to FOIA Requests for Special Waste Information

If a Freedom of Information Act (FOIA) request is received by the district to obtain information concerning regulated substances investigations (e.g., PESA and PSI) conducted for IDOT projects, the request and any responsive records shall be immediately forwarded to the Department's FOIA Officer at DOT.FOIAOfficer@illinois.gov. The FOIA Officer and Office of Chief Counsel will conduct a review to determine if any information within the responsive records should be withheld under one or more of FOIA statutory exemptions. The district shall provide assistance to the FOIA Officer in order to prepare an appropriate response to the request.

27-3.13 Responding to General Information Requests

An outside entity (e.g., local public agency or their consultant) working on a road project involving roadway under IDOT jurisdiction may request a copy of IDOT environmental assessments completed in the affected area. In these specific situations, it is appropriate to provide the entity with a copy of the IDOT PESA(s) or other similar Phase I due diligence assessments associated with the road project. Because the information presented in these documents is readily accessible via public sources, the Phase I assessments can be provided to the entity without a FOIA request.

Phase II assessments (e.g., PSI) should not be released in the manner described above. Rather, if the entity desires to obtain a copy of IDOT PSIs or other similar intrusive environmental assessments, they should be directed to submit a FOIA request. The PSI and supporting documents are available to “authorized bidders” through the Department’s standard bidding process (i.e., the Integrated Contractor’s Exchange or ICX).

All other situations involving requests for regulated substances assessments completed by IDOT shall be handled through the Department’s FOIA process.

27-4 ASBESTOS REQUIREMENTS FOR HIGHWAY BRIDGES

27-4.01 Background

In an October 19, 2001 letter, the Region 5 Office of the U.S. Environmental Protection Agency (USEPA) approved a Department request for a waiver from the asbestos notification requirements under 40 CFR 61.145 for highway bridges, as defined in 23 CFR 650.403(a), determined not to involve asbestos in the bridge deck wearing surface or waterproofing membrane. The initial group of bridges covered by the waiver was included in a list sent to each district. The USEPA Region 5 also approved the Department's proposed approach for addressing bridges in which involvement of asbestos in the bridge deck wearing surface or waterproofing membrane is unconfirmed. Application of this approved approach will allow for exempting other bridges from the asbestos notification requirements upon confirmation that the bridge deck wearing surface and waterproofing membrane, if one is present, do not contain asbestos.

These procedures do not address the evaluation of asbestos in structures such as tender houses associated with bridges. Work affecting such structures should be coordinated with the Asbestos Abatement Unit in the central Bureau of Administrative and Facility Services for compliance with applicable inspection and notification requirements. This coordination should be initiated sufficiently in advance of the commencement of work that would affect the structures to allow time for accomplishing any necessary investigations and paperwork.

Additionally, these procedures do not address the evaluation of and response to asbestos in pipes, conduits, or other such utilities associated with bridges. The owners of the pipes, conduits, etc. shall be responsible for determining whether they involve asbestos and for ensuring compliance with applicable requirements for any work that could disturb regulated asbestos that the pipes, conduits, etc. may contain. If unexpected pipes or conduits are encountered (e.g., embedded in the concrete bridge components), work affecting the pipes or conduits shall be suspended until ownership has been determined and any necessary inspection, testing, and notification has been completed.

The following sections describe the procedures for documenting application of the notification waiver for bridges in the initial group and for applying and documenting the approved approach for addressing bridges with unconfirmed asbestos involvement. They also describe the notification procedures and special provision to be followed for bridges involving bituminous overlays and waterproofing membranes that are confirmed to contain asbestos.

Bridge lists coordinated with IEPA for purposes of the asbestos notification waiver request were prepared in cooperation with the Bureau of Urban Program Planning, Planning Services Section based on information provided by the districts. If errors or omissions are found in the lists, they should be brought to the attention of the Planning Services Section in Urban Program Planning and the Bridge Planning Section in the Bureau of Bridges and Structures.

27-4.02 Applicability

The procedures in this memorandum are applicable to all highway bridges under State jurisdiction.

27-4.02(a) Procedures

For all projects that will involve bridge demolition (removal or wrecking of any load-supporting structural member), reconstruction, rehabilitation, or deck repair, the district must determine and document applicability of the asbestos notification requirements. The district will be responsible for complying with the asbestos notification requirements for any work that will disturb a bridge deck wearing surface or waterproofing membrane that contains asbestos. (See Section 27-4.01 regarding structures such as tender houses and pipes or conduits associated with a bridge that may contain asbestos). The asbestos notification determination should be completed as far in advance as practical of the anticipated date for beginning construction work to allow enough time for compliance with notification requirements, if applicable. The asbestos notification determination and documentation for highway bridges shall be accomplished in accordance with the following procedures.

For purposes of documenting the asbestos determination finding, BBS 2536, Asbestos Determination Certification form can be used to cover multiple structures when the same asbestos determination finding applies. BBS 2536 would then be submitted to the Bridge Planning Section of the Bureau of Bridges and Structures, and a copy included in the district files and Phase I Engineering Report for each project involving one of the covered structures, as described in these procedures. The following discusses five potential determination outcomes, as described on the form.

27-4.02(b) Bridges on Approved No Asbestos (Waiver) List

Each district has been provided a list of bridges covered by the notification waiver as of October 19, 2001, the date of USEPA approval of the waiver. This list is labeled “State Owned Bridges - No Asbestos.” For bridges included in this list, the district should complete the “Structure Identification” and “Certification” sections of BBS 2536 and check box number 1. A copy of the completed form should be included in the district files and in the Phase I Engineering Report when a project is proposed involving demolition, reconstruction, or rehabilitation of the bridge, or repair of the deck on the bridge. This will document the basis for determining that the bridge does not contain asbestos in the bridge deck wearing surface or waterproofing membrane and is exempt from the asbestos notification requirements.

27-4.02(c) Bridges on Confirmed/Unconfirmed List

Each district has also been provided a second list of bridges that either are known to contain asbestos or for which the presence or absence of asbestos is unconfirmed. This list is labeled “State Owned Bridges Under Investigation for Asbestos.” For bridges listed as having known asbestos involvement refer to the procedures in the section below on “Asbestos Involvement Confirmed.” For unconfirmed cases, proceed with the following steps for evaluation.

27-4.02(d) Evaluation Based on Available Information

In accordance with the approach approved by USEPA, if a bridge is included in the list of bridges under investigation for asbestos and is unconfirmed for asbestos involvement, the district should first examine available information (e.g., file information, bridge plans) to attempt to verify whether asbestos is present in the bridge deck wearing surface or waterproofing membrane. If the district confirms based on its information that asbestos is involved, refer to Section 27-4.03(e).

If the district confirms based on its information that asbestos is not involved, it should complete the “Structure Identification” and “Certification” sections of BBS 2536 and check box number 2. The district shall submit a copy of the completed form to the Bridge Planning Section of the Bureau of Bridges and Structures at the time the asbestos determination is made. Bridges covered by a signed BBS 2536 indicating that no asbestos is present will be exempt from the EPA asbestos notification requirements upon submittal of the signed certification form to the Bureau of Bridges and Structures. These bridges will be re-coded as “Asbestos Investigation Status: Complete” and “Bridge Contains Asbestos: N” on the list of bridges under investigation for asbestos. The Bureau of Bridges and Structures will provide the affected district(s) and IEPA (which administers the asbestos requirements in Illinois on behalf of USEPA) updates to the bridge list for any month in which changes occur. A copy of the completed BBS 2536 should be included in the district files and in the Phase I Engineering Report when a project is proposed involving demolition, reconstruction, or rehabilitation of the bridge, or repair of the deck on the bridge.

27-4.02(e) Evaluation Based on Sampling and Testing

If information available to the district is not enough to confirm whether or not a bridge involves asbestos, the following sampling and testing procedures shall be applied. Asbestos determination for applicable bridges must be completed prior to commencing any work that would disturb the wearing surface or waterproofing membrane. The determination must be made sufficiently in advance of the commencement of construction or demolition work to allow compliance with the notification requirements of the asbestos national emissions standards; see 40 CFR 61.

27-4.02(e)1 ***Sampling***

The purpose of this sampling procedure is to obtain one or more representative samples of the bituminous wearing surface and/or waterproofing membrane, if one is present, for asbestos determination. At least one sample must be taken from each representative portion of the suspect bridge deck overlay material. If portions of a bridge deck involve overlay materials installed at different times, each such area must be sampled. If there is any reason to suspect that overlay materials might be different, even though they appear uniform, they should be sampled separately. Use of a licensed asbestos inspector for conducting the sampling is not required provided the protocol described below is followed.

Before initiating sampling, prepare a plan-view diagram of the bridge deck indicating the approximate dimensions, the area(s) of the deck surface to be sampled, and the sample location(s). If more than one sample will be taken, number the sample locations on the diagram and use the corresponding numbers when labeling each sample. The sampling diagram should be retained in the project files at least until testing of the samples has been completed and any areas of the bridge deck requiring application of the special provision for “Asbestos Waterproofing Membrane and Asbestos Bituminous Concrete Surface Removal (BDE)” have been identified.

Samples shall be removed with a minimum 2-inch diameter core drill. The depth of each sample shall be sufficient to include the full thickness of both the bituminous wearing surface and the waterproofing membrane, if one is present. For each sampling operation, sufficient water shall be applied before and during the core drilling to prevent generation of airborne dust as a result of the drilling and removal of the sample. Upon removal of the core sample, it shall immediately be placed in a resealable plastic sample bag. Each sample bag shall be labeled with the structure number (000-0000); route identification; county; water body or facility crossed; name and employer, if other than IDOT, of the person removing the sample, and sample number keyed to the diagram of the bridge deck showing the sample location(s).

27-4.02(e)2 ***Testing***

The samples of the bituminous bridge deck wearing surface and/or bituminous waterproofing membrane shall be tested for the presence of asbestos using the Polarized Light Microscopy (PLM) method specified in Section 1 of Appendix E, Subpart E, 40 CFR 763. The testing shall be performed by a laboratory that has National Voluntary Laboratory Accreditation Program (NVLAP) or National Environmental Laboratory Accreditation Program (NELAP) accreditation for asbestos fiber analysis using the PLM method and is equipped for performing analysis of non-friable organically bound asbestos using Gravimetric Reduction.* If a bituminous waterproofing membrane layer is present, testing shall be conducted on portions of the sample from both the waterproofing membrane layer and the wearing surface layer. Materials which are determined, through application of the specified testing method, to contain more than one percent asbestos are classified as Category II non-friable Asbestos Containing Materials (ACM). Work that would disturb Category II non-friable ACM is subject to the notification requirements in 40 CFR 61.145. Removal of such materials shall be accomplished in accordance with the Statewide special provision for “Asbestos Waterproofing Membrane and Asbestos Bituminous Concrete Surface Removal (BDE).”

A listing of laboratories that are accredited for asbestos testing through the NVLAP is available at http://ts.nist.gov/ts/htdocs/210/214/scopes/plmtm.html.

Information concerning laboratories that are accredit ed through the NELAP is available at http://www.epa.gov/ttn/nelac/accreditlabs.html.

27-4.02(e)3 ***Results***

If the results of testing confirm that asbestos is not involved, complete the “Structure Identification” and “Certification” sections of BBS 2536 and check box number 3 in the “Asbestos Determination” section. The district shall submit a copy of the completed form to the Bridge

Planning Section of the Bureau of Bridges and Structures at the time the asbestos determination is made. Bridges covered by a signed BBS 2536 indicating that no asbestos is present will be exempt from the IEPA asbestos notification requirements upon submittal of the signed certification form to the Bureau of Bridges and Structures. These bridges will be re-coded as “Asbestos Investigation Status: Complete” and “Bridge Contains Asbestos: N” on the list of bridges under investigation for asbestos. The Bureau of Bridges and Structures will provide the affected district(s) and IEPA updates to the bridge list for any month in which changes occur. A copy of the completed BBS 2536 should be included in the district files and in the Phase I Engineering Report when a project is proposed involving demolition, reconstruction, or rehabilitation of the bridge, or repair of the deck on the bridge.

If the test results confirm that asbestos is involved, refer to the next section.

27-4.02(f) Asbestos Involvement Confirmed

For bridges that are confirmed to involve asbestos in the bridge deck wearing surface and/or waterproofing membrane, if one is present, complete the “Structure Identification” and “Certification” sections of the BBS 2536 and check box number 4. A copy of the completed form should be included in the district files and in the Phase I Engineering Report when a project is proposed involving demolition, reconstruction, or rehabilitation of the bridge, or repair of the deck on the bridge. For structures that the “Asbestos Investigation Status” is shown as “Not Complete” in the list of bridges under investigation for asbestos, the district also should submit a copy of the completed form to the Bridge Planning Section of the Bureau of Bridges and Structures at the time the asbestos determination is made. The information in the list will be re-coded to indicate “Asbestos Investigation Status: Complete” and “Bridge Contains Asbestos: Y” and updates will be provided to the affected district(s) and IEPA for any month in which changes occur in the list.

The district will be responsible for ensuring compliance with the asbestos notification requirements for demolition or renovation of bridges involving deck wearing surfaces or waterproofing membranes containing asbestos. A completed “Notification of Demolition and Renovation” form (available at http://www.epa.state.il.us/air/asbestos/asbestos-form-combined.pdf) must be submitted to IEPA at least 10 working days prior to commencing any work that would disturb any of the bituminous materials containing asbestos.

The IEPA has advised that the start date and complete date for demolition and asbestos removal are key items of information for the notification. If exact dates are not known at the time the initial notification form is submitted estimated dates may be used. Revised notification must then be submitted to correct the information when the actual start and complete dates have been determined. The revised notification still must satisfy the requirement for submittal at least 10 working days prior to commencing any work that would disturb any of the bituminous materials containing asbestos. Since the notification forms will generally require information from both the contractor and the district, it is suggested that, where practical, the notification forms should be prepared at the pre-construction conference.

The district will also be responsible for ensuring that the special provision for “Asbestos Waterproofing Membrane and Asbestos Bituminous Concrete Surface Removal (BDE)” is included in the contract for work involving removal of bridge deck wearing surfaces or waterproofing membranes containing asbestos. The district should include a general note in the project plans or in the project commitment file to indicate that asbestos is present and will be subject to a special provision.

When removal operations are completed for all asbestos bituminous concrete surface and asbestos waterproofing membrane on a bridge, the district should complete the “Structure Identification” and “Certification” sections of BBS 2536 and check box number 5 and submit a copy of the completed form to the Bridge Planning Section in the Bureau of Bridges and Structures. The information in the bridge list will be re-coded to indicate “Bridge Contains Asbestos: N” and updates will be provided to the affected district(s) and IEPA for any month in which changes occur. Bridges covered by a signed BBS 2536 form indicating that all asbestos-containing materials have been removed will be exempt from the IEPA asbestos notification requirements upon submittal of the signed certification form to the Bureau of Bridges and Structures. A copy of the completed form should be included in the district files. For bridges that remain in place following removal of the asbestos-containing materials, a copy of the form also should be included in the Phase I Engineering Report for future work involving demolition, reconstruction, or rehabilitation of the bridge, or repair of the deck on the bridge.

27-4.02(g) Removal of All Asbestos Containing Bridges from the State

When the bridge list indicates that all of the asbestos bituminous concrete surface and asbestos waterproofing membrane has been removed from all highway bridges in the State, the Bridge Planning Section in the Bureau of Bridges and Structures will advise the Bureau of Design and Environment (BDE). BDE will notify the IEPA in writing and request approval to discontinue the asbestos determination and tracking procedures for highway bridges. Upon receipt of approval from IEPA/USEPA, these procedures will be rescinded.

Chapter Twenty-eight
ENVIRONMENTAL PERMITS/CERTIFICATIONS

Table of Contents

Chapter Twenty-eight
ENVIRONMENTAL PERMITS/CERTIFICATIONS

28-1 GENERAL

Many activities performed by the Illinois Department of Transportation impact the environment, navigation, public land or private land. Depending upon the nature of the impact, the activity may require the Department to obtain a permit or certification. Some of these permits/certifications may be obtained during the planning phase of project development, and others may be obtained during the design or construction phase. Any necessary permit authorizations/certifications should be obtained before commencement of work requiring the permit/certification. Personnel involved in project development should be aware of the requirements for these permits/certifications to ensure that necessary authorizations and clearances are obtained in a timely manner to allow the work requiring the permit/certification to proceed as scheduled. As practical, the permit authorization/certification should be obtained close to the start date for the work to optimize the time frame available for accomplishing the work before the authorization expires. Districts must carefully monitor expiration dates for permit authorizations to ensure that any necessary extension or renewal request is processed in a timely manner to avoid non-compliance or delay in the work covered by the permit.

Chapter 28 briefly documents the basic information related to the permits/certifications which might be required for a project. Note that a joint application form (NCR Form 426) has been developed by the US Army Corps of Engineers (Corps), Illinois Environmental Protection Agency (IEPA), and Illinois Department of Natural Resources Office of Water Resources (OWR), which is used to apply for Section 10 and Section 404 permits from the Corps and for obtaining the related Section 401 Water Quality Certification from the IEPA. The form is also used for obtaining permits from the OWR for Construction in Floodways of Rivers, Lakes, and Streams and for work affecting public waters. The current version of the joint application form is available on the websites for the Chicago, Rock Island (lead Corps District for Illinois) and St. Louis Corps Districts, and the OWR website. Districts also may contact the Corps, IEPA, or OWR to obtain the current version of the joint application form.

Figure 28-1.A presents and explains the format used for describing each Federal or State permit/certification. The descriptions of each permit or certification are presented in Sections 28-2 and 28-3. Figure 28-1.B identifies the address for each agency from whom a permit or certification is required.

Permit/Certification: Identification of the short or common name typically used for the permit/ certification.

Responsible Agency: Identification of the agency responsible for evaluating permit/certification applications and for issuing the permit or certification.

Responsible IDOT Unit: Identification of the Department unit which must obtain the permit/ certification.

Legal Reference: Identification of the legal authority for the permit/certification.

Purpose: Identification of the basic intent of the permit/certification.

Applicability: Identification of the type of activity that dictates the need for the permit/certification.

Permit/Certification Information Needs: Identification of the basic information needed for the submission of the permit or certification application.

PERMIT AGENCY OFFICES

Figure 28-1.B

28-2 FEDERAL PERMITS/CERTIFICATIONS

IDOT is responsible for obtaining several Federal permits/certifications as required on individual projects. This section briefly discusses the identification, applicability, and information needs of each permit/ certification. The Federal permits/certifications are:

1. Section 404 Permit. This permit is obtained from the Corps for the discharge of dredge or fill material into waters of the United States, including wetlands.

2. Section 9 Permit. This permit is obtained from the US Coast Guard (USCG) for construction of bridges or causeways over navigable waters of the United States.

3. Section 10 Permit. This permit is obtained from the Corps for structures or work (other than bridges and causeways) affecting the navigable waters of the United States.

4. Section 401 Water Quality Certification. This certification is obtained from the IEPA and is required in conjunction with a Section 404 permit (i.e., the IEPA must either approve or waive the water quality certification as a condition for issuance of an individual Section 404 permit or for use of a nationwide or regional Section 404 permit).

5. Section 402 National Pollutant Discharge Elimination System (NPDES) Point-Source Permit. This permit is obtained from the IEPA for projects such as rest areas that involve a point-source discharge of pollutants into waters of the United States.

6. Section 402 NPDES Construction Permit. This permit is administered by the IEPA and applies to projects that will involve clearing, grading, and excavation activities that result in the disturbance of one acre (4047 m^2) or more of total land area.

Permit: Section 404

Responsible Agency: United States Army Corps of Engineers

Responsible IDOT Unit: District

Legal Reference: Section 404 of the *Federal Water Pollution Control Act* (1972), as amended by the *Clean Water Act* (1977 & 1987): 33 USC 1251-1376, DOT Order 5660.1A; 23 CFR 650, Subpart B; 33 CFR 209, 320-323, 325, 328, 330; 40 CFR 121-125, 129-131, 135-136, and 230-231.

Purpose: To restore and maintain the chemical, physical, and biological integrity of the Nation's waters through prevention, reduction, and elimination of pollution.

Applicability: Permit required for any discharge of dredged or fill material into waters of the United States, including wetlands that are subject to Corps jurisdiction. See the following references, available on the Corps Headquarters website, for guidance on jurisdiction under Section 404:

- Regulatory Guidance Letter 07-01 "Practices for Documenting Jurisdiction under Section 404 of the *Clean Water Act* (CWA) and Sections 9 & 10 of the *Rivers and Harbors Act of 1899*," and

- Regulatory Guidance Letter 08-02 "Jurisdictional Determinations."

Permit Information Needs: The list below indicates the typical items of information required for an individual Section 404 permit. Some Corps districts may require additional items of information (e.g., photographs of the project site, quantity calculations for fill activities, documentation of coordination with Soil and Water Conservation Districts regarding proposed erosion and sediment control measures):

1. Name and address of permit applicant.
2. Complete, detailed description of the proposed activity, its purpose, intended use, and drainage area of the watershed to the downstream limit of the project. The description should include information on temporary stream crossings, work pads, temporary bypass channels, cofferdams, etc., that will be involved in the construction work requiring a Section 404 permit. For dredging and fill activities, describe the location, type, composition, and quantity of material to be dredged/filled, method of dredging/filling, and method of transportation to disposal/fill site. Also, describe the disposal/fill site by including the location, quantity of material it will hold, composition of receiving soil, and method of containment. Identify any practical alternatives that would fulfill the objectives of the proposed project and explain why the final proposal was selected.
3. Location of the proposed activity, including legal description.
4. If applicable, name, address, and title of authorized agent.
5. Names, addresses, and telephone numbers of all adjoining and potentially affected property owners, including the property involved with the permit action, if different from the applicant.

6. Date activity is proposed to commence.
7. Estimated time of construction.
8. Indication of whether any portion of the activity for which authorization is sought is complete.
9. List of all approvals or certifications required by other Federal, interstate, State, or local agencies for any structures, construction, discharges, deposits, or other activities described in the application.
10. Indication of whether any agency has denied approval for the activity described in the application or for any activity directly related to the activity described.
11. Engineering details (e.g., limit of fill activity, amount of fill, area taken, linear feet (meters) of disturbance, erosion control plan, disposal of waste material).
12. Copy of EIS or EA, if prepared, describing environmental impacts (e.g., soils, water quality, groundwater, wetlands, fish, wildlife, floodplains). If EIS or EA not prepared, copy of Wetland Determination Report, Wetland Impact Evaluation form, and Natural Resource Review Tool (NRRT) report or Ecological Compliance Assessment Tool (EcoCAT) report.
13. Mitigation plan.
14. Project drawings (8½ inches x 11 inches (216 mm x 279 mm)), including a vicinity map, plan view of the project and a cross section view of the project.
15. Environmental signoffs.

In addition to individual Section 404 permit authorizations, certain activities may be authorized under a regional or nationwide permit, provided they meet the conditions for use of the permit. Regional permits are addressed in public notices issued by the applicable Corps district(s).

The Chicago Corps District has issued Regional Permits for use in Cook, DuPage, Kane, Lake, McHenry, and Will Counties. The Chicago Corps District's Regional Permit Program includes several permits that may be applicable for IDOT project activities. These include the following:

- *Regional Permit 3 – Transportation Projects,*
- *Regional Permit 4 – Minor Discharges and Minor Dredging,*
- *Regional Permit 5 – Wetland/Stream Restoration and Enhancement,*
- *Regional Permit 7 – Temporary Construction Activities,*
- *Regional Permit 10 – Bank Stabilization, and*
- *Regional Permit 12 – Bridge Scour Protection.*

Information about these Regional Permits is available on the Chicago Corps District website.

The Rock Island Corps District has issued Regional Permits for use anywhere in the State of Illinois. Regional Permits that may be applicable for IDOT project activities include the following:

- *Regional Permit 16 – Bank Stabilization Activities, and*
- *Regional Permit 26 – Emergency Reconstruction and Repair Activities for Flood Damaged Areas.*

Information about these Regional Permits is available on the Rock Island Corps District website. The nationwide permits are published in the Federal Register and are available on the Corps Headquarters website. BDE disseminates current nationwide permit information from the Federal Register via a BDE Information Memorandum.

The information needs, applicability provisions, processing procedures, and conditions applicable to regional and nationwide permits vary according to the specific permit involved. Some Corps districts require submittal of essentially the same information for nationwide or regional permits as for individual permits.

For Nationwide Permit 14, which addresses Linear Transportation Projects, the description of the project provided to the Corps should include information on temporary stream crossings, work pads, temporary bypass channels, cofferdams, etc., that will be involved in the construction work, to the extent that this information is known or can be anticipated at the time of the permit submittal. If these temporary work features are addressed for permitting purposes after the initial permit submittal, they may be eligible for coverage under Nationwide Permit 33 – "Temporary Construction, Access, and Dewatering." It should be recognized that time will be required to obtain separate permit authorization for the additional temporary work items. This time factor should be anticipated and factored into the project schedule. To minimize potential disruption of the project implementation schedule, districts can include in the original permit submittal, information reflecting their best estimate of the type, size, and location of temporary work features needed for construction of the bridge/culvert requiring the 404 permit. To the extent that this information adequately covers the temporary work features that the contractor ultimately proposes, it will eliminate the need for having the contractor obtain a separate permit authorization for the temporary work and will avoid the associated potential for delays in project implementation.

For Nationwide Permit 23, which covers Approved Categorical Exclusions, the Federal Highway Administration (FHWA) and the Corps have an agreement that applies additional requirements beyond those addressed in the Federal Register notice for the nationwide permits. Section 28-4 provides a discussion of these special requirements applicable to Nationwide Permit 23.

Permit: Section 9 Navigable Waters

Responsible Agency: United States Coast Guard

Responsible IDOT Unit: Bureau of Bridges and Structures

Legal Reference: Section 9 of the *Rivers and Harbors Act* of 1899; 33 USC 401, et seq, as amended and supplemented; 23 CFR part 650, Subpart H; and 33 CFR 114-115.

Purpose: To ensure that there will be no interference to navigation on the navigable waterways of the United States.

Applicability: Permit required for the construction, modification, replacement, or removal of any bridge or causeway over a navigable waterway.

Permit Information Needs: Permit application for Section 9 requires:

1. Name and address of permit applicant.
2. Name of waterway to be bridged.
3. Bridge location (miles (kilometers) above mouth of waterways; nearest city, county).
4. Estimated cost of bridge.
5. Estimated cost of low level bridge at this location.
6. List of property owners adjacent to bridge and its approaches.
7. Cubic yards (cubic meters) of material to be excavated and filled below the 100-year flood contours.
8. Environmental compliance documentation.
9. Any required State permits or a statement that none are required.
10. Evidence of Section 401 water quality certification for the project.
11. Statement concerning planned disposition of any bridge(s) to be removed.
12. Statement that old bridge will be completely removed unless the Corps has approved retention of the bridge or portions of the bridge for purposes other than a bridge or, unless all parts of the old bridges are to be removed at least to natural ground and/or riverbed, in which case, cut-off elevations may be submitted for approval.
13. Plans of existing bridge showing length, width and number of travel lanes, dimension horizontal clearance in channel span(s), elevations of low steel in channel spans, graphic scale, north arrow, name of bridge and year constructed, and owner of bridge.
14. Vicinity map* (small scale) showing location of proposed bridge in relation to major highways and rivers, major communities, and 4(f) lands, if any.
15. Location map* (large scale) showing all highways and rivers; showing local communities; showing existing bridges (with any to be removed labeled as such), docks, locks, dams, dikes, etc.; 4(f) lands, if any; and showing a flow arrow and soundings in feet (meters) below established government datum planes (usually normal pool).
16. Elevation view* of proposed bridge from abutment to abutment showing dimension minimum vertical clearance in navigation span(s) above normal pool or record low water; 2% flowline elevation, 100-year flood, and record high water; elevation of low steel in channel span(s) at channelward faces of channel piers, 25 ft (7.6 m) from each pier, and

at center of span; cross section of watercourse; and, if bridge is moveable, dimension vertical clearance in open and closed positions.

17. Plan view* of proposed bridge from abutment to abutment showing length of bridge; width of bridge and number of travel lanes; dimension distance between bridges for dual bridges; angle between axis of bridge and channel or flow of river, if applicable; dimension size and location of any proposed pier protection cells, sheer fences, fenders, etc.; dimension minimum horizontal clearance between channel piers, or pier protection, as measured normal to the axis of the channel or flow of the river.

*Samples of these drawings are included in Section 2 of the *IDOT Bridge Manual*.

Permit: Section 10 Navigable Waters

Responsible Agency: United States Army Corps of Engineers

Responsible IDOT Unit: District

Legal Reference: Section 10 of the *Rivers and Harbors Act* of 1899; 33 USC 401, et seq, as amended and supplemented; 23 CFR part 650, Subpart H; 33 CFR 320, 322, 323, 325, 326, 327, 329, and 330.

Purpose: To protect and preserve the navigable waterways of the United States against any degradation in water quality.

Applicability: Permit required for structures or work (other than bridges or causeways) affecting a navigable waterway. Examples of work include dredging, channelization, filling, and construction of pier protection cells.

Permit Information Needs: Permit application for Section 10 requires:

1. Name and address of permit applicant.
2. Complete, detailed description of the proposed activity, including its purpose, intended use, and drainage area of the watershed to the downstream limit of the project. For dredging and fill activities, describe the location, type, composition, and quantity of material to be dredged/filled, method of dredging/filling, and method of transportation to disposal/fill site. Also, describe the disposal/fill site by including the location, quantity of material it will hold, composition of receiving soil, and method of containment. Identify any practical alternatives that would fulfill the objectives of the proposed project and explain why the final proposal was selected.
3. Location of the proposed activity, including legal description.
4. If applicable, name, address, and title of authorized agent.
5. Names, addresses, and telephone numbers of all adjoining and potentially affected property owners, including the property involved with the permit action, if different from the applicant.
6. Date activity is proposed to commence.
7. Estimated time of construction.
8. Indication of whether any portion of the activity for which authorization is sought is complete.
9. List of all approvals or certifications required by other Federal, interstate, State, or local agencies for any structures, construction, discharges, deposits, or other activities described in the application.
10. Indication of whether any agency has denied approval for the activity described in the application or for any activity directly related to the activity described.
11. Engineering details (e.g., limit of fill activity, amount of fill, area taken, linear feet (meters) of disturbance, erosion control plan, disposal of waste material).
12. Copy of EIS or EA, if prepared, describing environmental impacts (e.g., soils, water quality, groundwater, wetlands, fish, wildlife, floodplains).
13. Mitigation plan.

14. Project drawings (8½ inches x 11 inches (216 mm x 279 mm)), including a vicinity map, plan view of the project and a cross section view of the project.
15. Environmental signoffs.

Certification: Section 401 Water Quality Certification

Responsible Agency: Illinois Environmental Protection Agency

Responsible IDOT Unit: District

Legal Reference: Section 401 of the *Federal Water Pollution Control Act* (1972), as amended by the *Clean Water Act* (1977 & 1987): 33 USC 1251-1376, DOT Order 5660.1A; 23 CFR 650, Subpart B; 33 CFR 209, 320-323, 325, 328, 329; 40 CFR 121-125, 129-131, 133, 135-136, and 230-231.

Purpose: To restore and maintain the chemical, physical, and biological integrity of the Nation's waters through prevention, reduction, and elimination of pollution.

Applicability: Certification or a waiver of certification is required in conjunction with any Federal permit or license to conduct any activity which may result in any discharge into waters of the United States.

Permit Information Needs: The information needed for the 401 water quality certification review generally is the same as that which is required in the application for the Federal permit involved. The information is provided to IEPA via a copy of the appropriate permit application form. Refer to the information needs described in this section for Section 404, Section 9, Section 10, and Section 402 permits.

For discharges that require an individual Section 401 water quality certification/waiver (i.e., not covered by a blanket 401 certification/waiver), 35 Ill. Adm. Code 302.105 requires the Illinois EPA to conduct an "anti-degradation assessment" for the proposed discharge. The purpose of the assessment is to evaluate the effect of the discharge (i.e., increase in pollutant loadings) and ensure that it will not cause water quality standards to be exceeded. When an anti-degradation assessment is necessary, IEPA may require the following information from the applicant for purposes of the assessment:

- identification and characterization (e.g., current physical, biological, chemical conditions) of the water body affected by the proposed project and the water body's existing uses;
- quantity of the pollutant load increase to the water body;
- potential impacts of the proposed project on the water body;
- purpose and anticipated benefits of the proposed project;
- assessment of the alternatives to the proposed project that will result in a reduced pollutant load to the water body, no load increase or minimal environmental degradation. Alternatives that result in no discharge to the water body and changes in the location of the activity must be addressed in the submission; and/or
- proof that a copy of the application was provided to the Illinois Department of Natural Resources.

As a part of the public notice process for the individual 401 water quality certification, IEPA will publish a fact sheet containing information on the anti-degradation assessment.

<u>Permit</u>: Section 402 National Pollutant Discharge Elimination System (NPDES) Point-Source Permit

<u>Responsible Agency</u>: US Environmental Protection Agency (USEPA) through the IEPA

<u>Responsible IDOT Unit</u>: District

<u>Legal Reference</u>: Section 402 of the *Federal Water Pollution Control Act* (1972), as amended by the *Clean Water Act* (1977 & 1987): 33 USC 1251-1376, DOT Order 5660.1A; 23 CFR 650, Subpart B; 40 CFR 121-125, 129-131, 133, and 135-136.

<u>Purpose</u>: To restore and maintain the chemical, physical, and biological integrity of the nation's waters through prevention, reduction, and elimination of pollution.

<u>Applicability</u>: Required for all point-source discharges (other than those addressed by the Section 404 Permit) into the Nation's waters (e.g., for rest areas).

<u>Permit Information Needs</u>: Permit application for Section 402 NPDES Point-Source requires:

1. USEPA Identification Number.
2. Facility name and address.
3. Pollutant characteristics (e.g., hazardous wastes, injection of fluids, air, agricultural, industrial wastes).
4. Facility contact and mailing address.
5. Facility location.
6. Standard Industrial Classification (SIC) Code.
7. Operator (e.g., name, Federal/State/private).
8. Existing environmental permits.
9. Map of area (e.g., topographic, locations of existing/proposed intakes and discharges, surface water bodies).
10. Nature of business.
11. Receiving waters (e.g., latitude/longitude).
12. Discharge date.
13. Type of waste.
14. Effluent characteristics (e.g., type of pollutants, maximum daily and average daily discharges).
15. Indication of intermittent or seasonal discharge.
16. Treatment system description.

Permit: Section 402 National Pollutant Discharge Elimination System (NPDES) Construction Permit

Responsible Agency: USEPA through the IEPA

Responsible IDOT Unit: Central Office disseminates information on general permit to district; district files Notice of Intent to use permit. *Note: Contractor must also sign Contractor Certification Statement.*

Legal Reference: Section 402 of the *Federal Water Pollution Control Act* (1972), as amended by the *Clean Water Act* (1977 & 1987): 33 USC 1251-1376, DOT Order 5660.1A; 23 CFR 650, Subpart B; 40 CFR 121-125, 129-131, 133, 135-136

Purpose: To restore and maintain the chemical, physical, and biological integrity of the Nation's waters through prevention, reduction, and elimination of pollution.

Applicability: Required for construction activities involving clearing, grading, and excavation activities that disturb one acre (4047 m^2) or more of land area.

Permit Information Needs: Section 402 NPDES Construction Permit requires:

1. Mailing address and location of construction site, if available, and latitude and longitude of the approximate center of the site.
2. The owner's name, address, telephone number, and status as Federal, State, private, public, or other entity.
3. The name, address, and telephone number of the general contractor(s) that has been identified at the time of the Notice of Intent (NOI) submittal.
4. The name of the receiving water(s) or, if the discharge is through a municipal separate storm sewer, the name of the municipal operator of the storm sewer and the ultimate receiving water(s).
5. The number of any NPDES permit for any discharge (including non-storm water discharges) from the site that is currently authorized by an NPDES permit.
6. A yes or no indication of whether the owner or operator has existing quantitative data that describes the concentration of pollutants in storm water discharges.
7. A brief description of the project.
8. Contract/plan information including: contract number, letting date, item number, page numbers in plans where permit-related information can be found and sheet numbers where erosion and sediment control plans can be found.
9. Estimated timetable for major activities.
10. Estimates of the number of acres (hectares) of the site on which soil will be disturbed.
11. Storm Water Pollution Prevention Plan, including site description (e.g., map, nature of construction activity, area disturbed), erosion and sediment controls, storm water management plan, maintenance of site, inspection schedule, reports, and identification of the contractors/sub-contractors.

28-3 STATE PERMITS/CERTIFICATIONS

IDOT is responsible for obtaining several State permits/certifications as required on individual projects. This section discusses the identification, applicability, and information needs of each permit/certification. The State permits/certifications are:

1. Construction in Floodways of Rivers, Lakes, and Streams. This permit is obtained from the Illinois Department of Natural Resources, Office of Water Resources (OWR) for construction in the floodway of identified streams serving a tributary area of 640 acres (259 hectares) or more (urban) or 6400 acres (2590 hectares) or more (rural).

2. Regulation of Public Waters. This permit is obtained from the OWR for construction in those rivers, lakes, streams, and waterways considered public waters.

3. Floodway Construction in Northeastern Illinois. This permit is obtained from the OWR for new construction within the regulatory floodways of rivers, lakes, and streams in Cook, DuPage, Kane, Lake, McHenry, and Will counties excluding the City of Chicago.

4. Open Burning of Landscape Waste Generated by Land Clearing Activities. This permit is obtained from the IEPA for any proposed open burning of landscape waste generated from land clearing activities precipitated by road construction projects.

5. Supplemental Waste Stream Permit. This permit is obtained from the IEPA to allow a disposal facility to accept special waste generated by project involvement.

6. *Resource Conservation and Recovery Act* (RCRA) Permit. This permit is obtained from the IEPA for any project involvement with hazardous wastes for which the Department will conduct remedial activities.

7. Underground Storage Tank (UST) Permit. This permit is obtained from the Office of the State Fire Marshal (OSFM) for removing any underground storage tank.

Permit Name: Construction in Floodways of Rivers, Lakes, and Streams

Responsible Agency: Illinois Department of Natural Resources, Office of Water Resources

Responsible IDOT Unit: Bureau of Bridges and Structures (for bridges) or district (for culverts, embankments, storm sewers, or other construction within the flood plains of applicable streams and rivers).

Legal Reference: Authorized by Sections 23, 29, and 30 of the *Rivers, Lakes, and Streams Act* 615 ILCS 5/23, 29a and 30. Implementing rules in 17 Ill. Adm. Code 3700.

Purpose: To protect the rights, safety, and welfare of private and public landowners through the regulation of floodway development.

Applicability: All rivers, lakes, and streams under the jurisdiction of the OWR except those in the counties of Cook, Will, DuPage, Kane, Lake, and McHenry for which floodway limits have been defined pursuant to 92 Ill. Adm. Code 708. A permit is required for construction in the floodway of streams serving a tributary area of 640 acres (259 hectares) or more in an urban area or in the floodway of a stream serving a tributary area of 6400 acres (2590 hectares) or more in a rural area.

Permit Information Needs: Refer to the *IDOT Drainage Manual*.

Permit Name: Regulation of Public Waters

Responsible Agency: Illinois Department of Natural Resources, Office of Water Resources

Responsible IDOT Unit: Bureau of Bridges and Structures (for bridges) or district (for culverts, embankments, storm sewers, or other construction affecting public waters).

Legal Reference: Authorized by the *Rivers, Lakes, and Streams Act* 615 ILCS 5. Implementing rules in 17 Ill. Adm. Code 3704.

Purpose: To protect the public's interests, rights, safety, and welfare in the State's public bodies of water by preventing construction or other uses that would:

- obstruct or interfere with the navigability of any public body of water;
- encroach on any public body of water; or
- impair the rights, interests, or uses of the public in any public body of water or in the natural resources thereof.

Applicability: The permit requirements are applicable to those lakes, rivers, streams, and waterways that are considered public waters (listed in the Ill. Adm. Code 92-704, Appendix A).

Permit Information Needs: Refer to the *IDOT Drainage Manual*.

Permit Name: Floodway Construction in Northeastern Illinois

Responsible Agency: Illinois Department of Natural Resources, Office of Water Resources (By agreement with OWR, the Bureau of Bridges and Structures issues floodway construction permits for highway projects in the District One area, excluding the City of Chicago.)

Responsible IDOT Unit: Bureau of Bridges and Structures (for bridges) or district (for culverts and all other construction in regulatory floodways).

Legal Reference: Authorized by Section 18g of the *Rivers, Lakes, and Streams Act* 615 ILCS 5/18g. Implementing rules in 17 Ill. Adm. Code 3708.

Purpose: To regulate construction and filling in the regulatory floodway of rivers, lakes, and streams of Cook, DuPage, Kane, Lake, McHenry, and Will Counties, excluding the City of Chicago, so that periodic inundation will not:

- pose a danger to the general health and welfare of the user,
- require the expenditure of public funds,
- require the provision of public resources or disaster relief services, or
- result singularly or cumulatively in greater flood damages or potential flood damages due to increases in flood stage or velocities or loss of flood storage.

Applicability: A permit under this provision is required for construction, including replacement structures, roadway widening, etc., within the regulatory floodways in Cook, DuPage, Kane, Lake, McHenry, and Will Counties, except for those areas that are within the City of Chicago. A permit is not required for repair, remodeling, or maintenance of buildings or structures in existence as of November 18, 1987.

Permit Information Needs: Refer to the *IDOT Drainage Manual*.

If the regulatory floodway delineation or base flood elevation will change due to the proposed project, the application will not be considered complete until the OWR has indicated conditional approval of the regulatory floodway map change and the completed request for the regulatory floodway map change has been submitted to FEMA.

<u>Permit Name</u>: General Permit for Open Burning of Landscape Waste Generated by Land Clearing Activities Necessitated by Road Construction Projects Included in the "Annual Program" and "Service Bulletins" of the Illinois Department of Transportation

<u>Responsible Agency</u>: Illinois Environmental Protection Agency

<u>Responsible IDOT Unit</u>: Central Office administers renewal of general permit; district processes Notice of Intent to use permit.

<u>Legal Reference</u>: 415 ILCS 5/39.5. Implementing rules in 35 Ill. Adm. Code 237, Subpart B.

<u>Purpose</u>: To impose appropriate conditions and restrictions on open burning of landscape waste to protect public health and welfare.

<u>Applicability</u>: Required for any proposed open burning of landscape waste generated from land clearing activities necessitated by road construction projects.

<u>Permit Information Needs</u>: A completed Notice of Open Burn form must be sent to the IEPA Air Permit Section not less than seven working days prior to each open burn. The Notice of Open Burn form must provide the following information:

1. Name and address of the contractor proposing the open burn.
2. The site location of the proposed open burn (address, county, township), sketch of the immediate vicinity of the proposed open burn site, and a printed map of the general area with the site and nearby features marked and distances to the features (e.g., structures, residences, populated areas, roadways, airports, lakes and waterways, hospitals, nursing homes, schools) indicated.
3. Schedule of the open burning activity (estimated duration and dates).
4. Estimated quantity of material to be burned.
5. IDOT construction contract number.
6. Authorized signature of person responsible for the open burn activity.

Permit Name: Supplemental Waste Stream Permit.

Responsible Agency: Illinois Environmental Protection Agency.

Responsible IDOT Unit: Application is prepared by the disposal facility on behalf of the firm handling waste disposal working for the prime construction contractor. BDE will assist as needed.

Legal Reference: Implementing rules in 35 Ill. Adm. Code 807.210 and 809.302b.

Purpose: To allow disposal facility to accept generated special waste.

Applicability: Permit is required to allow disposal facility to accept special waste generated by project involvement.

Permit Information Needs: The Supplemental Waste Stream Permit requires:

1. Receiving facility information, as follows:
    a. Name and address of facility.
    b. Name and address of applicant.
    c. IEPA site code.
    d. USEPA site code.
    e. Facility contact name and telephone number.
2. Waste generator information, as follows:
    a. Plant address.
    b. Mailing address.
    c. Generator IEPA code.
    d. Generator USEPA code (if applicable).
    e. Generator contact name and telephone number.
    f. Generator SIC code.
    g. Process/Operation code, name, and description.
    h. Generic waste code and generic waste name.
    i. Indication of ultimate disposition of treatment residuals or wastes.
3. Waste characteristic information, as follows:
    a. Indication of whether waste is hazardous or non-hazardous.
    b. USEPA hazardous waste number(s) (if applicable).
    c. Results for paint filter test, penetrometer test.
    d. Waste phase.
    e. Transport frequency.
    f. Waste class.
    g. Flash point.
    h. Percent Acidity.
    i. Percent Alkalinity.
    j. pH.
    k. Percent solids.
    l. Land Disposal Restricted Waste (if applicable).
    m. Waste component names and percentages.
    n. Total concentrations of heavy metals and other specified constituents in waste.

o. Summary of all available analytical results for waste.

Permit Name: *Resource Conservation and Recovery Act* (RCRA) Permit.

Responsible Agency: Illinois Environmental Protection Agency.

Responsible IDOT Unit: Application prepared by environmental firm working for prime construction contractor; BDE will assist as needed.

Legal Reference: Section 22.4 and Section 27 of the *Illinois Environmental Protection Act* (415 ILCS 5/22.4 and 27). Implementing rules in 35 Ill. Adm. Code 703.

Purpose: To apply appropriate conditions and restrictions for the operation of hazardous waste storage, hazardous waste treatment, or hazardous waste disposal operations.

Applicability: Applies to any project involvement with hazardous wastes in which the Department will conduct remediation activities involving storage of hazardous waste for more than 90 days.

Permit Information Needs:

1. Description of the activities conducted by the applicant that require it to obtain permits under RCRA.
2. Name, mailing address, and location of the facility for which the application is submitted.
3. Up to four SIC codes that best reflect the principal products or services provided by the facility.
4. The operator's name, address, telephone number, ownership status, and status as Federal, State, private, public, or other entity.
5. The name, address, and phone number of the owner of the facility.
6. A listing of all permits or construction approvals received or applied for under certain listed permit authorities.
7. A topographic map (or other map if a topographic map is unavailable) extending one mile (1.6 km) beyond the property boundaries of the source, depicting the facility and each of its intake and discharge structures; each of its hazardous waste treatment, storage, or disposal facilities; each well where fluids from the facility are injected underground; and those wells, springs, other surface water bodies, and drinking water wells listed in public records or otherwise known to the applicant within 0.25 miles (400 m) of the facility property boundary.
8. A brief description of the nature of the business.
9. Additional specific information regarding facility location; facility layout; groundwater protection; processes to be used for treating, storing, and disposing of hazardous waste; types of wastes to be treated, stored, or disposed of.

Permit Name: Underground Storage Tank (UST) Permit.

Responsible Agency: Office of the State Fire Marshal (OSFM).

Responsible IDOT Unit: Application prepared by environmental firm working for prime construction contractor; BDE will assist as needed. Permit application must be approved by IDOT Chief Counsel prior to sending to OSFM.

Legal Reference: *Gasoline Storage Act* 430 ILCS 15. Implementing rules in 35 Ill. Adm. Code 731.

Purpose: To ensure that tank removal meets acceptable closure standards.

Applicability: A permit is required for removing any underground storage tank. (*Note: Permits for removing an UST can only be obtained by licensed UST removal contractors.*)

Permit Information Needs: The Underground Storage Tank Permit requires:

1. Name and address of owner of tank(s) and type of ownership.
2. Name and address of facility where tanks are located and type of facility.
3. Name and address of person, firm, or company performing work on tanks.
4. Number and size of tanks being removed and their status and age.
5. Reason for removal.
6. ESDA incident number (if tank is leaking).
7. Description of products that were stored in each tank.
8. Date tank was last used.
9. Description of tank construction materials.
10. Description of piping materials and type.

28-4 PROCEDURES/DOCUMENTATION FOR USE OF THE CATEGORICAL EXCLUSION NATIONWIDE SECTION 404 PERMIT

28-4.01 Background

For Categorical Exclusion (CE) actions involving the use of the CE nationwide permit (refer to BDE-IM for *Federal Register* notice containing current nationwide permits), the appropriate Corps district must be contacted and afforded an opportunity to review the proposal. This will ensure that the CE activities requiring a Section 404 permit will have only minimal adverse individual and cumulative impacts on the aquatic environment.

For CE actions that will involve discharges covered by another of the nationwide permits, the permit that is the least burdensome procedurally should be used.

28-4.02 Applicability

The following procedures are applicable to all State highway projects developed in conformance with FHWA procedures to obtain Federal funding (1) that are eligible to be processed as CEs, and (2) for which the responsible IDOT district wishes to pursue use of the CE nationwide Section 404 permit.

28-4.03 Procedures

28-4.03(a) General

Proposed CE projects that will involve an activity (or activities) subject to Section 404 permit requirements should be evaluated as early as practical by the affected IDOT district to assess the potential applicability of the CE nationwide permit. This evaluation should consider (1) whether the activity(ies) requiring a permit will involve placement of substantial amounts of fill that may result in more than minor water quality impacts, and (2) whether applicable nationwide permit conditions can be satisfied for the proposed activities. If additional information is needed concerning the environmental conditions for use of the nationwide permits (e.g., endangered species), coordination should be initiated with BDE to obtain the necessary information.

The results of these evaluations should be discussed with the FHWA Division Office and BDE representatives. These discussions and the determination of whether or not the CE nationwide permit is appropriate for a specific project should be documented either in the minutes of a coordination meeting or through other means (e.g., a memorandum to the file). A copy of this documentation should accompany the project report when it is submitted to BDE for approval to indicate the basis for the permit processing decision.

The CE permit can be used only in conjunction with projects being developed according to Federal procedures (i.e., projects developed as probable State-only funded actions and that, hence, may not conform to Federal procedures are not eligible for CE permit authorization from the FHWA). However, when use of the CE permit has been authorized for a project (and provided the Corps has not advised that it intends to seek assertion of its authority to require an individual permit for the action), the CE permit will still be valid even if the project is subsequently programmed for State-only funding, provided there are no changes in the project that would result in more than minor water quality impacts or would conflict with the applicable nationwide permit conditions.

Construction-stage activities subject to Section 404 requirements (e.g., runarounds) can be covered under the CE permit authorization if they are identified and addressed when the project is coordinated for purposes of requesting CE permit approval. If such activities are subsequently proposed and were not addressed during the initial CE permit review, a separate permit review by the Corps will be necessary. As practical, districts should identify and address construction-stage activities during the initial CE permit review to eliminate the need for later separate review by the Corps.

28-4.03(b) CE Projects Potentially Eligible for Nationwide Permit

Categorical Exclusion projects are potentially eligible for processing under the CE nationwide permit when the IDOT district has determined they (1) will not involve more than minor water quality impacts (or that it is questionable whether more than minor water quality impacts will be involved) and (2) are such that the applicable permit conditions can be met.

In accordance with Corps Regulatory Guidance Letter 05-07, certain actions proposed for processing under the CE permit require submission of a preconstruction notification to the appropriate Corps district engineer prior to commencing the activity. Submission of the pre-construction notification must be accomplished in accordance with the requirements in the "Preconstruction Notification" general condition of the current nationwide permits, available on the Corps website. Preconstruction notification to the Corps is required for the following actions listed in 23 CFR 771.117 "Categorical exclusions":

- activities occurring under paragraphs:
    + (c)(3) construction of bicycle and pedestrian lanes, paths and facilities;
    + (c)(7) landscaping;
    + (c)(9) emergency repairs under 23 USC 125; and
    + (c)(12) improvements to existing rest areas and truck weigh stations; and
- all activities under paragraph (d).

The Corps districts will review each preconstruction notification and verify whether the activity meets the terms and conditions of the CE nationwide permit. Special conditions may be added to the CE permit verification to ensure that the individual and cumulative adverse effects on the aquatic environment are minimal. If the Corps district believes concerns for the aquatic environment or any public interest factor warrant further review, discretionary authority may be exercised on a case-by-case basis to require an individual permit.

Corps districts will provide a response, verifying whether the activity meets the terms and conditions for use of the CE permit, within the designated response period for the most recently issued nationwide permits (as provided in the "Notification" general condition for the nationwide permits) or the appropriate regional condition. If the Corps district does not respond within the designated time, the activity qualifies for CE permit authorization.

For other potentially eligible CE projects that are not subject to the requirement for submitting formal preconstruction notification to the Corps, FHWA may approve use of the CE permit. Such projects should be discussed with BDE and FHWA representatives, and approval should be requested from the FHWA representative for use of the CE nationwide permit. If FHWA does not approve use of the nationwide permit, the procedures discussed in Section 28-4.03(c) for "ineligible" projects will apply. If FHWA approves the use of the permit, the district provides the responsible Corps district:

- documentation of FHWA's approval,
- a sketch and brief description of the work requiring a 404 permit,
- an indication of the type and approximate quantity of fill involved, and
- a copy of the biological information received in response to the environmental survey request for the action.

A form has been developed for documenting CE permit authorizations by FHWA, issued via a BDE Technical Environmental Memorandum. Upon receipt of FHWA's approval of the CE permit for a project, the district provides a copy of the signed form, with supporting information as indicated above, to the responsible Corps district and to BDE. *Some Corps districts may require the submittal of a completed permit application form to provide the supporting information*. In addition, when the discussions with FHWA leading to authorization of the CE permit involve substantial problems or conditions for permit authorization, include a copy of the minutes of the meeting, or other documentation of the discussions, as a part of the supporting information submitted to the Corps and BDE.

Upon receiving the necessary Section 401 water quality certification from the IEPA, the action may proceed under the nationwide permit authorization. For CE permit authorizations received from the Corps or FHWA, information concerning the need to comply with the permit conditions should be incorporated into the district's procedures for ensuring follow-through on commitments. This will ensure that those having later project involvements (including contractors) will be aware of the applicable commitments.

28-4.03(c) CE Projects Ineligible for Nationwide Permit

If the Corps advises that an individual permit will be required, BDE should be advised of this action either by copy of the correspondence from the Corps or by memorandum.

If the IDOT district, BDE, or FHWA determines that a CE-type project activity subject to Section 404 permit requirements will involve more than minor water quality impacts, or that one or more of the conditions for the nationwide permit cannot be met, application to the Corps for an individual or, where appropriate, a regional permit will be necessary for the activity. For CE projects that the district, BDE, or FHWA determines will require an individual permit, the transmittal letter to the Corps accompanying the permit application should note that the project will be processed as a CE for compliance with NEPA.

U.S. DEPARTMENT OF TRANSPORTATION Federal Highway Administration	
SUBJECT GUIDANCE FOR PREPARING AND PROCESSING ENVIRONMENTAL AND SECTION 4(F) DOCUMENT	FHWA TECHNICAL ADVISORY T 6640.8A October 30, 1987

1. **PURPOSE**. To provide guidance to Federal Highway Administration (FHWA) field offices and to project applicants on the preparation and processing of environmental and Section 4(f) documents.

2. **CANCELLATION**. Technical Advisory T 6640.8, "Guidance Material for the Preparation of Environmental Documents," dated February 24, 1982, is canceled effective on November 27, 1987.

3. **APPLICABILITY**.

a. This material is not regulatory. It has been developed to provide guidance for uniformity and consistency in the format, content and processing of the various environmental studies and documents pursuant to the National Environmental Policy Act (NEPA), 23 U.S.C. 109(h) and 23 U.S.C. 138 (Section 4(f) of the DOT Act) and the reporting requirements of 23 U.S.C. 128.

b. The guidance is limited to the format, content and processing of NEPA and Section 4(f) studies and documents. It should be used in combination with a knowledge and understanding of the Council on Environmental Quality (CEQ) Regulations for Implementing NEPA (40 CFR 1500-1508), FHWA's Environmental Impact and Related Procedures (23 CFR 771) and other environmental statutes and orders (see Appendix A).

c. This guidance should not be used until November 27, 1987, the effective date of the 1987 revisions to 23 CFR 771.

GUIDANCE FOR PREPARING AND PROCESSING ENVIRONMENTAL AND SECTION 4(F) DOCUMENTS

Background

An earlier edition of this advisory (dated February 24, 1982) placed major emphasis on environmental impact statements (EISs) and provided limited guidance on environmental assessments (EAs) and other environmental studies needed for a categorical exclusion (CE) determination or a finding of no significant impact (FONSI). The revised guidance gives expanded coverage to CE determinations, EAs, FONSIs, EISs, supplemental EISs, reevaluations, and Section 4(f) evaluations. This material is not regulatory. It does, however, provide for uniformity and consistency in the documentation of CEs and the development of environmental and Section 4(f) documents.

The FHWA subscribes to the philosophy that the goal of the NEPA process is better decisions and not more documentation. Environmental documents should be concise, clear, and to the point and should be supported by evidence that the necessary analyses have been made. They should focus on the important impacts and issues with the less important areas only briefly discussed. The length of EAs should normally be less than 15 pages and EISs should normally be less than 150 pages for most proposed actions and not more than 300 pages for the most complex proposals. The use of technical reports for various subject areas would help reduce the size of the documents.

The FHWA considers the early coordination process to be a valuable tool in determining the scope of issues to be addressed and in identifying and focusing on the proposed action's important issues. This process normally entails the exchange of information with appropriate Federal, State and local agencies and the public from inception of the proposed action to preparation of the environmental document or to completion of environmental studies for applicable CEs. Formal scoping meetings may also be held where such meetings would assist in the preparation of the environmental document. The role of other agencies and other environmental review and consultation requirements should be established during scoping. The Council on Environmental Quality (CEQ) has issued several guidance publications on NEPA and its regulations as follows: (1) "Questions and Answers about the NEPA Regulations," March 30, 1981; (2) "Scoping Guidance," April 30, 1981; and (3) "Guidance Regarding NEPA Regulations," July 28, 1983. This nonregulatory guidance is used by FHWA in preparing and processing environmental documents. Copies of the CEQ guidance are available in the FHWA Office of Environmental Policy (HEV-11).

Note, highway agency (HA) is used throughout this document to refer to a State and local highway agency responsible for conducting environmental studies and preparing environmental documents and to FHWAs Office of Direct Federal Programs when that office acts in a similar capacity.

I. CATEGORICAL EXCLUSION (CE)

Categorical exclusions are actions or activities which meet the definition in 23 CFR 771.117(a) and, based on FHWA's past experience, do not have significant environmental effects. The CEs are divided into two groups based on the action's potential for impacts. The level of documentation necessary for a particular CE depends on the group the action falls under as explained below.

A. Documentation of Applicability

The first group is a list of 20 categories of actions in 23 CFR 771.117(c) which experience has shown never or almost never cause significant environmental impacts. These categories are non-construction actions (e.g., planning, grants for training and research programs) or limited construction activities (e.g., pedestrian facilities, landscaping, fencing). These actions are automatically classified as CEs, and except where unusual circumstances are brought to FHWA's attention, do not require approval or documentation by FHWA. However, other environmental laws may still apply. For example, installation of traffic signals in a historic district may require compliance with Section 106, or a proposed noise barrier which would use land protected by Section 4(f) would require preparation of a Section 4(f) evaluation (23 CFR 771.135(i)). In most cases, information is available from planning and programming documents for the FHWA Division Office to determine the applicability of other environmental laws. However, any necessary documentation should be discussed and developed cooperatively by the highway agency (HA) and the FHWA.

The second group consists of actions with a higher potential for impacts than the first group, but due to minor environmental impacts still meets the criteria for categorical exclusions. In 23 CFR 771.117(d), the regulation lists examples of 12 actions which past experience has found appropriate for CE classification. However, the second group is not limited to these 12 examples. Other actions with a similar scope of work may qualify as CEs. For actions in this group, site location is often a key factor. Some of these actions on certain sites may involve unusual circumstances or result in significant adverse environmental impacts. Because of the potential for impacts, these actions require some information to be provided by the HA so that the FHWA can determine if the CE classification is proper (23 CFR 771.117(d)). The level of information to be provided should be commensurate with the action's potential for adverse environmental impacts. Where adverse environmental impacts are likely to occur, the level of analysis should be sufficient to define the extent of impacts, identify appropriate mitigation measures, and address known and foreseeable public and agency concerns. As a minimum, the information should include a description of the proposed action and, as appropriate, its immediate surrounding area, a discussion of any specific areas of environmental concern (e.g., Section 4(f), wetlands, relocations), and a list of other Federal actions required, if any, for the proposal.

The documentation of the decision to advance an action in the second group as a CE can be accomplished by one of the following methods:

(1) Minor actions from the list of examples:
Minor construction projects or approval actions need only minimum documentation. Where project-specific information for such minor construction projects is included with the Section 105 program and clearly shows that the project is one of the 12 listed examples in Section 771.117(d), the approval of the Section 105 program can be used to approve the projects as CEs. Similarly, the three approval actions on the list (examples (6), (7) and (12)) should not normally require detailed documentation, and the CE determination can be documented as a part of the approval action being requested.

(2) Other actions from the list of examples:
For more complex actions, additional information and possibly environmental studies will be needed. This information should be furnished to the FHWA on a case-by-case basis for concurrence in the CE determination.

(3) Actions not on the list of examples:
Any action which meets the CE criteria in 23 CFR 771.117(a) may be classified as a CE even though it does not appear on the list of examples in Section 771.117(d). The actions on the list should be used as a guide to identify other actions that may be processed as CEs. The documentation to be submitted to the FHWA must demonstrate that the CE criteria are satisfied and that the proposed project will not result in significant environmental impacts. The classification decision should be documented as a part of the individual project submissions.

B. <u>Consideration of Unusual Circumstances</u>

Section 771.117(b) lists those unusual circumstances where further environmental studies will be necessary to determine the appropriateness of a CE classification. Unusual circumstances can arise on any project normally advanced with a CE; however, the type and depth of additional studies will vary with the type of CE and the facts and circumstances of each situation. For those actions on the fixed list (first group) of CEs, unusual circumstances should rarely, if ever, occur due to the limited scope of work. Unless unusual circumstances come to the attention of the HA or FHWA, they need not be given further consideration. For actions in the second group of CEs, unusual circumstances should be addressed in the information provided to the FHWA with the request for CE approval. The level of consideration, analysis, and documentation should be commensurate with the action's potential for significant impacts, controversy, or inconsistency with other agencies' environmental requirements.

When an action may involve unusual circumstances, sufficient early coordination, public involvement and environmental studies should be undertaken to determine the likelihood of significant impacts. If no significant impacts are likely to occur, the result of environmental studies and any agency and public involvement should adequately support such a conclusion and be included in the request to the FHWA for CE approval. If significant impacts are likely to occur, an EIS must be prepared (23 CFR 771.123(a)). If the likelihood of significant impacts is uncertain even after studies have been undertaken, the HA should consult with the FHWA to determine whether to prepare an EA or an EIS.

II. ENVIRONMENTAL ASSESSMENT (EA)

The primary purpose of an EA is to help the FHWA and HA decide whether or not an EIS is needed. Therefore, the EA should address only those resources or features which the FHWA and the HA decide will have a likelihood for being significantly impacted. The EA should be a concise document and should not contain long descriptions or detailed information which may have been gathered or analyses which may have been conducted for the proposed action. Although the regulations do not set page limits, CEQ recommends that the length of EAs usually be less than 15 pages. To minimize volume, the EA should use good quality maps and exhibits and incorporate by reference and summarize background data and technical analyses to support the concise discussions of the alternatives and their impacts.

The following format and content is suggested:

A. Cover Sheet

There is no required format for the EA. However, the EIS cover sheet format, as shown in Section V, is recommended as a guide. A document number is not necessary. The due date for comments should be omitted unless the EA is distributed for comments.

B. Purpose of and Need for Action

Describe the locations, length, termini, proposed improvements, etc. Identify and describe the transportation or other needs which the proposed action is intended to satisfy (e.g., provide system continuity, alleviate traffic congestion, and correct safety or roadway deficiencies). In many cases the project need can be adequately explained in one or two paragraphs. On projects where a law, Executive Order or regulation (e.g., Section 4(f), Executive Order 11990 or Executive Order 11988) mandates an evaluation of avoidance alternatives, the explanation of the project need should be more specific so that avoidance alternatives that do not meet the stated project need can be readily dismissed.

C. Alternatives

Discuss alternatives to the proposed action, including the no-action alternative, which are being considered. The EA may either discuss (1) the preferred alternative and identify any other alternatives considered or (2) if the applicant has not identified a preferred alternative, the alternatives under consideration. The EA does not need to evaluate in detail all reasonable alternatives for the project, and may be prepared for one or more build alternatives.

D. Impacts

For each alternative being considered, discuss any social, economic, and environmental impacts whose significance is uncertain. The level of analysis should be sufficient to adequately identify the impacts and appropriate mitigation measures, and address known and foreseeable public and agency concerns. Describe why these impacts are considered not significant. Identified impact areas which do not have a reasonable possibility for individual or cumulative significant environmental impacts need not be discussed.

E. Comments and Coordination

Describe the early and continuing coordination efforts, summarize the key issues and pertinent information received from the public and government agencies through these efforts, and list the agencies and, as appropriate, members of the public consulted.

F. Appendices (if any).

The appendices should include only analytical information that substantiates an analysis which is important to the document (e.g., a biological assessment for threatened or endangered species). Other information should be referenced only (i.e., identify the material and briefly describe its contents).

G. Section 4(f) Evaluation (if any).

If the EA includes a Section 4(f) evaluation, the EA/Section 4(f) evaluation or, if prepared separately, the Section 4(f) evaluation by itself must be circulated to the appropriate agencies for Section 4(f) coordination (23 CFR 771.135(i). Section VII provides specific details on distribution and coordination of Section 4(f) evaluations. Section IX provides information on format and content of Section 4(f) evaluation.

If a programmatic Section 4(f) evaluation is used on the proposed project, this fact should be included and the Section 4(f) resource identified in the EA. The avoidance alternatives evaluation called for in Section 771.135(i) need not be repeated in the EA. Such evaluation would be part of the documentation to support the applicability and findings of the programmatic document.

H. EA Revisions.

Following the public availability period, the EA should be revised or an attachment provided, as appropriate, to (1) reflect changes in the proposed action or mitigation measures resulting from comments received on the EA or at the public hearing (if one is held) and any impacts

of the changes, (2) include any necessary findings, agreements, or determination (e.g., wetlands, Section 106, Section 4(f) required for the proposal, and (3) include a copy of pertinent comments received on the EA and appropriate responses to the comments.

III. FINDING OF NO SIGNIFICANT IMPACTS (FONSI)

The EA, revised or with attachment(s) (see paragraph above) is submitted by the HA to the FHWA along with (1) a copy of the public hearing transcript, when one is held, (2) a recommendation of the preferred alternative, and (3) a request that a finding of no significant impact be made. The basis for the HA's finding of no significant impact request should be adequately documented in the EA and any attachment(s).

After review of the EA and any other appropriate information, the FHWA may determine that the proposed action has no significant impacts. This is documented by attaching to the EA a separate statement (sample follows) which clearly sets forth the FHWA conclusions. If necessary, the FHWA may expand the sample FONSI to identify the basis for the decision, uses of land from Section 4(f) properties, wetland findings, etc.

The EA or FONSI should document compliance with NEPA and other applicable environmental laws, Executive Orders, and related requirements. If full compliance with these other requirements is not possible by the time the FONSI is prepared, the documents should reflect consultation with the appropriate agencies and describe when and how the requirements will be met. For example, any action requiring the use of Section 4(f) property cannot proceed until FHWA gives a Section 4(f) approval (49 U.S.C. 303(c)).

(SAMPLE)

FEDERAL HIGHWAY ADMINISTRATION
FINDING OF NO SIGNIFICANT IMPACT
FOR
(Title of Proposed Action)

The FHWA has determined that alternative (identify the alternative selected) will have no significant impact on the human environment. This FONSI is based on the attached EA (reference other environmental and non-environmental documents as appropriate) which has been independently evaluated by the FHWA and determined to adequately and accurately discuss the need, environmental issues, and impacts of the proposed project and appropriate mitigation measures. It provides sufficient evidence and analysis for determining that an EIS is not required. The FHWA takes full responsibility for the accuracy, scope, and content of the attached EA (and other documents as appropriate).

Date For FHWA

IV. DISTRIBUTION OF EAs AND FONSIs

A. Environmental Assessment

After clearance by FHWA, EAs must be made available for public inspection at the HA and FHWA Division offices (23 CFR 771.119(d)). Although only a notice of availability of the EA is required, the HA is encouraged to distribute a copy of the document with the notice to Federal, State and local government agencies likely to have an interest in the undertaking and to the State intergovernmental review contacts. The HA should also distribute the EA to any Federal, State or local agency known to have interest or special expertise (e.g. EPA for wetlands, water quality, air, noise, etc.) in those areas addressed in the EA which have or may have had potential for significant impact. The possible impacts and the agencies involved should be identified following the early coordination process. Where an individual permit would be required from the Corps of Engineers (COE) (i.e., Section 404 or Section 10) or from the Coast Guard (CG) (i.e., Section 9), a copy of the EA should be distributed to the involved agency in accordance with the U.S. Department of

Transportation (DOT)/Corps of Engineers Memorandum of Agreement or the FHWA/U.S. Coast Guard Memorandum of Understanding, respectively. Any internal FHWA distribution will be determined by the Division Office on a case-by-case basis.

B. Finding of No Significant Impact

Formal distribution of a FONSI is not required. The HA must send a notice of availability of the FONSI to Federal, State and local government agencies likely to have an interest in the undertaking and the State intergovernmental review contacts (23 CFR 771.121(b)). However, it is encouraged that agencies which commented on the EA (or requested to be informed) be advised of the project decision and the disposition of their comments and be provided a copy of the FONSI. This fosters good lines of communication and enhances interagency coordination.

V. Environmental Impact Statement (EIS) — FORMAT AND CONTENT

A. Cover Sheet

Each EIS should have a cover sheet containing the following information:

(EIS NUMBER)

Route, Termini, City or County, and State

Draft (Final) (Supplement)

Environmental Impact Statement

Submitted Pursuant to 42 U.S.C. 4332 (2) (c)

(and where applicable, 49 U.S.C. 303) by the

U.S. Department of Transportation

Federal Highway Administration

and

State Highway Agency

and

(As applicable, any other joint lead agency)

Cooperating Agencies
(Include List Here, as applicable)

____________Date of Approval ______________For (State Highway Agency)

_____________Date of Approval ________________For FHWA

The following persons may be contacted for additional information concerning this document:

__________(Name, address, and telephone number of HA contact) _______(Name, address, and telephone number of FHWA Division Office contact)

> A one-paragraph abstract of the statement.
>
> Comments on this draft EIS are due by (date) and should be sent to (name and address).

The top left-hand corner of the cover sheet of all draft final and supplemental EISs contains an identification number. The following is an example:

FHWA-AZ-EIS-87-01-D(F)(S)

FHWA - name of Federal agency

AZ - name of State (cannot exceed four characters)

EIS - environmental impact statement

87 - year draft statement was prepared

01 - sequential number of draft statement for each calendar year

D - designates the statement as the draft statement

F - designates the statement as the final statement

S - designates supplemental statement and should be combined with draft (DS) or final (FS) statement designation. The year and sequential number will be the same as those used for the original draft EIS.

The EIS should be printed on 8-1/2 x 11-inch paper with any foldout sheets folded to that size. The wider sheets should be 8-1/2 inches high and should open to the right with the title or identification on the right. The standard size is needed for administrative recordkeeping.

B. <u>Summary</u>

The summary should include:

(1) A brief description of the proposed FHWA action indicating route, termini, type of improvement, number of lanes, length, county, city, State, and other information, as appropriate.

(2) A description of any major actions proposed by other governmental agencies in the same geographic area as the proposed FHWA action.

(3) A summary of all reasonable alternatives considered. (The draft EIS must identify the preferred alternative or alternatives officially identified by the HA (40 CFR 1502.14(e)). The final EIS must identify the preferred alternative and should discuss the basis for its selection (23 CFR 771.125(a)(1)).

(4) A summary of major environmental impacts, both beneficial and adverse.

(5) Any areas of controversy (including issues raised by agencies and the public).

(6) Any major unresolved issues with other agencies.

(7) A list of other Federal actions required for the proposed action (i.e., permit approvals, land transfer, Section 106 agreements, etc.).

C. <u>Table of Contents</u>

For consistency with CEQ regulations, the following standard format should be used:

(1) Cover Sheet

(2) Summary

(3) Table of Contents

(4) Purpose of and Need for Action

(5) Alternatives

(6) Affected Environment

(7) Environmental Consequences

(8) List of Preparers

(9) List of Agencies, Organizations, and Persons to Whom Copies of the Statement are Sent

(10) Comments and Coordination

(11) Index

(12) Appendices (if any)

D. <u>Purpose of and Need for Action</u>

Identify and describe the proposed action and the transportation problem(s) or other needs which it is intended to address (40 CFR 1502.13). This section should clearly demonstrate that a "need" exists and should define the "need" in terms understandable to the general public. This discussion should clearly describe the problems which the proposed action is to correct. It will form the basis for the "no action" discussion in the "Alternatives" section, and assist with the identification of reasonable alternatives and the selection of the preferred alternative. Charts, tables, maps and other illustrations (e.g., typical cross-section, photographs, etc.) are encouraged as useful presentation techniques.
The following is a list of items which may assist in the explanation of the need for the proposed action. It is by no means all-inclusive or applicable in every situation and is intended only as a guide:

(1) Project Status — Briefly describe the project history including actions taken to date, other agencies and governmental units involved, actions pending, schedules, etc.

(2) System Linkage — Is the proposed project a "connecting link?" How does it fit in the transportation system?

(3) Capacity — Is the capacity of the present facility inadequate for the present traffic? Projected traffic? What capacity is needed? What is the level(s) of service for existing and proposed facilities?

(4) Transportation Demand — Including relationship to any statewide plan or adopted urban transportation plan together with an explanation of the project's traffic forecasts that are substantially different from those estimates from the 23 U.S.C. 134 (Section 134) planning process.

(5) Legislation — Is there a Federal, State, or local governmental mandate for the action.

(6) Social Demands or Economic Development — New employment, schools, land use plans, recreation, etc. What projected economic development/land use changes indicate the need to improve or add to the highway capacity?

(7) Modal Interrelationships — How will the proposed facility interface with and serve to complement airports, rail and port facilities, mass transit services, etc.?

(8) Safety — Is the proposed project necessary to correct an existing or potential safety hazard? Is the existing accident rate excessively high? Why? How will the proposed project improve it.

(9) Roadway Deficiencies — Is the proposed project necessary to correct existing roadway deficiencies (e.g., substantial geometrics, load limits on structures, inadequate cross-section, or high maintenance costs)? How will the proposed project improve it?

E. <u>Alternatives</u>

This section of the draft EIS must discuss a range of alternatives, including all "reasonable alternatives" under consideration and those "other alternatives" which were eliminated from detailed study (23 CFR 771.123(c)). The section should begin with a concise discussion of how and why the "reasonable alternatives" were selected for detailed study and explain why "other alternatives" were eliminated. The following range of alternatives should be considered when determining reasonable alternatives:

(1) "No-action" alternative: The "no-action" alternative normally includes short-term minor restoration types of activities (safety and maintenance improvements, etc.) that maintain continuing operation of the existing roadway.

(2) Transportation System Management (TSM) alternative: The TSM alternative includes those activities which maximize the efficiency of the present system. Possible subject areas to include in this alternative are options such as fringe parking, ride-sharing, high-occupancy vehicle (HOV) lanes on existing roadways, and traffic signal timing optimization. This limited construction alternative is usually relevant only for major projects proposed in urbanized areas over 200,000 population.

For all major projects in these urbanized areas, HOV lanes should be considered. Consideration of this alternative may be accomplished by reference to the regional transportation plan, when that plan considers this option. Where a regional transportation plan does not reflect consideration of this option, it may be necessary to evaluate the feasibility of HOV lanes during early project development. Where a TSM alternative is identified as a reasonable alternative for a "connecting link" project, it should be evaluated to determine the effect that not building a highway link in the transportation plan will have on the remainder of the system. A similar analysis should be made where a TSM element(s) (e.g., HOV lanes) is part of a build alternative and reduces the scale of the highway link.

While the above discussion relates primarily to major projects in urbanized areas, the concept of achieving maximum utilization of existing facilities is equally important in rural areas. Before selecting an alternative on new location for major projects in rural areas, it is important to demonstrate that reconstruction and rehabilitation of the existing system will not adequately correct the identified deficiencies and meet the project need.

(3) Mass Transit: This alternative includes those reasonable and feasible transit options (bus systems, rail, etc.) even though they may not be within the existing FHWA funding authority. It should be considered on all proposed major highway projects in urbanized areas over 200,000 population. Consideration of this alternative may be accomplished by reference to the regional or area transportation plan where that plan considers mass transit or by an independent analysis during early project development.

Where urban projects are multi-modal and are proposed for Federal funding, close coordination is necessary with the Urban Mass Transportation Administration (UMTA). In these situations, UMTA should be consulted early in the project-development process. Where UMTA funds are likely to be requested for portions of the proposal, UMTA must be requested to be either a joint lead agency or a cooperating agency at the earliest stages of project development (23 CFR 771.111(d)). Where applicable, cost-effectiveness studies that have been performed should be summarized in the EIS.

(4) Build alternatives: Both improvement of existing highway(s) and alternatives on new location should be evaluated. A representative number of reasonable alternatives must be presented and evaluated in detail in the draft EIS (40 CFR 1502.14(a)). For most major projects, there is a potential for a large number of reasonable alternatives. Where there is a large number of alternatives, only a representative number of the most reasonable examples, covering the full range of alternatives, must be presented. The determination of the number of reasonable alternatives in the draft EIS, therefore, depends on the particular project and the facts and circumstances in each case. Each alternative should be briefly described using maps or other visual aids such as photographs, drawings, or sketches to help explain the various alternatives. The material should provide a clear understanding of each alternative's termini, location, costs, and the project concept (number of lanes, right-of-way requirements, median width, access control, etc.). Where land has been or will be reserved or dedicated by local government(s), donated by individuals, or acquired through advanced or hardship acquisition for use as highway right-of-way for any alternative under consideration, the draft EIS should identify the status and extent of such property and the alternatives involved. Where such lands are reserved, the EIS should state that the reserved lands will not influence the alternative to be selected.

Development of more detailed design for some aspects (e.g., Section 4(f), COE or CG permits, noise, wetlands, etc.) of one or more alternatives may be necessary during preparation of the draft and final EIS in order to evaluate impacts or mitigation measures or to address issues raised by other agencies or the public. However, care should be taken to avoid unnecessarily specifying features which preclude cost-effective final design options.

All reasonable alternatives under consideration (including the no-build) need to be developed to a comparable level of detail in the draft EIS so that their comparative merits may be evaluated (40 CFR 1502.14(b) and (d)). In those situations where the HA has officially identified a "preferred" alternative based on its early coordination and environmental studies, the HA should so indicate in the draft EIS. In these instances, the draft EIS should include a statement indicating that the final selection of an alternative will not be made until the alternatives' impacts and comments on the draft EIS and from the public hearing (if held) have been fully evaluated. Where a preferred alternative has not been identified, the draft EIS should state that all reasonable alternatives are under consideration and that decision will be made after the alternatives' impacts and comments on the draft EIS and from the public hearing (if held) have been fully evaluated.

The final EIS must identify the preferred alternative and should discuss the basis for its selection (23 CFR 771.125(a)(1)). The discussion should provide the information and rationale identified in Section VIII (Record of Decision), paragraph (B). If the preferred alternative is modified after the draft EIS, the final EIS should clearly identify the changes and discuss the reasons why any new impacts are not significant.

F. Affected Environment

This section provides a concise description of the existing social, economic, and environmental setting for the area affected by all alternatives presented in the EIS. Where possible, the description should be a single description for the general project area rather than a separate one for each alternative. The general population served and/or affected (city, county, etc.) by the proposed action should be identified by race, color, national origin, and age. Demographic data should be obtained from available secondary sources (e.g., census data, planning reports) unless more detailed information is necessary to address specific concerns. All socially, economically, and environmentally sensitive locations or features in the proposed project impact area (e.g., neighborhoods, elderly/minority/ethnic groups, parks, hazardous material sites, historic resources, wetlands, etc.) should be identified on exhibits and briefly described in the text. However, it may be desirable to exclude from environmental documents the specific location of archeological sites to prevent vandalism.

To reduce paperwork and eliminate extraneous background material, the discussion should be limited to data, information, issues, and values which will have a bearing on possible impacts, mitigation measures, and on the selection of an alternative. Data and analyses should be commensurate with the importance of the impact, with the less important material summarized or referenced rather than be reproduced. Photographs, illustrations, and other graphics should be used with the text to give a clear understanding of the area and the important issues. Other Federal activities which contribute to the significance of the proposed action's impacts should be described.

This section should also briefly describe the scope and status of the planning processes for the local jurisdictions and the project area. Maps of any adopted land use and transportation plans for these jurisdictions and the project area would be helpful in relating the proposed project to the planning processes.

G. Environmental Consequences

This section includes the probable beneficial and adverse social, economic and environmental effects of alternatives under consideration and describes the measures proposed to mitigate adverse impacts. The information should have sufficient scientific and analytical substance to provide a basis for evaluating the comparative merits of the alternatives. The discussion of the proposed project impacts should not use the term significant in describing the level of impacts. There is no benefit to be gained from its use. If the term significant is used, however, it should be consistent with the CEQ definition and be supported by factual information.

There are two principal ways of preparing this section. One is to discuss the impacts and mitigation measures separately for each alternative with the alternatives as headings. The second (which is advantageous where there are few alternatives or where impacts are similar for the various alternatives) is to present this section with the impacts as the headings. Where appropriate, a sub-section should be included which discusses the general impacts and mitigation measures that are the same for the various alternatives under consideration. This would reduce or eliminate repetition under each of the alternative discussions. Charts, tables, maps, and other graphics illustrating comparisons between the alternatives (e.g., costs, residential displacements, noise impacts, etc.) are useful as a presentation technique.

When preparing the final EIS, the impacts and mitigation measures of the alternatives, particularly the preferred alternative, may need to be discussed in more detail to elaborate on information, firm-up commitments or address issues raised following the draft EIS. The final EIS should also identify any new impacts (and their significance) resulting from modification of or identification of substantive new circumstances or information regarding the preferred alternative following the draft EIS circulation. Note: Where new significant impacts are identified, a supplemental draft EIS is required (40 CFR 1502.9(c)).

The following information should be included in both the draft and final EIS for each reasonable alternative:

(1) A summary of studies undertaken, any major assumptions made and supporting information on the validity of the methodology (where the methodology is not generally accepted as state-of-the-art).

(2) Sufficient supporting information or results of analyses to establish the reasonableness of the conclusions on impacts.

(3) A discussion of mitigation measures. These measures normally should be investigated in appropriate detail for each reasonable alternative so they can be identified in the draft EIS. The final EIS should identify, describe and analyze all proposed mitigation measures for the preferred alternative.

In addition to normal FHWA program monitoring of design and construction activities, special instances may arise when a formal program for monitoring impacts or implementation of mitigation measures will be appropriate. For example, monitoring ground or surface waters that are sources for drinking water supply; monitoring noise or vibration of nearby sensitive activities (e.g., hospitals, schools); or providing an on-site professional archeologist to monitor excavation activities in highly sensitive archeological areas. In these instances, the final EIS should describe the monitoring program.

(4) A discussion, evaluation and resolution of important issues on each alternative. If important issues raised by other agencies on the preferred alternative remain unresolved, the final EIS must identify those issues and the consultations and other efforts made to resolve them (23 CFR 771.125(a)(2)).

Listed below are potentially significant impacts most commonly encountered by highway projects. These factors should be discussed for each reasonable alternative where a potential for impact exists. This list is not all-inclusive and, on specific projects, there may be other impact areas that should be included.

1. <u>Land Use Impacts</u>

This discussion should identify the current development trends and the State and/or local government plans and policies on land use and growth in the area which will be impacted by the proposed project.
These plans and policies are normally reflected in the area's comprehensive development plan, and include land use, transportation, public facilities, housing, community services, and other areas.

The land use discussion should assess the consistency of the alternatives with the comprehensive development plans adopted for the area and (if applicable) other plans used in the development of the transportation plan required by Section 134. The secondary social, economic, and environmental impacts of any substantial, foreseeable, induced development should be presented for each alternative, including adverse effects on existing communities. Where possible, the distribution between planned and unplanned growth should be identified.

2. Farmland Impacts

Farmland includes 1) prime, 2) unique, 3) other than prime or unique that is of statewide importance, and 4) other than prime or unique that is of local importance.

The draft EIS should summarize the results of early consultation with the Soil Conservation Service (SCS) and, as appropriate, State and local agriculture agencies where any of the four specified types of farmland could be directly or indirectly impacted by any alternative under consideration. Where farmland would be impacted, the draft EIS should contain a map showing the location of all farmlands in the project impact area, discuss the impacts of the various alternatives and identify measures to avoid or reduce the impacts. Form AD 1006 (Farmland Conversion Impact Rating) should be processed, as appropriate, and a copy included in the draft EIS. Where the Land Evaluation and Site Assessment score (from Form AD 1006) is 160 points or greater, the draft EIS should discuss alternatives to avoid farmland impacts.

If avoidance is not possible, measures to minimize or reduce the impacts should be evaluated and, where appropriate, included in the proposed action.

3. Social Impacts

Where there are foreseeable impacts, the draft EIS should discuss the following items for each alternative commensurate with the level of impacts and to the extend they are distinguishable:

(a) Changes in the neighborhoods or community cohesion for the various social groups as a result of the proposed action. These changes may be beneficial or adverse and may include splitting neighborhoods, isolating a portion of a neighborhood or an ethnic group, generating new development, changing property values, separating residents from community facilities, etc.

(b) Changes in travel patterns and accessibility (e.g., vehicular, commuter, bicycle, or pedestrian).

(c) Impacts on school districts, recreation areas, churches, businesses, police and fire protection, etc. This should include both the direct impacts to these entities and the indirect impacts resulting from the displacement of households and businesses.

(d) Impacts of alternatives on highway and traffic safety as well as on overall public safety.

(e) General social groups specially benefited or harmed by the proposed project. The effects of a project on the elderly, handicapped, nondrivers, transit-dependent and minority and ethnic groups are of particular concern and should be described to the extent these effects can be reasonably predicted. Where impacts on a minority or ethnic population are likely to be an important issue, the EIS should contain the following information broken down by race, color, and national origin: the population of the study area, the number of displaced residents, the type and number of displaced businesses, and an estimate of the number of displaced employees in each business sector. Changes in ethnic or minority employment opportunities should be discussed and the relationship of the project to other Federal actions which may serve or adversely affect the ethnic or minority population should be identified.

The discussion should address whether any social group is disproportionally impacted and identify possible mitigation measures to avoid or minimize any adverse impacts. Secondary sources of information such as census and personal contact with community leaders supplemented by visual inspections normally should be used to obtain the data for this analysis. However, for projects with major community impacts, a survey of the affected area may be needed to identify the extent and severity of impacts on these social groups.

4. <u>Relocation Impacts</u>

The relocation information should be summarized in sufficient detail to adequately explain the relocation situation including anticipated problems and proposed solutions. Project relocation documents from which information is summarized should be referenced in the draft EIS. Secondary sources of information such as census, economic reports and contact with community leaders, supplemented by visual inspections (and, as appropriate, contact with local officials) may be used to obtain the data for this analysis. Where a proposed project will result in displacements, the following information regarding households and businesses should be discussed for each alternative under consideration commensurate with the level of impact and to the extent they are likely to occur:

(a) An estimate of the number of households to be displaced, including the family characteristics (e.g., minority, ethnic, handicapped, elderly, large family, income level, and owner/tenant status). However, where there are very few displacees, information on race, ethnicity and income levels should not be included in the EIS to protect the privacy of those affected.

(b) A discussion comparing available (decent, safe, and sanitary) housing in the area with the housing needs of the displacees. The comparison should include (1) price ranges, (2) sizes (number of bedrooms), and (3) occupancy status (owner/tenant).

(c) A discussion of any affected neighborhoods, public facilities, non-profit organizations, and families having special composition (e.g., ethnic, minority, elderly, handicapped, or other factors) which may require special relocation considerations and the measures proposed to resolve these relocation concerns.

(d)A discussion of the measures to be taken where the existing housing inventory is insufficient, does not meet relocation standards, or is not within the financial capability of the displacees. A commitment to last resort housing should be included when sufficient comparable replacement housing may not be available.

(e) An estimate of the numbers, descriptions, types of occupancy (owner/tenant), and sizes (number of employees) of businesses and farms to be displaced. Additionally, the discussion should identify (1) sites available in the area to which the affected businesses may relocate, (2) likelihood of such relocation, and (3) potential impacts on individual businesses and farms caused by displacement or proximity of the proposed highway if not displaced.

(f) A discussion of the results of contacts, if any, with local governments, organizations, groups, and individuals regarding residential and business relocation impacts, including any measures or coordination needed to reduce general and/or specific impacts. These contacts are encouraged for projects with large numbers of relocatees or complex relocation requirements. Specific financial and incentive programs or opportunities (beyond those provided by the Uniform Relocation Act) to residential and business relocatees to minimize impacts may be identified, if available through other agencies or organizations.

(g) A statement that (1) the acquisition and relocation program will be conducted in accordance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended, and (2) relocation resources are available to all residential and business relocations without discrimination.

5. Economic Impacts

Where there are foreseeable economic impacts, the draft EIS should discuss the following for each alternative commensurate with the level of impacts:

(a)The economic impacts on the regional and/or local economy such as the effects of the project on development, tax revenues and public expenditures, employment opportunities, accessibility, and retail sales. Where substantial impacts on the economic viability of affected municipalities are likely to occur, they should also be discussed together with a summary of any efforts undertaken and agreements reached for using the transportation investment to support both public and private economic development plans. To the extent possible, this discussion should rely upon results of coordination with and views of affected State, county, and city officials and upon studies performed under Section 134.

(b) The impacts on the economic vitality of existing highway-related businesses (e.g., gasoline stations, motels, etc.) and the resultant impact, if any, on the local economy. For example, the loss of business or employment resulting from building an alternative on new location bypassing a local community.

(c) Impacts of the proposed action on established business districts, and any opportunities to minimize or reduce such impacts by the public and/or private sectors. This concern is likely to occur on a project that might lead to or support new large commercial development outside of a central business district.

6. Joint Development

Where appropriate, the draft EIS should identify and discuss those joint development measures which will preserve or enhance an affected community's social, economic, environmental, and visual values. This discussion may be presented separately or combined with the land use and/or social impacts presentations. The benefits to be derived, those who will benefit (communities, social groups, etc.) and the entities responsible for maintaining the measures should be identified.

7. Considerations Relating to Pedestrians and Bicyclists

Where current pedestrian or bicycle facilities or indications of use are identified, the draft EIS should discuss the current and anticipated use of the facilities, the potential impacts of the affected alternatives, and proposed measures, if any, to avoid or reduce adverse impacts to the facility(ies) and its users. Where new facilities are proposed as a part of the proposed highway project, the EIS should include sufficient information to explain the basis for providing the facilities (e.g., proposed bicycle facility is a link in the local plan or sidewalks will reduce project access impact to the community). The final EIS should identify those facilities to be included in the preferred alternative. Where the preferred alternative would sever an existing major route for non-motorized transportation traffic, the proposed project needs to provide a reasonable alternative route or demonstrate that such a route exists (23 U.S.C. 109(n)). To the fullest extent possible, this needs to be described in the final EIS.

8. Air Quality Impacts

The draft EIS should contain a brief discussion of the transportation-related air quality concerns in the project area and a summary of the project-related carbon monoxide (CO) analysis if such analysis is performed. The following information should be presented, as appropriate:

(a) Mesoscale Concerns: Ozone (0_3), Hydrocarbons (HC) and Nitrogen Oxide (NO_x) air quality concerns are regional in nature and as such meaningful evaluation on a project-by-project basis is not possible. Where these pollutants are an issue, the air quality emissions inventories in the State Implementation Plan (SIP) should be referenced and briefly summarized in the draft EIS. Further, the relationship of the project to the SIP should be described in the EIS by including one of the following statements:

(1) This project is in an area where the SIP does not contain any transportation control measures. Therefore, the conformity procedures of 23 CFR 770 do not apply to this project.

(2) This project is in an area which has transportation control measures in the SIP which was (conditionally) approved by the Environmental Protection Agency (EPA) on (date). The FHWA has determined that both the transportation plan and the transportation improvement program conform to the SIP. The FHWA has determined that this project is included in the transportation improvement program for the (indicate 3C planning area). Therefore, pursuant to 23 CFR 770, this project conforms to the SIP.

Under certain circumstances, neither of these statements will precisely fit the situation and may need to be modified. Additionally, if the project is a Transportation Control Measure from the SIP, this should be highlighted to emphasize the project's air quality benefits.

(b) Microscale Concerns: Carbon monoxide is a project-related concern and as such should be evaluated in the draft EIS. A microscale CO analysis is unnecessary where such impacts (project CO contribution plus background) can be judged to be well below the 1- and 8-hour National Ambient Air Quality Standards (or other applicable State or local standards). This judgment may be based on (1) previous analyses for similar projects; (2) previous general analyses for various classes of projects; or (3) simplified graphical or "look-up" table evaluations. In these cases, a brief statement stating the basis for the judgment is sufficient.

For those projects where a microscale CO analysis is performed, each reasonable alternative should be analyzed for the estimated time of completion and design year. A brief summary of the methodologies and assumptions used should be included in the draft EIS. Lengthy discussions, if needed, should be included in a separate technical report and referenced in the EIS. Total CO concentrations (project contribution plus estimated background) at identified reasonable receptors for each alternative should be reported. A comparison should be made between alternatives and with applicable State and nation standards. Use of a table for this comparison is recommended for clarity.

As long as the total predicted 1-hour CO concentration is less than 9 ppm (the 8-hour CO standard), no separate 8-hour analysis is necessary. If the 1-hour CO concentration is greater than 9 ppm, an 8-hour analysis should be performed. Where the preferred alternative would result in violations of the 1 or 8-hour CO standards, an effort should be made to develop reasonable mitigation measures through early coordination between FHWA, EPA, and appropriate State and local highway and air quality agencies. The final EIS should discuss the proposed mitigation measures and include evidence of the coordination.

9. Noise Impacts

The draft EIS should contain a summary of the noise analysis including the following for each alternative under detailed study:

(a) A brief description of noise sensitive areas (residences, businesses, schools, parks, etc.), including information on the number and types of activities which may be affected. This should include developed lands and undeveloped lands for which development is planned, designed, and programmed.

(b) The extent of the impact (in decibels) at each sensitive area. This includes a comparison of the predicted noise levels with both the FHWA noise abatement criteria and the existing noise levels. (Traffic noise impacts occur when the predicted traffic noise levels approach or exceed the noise abatement criteria or when they substantially exceed the existing noise levels). Where there is a substantial increase in noise levels, the HA should identify the criterion used for defining "substantial increase." Use of a table for this comparison is recommended for clarity.

(c) Noise abatement measures which have been considered for each impacted area and those measures that are reasonable and feasible and that would "likely" be incorporated into the proposed project. Estimated costs, decibel reductions and height and length of barriers should be shown for all abatement measures.

Where it is desirable to qualify the term "likely," the following statement or similar wording would be appropriate: "Based on the studies completed to date, the State intends to install noise abatement measures in the form of a barrier at (location(s)). These preliminary indications of likely abatement measures are based upon preliminary design for a barrier of ___________ high and __________ long and a cost of $_______________ that will reduce the noise level by ___________ dBA for _________________ residences (businesses, schools, parks, etc.). (Where there is more than one barrier, provide information for each one.) If during final design these conditions substantially change, the abatement measures might not be provided. A final decision on the installation of abatement measure(s) will be made upon completion of the project design and the public involvement process."

(d) Noise impacts for which no prudent solution is reasonably available and the reasons why.

10. <u>Water Quality Impacts</u>

The draft EIS should include summaries of analyses and consultations with the State and/or local agency responsible for water quality. Coordination with the EPA under the Federal Clean Water Act may also provide assistance in this area. The discussion should include sufficient information to describe the ambient conditions of streams and water bodies which are likely to be impacted and identify the potential impacts of each alternative and proposed mitigation measures. Under normal circumstances, existing data may be used to describe ambient conditions. The inclusion of water quality data spanning several years is encouraged to reflect trends.

The draft EIS should also identify any locations where roadway runoff or other nonpoint source pollution may have an adverse impact on sensitive water resources such as water supply reservoirs, ground water recharge areas, and high quality streams. The 1981 FHWA research report entitled "Constituents of Highway Runoff," the 1985 report entitled "Management Practices for Mitigation of Highway Stormwater Runoff Pollution" and the 1987 report entitled "Effects of Highway Runoff on Receiving Waters" contain procedures for estimating pollutant loading from highway runoff and would be helpful in determining the level of potential impacts and appropriate mitigation measures. The draft EIS should identify the potential impacts of each alternative and proposed mitigation measures.

Where an area designated as principal or sole-source aquifer under Section 1424(e) of the Safe Drinking Water Act may be impacted by a proposed project, early coordination with EPA will assist in identifying potential impacts. The EPA will furnish information on whether any of the alternatives affect the aquifer. This coordination should also identify any potential impacts to the critical aquifer protection area (CAPA), if designated, within affected sole-source aquifers. If none of the alternatives affect the aquifer, the requirements of the Safe Drinking Water Act are satisfied. If an alternative is selected which affects the aquifer, a design must be developed to assure, to the satisfaction of EPA, that it will not contaminate the aquifer (40 CFR 149). The draft EIS should document coordination with EPA and identify its position on the impacts of the various alternatives. The final EIS should show that EPA's concerns on the preferred alternative have been resolved.

Wellhead protection areas were authorized by the 1986 Amendments to the Safe Drinking Water Act. Each State will develop State wellhead protection plans with final approval by EPA. When a proposed project encroaches on a wellhead protection area, the draft EIS should identify the area, the potential impact of each alternative and proposed mitigation measures. Coordination with the State agency responsible for the protection plan will aid in identifying the areas, impacts and mitigation. If the preferred alternative impacts these areas, the final EIS should document that it complies with the approved State wellhead protection plan.

11. <u>Permits</u>

If a facility such as a safety rest area is proposed and it will have a point source discharge, a Section 402 permit will be required for point source discharge (40 CFR 122). The draft EIS should discuss potential adverse impacts resulting from such proposed facilities and identify proposed mitigation measures. The need for a Section 402 permit and Section 401 water quality certification should be identified in the draft EIS.

For proposed actions requiring a Section 404 or Section 10 (Corps of Engineers) permit, the draft EIS should identify by alternative the general location of each dredge or fill activity, discuss the potential adverse impacts, identify proposed mitigation measures (if not addressed elsewhere in the draft EIS), and include evidence of coordination with the Corps of Engineers (in accordance with the U.S. DOT/Corps of Engineers Memorandum of Agreement) and appropriate Federal, State and local resource agencies and State and local water quality agencies. Where the preferred alternative requires an individual Section 404 or Section 10 permit, the final EIS should identify for each permit activity the approximate quantities of dredge or fill material, general construction grades and proposed mitigation measures.

For proposed actions requiring Section 9 (U.S. Coast Guard bridge) permits, the draft EIS should identify by alternative the location of the permit activity, potential impacts to navigation and the environment (if not addressed elsewhere in the document), proposed mitigation measures and evidence of coordination with the U.S. Coast Guard (in accordance with the FHWA/U.S. Coast Guard Memorandum of Understanding). Where the preferred alternative requires a Section 9 permit, the final EIS should identify for each permit activity the proposed horizontal and vertical navigational clearances and include an exhibit showing the various dimensions.

For all permit activities, the final EIS should include evidence that every reasonable effort has been made to resolve the issues raised by other agencies regarding the permit activities. If important issues remain unresolved, the final EIS must identify those issues, the positions of the respective agencies on the issues and the consultations and other efforts made to resolve them (23 CFR 771.125(a)).

12. <u>Wetland Impacts</u>

When an alternative will impact wetlands the draft EIS should (1) identify the type, quality and function of wetlands involved, (2) describe the impacts to the wetlands, (3) evaluate alternatives which would avoid these wetlands, and (4) identify practicable measures to minimize harm to the wetlands. Wetlands should be identified by using the definition of 33 CFR 328.3(b) (issued on November 13, 1986) which requires the presence of hydrophytic vegetation, hydric soils and wetland hydrology. Exhibits showing wetlands in the project impact area in relation to the alternatives, should be provided.

In evaluating the impact of the proposed project on wetlands, the following two items should be addressed: (1) the importance of the impacted wetland(s) and (2) the severity of this impact. Merely listing the number of acres taken by the various alternatives of a highway proposal does not provide sufficient information upon which to determine the degree of impact on the wetland ecosystem. The wetlands analysis should be sufficiently detailed to provide an understanding of these two elements.

In evaluating the importance of the wetlands, the analysis should consider such factors as: (1) the primary functions of the wetlands (e.g., flood control, wildlife habitat, ground water recharge, etc.), (2) the relative importance of these functions to the total wetland resource of the area, and (3) other factors such as uniqueness that may contribute to the wetlands importance.

In determining the wetland impact, the analysis should show the project's effects on the stability and quality of the wetland(s). This analysis should consider the short- and long-term effects on the wetlands and the importance of any loss such as: (1) flood control capacity, (2) shore line anchorage potential, (3) water pollution abatement capacity, and (4) fish and wildlife habitat value. The methodology developed by FHWA and described in reports numbered FHWA-IP-82-23 and FHWA-IP-82-24, "A Method for Wetland Functional Assessment Volumes I and II," is recommended for use in conducting this analysis. Knowing the importance of the wetlands involved and the degree of the impact, the HA and FHWA will be in a better position to determine the mitigation efforts necessary to minimize harm to these wetlands. Mitigation measures which should be considered include preservation and improvement of existing wetlands and creation of new wetlands (consistent with 23 CFR 777).

If the preferred alternative is located in wetlands, to the fullest extent possible, the final EIS needs to contain the finding required by Executive Order 11990 that there are no practicable alternatives to construction in wetlands. Where the finding is included, approval of the final EIS will document compliance with the Executive Order 11990 requirements (23 CFR 771.125(a)(1)). The finding should be included in a separate subsection entitled "Only Practicable Alternative Finding" and should be supported by the following information:

(a) a reference to Executive Order 11990;

(b) an explanation why there are no practicable alternatives to the proposed action;

(b) an explanation why the proposed action includes all practicable measures to minimize harm to wetlands; and

(c) a concluding statement that: "Based upon the above considerations, it is determined that there is no practicable alternative to the proposed construction in wetlands and that the proposed action includes all practicable measures to minimize harm to wetlands which may result from such use."

13. <u>Water Body Modification and Wildlife Impacts</u>

For each alternative under detailed study, the draft EIS should contain exhibits and discussions identifying the location and extent of water body modifications (e.g., impoundment, relocation, channel deepening, filling, etc.). The use of the stream or body of water for recreation, water supply, or other purposes should be identified. Impacts to fish and wildlife resulting from loss degradation, or modification of aquatic or terrestrial habitat should also be discussed. The results of coordination with appropriate Federal, State and local agencies should be documented in the draft EIS. For example, coordination with FWS under the Fish and Wildlife Coordination Act of 1958.

14. Floodplain Impacts

National Flood Insurance Program (NFIP) maps or, if NFIP maps are not available, information developed by the highway agency should be used to determine whether an alternative will encroach on the base (100-year) floodplain. The location hydraulic studies required by 23 CFR 650, Subpart A must include a discussion of the following items commensurate with the level of risk or environmental impact, for each alternative which encroaches on base floodplains or would support base floodplain development:

(a)The flooding risks;

(b) The impacts on natural and beneficial floodplain values;

(c)The support of probable incompatible floodplain development (i.e., any development that is not consistent with a community's floodplain development plan);

(d) The measures to minimize floodplain impacts; and

(e) The measures to restore and preserve the natural and beneficial floodplain values.

The draft EIS should briefly summarize the results of the location hydraulic studies. The summary should identify the number of encroachments and any support of incompatible floodplain developments and their potential impacts. Where an encroachment or support of incompatible floodplain development results in substantial impacts, the draft EIS should provide more detailed information on the location, impacts and appropriate mitigation measures. In addition, if any alternative (1) results in a floodplain encroachment or supports incompatible floodplain development having significant impacts or (2) requires a commitment to a particular structure size or type, the draft EIS needs to include an evaluation an discussion of practicable alternatives to the structure or to the significant encroachment. The draft EIS should include exhibits which display the alternatives, the base floodplains and, where applicable, the regulatory floodways.

If the preferred alternative includes a floodplain encroachment having significant impacts, the final EIS must include a finding that it is the only practicable alternative as required by 23 CFR 650, Subpart A. The finding should refer to Executive Order 11988 and 23 CFR 650, Subpart A. It should be included in a separate subsection entitled "Only Practicable Alternative Finding" and must be supported by the following information.

(a) The reasons why the proposed action must be located in the floodplain;

(b)The alternatives considered and why they were not practicable; and

(c) A statement indicating whether the action conforms to applicable State or local floodplain protection standards.

For each alternative encroaching on a designated or proposed regulatory floodway, the draft EIS should provide a preliminary indication of whether the encroachment would be consistent with or require a revision to the regulatory floodway. Engineering and environmental analyses should be undertaken, commensurate with level of encroachment, to permit the consistency evaluation and identify impacts. Coordination with the Federal Emergency Management Agency (FEMA) and appropriate State and local government agencies should be undertaken for each floodway encroachment. If the preferred alternative encroaches on a regulatory floodway, the final EIS should discuss the consistency of the action with the regulatory floodway. If a floodway revision is necessary, the EIS should include evidence from FEMA and local or State agency indicating that such revision would be acceptable.

15. Wild and Scenic Rivers

If the proposed action could have foreseeable adverse effects on a river on the National Wild and Scenic Rivers System or a river under study for designation to the National Wild and Scenic Rivers System, the draft EIS should identify early coordination undertaken with the agency responsible for managing the listed or study river (i.e., National Park Service (NPS), Fish and Wildlife Service (FWS), Bureau of Land Management (BLM), or Forest Service (FS)). For each alternative under consideration, the EIS should identify the potential adverse effects on the natural, cultural, and recreational values of the listed or study river. Adverse effects include alteration of the free-flowing nature of the river, alteration of the setting or deterioration of water quality. If it is determined that any of the alternatives could foreclose options to designate a study river under the Act, or adversely affect those qualities of a listed river for which it was designated, to the fullest extent possible, the draft EIS needs to reflect consultation with the managing agency on avoiding or mitigating the impacts (23 CFR 771.123(c)). The final EIS should identify measures that will be included in the preferred alternative to avoid or mitigate such impacts.

Publicly owned waters of designated wild and scenic rivers are protected by Section 4(f). Additionally, public lands adjacent to a Wild and Scenic River may be subject to Section 4(f) protection. An examination of any adopted or proposed management plan for a listed river should be helpful in making the determination on applicability of Section 4(f). For each alternative that takes such land, coordination with the agency responsible for managing the river (either NPS, FWS, BLM, or FS) will provide information on the management plan, specific affected land uses and any necessary Section 4(f) coordination.

16. Coastal Barriers

The Coastal Barrier Resources Act (CBRA) establishes certain coastal areas to be protected by prohibiting the expenditure of Federal funds for new and expanded facilities within designated coastal barrier units. When a proposed project impacts a coastal barrier unit, the draft EIS should: include a map showing the relationship of each alternative to the unit(s); identify direct and indirect impacts to the unit(s); quantifying and describing the impacts as appropriate; discuss the results of early coordination with FWS, identifying any issues raised and how they were addressed, and; identify any alternative which (if selected) would require an exception under the Act. Any issues identified or exceptions required for the preferred alternative should be resolved prior to its selection. This resolution should be documented in the final EIS.

17. Coastal Zone Impacts

Where the proposed action is within, or is likely to affect land or water uses within the area covered by a State Coastal Zone Management Program (CZMP) approved by the Department of Commerce, the draft EIS should briefly describe the portion of the affected CZMP plan, identify the potential impacts, and include evidence of coordination with the State Coastal Zone Management agency or appropriate local agency. The final EIS should include the State Coastal Zone Management agency's determination on consistency with the State CZMP plan. (In some States, an agency will make a consistency determination only after the final EIS is approved, but will provide a preliminary indication before the final EIS that the project is "not inconsistent" or "appears to be consistent" with the plan.) (For direct Federal actions, the final EIS should include the lead agency's consistency determination and agreement by the State CZM agency.) If the preferred alternative is inconsistent with the State's approved CZMP, it can be Federally funded only if the Secretary of Commerce makes a finding that the proposed action is consistent with the purpose or objectives of the CZM Act or is necessary in the interest of national security. To the fullest extent possible, such a finding needs to be included in the final EIS. If the finding is denied, the action is not eligible for Federal funding unless modified in such a manner to remove the inconsistency finding. The final EIS should document such results.

18. Threatened or Endangered Species

The HA must obtain information from the FWS of the DOI and/or the National Marine Fisheries Service (NMFS) of the Department of Commerce to determine the presence or absence of listed and proposed threatened or endangered species and designated and proposed critical habitat in the proposed project area (50 CFR 402.12(c)). The information may be (1) a published geographical list of such species or critical habitat; (2) a project-specific notification of a list of such species or critical habitat; or (3) substantiated information from other credible sources. Where the information is obtained from a published geographical list the reasons why this would satisfy the coordination with DOI should be explained. If there are no species or critical habitat in the proposed project area, the Endangered Species Act requirements have been met. The results of this coordination should be included in the draft EIS.

When a proposed species or a proposed critical habitat may be present in the proposed project area, an evaluation or, if appropriate, a biological assessment is made on the potential impacts to identify whether any such species or critical habitat are likely to be adversely affected by the project. Informal consultation with FWS and/or NMFS should be undertaken during the evaluation. The draft EIS should include exhibits showing the location of the species or habitat, summarize the evaluation and potential impacts, identify proposed mitigation measures, and evidence coordination with FWS and/or NMFS. If the project is likely to jeopardize the continued existence of any proposed species or result in the destruction or adverse modification of proposed critical habitat, the HA in consultation with the FHWA must confer with FWS and/or NMFS to attempt to resolve potential conflicts by avoiding, minimizing, or reducing the project impacts (50 CFR 402.10(a)). If the preferred alternative is likely to jeopardize the continued existence of any proposed species or result in the destruction or adverse modification of proposed critical habitat, a conference with FWS and/or NMFS must be held to assist in identifying and resolving potential conflicts. To the fullest extent possible, the final EIS needs to summarize the results of the conference and identify reasonable and prudent alternatives to avoid the jeopardy to such proposed species or critical habitat. If no alternatives exist, the final EIS should explain the reasons why and identify any proposed mitigation measures to minimize adverse effects.
When a listed species or a designated critical habitat may be present in the proposed project area, a biological assessment must be prepared to identify any such species or habitat which are likely to be adversely affected by the proposed project (50 CFR 402.12). Informal consultation should be undertaken or, if desirable, a conference held with FWS and/or NMFS during preparation of the biological assessment. The draft EIS should summarize the following data from the biological assessment:

(a) The species distribution, habitat needs, and other biological requirements;

(b) The affected areas of the proposed project;

(c) Possible impacts to the species including opinions of recognized experts on the species at issue;

(d)Measures to avoid or minimize adverse impacts; and

(e) Results of consultation with FWS and/or NMFS.

In selecting an alternative, jeopardy to a listed species or the destruction or adverse modification of designated critical habitat must be avoided (50 CFR 402.01(a)). If the biological assessment indicates that there are no listed species or critical habitat present that are likely to be adversely affected by the preferred alternative, the final EIS should evidence concurrence by the FWS and/or NMFS in such a determination and identify any proposed mitigation for the preferred alternative.

If the results of the biological assessment or consultation with FWS and/or NMFS show that the preferred alternative is likely to jeopardize the continued existence of a listed species or result in the destruction or adverse modification of designated critical habitat, to the fullest extent possible, the final EIS needs to contain: (1) a summary of the biological assessment (see data above for draft EIS); (2) a summary of the steps taken, including alternatives or measures evaluated and conferences and consultations held, to resolve the project's conflicts with the listed species or critical habitat; (3) a copy of the biological opinion; (4) a request for an exemption from the Endangered Species Act; (5) the results of the exemption request; and (6) a statement that (if the exemption is denied) the action is not eligible for Federal funding.

19. Historic and Archeological Preservation

The draft EIS should contain a discussion demonstrating that historic and archeological resources have been identified and evaluated in accordance with the requirements of 36 CFR 800.4 for each alternative under consideration. The information and level of effort needed to identify and evaluate historic and archeological resources will vary from project to project as determined by the FHWA after considering existing information, the views of the SHPO and the Secretary of Interior's "Standards and Guidelines for Archeology and Historic Preservation." The information for newly identified historic resources should be sufficient to determine their significance and eligibility for the National Register of Historic Places. The information for archeological resources should be sufficient to identify whether each warrants preservation in place or whether it is important chiefly because of what can be learned by data recovery and has minimal value for preservation in place. Where archeological resources are not a major factor in the selection of a preferred alternative, the determination of eligibility for the National Register of newly identified archaeological resources may be deferred until after circulation of the draft EIS.
The draft EIS discussion should briefly summarize the methodologies used in identifying historic and archeological resources. Because Section 4(f) of the DOT Act applies to the use of historic resources on or eligible for the National Register and to archeological resources on or eligible for the National Register and which warrant preservation in place, the draft EIS should describe the historical resources listed in or eligible for the National Register and identify any archeological resources that warrant preservation in place. The draft EIS should summarize the impacts of each alternative on and proposed mitigation measures for each resource. The document should evidence coordination with the SHPO on the significance of newly identified historic and archaeological resources, the eligibility of historic resources for the National Register and the effects of each alternative on both listed and eligible historic resources. Where the draft EIS discusses eligibility for the National Register of archeological resources, the coordination with the SHPO on eligibility and effect should address both historic and archeological resources.

The draft EIS can serve as a vehicle for affording the Advisory Council on Historic Preservation (ACHP) an opportunity to comment pursuant to Section 106 requirements if the document contains the necessary information required by 36 CFR 800.8. The draft EIS transmittal letter to the ACHP should specifically request its comments pursuant to 36 CFR 800.6.

To the fullest extent possible, the final EIS needs to demonstrate that all the requirements of 36 CFR 800 have been met. If the preferred alternative has no effect on historic or archeological resources on or eligible for the National Register, the final EIS should indicate coordination with and agreement by the SHPO. If the preferred alternative has an effect on a resource on or eligible for the National Register, the final EIS should contain (a) a determination of no adverse effect concurred in by the Advisory Council on Historic Preservation, (b) an executed memorandum of agreement (MOA), or (c) in the case of a rare situation where FHWA is unable to conclude the MOA, a copy of comments transmitted from the ACHP to the FHWA and the FHWA response to those comments.

The proposed use of land from an historic resource on or eligible for the National Register will normally require an evaluation and approval under Section 4(f) of the DOT Act. Section 4(f) also applies to all archaeological sites on or eligible for the National Register and which warrant preservation in place. (See Section IX for information on Section 4(f) evaluation.)

20. Hazardous Waste Sites

Hazardous waste sites are regulated by the Resource Conservation and Recovery ACT (RCRA) and the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). During early planning, the location of permitted and nonregulated hazardous waste sites should be identified. Early coordination with the appropriate Regional Office of the EPA and the appropriate State agency will aid in identifying known or potential hazardous waste sites. If known or potential waste sites are identified, the locations should be clearly marked on a map showing their relationship to the alternatives under consideration. If a known or potential hazardous waste site is affected by an alternative, information about the site, the potential involvement, impacts and public health concerns of the affected alternative(s) and the proposed mitigation measures to eliminate or minimize impacts or public health concerns should be discussed in the draft EIS.
If the preferred alternative impacts a known or potential hazardous waste site, the final EIS should address and resolve the issues raised by the public and governmental agencies.

21. Visual Impacts

The draft EIS should state whether the project alternatives have a potential for visual quality impacts. When this potential exists, the draft EIS should identify the impacts to the existing visual resource, the relationship of the impacts to potential viewers of and from the project, as well as measures to avoid, minimize, or reduce the adverse impacts. When there is potential for visual quality impacts, the draft EIS should explain the consideration given to design quality, art, and architecture in the project planning. These values may be particularly important for facilities located in visually sensitive urban or rural settings. When a proposed project will include features associated with design quality, art or architecture, the draft EIS should be circulated to officially designated State and local arts councils and, as appropriate, other organizations with an interest in design, art, and architecture. The final EIS should identify any proposed mitigation for the preferred alternative.

22. Energy

Except for large scale projects, a detailed energy analysis including computations of BTU requirements, etc., is not needed. For most projects, the draft EIS should discuss in general terms the construction and operational energy requirements and conservation potential of various alternatives under consideration. The discussion should be reasonable and supportable. It might recognize that the energy requirements of various construction alternatives are similar and are generally greater than the energy requirements of the no-build alternative. Additionally, the discussion could point out that the post-construction, operational energy requirements of the facility should be less with the build alternative as opposed to the no-build alternative. In such a situation, one might conclude that the savings in operational energy requirements would more than offset construction energy requirements and thus, in the long term, result in a net savings in energy usage.

For large-scale projects with potentially substantial energy impacts, the draft EIS should discuss the major direct and/or indirect energy impacts and conservation potential of each alternative. Direct energy impacts refer to the energy consumed by vehicles using the facility. Indirect impacts include construction energy and such items as the effects of any changes in automobile usage. The alternative's relationship and consistency with a State and/or regional energy plan, if one exists, should also be indicated.

The final EIS should identify any energy conservation measures that will be implemented as apart of the preferred alternative. Measures to conserve energy include the use of high-occupancy vehicle incentives and measures to improve traffic flow.

23. <u>Construction Impacts</u>

The draft EIS should discuss the potential adverse impacts (particularly air, noise, water, traffic congestion, detours, safety, visual, etc.) associated with construction of each alternative and identify appropriate mitigation measures. Also, where the impacts of obtaining borrow or disposal of waste material are important issues, they should be discussed in the draft EIS along with any proposed measure to minimize these impacts. The final EIS should identify any proposed mitigation for the preferred alternative.

24. <u>The Relationship Between Local Short-term Uses of Man's Environment and the Maintenance and Enhancement of Long-term Productivity</u>

The EIS should discuss in general terms the proposed action's relationship of local short-term impacts and use of resources and the maintenance and enhancement of long-term productivity. This general discussion might recognize that the build alternatives would have similar impacts. The discussion should point out that transportation improvements are based on State and/or local comprehensive planning which consider(s) the need for present and future traffic requirements within the context of present and future land use development. In such a situation, one might then conclude that the local short-term impacts and use of resources by the proposed action is consistent with the maintenance and enhancement of long-term productivity for the local area, State, etc.

25. <u>Any Irreversible and Irretrievable Commitments of Resources Which Would be Involved in the Proposed Action</u>

The EIS should discuss in general terms the proposed action's irreversible and irretrievable commitment of resources. This general discussion might recognize that the build alternatives would require a similar commitment of natural, physical, human, and fiscal resources. An example of such discussion would be as follows:

"Implementation of the proposed action involves a commitment of a range of natural, physical, human, and fiscal resources. Land used in the construction of the proposed facility is considered an irreversible commitment during the time period that the land is used for a highway facility. However, if a greater need arises for use of the land or if the highway facility is no longer needed, the land can be converted to another use. At present, there is no reason to believe such a conversion will ever be necessary or desirable.

Considerable amounts of fossil fuels, labor, and highway construction materials such as cement, aggregate, and bituminous material are expended. Additionally, large amounts of labor and natural resources are used in the fabrication and preparation of construction materials. These materials are generally not retrievable. However, they are not in short supply and their use will not have an adverse effect upon continued availability of these resources. Any construction will also require a substantial one-time expenditure of both State and Federal funds which are not retrievable.

The commitment of these resources is based on the concept that residents in the immediate area, State, and region will benefit by the improved quality of the transportation system. These benefits will consist of improved accessibility and safety, savings in time, and greater availability of quality services which are anticipated to outweigh the commitment of these resources."

H. <u>List of Preparers</u>

This section should include lists of:

(1)State (and local agency) personnel, including consultants, who were primarily responsible for preparing the EIS or performing environmental studies, and a brief summary of their qualifications, including educational background and experience.

(2)The FHWA personnel primarily responsible for preparation or review of the EIS and their qualifications.

(3)The areas of EIS responsibility for each preparer.

I. <u>List of Agencies, Organizations, and Persons to Whom Copies of the Statement are Sent</u>

<u>Draft EIS</u>: List all entities from which comments are being requested (40 CFR 1502.10). <u>Final EIS</u>: Identify those entities that submitted comments on the draft EIS and those receiving a copy of the final EIS (23 CFR 771.125(a) and (g)).

J. <u>Comments and Coordination</u>

1. The draft EIS should contain copies of pertinent correspondence with each cooperating agency, other agencies and the public and summarize: 1) the early coordination process, including scoping; 2) the meetings with community groups (including minority and non-minority interests) and individuals; and 3) the key issues and pertinent information received from the public and government agencies through these efforts.

2. The final EIS should include a copy of substantive comments from the U.S. Secretary of Transportation (OST), each cooperating agency, and other commentors on the draft EIS. Where the response is exceptionally voluminous the comments may be summarized. An appropriate response should be provided to each substantive comment. When the EIS text is revised as a result of the comments received, a copy of the comments should contain marginal references indicating where revisions were made, or the response to the comments should contain such references. The response should adequately address the issue or concern raised by the commentor or, where substantive comments do not warrant further response, explain why they do not, and provide sufficient information to support that position.

The FHWA and the HA are not commentors within the meaning of NEPA and their comments on the draft EIS should not be included in the final EIS. However, the document should include adequate information for FHWA and the HA to ascertain the disposition of the comment(s).

3. The final EIS should (1) summarize the substantive comments on social, economic, environmental and engineering issues made at the public hearing, if one is held, or the public involvement activities or which were otherwise considered and (2) discuss the consideration given to any substantive issue raised and provide sufficient information to support that position.

4. The final EIS should document compliance with requirements of all applicable environmental laws, Executive Orders, and other related requirements, such as Title VI of the Civil Rights Act of 1964. To the extent possible, all environmental issues should be resolved prior to the submission of the final EIS. When disagreement on project issues exists with another agency, coordination with the agency should be undertaken to resolve the issues. Where the issues cannot be resolved, the final EIS should identify any remaining unresolved issues, the steps taken to resolve the issues, and the positions of the respective parties. Where issues are resolved through this effort, the final EIS should demonstrate resolution of the concerns.

K. Index

The Index should include important subjects and areas of major impacts so that a reviewer need not read the entire EIS to obtain information on a specific subject or impact.

L. Appendices

The EIS should briefly explain or summarize methodologies and results of technical analysis and research. Lengthy technical discussions should be contained in a technical report. Material prepared as appendices to the EIS should:

(1)consist of material prepared specifically for the EIS;

(2)consist of material which substantiates an analysis fundamental to the EIS;

(3)be analytic and relevant to the decision to be made; and

(4)be circulated with the EIS within FHWA, to EPA (Region), and to cooperating agencies and be readily available on request by other parties. Other reports and studies referred to in the EIS should be readily available for review or for copying at a convenient location.

VI.OPTIONS FOR PREPARING FINAL EISs

The CEQ regulations place heavy emphasis on reducing paperwork, avoiding unnecessary work, and producing documents which are useful to decision makers and to the public. With these objectives in mind, three different approaches to preparing final EISs are presented below. The first two approaches can be employed on any project. The third approach is restricted to the conditions specified by CEQ (40 CFR 1503.4(c)).

A. Traditional Approach

Under this approach, the final EIS incorporates the draft EIS (essentially in its entirety) with changes made as appropriate throughout the document to reflect the selection of an alternative, modifications to the project, updated information on the affected environment, changes in the assessment of impacts, the selection of mitigation measures, wetland and floodplain findings, the results of coordination, comments received on the draft EIS and responses to these comments, etc. Since so much information is carried over from the draft to the final, important changes are sometimes difficult for the reader to identify. Nevertheless, this is the approach most familiar to participants in the NEPA process.

B. Condensed Final EIS

This approach avoids repetition of material from the draft EIS by incorporating, by reference, the draft EIS. The final EIS is, thus, a much shorter document than under the traditional approach;

however, it should afford the reader a complete overview of the project and its impacts on the human environment.

The crux of this approach is to briefly reference and summarize information from the draft EIS which has not changed and to focus the final EIS discussion on changes in the project, its setting, impacts, technical analysis, and mitigation that have occurred since the draft EIS was circulated. In addition, the condensed final EIS must identify the preferred alternative, explain the basis for its selection, describe coordination efforts, and include agency and public comments, responses to these comments, and any required findings or determinations (40 CFR 1502.14(e) and 23 CFR 771.125(a)).

The format of the final EIS should parallel the draft EIS. Each major section of the final EIS should briefly summarize the important information contained in the corresponding section of the draft, reference the section of the draft that provides more detailed information, and discuss any noteworthy changes that have occurred since the draft was circulated.

At the time that the final is circulated, an additional copy of the draft EIS need not be provided to those parties that received a copy of the draft EIS when it was circulated. Nevertheless, if, due to the passage of time or other reasons, it is likely that they will have disposed of their original copy of the draft EIS, then a copy of the draft EIS should be provided with the final. In any case, sufficient copies of the draft EIS should be on hand to satisfy requests for additional copies. Both the draft EIS and the condensed final EIS should be filed with EPA under a single final EIS cover sheet.

C. Abbreviated Version of Final EIS

The CEQ regulation (40 CFR 1503.4(c)) provides the opportunity to expedite the final EIS preparation where the only changes needed in the document are minor and consist of the factual corrections and/or an explanation of why the comments received on the draft EIS do not warrant further response. In using this approach, care should be exercised to assure that the draft EIS contains sufficient information to make the findings in (2) below and that the number of errata sheets used to make required changes is small and that these errata sheets together with the draft EIS constitute a readable, understandable, full disclosure document. The final EIS should consist of the draft EIS and an attachment containing the following:

(1)Errata sheets making any necessary corrections to the draft EIS;

(2)A section identifying the preferred alternative and a discussion of the reasons it was selected. The following should also be included in this section where applicable:

(a) final Section 4(f) evaluations containing the information described in Section IX of these guidelines;

(b) wetland finding(s);

(c) floodplain finding(s);

(d) a list of commitments for mitigation measures for the preferred alternative; and

(3)Copies (or summaries) of comments received from circulation of the draft EIS and public hearing and responses thereto.

Only the attachment need be provided to parties who received a copy of the draft EIS, unless it is likely that they will have disposed of their original copy, in which case both the draft EIS and the attachment should be provided (40 CFR 1503.4(c)). Both the draft EIS and the attachment must be filed with EPA under a single final EIS cover sheet (40 CFR 1503.4(c)).

VII. DISTRIBUTION OF EISs AND SECTION 4(f) EVALUATIONS

A. Environmental Impact Statement

1. After clearance by FHWA, copies of all draft EISs must be made available to the public and circulated for comments by the HA to: all public officials, private interest groups, and members of the public known to have an interest in the proposed action or the draft EIS; all Federal, State, and local government agencies expected to have jurisdiction, responsibility, interest, or expertise in the proposed action; and States and Federal land management entities which may be affected by the proposed action or any of the alternatives (40 CFR 1502.19 and 1503.1). Distribution must be made no later than the time the document is filed with EPA for Federal Register publication and must allow for a minimum 45-day review period (40 CFR 1506.9 and 1506.10). Internal FHWA distribution of draft and final EISs is subject to change and is noted in memorandums to the Regional Administrators as requirements change.

2. Copies of all approved final EISs must be distributed to all Federal, State, and local agencies and private organizations, and members of the public who provided substantive comments on the draft EIS or who requested a copy (40 CFR 1502.19). Distribution must be made no later than the time the document is filed with EPA for Federal Register publication and must allow for a minimum 30-day review period before the Record of Decision is approved (40 CFR 1506.9 and 1506.10). Two copies of all approved EISs should be forwarded to the FHWA Washington Headquarters (HEV-11) for recordkeeping purposes.

3. Copies of all EISs should normally be distributed to EPA and DOI as follows, unless the agency has indicated to the FHWA offices the need for a different number of copies:

(a) The EPA Headquarters: five copies of the draft EIS and five copies of the final EIS (This is the “filing requirement” in Section 1506.9 of the CEQ regulation.) To the following address: Environmental Protection Agency, Office of Federal Activities (A-104), 401 M Street, SW., Washington, D.C. 20460.

(b) The appropriate EPA Regional Office responsible for EPA’s review pursuant to Section 309 of the Clean Air Act: five copies of the draft EIS and five copies of the final EIS.

(c) The DOI Headquarters to the following address:

U.S. Department of the Interior
Office of Environmental Project Review
Room 4239
18th and C Streets, NW.
Washington, D.C. 20240

(i) All States in FHWA Regions 1, 3, 4, and 5, plus Hawaii, Guam, American Samoa, Virgin Islands, Arkansas, Iowa, Louisiana, and Missouri; 12 copies of the draft EIS and 7 copies of the final EIS.

(ii) Kansas, Nebraska, North Dakota, Oklahoma, South Dakota, and Texas: 13 copies of the draft EIS and 8 copies of the final EIS.

(iii) New Mexico and all States in FHWA Regions 8, 9, and 10, except Hawaii, North Dakota, and South Dakota: 14 copies of the draft EIS and 9 copies of the final EIS.

Note: DOI Headquarters will make distribution within its Department. While not required, advance distribution to DOI field offices may be helpful to expedite their review.

B. Section 4(f) Evaluation

If the Section 4(f) evaluation is included in a draft EIS, the DOI Headquarters does not need additional copies of the draft or final EIS/Section 4(f) evaluation. If the Section 4(f) evaluation is processed separately or as part of an EA, the DOI should receive seven copies of the draft Section 4(f) evaluation for coordination and seven copies of the final Section 4(f) evaluation for information. In addition to coordination with DOI, draft Section 4(f) evaluations must be coordinated with the officials having jurisdiction over the Section 4(f) property and the Department of Housing and Urban Development (HUD) and the United States Department of Agriculture (USDA) where these agencies have an interest in or jurisdiction over the affected Section 4(f) resource (23 CFR 771.135(i)). The point of coordination for HUD is the appropriate Regional Office and for USDA, the Forest Supervisor of the affected National Forest. One copy should be provided to the officials with jurisdiction and two copies should be submitted to HUD and USDA when coordination is required.

VIII. RECORD OF DECISION — FORMAT AND CONTENT

The Record of Decision (ROD) will explain the reasons for the project decision, summarize any mitigation measures that will be incorporated in the project and document any required Section 4(f) approval. While cross-referencing and incorporation by reference of the final EIS (or final EIS supplement) and other documents are appropriate, the ROD must explain the basis for the project decision as completely as possible, based on the information contained in the EIS (40 CFR 1502.2). A draft ROD should be prepared by the HA and submitted to the Division Office with the final EIS. The following key items need to be addressed in the ROD:

A. Decision.

Identify the selected alternative. Reference to the final EIS (or final EIS supplement) may be used to reduce detail and repetition.

B. Alternatives Considered.

This information can be most clearly organized by briefly describing each alternative and explaining the balancing of values which formed the basis for the decision. This discussion must identify the environmentally preferred alternative(s) (i.e., the alternative(s) that causes the least damage to the biological and physical environment) (40 CFR 1505.2(b)). Where the selected alternative is other than the environmentally preferable alternative, the ROD should clearly state the reasons for not selecting the environmentally preferred alternative. If lands protected by Section 4(f) were a factor in the selection of the preferred alternative, the ROD should explain how the Section 4(f) lands influenced the selection.

The values (social, economic, environmental, cost-effectiveness, safety, traffic, service, community planning, etc.) which were important factors in the decision-making process should be clearly identified along with the reasons some values were considered more important than others. The Federal-aid highway program mandate to provide safe and efficient transportation in the context of all other Federal requirements and the beneficial impacts of the proposed transportation improvements should be included in this balancing. While any decision represents a balancing of the values, the ROD should reflect the manner in which these values were considered in arriving at the decision.

C. Section 4(f).

Summarize the basis for any Section 4(f) approval when applicable (23 CFR 771.127(a)). The discussion should include the key information supporting such approval. Where appropriate, this information may be included in the alternatives discussion above and referenced in this paragraph to reduce repetition.

D. Measures to Minimize Harm.

Describe the specific measures adopted to minimize environmental harm and identify those standard measures (e.g., erosion control, appropriate for the proposed action). State whether all practicable measures to minimize environmental harm have been incorporated into the decision and, if not, why they were not (40 CFR 1505.2(c)).

E. Monitoring or Enforcement Program.

Describe any monitoring or enforcement program which has been adopted for specific mitigation measures, as outlined in the final EIS.

F. Comments on Final EIS.

All substantive comments received on the final EIS should be identified and given appropriate responses. Other comments should be summarized and responses provided where appropriate.

For recordkeeping purposes, a copy of the signed ROD should be provided to the Washington Headquarters (HEV-11). For a ROD approved by the Division Office, copies should be sent to both the Washington Headquarters and the Regional Office.

IX. SECTION 4(f) EVALUATIONS — FORMAT AND CONTENT

A Section 4(f) evaluation must be prepared for each location within a proposed project before the use of Section 4(f) land is approved (23 CFR 771.135(a)). For projects processed with an EIS or an EA/FONSI, the individual Section 4(f) evaluation should be included as a separate section of the document, and for projects processed as categorical exclusions, as a separate Section 4(f) evaluation document. Pertinent information from various sections of the EIS or EA/FONSI may be summarized in the Section 4(f) evaluation to reduce repetition. Where an issue on constructive use Section 4(f) arises and FHWA decides that Section 4(f) does not apply, the environmental document should contain sufficient analysis and information to demonstrate that the resource(s) is not substantially impaired.

The use of Section 4(f) land may involve concurrent requirements of other Federal agencies. Examples include consistency determinations for the use of public lands managed by the Bureau of Land Management, compatibility determinations for the use of land in the National Wildlife Refuge System and the National Park System, determinations of direct and adverse effects for Wild and Scenic Rivers, and approval of land conversions under Section 6(f) of the Land and Water Conservation Fund Act. The mitigation plan developed for the project should include measures which would satisfy the various requirements. For example, Section 6(f) directs the Department of the Interior (National Park Service) to assure that replacement lands of equal value, location and usefulness are provided as conditions to approval of land conversions. Therefore, where a Section 6(f) land conversion is proposed for a highway project, replacement land will be necessary. Regardless of the mitigation proposed, the draft and final Section 4(f) evaluations should discuss the results of coordination with the public official having jurisdiction over the Section 4(f) land and document the National Park Service's position on the Section 6(f) land transfer, respectively.

A. Draft Section 4(f) Evaluation

The following format and content are suggested. The listed information should be included in the Section 4(f) evaluation, as applicable.

1. Proposed Action.

Where a separate Section 4(f) evaluation is prepared, describe the proposed project and explain the purpose and need for the project.

2. Section 4(f) Property.

Describe each Section 4(f) resource which would be used by any alternative under consideration. The following information should be provided:

(a) A detailed map or drawing of sufficient scale to identify the relationship of the alternatives to the Section 4(f) property.

(b) Size (acres or square feet) and location (maps or other exhibits such as photographs, sketches, etc.) of the affected Section 4(f) property.

(c) Ownership (city, county, State, etc.) and type of Section 4(f) property (park, recreation, historic, etc.).

(d) Function of or available activities on the property (ball playing, swimming, golfing, etc.).

(e) Description and location of all existing and planned facilities (ball diamonds, tennis courts, etc.).

(f) Access (pedestrian, vehicular) and usage (approximate number of users/visitors, etc.).

(g) Relationship to other similarly used lands in the vicinity.

(h) Applicable clauses affecting the ownership, such as lease, easement, covenants, restrictions, or conditions, including forfeiture.

(i) Unusual characteristics of the Section 4(f) property (flooding problems, terrain conditions, or other features) that either reduce or enhance the value of all or part of the property.

3. Impacts on the Section 4(f) Property(EIS).

Discuss the impacts on the Section 4(f) property for each alternative (e.g., amount of land to be used, facilities and functions affected, noise, air pollution, visual, etc.). Where an alternative (or alternatives) uses land from more than one Section 4(f) property, a summary table would be useful in comparing the various impacts of the alternative(s). Impacts (such as facilities and functions affected, noise, etc.) Which can be quantified should be quantified. Other impacts (such as visual intrusion) which cannot be quantified should be described.

4. Avoidance Alternatives.

Identify and evaluate location and design alternatives which would avoid the Section 4(f) property. Generally, this would include alternatives to either side of the property. Where an alternative would use land from more than one Section 4(f) property, the analysis needs to evaluate alternatives which avoid each and all properties (23 CFR 771.135(I)). The design alternatives should be in the immediate area of the property and consider minor alignment shifts, a reduced facility, retaining structures, etc. individually or in combination, as appropriate. Detailed discussions of alternatives in an EIS or EA need not be repeated in the Section 4(f) portion of the document, but should be referenced and summarized. However, when alternatives (avoiding Section 4(f) resources) have been eliminated from detailed study the discussion should also explain whether these alternatives are feasible and prudent and, if not, the reasons why.

5. Measures to Minimize Harm.

Discuss all possible measures which are available to minimize the impacts of the proposed action on the Section 4(f) property(ies). Detailed discussions of mitigation measures in the EIS or EA may be referenced and appropriately summarized, rather than repeated.

6. Coordination.

Discuss the results of preliminary coordination with the public official having jurisdiction over the Section 4(f) property and with regional (or local) offices of DOI and, as appropriate, the Regional Office of HUD and the Forest Supervisor of the affected National Forest. Generally, the coordination should include discussion of avoidance alternatives, impacts to the property, and measures to minimize harm. In addition, the coordination with the public official having jurisdiction should include, where necessary, a discussion of significance and primary use of the property.

Note: The conclusion that there are no feasible and prudent alternative is not normally addressed at the draft Section 4(f) evaluation stage. Such conclusion is made only

after the draft Section 4(f) evaluation has been circulated and coordinated and any identified issues adequately evaluated.

B. Final Section 4(f) Evaluation

When the preferred alternative uses Section 4(f) land, the final Section 4(f) evaluation must contain (23 CFR 771.135(i) and (j)):

(1) All the above information for a draft evaluation.

(2) A discussion of the basis for concluding that there are no feasible and prudent alternatives to the use of the Section 4(f) land. The supporting information must demonstrate that "there are unique problems or unusual factors involved in the use of alternatives that avoid these properties or that the cost, social, economic, and environmental impacts, or community disruption resulting from such alternatives reach extraordinary magnitudes" (23 CFR 771.135(a)(2)). This language should appear in the document together with the supporting information.

(3) A discussion of the basis for concluding that the proposed action includes all possible planning to minimize harm to the Section 4(f) property. When there are no feasible and prudent alternatives which avoid the use of Section 4(f) land, the final Section 4(f) evaluation must demonstrate that the preferred alternative is a feasible and prudent alternative with the least harm on the Section 4(f) resources after considering mitigation to the Section 4(f) resources.

(4) A summary of the appropriate formal coordination with the Headquarters Offices of DOI (and/or appropriate agency under that Department) and, as appropriate, the involved offices of USDA and HUD.

(5) Copies of all formal coordination comments and a summary of other relevant Section 4(f) comments received and an analysis and response to any questions raised. Where new alternatives or modifications to existing alternatives are identified and will not be given further consideration, the basis for dismissing these alternatives should be provided and supported by factual information.

Where Section 6(f) land is involved, the National Park Service's position on the land transfer should be documented.

(6) Concluding statement as follows: "Based upon the above considerations, there is no feasible and prudent alternative to the use of land from the (identify Section 4(f) property) and the proposed action includes all possible planning to minimize harm to the (Section 4(f) property) resulting from such use."

X. OTHER AGENCY STATEMENTS

A. The FHWA review of statements prepared by other agencies will consider the environmental impact of the proposal on areas within FHWA's functional area of responsibility or special expertise (40 CFR 1503.2).

B. Agencies requesting comments on highway impacts usually forward the draft EIS to the FHWA Washington Headquarters for comment. The FHWA Washington Headquarters will normally distribute these EISs to the appropriate Regional or Division Office (per Regional Office request) and will indicate where the comments should be sent. The Regional Office may elect to forward the draft statement to the Division Office for response.

C. When a field office has received a draft EIS directly from another agency, it may comment directly to that agency if the proposal does not fall within the types indicated in item (d) of this section. If more than one DOT Administration is commenting at the Regional level, the comments should be coordinated by the DOT Regional Representative to the Secretary or designee. Copies of the FHWA comments should be distributed as follows:

(1) Requesting agency — original and one copy.
(2) P-14 — one copy.
(3) DOT Secretarial Representative--one copy.
(4) HEV-11 — one copy.

D. The following types of actions contained in the draft EIS require FHWA Washington Headquarters review and such EISs should be forwarded to the Director, Office of Environmental Policy, along with Regional comments, for processing:

(1) actions with national implications, and
(2) legislation or regulations having national impacts or national program proposals.

XI. REEVALUATIONS

A. Draft EIS Reevaluation

If an acceptable final EIS is not received FHWA within 3 years from the date of the draft EIS circulation, then a written evaluation is required to determine whether there have been changes in the project or its surroundings or new information which would require a supplement to the draft EIS or a new draft EIS (23 CFR 771.129(a)). The written evaluation should be prepared by the HA in consultation with FHWA and should address all current environmental requirements. The entire project should be revisited to assess any changes that have occurred and their effect on the adequacy of the draft EIS.

There is no required format for the written evaluation. It should focus on the changes in the project, its surroundings and impacts and any new issues identified since the draft EIS. Field reviews, additional studies (as necessary) and coordination (as appropriate) with other agencies should be undertaken and the results included in the written evaluation. If, after reviewing the written evaluation, the FHWA concludes that a supplemental EIS or a new draft EIS is not required, the decision should be appropriately documented. Since the next major step in the project development process is preparation of a final EIS, the final EIS may document the decision. A statement to this fact, the conclusions reached and supporting information should be briefly summarized in the Summary Section of the final EIS.

B. Final EIS Reevaluation

There are two types of reevaluation required for a final EIS: consultation and written evaluation (23 CFR 771.129(b) and (c)). For the first, consultation, the final EIS is reevaluated prior to proceeding with major project approval (e.g., right-of-way acquisition, final design, and plans, specifications, and estimates (PS&E)) to determine whether the final EIS is still valid. The level of analysis and documentation, if any, should be agreed upon by the FHWA and HA. The analysis and documentation should focus on and be commensurate with the changes in the project and its surroundings, potential for controversy, and length of time since the last environmental action. For example, when the consultation occurs shortly after final EIS approval, an analysis usually should not be necessary. However, when it occurs nearly 3 years after final EIS approval, but before a written evaluation is required, the level of analysis should be similar to what normally would be undertaken for a written evaluation. Although written documentation is left to the discretion of the Division Administrator, it is suggested that each consultation be appropriately documented in order to have a record to show the requirements was met.

The second type of reevaluation is a written evaluation. It is required if the HA has not taken additional major steps to advance the project (i.e., has not received from FHWA authority to undertake final design, authority to acquire a significant portion of the right-of-way, or approval of the PS&E) within any 3-year time period after approval of the final EIS, the final supplemental EIS, or the last major FHWA approval action. The written evaluation should be prepared by the HA in consultation with FHWA and should address all current environmental requirements. The entire project should be revisited to assess any changes that have occurred and their effect on the adequacy of the final EIS.

There is no required format for the written evaluation. It should focus on the changes in the project, its surroundings and impacts and any new issues identified since the final EIS was approved. Field reviews, additional environmental studies (as necessary), and coordination with other agencies should be undertaken (as appropriate to address any new impacts or issues) and the results included in the written evaluation. The FHWA Division Office is the action office for the written evaluation. If it is determined that supplemental EIS is not needed, the project files should be document appropriately. In those rare cases where an EA is prepared to serve as the written evaluation, the files should clearly document whether new significant impacts were identified during the reevaluation process.

XII. SUPPLEMENTAL ENVIRONMENTAL IMPACT STATEMENTS (EISs)

Whenever there are changes, new information, or further developments on a project which result in significant environmental impacts not identified in the most recently distributed version of the draft or final EIS, a supplemental EIS is necessary (40 CFR 1502.9(c)). If it is determined that the changes or new information do not result in new or different significant environmental impacts, the FHWA Division Administrator should document the determination. (After final EIS approval, this documentation could take the form of notation to the files; for a draft EIS, this documentation could be a discussion in the final EIS.)

A. Format and Content of a Supplemental EIS

There is no required format for a supplemental EIS. The supplemental EIS should provide sufficient information to briefly describe the proposed action, the reason(s) why a supplement is being prepared, and the status of the previous draft or final EIS. The supplemental EIS needs to address only those changes or new information that are the basis for preparing the supplement and were not addressed in the previous EIS (23 CFR 771.130(a)). Reference to and summarizing the previous EIS is preferable to repeating unchanged, but still valid, portions of the original document. For example, some items such as affected environment, alternatives, or impacts which are unchanged may be briefly summarized and reference. New environmental requirements which became effective after the previous EIS was prepared need to be addressed in the supplemental EIS to the extent they apply to the portion of the project being evaluated and are relevant to the subject of the supplement (23 CFR 771.130(a)). Additionally, to provide an up-to-date status of compliance with NEPA, it is recommended that the supplement summarize the results of any reevaluations that have been performed for portions of or the entire proposed action. By this inclusion, the supplement will reflect an up-to-date consideration of the proposed action and its effects on the human environment. When a previous EIS is referenced, the supplemental EIS transmittal letter should indicate that copies of the original (draft or final) EIS are available and will be provided to all requesting parties.

B. Distribution of a Supplemental EIS

A supplemental EIS will be reviewed and distributed in the same manner as a draft and final EIS (23 CFR 771.130(d)). (See Section VII for additional information.)

XIII. Appendices

Two appendices are included as follows:

Appendix A: Environmental Laws, Authority and Related Statues and Orders

Appendix B: Preparation and Processing of Notices of Intent.

ENVIRONMENTAL LAWS, AUTHORITY, AND RELATED STATUTES AND ORDERS

AUTHORITY:

42 United States Code (U.S.C.) 4321 et seq., National Environmental Policy Act of 1969, as amended.

23 U.S.C. 138 and 49 U.S.C. 303, Section 4(f) of the Department of Transportation (DOT) Act of 1966.

23 U.S.C. 109(h), (i), and (j) standards.

23 U.S.C. 128, Public Hearings.

23 U.S.C. 315, Rules, Regulations and Recommendations.

23 Code of Federal Regulations (CFR), Part 771, Environmental Impact and Related Procedures.

40 CFR 1500 et seq., Council on Environmental Quality, Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act.

49 CFR 1.48(b), DOT Delegations of Authority to the Federal Highway Administration.

DOT Order 5610.1c, Procedures for Considering Environmental Impacts, September 18, 1979, and subsequent revisions.

RELATED STATUTES AND ORDERS: The following is a list of major statutes and orders on the preparation of environmental documents.

7 U.S.C. 4201 et seq., Farmland Protection Policy Act of 1981.

16 U.S.C. 461 et seq., Archaeological and Historic Preservation Act; and 23 U.S.C. 305.

16 U.S.C. 470f, Section 106, 110(d) and 110(f) of the National Historic Preservation Act of 1966.

16 U.S.C. 662, Section 2 of the Fish and Wildlife Coordination Act.

16 U.S.C. 1452, 1456, Sections 303 and 307 of the Coastal Zone Management Act of 1972.

16 U.S.C. 1271 et. seq., Wild and Scenic Rivers Act.

16 U.S.C. 1536, Section 7 of the Endangered Species Act of 1973.

33 U.S.C. 1251 et seq., Clean Water Act of 1977.

33 U.S.C. 1241 et seq., Resource Conservation and Recovery Act.

42 U.S.C. 300(f) et seq., Safe Drinking Water Act.

42 U.S.C. 4371 et seq., Environmental Quality Improvement Act of 1970.

42 U.S.C. 4601 et seq., Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970.

42 U.S.C. 4901 et seq., Noise Control Act of 1972.

42 U.S.C. 9601 et seq., Comprehensive Environmental Response, Compensation, and Liability Act of 1980.

42 U.S.C. 7401 et seq., Clean Air Act.

42 U.S.C. 2000d-d4, Title VI of the Civil Rights Act of 1964.

43 U.S.C. Coastal Barriers Resources Act of 1982.

Executive Order 11514, Protection and Enhancement of Environmental Quality, as amended by Executive Order 11991, dated May 24, 1977.

Executive Order 11593, Protection and Enhancement of the Cultural Environment, dated May 13, 1971, implemented by DOT Order 5650.1, dated November 20, 1972.

Executive Order 11988, Floodplain Management, dated May 24, 1977, implemented by DOT Order 5650.2, dated April 23, 1979.

Executive Order 11990, Protection of Wetlands, dated May 24, 1977, implemented by DOT Order 5660.1A, dated August 24, 1978.

Preparation and Processing of Notices of Intent

The CEQ regulations and Title 23, Code of Federal Regulations, Part 771, Environmental Impact and Related Procedures, require the Administration to publish a notice of intent in the Federal Register as soon as practicable after the decision is made to prepare an environmental impact statement (EIS) and before the scoping process (40 CFR 1501.7). A notice of intent will also be published when a decision is made to supplement a final EIS, but will not be necessary when preparing a supplement to a draft EIS (23 CFR 771.130(d)). The responsibility for preparing notices of intent has been delegated to Regional Federal Highway Administrators and subsequently redelegated to Division Administrators. The notice should be sent directly to the Federal Register at the address provided in Attachment 1 and a copy provided to the Project Development Branch (HEV-11), Office of Environmental Policy, and the appropriate Region Office.

In cases where a notice of intent is published in the Federal Register and a decision is made not to prepare the draft EIS or, when the draft EIS has been prepared, a decision is made not to prepare a final EIS, a revised notice of intent should be published in the Federal Register advising of the decision and the reasons for not preparing the EIS. This applies to future and current actions being processed.

Notices of intent should be prepared and processed in strict conformance with the guidelines in Attachment 1 in order to ensure acceptance for publication by the Office of the Federal Register. A sample of each notice of intent for preparation of an EIS and a supplemental EIS is provided as Attachment 2.

The Project Development Branch (HEV-11) will serve as the Federal Register contact point for notice of intent. All inquiries should be directed to that office.

GUIDELINES FOR PREPARATION AND PROCESSING OF NOTICES OF INTENT

FORMAT

1. Typed in black on white bond paper.

2. Paper size: 8-1/2″ x 11″.

3. Margins: Left at least 1-1/2″, all others 1″.

4. Spacing: All material double spaced (except title in heading).

5. Heading: Four items on first page at head of document (see Attachment 2):

   -Billing Code No. 4910-22 typed in brackets or parentheses

   -DEPARTMENT OF TRANSPORTATION (all upper case)

   -Federal Highway Administration

   -ENVIRONMENTAL IMPACT STATEMENT; COUNTY OR CITY, STATE (all upper case; single space)

6. Text: Five sections - AGENCY, ACTION, SUMMARY, FOR FURTHER INFORMATION CONTACT, AND SUPPLEMENTARY INFORMATION; each section title in upper case followed by colon (see Content (below) and Samples 1 and 2).

7. Closing:

- Include the Catalog of Federal Domestic Assistance number and title

- Issued on:
  (Indent 5 spaces and type or stamp in date <u>when document is</u> signed)

- Signature line
  (begin in middle of page; type name, title, and city under the signature; use name and title of the official <u>actually signing the document</u> (e.g., “John Doe, District Engineer,” not “John Doe, for the Division Administrator”))

8. Document should be neat and in form suitable for public inspection. Two or more notices of intent can be included in a single document by making appropriate revisions to the heading and text of the document.

<u>CONTENT</u>

1. AGENCY: Federal Highway Administration (FHWA), DOT.

2. ACTION: Notice of Intent.

3. SUMMARY: The FHWA is issuing this notice to advise the public that an environmental impact statement will be prepared for a proposed highway project in . . . .

4. FOR FURTHER INFORMATION CONTACT: This section should state the name and address of a person or persons within the FHWA Division Office who can answer questions about the proposed action and the EIS as it is being developed. The listing of a telephone number is optional. State and/or local officials may also be listed, but always following the FHWA contact person.

5. SUPPLEMENTARY INFORMATION: This section should contain:

a. a brief narrative description of the proposed action (e.g., location of the action, type of construction, length of the project, needs which will be fulfilled by the action);

For a supplement to a final EIS add: the original EIS number and approval date, and the reason(s) for preparing the supplement;

b. a brief description of possible alternatives to accomplish the goals of the proposed action (e.g., upgrade existing facility, do nothing (should always be listed), construction on new alignment, mass transit, multi-modal design); and

c. a brief description of the proposed scoping process for the particular action including whether, when, and where any scoping meeting will be held.

For a supplement to a final EIS: the scoping process is not required for a supplement; however, scoping should be discussed to the extend anticipated for the development of the supplement;

In drafting this section:

- use plain English
- avoid technical terms and jargon
- always refer to the proposed action or proposed project (e.g., the proposed action would ...)
- identify all abbreviations
- list FHWA first when other agencies (State or local) are listed as being involved in the preparation of the EIS

PROCESSING

1. Send three (3) duplicate originals each signed in ink by the issuing officer to:

   Office of the Federal Register
   National Archives and Records Administration
   Washington, D.C. 20408

2. The duplicates must be identical in all respects. The Federal Register will accept electrostatic copies as long as they are readable and individually signed.

3. Three (3) additional copies are required if material is printed on both sides. If a single original and two certified copies are sent, the statement “CERTIFIED TO BE A TRUE COPY OF THE ORIGINAL” and the signature of a duly authorized certifying officer must appear on each certified copy.

4. A record should be kept of the date on which each notice is mailed to the Federal Register.

5. Send one (1) copy each to the Project Development Branch (HEV-11) and the Regional office.

S A M P L E 1

[4910-22]

DEPARTMENT OF TRANSPORTATION

Federal Highway Administration

ENVIRONMENTAL IMPACT STATEMENT: WASHINGTON COUNTY, WASHINGTON

AGENCY: Federal Highway Administration (FHWA), DOT.

ACTION: Notice of Intent.

SUMMARY: The FHWA is issuing this notice to advise the public that an environmental impact statement will be prepared for a proposed highway project in Washington County, Washington.

FOR FURTHER INFORMATION CONTACT: James West, District Engineer, Federal Highway Administration, 400 Market Street, State Capital, Washington 98507, Telephone: (206) 222-2222.

SUPPLEMENTARY INFORMATION: The FHWA, in cooperation with the Washington Department of Transportation and the Washington County Highway Department, will prepare an environmental impact statement (EIS) on a proposal to improve U.S. Route 10 (U.S.10) in Washington County, Washington. The proposed improvement would involve the reconstruction of the existing U.S. 10 between the towns of Eastern and Western for a distance of about 20 miles.

Improvements to the corridor are considered necessary to provide for the existing and projected traffic demand. Also, included in this proposal is the replacement of the existing East End Bridge and a new interchange with Washington Highway 20 (W.H. 20) west of Eastern. Alternatives under consideration include (1) taking no action ; (2) using alternate travel modes; (3) widening the existing two-lane highway to four lanes; and (4) constructing a four-line, limited access highway on new location. Incorporated into and studied with the various build alternatives will be design variations of grade and alignment.

Letters describing the proposed action and soliciting comments will be sent to appropriate Federal, State, and local agencies, and to private organizations and citizens who have previously expressed or are known to have interest in this proposal. A series of public meetings will be held in Eastern and Western between May and June 1985. In addition, a public hearing will be held. Public notice will be given of the time and place of the meetings and hearing. The draft EIS will be available for public and agency review and comment prior to the public hearing. No formal scoping meeting is planned at this time.

To ensure that the full range of issues related to this proposed action are addressed and all significant issues identified, comments, and suggestions are invited from all interested parties.
Comments or questions concerning this proposed action and the EIS should be directed to the FHWA at the address provided above.

EXECUTIVE OFFICE OF THE PRESIDENT
COUNCIL ON ENVIRONMENTAL QUALITY
722 JACKSON PLACE, N.W.
WASHINGTON, D.C. 20006
March 16, 1981

MEMORANDUM FOR FEDERAL NEPA LIAISONS, FEDERAL, STATE AND LOCAL OFFICIALS AND OTHER PERSONS INVOLVED IN THE NEPA PROCESS

SUBJECT: Questions and Answers About the NEPA Regulations

During June and July of 1980, the Council on Environmental Quality, with the assistance and cooperation of EPA's EIS Coordinators from the ten EPA regions, held one-day meetings with federal, state and local officials in the ten EPA regional offices around the country. In addition, on July 10, 1980, CEQ conducted a similar meeting for the Washington, D.C. NEPA liaisons and persons involved in the NEPA process. At these meetings, CEQ discussed (a) the results of its 1980 review of Draft EIS's issued since the July 30, 1979 effective date of the NEPA regulations, (b) agency compliance with the Record of Decision requirements in Section 1505 of the NEPA regulations, and (c) CEQ's preliminary findings on how the scoping process is working. Participants at these meetings received copies of materials prepared by CEQ summarizing its oversight and findings.

These meetings also provided NEPA liaisons and other participants with an opportunity to ask questions about NEPA and the practical application of the NEPA regulations. A number of these questions were answered by CEQ representatives at the regional meetings. In response to the many requests from the agencies and other participants, CEQ has compiled forty of the most important or most frequently asked questions and their answers and reduced them to writing. The answers were prepared by the General Counsel of CEQ in consultation with the Office of Federal Activities of EPA. These answers, of course, do not impose any additional requirements beyond those of the NEPA regulations. This document does not represent new guidance under the NEPA regulations, but rather makes generally available to concerned agencies and private individuals the answers which CEQ has already given at the 1980 regional meetings. The answers also reflect the advice which the Council has given over the past two years to aid agency staff and consultants in their day-to-day application of NEPA and the regulations.

CEQ has also received numerous inquiries regarding the scoping process. CEQ hopes to issue written guidance on scoping later this year on the basis of its special study of scoping, which is nearing completion.

NICHOLAS C. YOST
General Counsel

INDEX

QUESTIONS AND ANSWERS ABOUT THE NEPA REGULATIONS (1981)

1a. Q. *What is meant by "range of alternatives" as referred to in Section 1505.1(e)?* *

A. The phrase "range of alternatives" refers to the alternatives discussed in environmental documents. It includes all reasonable alternatives, which must be rigorously explored and objectively evaluated, as well as those other alternatives, which are eliminated from detailed study with a brief discussion of the reasons for eliminating them. Section 1502.14. A decisionmaker must not consider alternatives beyond the range of alternatives discussed in the relevant environmental documents. Moreover, a decisionmaker must, in fact, consider all the alternatives discussed in an EIS. Section 1505.1(e).

1b. Q. *How many alternatives have to be discussed when there is an infinite number of possible alternatives?*

A. For some proposals there may exist a very large or even an infinite number of possible reasonable alternatives. For example, a proposal to designate wilderness areas within a National Forest could be said to involve an infinite number of alternatives from 0 to 100 percent of the forest. When there are potentially a very large number of alternatives, only a reasonable number of examples, covering the full spectrum of alternatives, must be analyzed and compared in the EIS. An appropriate series of alternatives might include dedicating 0, 10, 30, 50, 70, 90, or 100 percent of the Forest to wilderness. What constitutes a reasonable range of alternatives depends on the nature of the proposal and the facts in each case.

2a. Q. *If an EIS is prepared in connection with an application for a permit or other federal approval, must the EIS rigorously analyze and discuss alternatives that are outside the capability of the applicant or can it be limited to reasonable alternatives that can be carried out by the applicant?*

A. Section 1502.14 requires the EIS to examine all reasonable alternatives to the proposal. In determining the scope of alternatives to be considered, the emphasis is on what is "reasonable" rather than on whether the proponent or applicant likes or is itself capable of carrying out a particular alternative. Reasonable alternatives include those that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant.

2b. Q. *Must the EIS analyze alternatives outside the jurisdiction or capability of the agency or beyond what Congress has authorized?*

A. An alternative that is outside the legal jurisdiction of the lead agency must still be analyzed in the EIS if it is reasonable. A potential conflict with local or federal law does not necessarily render an alternative unreasonable, although such conflicts must be considered. Section 1506.2(d). Alternatives that are outside the scope of what Congress has approved or funded must still be evaluated in the EIS if they are reasonable, because the EIS may serve as the basis for modifying the Congressional approval or funding in light of NEPA's goals and policies. Section 1500.1(a).

3. Q. *What does the "no action" alternative include? If an agency is under a court order or legislative command to act, must the EIS address the "no action" alternative?*

* References throughout the document are to the Council on Environmental Quality's Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act. 40 CFR Parts 1500-1508.

A. Section 1502.14(d) requires the alternatives analysis in the EIS to "include the alternative of no action." There are two distinct interpretations of "no action" that must be considered, depending on the nature of the proposal being evaluated. The first situation might involve an action such as updating a land management plan where ongoing programs initiated under existing legislation and regulations will continue, even as new plans are developed. In these cases, "no action" is "no change" from current management direction or level of management intensity. To construct an alternative that is based on no management at all would be a useless academic exercise. Therefore, the "no action" alternative may be thought of in terms of continuing with the present course of action until that action is changed. Consequently, projected impacts of alternative management schemes would be compared in the EIS to those impacts projected for the existing plan. In this case, alternatives would include management plans of both greater and lesser intensity, especially greater and lesser levels of resource development.

The second interpretation of "no action" is illustrated in instances involving federal decisions on proposals for projects. "No action" in such cases would mean the proposed activity would not take place, and the resulting environmental effects from taking no action would be compared with the effects of permitting the proposed activity or an alternative activity to go forward.

Where a choice of "no action" by the agency would result in predictable actions by others, this consequence of the "no action" alternative should be included in the analysis. For example, if denial of permission to build a railroad to a facility would lead to construction of a road and increased truck traffic, the EIS should analyze this consequence of the "no action" alternative.

In light of the above, it is difficult to think of a situation where it would <u>not</u> be appropriate to address a "no action" alternative. Accordingly, the regulations require the analysis of the no action alternative even if the agency is under a court order or legislative command to act. This analysis provides a benchmark, enabling decisionmakers to compare the magnitude of environmental effects of the action alternatives. It is also an example of a reasonable alternative outside the jurisdiction of the agency which must be analyzed. Section 1502.14(c). See Question 2 above. Inclusion of such an analysis in the EIS is necessary to inform the Congress, the public, and the President as intended by NEPA. Section 1500.1(a).

4a. Q. *What is the "agency's preferred alternative"?*

A. The "agency's preferred alternative" is the alternative which the agency believes would fulfill its statutory mission and responsibilities, giving consideration to economic, environmental, technical and other factors. The concept of the "agency's preferred alternative" is different from the "environmentally preferable alternative," although in some cases one alternative may be both. See Question 6 below. It is identified so that agencies and the public can understand the lead agency's orientation.

4b. Q. *Does the "preferred alternative" have to be identified in the Draft EIS and the Final EIS or just in the Final EIS?*

A. Section 1502.14(e) requires the section of the EIS on alternatives to "identify the agency's preferred alternative if one or more exists, in the draft statement, and identify such alternative in the final statement ..." This means that if the agency has a preferred alternative at the Draft EIS stage, that alternative must be labeled or identified as such in the Draft EIS. If the responsible federal official in fact has no preferred alternative at the Draft EIS stage, a preferred alternative need not be identified there. By the time the Final EIS is filed, Section 1502.14(e) presumes the existence of a preferred alternative and requires its identification in the Final EIS "unless another law prohibits the expression of such a preference."

4c. Q. *Who recommends or determines the "preferred alternative"?*

A. The lead agency's official with line responsibility for preparing the EIS and assuring its adequacy is responsible for identifying the agency's preferred alternative(s). The NEPA regulations do not dictate which official in an agency shall be responsible for preparation of EIS's, but agencies can identify this official in their implementing procedures, pursuant to Section 1507.3.

Even though the agency's preferred alternative is identified by the EIS preparer in the EIS, the statement must be objectively prepared and not slanted to support the choice of the agency's preferred alternative over the other reasonable and feasible alternatives.

5a. Q. *Is the "proposed action" the same thing as the "preferred alternative"?*

A. The "proposed action" may be, but is not necessarily, the agency's "preferred alternative." The proposed action may be a proposal in its initial form before undergoing analysis in the EIS process. If the proposed action is internally generated, such as preparing a land management plan, the proposed action might end up as the agency's preferred alternative. On the other hand, the proposed action may be granting an application to a non-federal entity for a permit. The agency may or may not have a "preferred alternative" at the Draft EIS stage (see Question 4 above). In that case, the agency may decide at the Final EIS stage, on the basis of the Draft EIS and the public and agency comments, that an alternative other than the proposed action is the agency's "preferred alternative."

5b. Q. *Is the analysis of the "proposed action" in an EIS to be treated differently from the analysis of alternatives?*

A. The degree of analysis devoted to each alternative in the EIS is to be substantially similar to that devoted to the "proposed action." Section 1502.14 is titled "Alternatives including the proposed action" to reflect such comparable treatment. Section 1502.14(b) specifically requires "substantial treatment" in the EIS of each alternative including the proposed action. This regulation does not dictate an <u>amount</u> of information to be provided, but rather, prescribes a <u>level of treatment</u>, which may, in turn, require varying amounts of information, to enable a reviewer to evaluate and compare alternatives.

6a. Q. *What is the meaning of the term "environmentally preferable alternative" as used in the regulations with reference to Records of Decisions? How is the term "environment" used in the phrase?*

A. Section 1505.2(b) requires that, in cases where an EIS has been prepared, the Record of Decision (ROD) must identify all alternatives that were considered "... specifying the alternative or alternatives which were considered to be environmentally preferable." The environmentally preferable alternative is the alternative that will promote the national environmental policy as expressed in NEPA's Section 101. Ordinarily, this means the alternative that causes the least damage to the biological and physical environment; it also means the alternative which best protects, preserves, and enhances historic, cultural, and natural resources.

The Council recognizes that the identification of the environmentally preferable alternative may involve difficult judgments, particularly when one environmental value must be balanced against another. The public and other agencies reviewing a Draft EIS can assist the lead agency to develop and determine environmentally preferable alternatives by providing their views in comments on the Draft EIS. Through the identification of the environmentally preferable alternative, the decisionmaker is clearly faced with a choice between that alternative and others, and must consider whether the decision accords with the Congressionally declared policies of the Act.

6b. Q. *Who recommends or determines what is environmentally preferable?*

A. The agency EIS staff is encouraged to make recommendations of the environmentally preferable alternative(s) during EIS preparation. In any event, the lead agency official responsible for the EIS is encouraged to identify the environmentally preferable alternative(s) in the EIS. In all cases, commentors from other agencies and the public are also encouraged to address this question. The agency must identify the environmentally preferable alternative in the ROD.

7. Q. *What is the difference between the sections in the EIS on "alternatives" and "environmental consequences"? How do you avoid duplicating the discussion of alternatives in preparing these two sections?*

A. The "alternatives" section is the heart of the EIS. This section rigorously explores and objectively evaluates all reasonable alternatives including the proposed action. Section 1502.14. It should include relevant comparisons on environmental and other grounds. The "environmental consequences" section of the EIS discusses the specific environmental impacts or effects of each of the alternatives including the proposed action. Section 1502.16. In order to avoid duplication between these two sections, most of the "alternatives" section should be devoted to describing and comparing the alternatives. Discussion of the environmental impacts of these alternatives should be limited to a concise descriptive summary of such impacts in a comparative form, including charts or tables, thus, sharply defining the issues and providing a clear basis for choice among options. Section 1502.14. The "environmental consequences" section should be devoted largely to a scientific analysis of the direct and indirect environmental effects of the proposed action and of each of the alternatives. It forms the analytic basis for the concise comparison in the "alternatives" section.

8. Q. *Section 1501.2(d) of the NEPA regulations requires agencies to provide for the early application of NEPA to cases where actions are planned by private applicants or non-federal entities and are, at some stage, subject to federal approval of permits, loans, loan guarantees, insurance or other actions. What must and can agencies do to apply NEPA early in these cases?*

A. Section 1501.2(d) requires federal agencies to take steps toward ensuring that private parties and state and local entities initiate environmental studies as soon as federal involvement in their proposals can be foreseen. This section is intended to ensure that environmental factors are considered at an early stage in the planning process and to avoid the situation where the applicant for a federal permit or approval has completed planning and eliminated all alternatives to the proposed action by the time the EIS process commences or before the EIS process has been completed.

Through early consultation, business applicants and approving agencies may gain better appreciation of each other's needs and foster a decisionmaking process which avoids later unexpected confrontations.

Federal agencies are required by Section 1507.3(b) to develop procedures to carry out Section 1501.2(d). The procedures should include an "outreach program," such as a means for prospective applicants to conduct pre-application consultations with the lead and cooperating agencies. Applicants need to find out, in advance of project planning, what environmental studies or other information will be required, and what mitigation requirements are likely, in connection with the later federal NEPA process. Agencies should designate staff to advise potential applicants of the agency's NEPA information requirements and should publicize their pre-application procedures and information requirements in newsletters or other media used by potential applicants.

Complementing Section 1501.2(d), Section 1506.5(a) requires agencies to assist applicants by outlining the types of information required in those cases where the agency requires the applicant to submit environmental data for possible use by the agency in preparing an EIS.

Section 1506.5(b) allows agencies to authorize preparation of environmental assessments by applicants. Thus, the procedures should also include a means for anticipating and utilizing applicants' environmental studies or "early corporate environmental assessments" to fulfill some of the federal agency's NEPA obligations. However, in such cases, the agency must still evaluate independently the environmental issues and take responsibility for the environmental assessment.

These provisions are intended to encourage and enable private and other non-federal entities to build environmental considerations into their own planning processes in a way that facilitates the application of NEPA and avoids delay.

9. Q. *To what extent must an agency inquire into whether an applicant for a federal permit, funding or other approval of a proposal will also need approval from another agency for the same proposal or some other related aspect of it?*

A. Agencies must integrate the NEPA process into other planning at the earliest possible time to ensure that planning and decisions reflect environmental values, to avoid delays later in the process, and to head off potential conflicts. Specifically, the agency must "provide for cases where actions are planned by . . . applicants," so that designated staff are available to advise potential applicants of studies or other information that will foreseeably be required for the later federal action; the agency shall consult with the applicant if the agency foresees its own involvement in the proposal; and it shall ensure that the NEPA process commences at the earliest possible time. Section 1501.2(d). (See Question 8).

The regulations emphasize agency cooperation early in the NEPA process. Section 1501.6. Section 1501.7 on "scoping" also provides that all affected Federal agencies are to be invited to participate in scoping the environmental issues and to identify the various environmental review and consultation requirements that may apply to the proposed action. Further, Section 1502.25(b) requires that the draft EIS list all the federal permits, licenses and other entitlements that are needed to implement the proposal.

These provisions create an affirmative obligation on federal agencies to inquire early, and to the maximum degree possible, to ascertain whether an applicant is or will be seeking other federal assistance or approval, or whether the applicant is waiting until a proposal has been substantially developed before requesting federal aid or approval.

Thus, a federal agency receiving a request for approval of assistance should determine whether the applicant has filed separate requests for federal approval or assistance with other federal agencies. Other federal agencies that are likely to become involved should be then contacted, and the NEPA process coordinated, to ensure an early and comprehensive analysis of the direct and indirect effects of the proposal and any related actions. The agency should inform the applicant that action on its application may be delayed unless it submits all other federal applications (where feasible to do so), so that all the relevant agencies can work together on the scoping process and preparation of the EIS.

10a. Q. *What actions by agencies and/or applicants are allowed during EIS preparation and during the 30-day review period after publication of a final EIS?*

A. No federal decision on the proposed action shall be made or recorded until at least 30 days after the publication by EPA of notice that the particular EIS has been filed with EPA. Sections 1505.2 and 1506.10. Section 1505.2 requires this decision to be stated in a public Record of Decision.

Until the agency issues its Record of Decision, no action by an agency or an applicant concerning the proposal shall be taken which would have an adverse environmental impact or limit the choice of reasonable alternatives. Section 1506.1(a). But this does not preclude preliminary planning or design work which is needed to support an application for permits or assistance. 1506.1(d).

When the impact statement in question is a program EIS, no major action concerning the program may be taken which may significantly affect the quality of the human environment, unless the particular action is justified independently of the program, is accompanied by its own adequate environmental impact statement and will not prejudice the ultimate decision on the program. Section 1506.1(c).

10.b. Q. *Do these limitations on action (described in Question 10a) apply to state or local agencies that have statutory delegated responsibility for preparation of environmental documents required by NEPA, for example, under the HUD Block Grant program?*

A. Yes, these limitations do apply, without any variation from their application to federal agencies.

11. Q. *What actions must a lead agency take during the NEPA process when it becomes aware that a non-federal applicant is about to take an action within the agency's jurisdiction that would either have an adverse environmental impact or limit the choice of reasonable alternatives (e.g., prematurely commit money or other resources towards the completion of the proposal)?*

A. The federal agency must notify the applicant that the agency will take strong affirmative steps to ensure that the objectives and procedures of NEPA are fulfilled. Section 1506.1(b). These steps could include seeking injunctive measures under NEPA, or the use of sanctions available under either the agency's statutory mission. For example, the agency might advise an applicant that, if it takes such action, the agency will not process its application.

12a. Q. *What actions are subject to the Council's new regulations, and what actions are grandfathered under the old guidelines?*

A. The effective date of the Council's regulations was July 30, 1979 (except for certain HUD programs under the Housing and Community Development Act, 42 U.S.C. 5304(h), and certain state highway programs that qualify under Section 102(2)(D) of NEPA for which the regulations became effective on November 30, 1979). All the provisions of the regulations are binding as of that date, including those covering decisionmaking, public participation, referrals, limitations on actions, EIS supplements, etc. For example, a Record of Decision would be prepared even for decisions where the draft EIS was filed before July 30, 1979.

But in determining whether or not the new regulations apply to the preparation of a particular environmental document, the relevant factor is the date of filing of the draft of that document. Thus, the new regulations do not require the redrafting of an EIS or supplement if the draft EIS or supplement was filed before July 30, 1979. However, a supplement prepared after the effective date of the regulations for an EIS issued in final before the effective date of the regulations would be controlled by the regulations.

Even though agencies are not required to apply the regulations to an EIS or other document for which the draft was filed prior to July 30, 1979, the regulations encourage agencies to follow the regulations "to the fullest extent practicable"; i.e., if it is feasible to do so, in preparing the final document. Section 1506.12(a).

12b. Q. *Are projects authorized by Congress before the effective date of the Council's regulations grandfathered?*

No. The date of Congressional authorization for a project is not determinative of whether the Council's regulations or former Guidelines apply to the particular proposal. No incomplete projects or proposals of any kind are grandfathered in whole or in part. Only certain environmental documents, for which the draft was issued before the effective date of the regulations, are grandfathered and subject to the Council's former Guidelines.

12c. Q. *Can a violation of the regulations give rise to a cause of action?*

A. While a trivial violation of the regulations would not give rise to an independent cause of action, such a cause of action would arise from a substantial violation of the regulations. Section 1500.3.

13. Q. *Can the scoping process be used in connection with preparation of an environmental assessment; i.e., before both the decision to proceed with an EIS and publication of a notice of intent?*

A. Yes. Scoping can be a useful tool for discovering alternatives to a proposal, or significant impacts that may have been overlooked. In cases where an environmental assessment is being prepared to help an agency decide whether to prepare an EIS, useful information might result from early participation by other agencies and the public in a scoping process.

The regulations state that the scoping process is to be preceded by a Notice of Intent (NOI) to prepare an EIS. But that is only the minimum requirement. Scoping may be initiated earlier, as long as there is appropriate public notice and enough information available on the proposal so that the public and relevant agencies can participate effectively.

However, scoping that is done before the assessment, and in aid of its preparation, cannot substitute for the normal scoping process after publication of the NOI, unless the earlier public notice stated clearly that this possibility was under consideration, and the NOI expressly provides that written comments on the scope of alternatives and impacts will still be considered.

14a. Q. *What are the respective rights and responsibilities of lead and cooperating agencies? What letters and memoranda must be prepared?*

A. After a lead agency has been designated (Section 1501.5), that agency has the responsibility to solicit cooperation from other federal agencies that have jurisdiction by law or special expertise on any environmental issue that should be addressed in the EIS being prepared. Where appropriate, the lead agency should seek the cooperation of state or local agencies of similar qualifications. When the proposal may affect an Indian reservation, the agency should consult with the Indian tribe. Section 1508.5. The request for cooperation should come at the earliest possible time in the NEPA process.

After discussions with the candidate cooperating agencies, the lead agency and the cooperating agencies are to determine by letter or by memorandum which agencies will undertake cooperating responsibilities. To the extent possible at this stage, responsibilities for specific issues should be assigned. The allocation of responsibilities will be completed during scoping. Section 1501.7(a)(4).

Cooperating agencies must assume responsibility for the development of information and the preparation of environmental analyses at the request of the lead agency. Section 1501.6(b)(3). Cooperating agencies are now required by Section 1501.6 to devote staff resources that were normally primarily used to critique or comment on the Draft EIS after its preparation, much earlier in the NEPA process — primarily at the scoping and Draft EIS preparation stages. If a cooperating agency determines that its resource limitations preclude any involvement, or the degree of involvement (amount of work) requested by the lead agency, it must so inform the lead agency in writing and submit a copy of this correspondence to the Council. Section 1501.6(c).

In other words, the potential cooperating agency must decide early if it is able to devote any of its resources to a particular proposal. For this reason, the regulation states that an agency may reply to a request for cooperation that "other program commitments preclude any involvement or the degree of involvement requested in the action that is the subject of the environmental impact statement." (Emphasis added.) The regulation refers to the "action," rather than to the EIS, to clarify that the agency is taking itself out of all phases of the federal action, not just draft EIS preparation. This means that the agency has determined that it cannot be involved in the later stages of EIS review and comment, as well as decisionmaking on the proposed action. For this reason, cooperating agencies with jurisdiction by law (those which have permitting or other approval authority) cannot opt out entirely of the duty to cooperate on the EIS. See also Question 15, relating specifically to the responsibility of EPA.

14b. Q. *How are disputes resolved between lead and cooperating agencies concerning the scope and level of detail by analysis and the quality of data in impact statements?*

A. Such disputes are resolved by the agencies themselves. A lead agency, of course, has the ultimate responsibility for the content of an EIS. But it is supposed to use the environmental analysis and recommendations of cooperating agencies with jurisdiction by law or special expertise to the maximum extent possible, consistent with its own responsibilities as lead agency. Section 1501.6(a)(2).

If the lead agency leaves out a significant issue or ignores the advice and expertise of the cooperating agency, the EIS may be found later to be inadequate. Similarly, where cooperating agencies have their own decisions to make and they intend to adopt the environmental impact statement and base their decisions on it, one document should include all of the information necessary for the decisions by the cooperating agencies. Otherwise, they may be forced to duplicate the EIS process by issuing a new, more complete EIS or Supplemental EIS, even though the original EIS could have sufficed if it had been properly done at the outset. Thus, both lead and cooperating agencies have a stake in producing a document of good quality. Cooperating agencies also have a duty to participate fully in the scoping process to ensure that the appropriate range of issues is determined early in the EIS process.

Because the EIS is not the Record of Decision, but instead constitutes the information and analysis on which to base a decision, disagreements about conclusions to be drawn from the EIS need not inhibit agencies from issuing a joint document, or adopting another agency's EIS, if the analysis is adequate. Thus, if each agency has its own "preferred alternative," both can be identified in the EIS. Similarly, a cooperating agency with jurisdiction by law may determine in its own ROD that Alternative A is the environmentally preferable action, even though the lead agency has decided in its separate ROD that Alternative B is environmentally preferable.

14c. Q. *What are the specific responsibilities of federal and state cooperating agencies to review draft EIS's?*

A. Cooperating agencies (i.e., agencies with jurisdiction by law or special expertise) and agencies that are authorized to develop or enforce environmental standards must comment on environmental impact statements within their jurisdiction, expertise or authority. Sections 1503.2, 1508.5. If a cooperating agency is satisfied that its views are adequately reflected in the environmental impact statement, it should simply comment accordingly. Conversely, if the cooperating agency determines that a draft EIS is incomplete, inadequate or inaccurate, or it has other comments, it should promptly make such comments, conforming to the requirements of specificity in Section 1503.3.

14d. Q. *How is the lead agency to treat the comments of another agency with jurisdiction by law or special expertise which has failed or refused to cooperate or participate in scoping or EIS preparation?*

A. A lead agency has the responsibility to respond to all substantive comments raising significant issues regarding a draft EIS. Section 1503.4. However, cooperating agencies are generally under an obligation to raise issues or otherwise participate in the EIS process during scoping and EIS preparation if they reasonably can do so. In practical terms, if a cooperating agency fails to cooperate at the outset, such as during scoping, it will find that its comments at a later stage will not be as persuasive to the lead agency.

15. Q. *Are EPA's responsibilities to review and comment on the environmental effects of agency proposals under Section 309 of the Clean Air Act independent of its responsibility as a cooperating agency?*

A. Yes. EPA has an obligation under Section 309 of the Clean Air Act to review and comment in writing on the environmental impact of any matter relating to the authority of the Administrator contained in proposed legislation, federal construction projects, other federal actions requiring EIS's, and new regulations. 42 U.S.C. Sec. 7609. This obligation is independent of its role as a cooperating agency under the NEPA regulations.

16. Q. *What is meant by the term "third party contracts" in connection with the preparation of an EIS? See Section 1506.5(c). When can "third party contracts" be used?*

A. As used by EPA and other agencies, the term "third party contract" refers to the preparation of EIS's by contractors paid by the applicant. In the case of an EIS for a National Pollution Discharge Elimination System (NPDES) permit, the applicant, aware in the early planning stages of the proposed project of the need for an EIS, contracts directly with a consulting firm for its preparation. See 40 C.F.R. 6.604(g). The "third party" is EPA which, under Section 1506.5(c), must select the consulting firm, even though the applicant pays for the cost of preparing the EIS. The consulting firm is responsible to EPA for preparing an EIS that meets the requirements of the NEPA regulations and EPA's NEPA procedures. It is in the applicant's interest that the EIS comply with the law so that EPA can take prompt action on the NPDES permit application. The "third party contract" method under EPA's NEPA procedures is purely voluntary, though most applicants have found it helpful in expediting compliance with NEPA.

If a federal agency uses "third party contracting," the applicant may undertake the necessary paperwork for the solicitation of a field of candidates under the agency's direction, so long as the agency complies with Section 1506.5(c). Federal procurement requirements do not apply to the agency because it incurs no obligations or costs under the contract, nor does the agency procure anything under the contract.

17a. Q. *If an EIS is prepared with the assistance of a consulting firm, the firm must execute a disclosure statement. What criteria must the firm follow in determining whether it has any "financial or other interest in the outcome of the project" which would cause a conflict of interest?*

A. Section 1506.5(c), which specifies that a consulting firm preparing an EIS must execute a disclosure statement, does not define "financial or other interest in the outcome of the project." The Council interprets this term broadly to cover any known benefits other than general enhancement of professional reputation. This includes any financial benefit such as a promise of future construction or design work on the project, as well as indirect benefits the consultant is aware of (e.g., if the project would aid proposals sponsored by the firm's other clients). For example, completion of a highway project may encourage construction of a shopping center or industrial park from which the consultant stands to benefit. If a consulting firm is aware that it has such an interest in the decision on the proposal, it should be disqualified from preparing the EIS to preserve the objectivity and integrity of the NEPA process.

When a consulting firm has been involved in developing initial data plans for the project, but does not have any financial or other interest in the outcome of the decision, it need not be disqualified from preparing the EIS. However, a disclosure statement in the draft EIS should clearly state the scope and extent of the firm's prior involvement to expose any potential conflicts of interest that may exist.

17b. Q. *If the firm in fact has no promise of future work or other interest in the outcome of the proposal, may the firm later bid in competition with others for future work on the project if the proposed action is approved?*

A. Yes.

18. Q. *How should uncertainties about indirect effects of a proposal be addressed, for example, in cases of disposal of federal lands, when the identity or plans of future landowners is unknown?*

A. The EIS must identify all the indirect effects that are known and make a good faith effort to explain the effects that are not known but are "reasonably foreseeable." Section 1508.8(b). In the example, if there is total uncertainty about the identity of future landowners or the nature of future land uses, then of course, the agency is not required to engage in speculation or contemplation about their future plans. But, in the ordinary course of business, people do make judgments based upon reasonably foreseeable occurrences. It will often be possible to consider the likely purchasers and the development trends in that area or similar areas in recent years; or the likelihood that the land will be used for an energy project, shopping center, subdivision, farm or factory. The agency has the responsibility to make an informed judgment, and to estimate future impacts on that basis, especially if trends are ascertainable or potential purchases have made themselves known. The agency cannot ignore these uncertain, but probable, effects of its decisions.

19a. Q. *What is the scope of mitigation measures that must be discussed?*

A. The mitigation measures discussed in an EIS must cover the range of impacts of the proposal. The measures must include such things as design alternatives that would decrease pollution emission, construction impacts, esthetic intrusion, as well as relocation assistance, possible land use controls that could be enacted, and other possible efforts. Mitigation measures must be considered even for impacts that by themselves would not be considered "significant." Once the proposal itself is considered as a whole to have significant effects, all of its specific effects on the environment (whether or not "significant") must be considered, and mitigation measures must be developed where it is feasible to do so. Sections 1502.14(f), 1502.16(h), 1508.14.

19b. Q. *How should an EIS treat the subject of available mitigation measures that are (1) outside the jurisdiction of the lead or cooperating agencies, or (2) unlikely to be adopted or enforced by the responsible agency?*

A. All relevant, reasonable mitigation measure that could improve the project are to be identified, even if they are outside the jurisdiction of the lead agency or the cooperating agencies and, thus, would not be committed as part of the ROD's of these agencies. Section 1502.16(h), 1505.2(c). This will serve to alert agencies or officials who <u>can</u> implement these extra measures and will encourage them to do so. Because the EIS is the most comprehensive environmental document, it is an ideal vehicle in which to lay out not only the full range of environmental impacts but also the full spectrum of appropriate mitigation.

However, to ensure that environmental effects of a proposed action are fairly assessed, the probability of the mitigation measures being implemented must also be discussed. Thus, the EIS and the Record of Decision should indicate the likelihood that such measures will be adopted or enforced by the responsible agencies. Sections 1502.16(h), 1505.2. If there is a history of non-enforcement or opposition to such measures, the EIS and Record of Decision should acknowledge such opposition or non-enforcement. If the necessary mitigation measures will not be ready for a long period of time, this fact, of course, should also be recognized.

20a. Q. *When must a worst case analysis be included in an EIS?*

A. If there are gaps in relevant information or scientific uncertainty pertaining to an agency's evaluation of significant adverse impacts on the human environment, an agency must make clear that such information is lacking or that the uncertainty exists. An agency must include a worst case analysis of the potential impacts of the proposal and an indication of the probability or improbability of their occurrence if (a) the information relevant to adverse impacts is essential to a reasoned choice among alternatives and the overall costs of obtaining the information are exorbitant, or (b) the information relevant to adverse impacts is important to the decision and the means to obtain it are not known.

NEPA requires that impact statements, at a minimum, contain information to alert the public and Congress to all known <u>possible</u> environmental consequences of agency action. Thus, one of the federal government's most important obligations is to present to the fullest extent possible, the spectrum of consequences that may result from agency decisions, and the details of their potential consequences for the human environment.

20b. Q. *What is the purpose of a worst case analysis? How is it formulated and what is the scope of the analysis?*

A. The purpose of the analysis is to carry out NEPA's mandate for full disclosure to the public of the potential consequences of agency decisions, and to cause agencies to consider those potential consequences when acting on the basis of scientific uncertainties or gaps in available information. The analysis is formulated on the basis of available information, using reasonable projections of the worst possible consequences of a proposed action.

For example, if there are scientific uncertainty and gaps in the available information concerning the numbers of juvenile fish that would be entrained in a cooling water facility, the responsible agency must disclose and consider the possibility of the loss of the commercial or sport fishery.

In addition to an analysis of a low probability/catastrophic impact event, the worst case analysis should also include a spectrum of events of higher probability but less drastic impact.

21. Q. *Where an EIS or an EA is combined with another project planning document (sometimes called "piggybacking"), to what degree may the EIS or EA refer to and rely upon information in the project document to satisfy NEPA's requirements?*

A. Section 1502.25 of the regulations requires that draft EIS's be prepared concurrently and integrated with environmental analyses and related surveys and studies required by other federal statutes. In addition, Section 1506.4 allows any environmental document prepared in compliance with NEPA to be combined with any other agency document to reduce duplication and paperwork.

However, these provisions were not intended to authorize the preparation of a short summary or outline EIS, attached to a detailed project report of land use plan containing the required environmental impact data. In such circumstances, the reader would have to refer constantly to the detailed report to understand the environmental impacts and alternatives which should have been found in the EIS itself.

The EIS must stand on its own as an analytical document which fully informs decisionmakers and the public of the environmental effects of the proposal and those of the reasonable alternatives. Section 1502.1. But, as long as the EIS is clearly identified and is self-supporting, it can be physically included in or attached to the project report or land-use plan, and may use attached report material as technical backup.

Forest Service environmental impact statements for forest management plans are handled in this manner. The EIS identifies the agency's preferred alternative, which is developed in detail as the proposed management plan. The detailed proposed plan accompanies the EIS through the review process, and the documents are appropriately cross-referenced. The proposed plan is useful for EIS readers as an example to show how one choice of management options translates into effects on natural resources. This procedure permits initiation of the 90-day public review of proposed forest plans, which is required by the National Forest Management Act.

All the alternatives are discussed in the EIS, which can be read as an independent document. The details of the management plan are not repeated in the EIS, and vice versa. This is a reasonable functional separation of the documents: The EIS contains information relevant to the choice among alternatives; the plan is a detailed description of proposed management activities suitable for use by the land managers. This procedure provides for concurrent compliance with the public review requirements of both NEPA and the National Forest Management Act.

Under some circumstances, a project report or management plan may be totally merged with the EIS, and the one document labeled as both "EIS" and "management plan" or "project report." This may be reasonable where the documents are short, or where the EIS format and the regulations for clear, analytical EIS's also satisfy the requirements for a project report.

22. Q. *May State and federal agencies serve as joint lead agencies? If so, how do they resolve law, policy and resource conflicts under NEPA and the relevant State Environmental Policy Act? How do they resolve differences in perspective where, for example, national and local needs may differ?*

A. Under Section 1501.5(b), federal, State or local agencies, as long as they include at least one federal agency, may act as joint lead agencies to prepare an EIS. Section 1506.2 also strongly urges State and local agencies and the relevant federal agencies to cooperate fully with each other. This should cover joint research and studies, planning activities, public hearings, environmental assessments, and the preparation of joint EIS's under NEPA and the relevant "little NEPA" State laws, so that one document will satisfy both laws.

The regulations also recognize that certain inconsistencies may exist between the proposed federal action and any approved State or local plan or law. The joint document should discuss the extent to which the federal agency would reconcile its proposed action with such plan or law. Section 1506.2(d). (see Question 23).

Because there may be differences in perspective as well as conflicts among federal, State and local goals for resource management, the Council has advised participating agencies to adopt a flexible, cooperative approach. The joint EIS should reflect all of their interests and missions, clearly identified as such. The final document would then indicate how State and local interests have been accommodated or would identify conflicts in goals (e.g., how a hydroelectric project, which might induce second home development, would require new land-use controls). The EIS must contain a complete discussion of scope and purpose of the proposal, alternatives, and impacts so that the discussion is adequate to meet the needs of local, State and federal decisionmakers.

23a. Q. *How should an agency handle potential conflicts between a proposal and the objectives of federal, State or local land-use plans, policies and controls for the area concerned? see Section 1502.16(c).*

A. The agency should first inquire of other agencies whether there are any potential conflicts. If there would be immediate conflicts, or if conflicts could arise in the future when the plans are finished (see Question 23b below), the EIS must acknowledge and describe the extent of those conflicts. If there are any possibilities of resolving the conflicts, these should be explained as well. The EIS should also evaluate the seriousness of the impact of the proposal on the land-use plans and policies and whether, or how much, the proposal will impair the effectiveness of land use control mechanisms for the area. Comments from officials of the affected area should be solicited early and should be carefully acknowledged and answered in the EIS.

23b. Q. *What constitutes a "land use plan or policy" for purposes of this discussion?*

A. The term "land use plans," includes all types of formally adopted documents for land-use planning, zoning and related regulatory requirements. Local general plans are included, even though they are subject to future change. Proposed plans should also be addressed if they have been formally proposed by the appropriate government body in a written form and are being actively pursued by officials of the jurisdiction. Staged plans, which must go through phases of development such as the Water Resources Council's Level A, B, and C planning process, should also be included even though they are incomplete.

The term "policies" includes formally adopted statements of land use policy as embodied in laws or regulations. It also includes proposals for action such as the initiation of a planning process or a formally adopted policy statement of the local, regional or state executive branch, even if it has not yet been formally adopted by the local, regional or state legislative body.

23c. Q. *What options are available for the decisionmaker when conflicts with such plans or policies are identified?*

A. After identifying any potential land use conflicts, the decisionmaker must weigh the significance of the conflicts, among all the other environmental and non-environmental factors that must be considered in reaching a rational and balanced decision. Unless precluded by other law from causing or contributing to any inconsistency with the land use plans, policies or controls, the decisionmaker retains the authority to go forward with the proposal, despite the potential conflict. In the Record of Decision, the decisionmaker must explain what the decision was, how it was made, and what mitigation measures are being imposed to lessen adverse environmental impacts of the proposal, among the other requirements of Section 1505.2. This provision would require the decisionmaker to explain any decision to override land use plans, policies or controls for the area.

24a. Q. *When are EIS's required on policies, plans or programs?*

A. An EIS must be prepared if an agency proposed to implement a specific policy, to adopt a plan for a group of related actions, or to implement a specific statutory program or executive directive. Section 1508.18. In addition, the adoption of official policy in the form of rules, regulations and interpretations pursuant to the Administrative Procedure Act, treaties, conventions, or other formal documents establishing governmental or agency policy which will substantially alter agency programs could require an EIS. Section 1508.18. In all cases, the policy, plan, or program must have the potential for significantly affecting the quality of the human environment in order to require an EIS. It should be noted that a proposal "may exist in fact as well as by agency declaration that one exists." Section 1508.23.

24b. Q. *When is an area-wide or overview EIS appropriate?*

A. The preparation of an area-wide or overview EIS may be particularly useful when similar actions, viewed with other reasonably foreseeable or proposed agency actions, share common timing or geography. For example, when a variety of energy projects may be located in a single watershed, or when a series of new energy technologies may be developed through federal funding, the overview or area-wide EIS would serve as a valuable and necessary analysis of the affected environment and the potential cumulative impacts of the reasonably foreseeable actions under that program or within that geographical area.

24c. Q. *What is the function of tiering in such cases?*

A. Tiering is a procedure which allows an agency to avoid duplication of paperwork through the incorporation by reference of the general discussions and relevant specific discussions from an environmental impact statement of broader scope into one of lesser scope or vice versa. In the example given in Question 24b, this would mean that an overview EIS would be prepared for all of the energy activities reasonably foreseeable in a particular geographic area or resulting from a particular development program. This impact statement would be followed by site-specific or project-specific EIS's. The tiering process would make each EIS of greater use and meaning to the public as the plan or program develops, without duplication of the analysis prepared for the previous impact statement.

25a. Q. *When is it appropriate to use appendices instead of including information in the body of an EIS?*

A. The body of the EIS should be a succinct statement of all the information on environmental impacts and alternatives that the decisionmaker and the public need in order to make the decision and to ascertain that every significant factor has been examined. The EIS must explain or summarize methodologies of research and modeling and the results of research that may have been conducted to analyze impacts and alternatives.

Lengthy technical discussions of modeling methodology, baseline studies, or other work are best reserved for the appendix. In other words, if only technically trained individuals are likely to understand a particular discussion, then it should go in the appendix, and a plain language summary of the analysis and conclusions of that technical discussion should go in the text of the EIS.

The final statement must also contain the agency's responses to comments on the draft EIS. These responses will be primarily in the form of changes in the document itself, but specific answers to each significant comment should also be included. These specific responses may be placed in an appendix. If the comments are especially voluminous, summaries of the comments and responses will suffice. (See Question 29 regarding the level of detail required for response to comments.)

25b. Q. *How does an appendix differ from incorporation by reference?*

A. First, if at all possible, the appendix accompanies the EIS, whereas the material which is incorporated by reference does not accompany the EIS. Thus, the appendix should contain information that reviewers will be likely to want to examine. The appendix should include material that pertains to preparation of a particular EIS. Research papers directly relevant to the proposal, lists of affected species, discussion of the methodology of models used in the analysis of impacts, extremely detailed responses to comments, or other information, would be placed in the appendix.

The appendix must be complete and available at the time the EIS is filed. Five copies of the appendix must be sent to EPA with five copies of the EIS for filing. If the appendix is too bulky to be circulated, it instead must be placed in conveniently accessible locations or furnished directly to commentors upon request. If it is not circulated with the EIS, the Notice of Availability published by EPA must so state, giving a telephone number to enable potential commentors to locate or request copies of the appendix promptly.

Material that is not directly related to preparation of the EIS should be incorporated by reference. This would include other EIS's, research papers in the general literature, technical background papers or other material that someone with technical training could use to evaluate the analysis of the proposal. These must be made available, either by citing the literature, furnishing copies to central locations, or sending copies directly to commentors upon request.

Care must be taken in all cases to ensure that material incorporated by reference, and the occasional appendix that does not accompany the EIS, are in fact available for the full minimum public comment period.

26a. Q. *How detailed must an EIS index be?*

A. The EIS index should have a level of detail sufficient to focus on areas of the EIS of reasonable interest to any reader. It cannot be restricted to the most important topics. On the other hand, it need not identify every conceivable term or phrase in the EIS. If an agency believes that the reader is reasonably likely to be interested in a topic, it should be included.

26b. Q. *Is a keyword index required?*

A. No. A keyword index is a relatively short list of descriptive terms that identifies the key concepts or subject areas in a document. For example, it could consist of 20 terms which describe the most significant aspects of an EIS that a future research would need — type of proposal, type of impacts, type of environment, geographical area, sampling or modeling methodologies used. This technique permits the compilation of EIS data banks by facilitating quick and inexpensive access to stored materials. While a keyword index is not required by the regulations, it could be a useful addition for several reasons. First, it can be useful as a quick index for reviewers of the EIS, helping to focus on areas of interest. Second, if an agency keeps a listing of the keyword indexes of the EIS's it produces, the EIS preparers themselves will have quick access to similar research data and methodologies to aid their future EIS work. Third, a keyword index will be needed to make an EIS available to future researchers using EIS data banks that are being developed. Preparation of such an index now when the document is produced will save a later effort when the data banks become operational.

27a. Q. *If a consultant is used in preparing an EIS, must the list of preparers identify members of the consulting firm as well as the agency NEPA staff who were primarily responsible?*

A. Section 1502.17 requires identification of the names and qualifications of persons who were primarily responsible for preparing the EIS or significant background papers, including basic components of the statement. This means that members of a consulting firm preparing material that is to become part of the EIS must be identified. The EIS should identify these individuals even though the consultant's contribution may have been modified by the agency.

27b. Q. *Should agency staff involved in reviewing and editing the EIS also be included in the list of preparers?*

A. Agency personnel who wrote basic components of the EIS or significant background papers must, of course, be identified. The EIS should also list the technical editors who reviewed or edited the statements.

27c. Q. *How much information should be included on each person listed?*

A. The list of preparers should normally not exceed two pages. Therefore, agencies must determine which individuals had primary responsibility and need not identify individuals with minor involvement. The list of preparers should include a very brief identification of the individuals involved, their qualifications (expertise, professional disciplines), and the specific portion of the EIS for which they are responsible. This may be done in tabular form to cut down on length. A line or two for each person's qualifications should be sufficient.

28. Q. *May an agency file Xerox copies of an EIS with EPA pending the completion of printing the document?*

A. Xerox copies of an EIS may be filed with EPA prior to printing only if the Xerox copies are simultaneously made available to other agencies and the public. Section 1506.9 of the regulations, which governs EIS filing, specifically requires Federal agencies to file EIS's with EPA no earlier than the EIS is distributed to the public. However, this section does not prohibit Xeroxing as a form of reproduction and distribution. When an agency chooses Xeroxing as the reproduction method, the EIS must be clear and legible to permit ease of reading and ultimate microfiching of the EIS. Where color graphs are important to the EIS, they should be reproduced and circulated with the xeroxed copy.

29a. Q. *What response must an agency provide to a comment on a draft EIS which states that the EIS's methodology is inadequate or inadequately explained? For example, what level of detail must an agency include in its response to a simple postcard comment making such an allegation?*

A. Appropriate responses to comments are described in Section 1503.4. Normally, the responses should result in changes in the text of the EIS, not simply a separate answer at the back of the document. But, in addition, the agency must state what its response was, and if the agency decides that no substantive response to a comment is necessary, it must explain briefly why.

An agency is not under an obligation to issue a lengthy reiteration of its methodology for any portion of an EIS if the only comment addressing the methodology is a simple complaint that the EIS methodology is inadequate. But agencies must respond to comments, however brief, which are specific in their criticism of agency methodology. For example, if a commentor on an EIS said that an agency's air quality dispersion analysis or methodology was inadequate, and the agency had included a discussion of that analysis in the EIS, little if anything need be added in response to such a comment. However, if the commentor said that the dispersion analysis was inadequate because of its use of a certain computational technique, or that a dispersion analysis was inadequately explained because computational techniques were not included or referenced, then the agency would have to respond in a substantive and meaningful way to such a comment.

If a number of comments are identical or very similar, agencies may group the comments and prepare a single answer for each group. Comments may be summarized if they are especially voluminous. The comments or summaries must be attached to the EIS regardless of whether the agency believes they merit individual discussion in the body of the final EIS.

29b. Q. *How must an agency respond to a comment on a draft EIS that raises a new alternative not previously considered in the draft EIS?*

A. This question might arise in several possible situations. First, a commentor on a draft EIS may indicate that there is a possible alternative which, in the agency's view, is not a reasonable alternative. Section 1502.14(a). If that is the case, the agency must explain why the comment does not warrant further agency response, citing authorities or reasons that support the agency's position and, if appropriate, indicate those circumstances which would trigger agency reappraisal or further response. Section 1503.4(a). For example, a commentor on a draft EIS on a coal-fired power plant may suggest the alternative of using synthetic fuel. The agency may reject the alternative with a brief discussion (with authorities) of the unavailability of synthetic fuel within the time frame necessary to meet the need and purpose of the proposed facility.

A second possibility is that an agency may receive a comment indicating that a particular alternative, while reasonable, should be modified somewhat, for example, to achieve certain mitigation benefits or for other reasons. If the modification is reasonable, the agency should include a discussion of it in the final EIS. For example, a commentor on a draft EIS on a proposal for a pumped storage power facility might suggest that the applicant's proposed alternative should be enhanced by the addition of certain reasonable mitigation measures, including the purchase and set-aside of a wildlife preserve to substitute for the tract to be destroyed by the project. The modified alternative including the additional mitigation measures should be discussed by the agency in the final EIS.

A third slightly different possibility is that a comment on a draft EIS will raise an alternative which is a minor variation of one of the alternatives discussed in the draft EIS, but this variation was not given any consideration by the agency. In such a case, the agency should develop and evaluate the new alternative, if it is reasonable, in the final EIS. If it is qualitatively within the spectrum of alternatives that were discussed in the draft, a supplemental draft will not be needed. For example, a commentor on a draft EIS to designate a wilderness area within a National Forest might reasonably identify a specific tract of the forest and urge that it be considered for designation. If the draft EIS considered designation of a range of alternative tracts which encompassed forest area of similar quality and quantity, no supplemental EIS would have to be prepared. The agency could fulfill its obligation by addressing that specific alternative in the final EIS.

As another example, an EIS on an urban housing project may analyze the alternatives of constructing 2000, 4000, or 6000 units. A commentor on the draft EIS might urge the consideration of constructing 5000 units utilizing a different configuration of buildings. This alternative is within the spectrum of alternatives already considered and, therefore, could be addressed in the final EIS.

A fourth possibility is that a commentor points out an alternative which is not a variation of the proposal or of any alternative discussed in the draft impact statement and is a reasonable alternative that warrants serious agency response. In such a case, the agency must issue a supplement to the draft EIS that discusses this new alternative. For example, a commentor on a draft EIS on a nuclear power plant might suggest that a reasonable alternative for meeting the projected need for power would be through peak load management and energy conservation programs. If the permitting agency has failed to consider that approach in the Draft EIS, and the approach cannot be dismissed by the agency as unreasonable, a supplement to the Draft EIS, which discusses that alternative, must be prepared. (If necessary, the same supplement should also discuss substantial changes in the proposed action or significant new circumstances or information, as required by Section 1502.9(c)(1) of the Council's regulations.)

If the new alternative was not raised by the commentor during scoping, but could have been, commentors may find that they are unpersuasive in their efforts to have their suggested alternative analyzed in detail by the agency. However, if the new alternative is discovered or developed later, and it could not reasonably have been raised during the scoping process, then the agency must address it in a supplemental draft EIS. The agency is, in any case, ultimately responsible for preparing an adequate EIS that considers all reasonable alternatives.

30. Q. *When a cooperating agency with jurisdiction by law intends to adopt a lead agency's EIS and it is not satisfied with the adequacy of the document, may the cooperating agency adopt only the part of the EIS with which it is satisfied? If so, would a cooperating agency with jurisdiction by law have to prepare a separate EIS or EIS supplement covering the areas of disagreement with the lead agency?*

A. Generally, a cooperating agency may adopt a lead agency's EIS without recirculating it if it concludes that its NEPA requirements and its comments and suggestions have been satisfied. Section 1506.3(a), (c). If necessary, a cooperating agency may adopt only a portion of the lead agency's EIS and may reject that part of the EIS with which it disagrees stating publicly why it did so. Section 1506.3(a).

A cooperating agency with jurisdiction by law (e.g., an agency with independent legal responsibilities with respect to the proposal) has an independent legal obligation to comply with NEPA. Therefore, if the cooperating agency determines that the EIS is wrong or inadequate, it must prepare a supplement to the EIS, replacing or adding any needed information, and must circulate the supplement as a draft for public and agency review and comment. A final supplemental EIS would be required before the agency could take action. The adopted portions of the lead agency EIS should be circulated with the supplement. Section 1506.3(b). A cooperating agency with jurisdiction by law will have to prepare its own Record of Decision for its action, in which it must explain how it reached its conclusions. Each agency should explain how and why its conclusions differ, if that is the case, from those of other agencies which issued their Records of Decision earlier.

An agency that did not cooperate in preparation of an EIS may also adopt an EIS or portion thereof. But this would arise only in rare instances, because an agency adopting an EIS for use in its own decision normally would have been a cooperating agency. If the proposed action for which the EIS was prepared is substantially the same as the proposed action of the adopting agency, the EIS may be adopted as long as it is recirculated as a final EIS and the agency announces what it is doing. This would be followed by the 30-day review period and issuance of a Record of Decision by the adopting agency. If the proposed action by the adopting agency is not substantially the same as that in the EIS (i.e., if an EIS on one action is being adapted for use in a decision on another action), the EIS would be treated as a draft and circulated for the normal public comment period and other procedures. Section 1506.3(b).

31a. Q. *Do the Council's NEPA regulations apply to independent regulatory agencies like the Federal Energy Regulatory Commission (FERC) and the Nuclear Regulatory Commission*?

A. The statutory requirements of NEPA's Section 102 apply to "all agencies of the federal government." The NEPA regulations implement the procedural provisions of NEPA as set forth in NEPA's Section 102(2) for all agencies of the federal government. The NEPA regulations apply to independent regulatory agencies; however, they do not direct independent regulatory agencies or other agencies to make decisions in any particular way or in a way inconsistent with an agency's statutory charter. Sections 1500.3, 1500.6, 1507.1 and 1507.3.

31b. Q. *Can an Executive Branch agency like the Department of the Interior adopt an EIS prepared by an independent regulatory agency such as FERC?*

A. If an independent regulatory agency such as FERC has prepared an EIS in connection with its approval of a proposed project, an Executive Branch agency (e.g., the Bureau of Land Management in the Department of the Interior) may, in accordance with Section 1506.3, adopt the EIS or a portion thereof for its use in considering the same proposal. In such a case, the EIS must, to the satisfaction of the adopting agency, meet the standards for an adequate statement under the NEPA regulations (including scope and quality of analysis of alternatives) and must satisfy the adopting agency's comments and suggestions. If the independent regulatory agency fails to comply with the NEPA regulations, the cooperating or adopting agency may find that it is unable to adopt the EIS, thus, forcing the preparation of a new EIS or EIS Supplement for the same action. The NEPA regulations were made applicable to all federal agencies in order to avoid this result and to achieve uniform application and efficiency of the NEPA process.

32. Q. *Under what circumstances do old EIS's have to be supplemented before taking action on a proposal?*

A. As a rule of thumb, if the proposal has not yet been implemented, or if the EIS concerns an ongoing program, EIS's that are more than five years old should be carefully re-examined to determine if the criteria in Section 1502.9 compel preparation of an EIS supplement.

If an agency has made a substantial change in a proposed action that is relevant to environmental concerns, or if there are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts, a supplemental EIS must be prepared for an old EIS so that the agency has the best possible information to make any necessary substantive changes in its decisions regarding the proposal. Section 1502.9(c).

33a. Q. *When must a referral of an interagency disagreement be made to the Council?*

A. The Council's referral procedure is a pre-decision referral process for interagency disagreements. Hence, Section 1504.3 requires that a referring agency must deliver its referral to the Council not later than 25 days after publication by EPA of notice that the final EIS is available (unless the lead agency grants an extension of time under Section 1504.3(b)).

33b. Q. *May a referral be made after the issuance of a Record of Decision?*

A. No, except for cases where agencies provide an internal appeal procedure which permits simultaneous filing of the final EIS and the record of decision (ROD). Section 1506.10(b)(2). Otherwise, as stated above, the process is a pre-decision referral process. Referrals must be made within 25 days after the notice of availability of the final EIS, whereas the final decision (ROD) may not be made or filed until after 30 days from the notice of availability of the EIS. Sections 1504.3(b), 1506.10(b). If a lead agency has granted an extension of time for another agency to take action on a referral, the ROD may not be issued until the extension has expired.

34a. Q. *Must Records of Decision (ROD's) be made public? How should they be made available?*

A. Under the regulations, agencies must prepare a "concise public record of decision," which contains the elements specified in Section 1505.2. This public record may be integrated into any other decision record prepared by the agency, or it may be separate if decision documents are not normally made public. The Record of Decision is intended by the Council to be an environmental document (even though it is not explicitly mentioned in the definition of "environmental document" in Section 1508.10). Therefore, it must be made available to the public through appropriate public notice as required by Section 1506.6(b). However, there is no specific requirement for publication of the ROD itself, either in the Federal Register or elsewhere.

34b. Q. *May the summary section in the final Environmental Impact Statement substitute for or constitute an agency's Record of Decision?*

A. No. An environmental impact statement is supposed to inform the decisionmaker before the decision is made. Sections 1502.1, 1505.2. The Council's regulations provide for a 30-day period after notice is published that the final EIS has been filed with EPA before the agency make take final action. During that period, in addition to the agency's own internal final review, the public and other agencies can comment on the final EIS prior to the agency's final action on the proposal. In addition, the Council's regulations make clear that the requirements for the summary in an EIS are not the same as the requirements for a ROD. Sections 1502.12 and 1505.2.

34c. Q. *What provisions should Records of Decision contain pertaining to mitigation and monitoring?*

A. Lead agencies "shall include appropriate conditions [including mitigation measures and monitoring and enforcement programs] in grants, permits or other approvals" and shall "condition funding of actions on mitigation." Section 1505.3. Any such measures that are adopted must be explained and committed in the ROD.

The reasonable alternative mitigation measures and monitoring programs should have been addressed in the draft and final EIS. The discussion of mitigation and monitoring in a Record of Decision must be more detailed than a general statement that mitigation is being required, but not so detailed as to duplicate discussion of mitigation in the EIS. The Record of Decision should contain a concise summary identification of the mitigation measures which the agency has committed itself to adopt.

The Record of Decision must also state whether all practicable mitigation measures have been adopted, and if not, why not. Section 1505.2(c). The Record of Decision must identify the mitigation measures and monitoring and enforcement programs that have been selected and plainly indicate that they are adopted as part of the agency's decision. If the proposed action is the issuance of a permit or other approval, the specific details of the mitigation measures shall then be included as appropriate conditions in whatever grants, permits, funding or other approvals are being made by the federal agency. Section 1505.3(a), (b). If the proposal is to be carried out by the federal agency itself, the Record of Decision should delineate the mitigation and monitoring measures in sufficient detail to constitute an enforceable commitment or incorporate by reference the portions of the EIS that do so.

34d. Q. *What is the enforceability of a Record of Decision?*

A. Pursuant to generally recognized principles of federal administrative law, agencies will be held accountable for preparing Records of Decision that conform to the decisions actually made and for carrying out the actions set forth in the Records of Decision. This is based on the principle that an agency must comply with its own decisions and regulations once they are adopted. Thus, the terms of a Record of Decision are enforceable by agencies and private parties. A Record of Decision can be used to compel compliance with or execution of the mitigation measures identified therein.

35. Q. *How long should the NEPA process take to complete?*

A. When an EIS is required, the process obviously will take longer than when an EA is the only document prepared. But the Council's NEPA regulations encourage streamlined review, adoption of deadlines, elimination of duplicative work, eliciting suggested alternatives and other comments early through scoping, cooperation among agencies, and consultation with applicants during project planning. The Council has advised agencies that under the new NEPA regulations even large, complex energy projects would require only about 12 months for the completion of the entire EIS process. For most major actions, this period is well within the planning time that is needed in any event, apart from NEPA.

The time required for the preparation of program EIS's may be greater. The Council also recognizes that some projects will entail difficult long-term planning and/or the acquisition of certain data which of necessity will require more time for the preparation of the EIS. Indeed, some proposals should be given more time for the thoughtful preparation of an EIS and development of a decision which fulfills NEPA's substantive goals.

For cases in which only an environmental assessment will be prepared, the NEPA process should take no more than 3 months and, in many cases, substantially less, as part of the normal analysis and approval process for the action.

36a. Q. *How long and detailed must an environmental assessment (EA) be?*

A. The environmental assessment is a concise public document which has three defined functions: (1) It briefly provides sufficient evidence and analysis for determining whether to prepare an EIS; (2) it aids an agency's compliance with NEPA when no EIS is necessary (i.e., it helps to identify better alternatives and mitigation measures); and (3) it facilitates preparation of an EIS when one is necessary. Section 1508.9(a).

Since the EA is a concise document, it should not contain long descriptions of detailed data which the agency may have gathered. Rather, it should contain a brief discussion of the need for the proposal, alternatives to the proposal, the environmental impacts of the proposed action and alternatives, and a list of agencies and persons consulted. Section 1508.9(b).

While the regulations do not contain page limits for EA's, the Council has generally advised agencies to keep the length of EA's to not more than approximately 10-15 pages. Some agencies expressly provide page guidelines (e.g., 10-15 pages in the case of the Army Corps). To avoid undue length, the EA may incorporate by reference background data to support its concise discussion of the proposal and relevant issues.

36b. Q. *Under what circumstances is a lengthy EA appropriate?*

A. Agencies should avoid preparing lengthy EA's except in unusual cases where a proposal is so complex that a concise document cannot meet the goals of Section 1508.9 and where it is extremely difficult to determine whether the proposal could have significant environmental effects. In most cases, however, a lengthy EA indicates that an EIS is needed.

37a. Q. *What is the level of detail of information that must be included in a finding of no significant impact (FONSI)?*

A. The FONSI is a document in which the agency briefly explains the reasons why an action will not have a significant effect on the human environment and, therefore, why an EIS will not be prepared. Section 1508.13. The finding itself need not be detailed but must succinctly state the reasons for deciding that the action will have no significant environmental effects and, if relevant, must show which factors were weighted most heavily in the determination. In addition to this statement, the FONSI must include, summarize, or attach and incorporate by reference the environmental assessment.

37b. Q. *What are the criteria for deciding whether a FONSI should be made available for public review for 30 days before the agency's final determination whether to prepare an EIS?*

A. Public review is necessary, for example, (a) if the proposal is a borderline case; i.e., when there is a reasonable argument for preparation of an EIS; (b) if it is an unusual case, a new kind of action, or a precedent setting case such as a first intrusion of even a minor development into a pristine area; (c) when there is either scientific or public controversy over the proposal; or (d) when it involves a proposal which is or is closely similar to one which normally requires preparation of an EIS. Section 1501.4(e)(2), 1508.27. Agencies also must allow a period of public review of the FONSI if the proposed action would be located in a floodplain or wetland. E.O. 11988, Section 2(a)(4); E.O. 11990, Section 2(b).

38. Q. *Must EA's and FONSI's be made public? If so, how should this be done?*

A. Yes, they must be available to the public. Section 1506.6 requires agencies to involve the public in implementing their NEPA procedures, and this includes public involvement in the preparation of EA's and FONSI's. These are public "environmental documents" under Section 1506.6(b) and, therefore, agencies must give public notice of their availability. A combination of methods may be used to give notice, and the methods should be tailored to the needs of particular cases. Thus, a Federal Register notice of availability of the documents, coupled with notices in national publications and mailed to interested national groups, might be appropriate for proposals that are national in scope. Local newspaper notices may be more appropriate for regional or site-specific proposals.

The objective, however, is to notify all interested or affected parties. If this is not being achieved, then the methods should be re-evaluated and changed. Repeated failure to reach the interested or affected public would be interpreted as a violation of the regulations.

39. Q. *Can an EA and FONSI be used to impose enforceable mitigation measures, monitoring programs, or other requirements, even though there is no requirement in the regulations in such cases for a formal Record of Decision?*

A. Yes. In cases where an environmental assessment is the appropriate environmental document, there still may be mitigation measures or alternatives that would be desirable to consider and adopt even though the impacts of the proposal will not be "significant." In such cases, the EA should include a discussion of these measures or alternatives to "assist agency planning and decisionmaking" and to "aid an agency's compliance with [NEPA] when no environmental impact statement is necessary." Section 1501.3(b), 1508.9(a)(2). The appropriate mitigation measures can be imposed as enforceable permit conditions, or adopted as part of the agency final decision in the same manner mitigation measures are adopted in the formal Record of Decision that is required in EIS cases.

40. Q. *If an environmental assessment indicates that the environmental effects of a proposal are significant but that, with mitigation, those effects may be reduced to less than significant levels, may the agency make a finding of no significant impact rather than prepare an EIS? Is that a legitimate function of an EA and scoping?*

A. Mitigation measures may be relied upon to make a finding of no significant impact only if they are imposed by statute or regulation or submitted by an applicant or agency as part of the original proposal. As a general rule, the regulations contemplate that agencies should use a broad approach in defining significance and should not rely on the possibility of mitigation as an excuse to avoid the EIS requirement. Sections 1508.8, 1508.27.

If a proposal appears to have adverse effects which would be significant, and certain mitigation measures are then developed during the scoping or EA stages, the existence of such <u>possible</u> mitigation does not obviate the need for an EIS. Therefore, if scoping or the EA identifies certain mitigation possibilities without altering the nature of the overall proposal itself, the agency should continue the EIS process and submit the proposal, and the potential mitigation, for public and agency review and comment. This is essential to ensure that the final decision is based on all the relevant factors and that the full NEPA process will result in enforceable mitigation measure through the Record of Decision.

In some instances, where the proposal itself so integrates mitigation from the beginning that it is impossible to define the proposal without including the mitigation, the agency may then rely on the mitigation measures in determining that the overall effects would not be significant (e.g., where an application for a permit for a small hydro dam is based on a binding commitment to build fish ladders, to permit adequate downstream flow, and to replace any lost wetlands, wildlife habitat and recreational potential). In those instances, agencies should make the FONSI and EA available for 30 days of public comment before taking action. Section 1501.4(e)(2).

Similarly, scoping may result in a redefinition of the entire project, as a result of mitigation proposals. In that case, the agency may alter its previous decisions to do an EIS, as long as the agency or applicant resubmits the entire proposal, and the EA and FONSI are available for 30 days of review and comment. One example of this would be where the size and location of a proposed industrial park are changed to avoid affecting a nearby wetland area.

SECTION 4(f) POLICY PAPER

FHWA SECTION 4(f) POLICY PAPER

PART I — SECTION 4(f) OVERVIEW
1.0 Introduction

This Section 4(f) Policy Paper supplements the Federal Highway Administration's (FHWA) regulations governing the use of land from publicly owned parks, recreation areas, wildlife and waterfowl refuges, and public or private historic sites for Federal highway projects. Although these requirements are now codified at 23 U.S.C. § 138 and 49 U.S.C. § 303, this subject matter remains commonly referred to as Section 4(f) because the requirements originated in Section 4(f) of the Department of Transportation Act of 1966 (Pub. L. 89-670, 80 Stat. 931). The Section 4(f) Policy Paper replaces the FHWA's 2005 edition of the document. The FHWA's Section 4(f) regulations, entitled Parks, Recreation Areas, Wildlife and Waterfowl Refuges, and Historic Sites, are codified at 23 CFR Part 774. Many of the terms used in this Section 4(f) Policy Paper are defined in the regulation at 23 CFR 774.17.

1.1 Purpose

This Section 4(f) Policy Paper was written primarily to aid FHWA personnel with administering Section 4(f) in a consistent manner. In situations where a State has assumed the FHWA responsibility for Section 4(f) compliance, this guidance is intended to help the State fulfill its responsibilities. Such situations may arise when Section 4(f) responsibilities are assigned to the State in accordance with 23 U.S.C. §§ 325, 326, 327, or a similar applicable law. Unless otherwise noted, references to “FHWA” in this document include a State department of transportation (State DOT) acting in FHWA's capacity pursuant to an assumption of FHWA's responsibilities under such laws.
This guidance is also intended to help State DOTs and other applicants for grants-in-aid for highway projects to plan projects that minimize harm to Section 4(f) properties. Experience demonstrates that when Section 4(f) is given consideration early in project planning, the risk of a project becoming unnecessarily delayed due to Section 4(f) processing is minimized. Ideally, applicants should strive to make the preservation of Section 4(f) properties, along with other environmental concerns, part of their long and short range transportation planning processes. Information and tools to help State DOTs, metropolitan planning organizations and other applicants accomplish this goal are available on FHWA's Planning and Environmental Linkages website located at:

http://environment.fhwa.dot.gov/env_programs/PEL.aspx.

This Section 4(f) Policy Paper is based on and is intended to reflect: the statute itself, the legislative history of the statute; the requirements of the Section 4(f) regulations; relevant court decisions; and FHWA's experience with implementing the statute over four decades, including interactions with the public and with agencies having jurisdiction over Section 4(f) properties. The information presented is not regulatory and does not create any right of action that may be enforced by a private citizen in a court of law. This Section 4(f) Policy Paper sets forth the official policy of FHWA on the applicability of Section 4(f) to various types of land and resources, and other Section 4(f) related issues. While the other United States Department of Transportation (U.S. DOT) agencies may choose to rely upon some or all of this Section 4(f) Policy Paper as a reference, it was not written as guidance for any U.S. DOT agency other than FHWA.

This guidance addresses the majority of situations related to Section 4(f) that may be encountered in the development of a transportation project. If a novel situation or project arises which does not completely fit the situations or parameters described in this Section 4(f) Policy Paper, the relevant FHWA Division Office,[1] the FHWA Headquarters Office of Project Development and Environmental Review, the Resource Center Environment Technical Service Team, and/or the Office of Chief Counsel should be consulted as appropriate for assistance. For additional information on Section 4(f) beyond that which is contained in this Section 4(f) Policy Paper, readers should refer to the FHWA Environmental Review Toolkit.[2]

1.2 Agency Authority and Responsibilities

1.2.1 Role of U.S. DOT

The authority to administer Section 4(f) and make Section 4(f) approvals resides with the Secretary of the U.S. DOT. The statute designates the Secretaries of the Interior, Housing and Urban Development, and Agriculture, as well as the States, for consultation roles as appropriate. This means that the Secretary of Transportation is responsible for soliciting and considering the comments of these other entities, as well as the appropriate official(s) with jurisdiction over the Section 4(f) property, as part of the administration of Section 4(f). However, the ultimate decision maker is the Secretary of Transportation. In a number of instances, the Section 4(f) regulations require the concurrence of various officials in limited circumstances as discussed below.

The Secretary of Transportation has delegated the authority for administering Section 4(f) to the FHWA Administrator in 49 CFR 1.48. The authority has been re-delegated to the FHWA Division Administrators, the Associate Administrator for Planning, Environment, and Realty, and the Federal Lands Highway Associate Administrator by FHWA Order M1100.1A, Chapter 5, Section 17e and Chapter 6, Section 7d. Any approval of the use of Section 4(f) property, other than a use with a de minimis impact or a use processed with an existing programmatic Section 4(f) evaluation is subject to legal sufficiency review by the Office of Chief Counsel.

1.2.2 Role of Officials with Jurisdiction

Consultation

The regulations define the entities and individuals who are considered the officials with jurisdiction for various types of property in 23 CFR 774.17. In the case of historic sites, the officials with jurisdiction are the State Historic Preservation Officer (SHPO), or, if the property is located on tribal land, the Tribal Historic Preservation Officer (THPO).[3] If the property is located on tribal land but the relevant Indian tribe has not assumed the responsibilities of the SHPO, then a representative designated by the tribe shall be recognized as an official with jurisdiction in addition to the SHPO. When the Advisory Council on Historic Preservation (ACHP) is involved in consultation concerning a property under Section 106 of the National Historic Preservation Act (NHPA) (16 U.S.C. § 470), the ACHP is also an official with jurisdiction over that resource for the purposes of Section 4(f). When the Section 4(f) property is a National Historic Landmark (NHL), the designated official of the National Park Service is also an official with jurisdiction over that resource for the purposes of Section 4(f). In the case of public parks, recreation areas, and wildlife and waterfowl refuges, the officials with jurisdiction are the officials of the agency or agencies that own or administer the property in question and who are empowered to represent the agency on matters related to the property.

Coordination

The regulations require coordination with the official(s) with jurisdiction for the following situations prior to Section 4(f) approval (recognizing that additional coordination may be required under other statutes or regulations):

- Prior to making approvals, (23 CFR 774.3(a));
- Determining least overall harm, (23 CFR 774.3(c));
- Applying certain programmatic Section 4(f) evaluations, (23 CFR 774.5(c));
- Applying Section 4(f) to properties that are subject to Federal encumbrances, (23 CFR 774.5(d));
- Applying Section 4(f) to archeological sites discovered during construction, (23 CFR 774.9(e));
- Determining if a property is significant, (23 CFR 774.11(c));
- Determining application to multiple-use properties, (23 CFR 774.11(d));
- Determining applicability of Section 4(f) to historic sites, (23 CFR 774.11(e));
- Determining constructive use, (23 CFR 774.15(d));
- Determining if proximity impacts will be mitigated to equivalent or better condition, (23 CFR 774.15(f)(6)); and
- Evaluating the reasonableness of measures to minimize harm, (23 CFR 774.3(a)(2) and 774.17).

Lack of Objection

The regulations require a finding that the official(s) with jurisdiction have been consulted and "have not objected" in the following situations:

- When applying the exception for restoration, rehabilitation, or maintenance of historic transportation facilities, (23 CFR 774.13(a)); and
- When applying the exception for archeological sites of minimal value for preservation in place. (23 CFR 774.13(b)(2)).

Concurrence

The regulations require written concurrence of the official(s) with jurisdiction in the following situations:

- Finding there are no adverse effects prior to making de minimis impact findings, (23 CFR 774.5(b));
- Applying the exception for temporary occupancies, (23 CFR 774.13(d)); and
- Applying the exception for transportation enhancement activities and mitigation activities, (23 CFR 774.13(g)).

1.3 When Does Section 4(f) Apply?

The statute itself specifies that Section 4(f) applies when a U.S. DOT agency approves a transportation program or project that uses Section 4(f) property. The FHWA does not currently approve any transportation programs; thus, Section 4(f) is limited to project approvals. In addition, for the statute to apply to a proposed project there are four conditions that must all be true:

1. The project must require an approval[4] from FHWA in order to proceed;
2. The project must be a transportation project;[5]
3. The project must require the use of land from a property protected by Section 4(f) (See 23 U.S.C. § 138(a) and 49 U.S.C. § 303(a)); and
4. None of the regulatory applicability rules or exceptions applies (See 23 CFR 774.11 and 13).

Examples of the types of proposed situations where Section 4(f) would not apply include, but are not limited to:

1. A transportation project being constructed solely using State or local funds and not requiring FHWA approval.
2. A project intended to address a purpose that is unrelated to the movement of people, goods, and services from one place to another (i.e., a purpose that is not a transportation purpose).
3. A project to be located adjacent to a Section 4(f) property, causing only minor proximity impacts to the Section 4(f) property (i.e., no constructive use).
4. A project that will use land from a privately owned park, recreation area, or refuge.

Additional information about these examples and many other examples of situations where Section 4(f) approval is or is not required is located in the questions and answers provided in Part II of this Section 4(f) Policy Paper. In situations where FHWA has determined that Section 4(f) does not apply, the project file should contain sufficient information to demonstrate the basis for that determination (See Section 4.0, Documentation).

2.0 Background

The FHWA originally issued the Section 4(f) Policy Paper in 1985, with minor amendments in 1989. A 2005 edition provided comprehensive new guidance on when and how to apply the provisions of Section 4(f), including how to choose among alternatives that all would use Section 4(f) property. Later in 2005, Congress substantially amended Section 4(f) in the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), (Pub. L. 109-59 (Aug. 10, 2005), 119 Stat. 1144). SAFETEA-LU directed the U.S. DOT to revise its Section 4(f) regulations. In response, FHWA and the Federal Transit Administration consulted with interested agencies and environmental organizations before drafting a notice of proposed rulemaking. The notice of proposed rulemaking was published for comment in the Federal Register (71 Fed. Reg. 42611, July 27, 2006).

Following careful consideration of the comments submitted, the new Section 4(f) regulations were issued in March 2008 (73 Fed. Reg.13368, March 12, 2008). A minor technical correction followed shortly thereafter (73 Fed. Reg. 31609, June 3, 2008). The new Section 4(f) regulations clarified the feasible and prudent standard, implemented a new method of compliance for de minimis impact situations, and updated many other aspects of the regulations, including the adoption of regulatory standards based upon the 2005 edition of the Section 4(f) Policy Paper for choosing among alternatives that all use Section 4(f) property. This 2012 edition of the Section 4(f) Policy Paper includes guidance for all of the changes promulgated in the Section 4(f) regulations in 2008.

If any apparent discrepancy between this Section 4(f) Policy Paper and the Section 4(f) regulation should arise, the regulation takes precedence. The previous editions of this Section 4(f) Policy Paper are no longer in effect.

3.0 Analysis Process

3.1 Identification of Section 4(f) Properties

Section 4(f) requires consideration of:

- Parks and recreational areas of national, state, or local significance that are both publicly owned and open to the public
- Publicly owned wildlife and waterfowl refuges of national, state, or local significance that are open to the public to the extent that public access does not interfere with the primary purpose of the refuge[6]
- Historic sites of national, state, or local significance in public or private ownership regardless of whether they are open to the public (See 23 U.S.C. § 138(a) and 49 U.S.C. § 303(a))

When private institutions, organizations, or individuals own parks, recreational areas or wildlife and waterfowl refuges, Section 4(f) does not apply, even if such areas are open to the public. However, if a governmental body has a permanent proprietary interest in the land (such as a permanent easement, or in some circumstances, a long-term lease), FHWA will determine on a case-by-case basis whether the particular property should be considered publicly owned and, thus, if Section 4(f) applies (See Questions 1B and 1C). Section 4(f) also applies to all historic sites that are listed, or eligible for inclusion, in the National Register of Historic Places (NR) at the local, state, or national level of significance regardless of whether or not the historic site is publicly owned or open to the public.

A publicly owned park, recreational area or wildlife or waterfowl refuge must be a significant resource for Section 4(f) to apply (See 23 CFR 774.11(c) and Question 1A). Resources which meet the definitions above are presumed to be significant unless the official with jurisdiction over the site concludes that the entire site is not significant. The FHWA will make an independent evaluation to assure that the official's finding of significance or non-significance is reasonable. In situations where FHWA's determination contradicts and overrides that of the official with jurisdiction, the reason for FHWA's determination should be documented in the project file and discussed in the environmental documentation for the proposed action.

Section 4(f) properties should be identified as early as practicable in the planning and project development process in order that complete avoidance of the protected resources can be given full and fair consideration (See 23 CFR 774.9(a)). Historic sites are normally identified during the process required under Section 106 of the NHPA and its implementing regulations (See 36 CFR Part 800). Accordingly, the Section 106 process should be initiated and resources listed or eligible for listing in the NR identified early enough in project planning or development to determine whether Section 4(f) applies and for avoidance alternatives to be developed and assessed (See 23 CFR 774.11(e)).

3.2 Assessing Use of Section 4(f) Properties

Once Section 4(f) properties have been identified in the study area, it is necessary to determine if any of them would be used by an alternative or alternatives being carried forward for detailed study. Use in the Section 4(f) context is defined in 23 CFR 774.17 (Definitions) and the term has very specific meaning (see also Question 7 in this Section 4(f) Policy Paper). Any potential use of Section 4(f) property should always be described in related documentation consistent with this definition, as well as with the language from 23 CFR 774.13(d) (Exceptions- temporary occupancy) and 23 CFR 774. 15 (Constructive Use Determinations), as applicable. It is not recommended to substitute similar terminology such as affected, impacted, or encroached upon in describing when a use occurs, as this may cause confusion or misunderstanding by the reader.

The most common form of use is when land is permanently incorporated into a transportation facility. This occurs when land from a Section 4(f) property is either purchased outright as transportation right-of-way or when the applicant for Federal-aid funds has acquired a property interest that allows permanent access onto the property such as a permanent easement for maintenance or other transportation-related purpose.

The second form of use is commonly referred to as temporary occupancy and results when Section 4(f) property, in whole or in part, is required for project construction-related activities. The property is not permanently incorporated into a transportation facility but the activity is considered to be adverse in terms of the preservation purpose of Section 4(f). Section 23 CFR 774.13(d) provides the conditions under which “temporary occupancies of land…are so minimal as to not constitute a use within the meaning of Section 4(f).” If all of the conditions in Section 774.13(d) are met, the temporary occupancy does not constitute a use. If one or more of the conditions for the exception cannot be met, then the Section 4(f) property is considered used by the project even though the duration of onsite activities is temporary. Written agreement by the official(s) with jurisdiction over the property with respect to all the conditions is necessary and should be retained in the project file. Assurances that documentation will eventually be obtained via subsequent negotiations are not acceptable. Also, it is typical that the activity in question will be detailed in project plans as an integral and necessary feature of the project.

The third and final type of use is called constructive use. A constructive use involves no actual physical use of the Section 4(f) property via permanent incorporation of land or a temporary occupancy of land into a transportation facility. A constructive use occurs when the proximity impacts of a proposed project adjacent to, or nearby, a Section 4(f) property result in substantial impairment to the property's activities, features, or attributes that qualify the property for protection under Section 4(f). As a general matter this means that the value of the resource, in terms of its Section 4(f) purpose and significance, will be meaningfully reduced or lost. The types of impacts that may qualify as constructive use, such as increased noise levels that would substantially interfere with the use of a noise sensitive feature such as a campground or outdoor amphitheater, are addressed in 23 CFR 774.15. A project's proximity to a Section 4(f) property is not in itself an impact that results in constructive use. Also, the assessment for constructive use should be based upon the impact that is directly attributable to the project under review, not the overall combined impacts to a Section 4(f) property from multiple sources over time. Since constructive use is subjective, FHWA's delegation of Section 4(f) authority to the FHWA Division Offices requires consultation with the Headquarters Office of Project Development and Environmental Review prior to finalizing any finding of constructive use.

In making any finding of use involving Section 4(f) properties, it is necessary to have up to date right-of-way information and clearly defined property boundaries for the Section 4(f) properties. For publicly owned parks, recreation areas, and refuges, the boundary of the Section 4(f) resource is generally determined by the property ownership boundary. Up-to-date right-of-way records are needed to ensure that ownership boundaries are accurately documented. For historic properties, the boundary of the Section 4(f) resource is generally the NR boundary. If the historic property boundary of an eligible or listed site has not been previously established via Section 106 consultation, care should be taken in evaluating the site with respect to eligibility criteria. Depending upon its contributing characteristics, the actual legal boundary of the property may not ultimately coincide with the NR boundary. Since preliminary engineering level of detail (not final design) is customary during environmental analyses, it may be necessary to conduct more detailed preliminary design in some portions of the study area to finalize determinations of use.

Late discovery and/or late designations of Section 4(f) properties subsequent to completion of environmental studies may also occur. Each situation must be assessed to determine if the change in Section 4(f) status results in a previously unidentified need for a Section 4(f) approval pursuant to 23 CFR 774.13(c) (See Question 26). The determination should be considered and documented, as appropriate, in any re-evaluation of the project.

3.3 Approval Options

When FHWA determines that a project as proposed may use Section 4(f) property, there are three methods available for FHWA to approve the use:

1. Preparing a de minimis impact determination;
2. Applying a programmatic Section 4(f) evaluation; or
3. Preparing an individual Section 4(f) evaluation.

While the applicant will participate in gathering and presenting the documentation necessary for FHWA to make a Section 4(f) approval, the actual approval action is the FHWA's responsibility. The three approval options are set out in 23 CFR 774.3 and are discussed below.

3.3.1 Determination of a De Minimis Impact to Section 4(f) Property

A de minimis impact is one that, after taking into account any measures to minimize harm (such as avoidance, minimization, mitigation or enhancement measures), results in either:

1. A Section 106 finding of no adverse effect or no historic properties affected on a historic property; or
2. A determination that the project would not adversely affect the activities, features, or attributes qualifying a park, recreation area, or refuge for protection under Section 4(f).

In other words, a de minimis impact determination is made for the net impact on the Section 4(f) property. The final project NEPA decision document must include sufficient supporting documentation for any measures to minimize harm that were applied to the project by FHWA in order to make the de minimis impact determination (See 23 CFR 774.7(b)). A use of Section 4(f) property having a de minimis impact can be approved by FHWA without the need to develop and evaluate alternatives that would avoid using the Section 4(f) property. A de minimis impact determination may be made for a permanent incorporation or temporary occupancy of Section 4(f) property.

A de minimis impact determination requires agency coordination and public involvement as specified in 23 CFR 774.5(b). The regulation has different requirements depending upon the type of Section 4(f) property that would be used. For historic sites, the consulting parties identified in accordance with 36 CFR Part 800[7] must be consulted. The official(s) with jurisdiction must be informed of the intent to make a de minimis impact determination and must concur in a finding of no adverse effect or no historic properties affected in accordance with 36 CFR Part 800. Compliance with 36 CFR Part 800 satisfies the public involvement and agency coordination requirement for de minimis impact findings for historic sites.

For parks, recreation areas, or wildlife and waterfowl refuges, the official(s) with jurisdiction over the property must be informed of the intent to make a de minimis impact determination, after which an opportunity for public review and comment must be provided. After considering any comments received from the public, if the official(s) with jurisdiction concurs in writing that the project will not adversely affect the activities, features, or attributes that make the property eligible for Section 4(f) protection, then FHWA may finalize the de minimis impact determination. The public notice and opportunity for comment as well as the concurrence for a de minimis impact determination may be combined with similar actions undertaken as part of the NEPA process. If a proposed action does not normally require public involvement, such as for certain minor projects covered by a categorical exclusion, an opportunity for the public to review and comment on the proposed de minimis impact determination must be provided. The opportunity for public input may be part of a public meeting or another form of public involvement. The final determination should be made by the FHWA Division Administrator (or in the case of Federal Lands, the Division Engineer) and all supportive documentation retained as part of the project file (See Section 4.0, Documentation).

A de minimis impact determination (see Part II, Questions 11-12) is a finding. It is not an evaluation of alternatives and no avoidance or feasible and prudent avoidance alternative analysis is required. The definition of all possible planning in 23 CFR 774.17 explains that a de minimis impact determination does not require the traditional second step of including all possible planning to minimize harm because avoidance, minimization, mitigation, or enhancement measures are included as part of the determination.
A de minimis impact determination must be supported with sufficient information included in the project file to demonstrate that the de minimis impact and coordination criteria are satisfied (23 CFR 774.7(b)). The approval of a de minimis impact should be documented in accordance with the documentation requirements in 23 CFR 774.7(f). These requirements may be satisfied by including the approval in the NEPA documentation - i.e., an Environmental Assessment (EA), Environmental Impact Statement (EIS), or Categorical Exclusion (CE) determination, Record of Decision (ROD), or Finding of No Significant Impact (FONSI), – or in an individual Section 4(f) evaluation when one is prepared for a project. When an individual Section 4(f) evaluation is required for a project in which one or more de minimis impact determinations will also be made, it is recommended that the individual Section 4(f) evaluation include the relevant documentation to support the proposed de minimis impact determination(s).

In situations where FHWA concludes in the individual Section 4(f) evaluation that there is no feasible and prudent avoidance alternative and there are two or more alternatives that use Section 4(f) property, a least overall harm analysis will be necessary pursuant to 23 CFR 774.3(c) (See Section 3.3.3.2, Alternative with Least Overall Harm). In such instances, while the de minimis impact will be considered in that analysis, the de minimis impact is unlikely to be a significant differentiating factor between alternatives because the net harm resulting from the de minimis impact is negligible. The determination of least overall harm will depend upon a comparison of the factors listed in the regulation, 23 CFR 774.3(c)(1).

3.3.2 Programmatic Section 4(f) Evaluations

Programmatic Section 4(f) evaluations are a time-saving procedural option for preparing individual Section 4(f) evaluations (discussed in Section 3.3.3) for certain minor uses of Section 4(f) property. Programmatic Section 4(f) evaluations are developed by the FHWA based on experience with many projects that have a common fact pattern from a Section 4(f) perspective.

Through applying a specific set of criteria, based upon common experience that includes project type, degree of use and impact, the evaluation of avoidance alternatives is standardized and simplified. An approved programmatic Section 4(f) evaluation may be relied upon to cover a particular project only if the specific conditions in that programmatic evaluation are met. Programmatic evaluations can be nationwide, region-wide, or statewide. The development of any programmatic evaluation, including region-wide and statewide, must be coordinated with the FHWA Office of Project Development and Environmental Review and the FHWA Office of Chief Counsel.

As of the date of publication of this Section 4(f) Policy Paper, the FHWA has issued five nationwide programmatic Section 4(f) evaluations:[8]

1. Section 4(f) Statement and Determination for Independent Bikeway or Walkway Construction Projects
2. Programmatic Section 4(f) Evaluation and Approval for FHWA Projects that Necessitate the Use of Historic Bridges
3. Final Nationwide Section 4(f) Evaluation and Approval for Federally-Aided Highway Projects with Minor Involvements with Historic Sites
4. Final Nationwide Section 4(f) Evaluation and Approval for Federally-Aided Highway Projects with Minor Involvements with Public Parks, Recreation Lands, Wildlife and Waterfowl Refuges
5. Nationwide Programmatic Section 4(f) Evaluation and Approval for Transportation Projects That Have a Net Benefit to a Section 4(f) Property

Before being adopted, all of the nationwide programmatic Section 4(f) evaluations were published in draft form in the Federal Register for public review and comment. They were also provided to appropriate Federal agencies, including the Department of the Interior (U.S. DOI), for review. Each programmatic Section 4(f) evaluation was reviewed by FHWA's Office of Chief Counsel for legal sufficiency.

It is not necessary to coordinate project-specific applications of approved programmatic Section 4(f) evaluations with the U.S. DOI unless the U.S. DOI owns or has administrative oversight over the Section 4(f) property involved (is an official with jurisdiction or has an oversight role as described Questions 9D and 31). As specified in the applicable programmatic Section 4(f) evaluation, it is still necessary to coordinate with the official(s) with jurisdiction over such properties. A legal sufficiency review of a project-specific application of an approved programmatic Section 4(f) evaluation is not necessary. As such, a primary benefit to using the prescribed step-by-step approach contained in a programmatic evaluation is the reduction of time to process a Section 4(f) approval.

Documentation required to apply a programmatic Section 4(f) evaluation must support that the specific programmatic criteria have been met (See 23 CFR 774.3(d)(1)). A separate Section 4(f) document is not required but an indication in the NEPA documentation that Section 4(f) compliance was satisfied by the applicable programmatic evaluation is required (See 23 CFR 774.7(f)). As specified in the programmatic evaluations, the requirement to assess whether there is a feasible and prudent avoidance alternative and all possible planning applies. The necessary information supporting the applicability of the programmatic evaluation will be retained in the project file (See Section 4.0, Documentation).

3.3.3 Individual Project Section 4(f) Evaluations

An individual Section 4(f) evaluation must be completed when approving a project that requires the use of Section 4(f) property if the use, as described in Sections 3.1 and 3.2 above, results in a greater than de minimis impact and a programmatic Section 4(f) evaluation cannot be applied to the situation (23 CFR 774.3). The individual Section 4(f) evaluation documents the evaluation of the proposed use of Section 4(f) properties in the project area of all alternatives. The individual Section 4(f) evaluation requires two findings, which will be discussed in turn:

1. That there is no feasible and prudent alternative that completely avoids the use of Section 4(f) property; and
2. That the project includes all possible planning to minimize harm to the Section 4(f) property resulting from the transportation use (See 23 CFR 774.3(a)(1) and (2)).

3.3.3.1 Feasible and Prudent Avoidance Alternatives

The intent of the statute, and the policy of FHWA, is to avoid and, where avoidance is not feasible and prudent, minimize the use of significant public parks, recreation areas, wildlife and waterfowl refuges and historic sites by our projects. Unless the use of a Section 4(f) property is determined to have a de minimis impact, FHWA must determine that no feasible and prudent avoidance alternative exists before approving the use of such land (See 23 CFR 774.3). The Section 4(f) regulations refer to an alternative that would not require the use of any Section 4(f) property as an avoidance alternative. Feasible and prudent avoidance alternatives are those that avoid using any Section 4(f) property and do not cause other severe problems of a magnitude that substantially outweigh the importance of protecting the Section 4(f) property (23 CFR 774.17). This section of the Section 4(f) Policy Paper focuses on the identification, development, evaluation, elimination and documentation of potential feasible and prudent avoidance alternatives in a Section 4(f) evaluation document.

The first step in determining whether a feasible and prudent avoidance alternative exists is to identify a reasonable range of project alternatives including those that avoid using Section 4(f) property. The avoidance alternatives will include the no-build. The alternatives screening process performed during the scoping phase of NEPA is a good starting point for developing potential section 4(f) avoidance alternatives and/or design options.[9] Any screening of alternatives that may have occurred during the transportation planning phase may be considered as well. It may be necessary, however, to look for additional alternatives if the planning studies and the NEPA process did not identify Section 4(f) properties and take Section 4(f) requirements into account. If Section 4(f) avoidance alternatives were eliminated during the earlier phases of project development for reasons unrelated to Section 4(f) impacts or a failure to meet the project purpose and need, they may need to be reconsidered in the Section 4(f) process. In addition, it is often necessary to develop and analyze new alternatives, or new variations of alternatives rejected for non-Section 4(f) reasons during the earlier phases.

The no-action or no-build alternative is an avoidance alternative and should be included in the analysis as such. In identifying other avoidance alternatives, FHWA should consider the reasonable alternatives that meet the purpose and need of the project. Potential alternatives to avoid the use of Section 4(f) property may include one or more of the following, depending on project context:

- **Location Alternatives** - A location alternative refers to the re-routing of the entire project along a different alignment.
- **Alternative Actions** - An alternative action could be a different mode of transportation, such as rail transit or bus service, or some other action that does not involve construction such as the implementation of transportation management systems or similar measures.
- **Alignment Shifts** - An alignment shift is the re-routing of a portion of the project to a different alignment to avoid a specific resource.
- **Design Changes** - A design change is a modification of the proposed design in a manner that would avoid impacts, such as reducing the planned median width, building a retaining wall, or incorporating design exceptions.

When considering alignment shifts and design changes, it is important to keep in mind the range of allowable configurations and design values for roadway elements and different types of roads. These guidelines are contained within the official state standards and/or the “Green Book,” properly titled A Policy on the Geometric Design of Highways and Streets and published by the American Association of State Highway and Transportation Officials. The guidelines set out the generally acceptable ranges of dimensions for roadway elements and typical applications on different types of roadway facilities. These ranges of values provide planners and designers the ability to develop projects at an acceptable cost and level of performance (e.g. safety, traffic flow, sustainability), while balancing the site-specific conditions, constraints, and implications of design decisions. Where it may be appropriate to select a value or dimension outside of the ranges that are established in State and national guidelines, design exceptions are encouraged and permitted. However, the consideration and selection of a value outside of the established ranges should be based on the context of the facility and an analysis of how the design may affect the safety, flow of traffic, constructability, maintainability, environment, cost, and other related issues.
An important consideration in identifying potential avoidance alternatives is that they should have a reasonable expectation of serving traffic needs that have been identified in the project purpose and need. A final limitation in identifying potential avoidance alternatives is that a project alternative that avoids one Section 4(f) property by using another Section 4(f) property is not an avoidance alternative. The goal is to identify alternatives that would not use any Section 4(f) property. (Note: A determination of a De minimis impact for a specific Section 4(f) property may be made without considering avoidance alternatives for that property, even if that use occurs as part of an alternative that also includes other uses that are greater than De minimis.) Consequently, at this step of analysis the degree of impact to Section 4(f) property is not relevant - the only question is whether the alternative would require any use of Section 4(f) property because an alternative using any amount of Section 4(f) property is not an avoidance alternative. Subsequent steps in the analysis will consider the degree of impact as well as the availability of measures to minimize impacts.

Once the potential avoidance alternative(s) have been identified, the next task is to determine, for each potential avoidance option, whether avoiding the Section 4(f) property is feasible and prudent. The Section 4(f) regulations specify how FHWA is to determine whether a potential avoidance alternative is feasible and prudent in 23 CFR 774.17. The definition explains that a “feasible and prudent avoidance alternative” is one that avoids using Section 4(f) property and does not cause other severe problems of a magnitude that substantially outweigh the importance of protecting the Section 4(f) property. In order to determine whether there are other severe problems of a magnitude that substantially outweighs the importance of protecting the Section 4(f) property, both the feasibility and the prudence of each potential avoidance alternative must be considered.

Care must be taken when making determinations of feasibility and prudence not to forget or de-emphasize the importance of protecting the Section 4(f) property. This stems from the statute itself, which requires that special effort should be made to preserve the natural beauty of the countryside and public park and recreation lands, wildlife and waterfowl refuges, and historic sites. The regulation incorporates this aspect of the statute in the definition of feasible and prudent avoidance alternative which states that “it is appropriate to consider the relative value of the resource to the preservation purpose of the statute.” In effect, the first part of the definition recognizes the value of the individual Section 4(f) property in question, relative to other Section 4(f) properties of the same type. This results in a sliding scale approach that maximizes the protection of Section 4(f) properties that are unique or otherwise of special significance by recognizing that while all Section 4(f) properties are important, some Section 4(f) properties are worthy of a greater degree of protection than others.

The regulations state that a potential avoidance alternative is not feasible if it cannot be built as a matter of sound engineering judgment (23 CFR 774.17). If a potential avoidance alternative cannot be built as a matter of sound engineering judgment it is not feasible and the particular engineering problem with the alternative should be documented in the project files with a reasonable degree of explanation. In difficult situations, the FHWA Division may obtain assistance from FHWA subject matter experts located in FHWA Headquarters or the FHWA Resource Center.

The third and final part of the feasible and prudent avoidance alternative definition sets out standards for determining if a potential avoidance alternative is prudent. An alternative is not prudent if:

1. It compromises the project to a degree that it is unreasonable to proceed in light of the project's stated purpose and need (i.e., the alternative doesn't address the purpose and need of the project);
2. It results in unacceptable safety or operational problems;
3. After reasonable mitigation, it still causes severe social, economic, or environmental impacts; severe disruption to established communities; severe or disproportionate impacts to minority or low-income populations; or severe impacts to environmental resources protected under other Federal statutes;
4. It results in additional construction, maintenance, or operational costs of extraordinary magnitude;
5. It causes other unique problems or unusual factors; or
6. It involves multiple factors as outlined above that, while individually minor, cumulatively cause unique problems or impacts of extraordinary magnitude.

The prudence determination involves an analysis that applies each of the six factors, if applicable, to the potential avoidance alternative. If a factor is not applicable FHWA recommends simply noting that fact in the analysis.

Supporting documentation is required in the Section 4(f) evaluation for findings of no feasible and prudent alternatives (See 23 CFR 774.7(a)). Documentation of the process used to identify, develop, analyze and eliminate potential avoidance alternatives is very important. The Section 4(f) evaluation should describe all efforts in this regard. This description need not include every possible detail, but it should clearly explain the process that occurred and its results. It is appropriate to maintain detailed information in the project file with a summary in the Section 4(f) evaluation. If the information is especially voluminous, a technical report should be prepared, summarized, and referenced in the Section 4(f) evaluation. The discussion may be organized within the Section 4(f) evaluation in any manner that allows the reader to understand the full range of potential avoidance alternatives identified, the process by which potential avoidance alternatives were identified and analyzed for feasibility and prudence. Possible methods for organizing the discussion include a chronological discussion; a discussion organized geographically by project alternatives or project phases of construction; or by the type of Section 4(f) properties.

For larger highway projects with multiple Section 4(f) properties in the project area, it may be desirable to divide the analysis into a macro and a micro-level evaluation in order to distinguish the analysis of end-to-end project alternatives that avoid using any Section 4(f) property from the analysis of design options to avoid using a single Section 4(f) property. The macro-level evaluation would address any end-to-end avoidance alternatives that can be developed, as well as any alternative actions to the proposed highway project such as travel demand reduction strategies or enhanced transit service in the project area. The micro-level evaluation would then address, for each Section 4(f) property, whether the highway could be routed to avoid the property by shifting to the left or right, by bridging over, or tunneling under the property, or through another alignment shift or design change. The analysis may be presented in any manner that demonstrates, for each Section 4(f) property used, that there is no feasible and prudent avoidance alternative. Even if all of the alternatives use a Section 4(f) property, there is still a duty to try to avoid the individual Section 4(f) properties within each alternative.

3.3.3.2 Alternative with Least Overall Harm

If the analysis described in the preceding section concludes that there is no feasible and prudent avoidance alternative, then FHWA may approve, from among the remaining alternatives that use Section 4(f) property, only the alternative that causes the least overall harm in light of the statute's preservation purpose. Pursuant to substantial case law, if the assessment of overall harm finds that two or more alternatives are substantially equal, FHWA can approve any of those alternatives. This analysis is required when multiple alternatives that use Section 4(f) property remain under consideration.

To determine which of the alternatives would cause the least overall harm, FHWA must compare seven factors set forth in 23 CFR 774.3(c)(1) concerning the alternatives under consideration. The first four factors relate to the net harm that each alternative would cause to Section 4(f) property:

1. The ability to mitigate adverse impacts to each Section 4(f) property (including any measures that result in benefits to the property);
2. The relative severity of the remaining harm, after mitigation, to the protected activities, attributes, or features that qualify each Section 4(f) property for protection;
3. The relative significance of each Section 4(f) property; and
4. The views of the officials with jurisdiction over each Section 4(f) property.

When comparing the alternatives under these factors, FHWA policy is to develop comparable mitigation measures where possible. In other words, the comparison may not be skewed by over-mitigating one alternative while under-mitigating another alternative for which comparable mitigation could be incorporated. In addition, the mitigation measures relied upon as part of this comparison should be incorporated into the selected alternative. If subsequent design or engineering work occurs after the alternative is selected that requires changes to the mitigation plans for Section 4(f) property, FHWA may require revisions to previous mitigation commitments commensurate with the extent of design changes in accordance with 23 CFR 771.109(b)and(d), 127(b), 129, and 130.

The remaining three factors enable FHWA to take into account any substantial problem with any of the alternatives remaining under consideration on issues beyond Section 4(f). These factors are:

5. The degree to which each alternative meets the purpose and need for the project;
6. After reasonable mitigation, the magnitude of any adverse impacts to resources not protected by Section 4(f); and
7. Substantial differences in costs among the alternatives.
8.

By balancing the seven factors, four of which concern the degree of harm to Section 4(f) properties, FHWA will be able to consider all relevant concerns to determine which alternative would cause the least overall harm in light of the statute's preservation purpose. The least overall harm balancing test is set forth in 774.3(c)(1). This allows FHWA to fulfill its statutory mandate to make project decisions in the best overall public interest required by 23 U.S.C. § 109(h). Through this balancing of factors, FHWA may determine that a serious problem identified in factors (v) through (vii) outweighs relatively minor net harm to a Section 4(f) property. The least overall harm determination also provides FHWA with a way to compare and select between alternatives that would use different types of Section 4(f) properties when competing assessments of significance and harm are provided by the officials with jurisdiction over the impacted properties. In evaluating the degree of harm to Section 4(f) properties, FHWA is required by the regulations to consider the views (if any) expressed by the official(s) with jurisdiction over each Section 4(f) property. If an official with jurisdiction states that all resources within that official's jurisdiction are of equal value, FHWA may still determine that the resources have different value if such a determination is supported by information in the project file. Also, if the officials with jurisdiction over two different properties provide conflicting assessments of the relative value of those properties, FHWA should consider the officials' views but then make its own independent judgment about the relative value of those properties. Similarly, if the official(s) with jurisdiction decline to provide any input at all regarding the relative value of the affected properties, FHWA should make its own independent judgment about the relative value of those properties.

FHWA is required to explain how the seven factors were compared to determine the least overall harm alternative (See 23 CFR 774.7(c)). The draft Section 4(f) evaluation will disclose the various impacts to the different Section 4(f) properties thereby initiating the balancing process. It should also disclose the relative differences among alternatives regarding non-Section 4(f) issues such as the extent to which each alternative meets the project purpose and need. The disclosure of impacts should include both objective, quantifiable impacts and qualitative measures that provide a more subjective assessment of harm. Preliminary assessment of how the alternatives compare to one another may also be included. After circulation of the draft Section 4(f) evaluation in accordance with 23 CFR 774.5(a), FHWA will consider comments received on the evaluation and finalize the comparison of all factors listed in 23 CFR 774.3(c)(1) for all the alternatives. The analysis and identification of the alternative that has the overall least harm must be documented in the final Section 4(f) evaluation (See 23 CFR 774.7(c)). In especially complicated projects, the final approval to use the Section 4(f) property may be made in the decision document (ROD or FONSI).

3.4 Examples of Section 4(f) Approvals

The table below describes five project alternative scenarios. In each project scenario various alternatives are considered and there are various options available to approve the use of the Section 4(f) property needed for the project. The examples illustrate the approval options as well as the point that in some situations FHWA may only approve a certain alternative. These examples are not intended to address every possible scenario.

In Project 1 there is a single build alternative A, for which FHWA determines the use to be a de minimis impact and therefore does not require an individual Section 4(f) evaluation. Once the coordination required by 23 CFR 774.5(b) is completed, FHWA may approve the de minimis impact and the applicant may proceed with the build alternative.

Project 2 has two alternatives. The FHWA determines that alternative A has a de minimis impact on one Section 4(f) property, and alternative B has a de minimis impact on three Section 4(f) properties. Upon completion of the coordination required by 23 CFR 774.5(b), FHWA may approve either alternative under Section 4(f). As in the previous example, an individual Section 4(f) evaluation is not required, therefore the feasibility and prudence of avoiding Section 4(f) properties does not have to be determined. Furthermore, when there are only de minimis impacts, even among multiple alternatives, a least harm analysis is not necessary and there is no need to compare the significance of the competing Section 4(f) properties. The process to choose between alternatives A or B in the second example may be based on non-Section 4(f) considerations as determined appropriate through the project development process.
In Project 3, there are three alternatives under consideration. The FHWA determines that alternative A meets the criteria of a de minimis impact, while alternative B has a minor impact on

a Section 4(f) property for which the programmatic Section 4(f) evaluation for minor uses is applicable. Alternative C would use a Section 4(f) property to an extent that a de minimis impact determination is not possible and no programmatic Section 4(f) evaluation applies. In this example, all three alternatives use a Section 4(f) property and thus none can be considered to be an avoidance alternative. For this project, alternative A may proceed immediately once the coordination required by 23 CFR 774.5 is complete, through an approved de minimis impact determination. Alternative B may be approved by following the procedures designated in the applicable programmatic Section 4(f) evaluation, whose end result demonstrates no feasible and prudent avoidance alternative. However, in this example if the applicant favors alternative C, then an individual Section 4(f) evaluation can be prepared to consider whether or not alternative C can be approved under Section 4(f). The individual Section 4(f) evaluation first determines that there is no feasible and prudent avoidance alternative as defined in 23 CFR 774.17. The evaluation then considers which alternative (A, B, or C) has the least overall harm using the factors in 23 CFR 774.3(c). Alternative C could only be approved if it is identified as having the least overall harm, which would be possible; for example, if alternatives A and B both have severe impacts to an important non-Section 4(f) resource and the impacts of alternative C can be adequately mitigated. In that case, upon completion of the coordination required by 23 CFR 775.5(a) and all possible planning to minimize harm as defined in 23 CFR 774.17, alternative C could be approved.

Project 4 differs slightly in having multiple de minimis impacts to Section 4(f) properties with alternative A, and a mix of de minimis impacts and greater than de minimis impacts not covered by a programmatic section 4(f) evaluation with alternative B. If alternative A is chosen, FHWA would satisfy Section 4(f) by making a de minimis impact determination for each property used in accordance with 23 CFR 774.3(b), 774.5(b), and 774.7(c). To consider selecting alternative B, an individual Section 4(f) evaluation would be prepared in accordance with 23 CFR 774.3(a), 774.5(a), and 774.7(a); however, a determination of de minimis impact for a specific Section 4(f) property can be made without considering avoidance alternatives for that property, even if that use occurs as part of an alternative that also includes other uses that are greater than de minimis. In this example, an additional alternative C is developed as part of the Section 4(f) evaluation. Alternative C avoids using any Section 4(f) property, and the evaluation then determines, using the definition in 23 CFR 774.17, that alternative C is feasible and prudent. Alternative C may proceed immediately because it does not use any Section 4(f) property and no Section 4(f) approval is needed. In this example, since alternative C is a feasible and prudent avoidance alternative the FHWA may not approve alternative B, although alternative A would still be available for selection because its impacts on Section 4(f) properties are de minimis. However, if the facts are changed and we now assume that the evaluation of avoidance alternative C had found that it was <u>not</u> feasible and prudent, then the Section 4(f) evaluation could be completed. The evaluation would determine the least overall harm amongst alternatives A and B using the factors in 23 CFR 774.3(c). (In this variation of the example, the least overall harm determination does not include alternative C in the comparison because alternative C was previously eliminated when it was found not to be feasible and prudent.) Alternative B could only be approved if it is identified as having the least overall harm. This would be possible, for example if alternative A would not meet the project purpose and need as well as alternative B, alternative A would be substantially more expensive, and the Section 4(f) property used by alternative B has no unusual significance and could be adequately mitigated. In that example, upon completion of the coordination required by 23 CFR 774.5(a) and all possible planning to minimize harm as defined in 23 CFR 774.17, alternative B could be approved even though it uses Section 4(f) property.

Project 5 has two alternatives, both having greater than de minimis impacts on a different Section 4(f) property. To choose among alternatives A and B, an individual Section 4(f) evaluation must be prepared in accordance with 23 CFR 774.3(a), 774.5(a), and 774.7(a) that demonstrates no feasible and prudent avoidance alternative exists, and a least overall harm analysis must be completed using the factors in 23 CFR 774.3(c). The alternative identified as having the least overall harm may proceed upon completion of the coordination required by 23 CFR 774.5(a) and all possible planning to minimize harm as defined in 23 CFR 774.17.

Table 1. Project Alternative Scenarios

ALTERNATIVE	USE OF SECTION 4(f) PROPERTY	INDIVIDUAL SECTION 4(f) EVALUATION?	OUTCOME
Project 1, alternative A	de minimis impact	Not necessary	May proceed with A
Project 2, alternative A	de minimis impact on one property	Not necessary	May proceed with A or B; Section 4(f) is not determinative
Project 2, alternative B	de minimis impact on three properties	Not necessary	
Project 3, alternative A	de minimis impact	Not necessary	May proceed with A or B; Section 4(f) is not determinative
Project 3, alternative B	Minor use, programmatic Section 4(f) evaluation is applicable	Not necessary	
Project 3, alternative C	Greater than de minimis impact	Necessary. If no feasible and prudent avoidance alternative is identified, then a least overall harm analysis would compare A, B, and C.	May proceed with C only if C has less overall harm than A or B.
Project 4, alternative A	de minimis impact on two properties	Not necessary	May proceed with A
Project 4, alternative B	de minimis impact on one property & greater than de minimis impact on another property	Necessary. As part of the evaluation, a new Alternative C is developed that avoids using Section 4(f) property.	If C is found feasible and prudent, cannot proceed with B. If C is not feasible and prudent, may proceed with B only if B has less overall harm than A.
Project 4, alternative C	None	Not necessary to complete the Section 4(f) evaluation to proceed with C.	May proceed with C; no Section 4(f) approval is required.
Project 5, alternative A	Greater than de minimis impact	Necessary. The evaluation must seek to identify feasible and prudent avoidance alternatives. Assuming none are found, then a least harm analysis will compare A and B.	Least overall harm analysis determines which alternative, A or B, may proceed.
Project 5, alternative B	Greater than de minimis impact		

3.5 All Possible Planning to Minimize Harm

After determining that there are no feasible and prudent alternatives to avoid the use of Section 4(f) property, the project approval process for an individual Section 4(f) evaluation requires the consideration and documentation of all possible planning to minimize harm to Section 4(f) property (See 23 CFR 774.3(a)(2)). All possible planning, defined in 23 CFR 774.17, means that all reasonable measures identified in the Section 4(f) evaluation to minimize harm or mitigate for adverse impacts and effects must be included in the project. All possible planning to minimize harm does not require analysis of feasible and prudent avoidance alternatives, since such analysis will have already occurred in the context of searching for feasible and prudent alternatives that avoid Section 4(f) properties altogether under § 774.3(a)(1).

Minimization of harm may entail both alternative design modifications that reduce the amount of Section 4(f) property used and mitigation measures that compensate for residual impacts. Minimization and mitigation measures should be determined through consultation with the official(s) with jurisdiction. These include the SHPO and/or THPO for historic properties or officials owning or administering the resource for other types of Section 4(f) properties.

Mitigation measures involving public parks, recreation areas, or wildlife or waterfowl refuges may involve a replacement of land and/or facilities of comparable value and function, or monetary compensation to enhance the remaining land. Neither the Section 4(f) statute nor regulations requires the replacement of Section 4(f) property used for highway projects, but this option may be the most straightforward means of minimizing harm to parks, recreation areas, and wildlife waterfowl refuges and is permitted under 23 CFR 710.509 as a mitigation measure for direct project impacts.

Mitigation of historic sites usually consists of those measures necessary to preserve the historic integrity of the site and agreed to in accordance with 36 CFR 800 by FHWA, the SHPO or THPO, and other consulting parties. In any case, the cost of mitigation should be a reasonable public expenditure in light of the severity of the impact on the Section 4(f) property in accordance with 23 CFR 771.105(d). Additional laws such as Section 6(f) of the Land and Water Conservation Fund Act may have separate mitigation and approval requirements and compliance with such) requirements should also be described within the Section 4(f) discussion of all possible planning to minimize harm.

4.0 Documentation

U.S. DOT departmental requirements for documenting Section 4(f) analysis and approvals (DOT Order 5610.1C) have been incorporated into FHWA regulations, guidance and policy. The FHWA's procedures regarding the preparation and circulation of Section 4(f) documents is contained in 23 CFR 774.5 and FHWA's Technical Advisory, T 6640.8A, Guidance for Preparing and Processing of Environmental and Section 4(f) Documents.[10]

The documentation of all Section 4(f) determinations, consultations, coordination and approvals is intended to establish a record of FHWA's compliance with the regulatory process. Documentation also provides evidence that the substantive requirements have been met. Section 4(f) documentation and processing requirements vary depending on the type of Section 4(f) property used and whether or not the use meets the criteria of a de minimis impact. However, all situations which involve Section 4(f) property will necessitate some degree of documentation: either in the NEPA document, a Section 4(f) evaluation, or the project file.

The project file is the agency's written record that memorializes the basis for determining that an impact is de minimis or that there is no feasible and prudent avoidance alternative to the use of the Section 4(f) property and that FHWA undertook all possible planning to minimize harm to Section 4(f) property. When the agency determines that Section 4(f) is not applicable to a particular resource, written documentation of that decision should be maintained as part of the project file.

The project file should include all relevant correspondence which may include emails and other electronic information that is applicable to the decision-making process. The project file should generally be retained until three years after FHWA reimbursement on Federal-aid projects and three years after final payment on non-Federal aid projects (See FHWA Order M.1324.1A, 49 CFR 18.42, and 49 CFR 19.53).

De Minimis Impact Determinations

The de minimis impact determination must include sufficient supporting documentation to demonstrate that the impacts, after avoidance, minimization, mitigation, or enhancement measures are taken into account, are de minimis as defined in 23 CFR 774.17; and that the coordination required by 23 CFR 774.5(b) was completed.
Information related to the de minimis impact determination should be included in the project NEPA document (EA or EIS), or in the project file for a project processed as a CE (See 23 CFR 774.7(c)). Circulation of this information in the project NEPA document may satisfy the public involvement requirements required for de minimis impact findings. For projects which include both de minimis impacts and use of Section 4(f) property with more than a de minimis impact, the determination and supporting data should be included in a separate section of the Section 4(f) evaluation.

Applying Programmatic Section 4(f) Evaluation

Information related to an approval to use Section 4(f) property by applying a programmatic Section 4(f) evaluation should be included in the project NEPA document (EA or EIS), or in the project file for a project processed as a CE. For projects which include both a programmatic Section 4(f) approval and a use of Section 4(f) property for which there is more than a de minimis impact, information regarding the application of the programmatic Section 4(f) evaluation should be included in a separate section of the Section 4(f) evaluation.
The project file should include sufficient supporting documentation to demonstrate that the programmatic evaluation being relied upon applies to the use of the specific Section 4(f) property. In addition, the project file should include documentation that the coordination required by the applicable programmatic evaluation was completed and that all specific conditions of the applicable programmatic evaluation were met.

Individual Section 4(f) Evaluations

Individual Section 4(f) evaluations must include sufficient analysis and supporting documentation to demonstrate that there is no feasible and prudent avoidance alternative and shall summarize the results of all possible planning to minimize harm (23 CFR 774.7(a)). For projects requiring a least overall harm analysis under 23 CFR 774.3(c), that analysis must be included within the individual Section 4(f) evaluation (23 CFR 774.7(c)).
Individual Section 4(f) evaluations are processed in two distinct stages: draft and final. Draft evaluations must be circulated to the U.S. DOI and shared with the official(s) with jurisdiction. The public may review and comment on a draft evaluation during the NEPA process. When a project is processed as a CE the Section 4(f) evaluation must be circulated independently to the U.S. DOI. In all cases, final Section 4(f) evaluations are subject to FHWA legal sufficiency review prior to approval (23 CFR 774.5(d)).

Project Files

In general, the project file should contain the following essential information, with analysis, regarding Section 4(f):

- When making *de minimis* impact determinations

1. Applicability or non-applicability of Section 4(f) to the park, recreation, refuge or historic property proposed to be used by the project;
2. Whether or not there is a use of section 4(f) property;
3. Records of public involvement, or Section 106 consultation;
4. Results of coordination with the officials with jurisdiction;
5. Comments submitted during the coordination procedures required by 23 CFR 774.5 and responses to the comments; and
6. Avoidance, minimization or mitigation measures that were relied upon to make the *de minimis* impact finding.

- When applying programmatic Section 4(f) evaluations

1. Applicability or non-applicability of Section 4(f) to the park, recreation, refuge or historic property proposed to be used by the project;
2. Whether or not there is a use of section 4(f) property;
3. Records of public involvement, if any;
4. Results of coordination with the officials with jurisdiction; and
5. Documentation of the specific requirements of the programmatic evaluation that is being applied.

- When applying programmatic Section 4(f) evaluations

1. Applicability or non-applicability of Section 4(f) to the park, recreation, refuge or historic property proposed to be used by the project;
2. Whether or not there is a use of section 4(f) property;
3. Records of public involvement, if any;
4. Results of coordination with the officials with jurisdiction; and
5. Documentation of the specific requirements of the programmatic evaluation that is being applied.

- When preparing an individual Section 4(f) evaluation

1. Applicability or non-applicability of Section 4(f) to the park, recreation, refuge or historic property proposed to be used by the project;
2. Whether or not there is a use of Section 4(f) property;
3. Activities, features, and attributes of the Section 4(f) property;
4. Analysis of the impacts to the Section 4(f) property;
5. Records of public involvement;
6. Results of coordination with the officials with jurisdiction;
7. Alternatives considered to avoid using the Section 4(f) property, including analysis of the impacts caused by avoiding the Section 4(f) property;
8. A least overall harm analysis, if appropriate;
9. All measures undertaken to minimize harm to the Section 4(f) property;
10. Comments submitted during the coordination procedures required by 23 CFR 774.5 and responses to the comments; and
11. Results of the internal legal sufficiency review.

Administrative Records

If a Section 4(f) approval is legally challenged, the project file will be the basis of the administrative record that must be filed in the court for review. The administrative record will be reviewed in accordance with the Administrative Procedure Act (APA), (5 U.S.C. §706 (2)(A)), which provides judicial deference to U.S. DOT actions. Under the APA, the agency's action must be upheld unless it is arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law. The court will review the administrative record to determine whether FHWA complied with the essential elements of Section 4(f). If an inadequate administrative record is prepared, the court will lack the required Section 4(f) documentation to review and, therefore, will be unable to defer to FHWA's decision, especially when a Section 4(f) evaluation was not required. While agency decisions are entitled to a presumption of regularity and the courts are not empowered to substitute their judgment for that of the agency, judges will carefully review whether FHWA followed the applicable requirements.

PART II – QUESTIONS AND ANSWERS REGARDING SECTION 4(f) APPLICABILITY AND COMPLIANCE

The following questions and answers are intended to provide additional and detailed guidance for complying with the requirements of Section 4(f). Examples to aid in determining the applicability of Section 4(f) to various types of property and project situations are included. These examples represent FHWA's policy regarding Section 4(f) compliance for situations most often encountered in the project development process. Since it is impossible to address every situation that could occur, it is recommended that the FHWA Division Office be consulted for advice and assistance in determining the applicability of Section 4(f) to specific circumstances not covered in this paper. The FHWA Division Offices are encouraged to consult with the Headquarters Office of Project Development and Environmental Review, the Resource Center Environment Technical Services Team and/or the Office of the Chief Counsel in cases where additional assistance in Section 4(f) matters is required.

IDENTIFICATION OF SECTION 4(f) PROPERTIES

1. Public Parks, Recreation Areas and Wildlife and Waterfowl Refuges
Question 1A: When is publicly owned land considered to be a park, recreation area or wildlife and waterfowl refuge?
Answer: Publicly owned land is considered to be a park, recreation area or wildlife and waterfowl refuge when the land has been officially designated as such by a Federal, State or local agency, and the officials with jurisdiction over the land determine that its primary purpose is as a park, recreation area, or refuge. Primary purpose is related to a property's primary function and how it is intended to be managed. Incidental, secondary, occasional or dispersed activities similar to park, recreational or refuge activities do not constitute a primary purpose within the context of Section 4(f). Unauthorized activities, such as ad hoc trails created by the public within a conservation area, should not be considered as part of FHWA's determination of Section 4(f) applicability.

In addition, the statute itself requires that a property must be a significant public park, recreation area, or wildlife and waterfowl refuge. The term significant means that in comparing the availability and function of the park, recreation area or wildlife and waterfowl refuge, with the park, recreation or refuge objectives of the agency, community or authority, the property in question plays an important role in meeting those objectives. Except for certain multiple-use land holdings (Question 4), significance determinations are applicable to the entire property and not just to the portion of the property proposed for use by a project.

Significance determinations of publicly owned land considered to be a park, recreation area, or wildlife and waterfowl refuge are made by the official(s) with jurisdiction over the property. The meaning of the term significance, for purposes of Section 4(f), should be explained to the official(s) with jurisdiction if the official(s) are not familiar with Section 4(f). Management plans or other official forms of documentation regarding the land, if available and up-to-date, are important and should be obtained from the official(s) and retained in the project file. If a determination from the official(s) with jurisdiction cannot be obtained, and a management plan is not available or does not address the significance of the property, the property will be presumed to be significant. However, all determinations, whether stated or presumed, and whether confirming or denying significance of a property for the purposes of Section 4(f), are subject to review by FHWA for reasonableness pursuant to 23 CFR 774.11. When FHWA changes a determination of significance, the basis for this determination will be included in the project file and discussed in the environmental documentation for the proposed action.

Question 1B: Can an easement or other encumbrance on private property result in that property being subject to Section 4(f)?

Answer: Yes, in certain instances. Generally, an easement is the right to use real property without possessing it, entitling the easement holder to the privilege of some specific and limited use of the land. Easements take many forms and are obtained for a variety of purposes by different parties. Easements or similar encumbrances restricting a property owner from making certain uses of his/her property, such as conservation easements, are commonly encountered during transportation project development. Easements such as these often exist for the purpose of preserving open space, protection of habitat, or to limit the extent and density of development in a particular area, and they may be held by Federal, State or local agencies or non-profit groups or other advocacy organizations.
Although a conservation easement may not meet all of the requirements necessary to treat the property as a significant publicly-owned public park, recreation area, or wildlife and waterfowl refuge, it is a possibility that mandates careful case-by-case consideration when encountered. The terms of the easement should be carefully examined to determine if Section 4(f) applies to the property. Factors to consider include, but are not limited to, the views of the official(s) with jurisdiction, the purpose of the easement, the term of the easement, degree of public access to the property, how the property is to be managed and by whom, what parties obtained the easement (public agency or non-public group), termination clauses, and what restrictions the easement places on the property owner's use of the easement area. Questions on whether or not an easement conveys Section 4(f) status to a property should be referred to the FHWA Division Office and, if necessary, the Division Office should consult with the Headquarters Office of Project Development and Environmental Review, the Headquarters Office of Real Estate Services, the Resource Center Environment Technical Service Team, or the Office of Chief Counsel.

Easements and deed restrictions for the purpose of historic preservation are also commonly encountered during transportation project development. Section 4(f) applicability questions are unlikely to be encountered for these properties because if the property is not on or eligible for the NR Section 4(f) does not apply, notwithstanding the preservation easement. If the property is on or eligible for the NR, Section 4(f) applies. However, the existence and nature of such easements should be documented and considered as necessary within the feasible and prudent analysis and least harm analysis if a Section 4(f) evaluation is prepared.

Question 1C: When does a lease agreement with a governmental body constitute public ownership?

Answer: In some instances, a lease agreement between a private landowner and a governmental body may constitute a proprietary interest in the land for purposes of Section 4(f). Generally, under a long term lease to a governmental body, such land may be considered to be "publicly owned" land and if the property is being managed by the governmental body as a significant public park, recreation area, or wildlife and waterfowl refuge then a use of the property will be subject to the requirements of Section 4(f). Such lease agreements should be examined on a case-by-case basis with consideration of such factors as the term of the lease, the understanding of the parties to the lease, the existence of a cancellation clause, and how long the lease has been in place. Questions on whether or not the leasehold constitutes public ownership should be referred to the FHWA Division Office, and if necessary the Division Office should consult with the Headquarters Office of Project Development and Environmental Review, the Resource Center Environment Technical Service Team, or the Office of Chief Counsel. If FHWA determines that the lease agreement creates a proprietary interest that is equivalent to public ownership, FHWA must then determine whether the property is in fact being managed by the government body as a significant public park, recreation area, or wildlife and waterfowl refuge. If so, the property is subject to Section 4(f).

Question 1D: Are significant publicly owned parks and recreation areas that are not open to the general public subject to the requirements of Section 4(f)?

Answer: The requirements of Section 4(f) would apply if the entire public park or public recreation area permits visitation of the general public at any time during the normal operating hours. Section 4(f) would not apply when visitation is permitted to a select group only and not to the entire public. Examples of select groups include residents of a public housing project; military service members and their dependents; students of a public school; and students, faculty, and alumni of a public college or university (See Question 18B). The FHWA does, however, strongly encourage the preservation of such parks and recreation areas even though they may not be open to the general public or are not publicly owned and therefore are not protected by Section 4(f).

It should be noted that wildlife and waterfowl refuges have not been included in this discussion. Many wildlife and waterfowl refuges allow public access, while others may restrict public access to certain areas within the refuge or during certain times or seasons of the year for the protection of refuge habitat or species. In these cases, the property should be examined by the FHWA Division Office to verify that the primary purpose of the property is for wildlife and waterfowl refuge activities and not for other non-Section 4(f) activities, and that the restrictions on public access are limited to measures necessary to protect refuge habitat or species. If it is determined that the primary purpose of the property is for wildlife and waterfowl refuge activities and that the restrictions on public access are limited to the measures necessary to protect the refuge habitat or species, then the property is subject to Section 4(f) notwithstanding the access restriction.

Question 1E: What is a wildlife and waterfowl refuge for purposes of Section 4(f)?

Answer: The term wildlife and waterfowl refuge is not defined in the Section 4(f) law. On the same day in 1966 that Section 4(f) was passed, Congress also passed the National Wildlife Refuge System Administration Act (Pub. L. 89-669, 80 Stat. 926) to provide for the conservation, protection, and propagation of native species of fish and wildlife, including migratory birds, that are threatened with extinction; to consolidate the authorities relating to the administration by the Secretary of the Interior of the National Wildlife Refuge System; and for other purposes. The Refuge System referred to in that Act includes areas that were designated as wildlife refuges and waterfowl refuges.[11] FHWA has considered this contemporaneous legislation in our implementation of Section 4(f) regarding refuges. For purposes of Section 4(f), National Wildlife Refuges[12] are always considered wildlife and waterfowl refuges by FHWA in administering Section 4(f); therefore no individual determination of their Section 4(f) status is necessary. In addition, any significant publicly owned public property (including waters) where the primary purpose of such land is the conservation, restoration, or management of wildlife and waterfowl resources including, but not limited to, endangered species and their habitat is considered by FHWA to be a wildlife and waterfowl refuge for purposes of Section 4(f).

In determining the primary purpose of the land, consideration should be given to:

1. The authority under which the land was acquired;
2. Lands with special national or international designations;
3. The management plan for the land; and,
4. Whether the land has been officially designated, by a Federal, State, or local agency with jurisdiction over the land, as an area whose primary purpose and function is the conservation, restoration, or management of wildlife and waterfowl resources including, but not limited to, endangered species and their habitat.

Many refuge-type properties permit recreational activities that are generally considered not to conflict with species conservation, such as trails, wildlife observation and picnicking. Other activities, such as educational programs, hunting, and fishing, may also be allowed when the activity is consistent with the broader species conservation goals for the property.

Examples of properties that may function as wildlife and waterfowl refuges for purposes of Section 4(f) include: State or Federal wildlife management areas, a wildlife reserve, preserve or sanctuary; and waterfowl production areas including wetlands and uplands that are permanently set aside (in a form of public ownership) primarily for refuge purposes. The FHWA should consider the ownership, significance, function and primary purpose of such properties in determining if Section 4(f) will apply. In making the determination, the FHWA should review the existing management plan and consult with the Federal, State or local official(s) with jurisdiction over the property. In appropriate cases, these types of properties will be considered multiple-use public land holdings (See 23 CFR 774.11(d) and Question 4) and must be treated accordingly.

The U.S. DOI administers a variety of Federal grant programs in support of hunting, fishing, and related resource conservation. While the fact that a property owned by a State or local government has at some time in the past been the beneficiary of such a grant does not automatically confer Section 4(f) status, the existence and terms of such a prior grant, when known, should be considered along with the other aspects of the property described above when determining if the property should be treated as a wildlife and waterfowl refuge for purposes of Section 4(f). Finally, it should be noted that sites purchased as mitigation for transportation projects (e.g., for endangered species impacts) can be considered refuges for purposes of Section 4(f) if the mitigation sites meet all of the applicable criteria for Section 4(f) status as a refuge, including public ownership and access, significance, and functioning primarily as a refuge.

---

2. Historic Sites

Question 2A: How is Section 4(f) significance of historic sites determined?

Answer: Historic site is defined in 23 CFR 774.17. For purposes of Section 4(f), a historic site is significant only if it is on or eligible for the NR. Pursuant to the NHPA, FHWA in cooperation with the applicant consults with the SHPO and/or THPO, tribes that may attach religious and cultural significance to the property, and when appropriate, with local officials to determine whether a site is eligible for the NR. In case of disagreement between FHWA and the SHPO/THPO or if so requested by the ACHP, FHWA shall request a determination of eligibility from the Keeper of the NR (36 CFR 800.4(c)(2)). Any third party may also seek the involvement of the Keeper by asking the ACHP to request that the Federal agency seek a determination of eligibility.
If a site is determined not to be on or eligible for the NR, FHWA still may determine that the application of Section 4(f) is appropriate when an official (such as the Mayor, president of the local historic society, etc.) formally provides information to indicate that the historic site is of local significance. In rare cases such as this, FHWA may determine that it is appropriate to apply Section

4(f) to that property. In the event that Section 4(f) is found inapplicable, the FHWA Division Office should document the basis for not applying Section 4(f). Such documentation might include the reasons why the historic site was not eligible for the NR.

Question 2B: How does Section 4(f) apply in historic districts that are on or eligible for the NR?

Answer: Within a NR listed or eligible historic district, FHWA's long-standing policy is that Section 4(f) applies to those properties that are considered contributing to the eligibility of the historic district, as well as any individually eligible property within the district. Elements within the boundaries of a historic district are assumed to contribute, unless they are determined by FHWA in consultation with the SHPO/THPO not to contribute (See also Question 7C).

Question 2C: How should the boundaries of a property eligible for listing on the NR be determined where a boundary has not been established?

Answer: In this situation, FHWA makes the determination of a historic property's boundary under the regulations implementing Section 106 of the NHPA in consultation with the SHPO/THPO. The identification of historic properties and the determination of boundaries should be undertaken with the assistance of qualified professionals during the early stages of the NEPA process. This process should include the collection, evaluation and presentation of the information to document FHWA's determination of the property boundaries. The determination of eligibility, which would include boundaries of the site, rests with FHWA, but if the SHPO or THPO objects, or if the ACHP or the Secretary of the Interior so requests, then FHWA shall obtain a determination from the Keeper of the NR (36 CFR 800.4(c)(2)).
Selection of boundaries is a judgment based on the nature of the property's significance, integrity, setting and landscape features, functions and research value. Most boundary determinations will take into account the modern legal boundaries, historic boundaries (identified in tax maps, deeds, or plats), natural features, cultural features and the distribution of resources as determined by survey and testing for subsurface resources. Legal property boundaries often coincide with the proposed or eligible historic site boundaries, but not always and, therefore, should be individually reviewed for reasonableness. The type of property at issue, be it a historic building, structure, object, site or district and its location in either urban, suburban or rural areas, should include the consideration of various and differing factors set out in the National Park Service Bulletin: Defining Boundaries for National Register Properties.[13]

Question 2D: How do you reconcile the phased approach to identification and evaluation and treatment of historic properties under Section 106 of the NHPA with the timing for the completion of Section 4(f) requirements?

Answer: Compliance with Section 4(f) requires FHWA to carry out a reasonable level of effort to identify historic properties prior to issuing a Section 4(f) approval. The reasonableness of the level of effort depends upon the anticipated effects of the project and nature of likely historic resources present in the affected project area. Accordingly, the reasonable level of effort varies from project to project. While a visual survey may be necessary to identify above ground resources, it may be possible to rule out the likelihood for the presence of significant below ground resources based on literature review, prior studies of the area, consultation with consulting parties (e.g., Indian tribes) and factors that relate to archeological preservation such as soil and slope types. If a phased approach to identification and evaluation of historic properties is adopted pursuant to the Section 106 regulations, the methodology for that approach should be coordinated with FHWA to ensure that it will also satisfy Section 4(f) requirements.

You may be able to establish without carrying out a field survey that there is little or no potential for the presence of archeological resources that have value for preservation in place, and therefore are subject to Section 4(f). The project file should include documentation of the level of effort and justification for the conclusion that it is unlikely that there are additional unrecorded historic properties that could be subject to Section 4(f). A Memorandum of Agreement or project specific Programmatic Agreement focusing on a process for subsequent compliance should be executed prior to project approval. Those agreements may provide for the completion of additional identification and evaluation (e.g., archeological resource studies), assessment of effects, and refinement of mitigation measures after NEPA is approved.

Question 2E: How are National Historic Landmarks (NHL) treated under Section 4(f)?

Answer: Section 4(f) requirements related to the potential use of an NHL designated by the Secretary of Interior are essentially the same as they are for any historic property determined eligible under the Section 106 process, except that the July 5, 1983 Programmatic Section 4(f) Evaluation and Approval for FHWA Projects that Necessitate the Use of Historic Bridges may not be relied upon to approve the use of a historic bridge that is an NHL.

Section 110(f) of the NHPA (16 U.S.C. § 470-h-2) outlines the specific actions that an Agency must take when a NHL may be directly and adversely affected by an undertaking. Agencies must, “to the maximum extent possible...minimize harm” to the NHL affected by an undertaking. While not expressly stated in the Section 4(f) statute or regulations, the importance and significance of the NHL should be considered in the FHWA's Section 4(f) analysis of least overall harm pursuant to 23 CFR 774.3(c)(1)(iii). In addition, where there is a potential adverse effect to an NHL determined under the Section 106 process, the Secretary of Interior must be notified and given the option to participate in the Section 106 process. When the U.S. DOI has elected to participate, their representative (typically, the National Park Service) should be recognized as an additional official with jurisdiction and included in the required coordination in the course of the Section 4(f) process.

---

3. Archeological Resources

Question 3A: When does Section 4(f) apply to archeological sites?

Answer: Section 4(f) applies to archeological sites that are on or eligible for the NR <u>and</u> that warrant preservation in place, including those sites discovered during construction as discussed in Question 3B. Section 4(f) does not apply if FHWA determines, after consultation with the SHPO/THPO, federally recognized Indian tribes (as appropriate), and the ACHP(if participating) that the archeological resource is important chiefly because of what can be learned by data recovery (even if it is agreed not to recover the resource) and has minimal value for preservation in place, and the SHPO/THPO and ACHP (if participating) does not object to this determination (See 23 CFR 774.13(b)). The destruction of a significant archaeological resource without first recovering the knowledge of the past inherent in that resource should not be taken lightly. Efforts to preserve the resource or develop and execute a data recovery plan should be addressed in the Section 106 process.

Question 3B: How are archeological sites discovered during construction of a project handled?

Answer: When archeological sites are discovered during construction(23 CFR 774.9(e) and 11(f)), FHWA must determine if an approval is necessary or if an exception applies under 23 CFR 774.13(c) (See Question 26). Where preservation in place is warranted and a Section 4(f) approval would be required, the Section 4(f) process will be expedited. In such cases, the evaluation of feasible and prudent alternatives will take into account the level of investment already made. The review process, including the consultation with other agencies should be shortened, as appropriate consistent with the process set forth in Section 106 of the NHPA regulations and should include

Indian tribes that may attach religious and cultural significance to sites discovered (36 CFR 800.13). Discoveries may be addressed prior to construction in agreement documents that set forth procedures that plan for subsequent discoveries. When discoveries occur without prior planning, the Section 106 regulation calls for reasonable efforts to avoid, minimize, or mitigate such sites and provides an expedited timeframe for interested parties to reach resolution regarding treatment of the site. A decision to apply Section 4(f), based on the outcome of the Section 106 process, to an archeological discovery during construction would trigger an expedited Section 4(f) evaluation. Because the U.S. DOI has a responsibility to review individual Section 4(f) evaluations and is not usually a party to the Section 106 process, the U.S. DOI should be notified and any comments they provide considered within a shortened response period.

Question 3C: How do the Section 4(f) requirements apply to archaeological districts?

Answer: Section 4(f) requirements apply to archeological districts in the same way they apply in historic districts, but only where preservation in place is warranted. There would not be a Section 4(f) use if, after consultation with the SHPO/THPO, FHWA determines that the project would use only a part of the archaeological district which is considered a non-contributing element of that district or that the project occupies only a part of the district which is important chiefly because of what can be learned by data recovery and has minimal value for preservation in place. As with a historic district, if the project does not use any individual contributing element of the archeological district which is significant for preservation in place and FHWA determines that the project will result in an adverse effect, then FHWA must consider whether or not the proximity impacts will result in a constructive use in accordance with 23 CFR 774.15.

---

4. Public Multiple-Use Land Holdings

Question 4: Are multiple-use public land holdings (e.g., National Forests, State Forests, Bureau of Land Management lands) subject to the requirements of Section 4(f)?

Answer: When applying Section 4(f) to multiple-use public land holdings, FHWA must comply with 23 CFR 774.11(d). Section 4(f) applies only to those portions of a multiple-use public property that are designated by statute or identified in an official management plan of the administering agency as being primarily for public park, recreation, or wildlife and waterfowl refuge purposes, and are determined to be significant for such purposes. Section 4(f) will also apply to any historic sites within the multiple-use public property that are on or eligible for the NR. Multiple-use public land holdings are often vast in size, and by definition these properties are comprised of multiple areas that serve different purposes. Section 4(f) does not apply to those areas within a multiple-use public property that function primarily for any purpose other than significant park, recreation or refuge purposes. For example, within a National Forest, there can be areas that qualify as Section 4(f) resources (e.g. campgrounds, trails, picnic areas) while other areas of the property function primarily for purposes other than park, recreation or a refuge such as timber sales or mineral extraction. Coordination with the official(s) with jurisdiction and examination of the management plan for the area will be necessary to determine if Section 4(f) should apply to an area of a multiple-use property that would be used by a transportation project.

For multiple-use public land holdings which either do not have formal management plans or when the existing formal management plan is out-of-date, FHWA will examine how the property functions and how it is being managed to determine Section 4(f) applicability for the various areas of the property. This review will include coordination with the official(s) with jurisdiction over the property.

---

5. Tribal Lands and Indian Reservations

Question 5: How are lands owned by Federally Recognized Tribes, and/or Indian Reservations treated for the purposes of Section 4(f)?

Answer: Federally recognized Indian Tribes are sovereign nations and the land owned by them is not considered publicly owned within the meaning of Section 4(f). Therefore, Section 4(f) does not automatically apply to tribal land. In situations where it is determined that the property or resource owned by a Tribal Government or within an Indian Reservation functions as a significant public park, recreational area, or wildlife and waterfowl refuge (which is open to the general public), or is eligible for the NR, the land would be considered Section 4(f) property.

---

6. Traditional Cultural Places (TCPs)

Question 6: Are lands that are considered to be traditional cultural places subject to the provisions of Section 4(f)?

Answer: A TCP is defined generally as land that may be eligible for inclusion in the NR because of its association with cultural practices or beliefs of a living community that; (a) are rooted in that community's history, and (b) are important in maintaining the continuing cultural identity of the community.[14] Land referred to as a TCP is not automatically considered historic property, or treated differently from other potentially historic property. A TCP must also meet the NR criteria as a site, structure, building, district, or object to be eligible under Section 106, and thus for Section 4(f) protection. For those TCPs of significance to an Indian tribe or Native Hawaiian Organization (NHO), the THPO or designated representative of the Indian tribe or NHO should be acknowledged as possessing special expertise to assess the NR eligibility of the resources that possess religious and cultural significance to them. TCPs may be eligible under multiple criteria and therefore should not be presumed to be eligible only as archeological resources (See 23 CFR 774.11(e)).

USE OF SECTION 4(f) PROPERTIES

7. Use of Section 4(f) Property

Question 7A: What constitutes a transportation use of property from publicly owned public parks, public recreation areas, wildlife and waterfowl refuges and public or privately owned historic sites?

Answer: A use of Section 4(f) property is defined in 23 CFR 774.17. A use occurs when:
1. Land is <u>permanently incorporated</u> into a transportation facility;
2. There is a <u>temporary occupancy</u> of land that is adverse in terms of the Section 4(f) statute's preservationist purposes; or
3. There is a <u>constructive use</u> of a Section 4(f) property.

<u>Permanent Incorporation:</u> Land is considered permanently incorporated into a transportation project when it has been purchased as right-of-way or sufficient property interests have otherwise been acquired for the purpose of project implementation. For example, a permanent easement required for the purpose of project construction or that grants a future right of access onto a Section 4(f) property, such as for the purpose of routine maintenance by the transportation agency, would be considered a permanent incorporation of land into a transportation facility.

<u>Temporary Occupancy:</u> Examples of temporary occupancy of Section 4(f) land include right-of-entry, project construction, a temporary easement, or other short-term arrangement involving a

Section 4(f) property. A temporary occupancy will not constitute a Section 4(f) use when all of the conditions listed in 23 CFR 774.13(d) are satisfied:
1. Duration must be temporary, i.e., less than the time needed for construction of the project, and there should be no change in ownership of the land;
2. Scope of the work must be minor, i.e., both the nature and the magnitude of the changes to the Section 4(f) property are minimal;
3. There are no anticipated permanent adverse physical impacts, nor will there be interference with the protected activities, features, or attributes of the property, on either a temporary or permanent basis;
4. The land being used must be fully restored, i.e., the property must be returned to a condition which is at least as good as that which existed prior to the project; and
5. There must be documented agreement of the official(s) with jurisdiction over the Section 4(f) resource regarding the above conditions.

In situations where the above criteria cannot be met, the temporary occupancy will be a use of Section 4(f) property and the appropriate Section 4(f) analysis, coordination, and documentation will be required (See 23 CFR 774.13(d)). In those cases where a temporary occupancy constitutes a use of Section 4(f) property and the de minimis impact criteria (Questions 10 and 11) are also met, a de minimis impact finding may be made. de minimis impact findings should not be made in temporary occupancy situations that do not constitute a use of Section 4(f) property.

Constructive Use: FHWA must comply with 23 CFR 774.15 to determine whether or not there is a constructive use of Section 4(f) property. Constructive use of Section 4(f) property is only possible in the absence of a permanent incorporation of land or a temporary occupancy of the type that constitutes a Section 4(f) use. Constructive use occurs when the proximity impacts of a project on an adjacent or near-by Section 4(f) property, after incorporation of impact mitigation, are so severe that the activities, features, or attributes that qualify the property for protection under Section 4(f) are substantially impaired. Substantial impairment occurs when the protected activities, features, or attributes of the Section 4(f) property are substantially diminished. As a general matter this means that the value of the resource, in terms of its Section 4(f) purpose and significance (Questions 1 and 2), will be meaningfully reduced or lost. The degree of impact and impairment must be determined in consultation with the officials with jurisdiction in accordance with 23 CFR 774.15(d)(3). In those situations where a potential constructive use can be reduced below a substantial impairment by the inclusion of mitigation measures, there will be no constructive use and Section 4(f) will not apply.

The Section 4(f) regulations identify specific project situations where constructive use would and would not occur. The impacts of projects adjacent to or in reasonable proximity of Section 4(f) property should be carefully examined early in the NEPA process pursuant to 23 CFR Part 771. If it is determined that the proximity impacts do not cause a substantial impairment, FHWA can reasonably conclude that there will be no constructive use. The analysis of proximity impacts and potential constructive use should be documented in the project file. Documentation of a finding of no constructive use should apply the legal standards and terminology used in 23 CFR 774.15, Constructive Use Determinations. The use of the term “constructive use” is not required in such documentation, but should be used when appropriate – for example, when responding to comments in NEPA documents that specifically address constructive use, or where it is useful in demonstrating that FHWA has specifically considered the potential for a constructive use. Where a constructive use determination seems likely, the FHWA Division Office is required by the Administrator's delegation of Section 4(f) authority to consult with the Headquarters Office of Project Development and Environmental Review before the determination is finalized.
Since a de minimis impact finding can only be made where the transportation use does not adversely affect the activities, features, or attributes that qualify a property for protection under Section 4(f), a de minimis impact finding is inappropriate where a project results in a constructive use (See 23 CFR 774.3(b) and the definition of de minimis impact in 774.17).

Question 7B: Does Section 4(f) apply when there is an adverse effect determination under the regulations implementing Section 106 of the NHPA?

Answer: FHWA's determination of adverse effect under the Section 106 process (See 36 CFR 800.5) does not automatically mean that Section 4(f) will apply. Nor does a determination of no adverse effect mean that Section 4(f) will not apply in some cases. When a project permanently incorporates land of a historic site, regardless of the Section 106 determination, Section 4(f) will apply. If a project does not permanently incorporate land from the historic property but results in an adverse effect, it will be necessary for FHWA to further assess the proximity impacts of the project in terms of the potential for constructive use (Question 7A). This analysis is necessary to determine if the proximity impact(s) substantially impair the features or attributes that contribute to the NR eligibility of the historic site. If there is no substantial impairment, notwithstanding an adverse effect determination, there is no constructive use and Section 4(f) does not apply. The FHWA determines if there is a substantial impairment by consulting with all identified officials with jurisdiction, including the SHPO/THPO and the ACHP if participating, to identify the activities, features, and attributes of the property that qualify it for Section 4(f) protection and by analyzing the proximity impacts of the project (including any mitigation) on those activities, features, and attributes (See 23 CFR 774.15(d)(3)). The determination of Section 4(f) applicability is ultimately FHWA's decision, and the considerations and consultation that went into that decision should be documented in the project file.

An example of a situation in which there is a Section 106 adverse effect but no Section 4(f) use, is a proposed transportation enhancement project that would convert a historic railroad depot into a tourist center. For public use, the project will require consistency with the American with Disabilities Act (ADA). The incorporation of accessible ramps or elevator may result in a determination of adverse effect; however, there is no permanent incorporation of Section 4(f) land into a transportation facility. The FHWA may determine, after consultation with the SHPO/THPO on the historic attributes and impacts thereto, that the project will not substantially impair the attributes of the historic property. There would not be a Section 4(f) use in this case. There would be a Section 4(f) use only if land from the property is either incorporated into a transportation facility or if the property is substantially impaired.

Another example of an adverse effect where there is no Section 4(f) use might be construction of a new highway within the immediate view shed of a historic farmstead that results in an adverse effect finding under Section 106 for the diminishment of the setting. It is unlikely this visual intrusion would reach the threshold of substantial impairment of the attributes which cause the farmstead to be eligible for the NR as it would still retain its historic fabric and use features; however, a constructive use could occur where the proximity of the proposed project substantially impairs esthetic features or attributes of a property protected by Section 4(f), where such features or attributes are considered important contributing elements to the value of the property.

An example of a Section 4(f) use without a Section 106 adverse effect involves a project on existing alignment, which proposes minor modification at an intersection. To widen the roadway sufficiently a small amount of land from an adjacent historic site will be acquired. The land acquisition does not alter the integrity of the historic site and the SHPO concurs in FHWA's determination of no adverse effect. Even though under Section 106 there is no adverse effect, land from the site will be permanently incorporated into the transportation facility and Section 4(f) will apply. The use would likely qualify as a de minimis impact or may be approved using the Nationwide Section 4(f) Evaluation and Approval for Federally-Aided Highway Projects with Minor Involvements with Historic Sites[15] depending on the circumstances of the project.

Question 7C: How is a Section 4(f) use determined in historic districts?

Answer: When a project requires land from a non-historic or non-contributing property lying within a historic district and does not use other land within the historic district that is considered contributing to its historic significance, FHWA's longstanding policy is that there is no direct use of the historic district for purposes of Section 4(f). With respect to constructive use, if the Section 106 consultation results in a determination of no historic properties affected or no adverse effect, there is no Section 4(f) constructive use of the district as a whole. If the project requires land from a non-historic or non-contributing property, and the Section 106 consultation results in a determination of adverse effect to the district as a whole, further assessment is required pursuant to 23 CFR 774.15 to determine whether or not there will be a constructive use of the district. If the use of a non-historic property or non-contributing element substantially impairs the activities, features, or attributes that are related to the NR eligibility of the historic district, then Section 4(f) would apply. In any case, appropriate steps, including consultation with the SHPO/THPO on the historic attributes of the district and impacts thereto, should be taken to establish whether the property is contributing or non-contributing to the district and whether its use would substantially impair the historic attributes of the historic district.

For example, an intersection improvement proposed in a NR listed or eligible historic district, requires the demolition of a modern building that is neither individually eligible for the NR nor is a contributing element of the district. Although no right-of-way will be acquired from an individually eligible or contributing property, it is consistent with the NHPA regulations that there will be an adverse effect to the historic district because of changes resulting from the wider intersection and installation of more extensive traffic signals. It may be reasonably determined, however, that no individually eligible property, contributing element, or the historic district as a whole will be substantially impaired. Accordingly, in this example a Section 4(f) use will not occur in the form of either a permanent incorporation or a constructive use.

When a project uses land from an individually eligible property within a historic district, or a property that is a contributing element to the historic district, Section 4(f) is applicable. In instances where a determination is made under Section 106 of no historic properties affected or no adverse effect, then the use may be approved with a de minimis impact determination. If the use does not qualify for a de minimis impact determination, an individual Section 4(f) evaluation will be necessary. Exceptions recognized in 23 CFR 774.13 may be applied to individually eligible or contributing properties within a historic district, and to contributing elements within a historic district.

Question 7D: How are historic resources within highway rights-of-way considered?
Answer: In some parts of the country it is not uncommon for historic objects or features not associated with the roadway to exist within the highway right-of-way. Examples include rock walls, fences, and structures that are associated with an adjacent historic property. Others are linear properties such as drainage systems or railroad corridors. These properties, objects, or features are either not transportation in nature or are part of the roadway itself. This condition occurs for various reasons such as historic property boundaries coinciding with the roadway centerline or edge of the road, or situations where right-of-way was acquired but historic features were allowed to remain in place. When a future transportation project is advanced resulting in a Section 106 determination of no historic properties affected or no adverse effect to such resources, there would be no Section 4(f) use. If the historic features are determined to be adversely affected, the adverse effect should be evaluated to determine whether it results in a Section 4(f) use.

---

8. Historic Bridges, Highways and Other Transportation Facilities

Question 8A: How does Section 4(f) apply to historic transportation facilities?
Answer: The Section 4(f) statute imposes conditions on the use of land from historic sites for highway projects but makes no mention of bridges, highways, or other types of facilities such as railroad stations or terminal buildings, which may be historic and are already serving as

transportation facilities. The FHWA's interpretation is that the Congress clearly did not intend to restrict the rehabilitation or repair, of historic transportation facilities. The FHWA therefore established a regulatory provision that Section 4(f) approval is required only when a historic bridge, highway, railroad, or other transportation facility is adversely affected by the proposed project; e.g. the historic integrity (for which the facility was determined eligible for the NR) is adversely affected by the proposed project (See 23 CFR 774.13(a)).

Question 8B: Will Section 4(f) apply to the replacement of a historic bridge that is left in place?

Answer: FHWA's longstanding policy is that Section 4(f) does not apply to the replacement of a historic bridge on new location when the historic bridge is left in its original location and its historic integrity and value will be maintained. To maintain the integrity of the historic bridge, FHWA should ensure that a mechanism is in place for continued maintenance of the bridge that would avoid harm to the bridge due to neglect. In these situations it is also necessary to consider whether or not the proximity impacts of the new bridge will result in substantial impairment of the historic bridge that is left in place or whether there are other properties present which should be afforded consideration pursuant to Section 4(f). These considerations should be documented in the project file.

Question 8C: How do the requirements of Section 4(f) apply to donations of historic bridges to a State, locality, or responsible private entity?

Answer: A State DOT or local public agency that proposes to demolish a historic bridge for a replacement project may first make the bridge available for donation to a State, locality or a responsible private entity. This process is commonly known as marketing the historic bridge and often involves relocation of the structure, if the bridge is of a type suitable for relocation. Provided the State, locality or responsible entity that accepts the bridge enters into an agreement to maintain the bridge and the features that contribute to its historic significance and assume all future legal and financial responsibility for the bridge, Section 4(f) will not apply to the bridge.

If the bridge marketing effort is unsuccessful and the bridge will be demolished or relocated without preservation commitments, Section 4(f) will apply and the appropriate Section 4(f) analysis, consultation and documentation will be required. The Programmatic Section 4(f) Evaluation and Approval for FHWA Projects that Necessitate the Use of Historic Bridges[16] may be used.

Question 8D: Can the Programmatic Section 4(f) Evaluation and Approval for FHWA Projects that Necessitate the Use of Historic Bridges be applied to the replacement of a historic bridge or culvert that lacks individual distinction but is identified as a contributing element of a historic district that is on or eligible for listing on the NR?

Answer: Historic districts may include properties or elements that lack individual distinction but possess sufficient integrity to contribute to the overall significance of the district, as well as individually distinctive features that may be separately listed or determined eligible for the NR. All contributing properties or elements, including identified features and their settings are considered eligible for the NR and are therefore Section 4(f) resources. As such, bridges in historic districts may be individually eligible but may also be identified as contributing features within the larger historic district. The Programmatic Section 4(f) Evaluation and Approval for FHWA Projects that Necessitate the Use of Historic Bridges[17] may be applied to any historic bridge or culvert, either contributing to a district or individually eligible. The application of the historic bridge programmatic Section 4(f) evaluation would be limited to the bridge replacement or rehabilitation only and must meet all the applicability criteria stated in the programmatic Section 4(f) evaluation. If the bridge replacement requires use, either direct or constructive, of surrounding or adjoining property that contributes to the significance of the historic district, the use of that property would have to be evaluated via another form of Section 4(f) evaluation, including possibly an individual evaluation.

Question 8E: Does Section 4(f) apply to the construction of an access ramp providing direct vehicular ingress/egress to a public boat launch area from an adjacent highway?

Answer: When an access ramp is constructed as part of a project to construct a new bridge or to reconstruct, replace, repair, or alter an existing bridge on a Federal-aid system, FHWA's longstanding policy is that Section 4(f) approval is not necessary for the access ramp and public boat launching area. This policy was jointly developed by FHWA and the U.S. DOI in response to the enactment of section 147 of the Federal-Aid Highways Act of 1976 (Pub. L. 94-280 (HR 8235) May 5, 1976). Where public boat launching areas are located in publicly owned parks, recreational areas, or refuges otherwise protected by the provision of Section 4(f), it would be contrary to the intent of section 147 to search for feasible and prudent alternatives to the use of such areas as a site for an access ramp to the public boat launching area. Such ramps must provide direct access to a public boat launching area adjacent to the highway. This policy only applies to the access ramp and public boat launching area; any other use of Section 4(f) property for the project will require Section 4(f) approval.

Question 8F: Is compliance with Section 4(f) necessary for park roads and parkways projects funded under FHWA's Federal Lands Highway Program, 23 U.S.C. § 204?

Answer: No. Park roads and parkways projects funded under FHWA's Federal Lands Highway Program, 23 U.S.C. § 204, are expressly excepted from Section 4(f) requirements within the Section 4(f) statute itself and by 23 CFR 774.13(e). A park road is “a public road, including a bridge built primarily for pedestrian use, but with capacity for use by emergency vehicles, that is located within, or provides access to, an area in the National Park System with title and maintenance responsibilities vested in the United States” and a parkway is a road “authorized by Act of Congress on lands to which title is vested in the United States” (23 U.S.C. § 101(a)).

OFFICIALS WITH JURISDICTION; CONSULTATION; AND DECISIONMAKING

9. Officials with Jurisdiction

Question 9A: Who are the officials with jurisdiction for a park, recreation area, or wildlife and waterfowl refuge and what is their role in determining Section 4(f) applicability?
Answer: The officials with jurisdiction are defined in 23 CFR 774.17. Under that definition, there may be more than one official with jurisdiction for the same Section 4(f) property. For public parks, recreation areas, and wildlife and waterfowl refuges (Question 1) the official(s) with jurisdiction are the official(s) of an agency or agencies that own and/or administer the property in question and who are empowered to represent the agency on matters related to the property.
There may be instances where the agency owning or administering the land has delegated or relinquished its authority to another agency, via an agreement on how some of its land will function or be managed. The FHWA will review the agreement and determine which agency has authority on how the land functions. If the authority has been delegated or relinquished to another agency, that agency should be contacted to determine the purposes and significance of the property. Management plans that address or officially designate the purposes of the property should be reviewed as part of this determination. After consultation, and in the absence of an official designation of purpose and function by the officials with jurisdiction, FHWA will base its decision of Section 4(f) applicability on an examination of the actual functions that exist (See 23 CFR 774.11(c)).

The final decision on the applicability of Section 4(f) to a particular property is the responsibility of FHWA. In reaching this decision FHWA will rely on the official(s) with jurisdiction to identify the kinds of activities and functions that take place, to indicate which of these activities constitute the primary purpose, and to state whether the property is significant. Documentation of the determination of non- applicability should be included in the project file.

Question 9B: Who are the officials with jurisdiction for historic sites?

Answer: The officials with jurisdiction are defined in 23 CFR 774.17. For historic properties (Question 2 and 7) the official with jurisdiction is the State Historic Preservation Officer (SHPO). If the historic property is located on tribal land the Tribal Historic Preservation Officer (THPO) is considered the official with jurisdiction. If the property is located on tribal land but the tribe has not assumed the responsibilities of the SHPO, as provided for in the NHPA, then the representative designated by the tribe shall be recognized as an official with jurisdiction in addition to the SHPO. When the Advisory Council on Historic Preservation (ACHP) is involved in the consultation concerning a property under Section 106 of the NHPA,[18] the ACHP will also be considered an official with jurisdiction over that resource. For a NHL, the National Park Service is also an official with jurisdiction over that resource.

Question 9C: Who are the officials with jurisdiction when a park, recreation area, or refuge is also a historic site or contains historic sites within its boundaries?

Answer: Some public parks, recreation areas, and wildlife and waterfowl refuges are also historic properties either listed or eligible for listing on the NR. In other cases, historic sites are located within the property boundaries of public parks, recreation areas, or wildlife and waterfowl refuges. When either of these situations exists and a project alternative proposes the use of land from the historic site there will be more than one official with jurisdiction. For historic sites the SHPO/THPO and ACHP if participating are officials with jurisdiction. Coordination will also be required with the official(s) of the agency or agencies that own or administer the property in question and who are empowered to represent the agency on matters related to the property, such as commenting on project impacts to the activities, features, or attributes of property and on proposed mitigation measures. For a NHL, the National Park Service is also an official with jurisdiction over that resource.

Question 9D: When is coordination with the U.S. DOI required?

Answer: Prior to FHWA's final approval of a Section 4(f) use, individual Section 4(f) evaluations are provided to the U.S. DOI Office of Environmental Compliance and Policy, which coordinates the comments of all U.S. DOI agencies involved in the project (See 23 CFR 774.5(a)). However, the official with jurisdiction for Section 4(f) purposes is typically the field official charged with managing the Section 4(f) property at issue. For example, the official with jurisdiction for a project involving the use of a National Wildlife Refuge would be the Refuge Manager. If it is not clear which individual within the U.S. DOI is the official with jurisdiction for a particular Section 4(f) property, U.S. DOI's Office of Environmental Compliance and Policy should be consulted to resolve the question. The U.S. DOI has very specific expectations regarding the submission of Section 4(f) documents.[19] If the Section 4(f) property is under the jurisdiction of the U.S. Forest Service, the Department of Agriculture would be contacted for its review. The final authority on the content and format of Section 4(f) documents is FHWA's, as specified in 23 CFR Part 774, this Section 4(f) Policy Paper and the Technical Advisory, T 6640.8A, Guidance for Preparing and Processing of Environmental and Section 4(f) Documents.

It is not necessary to coordinate project specific applications of existing programmatic Section 4(f) evaluations with the U.S. DOI unless the U.S. DOI owns or has administrative oversight over the Section 4(f) property involved. In these cases, FHWA will need written concurrence from the U.S. DOI as the official with jurisdiction as stipulated in the applicable programmatic Section 4(f) evaluation. Consultation with the U.S. DOI was conducted during the development of all the existing programmatic Section 4(f) evaluations. Development of any new programmatic Section

4(f) evaluations would also require coordination with the U.S. DOI before they are made available for use (See 23 CFR 774.3(d)(2)).

Similarly, it is not necessary to conduct project-level coordination with the U.S. DOI when processing de minimis impact determinations unless the U.S. DOI has administrative oversight over the public park, recreation area, or wildlife and waterfowl refuge involved. In these situations, FHWA must obtain concurrence from the U.S. DOI as the official having jurisdiction that there is no adverse effect to the activities, features, or attributes of the property (See 23 CFR 774.5(b)). When a de minimis impact determination is anticipated for a historic site owned or administered by the U.S. DOI, and when the historic site is a NHL, the U.S. DOI will have the opportunity to participate during the Section 106 consultation as a consulting party (See Questions 11 through 13 for further guidance on de minimis impact determinations).
For situations in which the Section 4(f) property is encumbered with a Federal interest, for example as a result of a U.S. DOI grant, the answer to Question 1D or Question 31 may apply.

Question 9E: What is the official status of the Handbook on Departmental Reviews of Section 4(f) Evaluations, originally issued in February 2002 (and any subsequent revisions) by the U.S. DOI Office of Environmental Policy and Compliance?

Answer: The U.S. DOI Handbook[20] is intended to provide guidance to the National Park Service (NPS), the U.S. Fish and Wildlife Service and other designated lead bureaus in the preparation of U.S. DOI comments on the Section 4(f) evaluations prepared by the U.S. DOT pursuant to the authority granted in the Section 4(f) statute. The Handbook is an official U.S. DOI document and includes departmental opinion related to the applicability of Section 4(f) to lands for which they have jurisdiction and authority. The Section 4(f) statute requires U.S. DOT to consult and cooperate with the U.S. DOI as well as the Departments of Agriculture and Housing and Urban Development, as appropriate in Section 4(f) program and project related matters. The FHWA values the U.S. DOI's opinions related to the resources under their jurisdiction, and while the Handbook is a resource which FHWA may consider, it is not the final authority on Section 4(f) determinations.

Official FHWA policy on the applicability of Section 4(f) to lands that fall within the jurisdiction of the U.S. DOI is contained within 23 CFR 774 and this Section 4(f) Policy Paper. While FHWA is not legally bound by the guidance contained within the Handbook or the comments provided by the U.S. DOI or lead bureaus, every attempt should be made to reach agreement during project consultation. In some situations, one of the bureaus may be an official with jurisdiction. When unresolved conflicts arise during coordination with the U.S. DOI related to the applicability of Section 4(f) to certain types of property, it might be necessary for the Division Office to contact the FHWA Headquarters Office of Project Development and Environmental Review for assistance.

Question 9F: Section 4(f) also requires cooperation and consultation with the U.S. Department of Agriculture (USDA) and the U.S. Department of Housing and Urban Development (HUD). When is coordination with the USDA or HUD on a Section 4(f) matter appropriate?
Answer: Many national forests under the jurisdiction of the U.S. Forest Service of the USDA serve as multiple-use land holdings as described in Question 4. If the project uses land of a national forest, coordination with the USDA as the official with jurisdiction over the resource would be appropriate in determining the purposes served by the land holding and the resulting extent of Section 4(f) applicability to the land holding. HUD would be involved only in cases where HUD had an interest in a Section 4(f) property.

Question 9G: Who makes Section 4(f) decisions and de minimis impact determinations?

Answer: The FHWA Division Administrator is the responsible official for all Section 4(f) applicability decisions, approvals, and de minimis impact determinations for Federal-aid projects. The FHWA Federal Lands Highway Division Engineer has this authority for Federal Lands projects.

Coordination with the FHWA Headquarters or the FHWA Office of the Chief Counsel is not required for routine de minimis impact determinations but is recommended where assistance is needed for controversial projects or complex situations. It will be necessary for FHWA to consult and coordinate with the official(s) with jurisdiction as discussed above in making determinations of applicability and in approving the use of Section 4(f) property. When a programmatic Section 4(f) evaluation is relied upon to satisfy Section 4(f), the consultation requirements and approval process for the specific programmatic evaluation must be followed (See 23 CFR 774.3(d)).

---

10. Section 4(f) Evaluations for Tiered Projects

Question 10: How is Section 4(f) handled in tiered NEPA documents?

Answer: The FHWA must comply with 23 CFR 774.7(e) when tiered NEPA documents are used. In a tiered Environmental Impact Statement (EIS), the project development process moves from a broad scale examination at the first-tier stage to a more site specific evaluation in the second-tier stage. During the first-tier stage the detailed information necessary to complete the Section 4(f) approval may not be available. Even so, this does not relieve the FHWA from its responsibility to determine the possibility of making de minimis impact determinations or to consider alternatives that avoid the use of Section 4(f) properties during the first-tier stage. This analysis and documentation should address potential uses of Section 4(f) property and whether those uses could have a bearing on the decision to be made during this tier.

If sufficient information is available, a preliminary Section 4(f) approval may be made at the first-tier stage as to whether the impacts resulting from the use of a Section 4(f) property are de minimis or whether there are feasible and prudent avoidance alternatives. This preliminary approval must include all possible planning to minimize harm to the extent that the level of detail available at this stage allows (23 CFR 774.7(e)(1)). This planning may be limited to a commitment to ensure that opportunities to minimize harm at subsequent stages in the project development process have not been precluded by decisions made at the first-tier stage. Any preliminary Section 4(f) approvals must be incorporated into the first-tier EIS (23 CFR 774.7(e)(1)).

If sufficient information is unavailable during the first-tier stage, then the EIS may be completed without any preliminary Section 4(f) approvals. The documentation should state why no preliminary approval is possible during the first-tier stage and clearly explain the process that will be followed to complete Section 4(f) evaluations during subsequent tiers. The extent to which a Section 4(f) approval (preliminary or final) anticipated to be made in a subsequent tier may have an effect on any decision made during the first-tier stage should be discussed. Schedules to complete Section 4(f) evaluations, if available, should also be reported.

Preliminary first-tier Section 4(f) approvals will be finalized in the second-tier CE, EA, final EIS, ROD or FONSI, as appropriate (See 23 CFR 774.7(e)(2)). If no new Section 4(f) use, other than a de minimis impact, is identified in the second-tier study and if all possible planning to minimize harm has occurred, then the second-tier Section 4(f) approval may finalize the preliminary approval by reference to the first-tier documentation. Re-evaluation of the preliminary Section 4(f) approval is only needed to the extent that new or more detailed information available at the second-tier stage raises new Section 4(f) concerns not already considered.

<u>DE MINIMIS IMPACT DETERMINATIONS</u>

11. De minimis Impact Determinations for Parks, Recreation Areas, and Wildlife and Waterfowl Refuges

Question 11A: What constitutes a de minimis impact with respect to a park, recreation area, or wildlife and waterfowl refuge?

Answer: An impact to a public park, recreation area, or wildlife and waterfowl refuge may be determined to be de minimis if the transportation use of the Section 4(f) property, including incorporation of any measure(s) to minimize harm (such as any avoidance, minimization, mitigation, or enhancement measures), does not adversely affect the activities, features, or attributes that qualify the resource for protection under Section 4(f). Language included in the SAFETEA-LU Conference Report provides additional insight on the meaning of de minimis impact:

The purpose of the language is to clarify that the portions of the resource important to protect, such as playground equipment at a public park, should be distinguished from areas such as parking facilities. While a minor but adverse effect on the use of playground equipment should not be considered a de minimis impact under Section 4(f), encroachment on the parking lot may be deemed de minimis, as long as the public's ability to access and use the site is not reduced.

(Conference Report of the Committee of Conference on H.R. 3, Report 109-203, page 1057).

This simple example helps to distinguish the activities, features, or attributes of a Section 4(f) property that are important to protect from those which can be used without resulting in adverse effects. Playground equipment in a public park may be central to the recreational value of the park that Section 4(f) is designed to protect. The conference report makes it clear that when impacts are proposed to playground equipment or other essential features, a de minimis impact finding will at a minimum require a commitment to replace the equipment with similar or better equipment at a time and in a location that results in no adverse effect to the recreational activity. A parking lot encroachment or other similar type of land use, on the other hand, could result in a de minimis impact with minimal mitigation, as long as there are no adverse effects on public access and the official(s) with jurisdiction agree.

The impacts of a transportation project on a park, recreation area, or wildlife and waterfowl refuge that qualifies for Section 4(f) protection may be determined to be de minimis if:

1. The transportation use of the Section 4(f) property, together with any impact avoidance, minimization, and mitigation or enhancement measures incorporated into the project, does not adversely affect the activities, features, or attributes that qualify the resource for protection under Section 4(f);
2. The public has been afforded an opportunity to review and comment on the effects of the project on the protected activities, features, or attributes of the Section 4(f) property; and
3. The official(s) with jurisdiction over the property, after being informed of the public comments and FHWA's intent to make the de minimis impact finding, concur in writing that the project will not adversely affect the activities, features, or attributes that qualify the property for protection under Section 4(f).

(See 23 CFR 774.5(b)(2), 23 CFR 774.17). The concurrence of the official(s) with jurisdiction that the protected activities, features, or attributes of the resource are not adversely affected must be in writing (23 CFR 774.5(b)(2)(ii)). The written concurrence can be in the form of a signed letter on agency letterhead, signatures in concurrence blocks on transportation agency documents, agreements provided via e-mail or other method deemed acceptable by the FHWA Division Administrator. Obtaining these agreements in writing and retaining them in the project file is consistent with effective practices related to preparing project administrative records.

Question 11B: What role does mitigation play in the de minimis impact finding?

Answer: De minimis impact determinations are based on the degree of impact after the inclusion of any measure(s) to minimize harm, (such as any avoidance, minimization, mitigation, or enhancement measures) to address the Section 4(f) use (i.e., net impact). The expected positive effects of any measures included in a project to mitigate the adverse effects to a Section 4(f) property must be taken into account when determining whether the impact is de minimis (See 23 CFR 774.3(b)). The purpose of taking such measures into account is to encourage the incorporation of Section 4(f) protective measures as part of the project. De minimis impact findings must be expressly conditioned upon the implementation of any measures that were relied upon to reduce the impact to a de minimis level (See 23 CFR 774.7(b)). The implementation of such measures will become the responsibility of the project sponsor with FHWA oversight (See 23 CFR 771.109(b)).

Question 11C: What constitutes compliance with the public notice, review and comment requirements for de minimis impact findings for parks, recreation areas or wildlife and waterfowl refuges?

Answer: Information supporting a de minimis impact finding for a park, recreation area or refuge should be included in the NEPA document prepared for the project. This information includes, at a minimum, a description of the involved Section 4(f) property(ies), use and impact(s) to the resources and any measure(s) to minimize harm (such as any avoidance, minimization, mitigation, or enhancement measures) that are included in the project as part of the de minimis impact finding. The public involvement requirements associated with specific NEPA document and process will, in most cases, be sufficient to satisfy the public notice and comment requirements for the de minimis impact finding (See 23 CFR 774.5(b)(2)).

In general, the public notice and comment process related to de minimis impact findings will be accomplished through the State DOT's approved public involvement process (See 23 CFR 771.111(h)(1)). For those actions that do not routinely require public review and comment (e.g., certain categorical exclusions and re-evaluations) but for which a de minimis impact finding will be made, a separate public notice and opportunity for review and comment will be necessary. In these cases, appropriate public involvement should be based on the specifics of the situation and commensurate with the type and location of the Section 4(f) property, the impacts, and public interest. Possible methods of public involvement are many and include newspaper advertisements, public meetings, public hearings, notices posted on bulletin boards (for properties open to the public), project websites, newsletters, and placement of notices or documents at public libraries. All comments received and responses thereto, should be documented in the same manner that other comments on the proposed action would be incorporated in the project file. Where public involvement was initiated solely for the purpose of a de minimis impact finding, responses or replies to the public comments may not be required, depending on the substantive nature of the comments. All comments and responses should be documented, as appropriate, in the project file.

---

12. De minimis Impact Determinations on Historic Sites

Question 12A: What are the requirements for de minimis impact on a historic site?

Answer: A finding of de minimis impact on a historic site may be made when:

1. FHWA has considered the views of any consulting parties participating in the consultation required by Section 106 of the NHPA, including the Secretary of the Interior or his representative if the property is a NHL;

2. The SHPO/THPO, and Advisory Council on Historic Preservation (ACHP) if participating in the Section 106 consultation, are informed of FHWA's intent to make a de minimis impact finding based on their written concurrence in the Section 106 determination of “no adverse effect;” and
3. The Section 106 process results in a determination of “no adverse effect” with the written concurrence of the SHPO/THPO, and ACHP if participating in the Section 106 consultation.[21]
(See 23 CFR 774.5(b)(1) and the definition of de minimis impact in 23 CFR 774.17.)

Question 12B: How should the concurrence of the SHPO/THPO, and ACHP if participating in the Section 106 determination of effect, be documented when the concurrence will be the basis for a de minimis impact finding?
Answer: Section 4(f) requires that the SHPO/THPO, and ACHP if participating, must concur in writing in the Section 106 determination of no adverse effect (See 23 CFR 774.5(b)(1)(ii)). The request for concurrence in the Section 106 determination should include a statement informing the SHPO/THPO, and ACHP if participating, that FHWA or FTA intends to make a de minimis impact finding based upon their concurrence in the Section 106 determination.

Under the Section 106 regulation, if a SHPO/THPO does not respond within a specified time frame FHWA may move forward to the next step of the Section 106 process but Section 4(f) explicitly requires their written concurrence (See 23 CFR 774.5(b)(1)(ii)). It is therefore recommended that transportation officials share this guidance with the SHPOs and THPOs in their States so that these officials fully understand the implication of their concurrence in the Section 106 determinations and the reason for requesting written concurrence.

Question 12C: For historic sites, will a separate public review process be necessary for the determination of a de minimis impact?

Answer: No. The FHWA will consult with the parties participating in the Section 106 process but is not required to provide additional public notice or provide additional opportunity for review and comment. Documentation of consulting party involvement is required (See 23 CFR 774.5(b) and 774.7(b)). In addition, for projects requiring the preparation and distribution of a NEPA document, the information supporting a de minimis impact finding will be included in the NEPA documentation and the public will be afforded an opportunity to review and comment during the formal NEPA process.

Question 12D: Certain Section 106 programmatic agreements (PAs) allow the lead agency to assume the concurrence of the SHPO/THPO in the determination of no adverse effect or no historic properties affected if a response to a request for concurrence is not received within the time period specified in the PA. Does such concurrence through non-response, in accordance with a written and signed Section 106 PA, constitute the written concurrence needed to make a de minimis impact finding?
Answer: In accordance with the provisions of a formal Section 106 programmatic agreement (PA), if the SHPO/THPO does not respond to a request for concurrence in the Section 106 determination within a specified time frame, the non-response together with the written PA, will be considered written concurrence in the Section 106 determination that will be the basis for the de minimis impact finding by FHWA. The FHWA must inform the SHPO/THPO who are parties to such PAs, in writing, that a non-response which is treated as a concurrence in a no adverse effect or no historic properties affected determination will also be treated as the written concurrence for purposes of the FHWA de minimis impact finding (See 23 CFR 774.5(b)(1)(ii)). It is recommended that this understanding of the parties be documented via formal correspondence or other written means and appended to the existing PA. There is no need to amend the PA itself.

---

13. Other De minimis Impact Considerations

Question 13A: Are de minimis impact findings limited to any particular type of project or National Environmental Policy Act (NEPA) document?

Answer: No, the de minimis impact criteria may be applied to any project, as appropriate, regardless of the type of environmental document required by the NEPA process as described in the FHWA Environmental Impact and Related Procedures (See 23 CFR 771.115).

Question 13B: What effect does the de minimis impact provision have on the application of the existing FHWA nationwide programmatic Section 4(f) evaluations?

Answer: None. Existing FHWA programmatic Section 4(f) evaluations[22] remain in effect and may be applied, as appropriate, to the use of Section 4(f) property by a highway project.

Question 13C: Can a de minimis impact finding be made for a project as a whole, when multiple Section 4(f) properties are involved?

Answer: No, when multiple Section 4(f) properties are present in the study area and potentially used by a transportation project, de minimis impact findings must be made for the individual Section 4(f) properties because 23 CFR 774.3 requires an approval to use Section 4(f) property. The impacts to Section 4(f) properties and any impact avoidance, minimization, and mitigation or enhancement measures must be considered on an individual resource basis and de minimis impact findings made individually for each Section 4(f) property. When there are multiple resources for which de minimis impact findings are appropriate, however, the procedural requirements of Section 4(f) can and should be completed in a single process, document and circulation, so long as it is clear that distinct determinations are being made. Also in these cases, the written concurrence of the official(s) with jurisdiction may be provided for the project as a whole, so as long as the de minimis impacts findings have been made on an individual resource basis. For example, a no adverse effect determination made on an undertaking as a whole may be used to support individual de minimis impact findings provided individual historic sites are clearly identified in the Section 106 documentation.

ADDITIONAL EXAMPLES AND OTHER CONSIDERATIONS

14. School Playgrounds

Question 14: Are publicly owned school playgrounds subject to the requirements of Section 4(f)?

Answer: While the primary purpose of public school playgrounds is generally for structured physical education classes and recreation for students, these properties may also serve significant public recreational purposes and therefore may be subject to Section 4(f) requirements. When a public school playground serves only school activities and functions, the playground is not subject to Section 4(f). When a public school playground is open to the public and serves either organized or substantial walk-on recreational purposes that are determined to be significant (See Question 1), it will be subject to the requirements of Section 4(f). The actual function of the playground is the determining factor in these circumstances. Documentation should be obtained from the officials with jurisdiction over the facility stating whether or not the playground is of local significance for recreational purposes.

There may be more than one official with jurisdiction over a school playground. A school official is considered to be the official with jurisdiction of the land during school activities. However, in some cases a school board may have authorized another public agency (e.g., the city park and recreation department) to control the facilities after school hours. In such cases, the public agency with authority to control the playground would be considered an official with jurisdiction with regard to any after-hours use of the playground. The FHWA is responsible for determining which official or officials have jurisdiction over a playground.

The term playground refers to the area of the school property developed and/or used for public park or recreation purposes such as baseball diamonds, soccer fields, tennis courts, track and field facilities, and other features such as jungle gyms or swing sets. This can also include open space or practice fields if those areas serve a park or recreation function. Section 4(f) would apply to the playground areas only and not the entire campus, unless the school and campus are also significant historic sites.

---

15. Trails and Shared Use Paths

Question 15A: Do the requirements of Section 4(f) apply to shared use paths or similar facilities?

Answer: FHWA must comply with 23 CFR 774.13(f) when determining if a Section 4(f) approval is necessary for the use of a trail, path, bikeway, or sidewalk. If the publicly owned facility is primarily used for transportation and is an integral part of the local transportation system, the requirements of Section 4(f) would not apply since it is not a recreational area. Section 4(f) would apply to a publicly owned, shared use path or similar facility (or portion thereof) designated or functioning primarily for recreation, unless the official(s) with jurisdiction determines that it is not significant for such purpose. During early consultation, it should be determined whether or not a management plan exists that addresses the primary purpose of the facility in question. If the exceptions in 23 CFR 774.13(f) and (g) do not apply, the utilization of the Programmatic Section 4(f) Evaluation for Independent Bikeway or Walkway Construction Projects should be considered if the facility is within a park or recreation area. Whether Section 4(f) applies or not, it is FHWA's policy that every reasonable effort should be made to maintain the continuity of existing and designated shared use paths and similar facilities.[23]

Question 15B: The National Trails System Act permits the designation of scenic, historic, and recreation trails. Are these trails or other designated scenic or recreation trails on publicly owned land subject to the requirements of Section 4(f)?

Answer: FHWA must comply with 23 CFR 774.13(f) when determining if a Section 4(f) approval is necessary for the use of a trail, path, bikeway, or sidewalk. National Scenic Trails (other than the Continental Divide National Scenic Trail) and National Recreation Trails that are on publicly owned recreation land are subject to Section 4(f), provided the trail physically exists on the ground thereby enabling active recreational use.

The Continental Divide National Scenic Trail and National Historic Trails are treated differently. Public Law 95-625 provides that “except for designated protected components of the trail, no land or site located along a designated National Historic Trail or along the Continental Divide National Scenic Trail shall be subject to the provisions of [Section 4(f)] unless such land or site is deemed to be of historical significance under the appropriate historical criteria such as those for the [NR].” FHWA interprets this to mean that while the Continental Divide National Scenic Trail and the National Historic Trails themselves are exempt from Section 4(f), trail segments (including similar components such as trail buffers or other adjacent sites that were acquired to complement the trails) that are on or eligible for the NR are subject to Section 4(f) (See 23 CFR 774.13(f)(2)).

Question 15C: Are shared use paths, bikeways, or designated scenic or recreational trails on highway rights-of-way subject to the requirements of Section 4(f)?
Answer: FHWA must comply with 23 CFR 774.13(f) when determining if a Section 4(f) approval is necessary for the use of a trail, path, bikeway, or sidewalk. If a path or trail is simply described as occupying the right-of-way of the highway and is not limited to any specific location within the right-

of-way, a use of land would not occur provided that adjustments or changes in the alignment of the highway or the trail would not substantially impair the continuity of the path or trail. In this regard, it would be helpful if all future designations, including those made under the National Trails System Act, describe the location of the trail only as generally in the right-of-way.

Question 15D: Are trails on privately owned land, including land under public easement and designated as scenic or recreational trails subject to the requirements of Section 4(f)?

Answer: FHWA must comply with 23 CFR 774.13(f) when determining if a Section 4(f) approval is necessary for the use of a trail, path, bikeway, or sidewalk. Section 4(f) generally does not apply to trails on privately owned land. Section 4(f) could apply if an existing public easement permits public access for recreational purposes. In any case, it is FHWA's policy that every reasonable effort should be made to maintain the continuity of existing and designated trails.

Question 15E: Does Section 4(f) apply to trail-related projects funded under the Recreational Trails Program (RTP)?

Answer: No, projects funded under the Recreational Trails Program (RTP)[24] are exempt from the requirements of Section 4(f) by statute.[25] The exemption is limited to Section 4(f) and does not apply to other environmental requirements, such as NEPA or the NHPA.

---

16. User or Entrance Fees

Question 16: Does the charging of an entry or user fee affect Section 4(f) eligibility?
Answer: Many eligible Section 4(f) properties require a fee to enter or use the facility such as State Parks, National Parks, publicly owned ski areas, historic sites and public golf courses. The assessment of a user fee is generally related to the operation and maintenance of the facility and does not in and of itself negate the property's status as a Section 4(f) property. Therefore, it does not matter in the determination of Section 4(f) applicability whether or not a fee is charged, as long as the other criteria are satisfied.

Consider a public golf course as an example. Greens-fees are usually if not always required (Question 18A) and these resources are considered Section 4(f) properties when they are open to the public and determined to be significant. The same rationale should be applied to other Section 4(f) properties in which an entrance or user fee is required.

---

17. Transportation Enhancement Projects

Question 17A: How is Section 4(f) applied to transportation enhancement activity projects?[26]

Answer: FHWA must comply with 23 CFR 774.13(g) when determining if a Section 4(f) approval is necessary for a use by a transportation enhancement project or a mitigation activity. A transportation enhancement activity (TEA) is one of the specific types of activities set forth by statute at 23 U.S.C. § 101(a)(35). TEAs often involve the enhancement of an activity, feature or attribute on property that qualifies as a Section 4(f) property. In most cases, such work would be covered by the exception in 23 CFR 774.13(g) when the work is solely for the purpose of preserving or enhancing an activity, feature or attribute that qualified the property for Section 4(f) protection. The official(s) with jurisdiction over the Section 4(f) property must concur in writing with this assessment. For a use of Section 4(f) property to occur in conjunction with a TEA, there must be a transportation use of land from an existing Section 4(f) property. In other words, the State DOT or other applicant as defined in 23 CFR 774.17 must acquire land from a Section 4(f) property and convert its function from park, recreation, refuge or historic purposes to a transportation purpose.

Many TEA-funded activities will occur on land that remains owned by a non-transportation entity (such as a local or State parks and recreation agency). An example would be a TEA proposed to construct a new bicycle/pedestrian path within a public park or to reconstruct an already existing bicycle/pedestrian path within a public park. Though related to surface transportation, this type of project is primarily intended to enhance the park. Either scenario would qualify as an exception for Section 4(f) approval assuming the official(s) with jurisdiction agree in writing that the TEA provides for enhancement of the bicycle/pedestrian activities within the park.

A variation of the above example is local public agency that proposes a TEA for construction of a new bicycle/pedestrian facility that requires the acquisition of land from a public park. The purpose of the project is to promote a non-motorized mode of travel for commuters even though some recreational use of the facility is likely to occur. This TEA requires a transfer of land from the parks and recreation agency to the local transportation authority for ultimate operation and maintenance of the newly constructed bicycle/pedestrian facility. Since this TEA would involve the permanent incorporation of Section 4(f) land into a transportation facility, there is a use of Section 4(f) land and the appropriate Section 4(f) evaluation and documentation would be required. In this instance, the Programmatic Section 4(f) Evaluation for Independent Bikeway or Walkway Construction Projects[27] would likely apply depending on the particular circumstances of the project.

Other TEAs that involve acquisition of scenic or historic easements, or historic sites, often result in ultimate ownership and management of the facility by a non-transportation entity (such as a tourism bureau or historical society). An example would be the acquisition and/or restoration of a historic railroad station for establishment of a museum operated by a historical society. Even though Federal-aid transportation funds were used to acquire a historic building, a non-transportation entity ultimately will own and manage it. Accordingly, this TEA would qualify as an exception for Section 4(f) approval.

Section 106 still applies for any TEA involving a historic site on or eligible for listing on the NR. Please refer to the Nationwide Programmatic Agreement for Implementation of Transportation Enhancement Activities[28] that was issued in 1997 for more details.

For other complex or complicated situations involving TEA projects, it is recommended that the FHWA Division Office contact the Headquarters Office of Project Development and Environmental Review, the Resource Center Environment Technical Services Team, or the Office of the Chief Counsel for assistance.

Question 17B: Is the exception in 23 CFR 774.13(g) limited solely to work that is funded as a TEA pursuant to 23 U.S.C. § 101(a)(35)?

Answer: No. The exception cited in 23 CFR 774.13(g) refers to TEAs – though the term “project” is used instead of “activity” – and to mitigation activities (See Question 29 regarding mitigation activities). The discussion in the corresponding section of the preamble to the regulation involves TEAs within the context of 23 U.S.C. § 101(a)(35), but does not explicitly limit the exception to TEAs funded via the 10% set aside of Surface Transportation Program funds (See 73 Fed. Reg.13368, March 12, 2008). If proposed work very closely resembles a TEA but is not proposed for funding as a TEA, there are several options to consider.

If the proposed work could be characterized as a project mitigation feature, then the exception in 23 CFR 774.13(g) would apply without further consideration contingent upon the official(s) with jurisdiction concurring in writing that the work is solely for the purpose of preserving or enhancing an activity, feature or attribute that qualified the property for Section 4(f) protection.
In addition, the introductory paragraph of this section of the regulation indicates that the “exceptions include, but are not limited to” those listed in the ensuing paragraphs. If proposed work

resembles a TEA, avoidance of the property could be characterized as being inconsistent with the preservation purpose of the Section 4(f) statute. Uses of Section 4(f) property under the statute have long been considered to include only adverse uses that harm or diminish the resource that the statute seeks to protect. Further, this exception is limited to situations in which the official(s) with jurisdiction over the Section 4(f) property agrees that the use will either preserve or enhance an activity, feature, or attribute of the property that qualifies it for protection under Section 4(f). Work similar to TEAs may be very carefully evaluated on a case-by-case basis to determine if an exception for Section 4(f) approval might be justified consistent with the preservation purpose of the statute and 23 CFR 774.13(g).

If a Section 4(f) use is identified, under any scenario, the potential for complying with Section 4(f) via a de minimis impact finding or utilization of an approved programmatic Section 4(f) evaluation should be considered.

Question 17C: Is it possible for a TEA to create a Section 4(f) property?

Answer: Yes. TEA projects that are funded under TEA categories (A) Provision of facilities for pedestrians and bicycles and (H) Preservation of abandoned railway corridors (including the conversion and use of the corridors for pedestrian or bicycle trails) could create a new Section 4(f) resource. If a future Federal-aid highway project were to use the property, the fact that the resource was created with TEA funding would not preclude the application of Section 4(f).

---

18. Golf Courses

Question 18A: Are public golf courses subject to Section 4(f), even when fees and reservations are required?

Answer: Section 4(f) applies to golf courses that are owned, operated and managed by a public agency for the primary purpose of public recreation and determined to be significant. Section 4(f) does not apply to privately owned and operated golf courses even when they are open to the general public. Golf courses that are owned by a public agency but managed and operated by a private entity may still be subject to Section 4(f) requirements depending on the structure of the agreement.

The fact that greens-fees (Question 16) or reservations (tee times) are required by the facility does not alter the Section 4(f) applicability, as long as the standards of public ownership, public access and significance are met.

Some golf courses are also historic sites. If a golf course is on or eligible for listing in the NR, then the Section 4(f) requirement for public ownership and public access will not apply.

Question 18B: Are military golf courses subject to the requirements of Section 4(f)?

Answer: Military golf courses are publicly owned (by the Federal Government) but are not typically open to the public at large. Because the recreational use of these facilities is limited to active duty and retired military personnel, family, and guests they are not considered to be public recreational areas and are not subject to the requirements of Section 4(f) (See Question 1D), unless they are significant historic sites (Question 2A).

---

19. Museums, Aquariums, and Zoos

Question 19: Does Section 4(f) apply to museums, aquariums and zoos?

Answer: Publicly owned museums, aquariums, and zoos are not normally considered parks, recreational areas, or wildlife and waterfowl refuges and are therefore not subject to Section 4(f), unless they are significant historic sites (Question 2A).

Publicly owned facilities such as museums, aquariums or zoos may provide additional park or recreational opportunities and will need to be evaluated on a case-by-case basis to determine if the primary purpose of the resource is to serve as a significant park or recreation area. To the extent that zoos are considered to be significant park or recreational areas, or are significant historic sites they will be treated as Section 4(f) properties.

---

20. Fairgrounds
Question 20: Are publicly owned fairgrounds subject to the requirements of Section 4(f)?

Answer: Section 4(f) is not applicable to publicly owned fairgrounds that function primarily for commercial purposes (e.g. stock car races, horse racing, county or state fairs), rather than as park or recreation areas. When fairgrounds are open to the public and function primarily for public recreation other than an annual fair, Section 4(f) applies only to those portions of land determined significant for park or recreational purposes (See Question 1A), unless they are significant historic sites (Question 2A).

---

21. Bodies of Water

Question 21A: How does the Section 4(f) apply to publicly owned lakes and rivers?
Answer: Lakes are sometimes subject to multiple, even conflicting, activities and do not readily fit into one category or another. Section 4(f) would only apply to those portions of publicly owned lakes and/or adjacent publicly owned lands that function primarily for park, recreation, or refuge purposes. Section 4(f) does not apply to areas which function primarily for other purposes or where recreational activities occur on incidental, secondary, occasional or dispersed basis.
In general, rivers are not subject to the requirements of Section 4(f). Those portions of publicly owned rivers, which are designated as recreational trails are subject to the requirements of Section 4(f). Of course, Section 4(f) would also apply to lakes and rivers, or portions thereof, which are contained within the boundaries of a park, recreation area, refuge, or historic site to which Section 4(f) otherwise applies.

Question 21B: Are Wild and Scenic Rivers (WSR) subject to Section 4(f)?

Answer: FHWA must comply with 23 CFR 774.11(g) when determining if there is a use of a WSR. The National Wild and Scenic Rivers Act (WSRA) (16 U.S.C. § 1271 et seq. and 36 CFR 297.3) identifies those rivers in the United States which are designated as part of the WSR System. A WSR is defined as a river and the adjacent area within the boundaries of a component of the National Wild and Scenic Rivers System (National System). WSRs may be designated by Congress or, if certain requirements are met, the Secretary of the Interior. Each river is administered by either a Federal or state agency. Four Federal agencies have primary responsibility for the National Wild and Scenic Rivers System, specifically the Forest Service, the National Park Service, the Fish and Wildlife Service and the Bureau of Land Management.

Within this system there are wild, scenic and recreational designations. A single river can be classified as having separate or combined wild, scenic and recreation areas along the entire river. The designation of a river under the WSRA does not in itself invoke Section 4(f) in the absence of significant Section 4(f) attributes and qualities. In determining whether Section 4(f) is applicable to these rivers, FHWA should consult with the official with jurisdiction (Question 21D) to determine how the river is designated, how the river is being used and examine the management plan over that portion of the river. If the river is publicly owned and designated a recreational river under the WSRA or is a recreation resource under a management plan, then it would be a Section 4(f) property. Conversely, if a river is included in the System and designated as wild but is not being used as or designated under a management plan as a park, recreation area, wildlife and waterfowl refuge and is not a historic site, then Section 4(f) would not apply.

Significant publicly owned public parks, recreation areas, or wildlife and waterfowl refuges and historic sites (on or eligible of the NR) in a WSR corridor are subject to Section 4(f). Other lands in WSR corridors managed for multiple purposes may or may not be subject to Section 4(f) requirements, depending on the manner in which they are administered by the managing agency. Close examination of the management plan (as required by the WSRA) prior to any use of these lands for transportation purposes is necessary. Section 4(f) would apply to those portions of the land designated in a management plan for recreation or other Section 4(f) purposes as discussed above. Where the management plan does not identify specific functions, or where there is no plan, FHWA should consult further with the official with jurisdiction (Question 21D) prior to making the Section 4(f) determination. Privately owned lands in a WSR corridor are not subject to Section 4(f), except for significant historic and archeological sites when important for preservation in place (Question 3).

Question 21C: Does Section 4(f) apply to potential WSR corridors and adjoining lands under study (pursuant to Section 5(a) of the WSRA)?

Answer: No, Section 4(f) does not apply to potential WSRs and adjoining lands. In these cases, Section 4(f) would apply only to existing significant publicly owned public parks, recreation areas, refuges, or significant historic sites in the potential river corridor. It must be noted, however, that such rivers are protected under Section 12(a) of the WSRA,[29] which directs all Federal departments and agencies to protect river values and further recognizes that particular attention should be given to timber harvesting, road construction, and similar activities, which might be contrary to the purposes of this Act.

Question 21D: Who are the Officials with Jurisdiction for WSRs?

Answer: The definition of officials with jurisdiction is located in 23 CFR 774.17. For those portions of a WSR to which Section 4(f) applies, the official(s) with jurisdiction are the official(s) of the Federal agency or agencies that own or administer the affected portion of the river corridor in question. For State administered, federally designated rivers[30] the officials with jurisdiction include both the State agency designated by the respective Governor and the Secretary of the Interior.

---

22. Scenic Byways

Question 22: How does Section 4(f) apply to scenic byways?

Answer: The designation of a road as a scenic byway is not intended to create a park or recreation area within the meaning of Section 4(f). The reconstruction, rehabilitation, or relocation of a publicly-owned scenic byway would not trigger Section 4(f) unless they are significant historic sites (Question 8).

---

23. Cemeteries

Question 23A: Does Section 4(f) apply to cemeteries?

Answer: Cemeteries would only be considered Section 4(f) properties if they are determined to be on or eligible for the NR as historic sites deriving significance from association with historic events, from age, from the presence of graves of persons of transcendent importance, or from distinctive design features.[31]

Question 23B: Does Section 4(f) apply to other lands that contain human remains?

Answer: Informal graveyards, family burial plots, or Native American burial sites and those sites that contain Native American grave goods associated with burials, are not in and of themselves considered to be Section 4(f) property except when they are individually listed in or eligible for the NR. These sites should not automatically be considered only as archeological resources as many will have value beyond what can be learned by data recovery. If these sites are considered archeological resources on or eligible for the NR and also warrant preservation in place, Section 4(f) applies (See Question 3A).

When conducting the Section 4(f) determination for lands that may be Native American burial sites or sites with significance to a federally recognized tribe, consultation with appropriate representatives from the federally recognized tribes with interest in the site is essential. Sites containing human remains may also have cultural and religious significance to a tribe (See Question 6 for a discussion of Traditional Cultural Places).

---

24. Joint Development (Park with Highway Corridor)

Question 24: When a public park, recreation area, or wildlife and waterfowl refuge is established and an area within the Section 4(f) property is reserved for transportation use prior to or at the same time the Section 4(f) property was established, do the requirements of Section 4(f) apply?
Answer: The FHWA must comply with 23 CFR 774.11(i) when determining if Section 4(f) applies to a property that was jointly planned for development with a future transportation corridor. Generally, the requirements of Section 4(f) do not apply to the subsequent use of the reserved area for its intended transportation purpose. This is because the land used for the transportation project was reserved from and, therefore, has never been part of the protected Section 4(f) property. Nor is a constructive use of the Section 4(f) property possible, since it was jointly planned with the transportation project. The specific governmental action that must be taken to reserve a transportation corridor with the Section 4(f) property is a question of State and local law, but may include ordinances, adopted land use plans, deed restrictions, or other actions. Evidence that the reservation was contemporaneous with or prior to the establishment of the Section 4(f) property should be documented in the project file. Subsequent statements of intent to construct a transportation project within the resource should not be considered sufficient documentation. All measures which have been taken to jointly develop the transportation corridor and the park should be completely documented in the project files. To provide flexibility for the future transportation project, State and local transportation agencies are advised to reserve wide corridors. Reserving a wide corridor will allow the future transportation project to be designed to minimize impacts on the environmental resources in the corridor. The FHWA encourages the joint planning for the transportation project and the Section 4(f) property to specify that any land not needed for the transportation project right-of-way be transferred to the adjacent Section 4(f) property once the transportation project is completed.

---

25. Planned Section 4(f) Properties

Question 25: Do the requirements of Section 4(f) apply to publicly owned properties planned for park, recreation area, or wildlife refuge and waterfowl refuge purposes, even though they are not presently functioning as such?

Answer: Section 4(f) applies when the land is one of the enumerated types of publicly owned lands and the public agency that owns the property has formally designated and determined it to be significant for park, recreation area, or wildlife and waterfowl refuge purposes. Evidence of formal designation would be the inclusion of the publicly owned land, and its function as a Section 4(f) property into a city or county Master Plan. A mere expression of interest or desire is not sufficient. For example, when privately held properties of these types are formally designated into a Master Plan for future park development, Section 4(f) is not applicable. The key is whether the planned facility is presently publicly owned, presently formally-designated for Section 4(f) purposes, and presently significant. When this is the case, Section 4(f) would apply.

---

26. Late Designation and Late Discovery of Section 4(f) Properties

Question 26A: Are properties in the transportation right-of-way designated (as park and recreation lands, wildlife and waterfowl refuges, or historic sites) late in the development of a proposed project subject to the requirements of Section 4(f)?

Answer: FHWA must comply with 23 CFR 774.13(c) when determining if a Section 4(f) approval is necessary to use a late-designated property. Except for archaeological resources, including those discovered during construction (Question 3B), a project may proceed without consideration under Section 4(f) if that land was purchased for transportation purposes prior to the designation or prior to a change in the determination of significance and if an adequate effort was made to identify properties protected by Section 4(f) prior to the acquisition. The adequacy of effort made to identify properties protected by Section 4(f) should consider the requirements and standards that existed at the time of the search.

Question 26B: How do you address a Section 4(f) use identified late in the process?

Answer: When there will be a use of a Section 4(f) property that has changed or was not identified prior to processing a CE, FONSI, or ROD, a separate Section 4(f) approval will be required (23 CFR 774.9(c)) if a proposed modification of the alignment or design would require use of a Section 4(f) property; FHWA determines that Section 4(f) applies to the use of a property; or if a proposed modification of the alignment, design, or measures to minimize harm would result in a substantial increase in the amount of Section 4(f) property used, a substantial increase in the adverse impacts to Section 4(f) property, or a substantial reduction in the measures to minimize harm. Where a separate Section 4(f) approval is required, any activity not directly affected by the separate Section 4(f) approval can proceed during the analysis. A late discovery situation could also result when a property is overlooked despite a good faith effort to carry out adequate identification efforts and FHWA decides Section 4(f) now applies to a property. In cases where Section 4(f) may apply to archeological sites discovered during construction, the Section 4(f) process will be expedited and any required evaluation of feasible and prudent avoidance alternatives will take account of the level of investment already made (See Question 3B).

---

27. Temporary Recreational Occupancy or Use of Highway Rights-of-way

Question 27: Does Section 4(f) apply to temporary recreational uses of land owned by a State DOT or other applicant and designated for transportation purposes?

Answer: FHWA must comply with 23 CFR 774.11(h) when determining the applicability of Section 4(f) to non-park properties that are temporarily functioning for recreation purposes. In situations where land owned by a SDOT or other applicant and designated for future transportation purposes (including highway rights-of-way) is temporarily occupied or being used for either authorized or unauthorized recreational purposes such as camping or hiking, Section 4(f) does not apply (See 23 CFR 774.11(h)). For authorized temporary occupancy of transportation rights-of-way for park or recreation purposes, it is advisable to make clear in a limited occupancy permit, with a reversionary clause that no long-term right is created and the park or recreational activity is a temporary one that will cease once completion of the highway or transportation project resumes.

---

28. Tunneling or Bridging (Air Rights) and Section 4(f) Property

Question 28A: Is tunneling under a publicly owned public park, recreation area, wildlife or waterfowl refuge, or historic site subject to the requirements of Section 4(f)?

Answer: Section 4(f) applies to tunneling only if the tunneling:
1. Disturbs archaeological sites that are on or eligible for the NR which warrant preservation in place;
2. Causes disruption which would permanently harm the purposes for which the park, recreation, wildlife or waterfowl refuge was established;
3. Substantially impairs the historic values of a historic site; or
4. Otherwise does not meet the exception for temporary occupancy (See Question 7A).

Question 28B: Do the requirements of Section 4(f) apply to bridging over a publicly owned public park, recreation area, wildlife or waterfowl refuge, or historic site?

Answer: Section 4(f) applies to bridging a Section 4(f) property if piers or other appurtenances are physically located in the Section 4(f) property, requiring an acquisition of land from the property (actual use). Where the bridge will span the Section 4(f) property entirely, the proximity impacts of the bridge on the Section 4(f) property should be evaluated to determine if the placement of the bridge will result in a constructive use (See 23 CFR 774.15 and Question 7A). An example of a potential constructive use would be substantial impairment to the utility of a trail resulting from severely restricted vertical clearance. If temporary occupancy of a Section 4(f) property is necessary during construction, the criteria discussed in Question 7A will apply to determine use.

---

29. Mitigation Activities on Section 4(f) Property

Question 29: Does the expenditure of Title 23 funds for mitigation or other non-transportation activity on a Section 4(f) property result in a use of that property?

Answer: FHWA must comply with 23 CFR 774.13(g) when determining if a Section 4(f) approval is necessary for a proposed mitigation activity. A Section 4(f) use occurs only when Section 4(f) land is permanently incorporated into a transportation facility, there is a temporary occupancy that is adverse, or there is a constructive use. If mitigation activities proposed within a Section 4(f) property are solely for the preservation or enhancement of the resource and the official(s) with jurisdiction agrees in writing with this assessment, a Section 4(f) use does not occur.
An example involves the enhancement, rehabilitation or creation of wetland within a park or other Section 4(f) property as mitigation for a transportation project's wetland impacts. Where this work is consistent with the function of the existing park and considered an enhancement of the Section 4(f) property by the official with jurisdiction, then Section 4(f) would not apply. In this case the Section 4(f) land is not permanently incorporated into the transportation facility, even though it is a part of the project as mitigation.

30. Emergencies

Question 30: How does Section 4(f) apply in emergency situations?

Answer: In emergency situations, the first concern is responding to immediate threats to human health or safety, or immediate threats to valuable natural resources. Compliance with environmental laws, such as Section 4(f), is considered later. The FHWA may participate in the costs of repair or reconstruction of Federal-aid highways and roads on Federal lands which have suffered serious damage as a result of (1) natural disasters or (2) catastrophic failures from an external cause. The Emergency Relief (ER) Program, (23 U.S.C. § 125), supplements the commitment of resources by States, their political subdivisions, or other Federal agencies to help pay for unusually heavy expenses resulting from extraordinary conditions. As FHWA retains discretionary control over whether to fund projects under this program, Section 4(f) applies to all ER funding decisions. The general sequence of events following the emergency is:

1. Restore essential service. State and local highway agencies are empowered to respond immediately, which includes beginning emergency repairs to restore essential traffic service and to prevent further damage to Federal-aid highway facilities. Section 4(f) compliance is not required at this stage.
2. Governor's proclamation
3. Preliminary notification
4. Acknowledgement
5. Damage assessments
6. Formal state request
7. Division Administrator's finding
8. Implementation of projects (this is where Section 4(f) compliance occurs)

Under the ER Program, repairs are categorized either as “emergency” or “permanent.” Emergency repairs are made during and immediately following a disaster to restore essential traffic, to minimize the extent of damage, or to protect the remaining facilities. Permanent repairs to restore the highway to its pre-disaster condition normally occur after the emergency repairs have been completed.

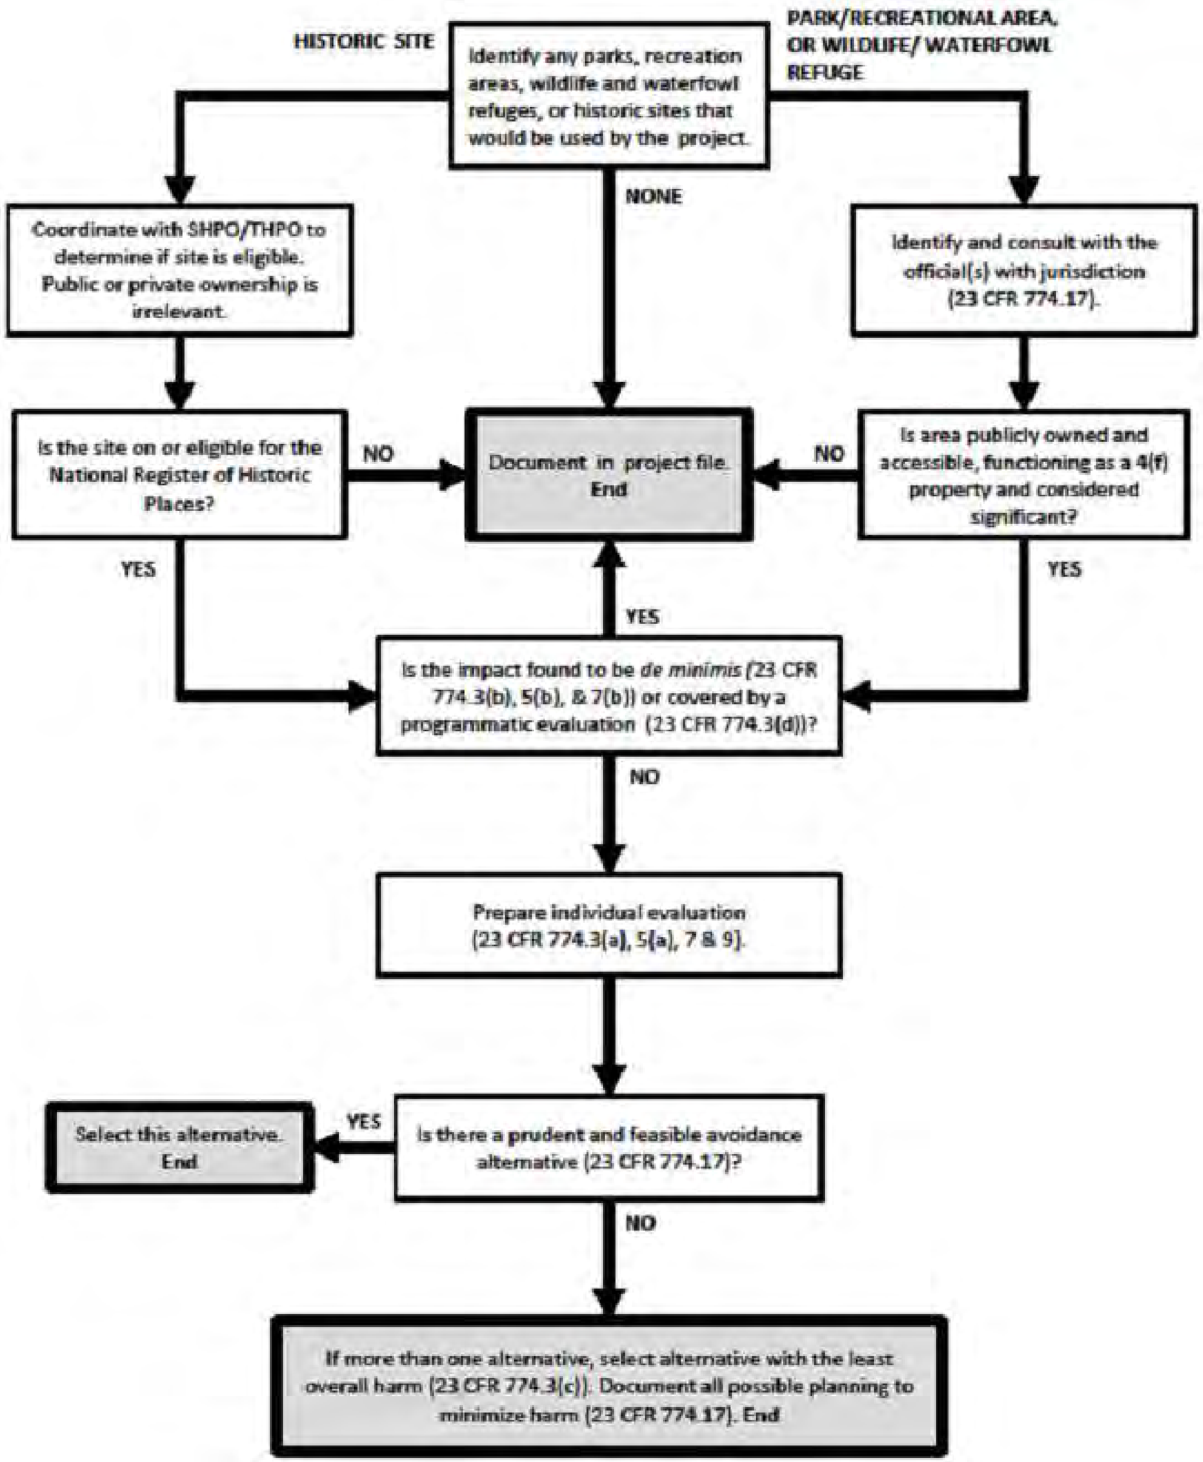
Section 4(f) compliance occurs during the “implementation of projects” stage for both emergency repairs and permanent repairs. For emergency repairs, Section 4(f) compliance is undertaken after the emergency repairs have been completed. For permanent repairs, Section 4(f) compliance is undertaken as part of the normal NEPA project development process, just as it would be for any other type of Federal-aid or Federal lands project (i.e. it must be completed prior to the authorization of right-of-way and construction).

31. Section 6(f) and Other Non-U.S. DOT Grant-in-Aid Program Requirements

Question 31: How are Section 6(f) of the Land and Water Conservation Fund Act and other non-U.S. DOT Federal grant-in-aid program requirements administered for purposes similar to Section 4(f)'s preservationist purpose treated in the Section 4(f) process?

Answer: For projects that propose the use of land from a Section 4(f) property purchased or improved with Federal grant-in-aid funds under the Land and Water Conservation Fund Act, the Federal Aid in Fish Restoration Act (Dingell-Johnson Act), the Federal Aid in Wildlife Act (Pittman-Robertson Act), or other similar law, or the lands are otherwise encumbered with a Federal interest, coordination with the appropriate Federal agency is required to ascertain the agency's position on the land conversion or transfer. Other Federal requirements that may apply to the property should be determined through consultation with the officials with jurisdiction and/or appropriate U.S. DOI, Housing and Urban Development, Federal Emergency Management Agency, or other Federal officials (See 23 CFR 774.5(d)). These Federal agencies may have regulatory authority or other requirements for converting land to a different use. These requirements are independent of the Section 4(f) requirements and must be satisfied during the project development process.

Section 4(f) Process



HISTORIC SITE
Identify any parks, recreation areas, wildlife and waterfowl refuges, or historic sites that would be used by the project.
PARK/RECREATIONAL AREA, OR WILDLIFE/ WATERFOWL REFUGE
NONE
Coordinate with SHPO/THPO to determine if site is eligible. Public or private ownership is irrelevant.
Identify and consult with the official(s) with jurisdiction (23 CFR 774.17).
Is the site on or eligible for the National Register of Historic Places?
NO
Document in project file. End
NO
Is area publicly owned and accessible, functioning as a 4(f) property and considered significant?
YES
YES
YES
Is the impact found to be *de minimis* (23 CFR 774.3(b), 5(b), & 7(b)) or covered by a programmatic evaluation (23 CFR 774.3(d))?
NO
Prepare individual evaluation (23 CFR 774.3(a), 5(a), 7 & 9).
Select this alternative. End
YES
Is there a prudent and feasible avoidance alternative (23 CFR 774.17)?
NO
If more than one alternative, select alternative with the least overall harm (23 CFR 774.3(c)). Document all possible planning to minimize harm (23 CFR 774.17). End

Glossary of Acronyms

ACHP - Advisory Council on Historic Preservation
CE - Categorical Exclusion
CFR - Code of Federal Regulations
DOI - Department of the Interior
DOT - Department of Transportation
EIS - Environmental Impact Statement
EA - Environmental Assessment
FHWA - Federal Highway Administration
FONSI - Finding of No Significant Impact
NEPA - National Environmental Policy Act
NHL - National Historic Landmark
NHPA - National Historic Preservation Act
NR - National Register of Historic Places
RTP - Recreational Trails Program
ROD - Record of Decision
TCP - Traditional Cultural Place
TEA - Transportation Enhancement Activity
THPO - Tribal Historic Preservation Officer
U.S.C. - United States Code
WSR - Wild and Scenic River

This may be a Federal Lands Highway Division Office if the project is located on Federal lands.
[1] http://www.environment.fhwa.dot.gov/
[2] Tribal lands means all lands within the exterior boundaries of any Indian reservation and all dependent Indian communities (16 U.S.C. § 470w).
[3] Examples include the obligation of construction funds and the approval of access modifications on the Interstate System.
[4] Most projects funded by FHWA are transportation projects; however, in a few instances certain projects eligible for funding, such as the installation of safety enhancement barriers on a bridge, have been determined not to have a transportation purpose and therefore do not require a Section 4(f) approval.
[5] Since the primary purpose of a refuge may make it necessary for the resource manager to limit public access for the protection of wildlife or waterfowl, FHWA's policy is that these facilities are not required to always be open to the public. Some areas of a refuge may be closed to public access at all times or during parts of the year to accommodate preservation objectives.
[6] Regulations implementing Section 106 of the NHPA.
[7] http://www.environment.fhwa.dot.gov/legislation/section4f/4fnationwideevals.aspx
[8] In the Section 4(f) statute, the term alternative is used in the context of an option which avoids using land from a Section 4(f) property and is not limited to the context of the end-to-end alternative as defined by the project applicant. This section of the Section 4(f) Policy Paper uses the phrase “avoidance alternatives and/or design options” in order to clarify that, depending upon the project context, the potential alternatives that should be evaluated to avoid Section 4(f) property may be end-to-end alternatives or may be a change to only a portion of the end-to-end project.
[9] These and other resources are available at the FHWA Environmental Toolkit http://environment.fhwa.dot.gov/.
[10] The National Wildlife Refuge System is currently comprised of the various categories of areas that are administered by the Secretary for the conservation of fish and wildlife, including species that are threatened with extinction, all lands, waters, and interests therein administered by the

Secretary as wildlife refuges, areas for the protection and conservation of fish and wildlife that are threatened with extinction, wildlife ranges, game ranges, wildlife management areas, or waterfowl production areas (16 U.S.C. § 668dd(a)(1)).

[11] The DOI's regulations state: "All national wildlife refuges are maintained for the primary purpose of developing a national program of wildlife and ecological conservation and rehabilitation. These refuges are established for the restoration, preservation, development and management of wildlife and wildlands habitat; for the protection and preservation of endangered or threatened species and their habitat; and for the management of wildlife and wildlands to obtain the maximum benefits from these resources" (50 CFR 25.11(b)).

[31]

Programmatic Section 4(f) Evaluation and Approval for FHWA Projects that Necessitate the Use of Historic Bridges

[As published in the Federal Register / Volume 48, No. 163 / Monday, August 22, 1983.]

This statement sets forth the basis for a programmatic Section 4(f) approval that there are no feasible and prudent alternatives to the use of certain historic bridge structures to be replaced or rehabilitated with Federal funds and that the projects include all possible planning to minimize harm resulting from such use. This approval is made pursuant to Section 4(f) of the Department of Transportation Act of 1966, 49 U.S.C. 303, and Section 18(a) of the Federal-Aid Highway Act of 1968, 23 U.S.C. 138.

Use

The historic bridges covered by this programmatic Section 4(f) evaluation are unique because they are historic, yet also part of either a Federal-aid highway system or a State or local highway system that has continued to evolve over the years. Even though these structures area on or eligible for inclusion on the National Register of Historic Places, they must perform as an integral part of a modern transportation system. When they do not or cannot, they must be rehabilitated or replaced in order to assure public safety while maintaining system continuity and integrity. For the purpose of this programmatic Section 4(f) evaluation, a proposed action will "use" a bridge that is on or eligible for inclusion on the National Register of Historic Places when the action will impair the historic integrity of the bridge either by rehabilitation or demolition. Rehabilitation that does not impair the historic integrity of the bridge as determined by procedures implementing the National Historic Preservation Act of 1966, as amended (NHPA), is not subject to Section 4(f).

Applicability

This programmatic Section 4(f) evaluation may be applied by the Federal Highway Administration (FHWA) to projects which meet the following criteria:

1. The bridge is to be replaced or rehabilitated with Federal funds.

2. The project will require the use of a historic bridge structure which is on or is eligible for listing on the National Register of Historic Places.

3. The bridge is not a National Historic Landmark.

4. The FHWA Division Administrator determines that the facts of the project match those set forth in the sections of this document labeled as Alternatives, Findings, and Mitigation.

5. Agreement among the FHWA, the State Historic Preservation Officer (SHPO), and the Advisory Council on Historic Preservation (ACHP) has been reached through procedures pursuant to Section 106 of the NHPA.

Alternatives

The following alternatives avoid any use of the historic bridge:

1. Do nothing.

2. Build a new structure at a different location without affecting the historic integrity of the old bridge, as determined by procedures implementing the NHPA.

3. Rehabilitate the historic bridge without affecting the historic integrity of the structure, as determined by procedures implementing the NHPA.

This list is intended to be all-inclusive. The programmatic Section 4(f) evaluation does not apply if a reasonable alternative is identified that is not discussed in this document. The project record must clearly demonstrate that each of the above alternatives was fully evaluated and that it must further demonstrate that all applicability criteria listed above were met before the FHWA Division Administrator concluded that the programmatic Section 4(f) evaluation applied to the project.

Findings

In order for this programmatic Section 4(f) evaluation to be applied to a project, each of the following findings must be supported by the circumstances, studies, and consultations on the project:

1. *Do Nothing*. The do nothing alternative has been studied. The do nothing alternative ignores the basic transportation need. For the following reasons, this alternative is not feasible and prudent:
a. Maintenance—The do nothing alternative does not correct the situation that causes the bridge to be considered structurally deficient or deteriorated. These deficiencies can lead to sudden collapse and potential injury or loss of life. Normal maintenance is not considered adequate to cope with the situation.

b. Safety—The do nothing alternative does not correct the situation that causes the bridge to be considered deficient. Because of these deficiencies, the bridge poses serious and unacceptable safety hazards to the traveling public or places intolerable restriction on transport and travel.

2. *Build on New Location Without Using the Old Bridge*. Investigations have been conducted to construct a bridge on new location or parallel to the old bridge (allowing for a one-way couplet), but, for one or more of the following reasons, this alternative is not feasible and prudent:

a. Terrain—The present bridge structure has already been located at the only feasible and prudent site, i.e., a gap in the land form, the narrowest point of the river canyon, etc. To build a new bridge at another site will result in extraordinary bridge and approach engineering and construction difficulty or costs or extraordinary disruption to established traffic patterns.

b. Adverse Social, Economic, or Environmental Effects—Building a new bridge away from the present site would result in social, economic, or environmental impact of extraordinary magnitude. Such impacts as extensive severing of productive farmlands, displacement of a significant number of families or businesses, serious disruption of established travel patterns, and access and damage to wetlands may individually or cumulatively weigh heavily against relocation to a new site.

c. Engineering and Economy—Where difficulty associated with the new location is less extreme than those encountered above, a new site would not be feasible and prudent where cost and engineering difficulties reach extraordinary magnitude. Factors supporting this conclusion include significantly increased roadway and structure costs, serious foundation problems, or extreme difficulty in reaching the new site with construction equipment. Additional design and safety factors to be considered include an ability to achieve minimum design standards or to meet requirements of various permitting agencies such as those involved with navigation, pollution, and the environment.

d. Preservation of Old Bridge—It is not feasible and prudent to preserve the existing bridge, even if a new bridge were to be built at a new location. This could occur when the historic bridge is beyond rehabilitation for a transportation or an alternative use, when no responsible party can be located to maintain and preserve the bridge, or when a permitting authority, such as the Coast Guard requires removal or demolition of the old bridge.

3. *Rehabilitation Without Affecting the Historic Integrity of the Bridge.* Studies have been conducted of rehabilitation measures, but, for one or more of the following reasons, this alternative is not feasible and prudent:

a. The bridge is so structurally deficient that it cannot be rehabilitated to meet minimum acceptable load requirements without affecting the historic integrity of the bridge.

b. The bridge is seriously deficient geometrically and cannot be widened to meet the minimum required capacity of the highway system on which it is located without affecting the historic integrity of the bridge. Flexibility in the application of the American Association of State Highway and Transportation Officials geometric standards should be exercised as permitted in 23 CFR Part 625 during the analysis of this alternative.

Measures to Minimize Harm

This programmatic Section 4(f) evaluation and approval may be used only for projects where the FHWA Division Administrator, in accordance with this evaluation, ensures that the proposed action includes all possible planning to minimize harm. This has occurred when:

1. For bridges that are to be rehabilitated, the historic integrity of the bridge is preserved, to the greatest extent possible, consistent with unavoidable transportation needs, safety, and load requirements;

2. For bridges that are to be rehabilitated to the point that the historic integrity is affected or that are to be moved or demolished, the FHWA ensures that, in accordance with the Historic American Engineering Record (HAER) standards, or other suitable means developed through consultation, fully adequate records are made of the bridge;

3. For bridges that are to be replaced, the existing bridge is made available for an alternative use, provided a responsible party agrees to maintain and preserve the bridge; and

4. For bridges that are adversely affected, agreement among the SHPO, ACHP, and FHWA is reached through the Section 106 process of the NHPA on measures to minimize harm and those measures are incorporated into the project. This programmatic Section 4(f) evaluation does not apply to projects where such an agreement cannot be reached.

Procedures

This programmatic Section 4(f) evaluation applies only when the FHWA Division Administrator:

1. Determines that the project meets the applicability criteria set forth above;

2. Determines that all of the alternatives set forth in the Findings section have been fully evaluated;

3. Determines that use of the findings in this document that there are no feasible and prudent alternatives to the use of the historic bridge is clearly applicable;

4. Determines that the project complies with the Measures to Minimize Harm section of this document;

5. Assures that implementation of the measures to minimize harm is completed; and

6. Documents the project file that the programmatic Section 4(f) evaluation applies to the project on which it is to be used.

Coordination

Pursuant to Section 4(f), this statement has been coordinated with the Departments of the Interior, Agriculture, and Housing and Urban Development.

Issued on July 5, 1983.

Ali F. Sevin

Director, Office of Environmental Policy,
Federal Highway Administration

Final Nationwide Section 4(f) Evaluation and Approval for Federally-Aided Highway Projects With Minor Involvements With Public Parks, Recreation Lands, and Wildlife and Waterfowl Refuges

[As published in the Federal Register / Volume 52, No. 160 / Wednesday, August 19, 1987.]

This programmatic Section 4(f) evaluation has been prepared for projects which improve existing highways and use minor amounts of publicly owned public parks, recreations lands, or wildlife and waterfowl refuges that are adjacent to existing highways. This programmatic Section 4(f) evaluation satisfies the requirements of Section 4(f) for all projects that meet the applicability criteria listed below. No individual Section 4(f) evaluations need be prepared for such projects.

[Note: A similar programmatic Section 4(f) evaluation has been prepared for projects which use minor amounts of land from historic sites.]

The FHWA Division Administrator is responsible for reviewing each individual project to determine that it meets the criteria and procedures of this programmatic Section 4(f) evaluation. The Division Administrator's determinations will be thorough and will clearly document the items that have been reviewed. The written analysis and determinations will be combined in a single document and placed in the project record and will be made available to the public upon request. This programmatic evaluation will not change the existing procedures for project compliance with the National Environmental Policy Act (NEPA) or with public involvement requirements.

Applicability

This programmatic Section 4(f) evaluation may be applied by FHWA only to projects meeting the following criteria:

1. The proposed project is designed to improve the operational characteristics, safety, and/or physical condition of existing highway facilities on essentially the same alignment. This includes "4R" work (resurfacing, restoration, rehabilitation, and reconstruction); safety improvements, such as shoulder widening and the correction of substandard curves and intersections; traffic operation improvements, such as signalization, channelization, and turning or climbing lanes; bicycle and pedestrian facilities; bridge replacements on essentially the same alignment; and the construction of additional lanes. This programmatic Section 4(f) evaluation does not apply to the construction of a highway on a new location.

2. The Section 4(f) lands are publicly owned public parks, recreation lands, or wildlife and waterfowl refuges located adjacent to the existing highway.

3. The amount and location of the land to be used shall not impair the use of the remaining Section 4(f) land, in whole or in part, for its intended purpose. This determination is to be made by the FHWA in concurrence with the officials having jurisdiction over the Section 4(f) lands, and will be documented in relation to the size, use, and/or other characteristics deemed relevant.

The total amount of land to be acquired from any Section 4(f) site shall not exceed the values in the following Table:

Total size of section 4(f) site	Maximum to be acquired
<10 acres	10 percent of site
10 acres – 100 acres	1 acre
>100 acres	1 percent of site

4. The proximity impacts of the project on the remaining Section 4(f) land shall not impair the use of such land for its intended purpose. This determination is to be made by the FHWA in concurrence with the officials having jurisdiction over the Section 4(f) lands, and will be documented with regard to noise, air, and water pollution, wildlife and habitat effects, aesthetic values, and/or other impacts deemed relevant.

5. The officials having jurisdiction over the Section 4(f) lands must agree, in writing, with the assessment of the impacts of the proposed project on, and the proposed mitigation for, the Section 4(f) lands.

6. For projects using land from a site purchased or improved with funds under the Land and Water Conservation Fund Act, the Federal Aid in Fish Restoration Act (Dingell-Johnson Act), the Federal Aid in Wildlife Act (Pittman-Robertson Act), or similar laws, or the lands are otherwise encumbered with a Federal interest (e.g., former Federal surplus property), coordination with the appropriate Federal agency is required to ascertain the agency's position on the land conversion or transfer. The programmatic Section 4(f) evaluation does not apply if the agency objects to the land conversion or transfer.

7. This programmatic evaluation does not apply to projects for which an environmental impact statement (EIS) is prepared, unless the use of Section 4(f) lands is discovered after the approval of the final EIS. Should any of the above criteria not be met, this programmatic Section 4(f) evaluation cannot be used, and an individual Section 4(f) evaluation must be prepared.

Alternatives

The following alternatives avoid any use of the public park land, recreational area, or wildlife and waterfowl refuge:

1. Do nothing.

2. Improve the highway without using the adjacent public park recreational land, or wildlife and waterfowl refuge.

3. Build an improved facility on new location without using the public park, recreation land, or wildlife or waterfowl refuge.

This list is intended to be all-inclusive. The programmatic Section 4(f) evaluation does not apply if a feasible and prudent alternative is identified that is not discussed in this document. The project record must clearly demonstrate that each of the above alternatives was fully evaluated before the FHWA Division Administrator concluded that the programmatic Section 4(f) evaluation applied to the project.

Findings

In order for this programmatic Section 4(f) evaluation to be applied to a project, each of the following findings must be supported by the circumstances, studies, and consultations on the project:

1. *Do Nothing Alternative*. The Do Nothing Alternative is not feasible and prudent because:

a. It would not correct existing or projected capacity deficiencies; or

b. It would not correct existing safety hazards; or

c. It would not correct existing deteriorated conditions and maintenance problems; and

d. Not providing such correction would constitute a cost or community impact of extraordinary magnitude, or would result in truly unusual or unique problems, when compared with the proposed use of the Section 4(f) lands.

2. *Improvement Without Using the Adjacent Section 4(f) Lands*. It is not feasible and prudent to avoid Section 4(f) lands by roadway design or transportation system management techniques (including, but not limited to, minor alignment shifts, changes in geometric design standards, use of retaining walls and/or other structures, and traffic diversions or other traffic management measures) because implementing such measures would result in:

a. Substantial adverse community impacts to adjacent homes, businesses, or other improved properties; or

b. Substantially increased roadway or structure cost; or

c. Unique engineering, traffic, maintenance, or safety problems; or

d. Substantial adverse social, economic, or environmental impacts; or

e. The project not meeting identified transportation needs; and

f. The impacts, costs, or problems would be truly unusual or unique, or of extraordinary magnitude when compared with the proposed use of Section 4(f) lands. Flexibility in the application of American Association of State Highway and Transportation Officials (AASHTO) geometric standards should be exercised, as permitted in 23 CFR Part 625, during the analysis of this alternative.

3. *Alternatives on New Location*. It is not feasible and prudent to avoid Section 4(f) lands by constructing on new alignment because:

a. The new location would not solve existing transportation, safety, or maintenance problems; or

b. The new location would result in substantial adverse social, economic, or environmental impacts (including such impacts as extensive severing of productive farmlands, displacement of a substantial number of families or businesses, serious disruption of established travel patterns, substantial damage to wetlands or other sensitive natural areas, or greater impacts to other Section 4(f) lands); or

c. The new location would substantially increase costs or engineering difficulties (such as an inability to achieve minimum design standards, or to meet the requirements of various permitting agencies such as those involved with navigation, pollution, and the environment); and

d. Such problems, impacts, costs, or difficulties would be truly unusual or unique, or of extraordinary magnitude when compared with the proposed use of Section 4(f) lands. Flexibility in the application of AASHTO geometric standards should be exercised, as permitted in 23 CFR Part 625, during the analysis of this alternative.

Measures to Minimize Harm

This programmatic Section 4(f) evaluation and approval may be used only for projects where the FHWA Division Administrator, in accordance with this evaluation, ensures that the proposed action includes all possible planning to minimize harm. This has occurred when the officials having jurisdiction over the Section 4(f) property have agreed, in writing, with the assessment of impacts resulting from the use of the Section 4(f) property and with the mitigation measures to be provided. Mitigation measures shall include one or more of the following:

1. Replacement of lands used with lands of reasonably equivalent usefulness and location and of at least comparable value.

2. Replacement of facilities impacted by the project including sidewalks, paths, benches, lights, trees, and other facilities.

3. Restoration and landscaping of disturbed areas.

4. Incorporation of design features (e.g., reduction in right-of-way width, modifications to the roadway section, retaining walls, curb and gutter sections, and minor alignment shifts); and habitat features (e.g., construction of new, or enhancement of existing wetlands or other special habitat types); where necessary to reduce or minimize impacts to the Section 4(f) property. Such features should be designed in a manner that will not adversely affect the safety of the highway facility. Flexibility in the application of AASHTO geometric standards should be exercised, as permitted in 23 CFR Part 625, during such design.

5. Payment of the fair market value of the land and improvements taken or improvements to the remaining Section 4(f) site equal to the fair market value of the land and improvements taken.

6. Such additional or alternative mitigation measures as may be determined necessary based on consultation with the officials having jurisdiction over the parkland, recreation area, or wildlife or waterfowl refuge.

If the project uses Section 4(f) lands that are encumbered with a Federal interest (see *Applicability*), coordination is required with the appropriate agency to ascertain what special measures to minimize harm, or other requirements, may be necessary under that agency's regulations. To the extent possible, commitments to accomplish such special measures and/or requirements shall be included in the project record.

Coordination

Each project will require coordination in the early stages of project development with the Federal, State, and/or local agency officials having jurisdiction over the Section 4(f) lands. In the case of non-Federal Section 4(f) lands, the official with jurisdiction will be asked to identify any Federal encumbrances. Where such encumbrances exist, coordination will be required with the Federal agency responsible for the encumbrance.

For the interests of the Department of Interior, Federal agency coordination will be initiated with the Regional Directors of the U.S. Fish and Wildlife Service, the National Park Service, and the Bureau of Reclamation; the State Directors of the Bureau of Land Management; and the Area Directors of the Bureau of Indian Affairs. In the case of Indian lands, there will also be coordination with appropriate Indian Tribal officials.

Before applying this programmatic evaluation to projects requiring an individual bridge permit, the Division Administrator shall coordinate with the U.S. Coast Guard District Commander.

Copies of the final written analysis and determinations required under this programmatic Section 4(f) evaluation shall be provided to the officials having jurisdiction over the involved Section 4(f) area and to other parties upon request.

Approval Procedures

This programmatic Section 4(f) approval applies only after the FHWA Division Administrator has:

1. Determined that the project meets the applicability criteria set forth above;
2. Determined that all of the alternatives set forth in the Findings section have been fully evaluated;
3. Determined that the findings in this document (which conclude that there are no feasible and prudent alternatives to the use of the publicly owned public park, recreation area, or wildlife or waterfowl refuge) are clearly applicable to the project;
4. Determined that the project complies with the Measures to Minimize Harm section of this document;
5. Determined that the coordination called for in this programmatic evaluation has been successfully completed;
6. Assured that the measures to minimize harm will be incorporated in the project; and
7. Documented the project file clearly identifying the basis for the above determinations and assurances.

Issued on December 23, 1986.

Director, Office of Environmental Policy,
Federal Highway Administration

Final Nationwide Section 4(f) Evaluation and Approval for Federally-Aided Highway Projects With Minor Involvements With Historic Sites

[As published in the Federal Register / Volume 52, No. 160 / Wednesday, August 19, 1987.]

This programmatic Section 4(f) evaluation has been prepared for projects which improve existing highways and use minor amounts of land (including non-historic improvements thereon) from historic sites that are adjacent to existing highways. This programmatic Section 4(f) evaluation satisfies the requirements of Section 4(f) for all projects that meet the applicability criteria listed below. No individual Section 4(f) evaluations need be prepared for such projects.

[Note: A similar programmatic Section 4(f) evaluation has been prepared for projects which use minor amounts of publicly owned parks, recreation lands, or wildlife and waterfowl refuges.]

The FHWA Division Administrator is responsible for reviewing each individual project to determine that it meets the criteria and procedures of this programmatic Section 4(f) evaluation. The Division Administrator's determination will be thorough and will clearly document the items that have been reviewed. The written analysis and determinations will be combined in a single document and placed in the project record and will be made available to the public upon request. This programmatic evaluation will not change the existing procedures for project compliance with the National Environmental Policy Act (NEPA) or with public involvement requirements.

Applicability

This programmatic Section 4(f) evaluation may be applied by FHWA to projects meeting the following criteria:

1. The proposed project is designed to improve the operational characteristics, safety, and/or physical condition of existing highway facilities on essentially the same alignment. This includes "4R" work (resurfacing, restoration, rehabilitation, and reconstruction); safety improvements, such as shoulder widening and the correction of substandard curves and intersections; traffic operation improvements, such as signalization, channelization, and turning or climbing lanes; bicycle and pedestrian facilities; bridge replacements on essentially the same alignment; and the construction of additional lanes. This programmatic Section 4(f) evaluation does not apply to the construction of a highway on new location.
2. The historic site involved is located adjacent to the existing highway.

3. The project does not require the removal or alteration of historic buildings, structures, or objects on the historic site.

4. The project does not require the disturbance or removal of archaeological resources that are important to preserve in place rather than to recover for archaeological research. The determination of the importance to preserve in place will be based on consultation with the State Historic Preservation Officer (SHPO) and, if appropriate, the Advisory Council on Historic Preservation (ACHP).

5. The impact on the Section 4(f) site resulting from the use of the land must be considered minor. The word minor is narrowly defined as having either a "no effect" or "no adverse effect" (when applying the requirements of section 106 of the National Historic Preservation

Act and 36 CFR Part 800) on the qualities which qualified the site for listing or eligibility on the National Register of Historic Places. The ACHP must not object to the determination of “no adverse effect.”

6. The SHPO must agree, in writing, with the assessment of the impacts of the proposed project on and the proposed mitigation for the historic sites.

7. This programmatic evaluation does not apply to projects for which an environmental impact statement (EIS) is prepared, unless the use of Section 4(f) lands is discovered after the approval of the final EIS.

Should any of the above criteria not be met, this programmatic Section 4(f) evaluation cannot be used, and an individual Section 4(f) evaluation must be prepared.

Alternatives

The following alternatives avoid any use of the historic site.

1. Do nothing.

2. Improve the highway without using the adjacent historic site.

3. Build an improved facility on new location without using the historic site.

This list is intended to be all-inclusive. The programmatic Section 4(f) evaluation does not apply if a feasible and prudent alternative is identified that is not discussed in this document. The project record must clearly demonstrate that each of the above alternatives was fully evaluated before the FHWA Division Administrator concluded that the programmatic Section 4(f) evaluation applied to the project.

Findings

In order for this programmatic Section 4(f) evaluation to be applied to a project, each of the following findings must be supported by the circumstances, studies, and consultations on the project:

1. *Do Nothing Alternative*. The Do Nothing Alternative is not feasible and prudent because:

a. It would not correct existing or projected capacity deficiencies; or

b. It would not correct existing safety hazards; or

c. It would not correct existing deteriorated conditions and maintenance problems; and

d. Not providing such correction would constitute a cost or community impact of extraordinary magnitude, or would result in truly unusual or unique problems, when compared with the proposed use of the Section 4(f) lands.

2. *Improvement Without Using the Adjacent Section 4(f) Lands*. It is not feasible and prudent to avoid Section 4(f) lands by roadway design or transportation system management techniques (including, but not limited to, minor alignment shifts, changes in geometric design standards, use of retaining walls and/or other structures, and traffic diversions or other traffic management measures) because implementing such measures would result in:

a. Substantial adverse community impacts to adjacent homes, businesses or other improved properties; or

b. Substantially increased roadway or structure cost; or

c. Unique engineering, traffic, maintenance, or safety problems; or

d. Substantial adverse social, economic, or environmental impacts; or
e. The project not meeting identified transportation needs; and

f. The impacts, costs, or problems would be truly unusual or unique, or of extraordinary magnitude when compared with the proposed use of Section 4(f) lands. Flexibility in the application of American Association of State Highway and Transportation Officials (AASHTO) geometric standards should be exercised, as permitted in 23 CFR Part 625, during the analysis of this alternative.

3. *Alternatives on New Location*. It is not feasible and prudent to avoid Section 4(f) lands by constructing on new alignment because:

a. The new location would not solve existing transportation, safety, or maintenance problems, or

b. The new location would result in substantial adverse social, economic, or environmental impacts (including such impacts as extensive severing of productive farmlands, displacement of a substantial number of families or businesses, serious disruption of established travel patterns, substantial damage to wetlands or other sensitive natural areas, or greater impacts to other Section 4(f) lands); or

c. The new location would substantially increase costs or engineering difficulties (such as an inability to achieve minimum design standards, or to meet the requirements of various permitting agencies such as those involved with navigation, pollution, and the environment); and

d. Such problems, impacts, costs, or difficulties would be truly unusual or unique, or of extraordinary magnitude when compared with the proposed use of Section 4(f) lands. Flexibility in the application of AASHTO geometric standards should be exercised, as permitted in 23 CFR Part 625, during the analysis of this alternative.

Measures to Minimize Harm

This programmatic Section 4(f) evaluation and approval may be used only for projects where the FHWA Division Administrator, in accordance with this evaluation, ensures that the proposed action includes all possible planning to minimize harm. Measures to minimize harm will consist of those measures necessary to preserve the historic integrity of the site and agreed to, in accordance with 36 CFR Part 800 by the FHWA, the SHPO, and, as appropriate, the ACHP.

Coordination

The use of this programmatic evaluation and approval is conditioned upon the satisfactory completion of coordination with the SHPO, the ACHP, and interested persons as called for in 36 CFR Part 800. Coordination with interested persons, such as the local government, the property owner, a local historical society, or an Indian tribe, can facilitate in the evaluation of the historic resource values and mitigation proposals and is therefore highly encouraged.

For historic sites encumbered with Federal interests, coordination is required with the Federal agencies responsible for the encumbrances.

Before applying this programmatic evaluation to projects requiring an individual bridge permit, the Division Administrator shall coordinate with the U.S. Coast Guard District Commander.

Approval Procedure

This programmatic Section 4(f) approval applies only after the FHWA Division Administrator has:

1. Determined that the project meets the applicability criteria set forth above;

2. Determined that all of the alternatives set forth in the Findings section have been fully evaluated;

3. Determined that the findings in this document (which conclude that there are no feasible and prudent alternatives to the use of land from or non-historic improvements on the historic site) are clearly applicable to the project;

4. Determined that the project complies with the Measures to Minimize Harm section of this document;

5. Determined that the coordination called for in this programmatic evaluation has been successfully completed;

6. Assured that the measures to minimize harm will be incorporated in the project; and

7. Documented the project file clearly identifying the basis for the above determinations and assurances.

Issued on December 23, 1986.

Director, Office of Environmental Policy,
Federal Highway Administration

Section 4(f) Evaluation and Approval
for Transportation Projects
That Have a Net Benefit to a Section 4(f) Property

[As published in the Federal Register / Volume 70, No. 75 / Wednesday, April 20, 2005.]

This nationwide programmatic Section 4(f) evaluation (programmatic evaluation) has been prepared for certain federally assisted transportation improvement projects on existing or new alignments that will use property of a Section 4(f) park, recreation area, wildlife or waterfowl refuge, or historic property, which in the view of the Administration and official(s) with jurisdiction over the Section 4(f) property, the use of the Section 4(f) property will result in a net benefit to the Section 4(f) property.

Definitions:

"Administration" refers to the Federal Highway Division Administrator or Division Engineer (as appropriate).

"Applicant" refers to a State Highway Agency or State Department of Transportation, local governmental agency acting through the State Highway Agency or State Department of Transportation.

A "net benefit" is achieved when the transportation use, the measures to minimize harm and the mitigation incorporated into the project results in an overall enhancement of the Section 4(f) property when compared to both the future do-nothing or avoidance alternatives and the present condition of the Section 4(f) property, considering the activities, features and attributes that qualify the property for Section 4(f) protection. A project does not achieve a "net benefit" if it will result in a substantial diminishment of the function or value that made the property eligible for Section 4(f) protection.

"Official(s) with jurisdiction" over Section 4(f) property (typically) include: for a park, the Federal, State or local park authorities or agencies that own and/or manage the park; for a refuge, the Federal, State or local wildlife or waterfowl refuge owners and managers; and for historic sites, the State Historic Preservation Officer (SHPO) or Tribal Historic Preservation Officer (THPO), whichever has jurisdiction under Section 106 of the National Historic Preservation Act (16 U.S.C. 470f).

Applicability

The Administration is responsible for review of each transportation project for which this programmatic evaluation is contemplated to determine that it meets the criteria and procedures of this programmatic evaluation. The information and determination will be included in the applicable National Environmental Policy Act (NEPA) documentation and administrative record. This programmatic evaluation will not change any existing procedures for NEPA compliance, public involvement, or any other applicable Federal environmental requirement.

This programmatic evaluation **satisfies** the requirements of Section 4(f) for projects meeting the applicability criteria listed below. An individual Section 4(f) evaluation will not need to be prepared for such projects:

1. The proposed transportation project uses a Section 4(f) park, recreation area, wildlife or waterfowl refuge, or historic site.

2. The proposed project includes all appropriate measures to minimize harm and subsequent mitigation necessary to preserve and enhance those features and values of the property that originally qualified the property for Section 4(f) protection.

3. For historic properties, the project does not require the major alteration of the characteristics that qualify the property for the National Register of Historic Places (NRHP) such that the property would no longer retain sufficient integrity to be considered eligible for listing. For archeological properties, the project does not require the disturbance or removal of the archaeological resources that have been determined important for preservation in-place rather than for the information that can be obtained through data recovery. The determination of a major alteration or the importance to preserve in-place will be based on consultation consistent with 36 CFR part 800.

4. For historic properties, consistent with 36 CFR part 800, there must be agreement reached amongst the SHPO and/or THPO, as appropriate, the FHWA and the Applicant on measures to minimize harm when there is a use of Section 4(f) property. Such measures must be incorporated into the project.

5. The official(s) with jurisdiction over the Section 4(f) property agree in writing with the assessment of the impacts; the proposed measures to minimize harm; and the mitigation necessary to preserve, rehabilitate and enhance those features and values of the Section 4(f) property; and that such measures will result in a net benefit to the Section 4(f) property.

6. The Administration determines that the project facts match those set forth in the Applicability, Alternatives, Findings, Mitigation and Measures to Minimize Harm, Coordination, and Public Involvement sections of this programmatic evaluation.

This programmatic evaluation can be applied to any project regardless of class of action under NEPA.

Alternatives

To demonstrate that there are no feasible and prudent alternatives to the use of Section 4(f) property, the programmatic evaluation analysis must address alternatives that avoid the Section 4(f) property. The following alternatives avoid the use of the Section 4(f) property:

1. Do nothing.

2. Improve the transportation facility in a manner that addresses the project's purpose and need without a use of the Section 4(f) property.

3. Build the transportation facility at a location that does not require use of the Section 4(f) property.

This list is intended to be all-inclusive. The programmatic evaluation does not apply if a feasible and prudent alternative is identified that is not discussed in this document. The project record must clearly demonstrate that each of the above alternatives was fully evaluated before the Administration can conclude that the programmatic evaluation can be applied to the project.

Findings

For this programmatic evaluation to be utilized on a project there must be a finding, given the present condition of the Section 4(f) property, that the do-nothing and avoidance alternatives described in the Alternatives section above are not feasible and prudent. The findings (1, 2, and 3. below) must be supported by the circumstances, studies, consultations, and other relevant information and included in the administrative record for the project. This supporting information and determination will be documented in the appropriate NEPA document and/or project record consistent with current Section 4(f) policy and guidance.

To support the finding, adverse factors associated with the no-build and avoidance alternatives, such as environmental impacts, safety and geometric problems, decreased transportation service, increased costs, and any other factors may be considered collectively. One or an accumulation of these kinds of factors must be of extraordinary magnitude when compared to the proposed use of the Section 4(f) property to determine that an alternative is not feasible and prudent. The net impact of the do-nothing or build alternatives must also consider the function and value of the Section 4(f) property before and after project implementation as well as the physical and/or functional relationship of the Section 4(f) property to the surrounding area or community.

1. *Do-Nothing Alternative*. The Do-Nothing Alternative is not feasible and prudent because it would neither address nor correct the transportation need cited as the NEPA purpose and need, which necessitated the proposed project.

2. *Improve the transportation facility in a manner that addresses purpose and need without use of the Section 4(f) property*. It is not feasible and prudent to avoid Section 4(f) property by using engineering design or transportation system management techniques, such as minor location shifts, changes in engineering design standards, use of retaining walls and/or other structures and traffic diversions or other traffic management measures if implementing such measures would result in any of the following:

◦ Substantial adverse community impacts to adjacent homes, businesses or other improved properties; or

◦ Substantially increased transportation facility or structure cost; or

◦ Unique engineering, traffic, maintenance or safety problems; or

◦ Substantial adverse social, economic or environmental impacts; or

◦ A substantial missed opportunity to benefit a Section 4(f) property; or

◦ Identified transportation needs not being met; and

◦ Impacts, costs or problems would be truly unusual, unique or of extraordinary magnitude when compared with the proposed use of Section 4(f) property after taking into account measures to minimize harm and mitigate for adverse uses, and enhance the functions and value of the Section 4(f) property.

Flexibility in the use of applicable design standards is encouraged during the analysis of these feasible and prudent alternatives.

3. Build a new facility at a new location without a use of the Section 4(f) property. It is not feasible and prudent to avoid Section 4(f) property by constructing at a new location if:

◦ The new location would not address or correct the problems cited as the NEPA purpose and need, which necessitated the proposed project; or

◦ The new location would result in substantial adverse social, economic or environmental impacts (including such impacts as extensive severing of productive farmlands, displacement of a substantial number of families or businesses, serious disruption of community cohesion, jeopardize the continued existence of any endangered or threatened species or resulting in the destruction or adverse modification of their designated critical habitat, substantial damage to wetlands or other sensitive natural areas, or greater impacts to other Section 4(f) properties); or

◦ The new location would substantially increase costs or cause substantial engineering difficulties (such as an inability to achieve minimum design standards or to meet the requirements of various permitting agencies such as those involved with navigation, pollution, or the environment); and

◦ Such problems, impacts, costs, or difficulties would be truly unusual or unique or of extraordinary magnitude when compared with the proposed use of the Section 4(f) property after taking into account proposed measures to minimize harm, mitigation for adverse use, and the enhancement of the Section 4(f) property's functions and value.

Flexibility in the use of applicable design standards is encouraged during the analysis of feasible and prudent alternatives.

Mitigation and Measures To Minimize Harm

This programmatic evaluation and approval may be used only for projects where the Administration, in accordance with this evaluation, ensures that the proposed action includes all possible planning to minimize harm, includes appropriate mitigation measures, and that the official(s) with jurisdiction agree in writing.

Coordination

In early stages of project development, each project will require coordination with the Federal, State, and/or local agency official(s) with jurisdiction over the Section 4(f) property. For non-Federal Section 4(f) properties, i.e., State or local properties, the official(s) with jurisdiction will be asked to identify any Federal encumbrances. When encumbrances exist, coordination will be required with the Federal agency responsible for such encumbrances.

Copies of the final written report required under this programmatic evaluation shall be offered to the official(s) with jurisdiction over the Section 4(f) property, to other interested parties as part of the normal NEPA project documentation distribution practices and policies or upon request.

Public Involvement

The project shall include public involvement activities that are consistent with the specific requirements of 23 CFR 771.111, Early coordination, public involvement and project development. For a project where one or more public meetings or hearings are held, information on the proposed use of the Section 4(f) property shall be communicated at the public meeting(s) or hearing(s).

Approval Procedure

This programmatic evaluation approval applies only after the Administration has:

1. Determined that the project meets the applicability criteria set forth in Applicability section;

2. Determined that all of the alternatives set forth in the Findings section have been fully evaluated;

3. Determined that the findings in the programmatic evaluation (which conclude that the alternative recommended is the only feasible and prudent alternative) result in a clear net benefit to the Section 4(f) property;

4. Determined that the project complies with the Mitigation and Measures to Minimize Harm section of this document;

5. Determined that the coordination and public involvement efforts required by this programmatic evaluation have been successfully completed and necessary written agreements have been obtained; and

6. Documented the information that clearly identifies the basis for the above determinations and assurances.

Programmatic Section 4(f) Statement for Independent Bikeway or Walkway Construction Projects

The following pages include the 1977 “Final Negative Declaration/Section 4(f) Statement and Determination for Independent Bikeway or Walkway Construction Projects” and copies of correspondence from the FHWA advising that the Section 4(f) Statement and Determination remains valid. The FHWA correspondence confirms that the programmatic statement may be used, as appropriate, for bikeway and walkway projects financed with transportation enhancement funds.

As indicated in the July 9, 1992 memorandum from FHWA headquarters, where out of date terms and references are used in the programmatic Section 4(f) Statement (e.g., negative declaration, FHPM, references to FHWA offices), current terminology should be substituted when using the programmatic Section 4(f) Statement.

As indicated in the “Application” section on page 2 of the Programmatic Section 4(f) Statement, it is only applicable to independent bikeway or walkway construction projects and its use is subject to the following constraints:

1. It is applicable only to the use of recreation and park areas established and maintained primarily for active recreation, open space, and similar purposes.

2. It is applicable only when the official having specific jurisdiction over the Section 4(f) property has given approval in writing that the project is acceptable and consistent with the designated use of the property and that all possible planning to minimize harm has been accomplished in the location and design of the bikeway or walkway facility.

3. The document does not apply if the project would require the use of critical habitat of endangered species.

4. It does not apply to the use of any land from a publicly owned wildlife or waterfowl refuge or any land from a historic site of national, State, or local significance.

5. It does not apply to projects where there are unusual circumstances (major impacts, adverse effects, or controversy).

To obtain approval under the programmatic Section 4(f) Statement, conformance with each of the above constraints must be documented to the satisfaction of the FHWA. If the applicability criteria cannot be satisfied for an independent bikeway or walkway project involving use of Section 4(f) land, processing with a separate Section 4(f) evaluation or under another programmatic Section 4(f) evaluation, when applicable, will be required.

Subject: Programmatic Section 4(f) Statement for Independent Bikeway or Walkway Construction Projects

Date: JUL 8 1992

From: Eugene W. Cleckley
Chief, Environmental Operations Division

Reply to Attn. of: HEP-31

To: Regional Federal Highway Administrators
Federal Lands Highway Program Administrator

Attached is a copy of the May 23, 1977 memorandum signed by former FHWA Executive Director L.P. Lamm, which transmitted the subject Section 4(f) statement to your office. In an effort to speed up the processing of environmental documentation for the transportation enhancement projects contained in ISTEA, this office has been re-examining all of our policy and guidance material. Based on discussions with our Environmental and Right of Way Law Branch, the subject document is still valid. It should be noted that there are terms and references used in the document which are out of date, such as negative declaration, FHPM, and FHWA office names. However, these are all minor items and do not affect the thought process used in the development of the programmatic document. Where these terms are used, simply substitute the current terminology, such as CE or EA/FONSI for negative declaration, Project Development Branch for Environmental Review Branch, etc. We believe this document combined with the bicycle and pedestrian facilities CE contained in 23 CFR 771.117(c) can greatly reduce the time required to process these types of enhancement projects.

Should you have any questions concerning the document and its use, please contact any of the Project Development Specialist in my office.

UNITED STATES GOVERNMENT
Memorandum

DEPARTMENT OF TRANSPORTATION
FEDERAL HIGHWAY ADMINISTRATION

DATE: May 23, 1977

In reply refer to: HEV-11

RECEIVED
REG. 4 F.H.W.A.
MAY 31 1977

SUBJECT: Negative Declaration/Section 4(f) Statement for Independent Bikeway or Walkway Construction Projects

FROM : Federal Highway Administrator

TO : Regional Federal Highway Administrators
Regions 1-10, and
Regional Engineer, Region 15

In order to reduce processing time and delays, we have prepared a negative declaration/Section 4(f) statement and determination (copy attached) to cover those independent bikeway and pedestrian walkway projects (FHPM 6-1-1-1) which require the use of recreation and park areas. This approved document should be distributed to Division Offices and State highway agencies for their use.

A draft of the negative declaration/Section 4(f) statement was published in the Federal Register (42 F.R. 15394) on March 21, 1977, inviting interested persons to comment. No major adverse comments were received during this commenting period. The majority of letters received were favorable and recommended approval of the document.

This environmental document will not relieve the Division Administrator from reviewing the impacts, mitigation measures, location, and design of individual bikeways. If there are any unusual circumstances (major impacts or controversy), a separate Section 4(f) statement and environmental document (EIS or negative declaration) should be considered for the individual project. It is likely that most projects which do not involve Section 4(f) properties would be nonmajor actions and would not require a formal environmental document.

It is also important to obtain approval from the official having specific jurisdiction over the Section 4(f) property that the project is acceptable and consistent with the designated use of the property, and that the location and design have been accomplished in a manner that will not cause harm to the property. A copy of the negative declaration/Section 4(f) statement, along with the approval letter from the official, should be placed in the individual project file.

If you have any question concerning the subject document, please contact the Environmental Review Branch, (202) 426-0106, in the Office of Environmental Policy.

For William M. Cox

Final Negative Declaration/Section 4(f) Statement

and Determination for Independent Bikeway or Walkway Construction Projects

Background

There is a growing interest in bicycling and walking for commuting, for recreation, and for other trip purposes. Where this activity occurs on high-speed roadways, both safety and efficiency can be impaired because of the mixture of motorized and non-motorized modes of travel. Construction of bikeways or pedestrian walkways can promote safety and will assist in retaining the motor vehicle carrying capacity of the highway while enhancing bicycle capacity.

The United States Congress recognized the importance of bicycle and pedestrian travel by including special provisions for these modes in the Federal-Aid Highway Act of 1973, Public Law 93-87. Section 124 of this Act (amended Title 23, U.S. Code, by adding Section 217) contained the following principal provisions:

(1) Federal funds available for the construction of preferential facilities to serve pedestrians and bicyclists are those apportioned in accordance with paragraphs (1), (2), (3) and (6) of Section 104(b), 23 U.S.C., and those authorized for Forest highways, Forest development roads and trails, public land development roads and trails, park roads and trails, parkways, Indian reservation roads, and public land highways.

(2) Not more than $40 million (amended to $45 million by Section 134 of the Federal-Aid Highway Act of 1976) apportioned in any fiscal year for purposes described in the preceding paragraph may be obligated for bicycle projects and pedestrian walkways.

(3) No State shall obligate more than $2 million (amended to $2.5 million by Section 134 of the Federal-Aid Highway Act of 1976) of Federal-aid funds for such projects in any fiscal year.

(4) Such projects shall be located and designed pursuant to an overall plan which will provide due consideration for safety and contiguous routes.

The funding limitations described in (2) and (3) above are applicable only to independent bikeway and walkway construction projects.

Project Description

Independent bikeway or walkway construction projects are those highway construction projects which provide bicycle or pedestrian facilities in contrast to a project whose primary purpose is to serve motorized vehicles. The requirements for qualification of proposed bikeway or walkway facilities as independent bikeway or walkway construction projects are contained in Volume 6, Chapter 1, Section 1, Subsection 1, of the Federal-Aid Highway Program Manual, codified as Part 652 of Chapter 1 of Title 23 of the Code of Federal Regulations (CFR).

The bikeways and walkways will be designed and constructed in a manner suitable to the site conditions and the anticipated extent of usage. In general, a bikeway will be designed with an alignment and profile suitable for bicycle use with a surface that will be reasonably durable that incorporates drainage as necessary, and that is of a width appropriate for the planned one-way or two-way use.

The facilities will be accessible to the users or will form a segment located and designed pursuant to an overall plan.

Projects may include the acquisition of land outside the right-of-way, provided the facility will accommodate traffic which would have normally used a Federal-aid highway route, disregarding any legal prohibitions on the use of the route by cyclists or pedestrians.

It is required that a public agency be responsible for maintenance of the federally funded bikeway or walkway. No motorized vehicles will be permitted on the facilities except those for maintenance purposes and snowmobiles where State or local regulations permit.

Application

This negative declaration/preliminary Section 4(f) document is only applicable for independent bikeway or walkway construction projects which require the use of recreation and park areas established and maintained primarily for active recreation, open space, and similar purposes. Additionally, this document is applicable only when the official having specific jurisdiction over the Section 4(f) property has given his approval in writing that the project is acceptable and consistent with the designated use of the property and that all possible planning to minimize harm has been accomplished in the location and design of the bikeway or walkway facility. This document does not apply if the project would require the use of critical habitat of endangered species.

This document does not cover the use of any land from a publicly owned wildlife or waterfowl refuge or any land from a historic site of national, State, or local significance. It also does not cover those projects where there are unusual circumstances (major impacts, adverse effects, or controversy). A separate Section 4(f) statement and environmental document must be prepared in these categories.

This document does not cover bicycle or pedestrian facilities that are incidental items of construction in conjunction with highway improvements having the primary purpose of serving motor vehicular traffic.

Summary

The primary purpose for the development of independent bikeway and walkway projects is to provide a facility for traffic which would have normally used a Federal-aid highway route. In some cases, the bikeway and walkway projects can serve a dual function by also providing for recreational use. Where this situation occurs, artificially routing a bikeway or walkway around a compatible park area is not a prudent alternative because it would decrease the recreational value of the bikeway or walkway.
The written approval of the official having specific jurisdiction over the Section 4(f) property and construction authorization by FHWA will confirm that all possible planning to minimize harm has been accomplished in the location and design of the bikeway or walkway facility.

Noise and air quality will not be affected by bicycles. There would be increase in the noise level if snowmobiles are permitted. However, this would likely occur at a time when other uses of the recreational facilities will be minimal.

Temporary impacts on water quality will be minimal. Erosion control measures will be used through the construction period. A certain amount of land will be removed from other uses. The type of land and uses will vary from project to project. However, due to the narrow cross-section of the bikeways and walkways, a minimal amount of land will be required for the individual projects. The projects will be blended into existing terrain to reduce any visual impacts.

Displacement of families and businesses will not be required.

No significant adverse social or economic impacts are anticipated. There will be beneficial impacts such as the enhancement of the recreational potential of the parks and the provision of an alternate mode of transportation for the commuter.

Comments and Coordination

A draft of this negative declaration/Section 4(f) statement was published in the Federal Register (42 F.R. 15394) March 21, 1977, inviting interested persons to comment. The majority of the letters received were favorable and recommended approval of the document.

The document was also circulated to the Departments of the Interior (DOI), Housing and Urban Development (HUD), and Agriculture. Comments were received from DOI and HUD and are included in the appendix along with our responses.

Individual projects will be coordinated at the earliest feasible time with all responsible local officials, including the State Outdoor Recreation Liaison Officer. The use of properties acquired or developed with Federal monies from the Land and Water Conservation Fund will also be coordinated with the Bureau of Outdoor Recreation of DOI.

If HUD Community Development Block Grant Funds are used in conjunction with Federal Highway Administration Funds, HUD environmental review procedures set forth in 24 CFR, Section 58, are applicable.

Determination

Based on the above and on the scope of these bikeway and walkway projects, it is determined that they will not have a significant effect upon the quality of the human environment. It is also our determination that (1) there is no feasible and prudent alternative to the use of Section 4(f) lands, and (2) the conditions for approval will insure that the bikeway proposals will include all possible planning to minimize harm resulting from such use.

May 23, 1977 [Original signed by L.P. Lamm]

DATE

For William M. Cox
Federal Highway Administrator

APPENDIX

United States Department of the Interior

OFFICE OF THE SECRETARY
WASHINGTON, D.C. 20240

In reply refer to:
(ER-77/105)

MAR 21 1977

Dear Mr. Lash:

This is in response to your February, 1977 request for the Department of the Interior's comments on the proposed Negative Declaration/Section 4(f) statement for Independent Bikeway or Walkway Construction Projects.

We are pleased that the proposed document responds to a number of the comments made in our letter of June 25, 1976, on the Bikeway Demonstration Program. We note that the present document is not applicable to the use of land from a publicly owned wildlife or waterfowl refuge or any land from a historic site, nor is it applicable if the project would require the use of critical habitat of endangered species. We note further that the document applies only to the use of recreation and park areas established and maintained primarily for active recreation, open space, and similar purposes.

We concur with these limitations on the application of the proposed Negative Declaration/Section 4(f) statement. However, we wish to again express our opinion that the proposed document not be applicable to: (1)

1. Significant wetlands;

2. Unique ecological areas set aside for the preservation, interpretation, or scientific study of plant and animal communities, e.g., Registered Natural Landmarks and Registered Environmental Education Landmarks.

AMERICAN REVOLUTION BICENTENNIAL 1776-1976

-2-

3. Play areas for small children (tot lots, etc.,); and

4. Small park areas where the bikeway or walkway may use a significant portion of the available space (vest-pocket parks, etc.,).

We are also pleased that the document makes provision for early coordination with all responsible local officials, including the State Outdoor Recreation Liaison Officer, and the Bureau of Outdoor Recreation (BOR) when Land and Water Conservation Fund grants are involved. We suggest, however, that you may wish to coordinate all projects of this type with the appropriate Regional Office of BOR for the technical assistance they can provide on bikeways and walkways. (2)

According to our calculations, a funding level of $45,000,000 for these bikeways and walkways would amount to somewhere between 1,800 and 4,500 miles of trail per year. This would directly remove from all other use (including use by flora and fauna) roughly 1,000 to 6,800 acres per year. This impact should be addressed in the proposed negative declaration. (3)

Thank you for the opportunity to review this proposed document.

Sincerely yours,

Stanley D. Doremus

Deputy Assistant Secretary of the Interior

Mr. Michael Lash
Director of Environmental Policy
U.S. Department of Transportation
Federal Highway Administration
Washington, D. C. 20590

Responses to the Department of the Interior
Letter of March 21, 1977

(1) We believe the Application section is adequate to cover those cases where there are unusual circumstances such as major impacts or adverse effects. The key point is that the official having specific jurisdiction over the Section 4(f) property has to agree that the project is acceptable and consistent with the designated use of the property, and that the location and design have been accomplished in a manner that will not cause harm to the property.

(2) The FHWA Division Administrator and the local officials will have the option of requesting additional coordination with the Bureau of Outdoor Recreation on all bikeway and walkway projects.

(3) The use of land for the bikeways and walkways has been addressed in the Summary section. However, it should be understood that this document is for individual projects and was not prepared to address the impacts of the entire bikeway program.

DEPARTMENT OF HOUSING AND URBAN DEVELOPMENT
WASHINGTON, D.C. 20410

FEB 15 1977

OFFICE OF THE ASSISTANT SECRETARY
FOR COMMUNITY PLANNING AND DEVELOPMENT

IN REPLY REFER TO:
CSR

Your reference:
HEV-11

Mr. Michael Lash
Director of
Environmental Policy
Department of Transportation
Federal Highway Administration
Nassif Building - Room 3234
Washington, D. C. 20590

Dear Mr. ~~Lash~~: Mike

Thank you for providing this Office with the opportunity to review and comment on the proposed draft negative declaration/Section 4(f) for the construction of independent bikeways and pedestrian walkways. While your negative declaration proposal will reduce processing time, we propose for your consideration the following recommendations:

1. Under the caption Application insert the following before the last sentence in the first paragraph: The project must be in accord with a unified and officially coordinated program for the development of open space land as part of local and areawide comprehensive planning. (1)

2. Under the caption Application add the following to the second paragraph: If unusual natural or man-made conditions exist in the proposed project area which might be deleteriously affected by the proposed bikeway or pedestrian walkway, then a Section 4(f) and an environmental impact statement shall be prepared for the project. (2)

2

3. Under the caption Coordination, second paragraph add the following: If HUD Community Development Block Grant (CDBG) funds are used by applicants in conjunction with Section 124 funds, HUD environmental review procedures set forth in 24 CFR Section 58 are applicable. (Copy attached) The CDBG program permits the use of funds for the construction of certain public works in conjunction with recreational purposes. (3)

Sincerely yours,

Richard H. Broun
Director, Office of
Environmental Quality

Attachment

Responses to the Department of Housing
and Urban Development Letter of
February 15, 1977

(1) We do not believe it is necessary to add this sentence to the Application section since this is already a Federal-aid qualification requirement. (See 23 CFR, Part 652.)

(2) This provision has been added to the Application section.

(3) The Coordination section has been expanded to include this situation.

STEWARDSHIP AND OVERSIGHT AGREEMENT
ON PROJECT ASSUMPTION AND PROGRAM OVERSIGHT BY AND BETWEEN
FEDERAL HIGHWAY ADMINISTRATION, ILLINOIS DIVISION AND THE
STATE OF ILLINOIS DEPARTMENT OF TRANSPORTATION

SECTION I. BACKGROUND AND INTRODUCTION

The Federal-aid Highway Program (FAHP) is a federally-assisted program of State-selected projects. The Federal Highway Administration (FHWA) and the State Departments of Transportation have long worked as partners to deliver the FAHP in accordance with Federal requirements. In enacting 23 U.S.C. 106(c), as amended, Congress recognized the need to give the States more authority to carry out project responsibilities traditionally handled by FHWA. Congress also recognized the importance of a risk-based approach to FHWA oversight of the FAHP, establishing requirements in 23 U.S.C. 106(g). This Stewardship and Oversight (S&O) Agreement sets forth the agreement between the FHWA and the State of Illinois Department of Transportation (IDOT) on the roles and responsibilities of the FHWA and the IDOT with respect to Title 23 project approvals and related responsibilities, and FAHP oversight activities.

For the purposes of this agreement, stewardship is defined as the efficient and effective management of the public funds that have been entrusted to FHWA for the Federal-aid Highway Programs. Oversight, an integral part of stewardship, is defined as specific activities which ensure that the implementation of the various elements of the Federal-aid Highway Program is in accordance with applicable laws, regulations, and policies.

The scope of FHWA responsibilities, and the legal authority for IDOT assumption of FHWA responsibilities, developed over time. The U.S. Secretary of Transportation delegated responsibility to the Administrator of the FHWA for the FAHP under Title 23 of the United States Code, and associated laws. (49 CFR 1.84 and 1.85) The following legislation further outlines FHWA's responsibilities:

- Intermodal Surface Transportation Efficiency Act (!STEA) of 1991;
- Transportation Equity Act for the 21st Century (TEA-21) of 1998;
- Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU) of 2005; and
- Moving Ahead for Progress in the 21st Century Act (MAP-21) of 2012 (P.L. 112-141).

The FHWA may not assign or delegate its decision-making authority to a State Department of Transportation unless authorized by law. Section 106 of Title 23, United States Code (Section106), authorizes the State to assume specific project approvals. For projects that receive funding under Title 23, U.S.C., and are on the National Highway System (NHS) including projects on the Interstate System, the State may assume the responsibilities of the Secretary of the U.S. Department of Transportation under Title 23 for design, plans, specifications, estimates, contract awards, and inspections with respect to the projects unless the Secretary determines that the assumption is not appropriate. (23 U.S.C. 106(c)(l)) For projects under Title 23, U.S.C. that are not on the NHS, the State shall assume the responsibilities for design, plans, specifications, estimates, contract awards, and inspections unless the State determines that such assumption is not appropriate. (23 U.S.C. 106(c)(2))

For all other project activities which do not fall within the specific project approvals listed in Section 106 or are not otherwise authorized by law, the FHWA may authorize IDOT to perform work needed to reach the FHWA decision point, or to implement FHWA's decision. However such decisions themselves are reserved to FHWA.

The authority given to the IDOT under Section 106(c)(l) and (2) is limited to specific project approvals listed herein. Nothing listed herein is intended to include assumption of FHWA's decision-making authority regarding Title 23, U.S.C. eligibility or Federal-aid participation determinations. The FHWA always must make the final eligibility and participation decisions for the Federal-aid Highway Program.

Section 106(c)(3) requires FHWA and the IDOT to enter into an agreement relating to the extent to which the IDOT assumes project responsibilities. This Stewardship and Oversight Agreement (S&O Agreement), includes information on specific project approvals and related responsibilities, and provides the requirements for FHWA oversight of the FAHP (Oversight Program), as required by 23 U.S.C. 106(g).

SECTION II. INTENT AND PURPOSE OF S&O AGREEMENT

The intent and purpose of this S&O Agreement is to document the roles and responsibilities of the FHWA's Illinois Division Office (FHWA or Division) and Illinois Department of Transportation (IDOT) with respect to project approvals and related responsibilities, and to document the methods of oversight which will be used to efficiently and effectively deliver the FAHP.
The Project Action Responsibility Matrix, Attachment A to this S&O Agreement and as further described in Section VIII of this S&O Agreement, identifies FHWA FAHP project approvals and related responsibilities State DOT assumes from FHWA on a program-wide basis pursuant to 23
U.S.C. 106(c) and other legal authorities. Upon execution of this agreement, Attachment A shall be controlling and except as specifically noted in Attachment A, no other agreements, attachments, or other documents shall have the effect of delegating or assigning FHWA approvals to State DOT on a program-wide basis under 23 U.S.C 106 or have the effect of altering Attachment A.

SECTION III. ASSUMPTION OF RESPONSIBILITIES FOR FEDERAL-AID PROJECTS ON THE NATIONAL HIGHWAY SYSTEM

A. The IDOT may assume the FHWA's Title 23 responsibilities for design; plans, specifications, and estimates (PS&E); contract awards; and inspections, with respect to Federal-aid projects on the National Highway System (NHS) if both the !DOT and FHWA determine that assumption of responsibilities is appropriate.

B. Approvals and related activities for which the IDOT has assumed responsibilities as shown in Attachment A will _apply program wide unless project specific actions for which the Division will carry out the approval or related responsibilities are documented in accordance with the FHWA Project of Division Interest/Project of Corporate Interest Guide (FHWA PoDI/PoCI Guide) located at http://www.fhwa.dot.gov/federalaid/stewardship/

Attachment D, "Selection and Monitoring of Projects of Division Interest (PoDI's)" outlines the processes for coordination of PoDI's between IDOT and FHWA.

C. The IDOT may not assume responsibilities for Interstate projects that are in high risk categories. (23 U.S.C. 106(c)(l))

D. The IDOT is to exercise any and all assumptions of the Secretary responsibilities for Federal-aid projects on the NHS in accordance with Federal laws, regulations and policies.

SECTION IV. ASSUMPTION OF RESPONSIBILITIES FOR FEDERAL-AID PROJECTS OFF THE NATIONAL HIGHWAY SYSTEM

A. The IDOT shall assume the FHWA's Title 23 responsibilities for design, PS&Es, contract awards, and inspections, with respect to Federal-aid projects off the NHS (non-NHS) unless the IDOT determines that assumption of responsibilities is not appropriate. (23 U.S.C. 106(c)(2))

B. Except as provided in 23 U.S.C. 109(0), the IDOT is to exercise the Secretary's approvals and related responsibilities on these projects in accordance with Federal laws.

C. The IDOT, in its discretion, may request FHWA carry out one or more non-NHS approvals or related responsibilities listed as "State" in Attachment A on a program-wide basis. For a project specific request, the State may request FHWA carry out any approval or related responsibility listed in Attachment A off the NHS. Such project-specific requests shall be documented in accordance with the FHWA PoDI/PoCI Guide.
Attachment D, "Selection and Monitoring of Projects of Division Interest (PoDI's)" outlines the processes for coordination of PoDI's between IDOT and FHWA. Pursuant to 23 U.S.C. 109(0), non-NHS projects shall be designed and constructed in accordance with State laws, regulations, directives, safety standards, design standards, and construction standards.

SECTION V. ASSUMPTION OF RESPONSIBILITIES FOR LOCALLY ADMINISTERED PROJECTS

The IDOT may permit local public agencies (LPAs) to carry out the IDOT's assumed responsibilities on locally administered projects. The IDOT is responsible and accountable for LPA compliance with all applicable Federal laws and requirements.

SECTION VI. PERMISSIBLE AREAS OF ASSUMPTION UNDER 23 U.S.C. 106(c)
An assumption of responsibilities under 23 U.S.C. 106(c) may cover only activities in the following areas:

A. Design which, includes preliminary engineering, engineering, and design-related services directly relating to the construction of a FARP-funded project, including engineering, design, project development and management, construction project management and inspection, surveying, mapping (including the establishment of temporary and permanent geodetic control in accordance with specifications of the National Oceanic and Atmospheric Administration), and architectural-related services.

B. PS&E which, represents the actions and approvals required before authorization of construction. The PS&E package includes geometric standards, drawings, specifications, project estimates, certifications relating to completion of right-of-way acquisition and relocation, utility work, and railroad work.
C. Contract awards which, include procurement of professional and other consultant services and construction-related services to include advertising, evaluating, and awarding contracts.

D. Inspections which, include general contract administration, material testing and quality assurance, review, and inspections of Federal-aid contracts as well as final inspection/acceptance.

E. Approvals and related responsibilities affecting real property as provided in 23 CFR 710.201(i) and any successor regulation in 23 CFR Part 710.

SECTION VII. FEDERAL APPROVALS AND RELATED RESPONSIBILITIES THAT MAY NOT BE ASSUMED BY THE IDOT

A. Any approval or related responsibility not listed in Attachment A cannot be assumed by the State without prior concurrence by FHWA Headquarters. The following is a list of the most frequently-occurring approvals and related responsibilities that may not be assumed by the IDOT:

- Civil Rights Program approvals;
- Environmental approvals, except those specifically assumed under other agreements. (23 U.S.C. 326 and 327; programmatic categorical exclusion agreements);
- Federal air quality conformity determinations required by the Clean Air Act;
- Approval of current bill and final vouchers;
- Approval of federally-funded hardship acquisition, protective buying, and 23 U.S.C. 108(d) early acquisition;
- Project agreements and modifications to project agreements and obligation of funds (including advance construction);
- Planning and programming pursuant to 23 U.S.C. 134 and 135;
- Special Experimental Projects (SEP-14 and SEP-15);
- Use of Interstate airspace for non-highway-related purposes;
- Any Federal agency approval or determination under the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (Uniform Act), as amended, and implementing regulations in 49 CFR Part 24;
- Waivers to Buy America requirements;
- Approval of Federal participation under 23 CFR I.9(b);
- Provide pre-approval for preventive maintenance project;
- Requests for credits toward the non-Federal share of construction costs for early acquisitions, donations, or other contributions applied to a project;
- Functional replacement of property;
- Approval of a time extension for preliminary engineering projects beyond the 10-year limit, in the event that actual construction or acquisition of right-of-way for a highway project has not commenced;
- Approval of a time extension beyond the 20-year limit for right of way projects, in the event that actual construction of a road on the right-of-way is not undertaken;
- Determine need for Coast Guard Permit;
- Training Special Provision - Approval of New Project Training Programs; and
- Any other approval or activity not specifically identified in Attachment A unless otherwise approved by the FHWA, including the Office of Chief Counsel.

B. For all projects and programs, the IDOT will comply with Title 23 and all applicable non-Title 23, U.S.C. Federal-aid program requirements, such as metropolitan and statewide planning; environment; procurement of engineering and design related service contracts (except as provided in 23 U.S.C. 109(0)); Civil Rights including Title VI of the Civil Rights Act, and participation by Disadvantaged Business Enterprises; prevailing wage rates; and acquisition of right-of-way, etc.

C. This Agreement does not modify the FHWA's non-Title 23 program approval and related responsibilities, such as approvals required under the Clean Air Act; National Environmental Policy Act, Executive Order on Environmental Justice (E.O. 12898), and other related environmental laws and statutes; the Uniform Act; and the Civil Rights Act of 1964 and related statutes.

SECTION VIII. PROJECT ACTION RESPONSIBILITY MATRIX

Attachment A, Project Action Responsibility Matrix, to this S&O Agreement identifies FAHP project approvals and related responsibilities. The Matrix specifies which approvals and related responsibilities are assumed by the State under 23 U.S.C. 106(c) or other statutory or regulatory authority, as well as approvals and related responsibilities reserved to FHWA.

SECTION IX. HIGH RISK CATEGORIES

A. In 23 U.S.C. 106(c), Congress directs that the Secretary shall not assign any approvals or related responsibilities for projects on the Interstate System if the Secretary determines the project to be in a high risk category. Under 23 U.S.C. 106(c)(B)(8), the Secretary may define high risk categories on a national basis, State-by-State basis, or national and State-by-State basis.

B. The Division has determined there are no high risk categories.

SECTION X. FHWA OVERSIGHT PROGRAM UNDER 23 U.S.C. 106(g)

A. In 23 U.S.C. 106(g), Congress directs that the Secretary shall establish an oversight program to monitor the effective and efficient use of funds authorized to carry out the FAHP. This program includes FHWA oversight of the State's processes and management practices, including those involved in carrying out the approvals and related responsibilities assumed by the State under 23 U.S.C. 106(c). Congress defines that, at a minimum, the oversight-program shall be responsive to all areas relating to financial integrity and project delivery.

B. The FHWA shall perform annual reviews that address elements of the IDOT"s financial management system in accordance with 23 U.S.C. 106(g)(2)(A). FHWA will periodically review the IDOT's monitoring of subrecipients pursuant to 23 U.S.C. 106(g)(4)(B).
C. The FHWA shall perform annual reviews that address elements of the project delivery systems of the IDOT, which elements include one or more activities that are involved in the life cycle of project from conception to completion of the project. The FHWA will also evaluate the practices of the IDOT for estimating project costs, awarding contracts, and reducing costs. 23 U.S.C. 106(g)(2) and (3).
D. To carry out the requirements of 23 U.S.C. 106(g), the FHWA will employ a risk management framework to evaluate financial integrity and project delivery, and balance risk with staffing resources, available funding, and the State's transportation needs. The FHWA may work collaboratively with the IDOT to assess the risks inherent with the FAHP and funds management, and how that assessment will be used to align resources to develop appropriate risk response strategies
Techniques the Division and IDOT may use to identify and analyze risks and develop response strategies include the following:

- Program Assessments;
- FIRE Reviews;
- Program Reviews;
- Certification Reviews;
- Recurring or periodic reviews such as the Compliance Assessment Program (CAP); and· • Inspections of project elements or phases.

These techniques will be carried out in a manner consistent with applicable Division Standard Operating Procedures or other control documents relating to program assessments, FIRE, program reviews, CAP, etc.

The following techniques and processes will be used to carry out the requirements of 23 U.S.C. 106(g):

The FHWA will monitor Federal Highway Programs and will maintain review and/or approval authority of activities that are not delegated to IDOT. In addition, FHWA and IDOT are responsible for ensuring financial integrity and compliance with applicable laws and regulations. The FHWA can review any program or project including those that have unique features, high-risk elements, unusual circumstances, or projects included in program and/or process reviews. FHWA will not require higher standards and policies be applied on a project merely because FHWA is involved in that project. FHWA's involvement in a project does not change governing policies although FHWA may request consideration of more rigorous criteria or alternative approaches.

The IDOT and FHWA are established leaders in the joint process review program. The cooperative approach taken in Illinois has led to reviews that are an integral part of process improvement at IDOT and FHWA. These reviews meet and exceed the requirements of 23 U.S. Code, Section 106(g)(3). During the annual process review selection meeting, IDOT and FHWA will ensure at least one review addressing project delivery is selected. Most of these reviews do address project delivery. Additional program reviews will be conducted at the required frequencies. These include, but are not limited to, the following:

The IDOT research program conducts a peer review of its program.
The FHWA reviews IDOT's Highway Performance Monitoring System program.
The FHWA reviews Illinois' Motor Fuel and Truck Tax collection program.
The FHWA and Federal Transit Administration conduct MPO Certification Reviews. The IDOT and FHWA review construction work zones.
The IDOT and FHWA conduct ad hoc reviews based on issues that emerge.
The IDOT audit program, with some FHWA participation, is conducted.
Other State entities review IDOT's program: Auditor General, Department of Central Management Services.

E. Program Responsibility Matrix
Attachment B to this S&O Agreement is the Program Responsibility Matrix example that identifies all relevant FHWA program actions, and Division and IDOT program contact offices.

F. Manuals and Operating Agreements

IDOT manuals, agreements and other control documents that have been approved for use on Federal-aid projects are listed in Attachment C to this S&O Agreement.

G. Stewardship and Oversight Indicators

FHWA and IDOT will jointly develop a set of Stewardship and Oversight Indicators (Indicators) as tools to assess whether the assumptions of responsibility outlined in this agreement are functioning appropriately. The Indicators will be risk-based, will continue to evolve to meet the needs of FHWA and IDOT and be reviewed annually for effectiveness. Once developed, Indicators will be included in an attachment to this agreement.

SECTION XI. IDOT OVERSIGHT AND REPORTING REQUIREMENTS

A. IDOT Oversight and Reporting Requirements

The IDOT is responsible for demonstrating to the FHWA how it is carrying out its responsibilities in accordance with this S&O Agreement. In order to fulfill this responsibility, the IDOT will meet its responsibilities in accordance with Illinois control documents, which are listed in Attachment C. The IDOT will consult with FHWA in accordance with Attachment A when IDOT considers deviating from the control documents, which represent established policies, guidance, standard procedures, and programmatic agreements. With FHWA approval, IDOT may implement an alternative approach to meeting State and Federal requirements.

IDOT will assume all responsibilities in accordance with Section 106 of Title 23. This applies to all design activities, Plan, Specifications, and Estimates (PS&E) approvals, concurrence in awards, and all construction and maintenance activities. This precludes the need for any FHWA approval or concurrence, except for those actions that require FHWA approval outside of Title 23 U.S.C., such as NEPA (42 USC 4321 et seq), Title VI of the Civil Rights Act (42 USC 2000d et seq), Fair Housing Act (42 USC 3601 et seq), and the Uniform Relocation Assistance and Land Acquisitions Policies Act (42 USC 4601 et seq).

Project level actions from FHWA are summarized in Attachment A. The IDOT will ensure the appropriate approvals are obtained and the appropriate documentation is submitted. For all Federal-aid projects on the NHS, under State or Local jurisdiction, IDOT will conduct all final inspections in lieu of FHWA to ensure the work was completed in substantial conformance with the approved PS&E. Although FHWA may request to participate in a PoDI's final inspection, IDOT will still have the lead in completing this action.

The process by which PoDI's are coordinated between IDOT and FHWA is outlined in Attachment D.

B. IDOT Oversight of Locally Administered Projects

B.1. IDOT is required to provide adequate oversight of subrecipients including oversight of any assumed responsibilities the IDOT delegates to a LPA.

B.2. Pursuant to 23 U.S.C. 106(g)(4), the IDOT shall be responsible for determining that subrecipients of Federal funds have adequate project delivery systems for locally administered projects and sufficient accounting controls to properly manage such Federal-aid funds. The State DOT is also responsible for ensuring compliance with reporting and other requirements applicable to grantees making sub-awards, such as monthly reporting requirements under the Federal Funding Accountability and Transparency Act of 2006, PL 109-282 (as amended by PL 110-252).

B.3. The IDOT acknowledges that it is responsible for sub-recepient awareness of Federal grant requirements, management of grants, awards and sub- awards and is familiar with and comprehends pass through entity responsibilities (2 C.F.R. 200.331 Requirements for Pass-thru Entities) The IDOT shall carry out these responsibilities using the following actions, programs, and processes:

As IDOT makes programs available to local units of government, IDOT provides the parameters, assists the locals in administration, and provides oversight of Federal and State funded programs. Eligible public agencies may be permitted, by IDOT, to take approval actions and administer Federal-aid design and construction projects when IDOT assures the public agency has the knowledge and capability to achieve compliance with State and Federal requirements.

State stewardship efforts include oversight and approval actions, as well as many day-to-day actions that are routinely performed to ensure the
Federal-aid Highway Program is administered in regulatory compliance and in ways that enhance the value of the program funds. In addition, IDOT maintains its Bureau of Local Roads and Streets Manual and provides training opportunities to communicate requirements, and IDOT staff reviews project documentation to ensure compliance.
B.4. The IDOT shall assess whether a sub-recipient has adequate project delivery systems and sufficient accounting controls to properly manage projects, using the following actions, programs, and processes:

Control documents, including the IDOT Bureau of Local Roads and Streets Manual, will be followed to ensure LPA projects are suitably administered. IDOT financial monitoring procedures will be applied to these projects.

B.5. The IDOT shall assess whether a sub-recipient is staffed and equipped to perform work satisfactorily and cost effectively, and that adequate staffing and supervision exists to manage the Federal project(s), by using the following actions, programs, and processes:

Control documents, including the IDOT Bureau of Local Roads and Streets Manual, will be followed to ensure LPA projects are suitably administered.

B.6. The IDOT shall assess whether sub-recipient projects receive adequate inspection to ensure they are completed in conformance with approved plans and specifications, by using the following actions, programs, and processes:

Control documents, including the IDOT Bureau of Local Roads and Streets Manual, will be followed to ensure LPA projects are suitably administered.

B.7. The IDOT shall ensure that when LPAs elect to use consultants for engineering services, the LPA, as provided under 23 CFR 635.105(b), shall provide a full-time employee of the agency to be in responsible charge of the project. The IDOT's process to ensure compliance with this requirement is documented by the following actions, programs, and processes:

Control documents, including the IDOT Bureau of Local Roads and Streets Manual, will be followed to ensure LPA projects are suitably administered.

B.8. The IDOT shall ensure that project actions will be administered in accordance with all applicable Federal laws and regulations. The IDOT will use the following process on required approvals on sub-recipient projects as described in control documents, such as the IDOT Bureau of Local Roads and Streets Manual, and approved on sub-recipient administered projects.

B.9. The IDOT shall document its oversight activities for LPA-administered projects and findings, and how it will share this information with the FHWA. FIRE reviews and monitoring projects' financial status will include LPA projects. IDOT will also coordinate resolution of project issues that deviate from control documents with FHWA.

SECTION XII. IMPLEMENTATION AND AMENDMENTS

A. This S&O Agreement will take effect as of the effective date of the signature of the FHWA Illinois Division Administrator, who shall sign this S&O Agreement last.

B. The Division and IDOT agree that updates to this Agreement will be considered periodically on a case-by-case basis or when:

- Significant new legislation, Executive orders, or other initiatives affecting the relationship or responsibilities of one or both parties to the S&O Agreement occurs;
- Leadership, or leadership direction, changes at the IDOT or FHWA; or
- Priorities shift as a result of audits, public perception, or changes in staffing at either the IDOT or Division Office.

C. The Division and IDOT agree that changes may occur to the contents of the Attachments to this S&O Agreement and documents incorporated by reference into the S&O Agreement. Except as provided in paragraph XII.D., and E, changes to the Attachments and documents incorporated by reference will not require the Division and IDOT to amend this S&O Agreement. The effective date of any revisions to one of these documents shall be clearly visible in the header of the revised document. This Agreement and any revised document shall be posted on the Division's S&O Agreement internet site within five (5) business days of the effective date.

D. Any changes to the high risk categories must be documented by an amendment to this S&O Agreement.

E. Any changes to the Project Action Responsibility Matrix must be approved by the FHWA Office of Infrastructure in writing and documented by an amendment to this S&O Agreement. (Drafting Note: The Project Action Responsibility Matrix is generally Attachment A.)

ATTACHMENT A
PROJECT ACTION RESPONSIBILITY MATRIX
(As of November 14, 2014)

The following matrix identifies Federal-aid highway program (FAHP) project approvals and related responsibilities. The matrix addresses which ones are subject to State assumption under the provisions of 23 U.S.C. 106(c) or other statutory or regulatory authority, as well as those which are reserved to FHWA.

PROJECT ACTION RESPONSIBILITY MATRIX (Excluding PoDIs, which are subject to separate PoDI Plans)		
ACTION	**AGENCY RESPONSIBLE**	
	PROJECTS ON THE NHS	**PROJECTS OFF THE NHS**
PROGRAMMING (All phases)		
Ensure project in Statewide Transportation Improvement Program (STIP)/Transportation Improvement Program (TIP)	STATE	STATE
Identify proposed funding category	STATE (1)	STATE (1)
FINANCIAL MANAGMENT (All phases)		
Obligate funds/approve Federal-aid project agreement, modifications, and project closures (project authorizations) (Note: this action cannot be assumed by State)	FHWA	FHWA
Authorize current bill (Note: this action cannot be assumed by State)	FHWA	FHWA
Review and Accept Financial Plan and Annual Updates for Federal Major Projects over $500 million [23 U.S.C. 106(h)] (Note: this action cannot be assumed by State)	FHWA	FHWA
Review Cost Estimates for Federal Major Projects over $500 million [23 U.S.C. 106(h)] (Note: this action cannot be assumed by State)	FHWA	FHWA

PROJECT ACTION RESPONSIBILITY MATRIX (Excluding PoDIs, which are subject to separate PoDI Plans)		
ACTION	AGENCY RESPONSIBLE	
	PROJECTS ON THE NHS	PROJECTS OFF THE NHS
Develop Financial Plan for Federal Projects between $100 million and $500 million. [23 U.S.C. 106(i)]	STATE	STATE
ENVIRONMENT (All phases)		
All EA/FONSI, EIS/ROD, 4(f), 106, 6(f) and other approval actions required by Federal environmental laws and regulations	FHWA (2)	FHWA (2)
Categorical Exclusion approval actions (Note this action cannot be assumed by the State except through an assignment under 23 U.S.C. 326 or 327, or through a programmatic agreement pursuant to Section 1318(d) of MAP-21 and 23 CFR 771.117(g)))	FHWA (2) for CEII STATE FOR CE-I	FHWA (2) for CEII STATE FOR CE-I
PRELIMINARY DESIGN (Design Phase)		
Consultant Contract Selection	STATE (3)	STATE (3)
Sole source Consultant Contract Selection	STATE (3)	STATE (3)
Approve hiring of consultant to serve in a "management" role (Note: this action cannot be assumed by State) [23 CFR 172.9]	FHWA	FHWA
Approve consultant agreements and agreement revisions (Federal non-Major Projects) [23 CFR 172.9]	STATE	STATE
Approve consultant agreements and agreement revisions on Federal Major Projects [23 CFR 172.9] (Note: this action cannot be assumed by State)	FHWA	FHWA
Approve exceptions to design standards [23 CFR 625.3(f)]	FHWA for Interstate; STATE for Non-Interstate	STATE
Interstate System Access Change [23 USC 111] (Note: this action	FHWA	N/A

PROJECT ACTION RESPONSIBILITY MATRIX (Excluding PoDIs, which are subject to separate PoDI Plans)		
ACTION	AGENCY RESPONSIBLE	
	PROJECTS ON THE NHS	PROJECTS OFF THE NHS
cannot be assumed by State)		
Interstate System Access Justification Report [23 USC 111] (Note: action may be assumed by State pursuant to 23 USC 111(e))	FHWA	N/A
Airport highway clearance coordination and respective public interest finding (if required) [23 CFR 620.104]	STATE	STATE
Approve Project Management Plan for Federal Major Projects over $500 million [23 USC 106(h)] (Note: this action cannot be assumed by State)	FHWA	FHWA
Approve innovative and Public-Private Partnership projects in accordance with SEP-14 and SEP-15 (Note: this action cannot be assumed by State)	FHWA	FHWA
Provide pre-approval for preventive maintenance project (until FHWA concurs with STATE procedures) (Note: this action cannot be assumed by State)	FHWA	FHWA
DETAILED / FINAL DESIGN (Design Phase)		
Provide approval of preliminary plans for unusual/complex structures on the Interstate. [23 USC 109(a) and FHWA Policy]	FHWA (4)	N/A
Provide approval of preliminary plans for unusual/complex structures (non-Interstate). [23 USC 109(a) and FHWA Policy]	STATE (4)	STATE
Approve retaining right-of-way encroachments [23 CFR 1.23 (b) & (c)]	STATE (5)	STATE
Approve use of local force account agreements	STATE	STATE

PROJECT ACTION RESPONSIBILITY MATRIX (Excluding PoDIs, which are subject to separate PoDI Plans)		
ACTION	AGENCY RESPONSIBLE	
	PROJECTS ON THE NHS	PROJECTS OFF THE NHS
[23 CFR 635.104 & 204]		
Approve use of publicly owned equipment [23 CFR 635.106]	STATE	STATE
Approve the use of proprietary products, processes [23 CFR 635.411]	STATE	STATE
Concur in use of publicly furnished materials [23 CFR 635.407]	STATE	STATE
RIGHT-OF-WAY (Design and Operational Phases)		
Make feasibility/practicability determination for allowing authorization of construction prior to completion of ROW clearance, utility and railroad work [23 CFR 635.309(b)]	FHWA for Interstate; STATE for Non-Interstate	STATE
Make public interest finding on whether State may proceed with bid advertisement even though ROW acquisition/relocation activities are not complete for some parcels [23 CFR 635.309(c)]	FHWA	FHWA
Ensure compliant ROW certificate is in place [23 CFR 635.309(c)]	STATE	STATE
Approve Hardship and Protective Buying [23 CFR 710.503] (If a Federal-aid project) (Note: this action cannot be assumed by State)	FHWA	FHWA
Approve Interstate Real Property Interest Use Agreements [23 CFR 710.405] (Note: this action cannot be assumed by State)	FHWA	N/A
Approve non-highway use and occupancy [23 CFR 1.23(c)]	FHWA for Interstate STATE for Non-Interstate (3)	STATE (3)
Approve disposal at less than fair	FHWA	FHWA

PROJECT ACTION RESPONSIBILITY MATRIX (Excluding PoDIs, which are subject to separate PoDI Plans)		
ACTION	AGENCY RESPONSIBLE	
	PROJECTS ON THE NHS	PROJECTS OFF THE NHS
market value of federally funded right-of-way, including disposals of access control [23 U.S.C. 156] (Note: this action cannot be assumed by State)		
Approve disposal at fair market value of federally funded right-of-way, including disposals of access control [23 CFR 710.409] (Note: Exception allowed per 23 CFR 710.201)	FHWA for Interstate STATE for Non-Interstate (3)	STATE (3)
Requests for credits toward the non-Federal share of construction costs for early acquisitions, donations or other contributions applied to a project (note: this action cannot be assumed by State)	FHWA	FHWA
Federal land transfers [23 CFR 710, Subpart F] (Note: this action cannot be assumed by State)	FHWA	FHWA
Functional replacement of property [23 CFR 710.509] (Note: this action cannot be assumed by State)	FHWA	FHWA
SYSTEM OPERATIONS AND PRESERVATION (Design Phase)		
Accept Transportation Management Plans (23 CFR 630.1012(b))	STATE	STATE
Approval of System Engineering Analysis (for ITS) [23 CFR 940.11]	STATE	STATE
PS&E AND ADVERTISING (Design Phase)		
Approve PS&E [23 CFR 630.201]	STATE	STATE
Authorize advance construction and conversions [23 CFR 630.703 & 709] (Note: this action cannot be assumed by State)	FHWA	FHWA
Approve utility or railroad force	STATE	STATE

PROJECT ACTION RESPONSIBILITY MATRIX (Excluding PoDIs, which are subject to separate PoDI Plans)		
ACTION	AGENCY RESPONSIBLE	
	PROJECTS ON THE NHS	PROJECTS OFF THE NHS
account work [23 CFR 645.113 & 646.216]		
Approve utility and railroad agreements [23 CFR 645.113 & 646.216]	STATE	STATE
Approve use of consultants by utility companies [23 CFR 645.109(b)]	STATE	STATE
Approve exceptions to maximum railroad protective insurance limits [23 CFR 646.111]	STATE	STATE
Authorize advertising for bids (FHWA authorization done via construction authorization) [23 CFR 635.112, 309]	STATE	STATE
CONTRACT ADVERTISEMENT AND AWARD (Design Phase) All contracts to be done by competitive bidding unless otherwise authorized by law		
Approve cost-effectiveness determinations for construction work performed by force account or by contract awarded by other than competitive bidding [23 CFR 635.104 &.204]	STATE	STATE
Approve emergency determinations for contracts awarded by other than competitive bidding [23 CFR 635.104 &.204]	FHWA	FHWA
Approve construction engineering by local agency [23 CFR 635.105]	STATE	STATE
Approve advertising period less than 3 weeks [23 CFR 635.112]	FHWA	FHWA
Approve addenda during advertising period [23 CFR 635.112]	STATE	STATE
Concur in award of contract [23 CFR 635.114]	STATE	STATE
Concur in rejection of all bids [23 CFR 635.114]	STATE	STATE
Approval of Design-Build	STATE	STATE

PROJECT ACTION RESPONSIBILITY MATRIX (Excluding PoDIs, which are subject to separate PoDI Plans)		
ACTION	AGENCY RESPONSIBLE	
	PROJECTS ON THE NHS	PROJECTS OFF THE NHS
Requests-for-Proposals and Addenda [23 CFR 635.112]		
CONSTRUCTION (Construction Phase)		
Approve changes and extra work [23 CFR 635.120]	STATE	STATE
Approve contract time extensions [23 CFR 635.120]	STATE	STATE
Concur in use of mandatory borrow/disposal sites [23 CFR 635.407]	STATE	STATE
Accept materials certification [23 CFR 637.207]	STATE	STATE
Concur in settlement of contract claims [23 CFR 635.124]	STATE	STATE
Concur in termination of construction contracts [23 CFR 635.125]	STATE	STATE
Waive Buy America provisions [23 CFR 635.410] (Note: this action cannot be assumed by State)	FHWA	FHWA
Final inspection/acceptance of completed work [23 USC 114(a)]	STATE	STATE
CIVIL RIGHTS (All phases)		
Approval of Disadvantaged Business Enterprise (DBE) Project Contract Goal set by the State DOT under 49 CFR 26.51(d). [49 CFR 26.51(e)(3)]	STATE	STATE
Acceptance of Bidder's Good Faith Efforts to Meet Contract Goal [49 CFR 26.53] or of Prime Contractor's Good Faith Efforts to Find Another DBE Subcontractor When a DBE Subcontractor is Terminated or Fails to Complete Its Work [49 CFR 26.53(g)] (Note: this action cannot be performed by the FHWA)	STATE	STATE

PROJECT ACTION RESPONSIBILITY MATRIX (Excluding PoDIs, which are subject to separate PoDI Plans)		
ACTION	AGENCY RESPONSIBLE	
	PROJECTS ON THE NHS	PROJECTS OFF THE NHS
Equal Employment Opportunity (EEO) Contract Compliance Review [23 CFR Part 230, Subpart D]).	STATE	STATE
Training Special Provision – Approval of Project Goal for training slots or hours [23 CFR Part 230, Subpart A]	STATE	STATE
Training Special Provision – Approval of New Project Training Programs (Note: this action cannot be assumed by State) [23 CFR 230.111(d), (e)]	FHWA	FHWA

FOOTNOTES:

(1) State is responsible for ensuring that all individual elements of the project are eligible. FHWA will check that the scope of the project as described in submitted project agreement is eligible for the category of funding sought. All final eligibility and participation determinations are retained by FHWA.

(2) This action cannot be assumed by the State except through an assignment under 23 U.S.C. 326 or 327, or through a programmatic agreement pursuant to Section 1318(d) of MAP-21. If there is a 23 U.S.C. 326 or 327 assignment or PCE agreement, decisions are handled in accordance with those assignments or agreements. Illinois has a PCE, and IDOT categorizes CE-I determinations, which are generally items in 23 CFR 771.117 (c) with no unusual circumstances.

(3) State's process and modifications to, or variation in process, require FHWA approval.

(4) Unusual/Complex bridges and structures are those that the Division determines to have unique foundation problems, new or complex designs, exceptionally long spans, exceptionally large foundations, complex hydrologic (including climate change and extreme weather events) aspects, complex hydraulic elements or scour related elements, or that are designed with procedures that depart from currently recognized acceptable practices (i.e., cable-stay, suspension, arch, segmental concrete, moveable, truss, tunnels, or complex geotechnical walls or ground improvement systems)

(5) FHWA approval is required for revocable occupancy permits of non-conforming outdoor advertising signs.

ATTACHMENT B
PROGRAM RESPONSIBILITY MATRIX

PROGRAM ACTION RESPONSIBILITY

The following matrix is an example list of program actions. The Division should refer to http://our.dot.gov/office/fhwa.hq/OfficeofInfrastructure/hipa/SO/Resources/Lists/Program%20Responsibilities%20Matrix/for the latest updated version which can be incorporated into the agreement or referenced as a control document. Modify the matrix to reflect the Division and State "Responsible Program Office." The primary office of contact should be listed, rather than an individual or the approving official.

Activity	Authority[1]	Frequency	Due Date	FHWA HQ Program Office	FHWA Division Responsible Program Office	State DOT Responsible Program Office	Remarks
Appropriations, Allotments, Obligations	31 USC 1341(a)(1)(A)& (B); 31 USC 1517(a); 23 USC 118(b), 23 USC 121	As needed	Not Applicable	Office of Chief Financial Officer	Finance & Logistics	Finance & Administration	State will monitor appropriations, allotments and obligations to ensure that all funding is used efficiently within each quarter and use all Obligation Authority (OA) by the end of the year.
Approval of Indirect Cost Allocation Plans (ICAPs)	2 CFR 200 Subpart E; ASMBC-10	As needed	Not Applicable	Office of Chief Financial Officer	Finance & Logistics	Finance & Administration	The State will certify that the ICAP was prepared in accordance with 2 CFR 200 Subpart E.

[1] All actions taken on or after December 26, 2014, shall be governed by the Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards in 2 CFR Part 200. Part 200 of 2 CFR supersedes 49 CFR Parts 18 and 19, and requirements from OMB Circulars A-21, A-87, A-110, and A-122 (which have been placed in OMB guidances); Circulars A-89, A-102, and A-133; and the guidance in Circular A-50 on Single Audit Act follow-up.

Activity	Authority[1]	Frequency	Due Date	FHWA HQ Program Office	FHWA Division Responsible Program Office	State DOT Responsible Program Office	Remarks
FIRE Program Activities	FHWA Order 4560.1C (or as superseded)	Ongoing		Office of Chief Financial Officer	Finance & Logistics	Finance & Administration	State will continue to provide oversight and conduct reviews to ensure Federal-aid compliance. FHWA will review and monitor. State responsibilities include multiple tasks in support of risk assessments, conducting reviews and implementation of recommendations.
Audit Coordination/FHWA Financial Statement Audit/State External Audit Reviews/State Internal Audit Reviews	FMFIA, 2 C.F.R. Part 200, Subpart F;; GAAP, CFO Act of 1990; DOT Order 8000.1C	As needed	Not Applicable	Office of Chief Financial Officer	Finance & Logistics	Finance & Administration	State assures corrective action is taken to resolve audit findings and FHWA will monitor activities to ensure implementation.
Improper Payments Review	Improper Payments Information Act of 2002, PL 107-300, Improper Payments Elimination and Recovery Act of 2010, PL 111-204, Improper Payments Elimination and Recovery Improvement Act of 2012, PL 112-248	Annually		Office of Chief Financial Officer	Finance & Logistics	Finance & Administration	State will provide all information necessary to document sampled payments and FHWA offices will review and complete appropriate data submittal forms.
Transfer of Funds between programs or to other FHWA offices or agencies as requested by State	23 USC 126, 23 USC 132, and FHWA Order 4551.1	As needed	Not Applicable	Office of Chief Financial Officer	Finance & Logistics	Finance & Administration	State will submit requests for transfer and FHWA approves and processes the funding transfers between programs, to other States, to other agencies, and to FHWA HQ, Federal Lands, or Research offices.

Prepare / Review State Internal EEO Affirmative Action Plan (Title VII) Accomplishments and Goals	23 CFR 230.311	Annually	1-Oct	Office of Civil Rights	Assistant Division Administrator	Chief Counsel	Courtesy copy to HQ.
Review DBE Program Revisions	49 CFR 26.21(b)(2)	As needed	Not Applicable	Office of Civil Rights	Assistant Division Administrator	Business & Workforce Diversity	Division sends to HCR for review and approval as
Prepare / DBE Uniform Awards and Commitment Report	49 CFR 26, Appendix B	Semi-Annual	June 1st December 1st	Office of Civil Rights	Assistant Division Administrator	Business & Workforce Diversity	Division Office reviews and sends to HCR
Prepare / Annual Analysis and Corrective Action Plan (if necessary)	49 CFR 26.47(c)	Annual (as necessary)	December 31st	Office of Civil Rights	Assistant Division Administrator	Business & Workforce Diversity	Division Office approves sends copy to HCR
Prepare / State DBE Program Goals	49 CFR 26.45(f)(1)	Triennial	August 1st	Office of Civil Rights	Assistant Division Administrator	Business & Workforce Diversity	Division reviews and approves; HCC provides legal sufficiency review and approval sends copy to HCR
Prepare / Review On-the-Job-Training (OJT) goals & accomplishments	23 CFR 230.111(b)	Annually	TBA	Office of Civil Rights	Assistant Division Administrator	Business & Workforce Diversity	Division office reviews and comments.
Approval of OJT and DBE Supportive Services fund requests	23 CFR 230.113 & 23 CFR 230.204	Annual	TBA	Office of Civil Rights	Assistant Division Administrator	Business & Workforce Diversity	Division recommends approval submits to HCR for final approval
Return of any unused discretionary grant program funding	23 CFR 230.117(2)	Annual	TBA	Office of Civil Rights	Assistant Division Administrator	Business & Workforce Diversity	Division works with HCR and CFO
Prepare / Review of Report on Supportive Services (OJT & DBE)	23 CFR 230.113(g), 230.121(e), 230.204(g)(6)	Quarterly		Office of Civil Rights	Assistant Division Administrator	Business & Workforce Diversity	Division office reviews and comments.
Prepare / Review Annual Contractor Employment Report (Construction Summary of Employment Data (Form PR-1392)	23 CFR 230.121(a); Appendix D to Subpart A, Part 230, General Information and Instructions	Annually	1-Dec	Office of Civil Rights	Assistant Division Administrator	Business & Workforce Diversity	Recommendation sent to HQ for approval.

Activity	Authority[1]	Frequency	Due Date	FHWA HQ Program Office	FHWA Division Responsible Program Office	State DOT Responsible Program Office	Remarks
Prepare / Review State DOT Employment Statistical Data (EEO-4)	23 CFR, Subpart C, Appendix A	Biannual	1-Dec	Office of Civil Rights	Assistant Division Administrator	Chief Counsel	Report sent to HQ quarterly for informational purposes and recommendation sent to HQ annually for approval.
Prepare / Review Annual Federal Projected Awards Reports - Historically Black Colleges & Universities/Tribal Colleges & Universities/Hispanic Serving Institutes, American Indian Alaskan Native, Asian Pacific & American Islander.	Presidential Executive Orders: 13230, 13256,13270, 13361, 13515	Annual	TBA	Office of Civil Rights	Assistant Division Administrator	Chief Counsel	Divisions submit data to HCR who prepares report for DOCR
Prepare / Review ADA Complaint Reports of Investigation	28 CFR 35.190	As needed	Not Applicable	Office of Civil Rights	Assistant Division Administrator	Chief Counsel	Division office reviews, FHWA HQ approves and issues finding.
Review Americans with Disabilities Act (ADA) /Sec. 504 Program Plan accomplishments and next year's goals	49 CFR 27.11(c), EO 12250	Annually	1-Oct	Office of Civil Rights	Assistant Division Administrator	Chief Counsel	Division office reviews and comments.
Return of unexpended funds used for Summer Transportation Institutes	23 CFR 230.117(2)	Annual	August 30; however, State procurement rules may govern	Office of Civil Rights	Assistant Division Administrator	Chief Counsel	Divisions work with HCR and CFO
Prepare / Review Request for National Summer Transportation Institute (NSTI) Proposals (SOWs)	23 USC 140(b)	Annual	TBA	Office of Civil Rights	Assistant Division Administrator	Chief Counsel	Divisions recommend approval. HCR gives final approval
Prepare / Review NSTI Report (questionnaire)	23 USC 140(b)	Annual	October 15th	Office of Civil Rights	Assistant Division Administrator	Chief Counsel	Divisions provide to HCR
Receipt of State Consultation Process with Tribal Governments	23 CFR 450.210(c)	As needed	Not Applicable	Office of Federal Lands Highway	Planning, Environment & ROW	Highways	Informational Purposes.

Activity	Authority[1]	Frequency	Due Date	FHWA HQ Program Office	FHWA Division Responsible Program Office	State DOT Responsible Program Office	Remarks
Approval of Contracting Procedures for Consultant Selection	23 CFR 172.5 & 172.9	As needed	Not Applicable	Office of Infrastructure	Field Engineering	Highways	FHWA Division Office Approval.
Determination of High Risk Categories - Limitation on Interstate Projects	23 USC 106(c)(4)(B)	As needed	Not Applicable	Office of Infrastructure	Division Administrator	Highways	Office of Program Administration determines national categories and must concur on any State designations.
Approval of State 3R Program	23 CFR 625.4(a)(3), 23 USC 109(n)	As needed	Not Applicable	Office of Infrastructure	Field Engineering	Highways	FHWA Division Office Approval.
Verify adoption of Design Standards (National Highway System, including Interstate)	23 CFR 625, 23 USC 109(b), 23 USC 109(c)(2), 23 USC 109(o)	As needed	Not Applicable	Office of Infrastructure	Field Engineering	Highways	FHWA HQ regulatory action to adopt NHS standards.
Approval of preliminary plans of Major and Unusual Bridges on the Interstate Highway System	(M1100.A)	As needed	Not Applicable	Office of Infrastructure	Assistant Division Administrator	Highways	Director of HIBT has approval of preliminary plans of Major and Unusual Bridges on the Interstate Highway System (M1100.A)
Approval of State Standard Specifications	23 CFR 625.3	As needed	Not Applicable	Office of Infrastructure	Field Engineering	Highways	FHWA Division Office Approval.
Verify State Design Exception Policy complies with FHWA Policy	23 CFR 625.3	As needed	Not Applicable	Office of Infrastructure	Field Engineering	Highways	FHWA Division Office Approval.
Approval of State Standard Detail Plans	23 CFR 625.3	As needed	Not Applicable	Office of Infrastructure	Field Engineering	Highways	FHWA Division Office Approval.
Approval of Pavement Design Policy	23 CFR 626.3	As needed	Not Applicable	Office of Infrastructure	Planning & Program Development	Highways	FHWA Division Office Approval.
Review of Value Engineering Policy and Procedures	23 CFR 627.1(b)&(c), 23 CFR 627.7 FHWA Order 1311.1B	As needed	Not Applicable	Office of Infrastructure	Field Engineering	Highways	FHWA Division Office Review.
Review of Value Engineering Annual Report	23 CFR 627.7, FHWA Order 1311.1B	Annual	Not Applicable	Office of Infrastructure	Field Engineering	Highways	FHWA Division Office collects, reviews, and submits to HQ for review and reporting.

Activity	Authority[1]	Frequency	Due Date	FHWA HQ Program Office	FHWA Division Responsible Program Office	State DOT Responsible Program Office	Remarks
Review and Approval of Interstate Access Requests	23 USC 111, 23 CFR 710, 74 FR 43743-43746 (Aug. 27, 2009)	As needed	Not Applicable	Office of Infrastructure	Field Engineering	Highways	FHWA Division Office approval with concurrence from HQ on more complex access requests.
Approval of Liquidated Damages Rate	23 CFR 635.127	Every 2 years	Not Applicable	Office of Infrastructure	Field Engineering	Highways	FHWA Division Office Approval.
Approval of Quality Assurance Program	23 CFR 637.205	As needed	Not Applicable	Office of Infrastructure	Planning & Program Development	Highways	State administers, with programmatic agreement by the Division Office, as part of their materials testing and construction quality assurance/acceptance program.
Assure Central Laboratory accredited by AASHTO Accreditation Program or FHWA approved comparable program	23 CFR 637.209	As needed	Not Applicable	Office of Infrastructure	Planning & Program Development	Highways	State administers, with programmatic agreement by the Division Office, as part of their materials testing and construction quality assurance/acceptance program.
Assure Non-STD designated lab performing Independent Assurance sampling and testing accredited by AASHTO Accreditation Program or FHWA approved comparable program	23 CFR 637.209	As needed	Not Applicable	Office of Infrastructure	Planning & Program Development	Highways	State administers, with programmatic agreement by the Division Office, as part of their materials testing and construction quality assurance/acceptance program.
Assure Non-STD designated lab used in dispute resolution accredited by AASHTO Accreditation Program or FHWA approved comparable program	23 CFR 637.209	As needed	Not Applicable	Office of Infrastructure	Planning & Program Development	Highways	State administers, with programmatic agreement by the Division Office, as part of their materials testing and construction quality assurance/acceptance program.

Activity	Authority[1]	Frequency	Due Date	FHWA HQ Program Office	FHWA Division Responsible Program Office	State DOT Responsible Program Office	Remarks
Review Independent Assurance Annual Report	23 CFR 637.207	Annually	1-Mar	Office of Infrastructure	Planning & Program Development	Highways	State administers, with programmatic agreement by the Division Office, as part of their materials testing and construction quality assurance/acceptance program.
Assure Labor Compliance - Prevailing Wage Rate	23 USC 113	As needed	Not Applicable	Office of Infrastructure	Assistant Division Administrator	Highways	FHWA Division Office Review and Approval
Determination of Eligible Preventive Maintenance Activity - Cost-Effective Means of Extending Useful Life Determination	23 USC 116(e)	As needed	Not Applicable	Office of Infrastructure	Field Engineering	Highways	FHWA Division Office Approval
Approval of Utility Agreement / Alternate Procedure	23 CFR 645.119	As needed	Not Applicable	Office of Infrastructure	Field Engineering	Highways	FHWA Division Office Approval
Approval of Utility Accommodation Policy	23 CFR 645.215, 23 USC 109(l), 23 USC 123	As needed	Not Applicable	Office of Infrastructure	Field Engineering	Highways	FHWA Division Office Approval
Review Bridge Construction, Geotechnical, and Hydraulics	23 CFR 650	As needed	Not Applicable	Office of Infrastructure	Assistant Division Administrator	Highways	
Review Plans of Corrective Action established to address NBIS compliance issues	23 CFR 650, 23 USC 144	Annually		Office of Infrastructure	Assistant Division Administrator	Highways	Division office performs annual compliance review and reports results to HQ.
Review NBI Data Submittal	23 CFR 650 Subpart C, Annual Memo from HQ, 23 USC 144	Annually	1-Apr	Office of Infrastructure	Assistant Division Administrator	Highways	Division resolve errors with States; States submit to HQ.
Review structurally deficient bridge construction Unit Cost submittal	23 USC 144	Annually	1-Apr	Office of Infrastructure	Assistant Division Administrator	Highways	Submit to HQ.
Review Section 9 of the Rivers and Harbors Act Submittals (Bridge Permits)	23 CFR 650 Subpart H; 33 CFR 114 & 115	As needed	Not Applicable	Office of Infrastructure	Field Engineering	Highways	

Activity	Authority[1]	Frequency	Due Date	FHWA HQ Program Office	FHWA Division Responsible Program Office	State DOT Responsible Program Office	Remarks
Approval for reduction of expenditures for off-system bridges	23 USC 133(g)(2)(B)	As needed	Not Applicable	Office of Infrastructure	Assistant Division Administrator	Highways	The FHWA Administrator may reduce the requirement for expenditures for off-system bridges if the FHWA Administrator determines that the State has inadequate needs to justify the expenditure.
Determination on Adequacy of State's Asset Management Plan	23 USC 119(5)	Annually beginning second fiscal year after establishment of the process		Office of Infrastructure	Planning & Program Development	Planning & Programming	
Certification and Recertification of States Process for Development of State Asset Management Plan	23 USC 119(6)	Recertification every four years after establishment of the process		Office of Infrastructure	Planning & Program Development	Planning & Programming	
Review Reporting on Performance Targets	23 USC 150(e)	Beginning four years after enactment of MAP-21 and biennially thereafter		Office of Infrastructure	Planning & Program Development	Planning & Programming	
Review National Highway System Performance Achievement Plan for Actions to achieve the targets (when State does not achieve or make significant progress toward achieving)	23 USC 119(7)	Required if State does not achieve targets (or significant progress) for 2 consecutive reports		Office of Infrastructure	Planning & Program Development	Planning & Programming	
States and sub-recipient failure to maintain projects - Notice and withholding Federal-aid Funds	23 USC 116(d)	As needed	Not Applicable	Office of Infrastructure	Planning & Program Development	Planning & Programming	
Emergency Relief (ER) Damage Assessments and Reports	23 CFR 668 23 USC 120 and 125	As needed	Not Applicable	Office of Infrastructure	Field Engineering	Highways	Perform with State.

Activity	Authority[1]	Frequency	Due Date	FHWA HQ Program Office	FHWA Division Responsible Program Office	State DOT Responsible Program Office	Remarks
Toll Credit and Maintenance of Effort (MOE) Calculation and Agreement	23 USC 120(i)	Annually		Office of Infrastructure	Field Engineering	Planning & Programming	State will calculate the amount of eligible toll credit and submit for approval. FHWA will review and approve the request.
Local Public Agency (LPA) Oversight	2 CFR 200.331; 23 USC 106(g)(4)	As needed	Not Applicable	Office of Infrastructure	Field Engineering	Highways	States are responsible to ensure that LPAs are aware of all the applicable Federal-aid Program requirements; States are responsible to ensure monitoring and oversight to assure compliance with Federal requirements. 23 USC further reinforces stressing accountability on "project delivery systems" and "accounting controls."
Approval to Sell, Lease or Otherwise Dispose of a Ferry Purchased with Federal-aid Funds	23 USC 129 (c)(6)	As needed	Not Applicable	Office of Infrastructure	Planning, Environment & ROW	Highways	Division Office reviews and submits for Office of Program Administration for Administrator Approval
Territorial Highway Program - Approval of Territory Agreement	23 USC 165(c)(5)	Reviewed and Revised as needed every two years		Office of Infrastructure	N/A	N/A	Division Office works with Office of Program Administration and HCC
TIFIA Credit Program	23 USC 601-609	As needed	Not Applicable	Office of Innovative Program Delivery	Finance & Logistics	Innovative Project Delivery	Project sponsors submit requests for credit assistance to the TIFIA JPO for review; approval by the Secretary
GARVEEs	23 USC 122; GARVEE Guidance 3/14	As needed	Not Applicable	Office of Innovative Program Delivery	Finance & Logistics	Innovative Project Delivery	MOUs strongly suggested for each GARVEE issue. FM contacts OIPD for review/concurrence before final approval

Activity	Authority[1]	Frequency	Due Date	FHWA HQ Program Office	FHWA Division Responsible Program Office	State DOT Responsible Program Office	Remarks
State Infrastructure Banks	NHS Act Section 308; 23 USC 610; SIB Guidance 3/14	Annual Report	Not Applicable	Office of Innovative Program Delivery	Finance & Logistics	Innovative Project Delivery	Division sends copy of report to OIPD. SIB submits annual report to Division Office.
Section 129 Tolling Authority Requests	23 USC 129(a)	As needed	Not Applicable	Office of Innovative Program Delivery	Field Engineering	Innovative Project Delivery	At the option of the project sponsor, may execute a Tolling Eligibility MOU with the Division Office; HIN coordinates FHWA HQ review
Section 166 HOV/HOT Lanes Tolling Authority Requests	23 USC 166(d)	As needed	Not Applicable	Office of Innovative Program Delivery	Field Engineering	Innovative Project Delivery	At the option of the project sponsor, may execute a Tolling Eligibility MOU with the Division Office; HIN coordinates FHWA HQ review
Value Pricing Pilot Program Tolling Authority Requests	ISTEA Section 1012(b)	As needed	Not Applicable	Office of Innovative Program Delivery	Field Engineering	Innovative Project Delivery	Requests submitted to HIN to coordinate review; approval by the Administrator
Interstate System Reconstruction and Rehabilitation Pilot Program Tolling Authority Requests	TEA-21 Section 1216(b)	As needed	Not Applicable	Office of Innovative Program Delivery	Field Engineering	Innovative Project Delivery	Applications submitted to HIN to coordinate review; approval by the Administrator
Annual Audit of Toll Facility Records and Certification of Adequate Maintenance - Report Submittal	23 USC 129(a)(3)(B); TEA-21 Section 1216(b)(5)(B); SAFETEA-LU Section 1604(b)(3)(A); ISTEA Section 1012(b)(3)	Annually		Office of Innovative Program Delivery	Field Engineering	Innovative Project Delivery	Division Office to receive the reports.
Project Management Plan (Major Projects)	23 U.S.C. 106(h)(2)	Prior to first federal authorization of construction funds for a Major Project	Not Applicable	Office of Innovative Program Delivery	Division Office will conduct concurrent review with HQ Office of Innovative Program Delivery.	State DOT or Project Sponsor will prepare and submit Project Management Plan.	Division Office will provide approval after receiving concurrence from HQ Office of Innovative Program Delivery.

Activity	Authority[1]	Frequency	Due Date	FHWA HQ Program Office	FHWA Division Responsible Program Office	State DOT Responsible Program Office	Remarks
Financial Plan (Major Projects)	23 U.S.C. 106(h)(3)	Prior to first federal authorization of construction funds for a Major Project and then annually.	Annually as noted in the approved Initial Financial Plan	Office of Innovative Program Delivery	Division Office will conduct concurrent review with HQ Office of Innovative Program Delivery.	State DOT or Project Sponsor will prepare and submit annual Financial Plans.	Division Office will provide approval after receiving concurrence from HQ Office of Innovative Program Delivery.
Financial Plan (Other Projects)	23 U.S.C. 106(i)	Prior to first federal authorization of construction funds for an Other Project and then annually.	Annually as noted in the approved Initial Financial Plan	Office of Innovative Program Delivery	Division Office will review and approve Financial Plans for Other Projects in accordance with its stewardship and oversight agreement with the State DOT or Project Sponsor.	State DOT or Project Sponsor will prepare and submit annual Financial Plans to the Division Office, only upon request.	Other Projects are defined as projects with an estimated total cost of $100 million or more that have not been designated as Major Projects.
Review Designation and Re-designation of Primary Freight Network	23 USC 167(d)	One year after enactment of MAP-21 and every ten years thereafter		Office of Operations	Planning, Environment & ROW	Planning & Programming	Under development, initial PFN designation scheduled for Spring 2014 completion.
Review Development and Update of National Freight Strategic Plan	23 USC 167(f)	Three years after enactment of MAP-21 and every five years thereafter		Office of Operations	Planning, Environment & ROW	Planning & Programming	OST lead
Review Freight Transportation Conditions and Performance Report	23 USC 167(g)	Two years after enactment of MAP-21 and every two years thereafter		Office of Operations	Planning, Environment & ROW	Planning & Programming	OST lead
Review HOV Operations Report for Tolled Use and Low-Emission and Energy-Efficient Vehicle Use	23 USC 166(d)	Annually		Office of Operations	Planning, Environment & ROW	Planning & Programming	
Congestion Partnerships Assessment	Annual Memo from HQ	Annually	1-Jul	Office of Operations	Planning, Environment & ROW	Planning & Programming	Complete with partners and forward to HQ.

Activity	Authority[1]	Frequency	Due Date	FHWA HQ Program Office	FHWA Division Responsible Program Office	State DOT Responsible Program Office	Remarks
Traffic Incident Management Self-Assessment	Annual Memo from HQ	Annually	1-Jul	Office of Operations	Mobility & Safety	Highways	Complete with partners and forward to HQ.
Work Zone Self-Assessment	Annual Memo from HQ	Annually	7/1/2013, This project is currently on hiatus and has not been determined whether it will be reestablished or not.	Office of Operations	Mobility & Safety	Highways	Complete with partners and forward to HQ.
Approval of State-Prepared Manual on Uniform Traffic Control Devices - State Traffic Control Manuals	23 CFR 655.603, 23 USC 109(d)	As needed	Not Applicable	Office of Operations	Mobility & Safety	Highways	
Review Vehicle Size & Weight Enforcement Plan	23 CFR 657.11, 23 USC 127	Annually	1-Oct	Office of Operations	Mobility & Safety	Highways	
Review Vehicle Size & Weight Enforcement Certification	23 CFR 657.13, 23 USC 141	Annually	1-Jan	Office of Operations	Mobility & Safety	Highways	
Approval of National Network Modifications	23 CFR 658.11	As needed	Not Applicable	Office of Operations	Mobility & Safety	Highways	
Intelligent Transportation System Architecture & Standards	23 CFR Part 940	As needed	Not Applicable	Office of Operations	Mobility & Safety	Highways	
Approval of Work Zone Significant Project Determination	23 CFR 630.1010	As needed		Office of Operations	Mobility & Safety	Highways	
Approval of Exceptions to Work Zone Procedures for Interstate Projects	23 CFR 630.1010	As needed		Office of Operations	Mobility & Safety	Highways	
Approval of Work Zone Policy and Procedures Conformance Review	23 CFR 630.1014	At appropriate intervals		Office of Operations	Mobility & Safety	Highways	
Process Review of Work Zone Safety and Mobility Procedures	23 CFR 630.1008, 23 USC 109(e)(2), 23 USC 112(g)	Every 2 years		Office of Operations	Mobility & Safety	Highways	

Activity	Authority[1]	Frequency	Due Date	FHWA HQ Program Office	FHWA Division Responsible Program Office	State DOT Responsible Program Office	Remarks
Approval of State Planning Work Program and Revisions (Part 1)	23 CFR 420.111, 23 CFR 420.115, and 23 CFR 420.209	Annually	Prior to Program Period	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	FHWA Division Office Approval.
Approval of State Research and Development Work Program (Part 2)	23 CFR 420.111, 23 CFR 420.115, and 23 CFR 420.209	Annually	Prior to Program Period	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	FHWA Division Office Approval.
Approval of State's Distribution of Planning Funds Formula - Allocation Formulas for PL Funds	23 CFR 420.109, 23 USC 104(d)(2)(A)(i)	When Revised	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	FHWA Division Office Approval.
Review of State Public Involvement Procedures	23 CFR 450.210(a)	As needed	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	FHWA Division Office Review to Assure Compliance.
Receipt of State Consultation Process for Non- metropolitan Local Officials	23 CFR 450.210(b)	As needed	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	Informational Purposes.
Review of Long-range Statewide Transportation Plan	23 CFR 450.214	As needed	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	FHWA Division Office Review to Assure Compliance.
Approval of Statewide Transportation Improvement Program (STIP)	23 CFR 450.216, 23 CFR 450.218(a) & (c), 23 USC 135(g)(7)	At least every 4 years	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	Joint FHWA and FTA approval.
Approval of STIP Amendments	23 CFR 450.218(a) & (c)	As needed	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	Joint FHWA and FTA approval.
Finding of Consistency of Planning Process with Section 134 and 135	23 USC 135(g)(8), 23 CFR 450.218(b)	Concurrent with STIP approval	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	FHWA and FTA issue a joint finding concurrent with STIP approval.
Review of State Self-certification that Planning Process is in Accordance with Applicable Requirements	23 CFR 450.218(a)	Submitted with proposed STIP or STIP amendments	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	Received with STIP.
Approval of Transportation Management Area (TMA) MPO Unified Planning Work Programs (UPWP)	23 CFR 450.308(b) and 23 CFR 420 (Subpart A)	Prior to Program End	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	

Activity	Authority[1]	Frequency	Due Date	FHWA HQ Program Office	FHWA Division Responsible Program Office	State DOT Responsible Program Office	Remarks
Approval of Non-TMA UPWA	23 CFR 450.308(b) and 23 CFR 420 (Subpart A)	Prior to Program End	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	May use simplified work statement.
Approval of UPWP Revisions and Amendments (All MPO's)	23 CFR 420.115	As needed	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	
Review of UPWP Performance and Expenditure Reports (All MPO's)	23 CFR 420.117(b)	Not more frequently than quarterly	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	
Approval of Report Before Publication (All MPO's)	23 CFR 420.117(e)	As needed	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	Waiver may be granted.
Approval to use Planning Funds outside Urbanized Areas for States Receiving Minimum Apportionment	23 USC 104(d)(1)(A)(ii)	As needed	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	
Review of Metropolitan Planning Area Boundary (Establishment and Changes)	23 CFR 450.312	As needed	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	Approval by MPO and the Governor, shape files forwarded to HQ. (Comment: No action is required by FHWA/FTA).
Review of Metropolitan Transportation Planning Organizations (MPO) Designation and Re-designation	23 CFR 450.310	As needed	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	Require agreement between Governor and local governments.
Review of Metropolitan Planning Agreements (MPA) for Attainment or Entire Nonattainment Area	23 CFR 450.314(a)	When Completed	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	Between MPO/State DOT/Transit Operator. Included in UPWP or Prospectus (23 CFR 450.314(d)).
Review of MPA - for MPA that do not include the entire nonattainment or maintenance area	23 CFR 450.314(b), 23 USC 109(j)	When Completed	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	Between MPO/State DOT/State AQ Agency.
Review of MPO Public Participation Procedures	23 CFR 450.316(a)	As needed	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	Must be developed and published.

Activity	Authority[1]	Frequency	Due Date	FHWA HQ Program Office	FHWA Division Responsible Program Office	State DOT Responsible Program Office	Remarks
Review of Metropolitan Transportation Plan (MTP) in Attainment Areas (and Updates)	23 CFR 450.322	Every 4 years	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	
Review of MTP in Non-Attainment and Maintenance Areas (and Updates)	23 CFR 450.322	Every 5 years	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	
Review of MTP Amendments	23 CFR 450.322(c)	As Needed	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	
Air Quality Conformity Determination on LRTP in Non-attainment and Maintenance Areas	23 CFR 450.322(d)	Concurrent with LRTP updates at least every 4 years and as needed on amendments	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	After receipt of MPO determination; Joint FHWA and FTA determination; In consultation with the Environmental Protection Agency (EPA).
Review of Transportation Improvement Program (TIP)	23 CFR 450.300(a); 23 CFR 450.324(b); 23 CFR 450.328(a), 23 USC 134(j)(1)(D)	Prior to Program Period	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	No succinct Federal approval action is required for the TIP. FHWA/FTA approval of the TIP is through the STIP approval process.
Review of TIP Amendments	23 CFR 450.324(a); 23 CFR 450.328(b)	As needed	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	No succinct Federal approval action is required for the TIP. FHWA/FTA approval of the TIP is through the STIP approval process.
Approval of Air Quality Conformity Determination on TIP	23 CFR 450.326; 23 CFR 450.328	At least every 4 years, or when the TIP has been modified (unless exempt projects)	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	Applies to non-attainment and maintenance areas only. After receipt of MPO determination, joint determination with FTA (in cooperation with EPA).

Activity	Authority[1]	Frequency	Due Date	FHWA HQ Program Office	FHWA Division Responsible Program Office	State DOT Responsible Program Office	Remarks
Federal Finding of Consistency of Planning Process with Section 134 and 135	23 CFR 450.218(b); 23 CFR 450.334(a)	Concurrent with (S)TIP submittal	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	At least every four years, joint finding with FTA when TIP is submitted.
In Metropolitan Planning Areas, Review of State and MPO Self-certification that Planning Process is in Accordance with Applicable Requirements	23 CFR 450.334 (a), 23 CFR 218(a)	Annually or concurrent with the STIP/TIP cycle	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	Required for all MPO's. May be included in the STIP, TIP, or UPWP, at least every 4 years.
In TMA's, Certification that Planning Process is in Accordance with Applicable Requirements	23 CFR 450.334(b), 23 USC 134(k)(5)	Every 4 years		Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	Joint FHWA and FTA Certification.
Approval of Federal-Aid Urban Area Boundaries	23 CFR 470.105 (a), 23 USC 101(a)(33)	As needed	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	
Approval of Revision of Functional Classification	23 CFR 470.105 (b)	As needed	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	
Approval by Administrator of Interstate Additions & Revisions	23 USC 103(c)(1)(D), 23 CFR 470.111, 23CFR 470.115 (a)	As needed	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	Approval by HQ – Administrator.
Approval by Office Director of National Highway System (NHS) Additions and Revisions	23 USC 103(b)(3), 23 CFR 470.113 and 470.115(a)	As needed	Not Applicable	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	Approved by HQ - Office Director.
Review of CMAQ Annual Report	CMAQ Guidance Memo October 31, 2006	Annually	1-Mar	Office of Planning, Environment & Realty	Planning, Environment & ROW	Planning & Programming	Division provides information on CMAQ projects including: amount of obligation, project description and location, and air quality benefits. The report must be submitted via the web-based CMAQ Tracking System.

ATTACHMENT D
SELECTION AND MONITORING OF PROJECTS OF DIVISION INTEREST (PODI'S)
IDOT/FHWA STEWARDSHIP AND OVERSIGHT AGREEMENT

Projects of Division Interest (PoDI's)[2] are IDOT projects on which there will be any sort of direct FHWA involvement beyond actions shown in Attachment A, "Project Action Responsibility Matrix". Projects of Corporate Interest (PoCI's) are a subset of PoDI's. PoCI's are IDOT projects on which there will be direct FHWA involvement but also have national significance and the increased potential for additional FHWA resources beyond the Illinois Division.

Projects designated as a PoDI / PoCI will typically be on the National Highway System (NHS). Due to special requirements needed to address federal requirements, projects funded through the TIGER program and projects classified as Major Projects will be designated as PoDI's regardless of the NHS status. Otherwise, projects off the NHS will only be considered for PoDI designation by IDOT request and FHWA concurrence although FHWA may prompt IDOT to make the request for a project with complex challenges or unusual circumstances.

Attachment A, "Project Action Responsibility Matrix", identifies the FHWA's level of direct involvement on the routine Federal Highway Program delivery. However, when a project is designated as a PoDI/ PoCI, various project actions normally marked State, will be assumed by FHWA due to the projects significance or risk identified, and stipulated in the project PoDI plan. The form of FHWA's approvals can be documented either through an FHWA letter, signature on an IDOT document, captured in meeting minutes sent to FHWA, or informal email from a FHWA representative.

The coordination process of PoDI's / PoCI's between the IDOT and the FHWA will be governed as follows:

- Annually, the IDOT will publish its Multi-Year Program on the IDOT website. The MYP is typically available in April of each year.
- The FHWA will then select PoDI's / PoCI's from the MYP and also identify the specific area(s) of federal involvement for each project. The PoDI / PoCI list will be finalized in June of each year.
- PoDI / PoCI milestones, such as designation and completion will be memorialized via formal correspondence between FHWA and IDOT. The PoDI plan will be the guide for when FHWA involvement is limited to a project phase and not the entirety of the authorized work.
- PoDI / PoCI status and tracking will be done electronically (i.e. website or SharePoint site) and FHWA will provide the tracking information to IDOT on an agreed upon frequency.

---

[2] *The following are considered PoDI projects: Major Projects (>$500M); Appalachian Development Highway Projects; TIGER Discretionary Grant Projects; NHS Projects with Retained FHWA Project Approval; Non-NHS Projects with Retained FHWA Project Approval;* and *Projects Selected by FHWA for Risk-based Stewardship & Oversight.* Regardless of retained project approval actions, any Federal-aid Highway Project either on or off the NHS that the Division identifies as having an elevated level of risk can be selected for risk-based stewardship and oversight and would then be identified as a PoDI. Please see *"Projects of Division Interest (PoDI)/Projects of Corporate Interest (PoCI) Guidance (available at* http://www.fhwa.dot.gov/federalaid/stewardship/

PROGRAMMATIC AGREEMENT
BETWEEN THE FEDERAL HIGHWAY ADMINISTRATION
AND THE ILLINOIS DEPARTMENT OF TRANSPORTATION
REGARDING THE PROCESSING OF ACTIONS CLASSIFIED AS
CATEGORICAL EXCLUSIONS FOR FEDERAL-AID HIGHWAY PROJECTS

THIS PROGRAMMATIC AGREEMENT ("Agreement"), made and entered into this 14th day of October 2020, by and between the FEDERAL HIGHWAY ADMINISTRATION, UNITED STATES DEPARTMENT OF TRANSPORTATION ("FHWA") and the STATE OF ILLINOIS acting by and through its DEPARTMENT OF TRANSPORTATION ("IDOT") hereby provides as follows:

WITNESSETH:

Whereas, the National Environmental Policy Act of 1969 (NEPA), 42 U.S.C. §§ 4321-4370h (2014), and the Regulations for Implementing the Procedural Provisions of NEPA (40 CFR parts 1500-1508) direct Federal agencies to consider the environmental impacts of their proposed major Federal actions through the preparation of an environmental assessment (EA) or environmental impact statement (EIS) unless a particular action is categorically excluded;

Whereas, the FHWA distribution and spending of Federal funds under the Federal-aid Highway Program and approval of actions pursuant to Title 23 of the U.S. Code are major Federal actions subject to NEPA;
Whereas, the Secretary of Transportation has delegated to FHWA the authority to carry out functions of the Secretary under NEPA as they relate to matters within FHWA's primary responsibilities (49 CFR 1.81(a)(5));

Whereas, the FHWA's NEPA implementing procedures (23 CFR part 771) list a number of categorical exclusions (CE) for certain actions that FHWA has determined do not individually or cumulatively have a significant effect on the human environment and therefore do not require the preparation of an EA or EIS;

Whereas, IDOT is a State agency that undertakes transportation projects using Federal funding received under the Federal-aid Highway Program and must assist FHWA in fulfilling its obligations under NEPA for IDOT projects (23 CFR 771.109);
Whereas, this Agreement applies to all action as defined in 23 CFR 771.107(b), which includes local government projects, in the State of Illinois;

Whereas, Section 1318(d) of the Moving Ahead for Progress in the 21st Century Act (MAP-21), Pub. L. 112-141, 126 Stat. 405 (July 6, 2012), amended by Section 1315(a) of Fixing America's Surface Transportation Act (FAST Act), allows FHWA to enter into programmatic agreements with the States that establish efficient administrative procedures for carrying out environmental and other required project reviews, including agreements that allow a State to determine whether a project qualifies for a CE on behalf of FHWA;

Whereas, the FHWA developed regulations implementing the authorities in section 1318(d), effective November 6, 2014;

Whereas, per 23 CFR 771.113(a), the FHWA must not authorize final design activities, property acquisition, or construction activities until a CE approval has been made;

Whereas, this Agreement supersedes all previous CE processing agreements held between FHWA and IDOT;

Whereas, FHWA has issued a Wetland Finding for Federal Aid Projects processed as Categorical Exclusions and is attached to this Agreement as Attachment I; and

Now, therefore, the FHWA and IDOT enter into this Programmatic Agreement (“Agreement”) for the processing of CEs.

I. **PARTIES**

The Parties to this Agreement are FHWA and IDOT.

II. **PURPOSE**

A. The purpose of this Agreement is to authorize IDOT to determine on behalf of FHWA whether a project qualifies for a CE specifically listed in 23 CFR 771.117 (listed in Appendix A and B of this Agreement) subject to the conditions specified in Section V of this Agreement.
B. This Agreement also requires IDOT to present information to FHWA for CE actions that 1) do not meet the conditions specified in this Agreement for IDOT to approve and 2) are not specifically listed in 23 CFR 771.117, but meet the CE criteria in 40 CFR 1508.4 and 23 CFR 771.117(a). For these actions, IDOT must request FHWA’s approval of the action as a CE.

III. **AUTHORITIES**

This agreement is entered into pursuant to the following authorities:
A. National Environmental Policy Act, 42 U.S.C. 4321 - 4370
B. Moving Ahead for Progress in the 21st Century Act, P.L. 112-141, 126 Stat. 405, Sec. 1318(d)
C. Fixing America’s Surface Transportation Act, P.L. 114-94, 129 Stat. 1312, Sec. 1315(a)
D. 40 CFR parts 1500 - 1508
E. DOT Order 5610.1C
F. 23 CFR 771.117

IV. **RESPONSIBILITIES**

A. IDOT is responsible for:

1. Ensuring the following process is completed for each project that qualifies for a CE:

a. IDOT may make a CE approval on behalf of FHWA (“State Approved CE”) for actions qualifying for a CE listed in Appendix A (CEs established in 23 CFR 771.117(c)) and Appendix B (CEs established in 23 CFR 771.117(d)), that do not exceed the thresholds in Section V of this Agreement (“Potential for Unusual Circumstances and Exclusions to State Approved CEs”). IDOT will identify the applicable listed CE, ensure any conditions or constraints are met, verify that there is no potential for unusual circumstances, address any and all other environmental requirements, and complete the review with an appropriate signature evidencing approval, per Section VII of this Agreement (“NEPA Approvals and Re-evaluations”). No separate review or approval of State Approved CEs by FHWA is required. Additionally, IDOT may request FHWA approval on an action that does not exceed the thresholds in Section V. For any of these actions, IDOT must compile and present to FHWA information that the action qualifies for a CE classification.

b. IDOT may not approve actions listed in Appendices A and B that exceed the thresholds in Section V. IDOT may not approve any actions that meet the definition of a CE and that may be classified as a CE according to the open-ended authority in 771.117(d). These actions require FHWA review, and if in agreement with the CE classification, FHWA approval of the CE ("Federal Approved CE") based on the information IDOT provides on the action.

c. IDOT shall submit, at a minimum, the following information to FHWA for review and CE approval prior to the time FHWA considers its next approval action for the project:

i. If requested by FHWA, IDOT shall provide a copy of the CE documentation prepared for the actions(s) in accordance with Section VI of this Agreement.

ii. If any project requires a Section 4(f) de minimis determination or programmatic evaluation, IDOT shall submit the 4(f) documentation for FHWA determination and approval.

iii. If FHWA determines that the information IDOT has provided is inadequate, they may request additional studies and documentation, and/or consultation with other agencies.

2. Consulting with FHWA for actions that involve potential for unusual circumstances (23 CFR §771.117(b)), to determine the appropriate class of action for environmental analysis and documentation. IDOT may decide, or FHWA may require that additional studies need to be performed prior to making a CE approval or deciding on the need to prepare an EA or EIS.

3. Meeting applicable documentation requirements in Section VI for State Approved CEs and Federal Approved CEs, providing information on CE projects to FHWA, applicable approval and re-evaluation requirements in Section VII, and applicable quality control/quality assurance, monitoring, and performance requirements in Section VIII.

4. Relying only upon employees directly employed by IDOT to make CE approvals, or requesting CE approvals from FHWA, under this agreement. IDOT may not delegate its responsibility for CE approvals, or requests for FHWA approval, to third parties (i.e., consultants, local government staff, and other State agency staff).

5. Maintaining adequate organizational and staff capability and expertise to effectively carry out the provisions of this Agreement. This includes, without limitation:

a. Using appropriate technical and managerial expertise to perform the functions set forth under this Agreement.

b. Devoting adequate financial and staff resources to carry out the approvals and processing of projects under this Agreement.

c. All individuals participating in the determination and approval of projects under this Agreement will be familiar with and follow the appropriate subsections of 23 CFR 771, the NEPA process, IDOT policy manuals, memoranda, and any other policies relevant to the documentation of CE determinations.

6. Whenever there is a conflict between FHWA regulations and this Agreement or IDOT's policies and procedures manual, FHWA regulations shall be followed.

B. The FHWA is responsible for:

1. Providing timely advice and technical assistance on CEs to IDOT, as requested.

2. Providing timely input and review of CE actions requiring FHWA approval. FHWA will base its approval of CE actions on the project documentation prepared by IDOT under this Agreement.

3. Overseeing the implementation of this Agreement in accordance with the provisions in Section VIII, including applicable monitoring and performance provisions.

V. **POTENTIAL FOR UNUSUAL CIRCUMSTANCES AND EXCLUSIONS TO STATE-APPROVED CEs**

When IDOT proposes to approve an action as a CE on FHWA's behalf, IDOT shall evaluate the action for unusual circumstances. This evaluation must consider the effects of all aspects of the project, which includes, but is not limited to, detours, runarounds, or ramp closures that the action will require. IDOT CE documentation will record the outcome of this evaluation (see Part VI(A)(1) below).

For activities that do not lead to construction and are consistent with Appendix A Item (1) (also 23 CFR 771.117(c)(1)), IDOT hereby determines that these projects have no potential to exceed the thresholds in this stipulation and are programmatically approved as State Approved Categorical Exclusions. These activities require no additional review, approval, or documentation. Activities that do not involve, or lead directly to construction, includes but is not limited to:

- planning and/or research activities (MPO funding, annual research program, etc.);
- training (Local Technical Assistance Program (LTAP), National Summer Transportation Institute (NSTI), etc.)
- bridge inspections;
- studies (feasibility, corridor, project reviews, etc.)
- DBE/Supportive Services Work Plans
- engineering services to define the elements of a proposed action or alternatives so that social, economic, and environmental effects can be assessed (Phase I/NEPA); and
- Federal-aid system revisions that establish classes of highways on the Federal-aid highway system.

IDOT may not approve actions listed in Appendices A and B that exceed the following thresholds. An action requires FHWA CE review and approval if it involves any of the following circumstances:

1) Require one or more residential or business relocations and/or the acquisition of more than 10 acres total for a non-linear improvement (spot improvement, e.g. bridge, intersection) or the acquisition of more than 3 acres per mile; or

2) Are defined as a "Type I project" per 23 CFR 772.5 and therefore requires a noise analysis; or

3) Result in an "adverse effect" finding to a historic property, as defined in 36 CFR 800.16(l); or

4) Requires an Individual Section 4(f) evaluation for the use of properties protected by Section 4(f) of the Department of Transportation Act (49 U.S.C. 303); or

5) Involve impacts that would require an Individual Section 404 Permit from the U.S. Army Corps of Engineers; or

6) Through Section 7 of the Endangered Species Act consultation, result in a finding of “may affect, likely to adversely affect” a federally listed or candidate species, or proposed or designated critical habitat; or

7) Require substantial changes in access, access control, or travel patterns. IDOT will present such information to FHWA to determine if changes are substantial; or

8) Require the use of a temporary road, detour or ramp closure, unless the use of such facilities satisfies the following conditions:

a) Provisions are made for access by local traffic and so posted,

b) Businesses dependent on through-traffic will not be adversely affected,

c) To the extent possible, there is no interference with any local special event or festival,
d) There is no substantial change to the environmental consequences of the action, and
e) There is no substantial controversy associated with such facilities.

9) Involve State designated Nature Preserves; or

10) Exceed the IDNR threshold for an increase in 100-year flood water surface elevations, or has potential for a "significant encroachment” to floodplains, as defined in Executive Order 11988; or

11) Require a permit from U.S. Coast Guard under Section 9 of the Rivers and Harbors Act of 1899; or

12) Require the acquisition of lands under the protection of Section 6(f) of the Land and Water Conservation Act of 1965; or

13) Involve impacts to a stream listed on the National Park Service’s National Rivers Inventory and would adversely affect the listings Outstandingly Remarkable Value; or

14) Have potential for controversy on environmental grounds as determined by FHWA, or inconsistency with Federal, State, or local requirements relating to the environment or planning.

VI. **DOCUMENTATATION OF CE APPROVALS**

A. For both IDOT CE approvals and FHWA CE approvals, IDOT shall ensure that it fulfills the following responsibilities for documenting the project-specific determinations made:

1. For actions listed in Appendix A and B that do not exceed the thresholds in Section V of this Agreement, IDOT will identify the applicable action, ensure any conditions specified in FHWA regulation are met, verify that there are no potential unusual circumstances, address all other environmental requirements, and complete the review with the appropriate IDOT signature evidencing approval.

2. Actions listed in Appendix A and B that exceed the thresholds in Section V of this Agreement require FHWA CE approval. IDOT shall prepare documentation that supports the CE determination and that no unusual circumstances exist that would make the CE approval inappropriate, and will address all other environmental requirements.

B. IDOT shall maintain a project record for State Approved CEs and Federal Approved CEs. This record should include as appropriate:

1. Any checklists, forms, or other documents and exhibits that summarize the consideration of project effects and potential for unusual circumstances;

2. A summary of public involvement complying with the requirements of IDOT's public involvement procedures;

3. Any stakeholder (including resource and regulatory agencies) communication, correspondence, consultation, or public meeting documentation;

4. The name and title of the CE approver and the date of the approval; and

5. If a documented re-evaluation was required, the date of approval of the determination that the CE decision is still valid, per Section VII.B. of this Agreement ("NEPA Approvals and Re-evaluations").

C. Any project records maintained by IDOT shall be provided to FHWA at their request. IDOT should retain those records for a period of no less than three (3) years after completion of project construction. Records should include, as appropriate: any stakeholder (including resource and regulatory agencies) communication, correspondence, consultation, and public meeting documentation. This 3-year retention provision does not relieve IDOT of its project or program recordkeeping responsibilities under 2 CFR § 200.333 or any other applicable laws, regulations, or policies.

VII. **NEPA APPROVALS AND RE-EVALUATIONS**

A. IDOT approval of Appendix A and Appendix B CEs is delegated to the Approving Officials and their Designees as identified in Appendix C.

B. In accordance with 23 CFR 771.129, prior to requesting any subsequent project approvals from FHWA, regardless of how much time has passed since the CE approval, IDOT shall ensure that CE determinations are still valid. IDOT will utilize their system of policy controls and procedures to determine if there are any changes to the proposed actions or new information or circumstances relevant to the project actions that necessitate IDOT to re-evaluate CE approvals. IDOT will determine if it is necessary to consult with FHWA, and/or prepare additional documentation to ensure that CE determinations are still valid. If additional documentation is prepared, IDOT shall maintain the documentation in the project file, per Section VI.B.5.

VIII. QUALITY CONTROL/QUALITY ASSURANCE, MONITORING AND PERFORMANCE

A. IDOT Quality Control & Quality Assurance

IDOT agrees to carry out regular quality control and quality assurance activities to ensure that its CE approvals and CE submissions to FHWA for approval are made in accordance with applicable law and this Agreement.

B. IDOT Performance Monitoring and Reporting

1. The FHWA and IDOT should cooperate in monitoring performance under this Agreement and work to assure quality performance.

2. IDOT shall annually submit to FHWA a report summarizing its performance under this Agreement, no later than February 28 of each calendar year. The report will identify any areas where improvement is needed and what measures IDOT is taking to implement those improvements. The report will include a description of actions taken by IDOT as part of its quality control efforts under Section VIII(A).

C. FHWA Oversight and Monitoring

1. Monitoring by FHWA will include consideration of the technical competency and organizational capacity of IDOT, as well as IDOT's performance of its CE processing functions. Performance considerations include, without limitation, the quality and consistency of IDOT's CE approvals, CE submissions to FHWA for approval, adequacy and capability of IDOT staff and consultants, and the effectiveness of IDOT's administration of its internal CE approvals. FHWA will conduct this oversight and monitoring through its participation in the regularly scheduled coordination meetings in each IDOT District Office.

2. Through the joint process review program, FHWA and IDOT will conduct one or more program reviews, during the term of this Agreement. This will serve to satisfy FHWA's oversight requirements under this Agreement. IDOT and FHWA, prior to completing the joint process review, will prepare and implement a corrective action plan to address any findings or observations identified in the joint process review. The results of the joint process review and corrective actions taken by IDOT shall be considered at the time this Agreement is considered for renewal.

3. Nothing in this Agreement prevents FHWA from undertaking other monitoring or oversight actions, including audits, with respect to IDOT's performance under this Agreement. The FHWA may require IDOT to perform such other quality assurance activities, including other types of monitoring, as may be reasonably required to ensure compliance with applicable Federal laws and regulations.

4. IDOT agrees to cooperate with FHWA in all oversight and quality assurance activities.

IX. **AMENDMENTS**

A. If the parties agree to amend this Agreement, then FHWA and IDOT may execute an amendment with new signatures and dates of the signatures. The term of the Agreement shall remain unchanged unless otherwise expressly stated in the amended Agreement.

B. Appendix A and B may be modified through verbal agreement by FHWA and IDOT without new signatures to this agreement based on activities added through FHWA rulemaking to those listed in 23 CFR 771.117(c) or example activities listed in 23 CFR 771.117(d) after the date of the execution of this Agreement. A modification date will be noted on the revised Appendix A and B.

C. IDOT may request in writing to modify Appendix C. Upon written concurrence from FHWA, Appendix C may be modified without new signatures to this Agreement. A modification date will be noted on the revised Appendix C.

X. TERM, RENEWAL, AND TERMINATION

A. This Agreement shall have a term of five (5) years, effective on the date of the last signature. IDOT shall post and maintain an executed copy of this Agreement on its website, available to the public.

B. This Agreement is renewable for additional five (5) year terms if IDOT requests renewal and FHWA determines that IDOT has satisfactorily carried out the provisions of this Agreement. In considering any renewal of this Agreement, FHWA will evaluate the effectiveness of the Agreement and its overall impact on the environmental review process.

C. Either party may terminate this Agreement at any time only by giving at least 30 days written notice to the other party.

D. Expiration or termination of this Agreement shall mean that IDOT is not able to make CE approvals on FHWA's behalf.

Execution of this Agreement and implementation of its terms by both parties provides evidence that both parties have reviewed this Agreement and agree to the terms and conditions for its implementation. This Agreement is effective upon the date of the last signature below.

Osman, Jr. — 9/22/20

APPENDIX A
(From 23 CFR 771.117(c))

(1) Activities which do not involve or lead directly to construction, such as planning and research activities; grants for training; engineering to define the elements of a proposed action or alternatives so that social, economic, and environmental effects can be assessed; and Federal-aid system revisions which establish classes of highways on the Federal-aid highway system.

(2) Approval of utility installations along or across a transportation facility.

(3) Construction of bicycle and pedestrian lanes, paths, and facilities.

(4) Activities included in the State's *highway safety plan* under 23 U.S.C. 402.

(5) Transfer of Federal lands pursuant to 23 U.S.C. 107(d) and/or 23 U.S.C. 317 when the land transfer is in support of an action that is not otherwise subject to FHWA review under NEPA.

(6) The installation of noise barriers or alterations to existing publicly owned buildings to provide for noise reduction.

(7) Landscaping.

(8) Installation of fencing, signs, pavement markings, small passenger shelters, traffic signals, and railroad warning devices where no substantial land acquisition or traffic disruption will occur.

(9) The following actions for transportation facilities damaged by an incident resulting in an emergency declared by the Governor of the State and concurred in by the Secretary, or a disaster or emergency declared by the President pursuant to the Robert T. Stafford Act (42 U.S.C. 5121):

(i) Emergency repairs under 23 U.S.C. 125; and

(ii) The repair, reconstruction, restoration, retrofitting, or replacement of any road, highway, bridge, tunnel, or transit facility (such as a ferry dock or bus transfer station), including ancillary transportation facilities (such as pedestrian/bicycle paths and bike lanes), that is in operation or under construction when damaged and the action:

(A) Occurs within the existing right-of-way and in a manner that substantially conforms to the preexisting design, function, and location as the original (which may include upgrades to meet existing codes and standards as well as upgrades warranted to address conditions that have changed since the original construction); and

(B) Is commenced within a 2-year period beginning on the date of the declaration.

(10) Acquisition of scenic easements.

(11) Determination of payback under 23 U.S.C. 156 for property previously acquired with Federal-aid participation.

(12) Improvements to existing rest areas and truck weigh stations.

(13) Ridesharing activities.

(14) Bus and rail car rehabilitation.

(15) Alterations to facilities or vehicles in order to make them accessible for elderly and handicapped persons.

(16) Program administration, technical assistance activities, and operating assistance to transit authorities to continue existing service or increase service to meet routine changes in demand.

(17) The purchase of vehicles by the applicant where the use of these vehicles can be accommodated by existing facilities or by new facilities which themselves are within a CE.

(18) Track and railbed maintenance and improvements when carried out within the existing right-of-way.

(19) Purchase and installation of operating or maintenance equipment to be located within the transit facility and with no significant impacts off the site.

(20) Promulgation of rules, regulations, and directives.

(21) Deployment of electronics, photonics, communications, or information processing used singly or in combination, or as components of a fully integrated system, to improve the efficiency or safety of a surface transportation system or to enhance security or passenger convenience. Examples include, but are not limited to, traffic control and detector devices, lane management systems, electronic payment equipment, automatic vehicle locaters, automated passenger counters, computer-aided dispatching systems, radio communications systems, dynamic message signs, and security equipment including surveillance and detection cameras on roadways and in transit facilities and on buses.

(22) Projects, as defined in 23 U.S.C. 101, that would take place entirely within the existing operational right-of-way. Existing operational right-of-way refers to right-of-way that has been disturbed for an existing transportation facility or is maintained for a transportation purpose. This area includes the features associated with the physical footprint of the transportation facility (including the roadway, bridges, interchanges, culverts, drainage, fixed guideways, mitigation areas, etc.) and other areas maintained for transportation purposes such as clear zone, traffic control signage, landscaping, any rest areas with direct access to a controlled access highway, areas maintained for safety and security of a transportation facility, parking facilities with direct access to an existing transportation facility, transit power substations, transit venting structures, and transit maintenance facilities. Portions of the right-of-way that have not been disturbed or that are not maintained for transportation purposes are not in the existing operational right-of-way.

(23) Federally-funded projects:

(i) That receive less than $5,000,000 of Federal funds; or

(ii) With a total estimated cost of not more than $30,000,000 and Federal funds comprising less than 15 percent of the total estimated project cost.

(24) Localized geotechnical and other investigation to provide information for preliminary design and for environmental analyses and permitting purposes, such as drilling test bores for soil sampling; archeological investigations for archeology resources assessment or similar survey; and wetland surveys.

(25) Environmental restoration and pollution abatement actions to minimize or mitigate the impacts of any existing transportation facility (including retrofitting and construction of stormwater treatment systems to meet Federal and State requirements under sections 401 and 402 of the Federal Water Pollution Control Act (33 U.S.C. 1341; 1342)) carried out to address water pollution or environmental degradation.

(26) Modernization of a highway by resurfacing, restoration, rehabilitation, reconstruction, adding shoulders, or adding auxiliary lanes (including parking, weaving, turning, and climbing lanes), if the action meets the constraints in paragraph (e)* of this section.

(27) Highway safety or traffic operations improvement projects, including the installation of ramp metering control devices and lighting, if the project meets the constraints in paragraph (e)* of this section.

(28) Bridge rehabilitation, reconstruction, or replacement or the construction of grade separation to replace existing at-grade railroad crossings, if the actions meet the constraints in paragraph (e)* of this section.

(29) Purchase, construction, replacement, or rehabilitation of ferry vessels (including improvements to ferry vessel safety, navigation, and security systems) that would not require a change in the function of the ferry terminals and can be accommodated by existing facilities or by new facilities which themselves are within a CE.

(30) Rehabilitation or reconstruction of existing ferry facilities that occupy substantially the same geographic footprint, do not result in a change in their functional use, and do not result in a substantial increase in the existing facility's capacity. Example actions include work on pedestrian and vehicle transfer structures and associated utilities, buildings, and terminals.

*Note: In items (26), (27), and (28), “paragraph (e)” constraints are as follows:

23 CFR 117.117(e) Actions described in (c)(26), (c)(27), and (c)(28) of this section may not be processed as CEs under paragraph (c) if they involve:

(1) An acquisition of more than a minor amount of right-of-way or that would result in any residential or non-residential displacements;

(2) An action that needs a bridge permit from the U.S. Coast Guard, or an action that does not meet the terms and conditions of a U.S. Army Corps of Engineers nationwide or general permit under section 404 of the Clean Water Act and/or section 10 of the Rivers and Harbors Act of 1899;

(3) A finding of “adverse effect” to historic properties under the National Historic Preservation Act, the use of a resource protected under 23 U.S.C. 138 or 49 U.S.C. 303 (section 4(f)) except for actions resulting in *de minimis* impacts, or a finding of “may affect, likely to adversely affect” threatened or endangered species or critical habitat under the Endangered Species Act;

(4) Construction of temporary access, or the closure of existing road, bridge, or ramps, that would result in major traffic disruptions;

(5) Changes in access control;

(6) A floodplain encroachment other than functionally dependent uses (*e.g.,* bridges, wetlands) or actions that facilitate open space use (*e.g.,* recreational trails, bicycle and pedestrian paths); or construction activities in, across or adjacent to a river component designated or proposed for inclusion in the National System of Wild and Scenic Rivers.

Appendix B
(From 23 CFR 771.117(d))

(1)-(3) [Reserved]

(4) Transportation corridor fringe parking facilities.

(5) Construction of new truck weigh stations or rest areas.

(6) Approvals for disposal of excess right-of-way or for joint or limited use of right-of-way, where the proposed use does not have significant adverse impacts.

(7) Approvals for changes in access control.

(8) Construction of new bus storage and maintenance facilities in areas used predominantly for industrial or transportation purposes where such construction is not inconsistent with existing zoning and located on or near a street with adequate capacity to handle anticipated bus and support vehicle traffic.

(9) Rehabilitation or reconstruction of existing rail and bus buildings and ancillary facilities where only minor amounts of additional land are required and there is not a substantial increase in the number of users.

(10) Construction of bus transfer facilities (an open area consisting of passenger shelters, boarding areas, kiosks and related street improvements) when located in a commercial area or other high activity center in which there is adequate street capacity for projected bus traffic.

(11) Construction of rail storage and maintenance facilities in areas used predominantly for industrial or transportation purposes where such construction is not inconsistent with existing zoning and where there is no significant noise impact on the surrounding community.

(12) Acquisition of land for hardship or protective purposes. Hardship and protective buying will be permitted only for a particular parcel or a limited number of parcels. These types of land acquisition qualify for a CE only where the acquisition will not limit the evaluation of alternatives, including shifts in alignment for planned construction projects, which may be required in the NEPA process. No project development on such land may proceed until the NEPA process has been completed.

(i) Hardship acquisition is early acquisition of property by the applicant at the property owner's request to alleviate particular hardship to the owner, in contrast to others, because of an inability to sell his property. This is justified when the property owner can document on the basis of health, safety or financial reasons that remaining in the property poses an undue hardship compared to others.

(ii) Protective acquisition is done to prevent imminent development of a parcel which may be needed for a proposed transportation corridor or site. Documentation must clearly demonstrate that development of the land would preclude future transportation use and that such development is imminent. Advance acquisition is not permitted for the sole purpose of reducing the cost of property for a proposed project.

(13) Actions described in paragraphs (c)(26), (c)(27), and (c)(28) of this section that do not meet the constraints in paragraph (e) of this section.*

* Note: In Item (13), paragraphs (c)(26), (c)(27), and (c)(28) are in reference to actions listed in Appendix A as items (26), (27), and (28).

Attachment I – Programmatic Wetland Finding

WETLAND FINDING FOR FEDERAL AID PROJECTS COVERED UNDER THE PROGRAMMATIC AGREEMENT REGARDING THE PROCESSING OF CATEGORICAL EXCLUSIONS

Introduction

This wetland finding is made on a program-wide basis and has been prepared for transportation improvement projects, which are classified as a categorical exclusion (CE). It satisfies the requirements of Executive Order 11990 (EO) titled "Protection of Wetlands" and U.S. Department of Transportation Order 5660.1A (DOT Order) titled "Preservation of the Nation's Wetlands." No individual wetland finding needs to be prepared for such projects. An individual wetland finding shall be made for each Environment Assessment (EA) and Environmental Impact Statement (EIS).

Background

EO 11990, issued on May 24, 1977, requires each agency to develop procedures for Federal actions whose impact is not significant enough to require the preparation of an EIS under Section
102 (2)(c) of the National Environmental Policy Act (NEPA), as amended. The EO states that each Federal agency "shall avoid undertaking or providing assistance for new construction located in wetlands unless the head of the agency finds (1) that there is no practicable alternative to such construction, and (2) that the proposed action includes all practicable measures to minimize harm to wetlands which may result for such use."

The EO defines "new construction" to include "draining, dredging, channelizing, filling, diking, impounding, and related activities." This EO essentially requires a wetland finding for all Federal undertakings, which have virtually any impact to a wetland. DOT Order 5660.1A, issued on August 24, 1978 clarified "new construction" by excluding only "routine repairs and maintenance of existing facilities."

The U.S. DOT Order states, "In carrying out any activities (including small scale projects which do not require documentation) with a potential effect on wetlands, operating agencies should consider the following factors…" This requires U.S. DOT agencies to consider the effects on wetlands for all projects (including CEs). Effects on wetlands are considered through coordination and consultation with the Illinois Department of Natural Resources and with the US Fish and Wildlife Service (USWS), US Army Corps of Engineers (USACE), US Environmental Protection Agency (USEPA), and the Illinois Environmental Protection Agency (IEPA), as appropriate. The Illinois Department of Transportation (IDOT) and Federal Highway Administration (FHWA) evaluate wetland resources and consider practicable avoidance alternatives or options. If avoidance alternatives are not practicable, then practicable measures to minimize harm are considered and included in the project. Unavoidable impacts are mitigated.

Federal-aid applicants consider these effects through the NEPA evaluation process and further consider these effects through the wetland permitting process and any associated meetings with resource agencies (USACE, USEPA, USFWS, and IEPA). IDOT and FHWA evaluate practicable avoidance alternatives or options. If avoidance alternatives are not practicable, then practicable measures to minimize harm are considered and included in the project.

The U.S. DOT Order requires U.S. DOT agencies to make a formal wetland finding for all EAs and EISs. This formal wetland finding will be made in the EA/Finding of No Significant Impact or Final EIS/Record of Decision.

Finding:

In accordance with Executive Order 11990, and based on the above procedures, the FHWA Illinois Division finds for all Federal-aid projects classified as a categorical exclusion with an approved USACE permit that:

1. There will be no practicable alternative to the proposed construction in wetlands, and
2. The proposed project will include all practicable measures to minimize harm to the involved wetlands which may result from such use.

Any Federal-aid transportation project requiring an EA or EIS shall require an individual wetland finding.

Catherine A. Batey
Division Administrator

ILLINOIS STATEWIDE IMPLEMENTATION AGREEMENT
BETWEEN
THE FEDERAL HIGHWAY ADMINISTRATION
AND
THE ILLINOIS DEPARTMENT OF TRANSPORTATION
FOR
ESTABLISHMENT OF TIMEFRAMES FOR ENVIRONMENTAL IMPACT STATEMENTS AND ENVIRONMENTAL ASSESSMENTS

I. BACKGROUND

Section 1309 of the Transportation Equity Act of the 21st Century (TEA-21) established the need to conduct a coordinated environmental review process with concurrent interagency reviews and established time periods. This need was also reflected in Executive Order 13274, *Environmental Stewardship and Transportation Infrastructure Project Reviews*.

In July 1999 the U.S. Department of Transportation (DOT) and six Federal agencies entered into a National Environmental Streamlining Memorandum of Understanding (MOU). The six agencies included the Environmental Protection Agency, the Advisory Council on Historic Preservation, the US Army Corps of Engineers, and the Departments of Commerce, Agriculture and the Interior. In the MOU, all of the agencies agreed to streamline environmental review processes in accordance with TEA-21 and other relevant environmental statutes in ways that reinforce the federal responsibility to protect the environment. With respect to establishing timeframes, the MOU calls upon all agencies to:

"Support and encourage field offices to explore flexible streamlining opportunities on their own and with state transportation and environmental partners including developing MOUs to lay out mutual expectations, funding agreements in support of streamlining, and concurrent review within cooperatively determined time frames."

Through an intensive and interactive process to identify the Federal Highway Administration's (FHWA) goals, objectives, and performance targets, FHWA selected the establishment and meeting of timeframes as a measure of improved timeliness. The FHWA has established specific national targets, which include the following that apply to all Environmental Impact Statements (EISs) and Environmental Assessments (EAs):

- o Establish timeframes for EAs and EISs and meet the schedules for 90% of those projects by 09/30/07;
- o Decrease the median time it takes to complete an EIS from 54 months to 36 months by 09/30/07; and
- o Decrease the median time to complete an EA from approximately 18 months to 12 months by 09/30/07.

II. PURPOSE

This Statewide Implementation Agreement (SIA) is based on the legislation and actions cited above and the attached "Questions and Answers Regarding the Environmental Vital Few Goal of Negotiated Timeframes".

Good project management: The establishment of timeframes for the environmental review process is viewed as an element of good project management. Timeframes can provide goals and structure for the process and can be an effective continuous process improvement tool to identify bottlenecks, conflicts, and systematic issues, as well as to monitor progress.

Timeliness: There may be sources of delays throughout the entire project development process, such as changes in program/political priorities, local controversy, or other issues outside the control of the parties involved in negotiating timeframes. However, since congressional directives and statutory mandates focus heavily on the Federal environmental review process as a source of project delay, FHWA deems it important to pursue the improvement of timeliness, and thus selected a target goal of 90% of EIS and EA timeframes being met by 09/30/07.

Project efficiencies: Establishing timeframes will require upfront discussion among FHWA, the State DOT and other involved agencies (Federal, State and local) and can lead to the realization of project efficiencies, such as the following:

Improved timeliness of the process
Early identification of issues
Early participation of environmental resource and permitting agencies
Recognition of resource limitations upfront

Accountability: Timeframes should create a sense of predictability and accountability with the public and agencies. There are no legal consequences for not meeting the established timeframes. Reasons for schedule delays should be analyzed for lessons learned and, where appropriate, these lessons should be applied to future studies.

III. APPLICABILITY OF SIA

All EIS and EA documents initiated after the start of the federal FY 04 (October 1, 2003) shall have negotiated timeframes for the environmental review process.

IV. IMPLEMENTING PROCEDURES

A. DEFINITIONS

The following definitions are adopted for this SIA:

Timeframe: This term refers to the established schedule or timeline for the processing of an EIS or EA. This schedule is generally part of a larger project schedule that includes final design, right-of-way acquisition, and construction.

Negotiated: Project schedules should be developed by the FHWA Illinois Division office in cooperation with the Illinois Department of Transportation (IDOT). On locally sponsored projects the appropriate local agency should be involved in the negotiation process.

Initiated. For an EIS, this is the date that the Notice of Intent (NOI) is published in the *Federal Register*. For an EA, this is the date of the initial public meeting held to present the general scope of work, the possible alternatives that have been identified, and the preliminary decision on preparing an EA for the project (herein referred to as "initial public meeting").

Median Time. A national aggregate of processing times for environmental documents. This is the value below and above which there is an equal number of values. Using the median helps avoid the disproportionate skew due to extremely short or long processing times.

B. PROCESS

The appropriate IDOT District office will notify the FHWA Illinois Division office early in the project planning to allow ample time to establish timeframes for each EIS and EA prior to its initiation (NOI or initial public meeting).

The FHWA and IDOT (and local agencies when applicable) will work together to establish timeframes using the attached flowcharts as examples. The timeframes should cover the environmental review process and identify milestones as well as set a target completion date for each milestone. Actual milestone activities and time periods may vary from project to project.

Timeframe negotiations should typically occur in conjunction with FHWA/IDOT coordination meetings. The meeting minutes will document the approval of the timeframe for the project by the appropriate FHWA and IDOT district personnel. The dated flowcharts with the agreed-upon timeframes will be attached to the minutes. These same procedures will apply if timeframes are revised (see Section E).
Timeframes will account for the necessary review periods by the FHWA Division Office and IDOT Headquarters, and legal sufficiency review by the FHWA Office of Chief Counsel. Both the FHWA and IDOT are committed to a timely review of all documents.

The FHWA and IDOT will than provide a copy of the timeframes to the involved environmental review and permitting agencies (e.g., U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service) as part of the early coordination/scoping process (e.g., NEPA/ 404 Merger or other meetings, electronic or written correspondence).

Timeframes should be established based on the complexity and characteristics of the project(s), as well as IDOT's own sense of priority. Dates will be adjusted as necessary, depending on agency resources or known project issues that are likely to affect the dates. A complex project may require acknowledgement upfront that a long timeframe will be required and that, as the project progresses, ongoing assessment and tracking must be provided to determine if it is necessary to modify the timeframe.
Timeframes can be affected by limitations of human, financial, and time resources, as well as seasonal schedules beyond human control, such as growing seasons for assessment of biological resources. These issues should be considered early in the process, along with a general level of priority established for the project.

Schedules should be achievable and realistic, and should strive to maintain high quality of documents and reviews.

All parties involved will receive a copy of the agreed upon schedule, including revisions when they occur.

C. GOALS FOR COMPLETION DATES

All EIS and EA projects initiated after the start of federal FY 04 **(October 1, 2003)** are to have negotiated timeframes for the environmental review process.

In **Illinois** the established goals for establishing maximum completion timeframes for projects initiated in federal FY 04-07 are:

FY 04: EIS – 54 months	**FY 06: EIS – 42 months**
EA – 18 months	**EA – 15 months**
FY 05: EIS – 48 months	**FY 07: EIS – 36 months**
EA – 18 months	**EA – 12 months**

In pursuing the targets of reducing the median processing times, all agencies involved in the environmental review process should continue seeking methods to streamline, yet also maintain a high quality of decision-making documents. Timeframe objectives should not compromise quality.

D. TRACKING OF DATES

Coordinating with IDOT, the FHWA will enter the actual dates on the project's individual flowchart to assess whether the milestone dates are being met throughout the project's development and whether the final target date will be achieved. FHWA will also enter the information in the Illinois Division's ITRACKS database and in the FHWA's national Environmental Document Tracking System (EDTS), including any reasons for delays and revision of dates.

E. REVISIONS TO TIMEFRAMES

When new issues arise or priorities change, the timeframes may be reviewed and revised as necessary, subject to the following limits:

Modifications to the timeframe of an EIS may be made up to 30 days following the end of the Draft EIS comment period, and on an EA up to 15 days following the end of the public availability period.

The updated timeframes will typically be discussed at FHWA/IDOT coordination meetings. Approval by the applicable IDOT district and the FHWA Division personnel will be documented in the minutes, and the date of the agreed revision will be included on the flowchart attached to the minutes. All involved agencies should be provided a copy of these changes.

F. MODIFICATION / TERMINATION

This agreement may be modified at any time by mutual agreement of both FHWA and IDOT. Proposal for modification will be given a 30-day review period, after which approval by the other agency will be indicated by written acceptance. Either agency may also terminate participation in this agreement upon written notice to the other agency.

G. APPROVAL OF AGREEMENT

The undersigned have reviewed this agreement and determined that it complies with Section 1309 of TEA-21 and related guidance. Accordingly, it is hereby approved and becomes effective on the last date noted below.

Illinois Department of Transportation **Federal Highway Administration**

[signed 3/29/05] [signed 3/3/05]

Victor A. Modeer, P.E.	Norman R. Stoner, P.E.
Director of Highways	Division Administrator

**MEMORANDUM OF UNDERSTANDING
AMONG THE FEDERAL HIGHWAY ADMINISTRATION, ILLINOIS DEPARTMENT OF TRANSPORTATION, U.S. ARMY CORPS OF ENGINEERS, U.S. FISH AND WILDLIFE SERVICE, U.S. COAST GUARD AND
U.S. ENVIRONMENTAL PROTECTION AGENCY
FOR THE CONCURRENT TRANSPORTATION DECISION-MAKING PROCESS AND SECTION 404 OF THE CLEAN WATER ACT FOR FEDERAL-AID HIGHWAY PROJECTS IN ILLINOIS**

This Memorandum of Understanding ("MOU") is entered into among the Federal Highway Administration (FHWA) Illinois Division, the U.S. Army Corps of Engineers (Chicago, Rock Island, St. Louis, Louisville, and Memphis districts), the U.S. Environmental Protection Agency (Region 5), and the U.S. Fish and Wildlife Service (Chicago and Illinois and Iowa Field offices), the U.S. Coast Guard (St. Louis and Cleveland) and the Illinois Department of Transportation (IDOT), herein referred to as the Signatory Agencies.

This MOU is intended to be complimentary to the statutes, regulations, and policies of the Signatory Agencies. This MOU is not intended to supersede, diminish, modify, conflict with, or otherwise affect the Signatory Agencies' statutory or regulatory authorities or directives, or those of the National Environmental Policy Act (NEPA). All activities conducted pursuant to this MOU shall be carried out in compliance with all applicable laws, regulations, and other legal requirements.

The Signatory Agencies agree to the following:

<u>PURPOSE</u>

The purpose of this MOU is to establish a process that integrates the procedural requirements of NEPA with the substantive Section 404 Clean Water Act decision-making process in a manner that facilitates synchronized review and decision-making for projects subject to the applicability criteria in this MOU. This MOU is also intended to ensure that the documentation developed for NEPA will satisfy the statutory requirements of the Signatory Agencies, and to increase the likelihood that the preferred alternative identified through the NEPA process does not conflict with the Section 404(b)(1) Guidelines.

This MOU supersedes the Statewide Implementation Agreement on the same processes, entered into by the Signatory Agencies on May 8, 2008.

<u>AUTHORITIES</u>

This MOU is consistent with the following authorities:

<u>National Environmental Policy Act (NEPA)</u>, 42 U.S.C. 4321 - 4370
<u>Moving Ahead for Progress in the 21st Century Act</u>, P.L. 112-141, 126 Stat. 405, Sec. 1305
<u>Fixing America's Surface Transportation Act, P.L. 114-94, 129 Stat. 1312, Sec. 1304(k)</u>

40 CFR parts 1500 – 1508, as amended
23 U.S.C. Sec. 139 Efficient environmental reviews for project decisionmaking
DOT Order 5610.1C

APPLICABILITY

This MOU is applicable for NEPA projects when:

The FHWA is the lead agency for the preparation of an Environmental Impact Statement (EIS) or an Environmental Assessment (EA), and;
The USACE is a cooperating agency under NEPA and the project is likely to require an individual permit from the USACE under Section 404 of the Clean Water Act (Section 404) and/or Section 10 of the Rivers and Harbors Act (Section 10).

A Signatory Agency may request that this MOU be applied to a project that does not meet the applicability criteria; however, FHWA and IDOT reserve the right to make that determination and will consult with the other Signatory Agencies as appropriate.

NEPA projects that meet the applicability criteria may be excluded from this MOU if the Signatory Agencies agree that the project is not of sufficient complexity to warrant coordination under this MOU.

If a NEPA project initially meets the applicability criteria and is later determined that an individual permit will not be required, then FHWA and IDOT may notify the Signatory Agencies that the project will no longer be processed under this MOU.

This MOU is also applicable to projects being evaluated pre-NEPA when:

IDOT is developing a planning product (e.g., Purpose and Need, Alternatives Analysis) as part of a Planning and Environment Linkages (PEL) study for a potential transportation project, and;
FHWA will be the lead agency for the NEPA process; and
IDOT expects an individual Section 404 permit will be required and either an EIS or EA will be prepared after the PEL study is complete.

DEFINITIONS

Concurrence – Confirmation by the concurring agency that the information presented is sufficient for this stage of the NEPA process and the project may proceed to the next stage of project development. Concurrence does not imply that an agency endorses the project or releases its obligation to determine if the project meets statutory review criteria.

Concurrence Points – Milestones with the NEPA process where FHWA and IDOT request concurrence from the Signatory Agencies to this agreement. There are three Concurrence Points for NEPA projects processed under this MOU:

Purpose and Need
Alternatives to be Carried Forward, and
Preferred Alternative

Consistency Determination – Confirmation by the Signatory Agencies that the information presented as part of a PEL study contains appropriate documentation and analysis, on par with a NEPA-level analysis, such that the information could be incorporated into a NEPA document at a later date, with no revisions or minimal revisions due to changed conditions in the project area or revised laws.

Coordination Points – Milestones within PEL studies where IDOT requests a consistency determination from the Signatory Agencies. There are two Coordination Points for a PEL under this MOU:

Purpose and Need
Alternatives to be Carried Forward

Planning and Environment Linkages (PEL) - Planning and Environment Linkages (PEL) represents a collaborative and integrated approach to transportation decision-making that 1) considers environmental, community, and economic goals early in the transportation planning process, and 2) uses the information, analysis, and products developed during planning to inform the environmental review process. Using a PEL approach can facilitate the accelerated review process timeline required by the Council on Environmental Quality NEPA regulations.

Waters of the United States – Those waters as defined in 33 CFR 328.3, as amended.

SIGNATORY AGENCIES' ROLES AND RESPONSIBILITIES

The Signatory Agencies agree to:

Consider the potential impacts to Waters of the United States in Illinois at the earliest practicable time in project development;

Avoid adverse impacts to such waters to the extent practicable;

Minimize and mitigate unavoidable adverse impacts and for wetlands, strive to achieve a goal of no overall net loss of values and functions; and

Pursue interagency cooperation and consultation diligently throughout this process to ensure that the concerns of the Signatory Agencies are given timely and appropriate consideration and that the Signatory Agencies are involved at key decision points in project development.

IDOT will ensure data collection, including information for determining compliance with the Section 404(b)(1) guidelines, will take place early in the coordination process so that information will be available for discussion at the concurrence point meetings. All Signatory Agencies will be responsible for reviewing the data and evaluations, and providing supplemental information and/or comments, as appropriate.

IDOT will provide information to the Signatory Agencies regarding the analysis of alternatives to avoid, minimize, and mitigate adverse impacts to Waters of the United States. This information may be presented in a matrix or similar summary. The Signatory Agencies will provide input on the adequacy of the avoidance, minimization, and mitigation analysis of the alternatives.

IMPLEMENTING PROCEDURES

FHWA and IDOT will hold "NEPA-404 merger meetings" to present projects under this MOU for information only, to seek concurrence for NEPA projects, or to seek a consistency determination for a PEL planning product. The NEPA-404 merger meetings will be held in February, June, and September and as necessary based on project priority, FHWA and IDOT may hold additional NEPA-404 merger meetings. FHWA and IDOT may invite additional resource agencies to attend meetings, as appropriate, based on the project impacts and the agencies' expertise.

At least 30-days in advance of each merger meeting, FHWA or IDOT will provide the Signatory Agencies, and other agencies as appropriate, the Concurrence Point or Coordination Point package for each proposed action that will be discussed to allow agencies adequate time to review and prepare their comments. The notification letter will include the time and place of the meeting, an agenda, descriptions of the proposed actions to be discussed, and the Concurrence Point(s) or Coordination Point(s) being sought by FHWA and IDOT.

About two weeks before each NEPA-404 merger meeting, FHWA and IDOT will host a teleconference call with the Signatory Agencies. The purpose of the call is for the Signatory Agencies to identify any data gaps or questions they have for projects that will be presented for a Concurrence Point or a Coordination Point. FHWA and IDOT will convey that information to the project teams so they can be prepared to address the Signatory Agencies' questions at the merger meeting.

During the merger meeting, the project teams will present the information and address questions from the Signatory Agencies. The FHWA will seek concurrence, or a consistency determination for PEL products, from each agency attending the meeting. The agencies' verbal concurrence will be documented in the merger meeting summary, which will be coordinated with the Signatory Agencies before being finalized. The finalized merger meeting summaries will serve as written concurrence by the agencies with the Concurrence Points and/or consistency determinations for the Coordination Points. Agencies may also provide concurrence via e-mail or letter if they are unable to attend a meeting or if they need additional time to decide.

Normally, FHWA and IDOT will seek concurrence on each Concurrence Points and consistency determinations on Coordination Points separately. On less complex actions, FHWA and IDOT may seek concurrence on NEPA Alternatives to be Carried Forward and Preferred Alternative simultaneously.

For NEPA projects, Concurrence Points will not be revisited unless there is new information, or if there are substantial changes to the project, the environment, or laws and regulations which affect the concurrence point achieved.

Because a PEL product (i.e., Purpose and Need and/or Alternatives to be Carried Forward) is a planning document and not a NEPA milestone, IDOT and FHWA will re-coordinate with the Signatory Agencies when the PEL study transitions to NEPA. FHWA and IDOT will review, and update if necessary, the information developed in the PEL study and submit it to the Signatory Agencies. FHWA and IDOT will request written concurrence that the NEPA Purpose and Need and/or NEPA Range of Alternatives to be Carried Forward is/are adequate to advance to the next stage of the NEPA process. The Signatory Agencies have 10 days to concur or not concur. If the Signatory Agency does not concur, they shall provide a written statement detailing why concurrence was not achieved. If a Signatory Agency requires more than 10 days to make a concurrence decision, a request for additional time may be made to FHWA and IDOT.

If a consistency determination has been made for two Coordination Points (i.e., purpose and need, alternatives to be carried forward), then FHWA and IDOT may seek concurrence on both of these NEPA milestones at the same time.

DOCUMENTATION REQUIREMENTS

Purpose and Need (Concurrence Point/Coordination Point)

The Purpose and Need documentation will include the following:

Sufficient data and analysis to support the reasons for proposing the action;
The logical termini for the proposed action;
Evidence that the proposed action has independent utility; and
A purpose and need as comprehensive, specific and concise as possible, while not being so narrowly constrained that it limits the range of alternatives or establishes the preferred alternative.

Alternatives to be Carried Forward (Concurrence Point/Coordination Point)

The Alternatives to be Carried Forward documentation will include the following:

A description of all alternatives considered;
The alternatives analysis methodology for eliminating alternatives; and
An explanation of the way in which Alternatives to be Carried Forward are reasonable, practicable, and address the Purpose and Need.

Alternatives may be dismissed for reasons including, but not limited to, not satisfying the Purpose and Need, environmental impacts, or engineering and economic factors.

3) Preferred Alternative (Concurrence Point)

The Preferred Alternative documentation will include the following:

Identification of the environmentally Preferred Alternative/least environmentally damaging practicable alternative,
Summary of comments received from the public and other government entities, if any,
Explanation of the rationale for the selection of the pre1iminary Preferred Alternative,
Explanation of the rationale for the dismissal of the other alternatives carried forward, and

DISPUTE RESOLUTION

If any Signatory Agency does not agree with any Concurrence Point or Coordination Point, FHWA and IDOT will work with them to the extent feasible to address their concerns. If FHWA and IDOT, after making good-faith efforts to address their concerns, conclude that an impasse has been reached with one or more Signatory Agencies, FHWA and IDOT may proceed to the next stage of project development without that agency's concurrence. FHWA and IDOT will notify all Signatory Agencies of their decision and proposed course of action. The decision to move an action forward without concurrence does not eliminate a Signatory Agency's statutory or regulatory authorities, or their right to elevate the dispute through established agency dispute resolution procedures. FHWA and IDOT recognize and accept the risk of proceeding with an action without receiving a Signatory Agency's concurrence.

MODIFICATION/TERMINATION

This MOU may be modified upon approval of all Signatory Agencies. Signatory agencies may submit proposed modifications to FHWA and IDOT. FHWA and IDOT will circulate proposals for modification to the other Signatory Agencies for a 30-day period of review.
Approval of such proposals must be in writing.

A Signatory Agency may terminate participation in this agreement upon written notice to all other Signatory Agencies.

The Federal Agencies in cooperation with the Illinois Department of Transportation (IDOT) agree to implement, to the fullest extent practicable and as funding and staffing level allow, the process in this Memorandum of Understanding.

This agreement becomes effective upon signature of the agencies and may be modified by written approval of each agency. This agreement may be revoked by agreement of all agencies or by any agency upon 30-days written notice to the other agencies.

GENERAL PROVISIONS

Nothing contained in this MOU is intended to or should be construed to limit or affect the authority or legal responsibilities of the undersigned agencies or binds the undersigned agencies to perform actions beyond their respective authorities.
Nothing in this MOU shall be construed to impair or otherwise adversely affect:
the authority granted by law to an executive department or agency, or the head thereof; or
the functions of the Director of the Office of Management and Budget relating to budgetary, administrative, or legislative proposals.
Nothing in this MOU is intended to, or should, be construed to restrict the agencies from participating in similar activities or arrangements with other public or private entities, organizations, or individuals.
Independent agency staff will comply with this MOU to the maximum extent practicable, consistent with such agency's status as an independent agency, statutory requirements, and such agency's regulations and procedures.
The mission requirements, funding, personnel, and other priorities of the undersigned agencies may affect their ability to fully implement all the provisions identified in this MOU.
This MOU shall be implemented consistent with applicable law and subject to the availability of appropriations.
Specific activities that involve the transfer of money, services, or property between or among the undersigned agencies may require execution of separate agreements or contracts.
This MOU is not intended to, and does not, create any right or benefit, substantive or procedural, enforceable at law or in equity by any party against the United States, its departments, agencies, or entities, its officers, employees, or agents, or any other person.

MEMORANDUM OF UNDERSTANDING BY AND BETWEEN THE ILLINOIS DEPARTMENT OF NATURAL RESOURCES AND THE ILLINOIS DEPARTMENT OF TRANSPORTATION

Pursuant to Title 17 Part 1075.30(d) of the Illinois Administrative Code, this agreement between the Illinois Department of Natural Resources (IDNR) and the Illinois Department of Transportation (IDOT) sets forth the framework for an expedited review process for compliance with Section 11(b) of the Illinois Endangered Species Protection Act (520 ILCS 10/11(b)), Section 17 of the Illinois Natural Areas Preservation Act (525 ILCS 30/17), and administrative rules promulgated thereunder (11 Ill. Admin. Code 1075). The parties enter into this MOU pursuant to the provisions of the Intergovernmental Cooperation Act (5 ILCS 220/1-16). This Memorandum of Understanding (MOU) supersedes the MOU effective December 30, 2010.

General Principles of Coordination

The review processes required under the Illinois Endangered Species Act and the Illinois Natural Areas Preservation Act, and provisions of the Interagency Wetland Policy Act of 1989, are designed to examine potential impacts to protected natural resources. The IDNR Division of Ecosystems and Environment (E&E) and the IDOT Bureau of Design and Environment (BDE) will be the points of contact for processing of all proposed projects. All official comments, recommendations, and responses made by either IDNR or IDOT shall be made via email or letter, except in emergency situations as defined in 17 Ill. Admin. Code 1075.60.

The !DOT agrees to:

1. Ensure that proposed projects funded or performed by IDOT comply with the Interagency Wetland Policy Act of 1989 and the IDOT Wetlands Action Plan.
2. Review proposed projects that will be funded or performed by IDOT to determine if they could have an adverse effect on a State-listed threatened or endangered species (T&E species), or a site listed on the Illinois Natural Areas Inventory (INAI site), which include Illinois Natural Area Inventory sites, dedicated Illinois Nature Preserves, and registered Land and Water Reserves.
3. Submit to the IDNR EcoCAT website consultation requests for proposed actions that could have an adverse effect, that are adjacent to a Nature Preserve or Land and Water Reserve, or that entail excavation outside of an existing right-of-way and are within one mile of a Nature Preserve or Land and Water Reserve.
4. Determine if proposed projects funded or performed by IDOT could adversely affect additional natural resources (listed below). Submit to IDNR for review those actions that could have an adverse effect on these resources.
   a. Streams
   b. Forest/trees
      i. Alignment bisects or fragments a block of trees ≥ 20 acres
      ii. New alignment on any stream segment
      iii. Existing alignment in a riparian corridor
   c. Prairie/savanna areas
   d. Properties owned, leased, or managed by IDNR

5. Conduct biological surveys at IDOT's discretion or when recommended by IDNR. Provide copies of the survey results to IDNR, or a written explanation if recommended surveys are not conducted.

6. Develop measures to avoid, minimize or mitigate potential adverse effects to T&E species, INAI sites, or the natural resources listed in Paragraph 4. Submit the measures to IDNR for concurrence.

7. Implement and monitor mitigation measures per IDNR 3(b).

8. By February 1st of each year, report to IDNR the total number of proposed actions that were reviewed by BDE the previous year and not submitted for consultation because there were no protected resources in the vicinity or IDOT determined that the actions were unlikely to have an adverse effect. Provide copies of a random 2% of those reviews to IDNR.

9. Take all reasonable precautions to protect and maintain the confidentiality of protected natural resource data consistent with the use intended by this MOU.

<u>The IDNR agrees to:</u>

1. Review BDE EcoCAT reports within 30 days of receipt. After review, IDNR will either:

   a. Terminate consultation because adverse effects are unlikely, or
   b. Request additional information and/or request a biological survey.

2. Review mitigation measures submitted by IDOT and coordinate with appropriate= IDNR staff to determine whether further analysis or recommendations are required.

3. Within 90 days of receipt of IDOT-proposed mitigation measures, IDNR will= either:

   a. Recommend additional measures to avoid or minimize adverse effects, or
   b. Concur with proposed mitigation measures and terminate consultation.

Both agencies have 45 days to resolve any differences that may remain. If resolution is not reached within this time, both parties can agree to: terminate consultation, elevate the issue within each department, or continue negotiations.

<u>TERMS OF THE MOU</u>

The term of this MOU shall be a period of three (3) years from the date this MOU is executed by all parties. This MOU shall automatically be renewed for an additional three (3) year period unless terminated per the terms of this agreement. Either party shall have the right to terminate this MOU at any time by providing at least ninety (90) days written notice to the other party.

IN WITNESS WHEREOF, the Departments have entered into this Agreement as of the date written below.

Illinois Department of Transportation
WETLANDS ACTION PLAN

April 15, 1998

[signed] 4/15/98
IDOT Approval Date

[signed] 4/21/98
IDNR Approval Date

I. Purpose

The purpose of this Action Plan is to set forth a framework of policy and procedures for the Illinois Department of Transportation (IDOT) that will establish compliance with the goals of the Interagency Wetland Policy Act of 1989 (the Act) and the "Implementing Procedures for the Interagency Wetland Policy Act" (17 Ill. Admin. Code 1090).

II. Applicability

This Action Plan applies to all IDOT and IDOT pass-through funded projects involving adverse impacts to wetlands except those actions specifically exempted. Approvals to proceed with construction of non-exempted actions adversely affecting wetlands will be contingent on demonstrating compliance with this Plan. For IDOT pass-through funded projects, the entity receiving the pass-through funds will be responsible for complying with the provisions of this Plan. For such projects, IDOT may require the entity receiving the pass-through funds to assume responsibility for necessary wetlands-related studies and coordination with the Illinois Department of Natural Resources (IDNR) which this Plan describes as IDOT responsibilities.

In accordance with 17 Ill. Admin. Code 1090.20 (Implementing Procedures for the Interagency Wetland Policy Act), actions that may involve adverse wetlands impacts include, but are not limited to:
The alteration, removal, excavation, or dredging of soil, sand, gravel, minerals, organic matter, vegetation, or naturally occurring materials of any kind from a wetland;
The discharge or deposit of fill material or dredged material into a wetland;
The alteration of existing drainage characteristics, sedimentation patterns, or flood retention characteristics of a wetland;
The disturbance of the water level or water table of a wetland;
The destruction or removal of plant life that would alter the character of a wetland, except for activities undertaken in accordance with the Illinois Noxious Weed Act; and
The transfer of State-owned wetlands to any entity other than another State agency.

Compliance with this Action Plan is not required for any construction, land management, or other activity funded or performed by IDOT which will *not* result in an adverse impact to a wetland. In addition, in accordance with 17 Ill. Admin. Code 1090.20, the following activities also are specifically excluded from the State wetlands compliance requirements:
Activities undertaken for the maintenance of existing ponds, storm water detention basins and channels, drainage ditches or navigation channels
Installation of signs, lighting and fences and the mowing of vegetation within existing maintained rights-of-way, provided such actions do not jeoparde the existence of a threatened or endangered species, Illinois Natural Area Inventory Site, or the designated essential habitat of a threatened or endangered species
Repair and maintenance of existing buildings, facilities, lawns, and ornamental plantings
Issuance of permits and licenses
Construction projects that were let for bidding prior to May 6, 1996

Application of media (including deicing chemicals) on the surface of existing roads for the purposes of public safety
Non-surface disturbing surveys and investigations for construction, planning, maintenance or location of environmental resources

After initial approval by IDNR, this Plan shall continue in effect, subject to renewal through IDNR every 4 years in accordance with 17 Ill. Admin. Code 1090.40(d).

III. Consistency with Existing IDOT Policies and Procedures

Upon acceptance by IDNR, this Action Plan becomes IDOT's framework for compliance with the Interagency Wetland Policy Act. To the extent that there are any inconsistencies between this Plan and existing IDOT Departmental Orders, policies, and operating procedures regarding wetlands, this Action Plan supersedes such Orders, policies, and procedures until they are revised to achieve consistency.

IV. Identification and Delineation of Wetlands

At the earliest practical stage in the project planning process, an assessment will be made of the extent to which wetlands will be affected. Unless an Illinois-specific manual is available and approved for use, the current approved federal manual for identifying and delineating wetlands shall be used as the basis for determining wetlands subject to the Act. Wetlands shall be categorized according to the types listed in Appendix B. Additional regulatory guidance issued by the Corps of Engineers for the federal wetlands manual (e.g., concerning the treatment of farmed wetlands) also will be followed, as applicable. The most recent version of the "National List of Plant Species that Occur in Wetlands" published by the U S Fish and Wildlife Service will be used to determine hydrophytic vegetation. The most recent list of hydric soil map units maintained by each county Natural Resources Conservation Service Office will be used when locating areas of hydric soils.

The National Wetlands Inventory (NWI) maps and wetland maps that may be produced by local jurisdictions shall be used in determining the need to undertake field surveys to delineate and evaluate wetlands affected by IDOT or IDOT pass-through funded projects. Consideration also shall be given to the location of the project in the landscape and the proposed scope of work. Where wetlands are likely to occur and where such wetlands could be affected by the proposed project, field investigations shall be conducted to verify the presence of wetlands and to delineate any wetlands in the area the project may affect.

V. Policy on Wetlands Impacts and Compensation

Each Division of IDOT responsible for activities subject to the requirements of this Action Plan shall ensure that its policies and operating procedures reflect the following sequence of actions for addressing adverse wetlands impacts while giving due consideration to safety and appropriate design standards:

First priority: Avoidance of adverse wetland impacts.

Second priority: Minimization of adverse wetland impacts.

Third priority: Compensation for unavoidable adverse wetland impacts in accordance with the ratios in 17 Ill. Admin. Code 1090.50(c)(8).

Wetland impacts of less than 0.3 acre resulting from IDOT or IDOT pass-through funded projects will be compensated for from a wetland compensation account site or other approved source of preexisting wetland credits (e.g., commercial wetland bank), or may be accumulated for compensation in a larger compensation site or sites. In either case, the compensation will be subject to the applicable ratios specified in 17 Ill. Admin. Code 1090.50(c)(8). Opportunities to compensate for accumulated impacts will be pursued, as practical, when developing project-specific wetlands compensation for larger impacts, when new wetland compensation account/bank sites become available for use, or when establishment of a site or sites to offset accumulated impacts is determined appropriate as a stand-alone project.

Any accumulated acres of impact associated with IDOT or IDOT pass-through funded projects will be accounted for on the basis of the boundaries of the nine IDOT highway districts. IDOT will confer with IDNR at least once each year regarding the status of any accumulated impact balances in each of the IDOT highway districts and the status of compensation to offset the accumulated balances. The total of accumulated acres of impacts at any given time shall not exceed 5 acres in any IDOT highway district or 25 acres statewide. If accumulated balances approach either of these thresholds, IDOT will confer with IDNR to decide how compensation will be provided to reduce the accumulated balances.

Compensation for unavoidable adverse impacts of 0.3 acre or more, will be provided prior to or concurrent with the project action causing the wetland impact. In proposing such compensation for IDOT or IDOT pass-through funded projects, priority shall be given to locating the compensation close to the impacted wetlands to the extent practical. In evaluating the practicality of sites for potential use, the following will be considered:

The site must be suitable for establishment of wetlands; i.e., contain hydric soils and be capable of providing suitable wetlands hydrology.
IDOT, or the local agency responsible for an IDOT pass-through funded project, must be able to acquire the site for wetlands compensation purposes (i.e., for sites that are not adjacent to existing or proposed project right-of-way, either the site must have a willing seller or IDNR will provide written documentation confirming suitability of the site for use, in order to support condemnation action by IDOT, or local agency, in the case of an IDOT pass-through funded project).
For sites that are not adjacent to existing or proposed project right-of-way, it must be possible for an agreement to be reached for transferring jurisdiction and responsibility for long-term management to the IDNR or another entity that meets the requirements of 17 Ill. Admin. Code 1090.90. (IDOT or a local highway agency ordinarily will assume responsibility for long-term management of sites adjacent to existing or proposed highway rights-of-way.)

When adverse wetlands impacts occur, one-for-one replacement of new wetlands of comparable functional type and size will be provided through wetlands restoration or creation before acquisition or research alternatives are considered. Buffer areas may be included for compensation credit when such areas are important to the protection of the compensation wetlands and the maintenance of their functions. The amount of credit allowed for buffer areas will be determined in consultation with IDNR on a case-by-case basis.

If a wetland compensation plan that meets the objectives of the Act cannot be developed, or if unique opportunities exist to further the goals of the Act through other means, approval may be requested from IDNR for the following:
Acquisition of high quality wetlands and associated buffer;
Funding of needed relevant research; or
Wetlands compensation that provides replacement of the same and different wetland types as the adversely impacted wetlands.

Consistent with the requirements of the Interagency Wetland Policy Act, IDOT Divisions shall consider opportunities for increasing the quantity and quality of the State's wetlands resources as a component of ongoing operations to augment the amounts of wetlands provided through compensatory mitigation. These opportunities will be pursued primarily through cooperative initiatives with the IDNR. Such opportunities will be assessed for practicality and implemented as funding and manpower resources allow.

In identifying and evaluating potential sites for IDOT wetlands compensation accounts or other project-specific wetlands compensation, IDOT will coordinate with IDNR to obtain information as appropriate on potential sites that would be suitable for establishment of wetlands and that would complement IDNR natural resource programs and property management objectives. IDOT will consider the information from IDNR along with information obtained from other sources in proposing sites for approval. As practical, IDOT will give priority to pursuing the sites that would complement IDNR programs and objectives in developing compensation for IDOT projects.

VI.Processing Procedures

Project coordination with IDNR for actions subject to this Action Plan will be in accordance with the "Natural Resource Review and Coordination Agreement Between IDNR and IDOT," as executed in January 1996, or as subsequently amended, and the procedures in this section.

When potential impacts are identified, alternatives for avoiding and minimizing adverse impacts will be analyzed, consistent with applicable design standards and safety considerations. When the analysis of alternatives determines that the project will involve unavoidable adverse wetland impacts, IDOT will coordinate wetlands issues with IDNR in accordance with the following:

A. Programmatic Review Actions

For purposes of this Action Plan, Programmatic Review Actions are those which involve impacts to wetlands only in areas where construction is within existing rights-of-way or in new right-of-way which is contiguous to (i.e., does not separate from) the existing right-of-way and for which there is no practicable alternative which would avoid adverse wetlands impacts. Examples of project-types that could qualify as Programmatic Review Actions if they meet the preceding criteria include, but are not limited to, the following: adding through or auxiliary lanes to an existing highway, widening and resurfacing existing pavements, widening shoulders on an existing highway, realigning an existing intersection, reconstructing or replacing an existing bridge, constructing runaround detours or temporary stream crossings, and installing scour countermeasures (e.g., flexible revetment, rigid revetment, or flow control structures) for existing bridges.

Adverse wetland impacts resulting from Programmatic Review Actions will be compensated in accordance with the "minimal alteration" ratios specified in 17 Ill. Admin. Code 1090.50(c)(8) except when the affected wetlands involve any of the factors specified in that section as requiring application of a 5.5:1 ratio.

For projects which qualify as Programmatic Review Actions, project-specific coordination with IDNR for wetlands compliance generally will not be required. However, when the work involving wetlands will require coordination with the Corps of Engineers for approval of a wetlands compensation plan, IDOT will provide information describing the proposed compensation to IDNR. This submittal will allow appropriate IDNR staff the opportunity to review and comment on the proposed compensation prior to receiving the compensation plan information as a part of the permit information from the Corps. In addition, IDOT will provide IDNR periodic lists of all projects that qualified as Programmatic Review Actions and were not coordinated with IDNR. The lists will be provided quarterly during the first year of operation under this Wetlands Action Plan, semiannually during the second year of operation, and annually thereafter. The lists will include the following information for each Programmatic Review Action:

Project name/number
Project type and location
NWI classification code for each wetland affected
Approximate size of the wetlands area(s) to be adversely affected by the project
Description of compensation
Current status and anticipated year of construction

IDOT will maintain complete files on all actions processed under this programmatic procedure. These files will be made available for audit by IDNR upon request.

For each Programmatic Review Action in which compensation will be provided through wetlands restoration or creation on a project-specific basis, IDOT will provide periodic monitoring reports in accordance with Section X of this Plan. IDOT also will notify IDNR at the end of the wetland compensation monitoring period to advise that the compensation work has been completed and to report on its success.

B. Standard Review Actions

For purposes of this Plan, Standard Review Actions are projects which involve unavoidable adverse wetlands impacts and which do not qualify as Programmatic Review Actions. Consultation with IDNR regarding wetlands shall occur on a project-by-project basis for Standard Review Actions. As the initial step in the wetlands coordination process for Standard Review Actions, IDOT will submit a Wetland Impact Evaluation to IDNR. This evaluation will be submitted after the analysis of avoidance and minimization alternatives has been completed and the anticipated location and extent of any unavoidable adverse wetlands impacts has been determined. The Wetland Impact Evaluation will include the following:

Information identifying the wetland site(s) affected and the relationship to the proposed action (including wetland delineation report(s), forms, and map(s), and NWI map(s) for the project area);

Information describing the proposed work affecting each individual wetland (e.g., placement of fill, excavation, draining, removal of vegetation) in sufficient detail to allow a thorough review of the potential adverse wetlands impacts;

Anticipated starting and ending dates for the project, if known;

Indication of the total acreage expected to be converted from wetland habitat to other use(s); and

Description of alternatives considered and an explanation of why there are no practicable alternatives to the proposed action.

Within 30 days of receipt of the Wetlands Impact Evaluation, IDNR will advise IDOT of any deficiencies in the information provided. IDNR will notify IDOT in writing of the date the Wetlands Impact Evaluation is deemed filed. Unless extended by written agreement between IDOT and IDNR, IDNR will complete its review of the Wetland Impact Evaluation within 60 days of the date it is deemed filed and will respond in accordance with 17 Ill. Admin. Code 1090.50(a)(2). IDOT may request a reevaluation of IDNR's response in accordance with 17 Ill. Adm. Code 1090.50 (a)(2)(D). IDNR's final response to the Wetland Impact Evaluation will be valid for 3 years and shall be extended by IDNR upon demonstration that the project is being pursued in good faith and the conditions of the site have remained substantially unchanged.

For unavoidable adverse wetlands impacts resulting from Standard Review Actions, a project-specific wetland compensation plan will be prepared for approval by IDNR. When the necessary compensation is proposed from a wetland compensation account or other approved source of preexisting compensation credits, the compensation plan will provide information in accordance with Section VII A, below. For all other Standard Review Actions, IDNR will be provided a project-specific conceptual plan (see Section VII B) for concurrence and a wetland compensation plan (see Section VII C) for approval. IDOT will expect that the response from IDNR to the conceptual plan will indicate whether compensation sites proposed are acceptable, and whether IDNR has any other suitable sites available on which the necessary compensation would be feasible.

Unless IDOT and IDNR mutually agree to a longer time period, IDNR will respond to compensation plan submittals within 45 days of receipt. IDOT will accomplish follow-up coordination with IDNR as necessary to respond to comments from IDNR regarding the compensation proposal.

Proposals for use of wetland research funds to provide any part of the required compensation will be developed in consultation and coordination with IDNR and the Interagency Wetland Committee. Review and processing times described above will not be operative when compensation plans propose use of research funding for compensation. In these cases, IDNR will notify IDOT within 30 days of receipt of the compensation plan as to when the Committee will be convened to review the proposal for use of research funds. The review by the Committee should occur at the next regularly-scheduled Committee meeting or within 60 days of receipt of the plan by IDNR, whichever occurs first.

For Standard Review Actions, construction that would adversely affect wetlands will not commence until consultation with IDNR has occurred and IDNR has either approved the wetland compensation plan for unavoidable adverse wetland impacts or agreed that the impacts may be accumulated for after-the-fact compensation.

As provided in 17 Ill. Admin. Code 1090.50(5), IDNR approval of a compensation plan is valid for three years. For projects involving a conceptual plan and a wetland compensation plan, the three-year time frame will begin upon approval of the wetland compensation plan. If IDOT does not commence implementation of a wetland compensation plan within the three year time frame, IDOT will re-coordinate with IDNR to renew the approval prior to proceeding with implementation of the compensation plan. IDOT will determine whether any changes have occurred at the proposed compensation site which would require revision of the compensation plan and will advise IDNR. If such changes have occurred, the plan will be revised as necessary to respond to those changes.

For Standard Review Actions, status reports will be provided to IDNR on implementation of wetland compensation plans involving wetlands restoration or creation, in accordance with 17 Ill. Admin. Code 1090.50(6). These reports will include the following:

A post-construction site evaluation report which will be submitted within 90 days after completion of any construction, seeding, planting, etc. necessary for establishing the replacement wetlands;
Up to 4 annual reports on the status of the replacement wetlands and any associated buffer; and
A final report on the status of the replacement wetlands and any associated buffer which will be submitted 5 years after the post-construction evaluation report.

VII. Content of Wetland Compensation Plans

A. Plans for Use of Approved Preexisting Compensation Credits

When all of the necessary wetland compensation for a project is proposed from an approved wetland compensation account or other approved source of preexisting wetland credits, the following information will be provided in the wetland compensation plan:

Project name/number, location, and description
Name and address of the office responsible for the project
Indication of type(s) (per Appendix B), amount(s), and locations of wetlands affected, including the drainage basin(s) and watercourses involved
Description of alternatives which would avoid or minimize adverse impacts to the wetland and, as applicable, the reasons for their rejection
Reasons for proposing use of an approved wetland compensation account or other source of preexisting wetland credits
Description of the applicable compensation ratio(s), the amount and type (per Appendix B) of compensation credit to be provided, and the source of the credits, including location, current balances and any pending changes.

B. Conceptual Plan

When all or a part of the necessary compensation will be provided through establishment of wetlands on a project-specific basis, a conceptual plan will be provided to outline the proposed compensation. The conceptual plan will present sufficient preliminary information to enable IDNR to concur in the proposed location and approach to providing compensation prior to proceeding with development of the details necessary for actually implementing the compensation.

The following is an outline of information that a conceptual compensation plan may include. The first two items will be provided in all cases. The remaining items will be addressed as necessary and appropriate to adequately describe the project's involvement with wetlands and the proposed compensation.

Project name/number, location, and description
Name and address for the office responsible for implementation of the wetland compensation plan
Date of and summary statement of wetland surveys and the name, work address, and phone number of person(s) conducting surveys
Indication of type(s) (per Appendix B) and amount(s) of wetland affected, including drainage basin(s) and watercourse(s) involved
Description of alternatives considered which would avoid or minimize adverse impacts to the wetland and, as applicable, the reasons for their rejection
Description of the precise location of the proposed wetland replacement site (including a map, legal description, and an indication of the distance from the wetland impact location(s) for which it provides compensation) and an indication of its current land use, biological, hydrological, and soils characteristics
Description of the proposed wetlands compensation, including a clear statement of goals, description of compensating wetlands to be created, restored, or acquired (including type(s) per Appendix B, and a conceptual plan drawing showing approximate layout, shape, etc.); compensation ratios to be applied; any research funding proposed in lieu of other compensation; and, if use of preexisting wetlands credits is proposed as a component of the compensation, the source of the credits, including current balances and pending changes
General description of the work (e.g., grading, planting, importation of topsoil, alteration of hydrology) proposed to establish compensation site(s)
Indication of the entity(ies) that will assume long-term responsibility for compensation sites to be established

C. Wetland Compensation Plan

A detailed wetlands compensation plan will provide the level of information necessary for implementing proposed compensation. The wetland compensation plan will include the information from the conceptual plan in addition to the items listed in 17 Ill. Admin. Code 1090.50(c)(3), as necessary and appropriate for the specific compensation proposed.

VIII. Wetland Compensation Accounts

IDOT recognizes the benefits of consolidating compensation for numerous small impacts in larger sites. Such consolidation allows for economies of scale in planning, implementation, and maintenance of compensation and promotes the establishment of wetlands in advance of impacts that offer the potential for providing a broader range of functional benefits. IDOT also acknowledges the advantages such sites offer in terms of their potential for being located and sized to complement the plans and programs of resource agencies to make the sites more desirable for long term management and to provide enhanced environmental and social benefits for the people of Illinois. IDOT will actively pursue the development and use of wetland compensation account sites as practical for IDOT and IDOT pass-through funded projects, to maximize the benefits such sites provide. Establishment of wetland compensation accounts by IDOT or local agencies and project sponsors for use in complying with wetlands compensation requirements under the Act will be accomplished through formal agreement with IDNR. The unit of measurement for debits and credits will be established in the agreement for the compensation account. Use of credits from wetland compensation accounts will be subject to the compensation ratios in 17 Ill. Admin. Code 1090.50.

IX.Authority and Policies for Acquisition of Wetland Compensation Land

IDOT may acquire for highway purposes any property necessary for a highway project, or any other property for which a specific appropriation has been made. Mitigation property on-site or contiguous to a project will be described and discussed in appropriate project planning and design documents to adequately establish the necessity of acquisition. For other mitigation parcels, the need will be documented in wetland compensation account proposals or compensation plans submitted by IDOT and in written approval of such proposals and plans by IDNR.

Lands for IDOT wetland compensation accounts will be acquired through whatever means IDOT determines appropriate, consistent with IDOT's statutory powers and authorities.
Local agencies and sponsors may use available eminent domain authority for compensation land within project rights-of-way and, when specifically allowed by law, for off-site compensation.

X. Monitoring

Monitoring and reporting procedures for wetland compensation areas will be addressed in accordance with the following:

For IDOT or local agency wetlands compensation account (bank) sites, monitoring and reporting requirements will be specified in the interagency agreement with IDNR and other appropriate signatories authorizing establishment of the sites.

For project-specific wetlands restoration or creation associated with Standard Review Actions or with Programmatic Review Actions that will require coordination with the Corps of Engineers for approval of the wetland compensation plan, monitoring and reporting procedures will be determined in consultation with the IDNR and the Corps of Engineers as a part of the Wetland Compensation Plan.

For project-specific wetlands restoration or creation associated with Programmatic Review Actions that do not require coordination with the Corps of Engineers for approval of a wetlands compensation plan, monitoring procedures will be documented in the compensation plan on file for the project and will be based on the guidance in Chapter 5 of the "Illinois Wetland Restoration and Creation Guide" (Illinois Natural History Survey Special Publication 19, March 1997), and Chapter 8 of NCHRP Report 379 "Guidelines for the Development of Wetland Replacement Areas." The monitoring procedures will be commensurate with the size and complexity of the wetlands to be restored/created. For these actions, IDNR will be provided an annual report of the monitoring results for a period of up to 5 years, as necessary to verify wetlands success. This will be in addition to the information provided in the periodic summary reports on Programmatic Review Actions described in Section VI A.

Monitoring will be carried out by or under the direction of IDOT except when that responsibility is delegated to a local agency or sponsor, subject to approval by IDNR of the monitoring plan of that local agency or sponsor.

XI.Transfer of Wetlands

Whenever IDOT can transfer management responsibility for wetland compensation areas without jeopardizing project operation, it will submit a written request to IDNR for approval of the transfer. IDOT will ask that IDNR respond to such requests within 60 days. IDOT will identify the proposed recipient of the land and will provide or outline the terms of the transfer agreement. IDOT generally will give preference to qualified entities which can ensure appropriate management without need for funding support from IDOT for assuming the management activities.

In accordance with the requirements of the Act, and subject to obtaining any required approvals from the Governor or the State Legislature, IDOT will transfer compensation wetlands (other than those which are located within or that are otherwise an integral part of project rights-of-way) to IDNR or other eligible sponsors subject to formal transfer agreements that will fulfill all obligations of IDOT related to the approved compensation plan. In the event that IDOT is unable to find any other suitable entity to assume responsibility for long-term management of IDOT-developed wetland compensation sites, IDOT will transfer such sites to IDNR for long-term management. Such transfer shall not require a commitment from IDOT to provide funds to IDNR to support the management activities.

As long as wetland compensation property is held by IDOT, it will be maintained for its designated use. Where wetland compensation sites for IDOT pass-through funded projects are under the jurisdiction of a local agency, IDOT will require the local agency to ensure that the site will be maintained for wetlands purposes. Local agencies or sponsors may transfer wetlands or maintenance responsibilities to other public or private entities when allowed by law, subject to obtaining IDNR approval of such transfer.

If IDOT proposes the sale, exchange, or release of State-owned land containing wetlands to an entity other than another State agency, it will require the recipient of the land to grant a conservation easement which must contain provisions to protect the wetlands and any associated buffer areas from adverse impacts. Such easements will be written and recorded pursuant to the Real Property Conservation Rights Act. IDOT will attempt to have a unit of local government be the grantee of the easement. If a unit of local government cannot be obtained, IDOT will attempt to have an acceptable not-for-profit corporation or charitable trust be the grantee. If a unit of local government or not-for-profit entity cannot be obtained, IDOT will reserve conservation rights in its deed or release document and will transfer those rights to IDNR. Prior to the sale, exchange, or release of State-owned lands under IDOT control to an entity other than another State agency, the department will submit a written request to IDNR in accordance with 17 Ill. Admin. Code 1090.90(c)(4).

XII. Compliance with Other Requirements

In implementing the provisions of this Action Plan, IDOT will ensure appropriate compliance with laws and regulations applicable to significant historic and archaeological sites and other resources requiring special consideration.

XIII. Conflict Resolution Procedures

Every effort will be made to cooperate with and coordinate wetland matters with IDNR. If circumstances arise in which a disagreement occurs over any substantive matter contained in this Action Plan or its application to IDOT actions or projects, the first attempt at resolution shall occur with technical managers in both Departments. If the matter cannot be resolved at this level within a reasonable period, it may be referred to higher management levels for resolution. The priority of the issues involved and the urgency of the need for resolution shall determine the time frames for referral to higher levels and how high within each organization the matter ultimately will be referred. If a conflict cannot be satisfactorily resolved between administrators in IDOT and IDNR, up to and including the Secretary of IDOT and Director of IDNR, the matter may be referred to the Governor’s office for resolution.

XIV. Reports on Action Plan Implementation

Following approval of this Action Plan, IDOT will submit to IDNR a biennial report summarizing actions taken to implement the provisions of the Action Plan. The report will provide a listing of projects advanced through the wetlands compliance process and a tabulation of the amounts and types of associated mitigation accomplished. The report also will provide a description of other activities that resulted in the establishment of wetlands and a tabulation of the amount and type(s) of wetlands generated by those activities. The first biennial report will be submitted to IDNR on or before June 30 of the second year following initial approval of the Action Plan. Subsequent reports will be submitted on or before June 30 every other year thereafter.

Appendix B

Wetlands Categories

Wetlands in Illinois can be classified into 12 categories as indicated below (refer to the accompanying category definitions), all of which are afforded protection under the Interagency Wetland Policy Act of 1989. For purposes of the IDOT wetland action plan, "disturbed" wetlands are treated as a separate category and the remaining categories are placed in three groups indicating their relative quality/complexity/rarity. (The order in which the wetland types are listed within each group does not indicate a relative ranking of the types within the group.) The groups are discussed in the following paragraphs and are intended primarily to guide project decision makers in planning wetlands compensation that will contribute to improving the quality of wetlands in Illinois.

□Group 1

Bog
Fen
Flatwoods

Wetland types represented by the Group 1 categories are the rarest types in Illinois. Because of the unique geological and topographic conditions essential to their existence, the potential for creating replacement wetlands of these types is extremely limited (in the case of fens) or nonexistent (in the case of bogs and flatwoods). The utmost effort shall be made to avoid any adverse impacts to wetlands in these categories.

□Group 2

Sedge Meadow
Prairie, wet
Swamp

Group 2 wetland types are high quality, relatively complex systems. They are somewhat limited in their occurrence in the State because of the special conditions on which their existence depends. Because of their complexity, they will be somewhat difficult to create or establish and will have to meet demanding site criteria in order to be sustainable. For unavoidable impacts to Group 2 wetlands, compensation shall be of the same type as the wetland affected, to the fullest extent possible.

□Group 3

Marsh
Wet meadow
Forested
Scrub-shrub
Open water

Group 3 wetlands are the most prevalent in Illinois. These categories also can be more readily created or established in more areas of the State than can Group 1 or Group 2 wetlands.

□Disturbed wetlands

Disturbed wetlands include sites such as farmed wetlands, successional old fields, and urban disturbed areas which, because of their disturbed nature, do not readily fit any other wetlands category. For Disturbed wetlands, compensation for unavoidable adverse impacts will not be in-kind; it shall be either a Group 3 type or a Group 2 type.

Definitions of Wetland Categories

Bog The bog communities of Illinois are found almost exclusively in glaciated depressions of the northeast corner of the state. Drainage is usually restricted, and this, coupled with an abundance of sphagnum moss, results in conditions which are highly acidic. The soils of a bog are saturated throughout the growing season in most years, and small open water areas are common. Vegetation consists of a variety of emergents with shrubs and/or small trees occurring on more consolidated peat. (At the beginning of 1994, there were 10 identified bogs in Illinois which comprised 232.8 acres.)
Definition adapted from A Field Guide to the Wetlands of Illinois, 1988)

Fen A fen is a type of wet meadow fed by an alkaline water source such as a calcareous spring or seep. The deposition of calcium and magnesium in the soil results in an elevated soil pH and gives rise to a variety of unique plants adapted to surviving these conditions. The vegetation is normally comprised of herbaceous emergents although woody shrubs or even trees sometimes occur. (At the beginning of 1994, there were 20 identified fens in Illinois which comprised 153.1 acres.)
Definition adapted from A Field Guide to the Wetlands of Illinois, 1988.

Flatwoods Flatwoods are woodlands growing on level surfaces, usually with widely spaced trees, with slowly permeable and poorly drained soils that contain an argillic horizon or claypan. (At the beginning of 1994, there were 24 identified flatwoods in Illinois which comprised 617.5 acres.)

Definition adapted from White, John, 1978. Illinois Natural Areas Inventory Technical Report, Volume 1 Survey Methods and Results.

Sedge Meadow A sedge meadow is a wetland dominated by sedges (*Carex*) and occurring on peat, muck, or wet sand.
Definition adapted from White, John, 1978. Illinois Natural Areas Inventory Technical Report, Volume 1 Survey Methods and Results.

Prairie, wet A wet prairie is a community dominated by graminoid vegetation on mineral soil which is almost always saturated.
Definition adapted from White, John, 1978. Illinois Natural Areas Inventory Technical Report, Volume 1 Survey Methods and Results.

Swamp A swamp is a wetland characterized by the presence of permanent to semi-permanent water and a greater than 30% areal canopy cover of tall (over 20 feet) woody vegetation. In many areas, the canopy cover exceeds 80%.
Definition adapted from A Field Guide to the Wetlands of Illinois, 1988.

Marsh A marsh is a wetland in which tall graminoid plants dominate the plant communities. Marshes have water near or above the surface for most of the year. Soils may be peat, muck, or mineral.
Definition adapted from White, John, 1978. Illinois Natural Areas Inventory Technical Report, Volume 1 Survey Methods and Results.

Wet meadow A wet meadow is a wetland characterized by moist to saturated soils with standing water present for only brief to moderate periods during the growing season. Vegetation includes a wide variety of herbaceous species, from sedges and rushes to forbs and grasses. Woody vegetation, if present, accounts for less than 30% of the total areal cover.
Definition adapted from A Field Guide to the Wetlands of Illinois, 1988.

Forested Forested wetlands differ from true swamps in that they lack continuously standing water, although repeated flooding is common. Differences in the length of inundation give rise to a variety of community types within this classification.
Definition adapted from A Field Guide to the Wetlands of Illinois, 1988.

Scrub-shrub A scrub-shrub wetland typifies a community in transition and exemplifies the dynamic nature of wetlands in general. Many emergent wetlands left undisturbed, will gradually be replaced through succession by woody vegetation that will in time develop into a mature forest. The scrub-shrub wetland is often found grading shoreward from an emergent wetland which borders a lake, stream, or pond. The woody vegetation accounts for at least 30% of the vegetation present, and must be less than 20 feet (6 meters) tall. Species composition is dependent on the length of inundation, with willows and dogwood growing in the temporarily to seasonally wet areas and buttonbush in semi-permanently flooded areas.
Definition adapted from A Field Guide to the Wetlands of Illinois, 1988.

Open water wetlands Small and shallow [area < 20 acres (8.1 ha) and depth < 6.6 ft. (2 m)] open water areas that lack emergent woody or graminoid vegetation. Natural ponds, farm ponds, borrow pits, and open water areas that occur within a marsh or swamp are included in this category. (Lacustrine and riverine systems are not included in this category.)

ILLINOIS DEPARTMENT OF TRANSPORTATION'S AGRICULTURAL LAND PRESERVATION POLICY STATEMENT AND COOPERATIVE WORKING AGREEMENT

PREFACE

The Farmland Preservation Act [505 ILCS 75/1 et seq.] requires the Department of Transportation (IDOT) and seven other State agencies to develop a policy statement specifying each agency's policy toward farmland preservation. IDOT has prepared the following statement in response to that requirement. A working agreement has also been prepared to describe the administrative process that will be used to implement the policy. The Agricultural Land Preservation Policy prepared in response to Executive Order 80-4, signed by Governor James R. Thompson on July 22, 1980, will also remain in effect in accordance with Section 4 of the Farmland Preservation Act.

POLICY

Recognizing that its transportation objectives must be in concert with the overall goals of the State, it is the policy of the IDOT, in its programs, procedures, and operations, to preserve Illinois farmland to the extent practicable and feasible, giving appropriate consideration to the State's social, economic, and environmental goals.

BACKGROUND/PERSPECTIVE

Highways, rail systems, airports, and port terminals by their nature, occupy land. The extent that transportation facilities will occupy today's farmland in the future primarily will depend on the IDOT's programs, safety and operational requirements, and the degree to which a responsible balance is established among the various development and preservation interests of the State of Illinois.

With the existence of a comprehensive and largely complete transportation system in Illinois, the IDOT's major program emphasis is directed toward preservation and rehabilitation of existing facilities, rather than expansion. Rehabilitation of the system for full and effective use, however, will require some additional land acquisitions to satisfy current safety and operational requirements. A limited number of new or expanded transportation facilities will be required in order to attract business and industry and improve service and access to Illinois markets. Expansion efforts must be carefully managed to preserve the agricultural community while serving the rural areas of the State.

In the past, new transportation facilities often were constructed on farmlands. This was due, in part, to a number of Federal laws and regulations pertaining to the protection of other sensitive areas, such as floodplains, wetlands, wildlife habitat, etc. Special protection is also provided for parks and historic sites. Federal law requires that such lands not be used for Federal-aid highway purposes, unless no feasible and prudent alternative is available. Executive Order 80-4 and the Farmland Preservation Act increase the protection afforded to farmland, so that it is commensurate with the importance of the resource.

It should be noted that new transportation facilities generally involve some conversion of farmland since farmland occupies a major portion of the State and engineering constraints, safety considerations, occurrence of developed areas and protection afforded to other types of resources (e.g., historic sites, publicly owned parks, recreation area and wildlife and waterfowl refuges, wetlands and habitat essential to threatened or endangered) often limit the options for avoiding conversion.

AGRICULTURAL IMPACTS OF HIGHWAY CONSTRUCTION

The rate of farmland conversion for highway usage is expected to remain near current levels. The current emphasis on rehabilitation of the existing system is expected to continue in the future and such a program is not expected to require significant land acquisitions. Because much of today's system was constructed in the 1920's and 1930's, an extensive and continuing program is necessary to rehabilitate and replace narrow and deteriorated bridges and pavements. However, a great amount of farmland could sustain conversion due to the rehabilitation of existing highways and the construction of new interstate projects. Mitigation measures for reducing adverse agricultural impacts are routinely introduced into highway designs. For example, current design practices encourage use of narrower medians and smaller interchanges. There is an increased importance given to agricultural conversions in decisions regarding highway projects. Where practicable, highway designs feature reduced medians, larger crossovers to accommodate farm equipment, minimization of landlocked parcels and severances, as well as upgraded field entrances to reduce farmland conversion impacts and secondary impacts to agricultural operations.

AGRICULTURAL IMPACTS OF AIRPORT DEVELOPMENT

With a few exceptions, the State Airport System is mature and in place. One exception includes the development of a third major airport to serve the Chicago area and its environs. In addition, construction of four or five new small airports is anticipated over the next 20 years. Limited expansion of existing airports may also be undertaken. Safety requirements of proposed airport projects will be balanced with an analysis of farmland impacts as required by Executive Order 80-4, the Farmland Protection Act, and this Department Policy Statement.

AGRICULTURAL IMPACTS OF RAILROADS

The Illinois railroad system is a mature network which includes mainlines and branchlines. This system has been gradually shrinking over the years as light density lines are abandoned and traffic is concentrated on fewer lines. Occasionally, the net result of branchline abandonment has been an increase in the amount of land in agricultural production since abandoned right-of-way can be restored to farmland usage.

The IDOT does not own or operate railroad lines and does not exercise jurisdiction over most railroad project which might affect farmland. However, in those instances where future IDOT decisions regarding railroad projects might impact the State's farmland resources, due consideration will be given to preserving agricultural land and minimizing adverse impacts on its productive capacity.

IMPACT MITIGATION

The IDOT is committed to initiating special measures when transportation projects affect agricultural lands. Design standards are periodically reviewed and revised, and the new standards tend to favor minimal land acquisition, taking only those lands needed for construction and maintenance. For example, standardized right-of-way requirements for certain types of highways have been eliminated in favor of flexible requirements that stipulate acquisition of only those lands essential for construction and maintenance. Minimum median widths and compressed diamond interchanges also are representative of mitigation measures that reduce the adverse impact of highway construction on agricultural resources. The IDOT will also place a high priority on selecting lands which are not upland prime farmlands for wetland mitigation purposes in devising wetland compensation plans. Consideration will also be given to mitigating wetland impacts on publicly owned lands (State or Federal lands). In developing proposals for wetland compensation or other environmental mitigation and in the selection of State furnished borrow pits, IDOT will pursue practical alternatives to minimize impacts to prime and important farmland and farm operations. Where land is purchased to prevent developments incompatible with transportation system safety or noise standards, such as land adjacent to airports, the IDOT will give priority to acquiring easements on its own projects and will encourage other agencies to acquire only the development rights in the surrounding areas, so that the acreage can continue in agricultural use.

Planning studies for transportation will include an early determination of the potential for farmland impacts. The IDOT will carefully consider the impacts of farmland conversion on the agricultural economy of the State. Studies conducted in conjunction with transportation projects will include early coordination and consultation with the Illinois Department of Agriculture (IDOA) and, when appropriate, other agricultural representatives. This interdisciplinary approach should assure that the impacts of IDOT projects on the agricultural community are adequately and accurately assessed.

Although the IDOT's mitigation measures will not necessarily eliminate the conversion of farmland to non-agricultural purposes, impact analysis and extensive coordination will assure that a given conversion is consistent with our programmatic responsibilities, Executive Order 80-4, and the Farmland Preservation Act.

Illinois Department of Transportation – Illinois Department of Agriculture Cooperative Working Agreement

Pursuant to Section 4 of the Farmland Preservation Act, the Illinois Department of Transportation ("IDOT") and the Illinois Department of Agriculture ("IDOA") hereby mutually agree to the following:

This Cooperative Working Agreement ("AGREEMENT") sets the guidelines for the implementation of the IDOT Agricultural Land Preservation Policy.
This AGREEMENT shall apply to those projects which the IDOT authorizes, or in which it participates, except the following:
a) Those non-linear (spot) projects acquiring 10 acres or less of land;
b) Those linear projects acquiring 3 acres or less of land per project mile;
c) Those projects located within the boundary of an incorporated municipality.
If any of the above thresholds are exceeded, it is the responsibility of IDOT to coordinate projects that will convert prime and important farmland to nonagricultural purposes. The IDOT agrees to notify, in writing, the IDOA of projects that will have an impact on farmland in Illinois. The notice from the IDOT should always be sent to the IDOA in the early planning stage of project development, within the location and environmental study phase and prior to the holding of any public hearings related to the project. For projects involving compensation for wetland or other environmental impacts, environmental analysis provided to IDOA in accordance with this Section will include information describing the impacts and associated proposed mitigation. This notice may be accomplished by the transmission of documents such as, but not limited to, the following:
a) proposed airport layout plans;
b) draft and / or final Environmental Assessments, Environmental Impact Statements, or Technical Reports;
c) Illinois Rail Plan, and
d) FY Highway Improvement Plan
The IDOA shall determine whether a Study of Agricultural Impacts is needed or not. When IDOA finds that such a study is necessary, the study shall be conducted as provided in paragraph 8 below.
The IDOT will update its notices of farmland impacts to the IDOA as plans are changed and new information becomes available.
The IDOT will cooperate in IDOA's preparation of its annual report to the Governor and to the General Assembly on the amount of farmland converted to non-agricultural uses as a result of State agency action. The IDOA will attempt to advise the IDOT of the type of information needed one year in advance of the request for that information.

The IDOT will mitigate the agricultural impacts of its projects covered by this AGREEMENT as provided in the Illinois Department of Transportation “Agricultural Land Preservation Policy” and its subsequent amendments.

The IDOA further agrees to the following:

a) to follow its project review process contained in its “Agricultural Land Preservation Policy” as amended, or other procedures upon which the parties have agreed, in carrying out its review under this AGREEMENT;

b) to complete its review of IDOT projects within 30 days after notice with all required project information from the IDOT;

c) to provide information and assistance to the IDOT and its consultant upon request, and

d) to provide its comments in accordance with the procedures specified in the relevant documents or as otherwise agreed between it and the IDOT.

The Illinois Departments of Agriculture and Transportation further agree that this AGREEMENT shall bind each only to the other and creates no rights in third parties.

All changes to the AGREEMENT shall be made after consultation with and concurrence by both parties.

This AGREEMENT shall become effective upon its signature by the Secretary of Transportation and the Director of Agriculture and shall remain in effect until January 1, 2011.

Memorandum of Understanding
Among the Federal Highway Administration,
the U.S. Environmental Protection Agency (Region 5),
and the Illinois Department of Transportation Regarding
Sole Source Aquifers
in the State of Illinois

I. INTRODUCTION

The purpose of this memorandum is to develop an understanding among the U.S. Environmental Protection Agency (EPA) Region 5, the Federal Highway Administration (FHWA), and the Illinois Department of Transportation (IDOT), collectively referred to as the "PARTIES" and individually referred to as "PARTY," concerning the review of Federal-aid highway projects that may contaminate any Sole Source Aquifer (SSA) located in the State of Illinois (hereinafter referred to as the "Aquifers"), as shown in Attachment A. Section 1424(e) of the Safe Drinking Water Act of 1974 (the Act) (42 U.S.C. § 300h-3(e)) states that once the EPA issues a notice of determination designating all or part of an aquifer as an SSA, "no commitment for Federal financial assistance (through a grant, contract, loan guarantee, or otherwise) may be entered into for any project which the Administrator determines may contaminate such aquifer through a recharge zone so as to create a significant hazard to public health, but a commitment for Federal financial assistance may, if authorized under another provision of law, be entered into to plan or design the project to assure that it will not so contaminate the aquifer."

This Memorandum of Understanding (MOU) outlines the criteria used to evaluate proposed projects within the State of Illinois that are subject to review under the Act and the procedures to be followed by the PARTIES in evaluating and reviewing proposed projects. This MOU also outlines the categories of proposed projects that do not need to be submitted to EPA for review.

The IDOT will caution all contractors of the location of designated SSAs, identify applicable permits and recommended Best Management Practices (BMPs) necessary to minimize impact to the Aquifers.

This MOU is a voluntary agreement that expresses the good-faith intentions of the parties, is not intended to be legally binding, and is not enforceable by any party.

This MOU does not create any right or benefit, substantive or procedural, enforceable by law or equity, by persons who are not party to this MOU, or against the PARTIES, their officers or employees, subrecipients, or any other person. This MOU does not apply to any person outside of the PARTIES except for subrecipients of FHWA-funding where IDOT has oversight authority.

II. APPLICABILITY

This MOU applies to the review of all projects within all current and future SSA areas in the State of Illinois. When an aquifer in the State of Illinois is designated as an SSA, EPA will notify FHWA and IDOT, and Attachment A will be updated as necessary.

III. GOAL

The goal of this MOU is to assure each project receiving Federal-aid highway funding or requiring FHWA approval is planned, designed and constructed in a manner that will not contaminate an SSA so as to not create a significant hazard to public health as defined in Attachment B.

IV. GUIDING PRINCIPLES FOR PROJECT REVIEW

For the purposes of this MOU, in determining whether the act of constructing a proposed project would create a significant hazard to public health, the following factors, at a minimum, shall be considered:

1. The toxicity and migration/transformation potential of the contaminants involved;
2. The volume of contaminants that may enter any of the Aquifers; and
3. Characteristics of the Aquifers in the area affected by the project (i.e., geochemical, hydrological, geological, etc.), and attenuation capability of the Aquifers.

Attachment B contains additional definitions for terms used in this MOU.

V. CRITERIA AND PROCEDURES

A. The current procedure for submission and review of projects is as follows:

1. The IDOT will review proposed projects to determine if they require EPA SSA review. The Illinois Bureau of Design and Environment (BDE) Manual contains steps to determine if a project requires EPA SSA review.

2. The IDOT will submit a brief written narrative to EPA describing the proposed project highlighting any risks that could create a significant hazard to public health. If there are any risks due to the project that could create a significant hazard to public health, the narrative will identify the proposed mitigation measures to the EPA SSA Coordinator.

3. The EPA agrees that all requests for Region 5 SSA reviews shall be responded to within thirty (30) calendar days of receipt unless:

a) There are comments (with substantiating data) arising from review by the public, interested agencies, and tribes, indicating potential adverse impacts on the Aquifers. The IDOT, through FHWA, will immediately send these comments to EPA who will notify FHWA and IDOT within thirty (30) calendar days of receipt of the comments regarding EPA's decision. The EPA reserves the right to extend· this time period when it finds that additional information is needed, that additional administrative review is necessary, or that it will be in the public interest to hold a public meeting. The EPA will notify FHWA of any extension of the review time period.

b) The EPA receives a citizen's request at any time during the review or at any time before FHWA has approved the project's final environmental document, the EPA will immediately notify FHWA and IDOT (in writing, if time permits or by telephone if the end of the comment period is near). The EPA will consult with FHWA and IDOT as necessary to reevaluate the project with respect to the concern[s] contained in the request, and will notify FHWA and IDOT within thirty (30) calendar days of receiving such request information of EPA's decision.

c) The EPA requests additional review time either by telephone or in writing. If EPA requests additional time, EPA will inform FHWA and IDOT within thirty (30) additional calendar days, or any other reasonable period of time needed to conduct the review, of the results of this evaluation.

4. The EPA review will result in one of the following outcomes, which will be submitted in writing to IDOT and, if appropriate, FHWA:

a) A determination that the proposed project as designed most likely will not result in contamination of the Aquifers so as to create a significant hazard to public health and no further assessment or evaluation is required.

b) A determination that the project has the potential to result in contamination of the Aquifers so as to create a significant hazard to public health, and a Detailed Ground Water Impact Assessment is required.

i. If such a determination is made, EPA and FHWA will agree on measures that must be implemented to assure that no contamination of the Aquifers that would result in a significant hazard to the public health will occur; and

ii. The FHWA and IDOT will inspect and monitor to ensure that such measures are implemented.

5. FHWA and IDOT may advance the project after notifying in writing the EPA Region 5 Sole Source Aquifer Coordinator that the official review period has concluded. Although comments from EPA will be accepted at any time, FHWA and IDOT will consider to the maximum extent practicable those comments that are submitted after the official review period has concluded, and will accept EPA's final determination (which will be announced after consultation with FHWA and IDOT).

6. When roadways and/or bridges need emergency repair as determined by FHWA, most such repairs will meet the criteria in Section V.B. "Projects Exempt from EPA Review". If emergency activities do not meet the Section V.B. criteria, EPA will strive to complete its review in such emergency situations within seven (7) calendar days of receipt of FHWA's notification. In the rare cases when the emergency circumstances require immediate attention to address threats to life or property, and the activities do not meet the exemption criteria, then emergency repairs will proceed and FHWA shall notify EPA as soon as practicable.

To the extent practicable for the emergency situation, IDOT will ensure that emergency repairs are conducted in a manner that will not contaminate an SSA so as to create a significant hazard to public health.

7. The EPA will maintain a project review file that includes copies of all project review documents and correspondence.

B. Projects Exempt from EPA Review

Federal-aid highway projects that do not pose a significant hazard to public health in the Project Review Area are excluded from EPA review. Those projects classified as Categorical Exclusions (CEs) under 23 C.F.R. § 771.117 typically will not impact the Aquifers because they do not require substantial excavation depth (greater than 10 feet), and do not require the use of chemicals listed in the National Primary Drinking Water Regulations, 40 C.F.R. Part 141. In addition, all IDOT projects, including CEs, are subject to permit requirements in the Clean Water Act (CWA), including CWA BMPs. Implementation of these BMPs will prevent the exceedance of drinking water standards in surface waters, so will be protective of the SSA Therefore, CEs will not pose a significant hazard to public health and are exempt from EPA review.

The EPA reserves the right to review an exempt project upon written notice to FHWA and IDOT should new information lead it to conclude the project may contaminate an SSA so as to create a significant hazard to public health.

VI. MODIFICATION AND TERMINATION

This MOU is to take effect upon signature and remain in effect for a period of five (5) years. This MOU may be extended or modified, at any time through the mutual written consent of the PARTIES. Additionally, a PARTY may terminate its participation in this MOU at any time by providing written notice to the other PARTIES, at least ninety (90) days in advance of the desired termination date.

VII. COORDINATION AND CONTACTS

Materials furnished to EPA by !DOT, with a copy to FHWA, under this MOU will be addressed to the attention of the SSA Program Contact listed on the Region 5 EPA SSA website.
Agency contact information is listed as follows: FHWA: Environmental Engineer
FHWA Illinois Division
3250 Executive Park Drive Springfield, IL 62703
(217) 492-4600

IDOT: Illinois Department of Transportation
Design and Environment Bureau Chief, Room 330 2300 S. Dirksen Parkway
Springfield, IL 62764
(217) 782-7820

USEPA: Sole Source Aquifer Coordinator
Water Division, Groundwater and Drinking Water Branch
U.S. Environmental Protection Agency, Region 5 (WG-15J) 77 W. Jackson Blvd.
Chicago, IL 60604
(see the Region 5 EPA SSA website for current contact information)

This MOU is subject to revision upon agreement of all of the following agencies.

Randall S. Blankenhorn, Secretary
Illinois Department of Transportation

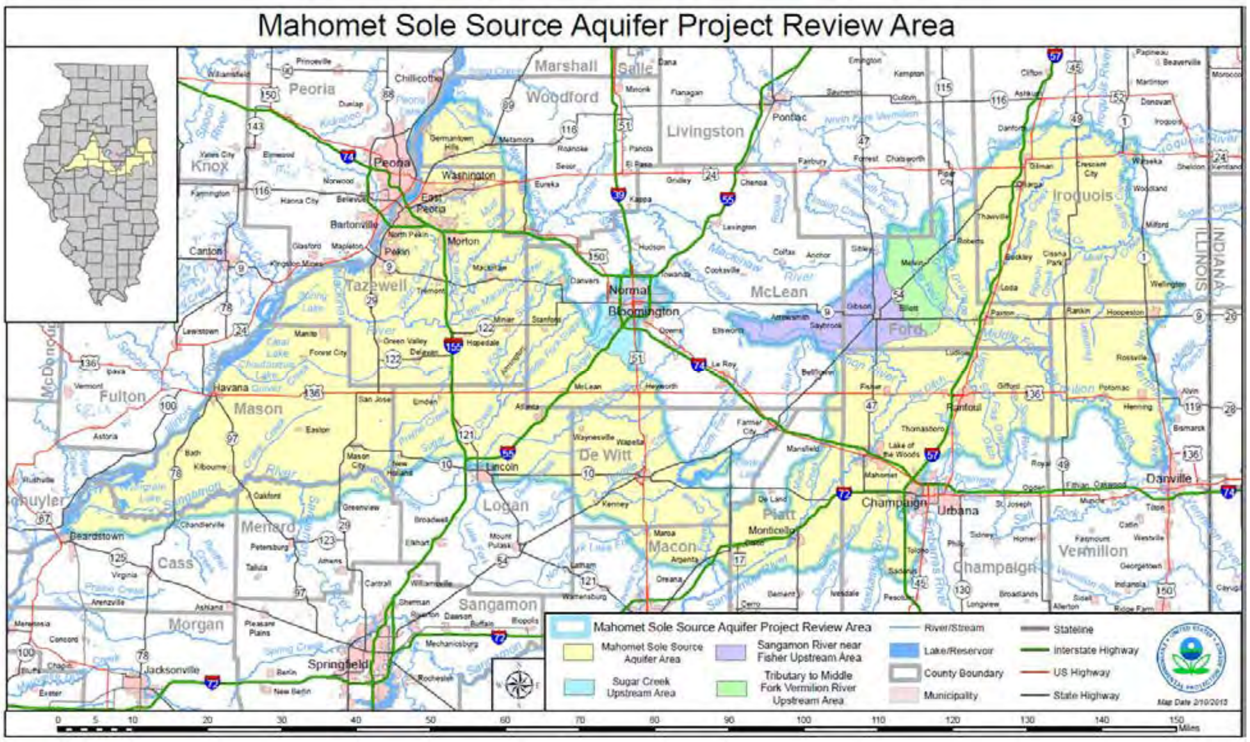
ATTACHMENT A - AQUIFERS

Pursuant to the Safe Drinking Water Act, EPA has determined that the Mahomet Aquifer System in Illinois is the sole or principal drinking water source for its designated area. See EPA's March 19, 2015 Notice of Determination at 80 Fed. Reg. 14370. As such, no commitment for Federal financial assistance identified by FHWA as Federal-aid highway funding may be authorized, and no FHWA approval may be given, for projects within the boundaries of the Mahomet Aquifer's designated Project Review Area for any project that EPA determines may contaminate this designated aquifer through its recharge area so as to create a significant hazard to public health.

Map of the Mahomet Sole Source Aquifer Project Review Area:



ATTACHMENT B - DEFINITIONS

Aquifer means a geological formation, group of formations, or part of a formation that is sufficiently permeable that when saturated can yield useful quantities of groundwater to wells, springs, or streams (Illinois Groundwater Protection Act 1987).

Designated Area means the surface area above the aquifer and its recharge area.

Federal Financial Assistance for the purpose of this MOU is defined as Federal-aid highway projects (described below). It does not include actions or programs carried out directly by or on behalf of the Federal government (e.g., U.S. Army Corps of Engineers 404 permits, U.S. Coast Guard permits, etc.). EPA determines whether projects receive "Federal financial assistance" on a case- by-case basis and based on the specific project, person, or entity completing the project, source of Federal funds involved, and any other relevant factors.

Federal-Aid Highway Project is any roadway or bridge project that receives Federal-aid highway funding (i.e., "Federal financial assistance" referred to in Section 1424(e) of the Safe Drinking Water Act) or that requires any FHWA approval action, such as interstate access approvals.

Pollution Generating Impervious Surface (PG/SJ means an impervious surface that is considered a significant source of pollutants in stormwater runoff, including surfaces that receive direct rainfall (or run-on or blow-in of rainfall) and are subject to vehicular use; industrial activities; or storage of erodible or leachable materials, wastes, or chemicals. Erodible or leachable materials, wastes, or chemicals are substances that, when exposed to rainfall, measurably alter the physical or chemical characteristics of the rainfall runoff. Examples include roadways, sidewalks that are regularly treated with salt or other deicing chemicals, erodible soils that are stockpiled, uncovered process wastes, fertilizers, oily substances, ashes, kiln dust, and garbage container leakage. A surface, whether paved or not, is considered subject to vehicular use if it is regularly used by motor vehicles. The following are considered regularly used surfaces: roads, un-vegetated road shoulders, bicycle lanes within the travel lane of a roadway, driveways, parking lots, unfenced fire lanes, vehicular equipment storage yards, and airport runways.

Project Review Area means the area within which Federal financially-assisted projects will be reviewed, which could include all or part of the designated area and streamflow source areas identified on the Project Review Area map.

Significant Hazard to Public Health means the level of contaminants in an Aquifer that would:
1. Exceed National Primary Drinking Water Standards, or
2. Exceed Federal, Tribal or State public health advisory levels for currently unregulated contaminants, or
3. Violate the intent of Executive Order 12088, "Federal Compliance with Pollution Control Standards".

Sole Source Aquifer (SSA) means an aquifer which is designated as a Sole or Principal Source Aquifer under section 1424(e) of the Safe Drinking Water Act. An SSA is an aquifer designated by EPA as the "sole or principal source" of drinking water for a given aquifer service area; that is, an aquifer which is needed to supply 50% or more of the drinking water for that area and for which there is no reasonably available alternative sources should the aquifer become contaminated.
A project that is "located within a sole source aquifer" means a Federal-aid highway project with any associated construction element that is situated within the boundaries defined on the Sole Source Aquifer Project Review Area map.

PROGRAMMATIC AGREEMENT AMONG THE FEDERAL HIGHWAY ADMINISTRATION, THE ILLINOIS DEPARTMENT OF TRANSPORTATION, THE ILLINOIS STATE HISTORIC PRESERVATION OFFICER, AND THE ADVISORY COUNCIL ON HISTORIC PRESERVATION REGARDING SECTION 106 IMPLEMENTATION FOR FEDERAL-AID TRANSPORTATION PROJECTS IN THE STATE OF ILLINOIS

WHEREAS, the Federal Highway Administration (FHWA), under the authority of 23 USC 101 et seq., implements the Federal-aid Highway Program (Program) in the State of Illinois by funding and approving state and locally sponsored transportation projects that are administered by the Illinois Department of Transportation (IDOT); and

WHEREAS, the Illinois FHWA Division Administrator is the "Agency Official" responsible for ensuring that the Program in the state of Illinois complies with Section 106 of the National Historic Preservation Act (NHPA) of 1966, as amended (54 USC 300101) (Section 106), and codified in its implementing regulations, 36 CFR Part 800, as amended (August 5, 2004); and

WHEREAS, federal Aid Highway projects are subject to the National Environmental Policy Act of 1969 (NEPA), 42 U.S.C. § 4321 et seq., and the Regulations for Implementing the Procedural Provisions of NEPA (40 CFR parts 1500-1508), which require Federal agencies to consider one of three classes of action: 1) environmental impact statement (EIS), 2) environmental assessment (EA), or 3) categorical exclusion (CE); and

WHEREAS, as used herein, the term "SHPO" means the official appointed or designated pursuant to section l0l(b)(l) of the NHPA, as amended (54 U.S. Code§ 302301(1)), to administer the State historic preservation program or a representative designated to act for the State historic preservation officer (see 36 CFR § 800.16(v)); and

WHEREAS, the responsibilities of the Illinois State Historic Preservation Officer (SHPO) under Section 106 and 36 CFR Part 800 are to advise, assist, review, and consult with federal agencies as they carry out their historic preservation responsibilities and to respond to federal agencies' requests within a specified period of time; and

WHEREAS, the Illinois State historic preservation program presently resides within the Illinois Department of Natural Resources (IDNR), and the current Director of IDNR, Wayne A. Rosenthal, is the duly designated SHPO; and

WHEREAS, FHWA has determined that implementation of the Program in Illinois may have an effect upon properties included in, or eligible for inclusion in, the National Register of Historic Places (NRHP), hereafter referred to as historic properties, and has consulted with SHPO and the Advisory Council on Historic Preservation (ACHP) pursuant to 36 CFR 800.14(b) concerning this Programmatic Agreement (Agreement); and

WHEREAS, PHWA, SHPO, and IDOT cooperate in meaningful, long-term planning for the protection of historic properties and desire to (1) devote time and energy to identifying transportation- related concerns potentially affecting historic properties; (2) create innovative programs to address those concerns; and (3) develop a comprehensive and efficient Section 106 process that simplifies procedural requirements; and

WHEREAS, 36 CFR Part 800 encourages federal agencies to fulfill their obligations efficiently under Section 106 through the development and implementation of cooperative programmatic agreements; and

WHEREAS, in the spirit of stewardship, PHWA and IDOT are committed to designing transportation projects to 1) avoid, minimize, and mitigate adverse effects to historic properties, 2) utilize IDOT's "Context-Sensitive Solutions" approach, and 3) balance transportation needs with other needs of Illinois' communities; and

WHEREAS, FHWA has notified the public, federal and state agencies, Certified Local Governments (CLGs), and federally recognized Indian Tribes (Tribes) with an interest in Illinois lands about this Agreement, has requested their comments, and has taken any comments received into account; and

WHEREAS, FHWA retains the government-to-government responsibility to consult with federally recognized Tribes, and will follow the stipulations contained in the Memorandum of Understanding Regarding Tribal Consultation Requirements for the Illinois Transportation Program, as amended (Tribal MOU) which shall remain in effect, and is attached to this Agreement; and

WHEREAS, pursuant to the consultation conducted under 36 CFR 800.14(b), the signatories have developed this Agreement in order to establish an efficient and effective program alternative for taking into account the effects of the Program on historic properties in Illinois and for affording ACHP a reasonable opportunity to comment on undertakings covered by this Agreement; and

WHEREAS, ACHP has approved an exemption on March 10, 2005 that relieves federal agencies from the requirement of taking into account the effects of their undertakings on the Interstate Highway System, with the only exception in Illinois being the Interstate 74 Iowa-Illinois Memorial Bridge connecting Bettendorf, Iowa, with Moline, Illinois; and

WHEREAS, IDOT will apply ACHP's November 16, 2012 "Program Comment Issued for Streamlining Section 106 Review for Actions Affecting Post-1945 Concrete and Steel Bridges" that eliminates historic review requirements under Section 106 of the NHPA for the repair or replacement of common types of post-1945 concrete and steel bridges; and

WHEREAS, FHWA and IDOT will align their compliance with Section 106 to the fullest extent possible in coordination with their policies and procedures under the National Environmental Policy Act (NEPA) and Section 4(f) of the Department of Transportation Act of 1966, pursuant to Section 1301 of the Fixing America's Surface Transportation (FAST) Act.; and

WHEREAS, IDOT has participated in consultation and has been invited to be a signatory to this Agreement; and

WHEREAS, IDOT primarily utilizes the services of the Illinois State Archaeological Survey (ISAS) through an intergovernmental agreement with the Prairie Research Institute at the University of Illinois, to gather information, analyze data, prepare documentation, make eligibility recommendations, and complete mitigation requirements; and

WHEREAS, IDOT publishes and maintains a manual that establishes uniform policies and procedures for the location, design, and environmental evaluation of highway construction projects (the IDOT Manual); and

WHEREAS, the IDOT Manual describes the public involvement guidelines for involving the public in the project development process and the procedures followed to comply with Section 106; and

WHEREAS, this Agreement shall supersede the Programmatic Agreement among FHWA, IDOT, ACHP, and SHPO "Regarding the Implementation of Delegation of Authority for Minor Projects of the Federal-aid Highway Program in the State of Illinois", executed on September 21, 2010;

NOW, THEREFORE, FHWA, ACHP, SHPO, and IDOT agree that the Program in Illinois shall be carried out in accordance with the following stipulations in order to take into account the effects of the Program on historic properties in Illinois, and that these stipulations shall govern compliance of the Program with Section 106 until this Agreement expires or is terminated.

STIPULATIONS

The FHWA, with the assistance of IDOT, and SHPO shall ensure that the following stipulations are carried out.

I. Purpose and applicability

This Agreement sets forth the process by which FHWA, with the assistance of IDOT, will meet its responsibilities pursuant to Sections 106 and 110 of the NHPA for FHWA undertakings implemented by IDOT. This Agreement establishes the basis for considering the effects of FHWA undertakings on historic properties and establishes alternative procedures to implement Section 106 for the review of such undertakings by FHWA, SHPO, and ACHP.

II. Responsibilities of FHWA, IDOT, and SHPO

A. FHWA

1. The FHWA, as the Agency Official, will ensure that IDOT carries out the requirements of this Agreement, in compliance with its responsibilities under the NHPA.

2. The FHWA remains responsible for ensuring that the terms of this Agreement are carried out and for all findings and determinations made pursuant to this Agreement by IDOT under the authority of FHWA, consistent with the requirements of 36 CFR 800.2(a) and 800.2(c)(4).

3. The FHWA may intervene at any point in the Section 106 process, request documentation of any undertaking carried out under the authority of this Agreement, and may participate directly in any undertaking at its discretion.

B. IDOT

1. The IDOT agrees that the Cultural Resources Unit Chief shall meet the Secretary of Interior's Professional Qualification standards (36 CFR Part 61) and shall have the primary responsibility for ensuring that IDOT complies with this Agreement.

2. The IDOT will ensure that their District staff who conduct initial assessments of undertakings (Trained Staff) will receive training on the Section 106 process and on the implementation of this Agreement. The FHWA and IDOT will develop the training in cooperation with SHPO and ACHP.

3. The IDOT will ensure that historic property identification and effect determinations conducted under this Agreement are carried out by IDOT staff and/or consultants that meet the qualifications set forth in the Secretary of the Interior's Professional Qualifications Standards (Qualified Staff).

4. The IDOT is authorized by FHWA to independently perform the work and consultation described in 36 CFR 800.3 through 800.6, except where noted in "Stipulation VI- Review process for undertakings that may affect historic properties."

5. Consistent with 36 CFR 800.2(a)(3), IDOT may use consultants who meet the Secretary of Interior's qualifications to gather information, analyze data, and prepare documentation. The FHWA and IDOT remain responsible for all consultation, findings, and determinations made under this Agreement.

6. The IDOT Manual shall be updated to detail the process for implementing this Agreement within one year of its execution. The IDOT will work with FHWA on the draft revisions to the Manual implementing the provisions of this Agreement. Once FHWA and IDOT agree upon the draft revisions, the draft will be provided to SHPO for a 30-day review and comment opportunity.

C. SHPO

1. The SHPO is responsible for responding to FHWA and IDOT requests according to the terms of this Agreement.

2. The SHPO will participate in site visits and meetings to discuss large or complex undertakings upon request by IDOT or FHWA, as staff time and resources permit.

3. The SHPO will continue to share information related to the identification, evaluation, management, and treatment of Illinois cultural resources. The SHPO shall integrate archeological survey data into the Illinois State Archaeological Survey Cultural Resources Management Archives (CRMA), the State Museum Illinois Inventory of Archaeological and Paleontological Sites (HAPS), and SHPO shall integrate newly designated historic properties into the Historic and Architectural Resources Geographic Information System (HARGIS).

4. The SHPO may assist FHWA and IDOT in training staff in the implementation of this Agreement.

III. Consultation with Tribes

The FHWA retains the responsibility for government-to-government consultation with federally recognized Tribes that have expressed an interest in Illinois lands. FHWA shall take the lead in identifying Tribes and establishing consultation with Tribes consistent with the requirements of 36 CFR 800.2(c)(2) and 36 CFR 800.3(c)-(f). Tribes that might attach religious and cultural significance to historic properties in the Area of Potential Effects (APE) for an undertaking shall be invited by FHWA to be consulting parties. To allow adequate time for consideration of Tribes' concerns or comments, the FHWA will ensure that opportunities for consultation with Tribes are initiated early and provided throughout the development of the undertaking. FHWA may ask IDOT to assist in consultation if an individual Tribe agrees.
The IDOT may provide notification of undertakings and participate in consultation with Tribes in accordance with the Tribal MOU. If a Tribe requests notification and consultation procedures other than those in the Tribal MOU, FHWA and IDOT will consult with the Tribe to develop potential alternative procedures.

IV. Applicability to other federal agencies

Any federal agency may recognize FHWA as the lead federal agency for any undertaking covered by this Agreement and may adopt findings made pursuant to this Agreement, provided the federal agency's undertaking does not have the potential to cause effects to historic properties beyond those considered in FHWA undertaking.

V. Review process for undertakings unlikely to affect historic properties

A. "Appendix A - Exempt Activities" lists activities that have no potential to affect historic properties, whether or not there may be historic properties in the area of the undertaking. The IDOT Trained Staff will evaluate an undertaking to determine if it is limited to the activities listed in "Appendix A- Exempt Activities." If the undertaking is limited to these activities, then IDOT Trained Staff will document in the file that the undertaking does not require further obligation under Section 106, pursuant to 36 CFR 800.3(a).

B. If an undertaking is not limited to activities in "Appendix A - Exempt Activities," then IDOT Trained Staff will determine if the undertaking involves any of the following criteria:

1. new right-of-way,
2. new temporary or permanent easement,
3. in-stream work,
4. a bridge or culvert 40 years or older,
5. standing structures visible from the area of the undertaking that are greater than 40 years old,
6. previously undisturbed soil (includes land that has agricultural use), or
7. public controversy related to any historic property.

If none of these criteria applies, then IDOT Trained Staff will document in the file that the undertaking is unlikely to affect historic properties and that Section 106 has been completed. No additional review or consultation by the SHPO is required.

If any of these criteria do apply, then IDOT Trained Staff will coordinate with the IDOT Qualified Staff, and IDOT will initiate the review process for undertakings that may affect historic properties.

VI. Review process for undertakings that may affect historic properties

A. Initiate consultation

1. The IDOT will determine the Area of Potential Effects (APE). If the undertaking is either an EA or an EIS, then IDOT will consult with SHPO on the determination of the APE. When IDOT consults with SHPO on the APE, SHPO will have 30 days to respond. If SHPO does not respond within that time period, FHWA and IDOT may proceed to the next step.

2. The IDOT in consultation with FHWA, and SHPO as appropriate, will identify consulting parties (36 CFR 800.2(c) and 800.3(b)(c)(e) and (f)).

3. In accordance with the Tribal MOU, Tribes and the SHPO will be notified of the undertaking through the Project Notification System (PNS) when IDOT Qualified Staff determines that an archaeological field survey is required. The FHWA will conduct government-to-government consultation with Tribes upon their request, in accordance with the Tribal MOU.

4. The IDOT will follow the IDOT Manual to solicit public participation early in project development consistent with 36 CFR 800.2(d). The IDOT's consultation with consulting parties and the public will be appropriate to the scale and the scope of the undertaking.

B. Identify historic properties

1. The IDOT Qualified Staff shall determine the scope of identification efforts within the APE, consistent with 36 CFR 800.4. The IDOT Qualified Staff will determine if the undertaking requires an archaeological or architectural field survey by applying his/her professional judgment based on a review of appropriate databases. For archaeological resources, the databases include, but are not limited to, HAPS, soils maps, and aerial photographs. For architectural resources, the databases include, but are not limited to, HARGIS, NRHP databases, local landmark listings, and local government databases, in addition to photo logs.

2. The IDOT may use a phased process to conduct identification and evaluation efforts consistent with 36 CFR 800.4(b)(2) where alternatives under consideration consist of corridors or large land areas, or where access to properties is restricted.

3. The IDOT will involve consulting parties, the public, and Tribes in identification of historic properties, as appropriate (36 CFR 800.2(c) and 800.4(a)(3)). Consulting parties and the public will be offered opportunities through IDOT's public involvement process to participate in the identification of historic properties. Individuals and organizations not already so designated may become consulting parties upon request. The Tribes are provided opportunities to participate in the identification of historic properties through the procedures described in the Tribal MOU and may participate in consultation at any time during the process.

4. If IDOT Qualified Staff have determined that there are no historic properties present, then IDOT Qualified Staff will document in the file a finding of "no historic properties affected" pursuant to 36 CFR 800.1 l(d). The SHPO case-by-case review and concurrence with these findings of "no historic properties affected" is not required. The Section 106 process is concluded upon the IDOT Qualified Staff documenting the "no historic properties affected" finding.

5. If IDOT Qualified Staff have determined that historic properties are present, then IDOT will submit documentation of eligibility to SHPO for review. The documentation will identify historic properties, including those archaeological properties that are important chiefly because of what can be learned by data recovery and have minimal value for preservation in place. If SHPO does

not respond within 30 days, IDOT may assume that SHPO has no objection and IDOT may proceed to the next step of the process.

C. Assess effects to historic properties

1. No historic properties affected

When historic properties have been identified, FHWA and IDOT will make efforts to avoid and minimize effects to those properties. If effects can be avoided, then IDOT Qualified Staff will document in the file a finding of "no historic properties affected" pursuant to 36 CFR 800.I I(d). The SHPO case-by-case review and concurrence with these findings of "no historic properties affected" is not required. The Section 106 process is concluded upon the IDOT Qualified Staff documenting the "no historic properties affected" finding.

2. Historic properties affected

a) Consulting parties and the public will be offered opportunities through IDOT's public involvement process to provide their views on effects to historic properties. Participating Tribes are provided opportunities to provide their views on effects to historic properties through the procedures described in the Tribal MOU.

b) The IDOT Qualified Staff shall apply the criteria of adverse effect (36 CFR 800.5(a)), shall consider views provided by consulting parties, the public, and participating Tribes, and shall document either a finding of "no adverse effect" or "adverse effect."

(1)Finding of no adverse effect

i. The IDOT will prepare the "no adverse effect" documentation which will include·:

- information required by 36 CFR 800. I I(e),
- a list of all historic properties identified within the APE,
- the finding of effect to each of those properties, and
- measures to be incorporated into the design to ensure adherence to the Secretary's Standards for the Treatment of Historic Properties (36 CFR part 68).

ii. The IDOT will submit the finding of "no adverse effect" documentation to SHPO for a 30-day review. If the SHPO does not respond within 30 days, IDOT may assume that the SHPO has no objection and IDOT may proceed with the undertaking.

(2) Finding of adverse effect

i. The IDOT will prepare the "adverse effect" documentation which will include:

- information required by 36 CFR 800.1 I(e),
- a list of all historic properties identified within the APE,
- the finding of effect to each of those properties, and

- when applicable, measures to be incorporated into the design to ensure adherence to the Secretary's Standards for the Treatment of Historic Properties (36 CFR part 68), or other conditions to minimize harm.

ii. The IDOT will notify ACHP of the adverse effect and will copy FHWA and the SHPO on the submittal.

D. Resolve adverse effect to historic properties

1. The FHWA and IDOT will consult with the SHPO, participating Tribes, and other consulting parties as appropriate, and follow the requirements of 36 CFR 800.6 to resolve the adverse effect.

2. If IDOT Qualified Staff determines that an undertaking may adversely affect a National Historic Landmark, IDOT, in coordination with FHWA, shall request ACHP and the Secretary of the Interior to participate in consultation to resolve adverse effects, as outlined in 36 CFR 800.10.

3. If an undertaking has an adverse effect on only Euro-American Tradition archaeological habitation sites, FHWA and IDOT may follow the Illinois Programmatic Agreement for the Mitigation of Adverse Effects to Euro-American Tradition Archaeological Sites, and the Section 106 process is concluded. A memorandum of agreement is not required so long as all effects are limited to Euro-American Tradition archeological habitation sites. The IDOT may, with the concurrence of SHPO and ACHP (if participating) develop an undertaking-specific "treatment plan" that describes how adverse effects will be resolved for the undertaking. The treatment plan will be coordinated with consulting parties, the public, the participating Tribes, and SHPO. If SHPO and ACHP (if participating) concur in writing with the treatment plan, then the Section 106 process is concluded and the preparation of a memorandum of agreement is not required. The IDOT will file the treatment plan with ACHP.

4. When appropriate, IDOT will prepare a memorandum of agreement or programmatic agreement that stipulates the mitigation measures agreed upon by IDOT, FHWA, SHPO, and ACHP (if participating). The IDOT will file the executed agreement with ACHP, which concludes the Section 106 process. The IDOT will ensure the undertaking will be implemented in accordance with the agreement.

5. If there is a failure to resolve adverse effects or FHWA is unable to execute an agreement pursuant to 36 CFR 800.6(c), FHWA will request ACHP comment in accordance with 36 CFR 800.7.

VII. Standard treatment plans

The IDOT, in consultation with SHPO and FHWA, may develop standard treatment plans to address adverse effects for specific types of historic properties, such as archaeological habitation sites and historic buildings. For archaeological habitation sites, FHWA and IDOT will consult with the Tribes in the development of the treatment plan. A standard treatment plan may be added to this Agreement provided that IDOT, FHWA, and SHPO agree in writing with the standard treatment plan, the plan is appended to this Agreement, and all the signatories are notified.
When IDOT applies an approved standard treatment plan to an undertaking, the Section 106 process is concluded.

VIII. IDOT reporting to SHPO and FHWA

Every two months, IDOT shall provide to SHPO and FHWA a list of undertakings that have received a finding of "no historic properties affected," for which the Section 106 process has been concluded.

The list shall include the following information for each undertaking:

- The IDOT Sequence Number
- The IDOT District number
- County and municipality
- Location of undertaking
- Description of undertaking
- Identified historic properties

The IDOT will also provide to the SHPO the documentation supporting the findings. The list and documentation will be provided per the following schedule:

If Section 106 is completed between:	Then documentation will be submitted no later than:
Jul 1-Aug31	Sept 30
Sept 1- Oct 31	Nov 30
Nov 1-Dec 31	Jan 31
Jan 1-Feb 28	Mar 31
Mar 1-Apr 30	May31
May 1 - June 30	July 31

IX. Curation of archaeological materials

All archaeological materials collected on archaeological sites owned or controlled by the State and related records resulting from research, surveys and excavation under this Agreement shall be curated with the Illinois State Museum in compliance with 20 ILCS 3435 (Illinois Archaeological and Paleontological Resources Protection Act). The IDOT shall ensure that all records and materials resulting from the archaeological investigations will be processed, prepared for curation, and curated in accordance with 36 CFR Part 79.

X. Monitoring implementation of this Agreement

A. The FHWA, ACHP and SHPO may review activities carried out pursuant to this Agreement. The ACHP may provide advice or assistance to FHWA, IDOT, or other parties, and it may review any findings made by IDOT or FHWA pursuant to 36 CFR 800.2(b) and
36 CFR 800.9. The SHPO may request from IDOT Section 106 documentation for any undertaking and review it for compliance with this Agreement. The IDOT shall cooperate in carrying out any review activities.
B. The Tribes may submit comments to the FHWA at any time regarding the implementation of this Agreement.
C. The FHWA, SHPO, and IDOT shall meet annually, on or before August 31, to review the effectiveness of this Agreement and to discuss any comments received by the Tribes during the previous year. The FHWA shall notify ACHP in advance of these meetings and invite its participation. The FHWA will prepare a meeting summary and provide it to SHPO, IDOT, ACHP, and the Tribes.

XI. Emergency undertakings

As defined in 36 CFR 800.12, an emergency undertaking is an essential and immediate response to a disaster or emergency formally declared by the President or Governor; such undertakings that affect transportation infrastructure can be separated into two categories which shall be addressed as follows:

A. Undertakings that will be implemented within 30 days after the formal declaration of the disaster or emergency: The DOT Qualified Staff shall immediately determine if the emergency response could affect the physical integrity, character and/or use of historic properties. If so, IDOT shall notify FHWA, SHPO and ACHP within 48 hours. The parties will then consult, review and comment on the emergency undertaking as soon as possible to determine how to, as fully as practicable under the circumstances, avoid, minimize and/or mitigate for any potential adverse effects to historic properties. Nothing in this Agreement shall be construed as prohibiting IDOT from taking such actions as it deems necessary to stabilize the situation to protect the safety of the traveling public.

B. Immediate rescue and salvage operations conducted to preserve life or property such as necessitated by natural disaster or other catastrophic events are exempt from the provisions of Section 106 and this Agreement, in accordance with 36 CFR 800.12(d).

XII. Training

A. The IDOT Qualified Staff, IDOT Trained Staff, and supervisory staff of IDOT' s contractor (currently ISAS) responsible for implementing the terms of this Agreement will complete the following training requirements:

1. Section 106 course(s) provided by FHWA, ACHP, or an equivalent qualified entity, with refresher course every five years or as necessary.

2. Annual meeting to review the implementation of this Agreement.

B. The FHWA and IDOT will invite SHPO staff to attend Section 106 courses and refresher training.

C. Whenever major changes to 36 CFR Part 800 become effective, IDOT Qualified and Trained Staff will participate in training on the new regulations within one year of the effective date of the new regulations. The FHWA and IDOT will invite SHPO staff to attend the training.

XIII. Human remains

In the event that human remains are identified prior to (during archaeological investigations), during, or after project construction, IDOT will comply with the Illinois Human Skeletal Remains Protection Act (20 ILCS 3440) and the provisions of the Tribal MO.

XIV. Unanticipated discovery of or effects to historic properties

If unanticipated discoveries of historic properties are identified by IDOT during the implementation of an undertaking, FHWA will follow the provisions of the Tribal MOU, FHWA and IDOT shall comply with 36 CFR 800.13 by stopping work in the immediate area, taking measures to protect the historic property, and informing the SHPO of such unanticipated discoveries or effects within two (2) business days.

If IDOT or FHWA determine that unanticipated effects on historic properties have occurred during the implementation of an undertaking, FHWA and IDOT shall comply with 36 CFR 800.13 and inform SHPO immediately.

XV. Administrative stipulations

A. Dispute resolution. If SHPO, IDOT, ACHP, Tribes, or other consulting party for an individual undertaking carried out under the terms of this Agreement objects in writing to FHWA regarding any action carried out or proposed with respect to the implementation of this Agreement, then FHWA shall consult with the objecting party to resolve the objection. If after such consultation FHWA determines that the objection cannot be resolved through consultation, then FHWA shall forward all documentation relevant to the objection to ACHP, including FHWA's proposed response to the objection. Within 30 days after receipt of all pertinent documentation, ACHP shall exercise one of the following options:

- Advise FHWA that ACHP concurs in FHWA's proposed response to the objection, whereupon FHWA will respond to the objection accordingly; or

- Provide FHWA with recommendations, which FHWA shall take into account in reaching a final decision regarding its response to the objection.

Should ACHP not exercise one of the above options within 30 days after receipt of all pertinent documentation, FHWA may assume ACHP's concurrence with the proposed response to the objection.

B. Amendment. Any signatory to this Agreement may request that it be amended, whereupon the parties shall consult to consider such amendment. The amendment will be effective on the date a copy is signed by all of the original signatories.

C. Modifications. Standard Treatment Plans may be added or modified by the mutual written agreement of FHWA, IDOT, and SHPO, and shall not require an amendment to this Agreement. The FHWA and IDOT may add or modify activities listed in "Appendix A - Exempt Activities." The FHWA will provide the updated list to the signatory agencies and provide a 30-day review and comment period before the updated list goes into effect. This modification does not require an amendment to this Agreement.

D. Termination. Any signatory to this Agreement may terminate it by providing 30 days written notice to the other parties, provided that the parties shall consult during the period prior to termination to seek agreement on amendments or other action that would avoid termination. In the event of termination, FHWA shall conduct individual reviews of undertakings pursuant to 36 CFR Part 800.

E. Term of this Agreement. This Agreement remains in force for a period of five (5) years from the date of its execution by ACHP, and will remain in effect regardless of which individual is designated as the SHPO, or to which Illinois State Agency the SHPO may be assigned. Six months prior to the conclusion of the five (5) year period, IDOT will notify all signatories in writing. If IDOT receives no written objections from the signatories, the term of the Agreement will automatically be extended for an additional five (5) years. If any signatory objects in writing to extending the Agreement or proposes amendments, FHWA will consult with the signatories to consider amendments or other actions to avoid termination.

Execution and implementation of this agreement evidence that FHWA has delegated certain Section 106 responsibilities to IDOT, and has afforded ACHP a reasonable opportunity to comment on the Program and its individual undertakings in Illinois; that FHWA has taken into account the effects of the program and its individual undertakings on historic properties, and that FHWA has complied with Section 106 of the NHPA and 36 CFR 800 for the Program and its individual undertakings.

APPROVED FOR EXECUTION
Date: Feb. 13, 2018
Legal Counsel: (IDNR)

APPENDIX - Exempt Activities

The following activities have no potential to affect historic properties, whether or not there may be historic properties in the area of the undertaking.

(1)Activities which do not involve or lead directly to construction, such as planning and research activities; grants for training; engineering to define the elements of a proposed action or alternatives so that social, economic, and environmental effects can be assessed.

(2)General highway maintenance and repair, including but not limited to filling potholes, crack sealing, joint grinding, milling, resurfacing in kind, shoulder reconstruction, erosion control, ditch cleaning, storm sewer repair, and debris removal.

(3)Removal and replacement of existing sidewalks and ADA ramps with in-kind materials.

(4)Repair and replacement of highway signs or other traffic control devices.

(5)General pavement marking activities that include, but are not limited to, installation of raised pavement markers, striping, or installation of sensors in existing pavements.

(6)Repair and replacement of appurtenances such as glare screens, median barriers, fencing, guardrails, safety barriers, crash attenuators, safety cable, or lighting.

(7)Repair, rehabilitation, or removal of railroad grade crossings, separations or grade crossing protection.

(8)Roadway surface treatments such as pavement repair, median repair, seal coating, and pavement grinding.

(9)Improvements and repairs to Interstate Highway System including bridges, weigh and inspection stations, toll facilities, and rest areas.

(10) Establishment, replacement, or removal of landscaping or other vegetation on the interstate.

(11) Installation of interstate surveillance, changeable message signs, ramp metering equipment, appurtenances such as glare screens, median barriers, fencing, guardrails, safety barriers, crash attenuators, safety cable, or lighting.

**Illinois Department of Transportation and
Illinois Environmental Protection Agency Agreement on
Microscale Air Quality Assessments
for Illinois Department of Transportation-Sponsored
Transportation Projects**

The United States Department of Transportation (DOT) issued Environmental Impact and Related Procedures (23 CFR Part 771) to comply with directives of the National Environmental Policy Act (NEPA), the Council on Environmental Quality regulations, and other federal statutes and to incorporate the requirements of DOT Order 5610.1C, "Procedures for Considering Environmental Impacts." Subsequently, the Federal Highway Administration (FHWA) provided the "FHWA Technical Advisory T 6640.SA," as guidance to states for performing air quality analysis for federally assisted highway projects. In addition, the Illinois Department of Transportation "Illinois COSIM Version 4.0 Carbon Monoxide Screen for Intersection Modeling Air Quality Manual," dated April 2013, provides specific detailed information for performing carbon monoxide air quality analyses in Illinois.

In order to reflect current air quality practices, the Illinois Department of Transportation (IDOT) and the Illinois Environmental Protection Agency (Illinois EPA) hereby agree to the following:

1. The March 2010 "Illinois Department of Transportation and Illinois Environmental Protection Agency Agreement on Microscale Air Quality Assessments for Illinois Department of Transportation-Sponsored Transportation Projects" between IDOT and the Illinois EPA will be superseded by this Agreement on the date this Agreement is signed.

2. As outlined in FHWA's Technical Advisory T 6640.8A, dated October 30, 1987, IDOT is required and will continue to conduct project level microscale carbon monoxide (CO) analyses. Projects listed in Attachment A are exempt from the requirement for a CO analysis provided the projects do not increase capacity such as through the addition of through lanes or auxiliary turn lanes and have no sensitive receptors.

Historically, IDOT used 16,000 average daily traffic (ADT) as the threshold for conducting a microscale CO analysis. Since the I6,000 ADT threshold was in use for over 20 years, and CO emissions from vehicles were significantly reduced over this time-frame through various vehicle technology and fuel improvements, IDOT initiated and completed a study with the University of Illinois to develop a computer screening model to estimate CO emissions in order to replace the labor-intensive hand-calculated CO method and the 16,000 ADT threshold. Through this IDOT study, in 1999, the University of Illinois, in conjunction with the Illinois EPA and FHWA, developed the Illinois Carbon Monoxide Screen for Intersection Modeling (Illinois COSIM), Version 1.0. In 2003, the Illinois COSIM was updated to Illinois COSIM Version 2.0, which incorporated the United States Environmental Protection Agency's (USEPA) new MOBILE6 model and a pre-screen feature. The pre-screen feature requires input of the county in which the project is located, the ADT or peak hourly traffic volumes (vph) of the busiest intersection leg and the distance to the nearest sensitive receptor (as defined in the IDOT COSIM Air Quality Manual). As a result, the September 2003 "Agreement on Microscale Air Quality Assessments for IDOT-Sponsored Trai1sportation Projects" between IDOT and the Illinois EPA required use of the Illinois COSIM Version 2.0 screening model. Illinois COSIM Version 3.0, developed in 2008 and required for use pursuant to the March 2010 "Agreement on Microscale *Air* Quality Assessments for Illinois Department of Transportation-Sponsored Transportation Projects" between IDOT and the Illinois EPA, incorporated new emission factors that resulted from the Illinois EPA's implementation of an On-Board Diagnostic-based vehicle inspection and maintenance program in the Chicago and Metro-East St. Louis areas, updates to the pre-screen feature, and other minor model updates. Illinois COSIM Version 4.0, developed in 2012-13, incorporates CO emission factors generated by the USEPA's Motor Vehicle Emission Simulator (MOVES) model, which replaced the MOBILE6 model.

3. Illinois COSIM Version 4.0 will be used for conducting CO microscale air quality analyses. IDOT will conduct a full COSIM analysis for intersection projects (except Modern Roundabouts) that increase capacity such as through the addition of through lanes or auxiliary turn lanes and if traffic on one leg of an intersection is greater than or equal to 5,000 vehicles per hour (vph) or 62,500 average daily traffic (ADT), and which have sensitive receptors as identified in the IDOT COSIM Air Quality Manual (April, 2013). If the COSIM screening model shows a potential violation of the CO National Ambient Air Quality Standard, a further refined modeling analysis will be conducted for the project using the USEPA's CAL3QHC model.

4. Project level microscale CO analysis (using the Illinois COSIM Version 4.0 screening model) will be conducted using vehicle emission factors generated from the USEPA's MOVES 2010b model. IDOT will consult with the Illinois EPA for proper inputs to use for the MOVES 2010b model.

5. IDOT, Bureau of Design and Environment, will continue to work closely with the Illinois EPA, Bureau of Air, on general, as well as microscale, air quality issues.

6. This Agreement shall become effective upon execution by appropriate representatives of IDOT and the Illinois EPA. It shall terminate 30 days after written notice by either party.

7. It is anticipated that this Agreement may be modified to reflect experiences in its implementation and evolution of the air pollution control program. This Agreement may be modified only by mutual written agreement by the Illinois EPA and IDOT.

Attachment A

Projects Exempt from CO Analysis Requirement

As outlined in 40 CFR Part 93.126, the following projects are exempt from the requirement for a conformity determination. For purposes of this Agreement, these projects also are exempt from the requirement for a CO analysis, provided the projects do not involve the addition of through lanes or auxiliary tum lanes and have no sensitive receptors.

Safety

- Railroad/highway crossing.
- Projects that correct, improve, or eliminate a hazardous location or feature. Safer non-Federal-aid system roads.
- Shoulder improvements. Increasing sight distance.
- Highway Safety Improvement Program implementation.
- Traffic control devices and operating assistance other than signalization projects.
- Railroad/highway crossing warning devices.
- Guardrails, median barriers, crash cushions.
- Pavement resurfacing and/or rehabilitation.
- Pavement marking.
- Emergency relief (23 U.S.C. 125).
- Fencing.
- Skid treatments.
- Safety roadside rest areas. Adding medians.
- Truck climbing lanes outside the urbanized area.
- Lighting improvements.
- Widening narrow pavements or reconstructing bridges (no additional travel lanes).
- Emergency truck pullovers.

Air Quality

- Continuation of ride-sharing and van-pooling promotion activities at current levels.
- Bicycle and pedestrian facilities.

Other

Specific activities which do not involve or lead directly to construction, such as:

- Planning and technical studies.
- Grants for training and research projects.
- Planning activities conducted pursuant to titles 23 and 49 U.S.C.
- Federal-aid systems revisions.
- Engineering to assess social, economic, and environmental effects of the proposed action or alternatives to that action.
- Noise attenuation.

- Emergency or hardship advance land acquisitions (23 CFR 710.503).
- Acquisition of scenic easements.
- Plantings, landscaping, etc.
- Sign removal.
- Directional and informational signs.
- Transportation enhancement activities (except rehabilitation and operation of historic transportation buildings, structures, or facilities).
- Repair of damage caused by natural disasters, civil unrest, or terrorist acts, except projects involving substantial functional, locational, or capacity changes.

Appendix B

ACRONYMS/GLOSSARY OF ENVIRONMENTAL TERMS

Appendix B

ACRONYMS/GLOSSARY OF ENVIRONMENTAL TERMS

Appendix B presents acronyms and a glossary of environmental terms that are commonly used in the application of environmental procedures.

B-1 ACRONYMS

The evolution of environmental procedures has generated a considerable number of acronyms. These have been created for the names of many Federal and State agencies, laws, studies, terms, etc. The following identifies the more significant acronyms which have gained common usage:

1. AASHTO. American Association of State Highway and Transportation Officials
2. ACHP. Advisory Council on Historic Preservation
3. ADA. Americans with Disabilities Act
4. BDE. (IDOT) Bureau of Design and Environment
5. BMP. Best Management Practices
6. CAAA. Clean Air Act Amendments
7. CE. Categorical Exclusion
8. CERCLIS. Comprehensive Environmental Response, Compensation, and Liability Information System
9. CEQ. Council on Environmental Quality
10. CFR. Code of Federal Regulations
11. CWA. Clean Water Act
12. CZM. Coastal Zone Management
13. DEIS. Draft Environmental Impact Statement
14. DOI. (United States) Department of Interior

15. EA. Environmental Assessment

16. EIS. Environmental Impact Statement

17. EO. Executive Order

18. EPA. (United States) Environmental Protection Agency

19. ESA. (Federal) Endangered Species Act

20. FAA. Federal Aviation Administration

21. FEIS. Final Environmental Impact Statement

22. FEMA. Federal Emergency Management Agency

23. FHWA. Federal Highway Administration

24. FIFRA. Federal Insecticide, Fungicide, and Rodenticide Act

25. FOIA. Freedom of Information Act

26. FONSI. Finding of No Significant Impact

27. FPPA. (Federal) Farmland Protection Policy Act

28. FRA. Federal Railroad Administration

29. FSA. (Federal) Farm Service Agency

30. FTA. Federal Transit Administration (Note: This was formerly the Urban Mass Transit Administration (UMTA))

31. FWCA. Fish and Wildlife Coordination Act

32. FWPCA. Federal Water Pollution Control Act

33. FWS. (United States) Fish and Wildlife Service

34. HABS/HAER. Historic American Building Survey/Historic American Engineering Record

35. HOV. High-Occupancy Vehicle

36. HUD (United States Department of) Housing and Urban Development

37. IDNR. Illinois Department of Natural Resources

38. IDOA. Illinois Department of Agriculture

39. IDOT. Illinois Department of Transportation

40. IEPA. Illinois Environmental Protection Agency

41. IHPA. Illinois Historic Preservation Agency

42. INHS. Illinois Natural History Survey

43. INPC. Illinois Nature Preserves Commission

44. ISGS. Illinois State Geological Survey

45. ISTEA. Intermodal Surface Transportation and Efficiency Act (of 1991)

46. ISTHA. Illinois State Toll Highway Authority

47. ISWS. Illinois State Water Survey

48. LAWCON. Land and Water Conservation Fund (Act)

49. LUST. Leaking Underground Storage Tank

50. MOA. Memorandum of Agreement

51. MOU. Memorandum of Understanding

52. MPO. Metropolitan Planning Organization

53. MWRDGC. Metropolitan Water Reclamation District of Greater Chicago

54. NAAQS. National Ambient Air Quality Standards

55. NEPA. National Environmental Policy Act

56. NFIP. National Flood Insurance Program

57. NHPA. National Historic Preservation Act

58. NMFS. National Marine Fisheries Service

59. NPDES. National Pollutant Discharge Elimination System

60. NPS. National Park Service

61. NRCS. Natural Resources Conservation Service (Note: This was formerly the Soil Conservation Service (SCS))

62. NRHP. National Register of Historic Places

63. NWP. Nationwide (Section 404) Permit

64. OCZM. Office of Coastal Zone Management

65. OEPC. (DOI) Office of Environmental Policy and Compliance

66. OWR. Office of Water Resources (IDNR)

67. PE. Preliminary Engineering

68. PESA. Preliminary Environmental Site Assessment

69. PL. Public Law

70. PSI. Preliminary Site Investigation

71. RCRA. Resource Conservation and Recovery Act

72. REO. (DOI) Regional Environmental Officers

73. RMP. Risk Managed Project

74. ROD. Record of Decision

75. ROW. Right-of-Way

76. RPTA. Responsible Property Transfer Act

77. SAFETEA-LU. Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users

78. SARA. Superfund Amendments and Reauthorization Act

79. SDWA. Safe Drinking Water Act

80. SEE. Social, Economic, and Environmental

81. SIP. State Implementation Plan

82. SIR. State Improvement Report

83. SHPO. State Historic Preservation Officer

84. STIP. State Transportation Improvement Program

85. SWA. Special Waste Assessment

86. 3-C. Continuing, Cooperative, and Comprehensive (Planning)

87. TEA-21. Transportation Equity Act for the 21st Century

88. TCM. Transportation Control Measure

89. TIP. Transportation Improvement Program

90. TSM. Transportation System Management

91. URAA. Uniform Relocation Assistance Act

92. USC. United States Code

93. USACOE. United States Army Corps of Engineers

94. USCG. United States Coast Guard

95. USDA. United States Department of Agriculture

96. USDOT. United States Department of Transportation

97. USFS. United States Forest Service

98. USGS. United States Geological Survey

99. UST. Underground Storage Tank

B-2 DEFINITIONS

The following presents definitions typically used for environmental procedures:

1. Action. For purposes of 23 CFR 771, a highway ... project proposed for FHWA... funding. It also includes activities such as joint and multiple-use permits, changes in access control, etc., which may or may not involve a commitment of Federal funds. For Federal floodplain regulations, "action" is any highway construction, reconstruction, rehabilitation, repair, or improvement undertaken for Federally funded/regulated projects. For purposes of Illinois Endangered Species Act regulations, construction, land management, or other activities that are authorized, funded, or performed in whole or in part by agencies of State and local governments and that will result in a change to the existing environmental conditions or may affect listed threatened or endangered species or their essential habitat or Natural Areas.

2. Action Area. (For purposes of Federal Endangered Species Act regulations.) All areas to be affected directly or indirectly by the proposed action and not merely the immediate area involved in the action.

3. Administration Action. The approval by FHWA or UMTA of the applicant's request for Federal funds for construction. It also includes approval of activities such as joint and multiple-use permits, changes in access control, etc., which may or may not involve a commitment of Federal funds.

4. Adverse Impact. (For purposes of Illinois Endangered Species Act regulations.) A direct or indirect alteration of the physical or biological features or the air, land, or water which may affect the survival, reproduction, or recovery of a listed species or that may diminish the viability of a Natural Area.

5. Agency Action Report. A report submitted to the IDNR for a proposed action requiring consultation. The information required to be submitted shall be sufficient to determine the presence or absence of a threatened or endangered species or Natural Area in the vicinity of the proposed action.

6. Agricultural Land Conversion. (For purposes of Illinois Farmland Protection Act regulations.) The taking of land directly out of agricultural production or displacing it by another use and not returning it to production.

7. Agricultural Land or Farmland. (For purposes of Illinois Farmland Protection Act regulations.) All land in farms including cropland, hayland, pastureland, forestland, corrals, gardens, orchards, land used for farmsteads, buildings, barns, machinery sheds, adjacent yards or corrals, pens, waste lagoons, feedlots, farmstead or feedlot windbreaks, grain bins, lanes for farm residences and fields, field windbreaks, ponds, commercial feedlots, greenhouses, nurseries, broiler facilities, and farm landing strips.

8. Area of Potential Effects. (For purposes of the Section 106 historic preservation regulations.) The geographic area or areas within which an undertaking may cause changes in the character or use of historic properties, if any such properties exist.

9. Base Flood. The flood or tide having a 1-percent chance of being exceeded in any given year.

10. Base Floodplain. The area subject to flooding by the base flood.

11. Biological Assessment. Information on listed and proposed species and designated and proposed critical habitat that may be present in the action area and the evaluation of potential effects of the action on such species and habitat.

12. Biological Opinion (Federal). The document that states the opinion of the US Fish and Wildlife Service (USFWS) on whether or not an action is likely to jeopardize the continued existence of listed species or result in the destruction or adverse modification of critical habitat. (Illinois). The component of the Detailed Action Report prepared by the IDNR when a valid record of an occurrence for a threatened or endangered species or Natural Area exists within the vicinity of a proposed action. This opinion will conclude whether the action will jeopardize the listed species present, destroy or adversely modify their essential habitat, or adversely modify a Natural Area.

13. Categorical Exclusion (CE). (For purposes of 40 CFR 1500, *CEQ Regulations*.) A category of actions which do not individually or cumulatively have a significant effect on the human environment for which, therefore, neither an environmental assessment nor an environmental impact statement is required.

14. Class of Action. In Federal environmental parlance, the categorization of the significance of the environmental impact of a proposed action and the corresponding level of environmental documentation required.

15. Conference. (For purposes of Federal Endangered Species Act regulations.) A process involving coordination with USFWS for actions likely to jeopardize the continued existence of proposed species or result in the destruction or adverse modification of proposed critical habitat.

16. Cooperating Agency. Any Federal agency other than a lead agency which has jurisdiction by law or special expertise with respect to any environmental impact involved in a proposal (or a reasonable alternative) for legislation or other major Federal action significantly affecting the quality of the human environment. A State or local agency of similar qualifications may, by agreement with the lead agency, become a cooperating agency.

17. Council. (For purposes of the Section 106 historic preservation regulations.) The Advisory Council on Historic Preservation or a Council member or employee designated to act for the Council.

18. Critical Habitat. An area designated by USFWS as critical habitat.

19. Cumulative Effects. (For purposes of Illinois Endangered Species Act regulations.) Direct and indirect effects of a proposed action(s) together with the identifiable effects of actions that are interrelated or interdependent with the action. Indirect effects are those that are caused by the action but are later in time or farther in distance. Interrelated actions are those that are a part of a larger action. Interdependent actions are those that have independent utility apart from the action.

20. Cumulative Impact. (For purposes of 40 CFR 1500 *CEQ Regulations*.) The impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.

21. Destruction or Adverse Modification. (For purposes of Federal Endangered Species Act regulations.) A direct or indirect alteration that appreciably diminishes the value of critical habitat for both the survival and recovery of listed species. Such alterations include, but are not limited to, alterations adversely modifying any of those physical or biological features that were the basis for determining the habitat to be critical.

22. Detailed Action Report. A written report that is prepared by an agency when a threatened or endangered species or Natural Area has been identified within the vicinity of a proposed action. This report shall contain sufficient information to make a judgment regarding the potential adverse impacts to a listed species or its essential habitat or a Natural Area.

23. Effects. (For purposes of 40 CFR 1500, *CEQ Regulations*.) Effects include:

    a. Direct effects, which are caused by the action and occur at the same time and place.

    b. Indirect effects, which are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable. Indirect effects may include growth inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems.

24. Encroachment. An action within the limits of the base floodplain.

25. Environmental Assessment (EA). A concise public document for which a Federal agency is responsible that serves to briefly provide sufficient evidence and analysis for determining whether to prepare an environmental impact statement or a finding of no significant impact.

26. Environmental Documentation. Refers to environmental reports (e.g., EIS, EA) and the environmental information contained in Phase I Engineering Reports.

27. Environmental Impact Statement (EIS). A detailed written statement, prepared for major Federal actions significantly affecting the quality of the human environment, which discusses the environmental impact of the proposed action; any adverse environmental effects which cannot be avoided should the proposal be implemented; alternatives to the proposed action; the relationship between local short-term uses of man's environment and the maintenance and enhancement of long-term productivity; and any irreversible and irretrievable commitments of resources which would be involved in the proposed action should it be implemented.

28. Environmental Report. Refers specifically to an EIS or an EA.

29. Environmental Studies. The investigations of potential environmental impacts to determine the environmental process to be followed and to assist in the preparation of the environmental document.

30. Essential Habitat. The physical and biological environment that is required to maintain viable populations of a listed species to ensure the survival and recovery of that species.

31. Federally Funded/Regulated. Refers to the involvement of Federal funds and/or jurisdictional authority by any Federal agency for a proposed action.

32. Finding of No Significant Impact (FONSI). A document by a Federal agency briefly presenting the reasons why an action, not otherwise excluded, will not have a significant impact on the human environment and for which an environmental impact statement therefore will not be prepared.

33. Formal Consultation. (For purposes of Federal Endangered Species Act regulations.) A process between USFWS and the Federal agency responsible for a proposed action that commences with the Federal agency's written request for consultation and concludes with USFWS' issuance of a biological opinion.

34. Historic Property. (For purposes of the Section 106 historic preservation regulations.) Any prehistoric or historic district, site, building, structure, or object included in or eligible for inclusion in the National Register. This term includes artifacts, records, and remains that are related to and located within such properties. The term "eligible for inclusion in the National Register" includes both properties formally determined as such by the Secretary of the Interior and all other properties that meet National Register listing criteria.

35. Historic Significance. For purposes of Section 4(f), based on whether or not a historic site is included on or eligible for inclusion on the National Register of Historic Places (National Register).

36. Indian Tribe. The governing body of any Indian tribe, band, nation, or other group that is recognized as an Indian tribe by the Secretary of the Interior and for which the United States holds land in trust or restricted status for that entity or its members.

37. Interdisciplinary. Combining or involving various academic disciplines to ensure the integrated use of the natural and social sciences and the environmental design arts.

38. Interested Person. (For purposes of the Section 106 historic preservation regulations.) Those organizations and individuals that are concerned with the effects of an undertaking on historic properties.

39. Jeopardize. (For purposes of Illinois Endangered Species Act regulations.) To engage in an action which would reduce the likelihood of the survival or recovery of a listed species or would result in the destruction or adverse modification of the essential habitat of such a species or which would result in the destruction or adverse modification of a Natural Area.

40. Jeopardize the Continued Existence of. (For purposes of Federal Endangered Species Act regulations.) To engage in an action that reasonably would be expected, directly or indirectly, to reduce appreciably the likelihood of both the survival and recovery of a listed species in the wild by reducing the reproduction, numbers, or distribution of that species.

41. Land Class. One of eight classes of land in the Land Capability Classification System (Handbook 210, issued September 1961, and approved for reprinting January, 1973) as developed by the Natural Resources Conservation Service, United States Department of Agriculture. Incorporation by reference does not include any future editions or amendments. The land capability classification shows, in a general way, the suitability of soils for most kinds of field crops. The soils are grouped according to their limitations for field crops, the risk of damage to the soil if they are used for crops, and the way they respond to management.

42. Lead Agency. The agency or agencies preparing or having assumed primary responsibility for preparing the environmental document.

43. Listed Species (Federal). Any species of fish, wildlife, or plant which has been determined to be endangered or threatened pursuant to the Federal Endangered Species Act.

44. Listed Species (State). Any species of plant or animal which has been listed as threatened or endangered by the Illinois Endangered Species Protection Board or the USFWS.

45. Local Government. A city, county, parish, township, municipality, borough, or other general purpose political subdivision of a State.

46. Maintenance Area. Any geographic region of the United States previously designated nonattainment pursuant to the Clean Air Act Amendments of 1990 and subsequently redesignated to attainment, subject to the requirement to develop a maintenance plan under Section 175A of the Clean Air Act, as amended.

47. Major Construction Activity. (For purposes of Federal Endangered Species Act regulations.) A construction project (or other undertaking having similar physical impacts) which is a major Federal action significantly affecting the quality of the human environment as referred to in the National Environmental Policy Act (NEPA).

48. May. A permissive condition allowing individual judgment and discretion in the evaluation and decision-making. If the term is used in specifying a procedure, that procedure is optional.

49. Mitigation. Mitigation includes:

    a. Avoiding the impact altogether by not taking a certain action or parts of an action.

    b. Minimizing impacts by limiting the degree or magnitude of the action and its implementation.

    c. Rectifying the impact of repairing, rehabilitating, or restoring the affected environment.

    d. Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.

    e. Compensating for the impact by replacing or providing substitute resources or environments.

50. Mitigation Measures. Activities identified in the environmental process intended to lessen the severity of any unavoidable environmental impacts precipitated by the proposed action.

51. Modern Soil Survey. A document published after 1965 by NRCS containing a description of a county's soils, maps showing their distribution, and discussions concerning their behavior and adaptability.

52. National Historic Landmark. A historic property that the Secretary of the Interior has designated as a National Historic Landmark.

53. National Register. (For purposes of the Section 106 historic preservation regulations.) The National Register of Historic Places maintained by the Secretary of the Interior.

54. National Register Criteria. (For purposes of the Section 106 historic preservation regulations.) The criteria established by the Secretary of the Interior for use in evaluating the eligibility of properties for the National Register.

55. Natural Area. Any area of land in public or private ownership which is registered under the Illinois Natural Areas Preservation Act 525 ILCS 30 or is identified in the Illinois Natural Areas Inventory.

56. Natural and Beneficial Floodplain Values. These include but are not limited to fish, wildlife, plants, open space, natural beauty, scientific study, outdoor recreation, agriculture, aquaculture, forestry, natural moderation of floods, water quality maintenance, and groundwater recharge.

57. NEPA Process. The process for complying with the intent of NEPA to make environmental information available to decision makers at the appropriate time and to help public officials make decisions that are based on the understanding of environmental consequences and take actions that protect, restore, and enhance the environment.

58. Nonattainment Area. Any geographic region of the United States which has been designated as nonattainment under Section 107 of the Clean Air Act for any pollutant for which a national ambient air quality standard exists.

59. Notice of Intent. A notice that an Environmental Impact Statement will be prepared and considered.

60. Participating Agency. A Federal, State, Tribal, regional or local government agency that accepts an invitation to be involved in the NEPA process for a proposed transportation project. The roles and responsibilities of participating agencies include, but are not limited to:

    a. Participating in the NEPA process starting at the earliest possible time, especially with regard to the development of the purpose and need statement, range of alternatives, methodologies and level of detail for the analysis of alternatives.

    b. Identifying, as early as practicable, any issues of concern regarding the project's potential environmental or socioeconomic impacts. Participating agencies also may participate in the issue resolution process.

    c. Providing meaningful and timely input on unresolved issues.

    d. Participating in the scoping process.

61. Policy. For purpose of Part III of the *BDE Manual*, this is a general statement describing the official posture of IDOT on a particular matter.

62. Practicable. For purpose of the Federal floodplain regulations, means capable of being done within reasonable natural, social, or economic constraints.

63. Preserve. For purposes of the Federal floodplain regulations, to avoid modification to the functions of the natural floodplain environment or to maintain it as closely as practical in its natural state.

64. Programmatic Section 4(f) Evaluation and Approval. An evaluation and approval addressing a specific category of actions involving use of Section 4(f) land.

65. Proposed Critical Habitat. (For purposes of Federal Endangered Species Act regulations.) Habitat proposed in the Federal Register to be designated or revised as critical habitat for any listed or proposed species.

66. Proposed Species. (For purposes of Federal Endangered Species Act regulations.) Any species of fish, wildlife, or plant that is proposed to be listed under Section 4 of the Federal Endangered Species Act.

67. Reasonably Foreseeable. Deemed likely to occur in the future based on the best available planning information for the project area (such as formal planning documents, information from community officials, or local land-use/zoning/permitting processes).

68. Record of Decision (ROD). A FHWA document, prepared after the publication of the Final EIS, which a) presents the basis for the decision (i.e., the selected alternative), b) summarizes any mitigation measures that will be incorporated into the project, and c) documents any required Section 4(f) approval.

69. Regulatory Floodway. The floodplain area that is reserved in an open manner by Federal, State, or local requirements (i.e., unconfined or unobstructed either horizontally or vertically) to provide for the discharge of the base flood so that the cumulative increase in water surface elevation is no more than a designated amount (not to exceed 1 ft (300 mm)) as established by the Federal Emergency Management Agency (FEMA) for Administering the National Flood Insurance Program.

70. Restore. For purposes of the Federal floodplain regulations, to reestablish a setting or environment in which the functions of the natural and beneficial floodplain values adversely impacted by the highway agency action can again operate.

71. Risk. For purpose of the Federal floodplain regulations, the consequences associated with the probability of flooding attributable to an encroachment. It includes the potential for property loss and hazard to life during the service life of the highway.

72. Scoping. An early and open process for determining the scope of issues to be addressed in Environmental Impact Statements or Environmental Assessments and for identifying potentially significant issues related to the proposed action. Scoping is intended to focus the study effort on issues that are significant and avoid the collection of needless detailed information on insignificant issues.

73. Section 4(f) Approval. A finding that there is no feasible and prudent alternative to use of Section 4(f) land and that all possible planning to minimize harm to Section 4(f) land is included in the proposed action.

74. Section 4(f) Evaluation. Documentation of the involvement a project would have with Section 4(f) land, addressing alternatives to use of such land and measures to minimize any harm that would result from such use.

75. Section 4(f) Land. Land protected under 49 USC 303 (Section 4(f) of the USDOT Act of 1966); i.e., any significant publicly owned park, recreational area, or wildlife and waterfowl refuge or a historic site of national, State, or local significance. Significance is determined by the Federal, State, or local officials having jurisdiction over the park, recreational area, refuge or site. The term “historic site” includes both historic and prehistoric archaeological sites determined important for preservation in place.

76. Section 6(f) Lands. Lands which had Land and Water Conservation (LAWCON) funds involved in their purchase or development.

77. Shall, must. A mandatory condition. Users are obligated to adhere to the recommendations and applications presented in this context or to perform the evaluation indicated. If these terms are used in specifying a procedure, that procedure is mandatory.

78. Should. An advisory condition. Users are strongly encouraged to follow the criteria and guidance presented in this context. If these terms are used in specifying procedures, that procedure is recommended. Deviations from the specified procedure should be justified.

79. Significantly. Significantly as used in NEPA requires considerations of both context and intensity:

   a. Context. This means that the significance of an action must be analyzed in several contexts such as society as a whole (human, national), the affected region, the affected interests, and the locality. Significance varies with the setting of the proposed action. For instance, in the case of a site-specific action, significance would usually depend upon the effects in the locale rather than in the world as a whole. Both short- and long-term effects are relevant.

   b. Intensity. This refers to the severity of impact. Responsible officials must bear in mind that more than one agency may make decisions about partial aspects of a major action. The following should be considered in evaluating intensity:

      - Impacts that may be both beneficial and adverse. A significant effect may exist even if the Federal agency believes that on balance the effect will be beneficial.

      - The degree to which the proposed action affects public health or safety.

- Unique characteristics of the geographic area such as proximity to historic or cultural resources, park lands, prime farmlands, wetlands, wild and scenic rivers, or ecologically critical areas.

- The degree to which the effects on the quality of the human environment are likely to be highly controversial.

- The degree to which the possible effects on the human environment are highly uncertain or involve unique or unknown risks.

- The degree to which the action may establish a precedent for future actions with significant effects or represents a decision in principle about a future consideration .

- Whether the action is related to other actions with individually insignificant but cumulatively significant impacts. Significance exists if it is reasonable to anticipate a cumulatively significant impact on the environment. Significance cannot be avoided by terming an action temporary or by breaking it down into small component parts.

- The degree to which the action may adversely affect districts, sites, highways, structures, or objects listed in or eligible for listing in the National Register of Historic Places or may cause loss or destruction of significant scientific, cultural, or historical resources.

- The degree to which the action may adversely affect an endangered or threatened species or its habitat that has been determined to be critical under the Endangered Species Act of 1973.

- Whether the action threatens a violation of Federal, State, or local law or requirements imposed for the protection of the environment.

80. Significant Encroachment. A highway encroachment and any direct support of likely base floodplain development that would involve one or more of the following construction- or flood-related impacts:

    - a significant potential for interruption or termination of a transportation facility which is needed for emergency vehicles or provides a community's only evacuation route,

    - a significant risk, or

    - a significant adverse impact on natural and beneficial floodplain values.

81. Site. For purposes of Federal Farmland Protection Policy Act regulations, the location(s) that would be converted by the proposed action(s).

82. State Historic Preservation Officer. The official appointed or designated pursuant to Section 101(b)(1) of the National Historic Preservation Act to administer the State historic preservation program or a representative designated to act for the State Historic Preservation Officer. The State Historic Preservation Officer for Illinois is the Director of the State Historic Preservation Agency.

83. Supplemental Environmental Impact Statement (SEIS). A detailed written statement on changes in the proposed action and/or on the identification and analysis of new circumstances or information not addressed in the Draft or Final EIS, which would introduce new or changed environmental effects of significance on the quality of the human environment.

84. Support Base Floodplain Development. To encourage, allow, serve, or otherwise facilitate additional base floodplain development. Direct support results from an encroachment, while indirect support results from an action out of the base flood plain.

85. Tiering. Covering broad or more general matters in one EIS with a subsequent EIS (or EIS's) addressing narrower, more specific matters. The subsequent EIS(s) would incorporate by reference the general discussions and would concentrate solely on the issues specific to the latter. Tiering usually is applied to broad program or system EIS's and subsequent project-specific EIS's. It is intended to be an aid in focusing on issues which are ready for decision and excluding issues already decided or not yet ready.

86. Type I Project. (For purposes of the FHWA noise regulations.) A proposed highway project for the construction of a highway on new location or the physical alteration of an existing highway which significantly changes either the horizontal or vertical alignment or increases the number of through traffic lanes.

87. Type II Project. (For purposes of the FHWA noise regulation.) A proposed highway project for noise abatement on an existing highway.

88. Undertaking. (For purposes of the Section 106 historic preservation regulations.) Any project, activity, or program that can result in changes in the character or use of historic properties, if any such historic properties are located in the area of potential effects. The project, activity, or program must be under the direct or indirect jurisdiction of a Federal agency or licensed or assisted by a Federal agency. Undertakings include new and continuing projects, activities, or programs and any of their elements not previously considered under Section 106.

89. Undeveloped Lands. (For purposes of noise analyses.) Those tracts of land or portions thereof which do not contain improvements or activities devoted to frequent human habitation or use (including low-density recreational use) and for which no such improvements or activities are planned or programmed.

90. Use. For Section 4(f), use occurs (1) when land from a Section 4(f) site is acquired for a transportation project, (2) when there is an occupancy of land that is adverse in terms of

the preservationist purposes of Section 4(f), or (3) when the proximity impacts of a transportation project on a Section 4(f) site, without acquisition of land, are so great that the purposes for which the Section 4(f) site exists are substantially “impaired” (normally referred to as a “constructive use”).

91. Vicinity. (For purposes of the State Endangered Species Protection Act regulations.) The area surrounding the action, as determined by the life history requirements of the species of concern or proximity to a Natural Area.

92. Wetlands (Federal). Those areas inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas.

93. Wetlands (Illinois). Means land that has a predominance of hydric soils (soils which are usually wet and where there is little or no free oxygen) and that is inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances does support, a prevalence of hydrophytic vegetation (plants typically found in wet habitats) typically adapted for life in saturated soil conditions. Areas which are restored or created as the result of mitigation or planned construction projects and which function as a wetland are included within this definition even when all three wetland parameters are not present.

Appendix C

AUTHORITY/RESPONSIBILITIES

BUREAU OF DESIGN AND ENVIRONMENT MANUAL

Appendix C
AUTHORITY/RESPONSIBILITIES

The proper application of environmental procedures requires an understanding of the governing structure. Appendix C presents the legal authority for environmental regulations and the functional responsibilities of the governmental agencies which implement environmental law.

C-1 LEGAL AUTHORITY

The following subsections present a brief description of the significant Federal and State laws which impact environmental procedures. Where both a Federal and State law apply to a given situation, it is necessary to comply with both.

C-1.01 Federal

C-1.01(a) General Environmental Statutes

1. National Environmental Policy Act (NEPA). 42 U.S.C. 4321-4347 (P.L. 91-190 and 94-83), 23 CFR 771, 40 CFR 1500-1508, Executive Order 11514 as amended by Executive Order 11991 on NEPA responsibilities.

   Purpose: Consider environmental factors through systematic interdisciplinary approach before committing to a course of action.

   Applicability: All Federal actions.

   General Procedures: Procedures set forth in *CEQ Regulations* and 23 CFR 771.

   Coordination: Appropriate Federal, State, and local agencies.

2. Section 4(f) of the Department of Transportation Act. 23 U.S.C. 138, 49 U.S.C. 303 (P.L. 100-17, 97-449, and 86-670), 23 CFR 774.

   Purpose: Preserve publicly owned public parklands, waterfowl and wildlife refuges, and significant historic sites.

   Applicability: Significant publicly owned public parklands, recreation areas, wildlife and waterfowl refuges, and all significant historic sites "used" for a highway project.

   General Procedures: Specific finding required: (1) selected alternative must avoid protected areas, unless there are no feasible and prudent avoidance alternatives; and (2) selected alternative must include all possible planning to minimize harm.

Coordination: Department of Interior (DOI), Department of Agriculture (DOA), Department of Housing and Urban Development (HUD), State, or local agencies having jurisdiction, and State Historic Preservation Officer (for historic sites).

3. Section 6002 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU). 23 U.S.C. 139 ((P.L. 109-59).

Purpose: To make the environmental review process more efficient and timely. This statute describes the roles of the project sponsor and the lead, participating and cooperating agencies; sets new requirements for coordinating and scheduling agency reviews; broadens the authority for States to use Federal funds to ensure timely environmental reviews; and specifies a process for resolving interagency disagreements.

Applicability: The requirements of this directive apply to all Federally-funded transportation projects requiring preparation of an Environmental Impact Statement for compliance with the National Environmental Policy Act. The requirements also may apply to projects involving preparation of an Environmental Assessment, as determined by FHWA on a case-by-case basis.

General Procedures: Key requirements of the new environmental review process established by this statute include the following:

- early notification to Federal Highway Administration (FHWA) of the initiation of the NEPA process;
- identification and invitation of Federal, State, Tribal, regional and local government agencies to serve as participating agencies in the NEPA process;
- opportunity for involvement of participating agencies and the public in defining the project purpose and need;
- opportunity for involvement of participating agencies and the public in developing the range of alternatives for the project; and
- collaboration with participating agencies to determine the appropriate methodologies and the level of detail required in the analysis of alternatives.

Coordination: FHWA, appropriate Federal, State, regional and local agencies, and the public

4. Economic, Social, and Environmental Effects. 23 U.S.C. 109(h) (P.L. 91-605), 23 U.S.C. 128, 23 CFR 771.

Purpose: To assure that possible adverse, economic, social, and environmental effects of proposed highway projects and project locations are fully considered and that final decisions on highway projects are made in the best overall public interest.

Applicability: Planning and development of proposed projects on any Federal-aid system for which the FHWA approves the plans, specifications, and estimates, or has the responsibility for approving a program.

General Procedures: Identification of social, economic, and environmental effects; consideration of alternative courses of action; involvement of other agencies and the public; systematic interdisciplinary approach. The report required by Section 128, on the consideration given to the social, economic, and environmental impacts of the project, may serve as part of the NEPA compliance document.

Coordination: Appropriate Federal, State, and local agencies.

5. Uniform Relocation Assistance and Real Property Acquisition Act of 1970. 42 U.S.C. 4601 et seq., P.L. 91-646 as amended by the Uniform Relocation Act Amendments of 1987 (P.L. 100-17), 49 CFR 24.

   Purpose: To implement the Uniform Act as amended in an efficient manner; to ensure property owners of real property acquired for and persons displaced by Federal-aid projects are treated fairly, consistently, and equitably; and so they will not suffer disproportionate injuries.

   Applicability: All projects involving Federal-aid funds.

   General Procedures: Procedures set forth in 49 CFR 24.

   Coordination: DOT/FHWA has lead responsibility. Appropriate Federal, State, and local agencies.

6. Title VI of the Civil Rights Act of 1964. 42 U.S.C. 2000D et seq. and related statutes, 49 CFR 21, 23 CFR 200.

   Purpose: To ensure that no person shall, on the grounds of race, color, national origin, age, sex, or disability, be subjected to discrimination under any program or activity receiving Federal financial assistance.

   Applicability: All Federal programs and projects.

   General Procedures: Procedures set forth in 49 CFR 21 and 23 CFR 200.

   Coordination: FHWA headquarters and field offices.

7. Executive Order 12898: Environmental Justice. Federal Register Vol. 60, No. 125, pp 33896-33903.

   Purpose: Avoid Federal actions which cause disproportionately high and adverse impacts on minority and low-income populations with respect to human health and the environment.

   Applicability: All Federal programs and projects.

   General Procedures: Procedures set forth in DOT Final Environmental Justice Strategy and final DOT Order (Federal Register, Volume 62, No. 72, pp. 18377-18381.)

   Coordination: FHWA headquarters and field offices.

8. Public Hearings. 23 U.S.C. 128, 23 CFR 771.111.

   Purpose: To ensure adequate opportunity for public hearing(s) on the social, economic and environmental effects of alternative project locations and major design features, as well as the consistency of the project with local planning goals and objectives.

   Applicability: Public hearings or hearing opportunities are required for projects described in each State's FHWA-approved public involvement procedures.

   General Procedures: Public hearings or opportunities for public hearings during the consideration of highway location and design proposals are conducted as described in the State's FHWA-approved, public involvement procedures. States must certify to FHWA that such hearings have been held, or the opportunity for hearings has been offered and, when a hearing is held, must submit a transcript to FHWA.

   Coordination: Appropriate Federal, State, and local agencies.

9. Surface Transportation and Uniform Relocation Assistance Act of 1987. Section 123(f) Historic Bridges, 23 U.S.C. 144(o) (P.L. 100-17).

   Purpose: Complete an inventory of on-system and off-system bridges to determine their historic significance. Encourage the rehabilitation, reuse, and preservation of historic bridges.

   Applicability: Any bridge that is listed on, or eligible for listing on, the National Register of Historic Places.

   General Procedures: (1) Identify historic bridges on and off system, (2) seek to preserve or reduce impact to historic bridges, and (3) seek a recipient prior to demolition.

Coordination: State Historic Preservation Officer and Advisory Council on Historic Preservation.

10. Surface Transportation and Uniform Relocation Assistance Act of 1987. Section 130 Wildflowers, 23 U.S.C. 319(b) (P.L. 100-17), 23 CFR 752.

Purpose: To encourage the use of native wildflowers in highway landscaping.

Applicability: Native wildflowers are to be planted on any landscaping project undertaken on the Federal-aid highway system.

General Procedures: At least 1/4 of 1% of funds expended on a landscaping project must be used to plant native wildflowers on that project.

Coordination: FHWA - State, Division, Regional contacts.

11. Highway Beautification Act of 1965. 23 U.S.C. 131, 136, 319 (P.L. 89-285), 23 CFR 750, 751, 752.

Purpose: To provide effective control of outdoor advertising and junkyards, to protect the public investment, to promote the safety and recreational value of public travel and preserve natural beauty, and to provide landscapes and roadside development reasonably necessary to accommodate the traveling public.

Applicability: Interstate and primary systems including toll sections thereof.

General Procedures. Procedures set forth in 23 CFR 750, 751, and 752.

Coordination: DOT/FHWA, State, and local agencies.

C-1.01(b) Health

1. Safe Drinking Water Act. 42 U.S.C. 300f - 300j-6 (P.L. 93-523 and 99-339), 23 CFR 650, Subpart E, 40 CFR 141,149.

Purpose: Ensure public health and welfare through safe drinking water.

Applicability: (1) All public drinking water systems and reservoirs (including rest area facilities), (2) actions which may have a significant impact on an aquifer or wellhead protection area which is the sole or principal drinking water source, as designated through the Federal Register process.

General Procedures: (1) Compliance with national primary drinking water regulations, (2) compliance with State wellhead protection plans, (3) compliance with MOAs between EPA and FHWA covering specific sole-source aquifers.

Coordination: US Environmental Protection Agency (EPA) and appropriate State agency.

2. Solid Waste Disposal Act, as amended by the Resource Conservation and Recovery Act of 1976. 42 U.S.C. 6901, et seq., see especially 42 U.S.C. 6961-6964 (P.L. 89-272, 91-512, and 94-580), 23 CFR 751, 40 CFR 256-300.

Purpose: Provide for the recovery, recycling, and environmentally safe disposal of solid wastes.

Applicability: All projects which involve the recycling or disposal of solid wastes.

General Procedures: Solid wastes will be disposed of according to the rules for specific waste involved.

Coordination - EPA.

3. Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA). 7 U.S.C. 136-136y (P.L. 92-516), 40 CFR 152-171.

Purpose: Control the application of pesticides to provide greater protection to man and the environment.

Applicability: All activities which necessitate use of restricted pesticides.

General Procedures: Using or supervising "restricted use" pesticides will require certification.

Coordination: EPA.

C-1.01(c) Historic and Archeological Preservation

1. Section 106 of the National Historic Preservation Act, as amended. 16 U.S.C. 470f (P.L. 89-665, 91-243, 93-54, 94-422, 94-458, 96-199, 96-244, and 96-515), Executive Order 11593, 23 CFR 771, 36 CFR 60, 36 CFR 63, 36 CFR 800.

Purpose: Protect, rehabilitate, restore, and reuse districts, sites, buildings, structures, and objects significant in American architecture, archeology, engineering, and culture.

Applicability: All properties on or eligible for inclusion on the National Register of Historic Places.

General Procedures: (1) Identify and determine the effects of project on subject properties, (2) coordinate with the State Historic Preservation Officer, other consulting parties, and, as appropriate, the Advisory Council on Historic Preservation, in accordance with 36 CFR 800, (3) avoid or mitigate damages to greatest extent possible.

Coordination: State Historic Preservation Officer, Advisory Council on Historic Preservation, DOI National Park Service (NPS).

2. Section 110 of the National Historic Preservation Act, as amended. 16 U.S.C. 470h-2 (P.L. 96-515), 36 CFR 65, 36 CFR 78.

   Purpose: Protect national historic landmarks and record historic properties prior to demolition.

   Applicability: All properties designated as National Historic Landmarks. All properties on or eligible for inclusion on the National Register of Historic Places.

   General Procedures: (1) Identify and determine the effects of a project on subject properties, (2) afford Advisory Council an early opportunity to comment, in accordance with 36 CFR 800.

   Coordination: State Historic Preservation Officer, Advisory Council on Historic Preservation, DOI (NPS).

3. Archeological and Historic Preservation Act. 16 U.S.C. 469-469c (P.L. 93-291) (Moss-Bennett Act), 36 CFR 66 (draft).

   Purpose: Preserving significant historical and archeological data from loss or destruction.

   Applicability: Any unexpected archeological resources discovered as a result of a Federal construction project or Federally licensed activity or program.

   General Procedures: (1) Notify DOI (NPS) when a Federal project may result in the loss or destruction of a historic or archeological property, (2) DOI and/or the Federal agency may undertake survey or data recovery.

   Coordination: DOI (NPS) Departmental consulting archeologist and State Historic Preservation Officer.

4. Archeological Resources Protection Act. 16 U.S.C. 470AA-11 (P.L. 96-95), 18 CFR 1312, 32 CFR 229, 36 CFR 79, 296, 43 CFR 7.

   Purpose: Preserve and protect paleontological resources, historic monuments, memorials, and antiquities from loss or destruction.

Applicability: Archeological resources on Federal or Native American-owned property.

General Procedures: (1) Ensure contractor obtains permit, and identifies and evaluates resource. (2) Mitigate or avoid resource in consultation with appropriate officials in the State. (3) If necessary, apply for permission to examine, remove, or excavate such objects.

Coordination: Department or agency having jurisdiction over land on which resources may be situated (Bureau of Indian Affairs (BIA), Bureau of Land Management (BLM), DOA, Department of Defense (DOD), NPS, Tennessee Valley Authority (TVA), US Forest Service (USFS), State Historic Preservation Officer, Recognized Indian Tribe, if appropriate).

5. Act for the Preservation of American Antiquities. 16 U.S.C. 431-433 (P.L. 59-209), 36 CFR 251.50-.64, 43 CFR 3.

General Procedures: (1) Notify DOI (NPS) when a Federal project may result in the loss or destruction of a historic or archaeological property, (2) DOI and/or the Federal agency may undertake survey or data recovery.

Coordination: DOI (NPS) Departmental consulting archeologist, State Historic Preservation Officer.

6. American Indian Religious Freedom Act. 42 U.S.C. 1996 (P.L. 95-341).

Purpose: Protect places of religious importance to American Indians, Eskimos, and Native Hawaiians.

Applicability: All projects which affect places of religious importance to Native Americans.

General Procedures: Consult with knowledgeable sources to identify and determine any effects on places of religious importance. Comply with Section 106 procedures if the property is historic.

Coordination: BIA, State Historic Preservation Officer, State Indian liaison, Advisory Council on Historic Preservation, if appropriate.

7. Native American Grave Protection and Repatriation Act. (P.L. 101-601), 43 CFR 10.

Purpose: Protect human remains and cultural material of Native American and Hawaiian groups.

Applicability: Federal lands and Tribal lands.

General Procedures: Consult with Native American group.

Coordination: DOI (NPS), BIA, State Historic Preservation Officer.

C-1.01(d) Land and Water Usage

1. Wilderness Act. 16 U.S.C. 1131-1136, 36 CFR 251, 293, 43 CFR 19, 8560, 50 CFR 35.

   Purpose: Preserve and protect wilderness areas in their natural condition for use and enjoyment by present and future generations.

   Applicability: All lands designated as part of the wilderness system by Congress.

   General Procedures: Apply for modification or adjustment of wilderness boundary by either Secretary of the Interior or Agriculture, as appropriate.

   Coordination: Agriculture (USFS), DOI (US Fish and Wildlife Service (FWS), NPS, BLM), and State agencies.

2. Wild and Scenic Rivers Act. 16 U.S.C. 1271-1287, 36 CFR 297, 43 CFR 8351.2.

   Purpose: Preserve and protect wild and scenic rivers and immediate environments for benefit of present and future generations.

   Applicability: All projects which affect designated and potential wild, scenic, and recreational rivers, and/or immediate environments.

   General Procedures: Submit project plans and reports to appropriate Federal agency.

   Coordination: DOI (BLM, NPS, FWS) and/or Agriculture (USFS), State agencies.

3. Land and Water Conservation Fund Act (Section 6(f)). 16 U.S.C. 460*l*-4 to -11 (P.L. 88-578).

   Purpose: Preserve, develop, and assure the quality and quantity of outdoor recreation resources for present and future generations.

   Applicability: All projects that impact recreational lands purchased or improved with land and water conservation funds.

   General Procedures: The Secretary of the Interior must approve any conversion of property acquired or developed with assistance under this Act to other than public, outdoor recreation use.

Coordination: DOI, State agencies.

4. Executive Order 11990, Protection of Wetlands. DOT Order 5660.1A, 23 CFR 777.

Purpose: To avoid direct or indirect support of new construction in wetlands wherever there is a practicable alternative.

Applicability: Federally undertaken, financed, or assisted construction, and improvements in or with significant impacts on wetlands.

General Procedures: Evaluate and mitigate impacts on wetlands. Specific finding required in final environmental document.

Coordination: DOI (FWS), EPA, US Army Corps of Engineers (USACOE), National Marine Fisheries Service (NMFS), Natural Resources Conservation Service (NRCS), State agencies.

5. Intermodal Surface Transportation Efficiency Act of 1991 (Wetlands Mitigation Banks). Sec. 1006-1007 (P.L. 102-240, 105 STAT 1914), 23 CFR 771.

Purpose: To mitigate wetlands impacts directly associated with projects funded through NHS and STP, by participating in wetlands mitigation banks restoration, enhancement and creation of wetlands authorized under the Water Resources Development Act, and through contributions to Statewide and regional efforts.

Applicability: Federally undertaken, financed, or assisted construction, and improvements in, or with impacts on wetlands.

General Procedures: Evaluate and mitigate impacts on wetlands. Specific finding required in final environmental document.

Coordination: DOI (FWS), EPA, USACOE, NMFS, NRCS, State agencies.

6. Emergency Wetlands Resources Act of 1986. 16 U.S.C. - 3901 note (P.L. 99-645).

Purpose: To promote the conservation of wetlands in the U. S. in order to maintain the public benefits they provide.

Applicability: All projects that may impact wetlands.

General Procedures: (1) Preparation of a National Wetlands Priority Conservation Plan which provides priority with respect to Federal and State acquisition, (2) provide direction for the National Wetlands Inventory Project.

Coordination: FWS.

7. National Trails Systems Act. 16 U.S.C. 1241-1249, 36 CFR 251, 43 CFR 8350.

Purpose: Provide for outdoor recreation needs and encourage outdoor recreation.

Applicability: Projects affecting national recreational, scenic, or historic trails designated by Congress and lands through which such trails pass. National recreation trails and side and connecting trails are proposed by local sponsors and approved by DOI and DOA.

General Procedures: (1) Apply for right-of-way easement from the Secretary of Interior or Agriculture, as appropriate, and (2) ensure that potential trail properties are made available for use as recreational and scenic trails.

Coordination: DOI (NPS) or Agriculture (USFS). Other Federal land management agencies may apply for designation.

8. National Recreational Trails Fund Act of the Intermodal Surface Transportation Efficiency Act of 1991. 16 U.S.C. 1261 (P.L. 102-240).

Purpose: To establish a program to allocate funds to the States to provide and maintain recreational trail and trail-related projects.

Applicability: Trails and trail-related projects which are identified in, or which further a specific goal of, a trail plan included or referenced in a Statewide comprehensive outdoor recreation plan, as required by the Land and Water Conservation Fund Act.

General Procedures: Project-sponsor applies to the State, and FHWA approves spending for project. The State may be a project sponsor. Assured access to funds is given for motorized, non-motorized, and discretionary recreation uses. States shall give preference to projects with diversified uses.

Coordination: FHWA.

9. Rivers and Harbors Act of 1899. 33 U.S.C. 401, et seq., as amended and supplemented, 23 CFR 650, Subparts D and H, 33 CFR 114-115.

Purpose: Protection of navigable waters in the U.S.

Applicability: Any construction affecting navigable waters and any obstruction, excavation, or filling.

General Procedures: Must obtain approval of plans for construction, dumping, and dredging permits (Section 10) and bridge permits (Section 9).

Coordination: USACOE, US Coast Guard (USCG), EPA, State agencies.

10. Federal Water Pollution Control Act (1972), as amended by the Clean Water Act (1977 & 1987). 33 U.S.C. 1251-1376 (P.L. 92-500, 95-217, 100-4), DOT Order 5660.1A, FHWA Notices N5000.3 and N5000.4, 23 CFR 650, Subpart B, 771, 33 CFR 209, 320-323, 325, 328, 329, 40 CFR 121-125, 129-131, 133, 135-136, 230-231.

    Purpose: Restore and maintain chemical, physical, and biological integrity of the Nation's waters through prevention, reduction, and elimination of pollution.

    Applicability: Any discharge of a pollutant into waters of the U.S.

    General Procedures: (1) Obtain permit for dredge or fill material from USACOE or State agency, as appropriate (Section 404); (2) permits for all other discharges are to be acquired from EPA or appropriate State agency (Section 402), Phase I - NPDES - Issued for municipal separate storm sewer systems (MS4) serving large populations (over 250,000), medium populations (over 100,000) and regulated systems serving urbanized areas (i.e., areas that have a residential population of at least 50,000 and an overall population density of at least 1,000 people per square mile). Storm water discharges associated with industrial waste. Activities including construction sites disturbing one acre (4047 m^2) or more of total land area; (3) water quality certification is required from State water resource agency (Section 401); and (4) all projects shall be consistent with the State non-point source pollution management program (Section 319).

    Coordination: USACOE, EPA, designated State water quality control agency, designated State non-point source pollution agency.

11. Executive Order 11988, Floodplain Management, as amended by Executive Order 12148. DOT Order 5650.2, 23 CFR 650, Subpart A, 771.

    Purpose: To avoid the long- and short-term adverse impacts associated with the occupancy and modification of floodplains, and to restore and preserve the natural and beneficial values served by floodplains.

    Applicability: All construction of Federal or Federally aided buildings, structures, roads, or facilities which encroach upon or affect the base floodplain.

    General Procedures: (1) Assessment of flood hazards, and (2) specific finding required in final environmental document for significant encroachments.

    Coordination: Federal Emergency Management Agency (FEMA), State and local agencies.

12. National Flood Insurance Act. (P.L. 90-448), Flood Disaster Protection Act: (P.L. 93-234) 42 U.S.C. 4001-4128, DOT Order 5650.2, 23 CFR 650, Subpart A, 7, 23 CFR 771, 44 CFR 59-62, 64-68, 70-71, 75-77.

Purpose: (1) Identify flood-prone areas and provide insurance, and (2) requires purchase of insurance for buildings in special flood-hazard areas.

Applicability: Any Federally assisted acquisition or construction project in area identified as having special flood hazards.

General Procedures: Avoid construction in, or design to be consistent with, FEMA-identified flood-hazard areas.

Coordination: FEMA, State, and local agencies.

13. Marine Protection Research and Sanctuaries Act of 1972, as amended. 33 U.S.C. 1401-1445 (P.L. 92-532, 93-254, 96-572), 33 CFR 320, 330, 40 CFR 220-225, 227-228, 230-231.

Purpose: Regulate dumping of materials into U.S. ocean waters.

Applicability: Any transportation to and dumping into the open sea.

General Procedures: Apply for permit in accordance with existing procedures.

Coordination: EPA, USACOE (if dredge material).

14. Water Bank Act. 16 U.S.C. 1301-1311 (P.L. 91-559, 96-182), 7 CFR 752.

Purpose: Preserve, restore, and improve wetlands of the Nation.

Applicability: Any agreements with landowners and operators in important migratory waterfowl nesting and breeding areas.

General Procedures: Apply procedures established for implementing Executive Order 11990.

Coordination: Secretary of Agriculture, Secretary of Interior.

15. Coastal Zone Management Act of 1972. 16 U.S.C. 1451-1464 (P.L. 92-583, 94-370, 96-464), 15 CFR 923, 926, 930, 23 CFR 771.

Purpose: Preserve, protect, develop, and (where possible) restore and enhance resources of the coastal zone.

Applicability: All projects significantly affecting areas under the control of the State coastal zone management agency for which a plan is approved by the Dept. of Commerce.

General Procedures: Ensure that projects comply with Federal consistency regulations, management measures, and the appropriate approved State plan for coastal zone management programs.

Coordination: State coastal zone management agency and the Dept. of Commerce Office of Coastal Zone Management (OCZM) National Oceanic and Atmospheric Administration (NOAA), and EPA.

16. Coastal Zone Management Act Reauthorization Amendments of 1990. 6217(g)

Purpose: Manage non-point source pollution of activities located in coastal zones.

Applicability. All developmental activities located in coastal zone areas will be subject to non-point source control measures developed by the State Coastal Zone Agency.

General Procedures: Ensure projects comply with State CZM plans for controlling non-point sources.

Coordination: State CZM Agency, OCZM (NOAA), EPA.

17. Coastal Barrier Resources Act, as amended. 16 U.S.C. 3501-3510, 42 U.S.C. 4028 (P.L. 97-348), Great Lakes Coastal Barrier Act of 1988 (P.L. 100-707), 13 CFR 116 Subparts D, E, 44 CFR 71, 205 Subpart N.

Purpose: Minimize the loss of human life, wasteful expenditures of Federal revenues, and the damage to fish, wildlife, and other natural resources.

Applicability: Any project that may occur within the boundaries of a designated coastal barrier unit. Exemptions for certain actions are possible.

General Procedures: Coordinate early with the FWS Regional Director. Consult maps that depict the boundaries of each coastal barrier resources system unit.

Coordination: FEMA, DOI (FWS).

18. Farmland Protection Policy Act of 1981. 7 U.S.C. 4201-4209 (P.L. 97-98, 99-198), 7 CFR 658.

Purpose: Minimize impacts on farmland and maximize compatibility with State and local farmland programs and policies.

Applicability: All projects that take right-of-way in farmland, as defined by regulation.

General Procedures: (1) Early coordination with the NRCS, (2) land evaluation and site assessment, and (3) determination of whether or not to proceed with farmland conversion, based on severity of impacts and other environmental considerations.

Coordination: NRCS.

19. Resource Conservation and Recovery Act of 1976 (RCRA), as amended. 42 U.S.C. 6901, et seq. (P.L. 94-580, 98-616), 40 CFR 260-271.

Purpose: Protect human health and the environment, prohibit open dumping, manage solid wastes, and regulate treatment, storage, transportation, and disposal of hazardous waste.

Applicability: Any project that takes right-of-way containing a hazardous waste.

General Procedures: Coordinate with EPA or State agency on remedial action.

Coordination: EPA or State agency approved by EPA, if any.

20. Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA), as amended. 42 U.S.C. 9601-9657 (P.L. 96-510), 40 CFR 300, 43 CFR 11. Superfund Amendments and Reauthorization Act of 1986 (SARA) (P.L. 99-499).

Purpose: Provide for liability, compensation, cleanup, and emergency response for hazardous substances released into the environment and the cleanup of inactive hazardous waste disposal sites.

Applicability: Any project that might take right-of-way containing a hazardous substance.

General Procedures: (1) Avoid hazardous waste sites, if possible, (2) check EPA lists of hazardous waste sites, (3) field surveys and reviews of past and present land use, (4) contact appropriate officials if uncertainty exists, (5) if hazardous waste is present or suspected, coordinate with appropriate officials, and (6) if hazardous waste encountered during construction, stop project and develop remedial action.

Coordination: EPA or State agency approved by EPA, if any.

21. Endangered Species Act of 1973, as amended. 16 U.S.C. 1531-1543 (P.L. 93-205, 94-359, 95-632, 96-159, 97-304), 7 CFR 355, 50 CFR 17, 23, 81, 222, 225-227, 402, 424, 450-453.

Purpose: Conserve species of fish, wildlife and plants facing extinction.

Applicability: Any action that is likely to jeopardize continued existence of such threatened/ endangered species or result in destruction or modification of critical habitat.

General Procedures: Consult with the Secretary of the Interior or Commerce, as appropriate.

Coordination: DOI (FWS), Commerce (NMFS).

22. Fish and Wildlife Coordination Act. 16 U.S.C. 661-666(c) (P.L. 85-624, 89-72, 95-616).

Purpose: Conservation, maintenance, and management of wildlife resources.

Applicability: (1) Any project which involves impoundment (surface area of 4.05 hectares [ten acres] or more), diversion, channel deepening, or other modification of a stream or other body of water, and (2) transfer of property by Federal agencies to State agencies for wildlife conservation purpose.

General Procedures: Coordinate early in project development with FWS and State fish and wildlife agency.

Coordination: DOI (FWS), State fish and wildlife agencies.

23. Migratory Bird Treaty Act. 16 U.S.C. 760c-760g

Purpose: To protect most common wild birds found in the United States.

Applicability: Makes it unlawful for anyone to kill, capture, collect, possess, buy, sell, trade, ship, import, or export any migratory bird. Indirect killing of birds by destroying their nests and eggs is covered by the act so construction in nesting areas can constitute a taking.

General Procedures: The FWS is to review and comment on the effects of a proposal that could kill birds, even indirectly.

Coordination: DOI (FWS), State fish and wildlife agencies.

24. Intermodal Surface Transportation Efficiency Act of 1991. Transportation Enhancement Activities: Sec. 1007 (P.L. 102-240).

Purpose: To provide funds for Transportation Enhancement activities, such as landscaping and beautification, rehabilitation and operation of historic transportation facilities.

Applicability: Funds are to be used in all areas except roads classified as local or rural minor collectors, unless such roads are on a Federal-aid highway system.

General Procedures: 10% of STP funds annually apportioned to each State are for Transportation Enhancement activities.

Coordination: FHWA.

25. Intermodal Surface Transportation Efficiency Act of 1991, Sec. 1038 Recycled Paving Material. (P.L. 102-240).

Purpose: To reduce the use of virgin materials used for paving our nation's highways.

Applicability: Each State shall certify that it has satisfied the minimum utilization requirement for asphalt pavement containing recycled rubber.

General Procedures: 20% of asphalt funded with Federal-aid in each State is required to include recycled rubber by 1997.

Coordination: FHWA.

26. Intermodal Surface Transportation Efficiency Act of 1991 Sec. 1047 Scenic Byways Program. (P.L. 102-240).

Purpose: To identify and develop those special scenic byways that offer outstanding scenic, historic, natural, cultural, recreational, or archaeological values.

Applicability: Any public road or highway which meets the criteria for inclusion as a Scenic Byway or an All-American Road.

General Procedures: Nominations may originate from any local government, private group or individual, but must come through the States. Final designations will be made by the Secretary of Transportation.

Coordination: FHWA.

C-1.01(e) Noise

1. Standards. 23 U.S.C. 109(I) (P.L. 91-605), (P.L. 93-87), 23 CFR 772.

Purpose: Promulgate noise standards for highway traffic.

Applicability: All Federally funded projects for the construction of a highway on new location, or the physical alteration of an existing highway which significantly changes either the vertical or horizontal alignment or increases the number of through traffic lanes.

General Procedures: (1) Noise impact analysis. (2) Analysis of mitigation measures. (3) Incorporate reasonable and feasible noise abatement measures to reduce or eliminate noise impact.

C-1.01(f) Air Quality

1. Clean Air Act (as amended) Transportation Conformity Rule. 23 U.S.C. 109(j), 42 U.S.C. 7521(a) (P.L. 101-549), 23 CFR 771, 40 CFR 51 and 93.

   Purpose: To insure that transportation plans, programs and projects conform to the State's air quality implementation plans.

   Applicability: Non-attainment and maintenance areas.

   General Procedures: Transportation plans, programs, and projects must conform with State Implementation Plans (SIPs) that provide for attainment of the national ambient air quality standards.

   Coordination: Federal Transit Administration (FTA), EPA, Metropolitan Planning Organizations (MPOs), State Departments of Transportation and State and local Air Quality Control Agencies.

2. Clean Air Act (as amended), Sanctions. 42 U.S.C. 7509, Sec. 179(b), Sec. 110(m) (P.L. 101-549), 40 CFR 52.

   Purpose: To restrict Federal funding and approvals for highway projects in States that fail to submit or implement an adequate State Implementation Plan (SIP).

   Applicability: In non-attainment areas 24 months after EPA has identified a SIP deficiency. May be applied Statewide under separate rulemaking.

   General Procedures: (1) After EPA finds that a State failed to submit or implement a SIP, that the SIP is incomplete, or disapproves a SIP, an 18-month time clock begins. (2) Unless deficiencies are corrected within 18 months, 2:1 offset sanctions are applied. Six months later, highway sanctions are applied.

   Coordination: EPA.

3. Intermodal Surface Transportation Efficiency Act of 1991, Congestion Mitigation and Air Quality Improvement Program (CMAQ). Sec 1008, 23 U.S.C. 149.

   Purpose: To assist non-attainment and maintenance areas in reducing transportation-related emissions.

Applicability: Transportation programs or projects in non-attainment areas and areas redesignated to maintenance that are likely to contribute to the attainment or maintenance of the National Ambient Air Quality Standards (NAAQS).

General Procedures: (1) Project sponsor (transit operator, municipal office, etc.) develops formal proposal to improve air quality. (2) Submit to the MPO, State for evaluation and approval. (3) Included in the TIP and approved as eligible by FTA and FHWA in consultation with EPA.

Coordination: FTA, EPA, MPOs, State Departments of Transportation, and State and local Air Quality Control Agencies.

C-1.02 State

In addition to the Federal environmental legislation, the State of Illinois has enacted considerable State legislation for the implementation of environmental requirements. The following briefly discusses the significant State laws on environmental policies:

1. Interagency Wetland Policy Act of 1989, 20 Illinois Compiled Statutes (ILCS) 830/1-1, *et seq.*, (P.A. 86-157). This Act establishes a State goal of "no net loss" of wetlands acreage and their functional values due to State or State-supported activities. It provides that State agencies shall preserve, enhance, and create wetlands where necessary to increase the quality and quantity of the State's wetlands resource base. The Act establishes a State wetlands mitigation policy and requires designated State agencies to prepare Agency Action Plans for implementation procedures. The Act authorizes State agencies to establish wetlands compensation accounts, and it requires agencies to consider the avoidance and minimization of adverse impacts to wetlands and to provide compensation for unavoidable adverse impacts with a schedule of compensation ratios. The Act is administered by Illinois Department of Natural Resources (IDNR).

2. Illinois Historic Preservation Act, 20 ILCS 3410/1, *et seq.* This Act establishes the Illinois Register of Historic Places. It stipulates that no person shall demolish, cause to be demolished, or permit or order the demolition of any Critical Historical Feature of a Registered Illinois Historic Place unless the Director of the Illinois Historic Preservation Agency (IHPA) has issued a Certificate of Compliance stating that the requirements of the Act have been satisfied and setting forth any conditions agreed to. The Act provides that public funds shall not be used in any project that will have an adverse economic or environmental impact on a Registered Illinois Historic Place unless the Director of the IHPA determines:

   - the project is necessary to provide an important public service or benefit,
   - the project cannot be implemented practically to avoid the adverse effect, and
   - the adverse effect is minimized to the maximum extent feasible.

3. Illinois State Agency Historic Resources Preservation Act, 20 ILCS 3420/1, *et seq.* (P.A. 86-707). This Act establishes a program whereby State agencies (1) administer historic resources under their control to foster and enhance their availability to future generations; (2) prepare policies and plans to contribute to the preservation, restoration, and maintenance of State-owned historic resources for the inspiration and benefit of the people; and (3) consult with the Illinois Historic Preservation Agency to ensure that State projects consider the preservation and enhancement of State-owned and non-State-owned historic resources. The Act provides that consultation is not required for actions being reviewed in accordance with Section 106 of the National Historic Preservation Act.

4. Archaeological and Paleontological Resources Protection Act, 20 ILCS 3435/.01, *et seq.*, (P.A. 86-459, 86-707). This Act reserves to the State of Illinois the right of regulating, exploring, excavating, or surveying, through the Historic Preservation Agency, all archaeological and paleontological resources found upon State lands. It requires a permit from the Historic Preservation Agency for conducting any of these activities on public lands. The Act prohibits any person from knowingly disturbing any protected archaeological or paleontological resource or knowingly offering for sale or exchange any object collected or excavated in violation of the Act.

5. Soil and Water Conservation Districts Act of 1937, 70 ILCS 405/1, *et seq.*, as amended. This Act establishes a policy to strengthen and extend erosion and sedimentation control activities for both rural and urban lands. It provides for establishing and implementing, through the Illinois Department of Agriculture and Soil and Water Conservation Districts and in cooperation with units of local government, school districts, other political subdivisions of the State, agencies of the State and other public and private entities, a Statewide comprehensive and coordinated erosion and sediment control program to conserve and protect land, water, air, and other resources. The Act requires State agencies to cooperate with the Illinois Department of Agriculture and Soil and Water Conservation Districts in implementing programs undertaken pursuant to the Act.

6. Illinois Environmental Protection Act of 1970, 415 ILCS 5/8, *et seq.*(P.A. 76-2429). This Act establishes a unified, Statewide regulatory program to restore, protect, and enhance the quality of the environment and to ensure that adverse effects upon the environment are fully considered and borne by those who cause them. The Act implements permit and control programs for air pollution, water pollution, public water supplies, land pollution, noise, atomic radiation, used tires, potentially infectious medical wastes, and petroleum underground storage tanks.

7. Illinois Groundwater Protection Act, 415 ILCS 55/1, *et seq*. This Act establishes a State policy to restore, protect, and enhance the groundwater of the State as a natural and public resource, to prevent waste and degradation of groundwater resources, and to manage the underground water resource to allow for maximum benefit of the people of the State. The Act establishes within State government an Interagency Committee on Groundwater which is responsible for reviewing and coordinating the State's policy on groundwater protection and for reviewing various aspects of the State's groundwater protection program and making recommendations on those aspects. The Act authorizes

the establishment of an education program, a data collection program, and appropriate regulations for groundwater protection.

8. Agricultural Areas Conservation and Protection Act of 1979, 505 ILCS 5/1, *et seq* (P.A. 81-1173). This Act establishes a program whereby agricultural land may be protected and enhanced through designation as an "Agricultural Area." It provides that no land within an Agricultural Area shall be used for purposes other than agricultural production. The Act provides that any person may petition for withdrawal of land from a designated Agricultural Area, and this person must submit documentation of the proposed alternative use for the land, an explanation of the need for a change from the current use of the land, and an explanation of why land outside the Agricultural Area would not be suitable for the proposed use. The Act indicates that the County Board either accepts or rejects the petition for withdrawal of land after a hearing and an opportunity for review and comment by the county Agricultural Areas Committee and regional and county planning commissions, if any.

9. Farmland Preservation Act of 1982, 505 ILCS 75/1, *et seq.* (P.A. 82-945). This Act requires designated agencies to prepare policy statements and working agreements with the Illinois Department of Agriculture specifying the policy of the agencies toward farmland preservation and the administrative process used to implement that policy. It requires agencies to provide notice to the Illinois Department of Agriculture of projects that may lead to agricultural land conversion unless such projects are exempted from review by an agency's cooperative working agreement. The Act provides that the Department of Agriculture shall determine whether an agency's projects comply with its policy statement and cooperative working agreement and that the Department of Agriculture shall conduct a study of the agricultural impacts for any project that does not comply.

10. Endangered Species Protection Act of 1972, 520 ILCS 10/1, *et seq.*, (P.A. 77-2186). This Act protects State-listed animals and plants from unauthorized actions. It requires agencies of State and local governments to evaluate, through a consultation process with the Illinois Department of Natural Resources, whether actions authorized, funded, or implemented by them are likely to jeopardize the continued existence of Illinois-listed threatened or endangered species or are likely to result in the destruction or adverse modification of the designated essential habitat of such species. When an agency has so consulted, it shall be deemed to have complied with its obligations under the Act, provided that the agency action shall not result in the killing or injuring of any Illinois-listed animal species.

11. Illinois Natural Areas Preservation Act, 525 ILCS 30/1, *et seq.*, (P.A. 82-445). This Act establishes provisions for a system of dedicated nature preserves and registered natural areas. It provides that dedicated nature preserves may not be acquired under power of eminent domain or by other means for any other use except another public use and except upon approval by the Illinois Nature Preserves Commission, the Governor, and any public owner of a dedicated interest therein after a finding by the Commission of the existence of an imperative and unavoidable public necessity for such other public use,

and upon such terms and conditions as the Commission may determine, except as may otherwise be provided in the instrument of dedication. The Act requires the Commission to give public notice of the proposed action for which a finding of an imperative and unavoidable public necessity is being considered and to provide an opportunity for any person to request the holding of a public meeting and to be heard at such public meeting. It provides for promoting, by advice and other assistance, the protection of registered natural areas.

12. Regulation of Rivers, Lakes, and Streams Act, 615 ILCS 5/4, *et seq*. This Act assigns to the Office of Water Resources of the Department of Natural Resources jurisdiction over public waters of the State. It provides for general supervision of such waters to ensure that none are encroached upon or wrongfully seized by any private interest in any way. The Act establishes authority for requiring permits from the IDNR for actions affecting public waters, and it requires permits from the IDNR for construction within defined floodplains in the State.

13. Preservation of Illinois Farmland, Illinois Executive Order No. 4 (1980). This Order establishes a State policy to protect, through the administration of its current programs and regulations, the State's prime agricultural land from irreversible conversion to uses which result in its loss as an environmental or essential food production resource. It designates the Illinois Department of Agriculture as the lead for implementing the policy and requires designated agencies to prepare Agricultural Land Preservation Policies. The policies must include an analysis of the impact on agricultural land conversions caused by their programs, regulations, procedures, and operations, and they also must detail measures that can be implemented that will mitigate conversions to the maximum extent practicable. The policies must provide a greater degree of protection for Classes I, II, and III lands than for Classes IV through VIII. The Order provides that the Department of Agriculture will analyze State-funded capital projects that impact farmland conversion and advise the Governor's Office on the consistency of agency actions with the policy established by the Executive Order.

C-2 FUNCTIONAL RESPONSIBILITIES

Many governmental agencies, both Federal and State, have various functional responsibilities related to the implementation of environmental laws, regulations, policies, and procedures. This section briefly describes the functional responsibilities for these agencies, and it provides an address and phone number for preliminary contacts.

C-2.01 Federal

The following briefly describes the functional responsibilities of the major Federal agencies in the implementation of environmental procedures:

1. Council on Environmental Quality (CEQ). The Council is composed of three members appointed by the President which maintains a quality awareness of the nation's environmental resources. The CEQ oversees the implementation of NEPA by issuing regulations (40 CFR 1500-1508) to guide all Federal agencies.

   Address: Executive Director
   Council on Environmental Quality
   722 Jackson Place NW
   Washington, D.C. 20503

   Telephone No.: (202) 633-7032

2. Environmental Protection Agency (EPA). EPA is responsible for determining which pollutants and what concentrations are harmful to the health and safety of the human population. It establishes minimum safe requirements for the concentration of pollutants, and it establishes procedures for achieving and maintaining these concentration levels. For the CEQ, EPA conducts quality control tests on the proper implementation of NEPA. EPA issues the basic air quality, water quality, hazardous waste, and solid waste regulations for nationwide implementation.

   Address: Environmental Protection Agency
   Region 5 Office
   77 W. Jackson Boulevard
   Chicago, Illinois 60604-3507

   Telephone No.: (312) 353-2000

3. Federal Highway Administration (FHWA). The Federal Highway Administration (FHWA) administers the Federal-aid program that funds eligible highway improvements nationwide. Its basic responsibility is to ensure that the State DOT's comply with all applicable Federal laws in their expenditure of Federal funds and to ensure that the State DOT's meet the applicable requirements for proposed highway projects. This includes all applicable environmental laws, regulations, policies, and procedures. FHWA

maintains a Division Office within each State, and this is the primary point of contact for a State DOT. FHWA also maintains four regional Resource Centers to provide technical program assistance to the FHWA Division Offices and their partners.

Address: Environmental Programs Engineer
Illinois FHWA Division Office
3250 Executive Park Drive
Springfield, Illinois 62703

Telephone No.: (217) 492-4625

Address:
FHWA Resource Center
One Prairie Office Center
4749 Lincoln Mall Drive – 6th Floor
Matteson, Illinois 60443

Telephone No.: (708) 283-3500

4. Federal Transit Administration (FTA). As an agency of the U.S. Department of Transportation, FTA administers the national transit program and all federal laws, regulations, policies, and procedures applicable to the use of Federal transit funds. This includes those that pertain to the environment.

Address: Regional Administrator, Federal Transit Administration
200 West Adams Street, Suite 320
Chicago, Illinois 60606

Telephone No.: (312) 353-2789

5. US DOT - Chicago Metropolitan Office. FHWA and FTA jointly operate four metropolitan offices around the country that are extensions of their respective Division and Regional offices and Resource Centers. These offices provide assistance, guidance, and information on Federal transportation programs to local, State, and other Federal agencies in the affected metropolitan areas.

Address: US DOT Chicago Metropolitan Office
200 West Adams Street, Suite 320
Chicago, Illinois 60606

Telephone No.: (312) 886-1616

6. US Coast Guard (USCG). As an agency of the US Department of Transportation, the USCG administers the nation's waterways for vessels operating on navigable streams. Its responsibilities include the issuance of permits for bridges over navigable streams (Section 9 Permit).

Address: Commander
Attn: Bridge Branch
Ninth Coast Guard District
1240 E. 9th
Cleveland, Ohio 44199-2060

Telephone No.: (216) 902-6045

Address: Commander
Attn: Bridge Branch
Eighth Coast Guard District
Hale Boggs Federal Building
500 Poydras Street
New Orleans, LA 70130

Telephone No.: (504) 671-2128

Address: Commander
Attn: Bridge Branch
Ninth Coast Guard District
1240 E. 9th
Cleveland, Ohio 44199-2060

Telephone No.: (216) 902-6045

7. US Army Corps of Engineers (USACOE). The USACOE is responsible for maintaining the shipping lanes on navigable waters and the permitting process for the wetlands program (Section 404 Permit), and it operates many of the dams on navigable waters.

Address: Regulatory Branch
U.S. Army Corps of Engineers, Rock Island
Clock Tower Building
P.O. Box 2004
Rock Island, Illinois 61204-2004

Telephone No.: (309) 794-5376

Address: Regulatory Branch
U.S. Army Corps of Engineers, Chicago
111 North Canal Street, Suite 600
Chicago, Illinois 60606-7206

Telephone No.: (312) 846-5530

Address: Regulatory Branch

U.S. Army Corps of Engineers, St. Louis
1222 Spruce Street
St. Louis, Missouri 63103-2833

Telephone No.: (314) 331-8575

Address: Regulatory Branch
U.S. Army Corps of Engineers, Louisville
P.O. Box 59
Louisville, Kentucky 40201-0059
Telephone No.: (502) 582-5452

Address: Regulatory Branch
U.S. Army Corps of Engineers, Memphis
167 North Main Street, B-202
Memphis, Tennessee 38103-1894

Telephone No.: (901) 544-3005

8. Department of the Interior (DOI). The DOI includes the National Park Service, US Fish and Wildlife Service, Bureau of Indian Affairs, US Geological Survey, Bureau of Reclamation, and Bureau of Land Management. It is responsible for preserving and protecting the natural resources of the nation. Contacts are made to the individual agencies within USDOI, as presented in the following.

a. National Park Service (NPS). The NPS is responsible for administering the national parks, monuments, and parkways, and it is responsible for the national historic and archaeological programs including the National Register of Historic Places. The NPS maintains the national recreational programs including Section 6(f) of the Land and Water Conservation Fund Act. The NPS also administers the wild and scenic rivers program except for rivers on lands of the US Forest Service.

Address: Outdoor Recreation Planner
National Park Service
601 Riverfront Drive
Omaha, Nebraska 68102-4226

Telephone No.: (402) 661-1736

b. US Fish and Wildlife Service (FWS). The FWS administers the national freshwater fish program, wildlife programs and threatened and endangered species program.

Address: US Fish and Wildlife Service
Rock Island Field Office
1511 47th Ave.
Moline, IL 61265

Telephone No.: (309) 757-5800

Address: US Fish and Wildlife Service
Chicago Field Office
1250 South Grove Ave., Suite 103
Barrington, Illinois 60010-5010

Telephone No.: (847) 318-2253

Address: US Fish and Wildlife Service
8588 Route 148
Marion, Illinois 62959-4565

Telephone No.: (618) 997-3344

9. US Forest Service (USFS). The USFS administers the national forests.

Address: Shawnee National Forest Supervisor's Office
50 Hwy. 145 South
Harrisburg, Illinois 62946

Telephone No.: (618) 253-7114

10. Natural Resources Conservation Service (NRCS). Formerly the Soil Conservation Service, the NRCS maintains national farm soil maps and determines which farmlands are prime and unique. The contact will be the local county NRCS agent. Form NRCS-CPA-106 should be sent to the State NRCS office at the following address:

Address: United States Department of Agriculture
Natural Resources Conservation Services
Attention: State Soil Scientist
2118 West Park Court,
Champaign, Illinois 61821

C-2.02 State

The following briefly describes the functional responsibilities of the major State agencies in the implementation of environmental procedures:

1. <u>Illinois Department of Transportation (IDOT)</u>. Within the Division of Highways, the program development offices in the nine districts are responsible for project development and the accompanying environmental documentation addressing the potential project impacts. The central Bureau of Design and Environment supports the environmental studies by providing environmental expertise and policy guidance, by securing appropriate environmental field surveys and data collection upon the request of the districts, by accomplishing and facilitating coordination with resource and regulatory agencies, and by reviewing and commenting on preliminary and final environmental documentation.

2. <u>Illinois Department of Natural Resources (IDNR).</u> IDNR includes the former Illinois Department of Conservation, the former Illinois Department of Mines and Minerals, the former Division of Water Resources from IDOT, the Illinois Natural History Survey, the Illinois State Geological Survey, and the Illinois State Water Survey. IDNR is responsible for reviewing proposed projects, as applicable, to ensure compliance with the Illinois Endangered Species Protection Act, the Illinois Natural Areas Preservation Act, and the Illinois Interagency Wetland Policy Act. The agency also reviews and comments on projects, as appropriate, regarding the following additional resources:

   - streams,
   - forests/trees,
   - prairie/savanna areas,
   - IDNR properties,
   - nature preserves,
   - natural area inventory sites,
   - sites included in the Illinois Register of Land and Water Reserves, and
   - Office of Water Resources permits.

   Address: IDNR
   One Natural Resources Way
   Springfield, Illinois 62702-1271

   Telephone No.: (217) 785-5500 (Division of Ecosystems and Environment, Impact Assessment Section)

3. <u>Illinois Environmental Protection Agency (IEPA).</u> IEPA is responsible for issuing Section 401 Water Quality Certification on Section 404 permits. The Agency also reviews and comments on projects, as appropriate, relative to the following issues:

   - air quality/conformity,
   - water quality,
   - land pollution (including hazardous and special wastes),
   - noise, and
   - underground storage tanks.

Address: IEPA
1021 North Grand Avenue East
Springfield, Illinois 62794-9276

Transmittals sending environmental documents to IEPA for review should be addressed to the Director of the IEPA at the above office location.

Telephone No.: (217) 782-2829 (General Number)

4. Illinois Department of Agriculture (IDOA). IDOA reviews projects for impacts on farmland conversion to ensure compliance with the Illinois Farmland Preservation Act and Illinois Executive Order Number 4 (1980) for the preservation of Illinois farmland. This agency also completes the State component of the AD-1006 form in accordance with the regulations of the USDA Natural Resources Conservation Service.

Address: IDOA
State Fairgrounds
P. O. Box 19281
Springfield, Illinois 62794-9281

Telephone No.: (217) 782-2172 (General Number)

5. Illinois Historic Preservation Agency (IHPA). The Director of IHPA is designated as the State Historic Preservation Officer (SHPO). The Agency reviews projects for impacts to historical, architectural, archaeological, and paleontological resources to ensure compliance with Section 106 of the National Historic Preservation Act and the following State Acts:

- Illinois Historic Preservation Act (Illinois Register of Historic Places),
- Illinois State Agency Historic Resources Preservation Act, and
- Archaeological and Paleontological Resources Protection Act.

Address: IHPA
Preservation Services Division
#1 Old State Capitol Plaza
Springfield, Illinois 62701-1507

Telephone No.: (217) 782-4836 (General Number)

Appendix D

GUIDANCE ON EA/EIS PREPARATION

BUREAU OF DESIGN AND ENVIRONMENT MANUAL

Appendix D

GUIDANCE on EA/EIS Preparation

Table of Contents

Section **Page**

Table of Contents

(Continued)

GENERAL

The purpose of this guidance is assist district and consultant staff in the development of well written and easily understood Environment Assessments or Environmental Impact Statements. Chapter 24 (Environmental Assessments) and Chapter 25 (Environment Impact Statements) tell the reader the procedure to follow when an EA or EIS is required.

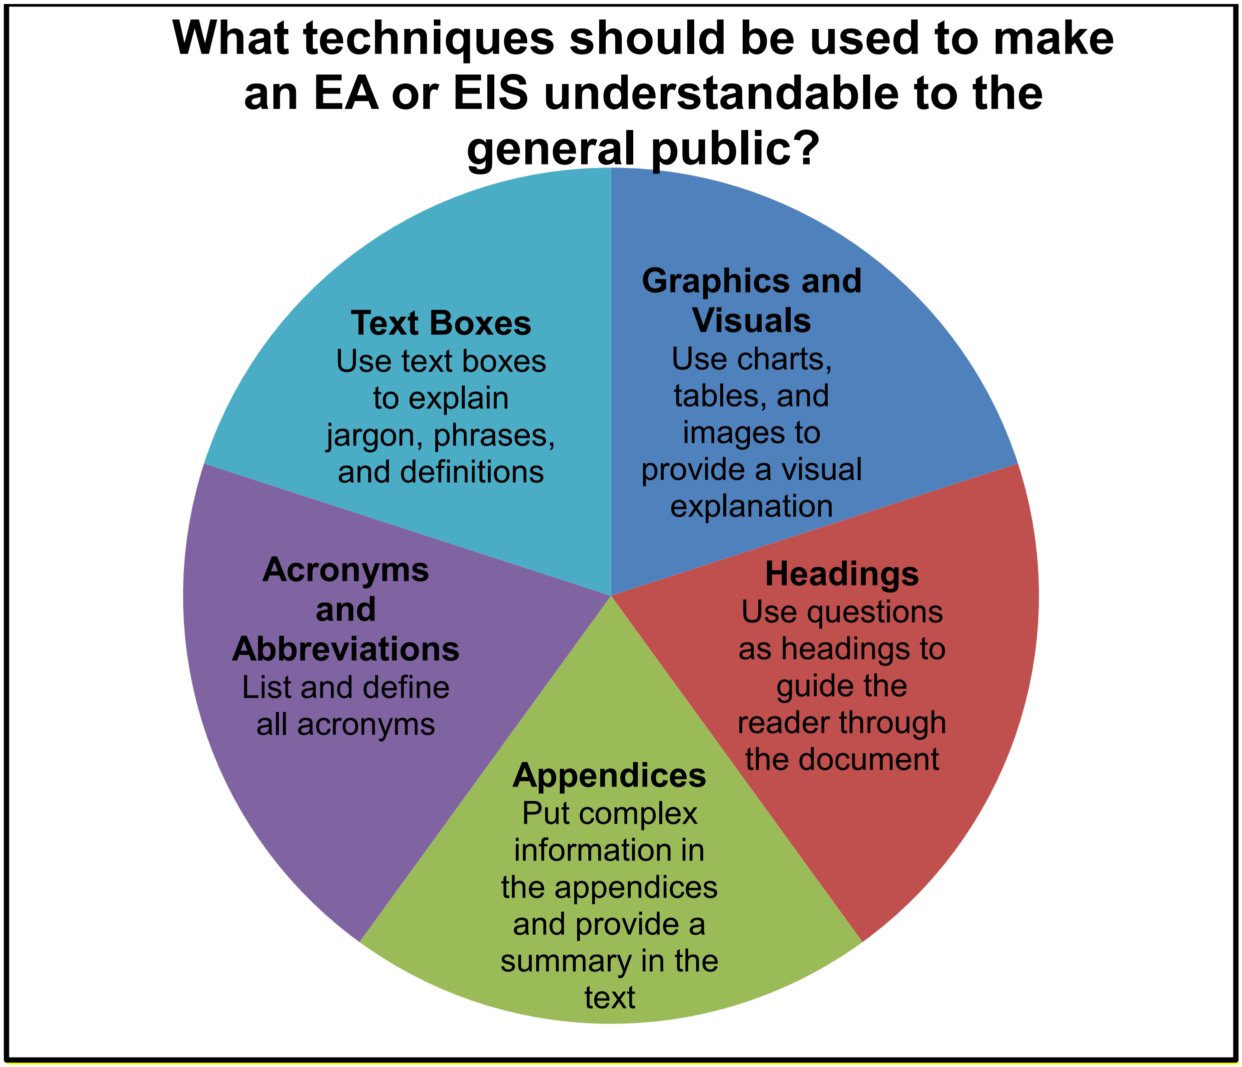
PART I: HOW TO WRITE AN ENVIRONMENTAL ASSESSMENT (EA) OR ENVIRONMENTAL IMPACT STATEMENT (EIS)

Part 1 provides guidance on how to write an Environmental Assessment (EA), a Draft Environmental Impact Statement (EIS), and a Draft Supplemental EIS. The EA, EIS, and Supplemental EIS will follow the same format except where noted. The purpose of the guidance is to set clear expectations for what information should be included in these documents and how the information should be displayed. The EA or EIS should[1]

- "tell the project's story" using clear and concise writing and quality graphics,
- be as brief as possible,
- be understandable to the general public, and
- demonstrate regulatory and legal compliance.
- be 75 pages in length for an EA or 150 pages in length for an EIS, unless the project is determined to be of unusual scope or complexity (see below).

To accomplish this, the EA or EIS must only include information that helps determine the significance of the environment impacts and inform the understanding of the environmental consequences of the proposed action, rather than including needless detail. If the EA or EIS exceeds the page limits, certain information may be moved to appendices to meet this requirement. Guidance on what to include in the appendices can be found at the end of Chapters 1 and 2 and the beginning of Chapter 3 of this document. EAs or EISs that are determined to be of unusual scope or complexity may be 150 or 300 pages, respectively. This determination may only be made by the FHWA Administrator. Figure 1 depicts techniques that can be used to make EAs and EISs understandable to the general public.

[1] *Improving the Quality of Environmental Documents* (A Report to the Joint AASHTO/ACEC Committee in Cooperation with the Federal Highway Administration), May 2006, p. 4.



Techniques for EA/EIS Understandability

Figure 1

Cover Sheet

If the project is an EA, use Figure 2 to format the Cover Sheet. If the project is a Draft Environmental Impact Statement use Figure 3. The Cover Sheets were adapted from FHWA Technical Advisory T6640.8A (see Appendix A) to provide information specific to Illinois. The Engineer of Design and Environment signs the Cover Sheet for the Department.

Please note that all cooperating agencies must be included on the cover sheet.

[Route, Termini, City or County, and State]

ENVIRONMENTAL ASSESSMENT

Submitted Pursuant to 42 USC 4332 (2)(c)

by the

U. S. Department of Transportation
Federal Highway Administration

and

Illinois Department of Transportation

Cooperating Agencies

[*Name, office address, and phone number of IDOT Regional Engineer*]

[*A one-paragraph abstract of the statement.*]

*FHWA will issue a single FEIS and Record of Decision document pursuant to Public Law 11: 141, 126 Statute 405, Section 1319(b) unless FHWA determines statutory criteria or practicabili consideration preclude issuance of the combined document pursuant to section 1319.

Comments on this document are due by [*Date*] and should be sent to [*Name and office address IDOT Regional Engineer*].*

DEIS/ Supplemental Cover Sheet

Figure 3

Summary (for EISs only)

Per 40 CFR 1502.10, summaries are required for EISs. EAs do not require a summary. In EISs the summary should include:

1. A brief description of the proposed project indicating route, termini, type of improvement, number of lanes, length, county, city, State, and other information, as appropriate.

2. A description of any major actions proposed by other governmental agencies in the same geographic area as the proposed FHWA action.

3. A summary of all reasonable alternatives considered, including alternatives that were carried forward for further study.

    a. If a preferred alternative is identified in the Draft EIS then the summary must identify the preferred alternative.

    b. The Final EIS must identify the preferred alternative and should discuss the basis for its selection.

4. A summary of major environmental impacts, both beneficial and adverse.

5. Any areas of controversy (including issues raised by agencies and the public).

6. Any major unresolved issues with other agencies.

7. A list of other Federal actions required for the proposed project (i.e., permit approvals, land transfer, Section 106 agreements, etc.).

8. The project's web address. All EAs and EISs are uploaded to IDOT's website. If there is a project specific website then the project specific website must be linked to IDOT's website.

The following is the recommended format for EAs, DEISs, and the FEIS traditional approach discussed in Part III.

Environmental Assessment/ [Draft, Final] Environmental Impact Statement Table of Contents

Chapter 1 - Purpose and Need

Every effort should be made to develop a concise purpose and need statement that focuses on the primary transportation challenges to be addressed. The purpose and need shall focus on identifying the transportation challenges and not a solution to the transportation challenges. The purpose and need should not be narrowly defined, point to a single solution, or predetermine an outcome.

1.1 Where is the project located?

Provide a clearly labeled map of the project study area and briefly describe:
- geographic features within the area
- the existing facility
- the length of the project
- the logical termini

Logical Termini:

Logical termini are typically two reasonably-determined locations that geographically delineate a transportation project. The most common logical termini are points of major traffic generation, especially intersecting roadways. Logical termini should be selected so:

- environmental issues can be treated on a sufficiently broad scope to ensure that the project will function properly without requiring additional improvements elsewhere,
- the project will not restrict consideration of alternatives for other reasonably foreseeable transportation improvements, and
- the action has stand-alone use or independent value and is a usable and reasonable expenditure even if no additional transportation improvements in the area are made.

1.2 What is the project's background?

Provide a summary of the following:

- the history of the proposed project
- summary of any planning or corridor studies relevant to the proposed project
- any other transportation projects occurring, or scheduled to occur within the project area

1.3 What is the Need for the Proposed Project?

This section includes the data and data analyses that demonstrate a traffic need not currently being met via other roadways or modes of transportation. The data presented shall demonstrate that a transportation problem exists and should answer the question "Why is the proposed project necessary?" The data may include, but is not limited to, safety ratings, sufficiency ratings, substandard geometrics, crash data and analysis, traffic models, origin-destination studies, etc.

Some examples of how the transportation need can be identified are:

- Identify and describe current and projected traffic, show data on maps;
- Describe the inadequacy of the existing capacity and performance conditions (e.g., level of service, quantified delays);
- Identify and describe any structural, operational, or functional deficiencies (e.g., substandard geometrics, load limits on structures, inadequate cross-section) and their effect on performance or safety;
- Describe regional population/traffic forecasts, including the proposed project's relationship to any statewide plan or adopted urban transportation plan, and any reasonable foreseeable land use changes;
- Describe and compare both the existing and projected crash rates without the project to the current statewide average. Include relevant crash data based on the latest 3-5 years using the crash severity scale (K, A, B, C, and O). Analyze the data to describe trends, locations, crash types, etc. that would assist in determining potential causes of crashes and contributing factors specifically associated with the roadway environment. Show crash locations on maps; and
- Discuss any maintenance issues and costs.

Identify any key assumptions and explain why those key assumptions were made.[2] For example, traffic forecasts are based on assumptions about future population and employment trends. The underlying assumptions must be credible for the results to be credible.

1.4 What is the Purpose of the Proposed Project?

State the primary purpose(s) of the proposed project and how it will address each of the identified transportation need(s). The purpose of a proposed project should lead directly back to the identified needs. For example, if data analysis supports the conclusion that there is insufficient highway capacity to support current or future traffic, the purpose would be to address the insufficient capacity. A project may contain more than one purpose if the data demonstrates the need for such. Any secondary purpose(s) should be stated after the primary purpose(s) have been stated.

The following considerations and questions should be used to identify the purpose(s) of the project (for additional information see FHWA Technical Advisory T6640.8A). Once identified, discuss.

<u>Primary Purpose</u>

The primary purpose answers why the project is being studied. All alternatives considered, except the No Build alternative, must meet the primary purpose.

<u>Secondary Purposes</u>

Secondary purposes are additional outcomes or benefits that are desired. Alternatives considered are not required to meet the secondary purpose.

[2] AASHTO Improving the Quality of Environmental Documents (A Report to the Joint AASHTO/ACEC Committee in Cooperation with the Federal Highway Administration), May 2006, p. 7.

1. **System Linkage (Connectivity)**
   - Is the proposed project a "connecting link?"
   - Describe the inadequacy of connectivity and/or continuity in the existing system.
2. **Capacity**
   - Is the capacity of the existing facility adequate for current and projected traffic?
   - Provide and analyze supporting data such as Level of Service and traffic volumes.

Connectivity refers to the effective movement of people, goods, and services.

Continuity refers to uniform speed and pavement widths that promote free flow movements of people, goods, and services.

3. **Legislation**
   - Explain any Federal, State, or local governmental mandate for the proposed project.
4. **Social Demands or Economic Development**
   - Describe any social or economic developments that necessitate the proposed project (e.g., new schools, places of employment, land development, etc.)
   - Consider what method would be used for evaluating economic development among alternatives.

Economic Development

Per FHWA Technical Advisory T6640.8A, social demands and economic development are allowed as part of a project's purpose. However, economic development should be a secondary need and not a primary need, when ***transportation continuity and connectivity*** (that promote economic development) are identified as a project need. Thus, addressing the primary need for continuity and connectivity may result in the promotion of economic development

5. **Modal Interrelationships**
   - Describe how the proposed will serve to complement airports, rail and port facilities, mass transit services, etc.
6. **Safety**
   - Describe the likely conditions related to crashes/safety without the project.
   - Is the proposed project necessary to correct an existing or potential safety hazard?
   - Is the existing accident rate excessively high? Why?
7. **Transportation Facility Deficiencies**
   - Describe any foreseeable deficiencies that may result if no action is taken.
   - Is the proposed project necessary to correct existing roadway deficiencies?

Improving safety

Highway improvements produce safety benefits. In order to include safety as a primary purpose, data supporting the need to improve safety must be documented and analyzed. The data and analysis should clearly demonstrate that there is a specific safety problem and the analysis will identify the root cause(s) and contributing roadway factors.

Do not include in the purpose or need section:

- **A discussion of alternatives.** The purpose and need create the foundation for an alternatives analysis; this section should not discuss alternatives.
- **The solution to the identified transportation purpose and need.**
- **A discussion of the potential environmental impacts.** The purpose and need statement only should identify transportation problems based on existing conditions and analysis of supporting data.

Page Limit Guidance:

EAs must be 75 pages

EIS must be 150 pages.

To assist in meeting these page limit requirements, the following section can be moved to the Appendix:

- Section 1.2 Project Background

Chapter 2 – Alternatives

2.1 What alternatives were considered?

The alternative analysis should include a reasonable range of alternatives that meet the purpose and need. Explain the alternatives development, screening, and evaluation process adequately so that it is rational, reasonable, and complete. Include the No Build alternative, Transportation System Management alternative, Mass transit alternative, and Build alternatives.[3]

2.1.1 No Build alternative

The No Build alternative typically includes maintenance and short-term minor restoration types of activities (such as resurfacing or safety improvements) that maintain continued operation of the existing roadway. It includes all reasonably foreseeable transportation improvements that will be implemented within the design year of the proposed project, but excludes the proposed project. Although the no-build frequently does not meet the purpose and need, it must be carried through the NEPA process as a baseline for comparison of impacts and benefits.

In the discussion of the No Build alternative:

- Describe the existing conditions;
  + State all key transportation improvements that are assumed to be in place in the forecast year;
  + Describe the conditions that will exist in the design year if the proposed project is not implemented;
- Include land use and traffic forecast data;
  + Consider other reasonably foreseeable actions that may affect the project (e.g., new subdivision, planned intermodal facility, industrial/commercial development, community development initiatives, etc.); and
  + Include supporting data for any assumptions made. Supporting data may come from Local Agencies, STIP, community development plans, etc.

Note**:** It is possible, though very rare, for No Build to be selected as the preferred alternative. This generally occurs in circumstances where there are substantial impacts or the need is not sufficiently supported to justify the impacts.

2.1.2 Transportation system management (TSM)

The TSM alternative includes better management and operation of existing transportation facilities to improve traffic flow and air quality, as well as enhance system accessibility and safety.

Evaluate if reconstruction and rehabilitation of the existing system corrects the identified deficiencies and meets the project purpose and need. TSM strategies are operational in nature and include, but are not limited to, improvements or additions of:

- intersections and signals,
- fringe parking,

[3] FHWA Technical Advisory T 6640.8A

- ride sharing,
- High Occupancy Vehicle lanes,
- acceleration/deceleration lanes, ramps, and weaving sections,
- horizontal and vertical curves,
- signage and pavement striping, and
- geometrics.

See Section 22-6.04 for additional requirements that apply if a proposed action is in a Transportation Management Area (i.e., an urban area with a population of 200,000 or more).

2.1.3 Mass transit or multi-modal alternative concepts

Include and describe those reasonable and feasible transit options even though they may not be within the existing FHWA funding authority. Close coordination is necessary with the transit agency(ies) and the local Metropolitan Planning Organization, if applicable, to ensure that IDOT's specific project is consistent those entities' plans.

2.1.4 Build alternatives

Build alternatives may include improvement of existing highways and alternatives on new locations, or a combination of both.

Evaluate and describe a reasonable range of build alternatives that will address the purpose and need using text plus maps and charts, or other visual aids.

2.2 What alternatives were eliminated and why?

- Evaluate and state whether each alternative meets the purpose and need.
- Eliminate all alternatives that do not meet the purpose and need.
- Explain the methods and criteria used for developing and screening alternatives.
- Disclose environmental impacts considered for all alternatives, including the No Build. Use the most current reasonably available information. Do not eliminate alternatives based on outdated information.
- Eliminate the alternatives anticipated to have disproportionately large environmental impacts (e.g., relocations, wetlands, cultural resources, etc.)
- For each alternative eliminated, provide an explanation why it was eliminated.
  + Do not dismiss alternatives for not meeting a screening criterion or evaluation measure, but then carry forward other alternatives that also do not meet that same criterion/measure, without providing the context of why such decisions are logical.
  + Support the decision to eliminate alternatives with sufficient explanation and documentation. Do not eliminate alternatives based on generalities without adequate explanation or documentation to support the decision.
- Summarize public and agency comments that influence which alternatives will be carried forward.
- Summarize the results of this process using visual aids such as charts and tables.
- Provide maps showing the alignments of the alternatives and environmental resources considered..

2.3 What are the Alternatives to be Carried Forward?

The alternatives to be carried forward are those reasonable alternatives that are studied in detail.

Discuss alternatives to be carried forward at a comparable level of detail to avoid any indication of bias toward a particular alternative. Disclose environmental impacts considered for all alternatives, including the No Build. Provide maps showing the alignments of the alternatives and environmental resources considered. Identify and describe any unique features and common design elements of each alternative.

The table below is an example of how to illustrate the alternatives analysis in a graphic form.

Alternative	Does the alternative meet the purpose and need?		Was the alternative carried forward for detailed study?	Alternatives studied in detail
	Yes	If no, why?	If no, why?	
1	x		6-lane road has greater impacts than 4-lane alternatives and is substantially more costly.	
2		The planter median included in the alternatives would decrease safety and roadway capacity.		
3	x			x
4	x			x
5	x		Requires major traffic flow changes.	

2.4 What is the Preferred Alternative?

Preferred alternative is the alternative that best meets the project's purpose and need while balancing and minimizing the impacts to environmental resources.

Place a brief summary of the preferred alternative at the beginning of the alternatives chapter when writing the EA or EIS.

Describe the preferred alternative. Explain the rationale for selecting the preferred alternative. Include a map of the preferred alternative alignment. When introducing the preferred alternative, do not use the term "determined" or "recommended." Instead use the term "identified."

Does the preferred alternative have to be identified in the Draft EIS?

FHWA strongly recommends that the preferred Alternative be identified in the Draft EIS (DEIS). This facilitates the process of having a combined Final EIS (FEIS) and Record of Decision (ROD) since MAP-21, Section 1319(b), requires FHWA, to the maximum extent practicable, to develop a single document that combines the FEIS and ROD. More information about this can be found in Chapter 25 of the BDE Manual .

Page Limit Guidance:

EAs must be 75 pages

EIS must be 150 pages.

To assist in meeting these page limit requirements, the following is suggested:

The NEPA/404 alternatives to be carried forward concurrence package can be added to the appendix. Then sections 2.1-2.3 should be succinctly summarized.

Chapter 3 – Environmental Setting, Impacts, and Mitigation

Page Limit Guidance:

EAs must be 75 pages

EIS must be 150 pages.

To assist in meeting these page limit requirements, the following is suggested:

- State all resources which have no impacts at the beginning of this section. If a resource has no impacts then any discussion, if needed, can be moved to the appendix, and;
- State all resources that are present but not affected at the beginning of this section. If a resource is present but not affected, the discussion can be moved to the appendix.

For example, if wetlands are not present in the project study area, state that fact at the beginning of this section. No further discussion is required in the EA or EIS.

Another example, if wetlands are present in the project study area but the preferred alternative will not impact wetlands then state that fact at the beginning of this section. No further discussion is required in the EA or EIS. Additional information regarding wetlands should be included in the appendix.

This chapter describes the current land uses, economy and jobs, noise, air quality, wildlife, wetlands, park land, cultural, and other resources that exist within the project study area. This chapter also describes the potential effects of the project on these resources.

3.1 Social and Economic Factors

Need more information? Please see IDOT’s Community Impact Assessment Manual.

3.1.1 What community(ies) exist within the project study area?

Describe the community(ies) within the project study area. Include in the description, community name, population, any ethnic, racial, religious minorities, elderly, and disabled groups. Use demographic data from the US Census decennial (ten year) data or American Community Survey (5 year) data, or both. Present median household income and unemployment rate for the project study area. As applicable, present population trends and future population projections. Present an exhibit that delineates and shows boundaries, as applicable, for neighborhoods, U.S. Census Tracts, cities, and county(ies).

Identify community facilities and community service centers (schools, places of worship, libraries, hospitals, parks, fire and police facilities, etc.). Public facilities in the project study area should be described and shown on exhibits.

3.1.2 Will the project impact Title VI, minority, or low-income populations?

State the following:

> *No groups or individuals have been, or will be, excluded from participation in public involvement activities, denied the benefit of the project, or subjected to discrimination in any way on the basis of ethnicity, religion, race, elderly, color, age, sex, national origin, or religion.*

Clearly state if minority, or low income populations are present using the following language:

> *The project area was evaluated in accordance with Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, to determine if there is a potential for disproportionate and adverse impacts to low-income or minority populations. Based on demographic information [2017 U.S. Census' American Community Survey or most recent data] and field observations of the project area indicates that residents of the project area are ___% white; ___% black; ___% American Indian and Alaskan native; ___% Hispanic; and ___% Asian and Hawaiian. The median family income for the project area is $_____. ___% of the residents are below the median family income within the project area. The [Health and Human Services 2017 or most recent guideline] Poverty Guidelines for a family of four is $_____.*

If minority and low-income populations are not present, then state the following:

> *Based on this demographic information and field observations of the project area, there are no minority or low-income populations in the project area.*

What is the relationship between Title VI and environmental justice?

Title VI of the Civil Rights Act of 1964 specifically provides that "…no person in the United States shall, on the ground of race, color, or national origin, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any program or activity receiving Federal financial assistance."

Environmental justice ensures that federal programs, policies, and other activities do not have disproportionately high and adverse effects on minority or low-income populations. This goal is to be achieved, in part, by actively adhering to the principles and practices of both Title VI and NEPA during the development and implementation of transportation activities.

If minority, or low-income populations are present, state whether there the proposed action will or will not cause adverse impacts to any minority, or low-income populations. If there are adverse impacts, clearly identify those impacts. Next, state if these *are* or *are not* disproportionate to minority or low-income populations. If there are disproportionate and adverse impacts, discuss relevant and reasonable mitigation measures in this order: avoiding the impacts, minimizing the impacts, rectifying the impacts, reducing the impacts, or off-setting benefits to the impacts. Discuss the public participation efforts to seek participation by underserved populations.

What impacts may be evaluated in an Environmental Justice analysis?

All reasonably foreseeable adverse social, economic, and environmental effects to minority populations and low-income populations are to be identified and addressed. Adverse effects include, but are not limited to:

Bodily impairment, infirmity, illness, or death..

- Air, noise, and water pollution; and soil contamination.
- Destruction or disruption of man-made or natural resources.
- Destruction or diminution of aesthetic values.
- Destruction or disruption of community cohesion or a community's economic vitality.
- Destruction or disruption of the availability of public and private facilities and services.
- Vibration.
- Adverse employment effects.
- Displacement of persons, businesses, farms, or nonprofit organizations.
- Increased traffic congestion, isolation, exclusion, or separation of minority or low-income individuals within a given community or from the broader community.
- The denial of, reduction in, or significant delay in the receipt of benefits of DOT programs, policies, or activities.

For access-controlled roadways in urban areas, evaluate and provide a brief history of transportation projects in the area to determine if there were any historical disproportionately high and adverse effects on minority or low-income and communities. For example, a roadway's original construction through a downtown area may have divided a neighborhood, or it may have restricted local travel to an important community center. State if there still exists evidence of the original neighborhood that has been isolated due to the presence of the roadway. If such actions occurred, document this history, and coordinate with FHWA to determine if there are reasonable measures that could reconnect the community, e.g. alternative alignments, design elements that facilitate better access across the transportation facility, etc. Proposed mitigation is eligible for federal funding, and must be a reasonable public expenditure after considering impacts and benefits.

3.1.3 Will the project have any change in travel patterns?

- Describe whether traffic patterns will change after completion of the proposed project.

- Discuss if travel times will increase or decrease. Typically, a project will result in a savings in travel time and allow transportation users to journey from their origin to their destination more quickly; if so, then discuss.

The assessment of travel pattern impacts should include all potential travel, including pedestrians, bicyclists, and persons with disabilities. The assessment of travel patterns is a factor in community cohesion.

- Discuss if the project has the potential for dividing or isolating communities or neighborhoods.

- Discuss if the project will positively or negatively disrupt community access from residential neighborhoods to public facilities (e.g., places of worship, schools, libraries, hospitals, community centers, parks, child care facilities) services (e.g., fire, police, ambulance), or businesses. Would any of these disruptions require mitigation? If any of these disruptions cause an adverse travel impact, then the EA or EIS must discuss avoidance and minimization efforts?

Transportation effects on community cohesion can be difficult to quantify. Thus, qualitative effects should be discussed. For example, an obvious negative impact to community cohesion would be a new road that creates a physical barrier between residents and community facilities, where prior to the transportation change the facilities could be accessed by an easy walk, bicycle or short drive.

- Where projects involve temporary changes in access due to road closures, traffic detours, etc., the analysis and assessment of impacts should summarize:

  + changes in neighborhood travel patterns;

  + disruptive effects of traffic detours;

  + “barrier” effects related to change in access for police, fire, or health services;

  + and if travel times will increase or decrease. The assessment of travel pattern impacts should include all potential travel, including pedestrians, bicyclists, and persons with disabilities.

3.1.4 Will the project change or impact any pedestrian, bicycle, or transit facilities?

Discuss if any changes to pedestrian, bicycle, or transit facilities are consistent with local and regional plans. Discuss any impacts to existing pedestrian, bicycle, or transit facilities including temporary or permanent

New pedestrian facilities and new bikeways can improve connections between residents and community facilities. If this occurs it should be documented in the EA or EIS.

changes. Discuss if the project increases transit options (bus, rail, etc.) for the project study area. Discuss impacts to school bus routes.

3.1.5 Will the project require any residential or business relocations?

If relocations are not involved the EA or EIS needs to contain a sentence stating "this project has no residential or commercial relocations."

If relocations are involved, state the number and types (i.e., residential, commercial, and agricultural). Discuss how the project avoided and minimized relocations. Discuss the availability of replacement property in the project vicinity. The discussion on relocation impacts shall include the following statements:

- the provisions of the "Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended" and the *IDOT Land Acquisition Procedures Manual* will be followed. *Note: This statement is needed whenever land must be acquired for any purpose*;
- a commitment to "provide housing of last resort, if necessary"; and
- the housing resources are available to all relocatees without discrimination.

3.1.6 Land Use

Describe existing and planned land use within the study area and indicate whether the proposed project is consistent with local and regional land use plans. Cite the applicable local government's land use plan(s). Discuss the effect of the proposed action on existing or planned land use in the community. If the proposed project is not reasonably expected to change land use in the project study area, then clearly state that fact.

3.1.7 Will the project cause any economic impacts, economic growth or economic development?

The necessity and degree for conducting an economic assessment is determined by the nature of the impact in the project study area, and the nature of the impact within the context of the larger regional area.

Describe types of businesses within the project study area. All major employers within the project study area should be identified and their respective number of employees stated. Discuss the potential for impacts to businesses, specifically for access changes and parking loss. Discuss if the project could decrease sales at an established, traffic-oriented businesses (e.g., gasoline service station, restaurant, or retail store). For each displaced business, state the estimated number of people employed.

Discuss the freight network and its multi-modal aspects for projects within metropolitan areas and Projects of National and Regional Significance.

Describe the potential for economic growth (typically quantitative) in the region. Discuss the potential for economic development (typically qualitative) in the region, such as it relates to a sustained longer-term change in economic activity leading to an improvement in the jobs, wealth, tax base, and well-being in the neighborhood, city, or county. Discuss the number of jobs created as a result of the proposed transportation project, using three distinct multipliers:

- Direct jobs are (for example: engineers, workers, and laborers on the road crew). The direct employment multiplier is 8.35 jobs for every $1 million spent on the project.
- Indirect jobs that may increase are (for example: employment at the local asphalt plant and various road supplies). The indirect employment multiplier is 9.25 to 12.7 jobs for every $1 million spent on the project.
- Induced jobs are increased secondary spending at a local restaurant. The induced employment multiplier is 10.5 jobs for every $1 million spent on the project.

The project team may utilize other methods to discuss and evaluate economic impacts, economic growth, economic development, or jobs created

3.2 Agricultural

Need more information? Please see Chapter 26-10.

Include the following language:

> *Conversion of agricultural land to highway right of way can lead to reductions in agricultural production. Minimizing these effects is required by the Federal Farmland Protection Policy Act and the Illinois Farmland Preservation Act*.

Note: the taking of a farm residence and known agricultural tax loss from right-of-way purchased should be summarized under the Social and Economic discussion.

3.2.1 Will the project impact farms or convert farmland to other uses?

Identify the estimated amount of farmland (prime or important farmland) to be converted to non-agricultural use. If known, include the estimated conversion of agricultural land for borrow or contractor-use areas and other proposed mitigation efforts (e.g., wetland mitigation).

The discussion of agricultural impacts shall include a summary of the following information:

Where possible, use tables and exhibits to illustrate agricultural impacts.

- the number of agricultural parcel severances created;
- the number of agricultural landlocked parcels created;
- the number of uneconomical agricultural remnants of three acres or less in size;
- the potential loss in crop production and potential cash receipts;
- the number of agricultural businesses relocated;
- the number of farmstead relocations;
- if the project adversely impacts farm equipment travel, describe the impact and the proposed mitigation measures; and
- the soil type and class information..

3.2.2 Will the project impact Protected Agricultural Areas?

Identify and discuss avoidance or non-avoidance of:

- land registered in the Illinois Agricultural Areas Conservation and Protection Act,
- farms and acreage enrolled in the federal Conservation Reserve Program, and
- farms certified by Illinois as Centennial or Sesquicentennial Farms.

State if any farms are registered with any farmland protection program administered by the respective county or by the Illinois Department of Agriculture.

3.2.3 Has coordination with the Natural Resources Conservation Service and the Illinois Department of Agriculture occurred?

Coordination is required with the Natural Resources Conservation Service (NRCS), unless the project is exempt per 523.10(B) or 523.11(E)(1) of the National Resource Conservation Service manual If coordination with the NRCS is required, include a copy of the Form NRCS-CPA-106 as an exhibit. Refer to Section 26-10 for the basis of coordination with the Illinois Department of Agriculture (IDOA). If coordination is not required for either NRCS or IDOA, explain why not.

3.3 Historic Properties

Need more information? See Section 26-5.

Include the following language:

> *Historic properties are any properties that are on or eligible for listing in the National Register of Historic Places (NRHP), and include below ground resources, like archaeological sites, and above ground resources, like buildings and bridges. These resources are protected by Section 106 of the National Historic Preservation Act (NHPA).*

Please note that if a property is not on the NRHP but is determined to be eligible, it is still protected under Section 106.

> Archaeological site locations are protected and should not be depicted on maps or otherwise shared with the general public.

3.3.1 How were historic properties identified in the project study area?

Depict the boundaries of the project's Area of Potential Effect (APE), as coordinated by FHWA with the Illinois State Historic Preservation Officer (SHPO), on the environmental inventory map. The APE may or may not be the same area as the ESR study area. Describe the steps taken to identify historic properties, including a list of consulting parties invited to be included in the process.

3.3.2 Do archaeological properties exist within the Area of Potential Effect?

Archaeological sites are typically habitation areas, but also include burial mounds and cemeteries. Special efforts should be made to avoid potential impacts to mounds and cemeteries.

If no, state that there are no archaeological properties within the APE. If yes, discuss the number and types (cemetery, mound, or habitation) of archaeological sites listed or eligible for listing on the NRHP within the APE, including the applicable criteria for eligibility.

3.3.3 Do historic architectural properties (buildings, bridges or structures) exist within the Area of Potential Effect?

If no, state that there are no historic architectural properties affected. If yes, describe each historic property's boundary (e.g., building plus parcel as concurred upon by the SHPO) including the characteristics that qualify them for the NRHP and the applicable criteria for eligibility, and clearly identify the NRHP boundaries of the properties in the appendix. Please note that the historic boundaries might include only the structure, or might also include additional land surrounding the structure.

3.3.4 Will the project impact archaeological properties?

If there are no archaeological properties in the APE or if archaeological properties are present but not affected, state that there are "no historic properties affected."

If there are archaeological properties, describe what steps were taken to avoid and minimize potential impacts to those sites. If the sites were avoided, state this fact.

If potential impacts to the sites cannot be avoided explain why not, state that the project will cause an adverse effect, that further archaeological work is necessary and that work will be completed according to stipulations specified in a Memorandum of Agreement (MOA) or project Programmatic Agreement (PA). The MOA or PA must be fully ratified prior to FHWA approving a FONSI or ROD.

3.3.5 Will the project impact historic architectural properties?

If there are historic architectural properties, describe what steps were taken to avoid and minimize potential impacts to those properties. If the properties were avoided, state this fact.

If potential impacts to architectural properties cannot be avoided, describe the effects on each historic property. If any land from within the historic property's NRHP boundary will be converted to transportation use by the project, clearly describe where and how much (in square feet or acres). This must be done for each historic property.

- If the impacts will not adversely affect the historic property, state that there will be "no adverse effect." Explain the basis for this determination and why the criteria of adverse effect do not apply. Cite and include in the appendix the letter that documents SHPO concurrence in this determination.

- If the impacts are determined to be "adverse effect", state the effect determination, explain the basis for this determination and why the criteria of adverse effect apply. State that work must be completed according to stipulations specified in a Memorandum of Agreement (MOA) or project Programmatic Agreement (PA). The MOA or PA must be fully ratified prior to FHWA approving a FONSI or ROD.

Include the following in the appendix:

- Copies or summaries of any views provided by consulting parties, including Tribes and the public, and SHPO letter(s) of concurrence on eligibility and effect determinations.
- If an adverse effect finding is made, include a copy of the letter to the Advisory Council on Historic Preservation notifying them of the Adverse Effect finding, and a copy of the executed MOA or PA.
- If the project is an EIS, all of the above information should be included in the DEIS if it is available. If the final effect finding and/or the MOU or PA is not available until the Final EIS is prepared, make note of the additional steps that will be taken prior to completion of the FEIS in the DEIS.

3.4 Air Quality

Include the following language:

Air quality is protected by the Clean Air Act and air quality standards established by the U.S. Environmental Protection Agency.

3.4.1 Carbon Monoxide Microscale Analysis

Need more information? See Section 26-14.

If the project does not add through lanes or auxiliary turning lanes, or does not involve any sensitive receptors and is not suitable for using COSIM, state the following:

In accordance with the IDOT-IEPA "Agreement on Microscale Air Quality Assessments for IDOT Sponsored Transportation Projects," this project is exempt from a project-level carbon monoxide air quality analysis because it does not add through lanes or auxiliary turning lanes and has no sensitive receptors.

If the project does not exceed 5,000 vph or 62,500 ADT, COSIM analysis is not required, so state the following:

In accordance with the IDOT-IEPA "Agreement on Microscale Air Quality Assessments for IDOT Sponsored Transportation Projects," this project is exempt from a project-level carbon monoxide air quality analysis because the highest design year approach volume on the busiest leg of the intersection is less than 5,000 vph or 62,500 ADT.

If COSIM analysis is required state the following:

> *The air quality effects of the proposed project were analyzed using the Illinois Carbon Monoxide Screen for Intersection Modeling (COSIM). The "worst case" analysis provided by the COSIM model indicated that the proposed undertaking does not have the potential for contributing to a violation of the National Ambient Air Quality Standards for CO. CO concentrations for the worst case receptor (i.e., residence) located [__________________] (see Exhibit [__]) were as follows: Existing ([year]) - ___ ppm; Build – Time of Completion (TOC) ([year]) - ___ ppm, TOC + 10 years ([year]) - ___ ppm, and Design Year ([year]) - ___ ppm; No Action - ___ ppm in [TOC year], ___ ppm in [TOC + 10 year], and ___ ppm in [design year].*

3.4.2 Air Quality Conformity

Need more information? See Section 26-11.

If the project is outside of a nonattainment or maintenance area, state the following:

> *No portion of this project is within a designated nonattainment or maintenance area for any of the air pollutants for which the U.S. Environmental Protection Agency has established standards. Accordingly, a conformity determination under 40 CFR Part 93 ("Determining Conformity of Federal Actions to State or Federal Implementation Plans") is not required.*

If the project is exempt from conformity requirements state the following:

> *This project is located within a designated nonattainment or maintenance area but is a project type that the U.S. Environmental Protection Agency (USEPA) has designated as exempt from regional emissions analyses of transportation plans and Transportation Improvement Programs for purposes of determining conformity with the State Implementation Plan (SIP). This designation is based on USEPA's determination that the nature of the project is such that it would not affect the outcome of a regional emissions analysis.*

If the project is not exempt and is within a nonattainment or maintenance area, see Section 26-11.03(d) for specific language to be used.

3.4.3 $PM_{2.5}$ and PM_{10} Nonattainment and Maintenance Areas

Need more information? See Section 26-12

Currently per the USEPA the state is in unclassifiable/attainment and therefore a Hot-Spot Analysis is not required for any projects.

3.4.4 Mobile Source Air Toxics (Section 26-13)

Need more information? See Section 26-13.

If the project is exempt under the Clean Air Act conformity rule under 40 CFR 93.126, then no analysis or discussion of MSATs is necessary.

If the project has potential MSAT effects, see Section 26-13.03(b), (c), and (d) for procedures and appropriate language.

3.4.5 Construction Related Particulate-Matter

State the following language:

> *Demolition and construction activities can result in short-term increases in fugitive dust and equipment-related particulate emissions in and around the project study area. (Equipment-related particulate emissions can be minimized if the equipment is well maintained.) The potential air quality impacts will be short-term, occurring only while demolition and construction work is in progress and local conditions are appropriate. The potential for fugitive dust emissions typically is associated with building demolition, ground clearing, site preparation, grading, stockpiling of materials, on-site movement of equipment, and transportation of construction activity, and during high wind conditions.*
>
> *The Department's Standard Specifications for Road and Bridge Construction include provisions on dust control. Under these provisions, dust and airborne dirt generated by construction activities will be controlled through dust control procedures or a specific dust control plan, when warranted. The contractor and the Department will meet to review the nature and extent of dust-generating activities and will cooperatively develop specific types of control techniques appropriate to the specific situation. Techniques that may warrant consideration include measures such as minimizing track-out of soil onto nearby publicly-traveled roads, reducing speed on unpaved roads, covering haul vehicles, and applying chemical dust suppressants or water to exposed surfaces, particularly those on which construction vehicles travel. With the application of appropriate measures to limit dust emissions during construction, this project will not cause any significant, short-term particulate matter air quality impacts.*

3.5 Noise

See Section 26-6 and the IDOT Highway Traffic Noise Assessment Manual to assist in completing this section.

Begin with a brief explanation about the regulations that pertain to noise analysis (federal regulations (23 CFR 772) and IDOT noise policy).

If the project did not require a noise analysis, then state the following and there is no need to continue with the rest of this section.

> *"The types of projects that do not require a noise analysis are stated in 23 CFR Part 772. This project meets those criteria and does not require a traffic noise analysis, noise barrier, or other noise abatement measures."*

If the project required a traffic noise analysis include the following language:

3.5.1 How is noise assessed for roadway projects?

Roadway noise depends on four main factors:

- *The number of vehicles present;*
- *Traffic speed;*
- *The number of large trucks present; and*
- *How far the listener is from the roadway.*

Traffic noise is predicted for Existing, future No Build, and future Build conditions. The Department uses data and findings from traffic noise reporting to determine if traffic noise impacts will occur due to the proposed project, then methods to reduce noise for the listener (called noise abatement) are considered.

There are four steps in highway traffic noise analysis:

1) *Identify places with similar noise and land use. This is done by determining Common Noise Environments (CNEs), which are a group of receptors with similar noise exposure, topography, traffic characteristics, and land use. CNEs are grouped by noise sensitivity based on FHWA Activity Categories (i.e., residential, parks, hotels, etc.). Assign one representative receptor per CNE, as the worst-case noise location in the CNE. A receptor is a location analyzed for noise impacts and is typically an exterior area of frequent human use (bench, patio, etc.).*
2) *Conduct noise modeling for each receptor. Existing, future No Build, and future Build conditions are modeled using FHWA Traffic Noise Model 2.5 (TNM 2.5) for each representative receptor, using comparative field monitoring to ensure the model accurately represents the area's noise characteristics.*
3) *Analyze representative receptors (one per CNE) for noise impacts. If the representative receptor is impacted, the entire CNE is considered to have a noise impact. There are two ways to identify noise impacts:*
   a) *Compare modeled future Build noise levels to the FHWA Noise Abatement Criteria (NAC) to determine if noise impacts will occur (see table below). The NAC does the following:*
      - *classifies where noise levels interfere with human speech;*
      - *differs by land use; and*
      - *establishes noise levels at which noise barriers need to be studied.*

      The CNE has a noise impact if future Build noise at the representative receptor is within one decibel, meet, or exceed the NAC.
   b) *For each representative receptor, the CNE has a noise impact if future Build noise is predicted to increase by 15 decibels or more at a representative receptor(s).*

4) *Determine if noise abatement is feasible and reasonable for each impacted CNE. Noise abatement are measures taken to reduce traffic noise impacts (i.e., construction of berms or noise walls, shifting roadway alignment, etc.). For each CNE determined to be impacted by noise, noise abatement is assessed.*

   Noise abatement must
   - *be feasible to construct;*
   - *effectively reduce noise;*
   - *be cost-effective; and*
   - *have a majority of those benefited by each abatement measure support its construction. This is called viewpoints solicitation, and depending on the project's characteristics, is completed in either preliminary engineering or after the final design has been approved.*

<u>What is noise abatement?</u>

Noise abatement reduces traffic noise impacts. Examples of noise abatement are construction of berms or noise walls, shifting roadway alignment, etc.

Example Land Uses	*FHWA Noise Abatement Category*	*FHWA Noise Abatement Criteria - Noise Level Where Impact Occurs (dB(A))*
Residential	*B*	*67*
Recreational areas, cemeteries, hospitals, medical facilities, parks, places of worship, schools, trails	*C*	*67*
Hotels, motels, restaurants, bars, offices	*E*	*72*
Agriculture, airports, emergency services, industrial, manufacturing, retail facilities, utilities, warehousing	*F*	*None*
Undeveloped lands that are not permitted for development	*G*	*None*

Table 1: Noise Abatement Criteria Categories and Noise Levels Where Impact Occurs

3.5.2 Are there any noise sensitive areas in the project study area?

Describe the type and number of Common Noise Environments (CNEs) (residences, businesses, schools, recreational, etc.) in the project study area. Make sure to include any undeveloped lands for which development is permitted.

3.5.3 Are there any noise impacts in the project study area?

If necessary, include a brief explanation of noise terminology (e.g., A-weighting, decibels, etc.) Reference the noise study that was conducted. State the Existing, No Build, and Build noise levels (in dB(A)) for all representative receptors at each CNE. The table below is an example of how to present the information.

Receptor # (keyed to a map)	Receptor Descrip-tion	Represents	FHWA Noise Abate-ment Criteria (dB(A))	Exist-ing Noise Level (Year) (dB(A))	Future No Build Noise Level (Year) (dB(A))	Build Noise Level (Year) (dB(A))	Noise Level Change (Build minus Exist-ing) (dB(A))	Impact-ed?
1	Residential	12 homes	67	65	67	66	1	Yes
2	Commercial	3 businesses	72	70	70	74	4	Yes

Table 2 : Example Traffic Noise Modeling Summary

If there are no traffic noise impacts, state:

> "*Future noise levels for the receptors would not approach, meet, or exceed the noise abatement criteria, or substantially exceed existing noise levels*."

If there are traffic noise impacts, state which CNEs have predicted traffic noise impacts, the types of activities which may be affected, and state the need to conduct a noise abatement evaluation.

3.5.4 Would a noise barrier be feasible and reasonable?

Describe the traffic noise abatement types considered for each CNE which are listed in Section 26-6.05(d)2. State the traffic noise abatement types that are feasible and reasonable and will likely be incorporated into the proposed project. For all abatement measures, state estimated costs, height and length of barriers, and if the barriers provide adequate noise reduction (meet the state Noise Reduction Design Goal (NRDG). The table below is an example of how to do this.

Receptor #	Barrier Height	Barrier Length	Total Cost	Does the Barrier meet NRDG?[1]	Estimated Build Cost per Benefited Receptor	Allowable Cost per Benefited Receptor[2]	Will the barrier likely be implemented?	If No, Reason(s) Why
1	18 feet	800 feet	$	Yes	$/benefited receptor	$/benefited receptor	No	Not cost effective

[1] There must be at least one benefited receptor that has noise levels reduced at least 8 dB(A) to meet the Noise Reduction Design Goal (NRDG).
[2] The allowable cost is calculated based on the IDOT Noise Policy.

Table 3: Example Noise Mitigation Summary

If abatement measures are NOT feasible and reasonable, document why and state the following:

> "*The proposed project is anticipated to have traffic noise impacts, but the noise barriers studied and identified in Table (reference table in NEPA documentation) do not meet IDOT's feasibility and reasonableness criteria. Due to this, traffic noise abatement measures are not likely to be implemented based on preliminary design. If the project's final design is different from the preliminary design, IDOT will determine if revisions to the traffic noise analysis are necessary. A final decision on noise abatement will not be made until the project's final design is approved and the public involvement processes is complete*."

If abatement measures are determined to be feasible, meets the IDOT Noise Reduction Design Goal, and are cost effective, but the solicitation of viewpoints from benefitted receptors will be deferred until Phase II Design then state the following:

> "*The noise barriers were determined to meet the feasibility criteria, the noise reduction design goal, and the cost effectiveness criteria as identified in Table (reference table in NEPA documentation). In order to determine if noise barrier(s) will be implemented, viewpoints solicitation still needs to occur. Viewpoints solicitation will occur after the project's final design is approved. If the project's final design is different from the preliminary design, IDOT will determine if revisions to the traffic noise analysis are necessary. A final decision on noise abatement will not be made until the project's final design is approved and the public involvement processes is complete.*"

What is viewpoints solicitation in a noise analysis?

Those that would be benefitted by a noise barrier are asked to vote on whether they support the barrier's construction. If more than 50 percent of received votes are in support of the barrier, the barrier is recommended for construction.

If noise abatement measures are determined to be feasible and reasonable, and viewpoints solicitation is completed during Phase I, then state the following:

> *"The noise barriers were determined to meet the feasibility and reasonableness criteria. If the project's final design characteristics is different from the preliminary design, IDOT will determine if revisions to the traffic noise analysis are necessary. A final decision on noise abatement will not be made until the project's final design is approved and the public involvement processes is complete."*

3.6 Energy

State the following:

> *Construction of the proposed (Route) improvement will require indirect consumption of energy for processing materials, construction activities, and maintenance for the lane miles to be added within the project limits. Energy consumption by vehicles in the area may increase during construction due to possible traffic delays.*
>
> *Construction of the proposed improvement will reduce traffic congestion and turning conflicts along the route and thereby reduce vehicular stopping and slowing conditions. Additional benefits would be realized from increased capacity and smoother riding surfaces. This will result in less direct and indirect vehicular operational energy consumption for the build alternative than for the no-action alternative. Thus, in the long term, post-construction operational energy requirements should offset construction and maintenance energy requirements and result in a net savings in energy usage.*

The following should be added when applicable:

> *The project includes provisions for improved bicycling and walking conditions, thereby encouraging travel by these non-motorized and thus non-energy consuming modes of transportation.*

Energy impacts should only be presented if it is an issue of concern in the project area or if substantial differences between alternatives are anticipated.

3.7 Natural Resources

3.7.1 Upland Plant Communities

Need more information? See Section 26-17 Tree/Vegetation Assessments and 26-18 Invasive Species.

If there will be a substantial impact to forest, prairie, or savanna, describe the location of the project in relation to the Natural Divisions of Illinois and provide a brief characterization of the Division(s) involved. Next, compare the characteristics of the Division(s) involved with the types and acreages of forest, prairie, and/or savanna in the project study area. This comparison can help provide context for upland plant communities and wildlife resource impacts.

3.7.1.1 What type of upland plant communities occur within the project study area?

Include a table indicating the number of acres of each cover type in the project study area. Include the following as applicable.

- Identify and depict on the environmental inventory map forested blocks greater than 20 acres in size, prairies, and savannas.
- Describe forested blocks of 20 acres (8 ha) or more based on dominant species, relative age, and quality.
- Trees on the inventory of state record trees, trees possessing exceptional size, form, etc., trees having recognized historical significance, or trees that perform a special function shall be discussed per Design and Environment Policy 18, Preservation and Replacement of Trees (D&E-18).
- Describe prairie/savanna areas by size (acres), prairie/savanna type (e.g. mesic, sand, dolomite), dominant species, grade of natural quality (A-E), and types of disturbance.
- Briefly describe dominant species and health of trees occurring as landscape elements in urban settings.

> Cover types are discussed in Section 26-17.06(b), Cover Type and Vegetation Surveys.

> The Memorandum of Understanding by and between Illinois Department of Natural Resources and Illinois Department of Transportation requires IDOT to coordinate with IDNR for actions adversely affecting prairies, savanna, and/or bisecting or fragmenting blocks of trees greater than or equal to 20 acres in size.

3.7.1.2 Will the project impact any upland plant communities?

Summarize project impacts (acres) to upland plant communities.

3.7.1.3 How were forested areas, prairies, and savannas avoided and minimized?

If applicable, discuss measures taken to avoid and minimize impacts to forested areas, prairies, and savannas.

3.7.1.4 Proposed Mitigation

If trees/forests will be impacted discuss the mitigation ratio per Design & Environment Departmental Policy 18 (D&E-18). If applicable, discuss plans for providing prairie/savanna replacement.

3.7.1.5 Are invasive plant species present in the project study area?

Briefly discuss the likely effects of the project on the introduction or spread of invasive species during construction and/or as a result of project maintenance. Identify invasive species in the project study area and briefly describe their potential effects on sensitive resources (e.g., adjacent natural areas, nature preserves, parks or forest preserves). Describe measures used to control invasive species during project construction and maintenance.

3.7.2 Wildlife Resources

Need more information? See Section 26-15 Migratory Birds and 26-16 Wildlife Resources.

3.7.2.1 What type of wildlife habitat occurs within the project study area?

Wildlife habitats in a project area coincide with major plant communities (i.e., cover types). Identify and briefly describe important wildlife habitats and habitats suitable for area-sensitive migratory birds. Identify and discuss wildlife species that occur in the project study area and are addressed in *The Illinois Comprehensive Wildlife Conservation Plan & Strategy* (Illinois Wildlife Action Plan) *as* "Species in Greatest Need of Conservation for Illinois."

3.7.2.2 Will the project impact wildlife habitat?

Briefly describe impacts to wildlife habitat. Any environmental commitments and mitigation should conform to the recommendations in the Illinois Wildlife Action Plan, to the fullest extent practical.

3.7.3 Threatened and Endangered Species

Need more information? See Section 26-9 Threatened and Endangered Species/Natural Area Impact Assessments and 27 Environmental Surveys.

Include the following language:

> *"The Federal Endangered Species Act protects species of plants and animals that are threatened or endangered within the U.S. The Illinois Endangered Species Protection Act protects species of plants and animals that are listed under the federal act plus additional plants and animals. Both acts provide for the*

conservation of threatened and endangered species and the ecosystems upon which they depend."

3.7.3.1 Federally-listed Species/Habitat

3.7.3.1.1 What federally threatened or endangered species exist in the project study area?

State the Federally listed species, species proposed to be listed, designated critical habitat, and/or proposed critical habitat and status for the county(ies) where the project is located.

3.7.3.1.2 Will the project affect federally threatened or endangered species?

An effect determination and the basis for that determination must be discussed for each federally listed species. The effect determinations are "no effect", "may affect, not likely to adversely affect", or "may affect, likely to adversely affect". Summarize the following information, as applicable:

- species distribution, habitat needs, and other biological requirements;
- affected areas of the proposed project;
- biological survey and database search results;
- possible impacts, including opinions of recognized experts on the species involved;
- measures to avoid impacts; and
- measures to minimize adverse impacts.

Federal species that are delisted are still State listed species until the Illinois Endangered Species Protection Board delists them.

If formal consultation is required, a copy of the Biological Assessment (BA) and the Biological Opinion (BO) should be included as an appendix to the EA or EIS and must be completed prior to the approval of the FONSI or ROD. The BA and BO should be summarized in the text of the EA or EIS.

3.7.3.2 State-Listed Species

3.7.3.2.1 What state threatened or endangered species exist in the project study area?

Identify each state-listed species that has a record of occurrence in IDNR's Natural Heritage Database in the vicinity of the project's study area. Also, identify any state listed species found during biological surveys conducted for the project.

3.7.3.2.2 Will the project affect state threatened or endangered species?

Summarize the habitat of each state listed species identified above and the results of the biological surveys conducted. Discuss potential project impacts to the species. Describe any avoidance measures, minimization and mitigation for any impacts. Reference any applicable compliance documentation (e.g., Detailed Action Report, Biological Opinion, and Incidental Take Authorization, as applicable) and include the documentation in the EA appendix.

3.8 Surface Water Resources

Need more information? See Section 26-19, 26-20 and 26-21.

Include the following language:

> *Surface water resources include wetlands, streams, rivers, lakes, and ponds. Wetlands are discussed in Section 3.10. Surface water resources are protected by the Clean Water Act.*

3.8.1 What waterbodies exist in the project study area?

Briefly describe all streams, rivers, lakes, and ponds that occur in the project study area and indicate their location on an environmental inventory map. Include a brief summary of important physical, biological, and chemical characteristics unique or pertinent to the project and the decision-making process.

In the appendix to the EA or EIS include the following three tables if data was collected or is available.

Chemical data for the streams, rivers, lakes, and ponds		
Date sample was collected	Amount detected of the following: pH, dissolved oxygen, total phosphorus, chloride, dissolved copper, dissolved lead, dissolved zinc, dissolved sulfate, total dissolved solids, water temperature, hardness, etc.	Include water quality standards for each parameter as appropriate

Physical Characteristics of Streams and Rivers					
Stream name	Upstream drainage are (square miles)	Flow water depth	Riparian habitat	Mean habitat score	Watershed characteristics

Biological Characteristics of Streams and Rivers						
# of fish present	# of intolerant fish species	Dominant fish species	% of intolerant fish species	Aquatic habitat quality	# of mussels	*Ephemeroptera*, *Plecoptera*, and *Trichoptera* (EPT) richness

3.8.2 Are there any water bodies that the Illinois Environmental Protection Agency lists as impaired or fully supporting for a designated use?

Identify impaired waterbodies in the project area plus the designated use, support level, and causes and sources of impairment. Also, identify any waterbodies that are fully supporting a designated use. This information can be found in Appendix B-2, B-3, and B-4 of the *IEPA Integrated Water Quality Report and Section 303d List*. Identify water bodies in the project area that have a Total Maximum Daily Load developed. This can be depicted in table form.

3.8.3 Are there any streams in the project study area that have a special designation?

Identify those resources that have a special designation including

- navigable waters,
- Wild and Scenic River,
- Nationwide Rivers Inventory stream,
- stream designated as a Illinois Natural Area Inventory Site,
- Advanced Identification (ADID) Stream,
- Illinois Biologically Significant Stream,
- Biological Stream Rating (BSR) for diversity or integrity, and/or
- Outstanding Resource Water (listed in 35 Ill. Adm. Code 303.206).

3.8.4 How will the project impact water resources during construction of the project?

Identify the types of construction activities (e.g., vegetation removal, in-stream work, bridge or culvert construction, bridge demolition, channel change, riprap placement) that will occur in and adjacent to each water crossing. Identify any potential effects on the biological and physical parameters and water quality characteristics of each water resource. Identify any minimization measures. If the proposed project will involve an Outstanding Resource Water, list and briefly describe measures to be implemented to avoid introducing water pollution from the project into an Outstanding Resource Water.

3.8.5 Will construction impacts to water resources be mitigated?

Depending on the nature of the impact, mitigation should be discussed. If channel realignment is necessary discuss what type of mitigation is proposed and if the mitigation will follow the Illinois Stream Mitigation Method. Aquatic habitat mitigation should be based on the wildlife needs as described in the Management Guidelines included in the Natural Division Assessments that are a part of the Illinois Wildlife Action Plan. If a watershed plan is available discuss mitigation in relation to the plan.

3.8.6 Will the project impact water resources during operation of the proposed project?

State any measures implemented to minimize water quality impacts. For any water listed as impaired on the 303(d) list or has a TMDL, discuss whether the project will contribute to the cause(s) of the impairment. If a pollutant loading analysis is required, discuss the results. Compare the results to the State water quality standard. If the chemical concentrations exceed the water quality standard, state the mitigation measures that will be implemented to reduce the chemical concentration below the water quality standard.

3.8.7 Will the project impact water resources during maintenance of the proposed project?

Pollutant loading analysis should be conducted if additional impervious surface will be added and one of the following occurs:

- the highway runoff is being discharged into a sensitive stream, seep, fen, or nature preserve;
- a waterbody is listed as impaired on the 303(d) list or has a Total Maximum Daily Load for a chemical in which the highway runoff would contribute additional load;

For projects that meet one of these criteria use SELDM to conduct the pollutant loading analysis for copper, lead, zinc, chloride and the chemical in which the water body is impaired.

If a pollutant loading analysis was used to analyze chloride concentrations discuss the results of the analysis. If chloride is a cause of impairment to the water body and an individual 401 Water Quality Certification is needed, demonstrate how the project will have a no net increase in chloride. If the water body being impacted has a TMDL for chloride, demonstrate how the project will meet compliance with the TMDL.

If SELDM was not used to analyze chloride concentrations discuss standard Best Management Practices with regards to IDOT's use of chloride.

Use the FHWA and USGS SELDM to analyze chloride concentrations if the project will add impervious surface and any of the following apply:

- The project is in an area with an IEPA-designated, chloride impaired watershed(s), or
- A water quality sample result is proximate to an exceedance of the chloride water quality standard.

3.8.8 What water related permits will the project require?

Indicate water body crossings requiring IDNR Office of Water Resources permit, US Coast Guard permit, NPDES permit, Section 401 Water Quality Certification, and the type of USACE 404 permit(s) anticipated for each water body crossing. If an NPDES construction permit is required, incorporate the following paragraph into the EA or EIS:

> *It is anticipated this project will result in the disturbance of one or more acres of land. As a result, a National Pollutant Discharge Elimination System (NPDES) permit for stormwater discharges from the construction sites is required. Permit coverage for the project will be obtained either under the IEPA General Permit for Stormwater Discharges from Construction Site Activities (NPDES Permit No. ILR10) or under an individual NPDES permit. Requirements applicable to such a permit will be followed, including the preparation of a Stormwater Pollution*

Prevention Plan. Such a plan shall identify potential sources of pollution which may reasonably be expected to affect the quality of stormwater discharges from the construction site and shall describe and ensure the implementation of practices which will be used to reduce the pollutants in discharges associated with construction site activity and to assure compliance with the terms of the permit.

3.9 Groundwater Resources

Need more information? See Section 26-22

3.9.1 Are any aquifer recharge areas, wellhead protection zones, or private and public water supply wells located in the project study area?

For the project study area, identify and describe aquifer recharge areas and wellhead protection zones. Due to public safety concerns the exact location of private and public water supply wells should not be identified in the EA/EIS, but should be explained in relationship to the project by stating the number of public and private water supply wells, depth of construction, and the proximity to the alternatives that are carried forward or the preferred alternative. This information can be accomplished via a table. If the project will potentially impact these groundwater resources or quality, discuss commitments for avoiding, minimizing, and mitigating for these impacts within the EA or EIS.

3.9.2 Will there be any impacts to any aquifer recharge areas, wellhead protection zones, or private and public water supply wells?

As applicable, include this statement in the EA or EIS

"This project will not create any new "potential routes" for groundwater pollution or any new potential sources of groundwater pollution as defined in the Illinois Environmental Protection Act (415 ILCS 5/3, et seq.)."

If the project will create a new potential route or source for groundwater pollution, describe the nature of the route or source and indicate whether it will be within a setback zone (minimum or maximum) for a potable water supply well. Indicate the type of well (i.e., community water supply or private water supply) and discuss any permits or mitigation measures that may be needed for the route or source to protect groundwater resources. Indicate whether the project is within a regulated recharge area established through Illinois Pollution Control Board rulemaking and describe the extent of the regulated area.

New "potential route" is defined by the Illinois Environmental Protection Act to mean a potential route which is not in existence or a potential route which expands laterally beyond the current permitted boundary. "Potential route" is defined as abandoned and improperly plugged wells of all kinds and any excavation for the discovery, development or production of stone, sand, or gravel.

3.9.3 Will the project impact karst topography?

If karst topography does not exist in the project area, state "The site is not located within karst topography according to the IEPA Source Water Assessment Program." If karst does exist in the project area, then the environmental document should briefly identify and discuss avoidance of the karst features, and, if applicable the use of storm water pollution prevention BMPs during construction and operation of the transportation facility. If there will be any project impacts to karst features the potential for groundwater contamination shall be discussed.

3.9.4 Will the project impact the Mahomet Sole Source Aquifer?

If the project is not within the Mahomet Sole Source Aquifer project review area, state the following:

> *There are no Sole Source Aquifers, as designated under Section 1424(e) of the Safe Drinking Water Act, within the project area.*

If the project is located within the Mahomet SSA project review area, use the following language:

> *"On March 11, 2015 the U.S. Environmental Protection Agency (USEPA) designated a portion of the Mahomet Aquifer system as a sole source aquifer (SSA) under Section 1424(e) of the Safe Drinking Water Act, as shown in the attached map. The Safe Drinking Water Act gives USEPA authority to designate all or part of an aquifer as a "sole source" if contamination of the aquifer would create a significant hazard to public health and there are no physically available or economically feasible alternative sources of drinking water to serve the population that relies on the aquifer. The designation authorizes USEPA review of projects that receive Federal financial assistance to assess the potential for contamination of the aquifer system that would create a significant hazard to public health.*
>
> *This project is within the review area of the Mahomet SSA and the potential to impact the SSA and create a significant hazard to public health has been evaluated as established by the memorandum of understanding between IDOT, FHWA, and USEPA Region 5, which is based upon procedures that ensure compliance with the requirements of Section 1424(e) of the Safe Drinking Water Act."*

Note: A significant hazard to public health is defined as the level of contaminants in an aquifer would exceed National Primary Drinking Water Standards or exceed Federal, Tribal or state public health advisory levels for currently unregulated contaminants, or violate the intent of EO 12088, "Federal Compliance with Pollution Control Standards."

If the project is located within the Mahomet SSA project review area, include a discussion of the following issues in the appendix:

- the extent of substantial excavation (greater than 10 feet in depth)
- addition of drainage wells, or stormwater infiltration facilities that do not meet IDOT treatment requirements
- adding Pollution Generating Impervious Surface (PGIS) of more than 5,000 square feet without applying pollution prevention BMPs
- opening of new material sources that could result in potential contamination
- replacement of drywells or other injection wells that do not meet IDOT treatment requirements or Underground Injection Control regulations

- drilled shafts or pile-driving, for bridge or other foundations that penetrate, or come close to penetrating the SSA
- installation, repair, or abandonment of a public or private water supply well that accesses the SSA
- construction or upgrading of sewage disposal stations at rest areas, weigh stations, scenic overlooks, or other locations
- use of pesticides, herbicides, and fertilizers that contain any of the chemicals listed in the National Primary Drinking Water Regulations, 40 CFR Part 141
- project located within the boundaries of a site listed on the USEPA National Priorities List (i.e., a Superfund site)
- removal of underground storage tanks that are known to have leaked (i.e., a Leaking Underground Storage Tank as listed in the Office of the Illinois State Fire Marshal (OSFM) website

Based on the evaluation, state whether the project will or will not cause risks to the Mahomet Aquifer that could create a significant hazard to public health. If there are risks, explain the risks. Coordination with USEPA can occur via the EA and EIS. Document the results of coordination with USEPA in the FONSI or ROD.

3.10 Floodplains

Need more information? See Section 26-7 Floodplains Encroachments.

Include the following language:

> *Floodplains are flat areas along streams and water bodies that hold excess water after a storm. Executive Order 11988 states that impacts to floodplains should be avoided when possible.*

If available for the project study area, use National Flood Insurance Program (NFIP) maps to identify the 100-year floodplain. If no floodplains are identified in the project study area then state how this conclusion was reached and the questions below can be removed from the document. If floodplains are identified please answer the following questions according to the directions below.

3.10.1 How were floodplains identified in the project study area?

Depict 100 year floodplain and, where applicable, regulatory floodways on the environmental inventory map. State the data being used to identify floodplains (i.e., NFIP map year). Describe the natural and beneficial values of the floodplain and regulatory floodways. Summarize comments on floodplain issues received through public meetings and Context Sensitive Solutions (CSS) processes, if applicable.

3.10.2 Will the project impact any floodplains in the project study area?

Discuss the project's potential effects on floodplains. Identify the number of floodplain encroachments. Each encroachment must be classified as a longitudinal or transverse encroachment and depicted on the environmental inventory map. Identify if there will be a significant floodplain encroachment.

If the project will affect a regulatory floodway, summarize the results of coordination with the Federal Emergency Management Agency and the local flood control agency regarding consistency of the project with the regulatory floodway requirements.

3.10.3 How were impacts to floodplains avoided or minimized?

State measures to minimize floodplain impacts, measures to avoid longitudinal encroachments, measures to avoid supporting incompatible floodplain development.

If the preferred alternative includes a significant encroachment, as defined in 23 CFR 650.105(q), an “Only Practicable Alternative Finding” must be documented. Include the following in the EA or EIS:

- a reference to Executive Order 11988 and 23 CFR 650 Subpart A,
- the reasons why the proposed action must be located in the floodplain,
- the alternatives considered and why they were not practicable, and
- a statement indicating whether the action conforms to applicable State or local floodplain protection standards.

If the preferred alternative encroaches in a regulatory floodway and mitigation is required the EA or EIS should describe the mitigation. An IDNR/Office of Water Resources (OWR) permit is required for construction within a regulatory floodway.

3.11 Wetlands

Need more information? See Section 26-8 “Wetlands”, Chapter 27 “Environmental Surveys”, and Chapter 28 “Environmental Permits/Certifications”.

Include the following language:

> *Wetlands are transitional areas between aquatic and terrestrial habitats where water occurs at or near the soil surface during the growing season. All wetlands are protected by the Illinois Interagency Wetlands Policy Act and some wetlands are protected by the Clean Water Act.*

If no wetlands were identified in the project study area then state how this conclusion was reached (wetland delineations, completely urban, etc.) and the questions below can be removed from the document. If wetlands were identified answer the following questions according to the directions below.

The Interagency Wetland Policy Act requires a mitigation ratio of 5.5:1.0 for impacts to wetlands with at least one of the following present:

- Wetlands with an FQI of 20 or greater or a mean C of 4.0 or greater
- Presence of a federally or state listed species
- Presence of an INAI site
- Presence of essential habitat for a listed species

3.11.1 What wetlands were identified in the project study area?

Depict the boundaries of the delineated wetlands and Advanced Identification (ADID) wetlands, where applicable, on an environmental inventory map of the project study area. Identify the version of the USACE Wetland Delineation Manual used to delineate the wetlands plus the date and author of the delineations. Briefly characterize each wetland plant community type, quality and functions. Functions discussed will be based on the project study area and may include wildlife habitat, heritage characteristics, flood storage, groundwater discharge, recreation values, and shoreline erosion control. Discuss wetlands with a Floristic Quality Index of 20 or higher or a mean C of 4 or higher. In northeastern Illinois, discuss wetlands that are classified as High Quality Aquatic Resource (HQAR) and Advanced Identification (ADID) because the USACE requires higher mitigation ratios for impacts to these wetlands.

If there are a large number of wetlands in the project study area, identify the wetland types and acreages that occur within the watershed(s) based on the National Wetlands Inventory (NWI). Next, compare the types and amount of wetlands that occur within the watershed to the amount and type which exist in the project study area. This comparison can help determine context and intensity for wetland impacts.

Please note that in an EA and EIS, impacts must be calculated as a worst case scenario. Thus, calculate from the estimated edges of right of way limits, not the proposed construction limits.

3.11.2 Will the project impact wetlands?

Include a table (as shown below) that details each wetland impacted in the project area. The table should include the FQI, mean C, wetland site number, wetland type, total size, impact, mitigation ratio, mitigation needed.

State that the wetland impacts included in the EA are based on the project's proposed right-of-way and is the worst case scenario. State that avoidance and minimization measures will continue during the design and permitting process. Identify impacts to each plant community type (acreage) and loss of function(s). Discuss the severity of the impact. If the project will have a significant impact on wetlands, preparation of an EIS is required.

Example Table of Wetland Impacts

Site Number	Wetland Type	FQI	Mean C	Total Area of Wetland (Acres)	Total Area of Wetland Impacted (Acres)	Mitigation Ratio	Total Area of Wetland Mitigation Required (Acres)	Map Sheet Number

3.11.3 How were wetlands avoided? How were wetland impacts minimized?

Provide a brief discussion of avoidance and minimization efforts (BDE 26-8.05(c)3). Identify practicable measures to reduce the impact.

3.11.4 How will mitigation for wetland loss be accomplished?

Provide a brief discussion of how much mitigation is required, what type of mitigation is proposed (bank, creation, etc.), and where mitigation will occur in relation to the impact (on-site, off-site, out of basin). Mitigation ratios should be based on the Interagency Wetland Policy Act of 1989.

Wetland Finding

See Section 26-8.05(e)2. If there are no practicable alternatives to construction in a wetland then an "Only Practicable Alternative Finding must be made. This must be included in the EA. It can be included in the DEIS if a preferred alternative has been chosen. If a preferred alternative was not chosen then it must be included in the FEIS. If there are no practicable alternatives to construction in a wetland, include the following items to support an "Only Practicable Alternative Finding":

- a reference to Executive Order 11990;
- an explanation why there are no practicable alternatives to the proposed action;
- an explanation why the proposed action includes all practicable measures to minimize harm to the wetlands; and
- a concluding statement that:

Based upon the above considerations, it is determined that there is no practicable alternative to the proposed construction in wetlands and that the proposed action includes all practicable measures to minimize harm to wetlands that may result from such use.

3.12 Special Waste

Need more information? See Section 27-3.

It is unnecessary to include the Phase I special waste assessment report in the EA or EIS. The main points of the report should be summarized in the text of the EA or EIS.

State the title, date, and author of the Phase I special waste assessment report. When the assessment is completed by the Illinois State Geological Survey (ISGS), include in the appendix the memorandum from IDOT stipulating additional special waste studies may be required during Phase II Engineering.

Discuss the following as applicable:

- If the assessment results in a finding of no properties with a confirmed or potential environmental condition (e.g., UST, dry cleaners, etc.), state that finding.
- If the assessment results in a finding of a property(ies) that may contain one or more potential environmental conditions,
  + summarize the categories of these properties (e.g., UST, dry cleaners, etc.),
  + characterize the potential magnitude of the environmental conditions,
  + compare the potential impacts of environmental conditions to each alternative, and
  + describe measures recommended to address or avoid them.

3.13 Special Lands

Depict locations of any special lands on the environmental inventory map.

3.13.1 Land and Water Conservation (LAWCON) Fund

If the project area includes LAWCON funded land, depict the location on the environmental inventory map. If no impact will occur state this fact. If the project will convert lands that used LAWCON funds to a transportation use, state any avoidance and minimization measures then describe the following:

- the land that will be taken and the potential replacement land,
- the process to obtain approval from the National Park Service (NPS) for the Section 6(f) land conversion, and
- the coordination that has occurred with IDNR and NPS and the timeline for requesting the approval of the conversion.

3.13.2 Open Space Lands Acquisition and Development (OSLAD)

If the project area includes OSLAD funded land, depict the location on the environmental inventory map. If no impact will occur state this fact. If the project will convert lands that have OSLAD funds to a transportation use, state any avoidance and minimization measures then describe the following:

- the land that will be taken and the potential replacement land,
- the process to obtain approval from IDNR, and

- the coordination that has occurred and the timeline for requesting the approval of the OSLAD land conversion request.

3.13.3 Other special lands

If the project will involve the use of lands that had grant funds including Illinois Bicycle Path Grant, Illinois Boat Access Area Development, Illinois Snowmobile Grant, Illinois Snowmobile Trail Establishment Fund, Illinois Off-Highway Vehicle Program, Federal Recreation Trails Program, Public Museum Capital Grants Program, Park and Recreational Facility Construction Program involved in their purchase or development, describe the involvement and summarize coordination with IDNR.

3.13.4 State Designated Lands

Need more information? See Section 26-9 Threatened and Endangered Species/Natural Area Impact Assessments and Chapter 27 Environmental Surveys.

State the following language:

> *State designated lands include Illinois Natural Area Inventory (INAI) Sites, Land and Water Reserves, Natural Heritage Landmarks, and Nature Preserves. The Illinois Natural Areas Preservation Act sets the criteria for these land designations to help protect Illinois' sensitive natural resources.*

3.13.4.1 Are there any state designated land in the project study area?

Depict the location of state designated lands in the project study area on an environmental inventory map. Indicate the name of each state designated land in the project study area, its size (acres/hectares), ownership (public or private) and the features that are the basis for its significance (i.e., "Element Occurrence").

> Use of land from significant, publicly-owned Illinois Nature Preserves, Land and Water Reserves and Illinois Natural Area Inventory Sites also may be subject to Section 4(f); see Section 26-2.

3.13.4.2 Will the project affect any state designated lands?

Impacts to Illinois Natural Areas and Natural Heritage Landmarks should be avoided to the extent practical. Taking of land from a Land and Water Reserve requires the Illinois Nature Preserves Commission and Illinois Department of Natural Resources to agree that the take is in the public's interest. If impacts cannot be avoided to these sites, identify the acreage (hectares) to be taken by the project and the effects on the elements which allowed the land to be designated.

3.13.4.3 How was the state designated land avoided? How were impacts minimized?

Identify any environmental commitments and/or mitigation associated with the impacts to the state designated land. Summarize the results of coordination with IDNR and the Illinois Nature Preserves Commission (for Land and Water Reserves) and include copies of correspondence with these entities in the Comments and Coordination section of the EA or EIS.

Illinois Statutes in 525 ILCS 30, afford dedicated Nature Preserves a high level of protection from conversion to other uses. The statutes include the following language:

> *Areas dedicated as nature preserves are hereby declared to be put to their highest, best and most important use for the public benefit. They shall be protected, managed and used in the manner provided by rules. They may not be taken under power of eminent domain or by other means for any other use except another public use and, except upon approval of the Commission, the Governor and any public owner of a dedicated interest therein after a finding by the Commission of the existence of an imperative and unavoidable public necessity for such other public use, and upon such terms and conditions as the Commission may determine, except as may otherwise be provided in the instrument of dedication.*

In light of these provisions, every effort should be made to avoid impacts to dedicated Nature Preserves.

3.14 Section 4(f) Evaluation

When Section 4(f) resources are involved, the EA should contain a separate heading entitled "Section 4(f) Evaluation;" unless an individual Section 4(f) evaluation is required, in which case it shall contain a separate chapter titled "Section 4(f) Evaluation." This Section should not repeat information contained in the EA. Rather, information should be included by reference only.

Need more information about Section 4(f)? See Section 26-4 and consult with FHWA. Note that only FHWA approves Section 4(f) determinations.

3.14.1 Are there any Section 4(f) properties in the project study area?

If no, state this fact. If yes, identify each property, describe why each property is protected by Section 4(f), and identify the boundary of the 4(f) property on the environmental inventory map.

3.14.2 Will any land from the 4(f) property be needed for the project (either temporarily or permanently?

If no, state this fact. If yes do the following for each 4(f) property where land is needed:

- If an “exception” to 4(f) is applicable under 23 CFR 774.13, provide explanation and documentation on how the exception criteria are met (see criteria in 23 CFR 774.13(d) for temporary occupancy which is one of the most common exceptions).
- If the “use qualifies for a de minimis determination then explain why and provide documentation listed in Section 26-2.04(d)2. Please note that the public must be provided the opportunity to comment on the use of the Section 4(f) property *prior* to the OWJ concurrence that the attributes of the property are not adversely affected by the project (“no adverse effect” if historic property and Section 106 applies).

    + If the public opportunity to comment on the de minimis *has* already occurred, include the written concurrence from the Official With Jurisdiction.
    + If the public comment opportunity *has not* occurred, explain that we are seeking public comment prior to making the de minimis determination. Provide concurrence from the Official With Jurisdiction; or explain we’re seeking public comment prior to making determination.
- If the “use” requires a Section 4(f) programmatic agreement evaluations or an individual evaluation then discuss feasible and prudent avoidance alternatives and, if appropriate, least harms analysis.

3.15 Indirect and Cumulative Impacts

Discuss the environmental resource areas identified during scoping and ongoing coordination that could have substantial indirect and cumulative impacts and methodologies for analyzing those impacts. Discuss reasonably foreseeable indirect and cumulative impacts for each of these environmental resource areas. This includes effects that would be caused by the project action later in time or further removed in distance, but that would still be reasonably foreseeable. Figure 4 illustrates the difference between indirect impacts and cumulative impacts.

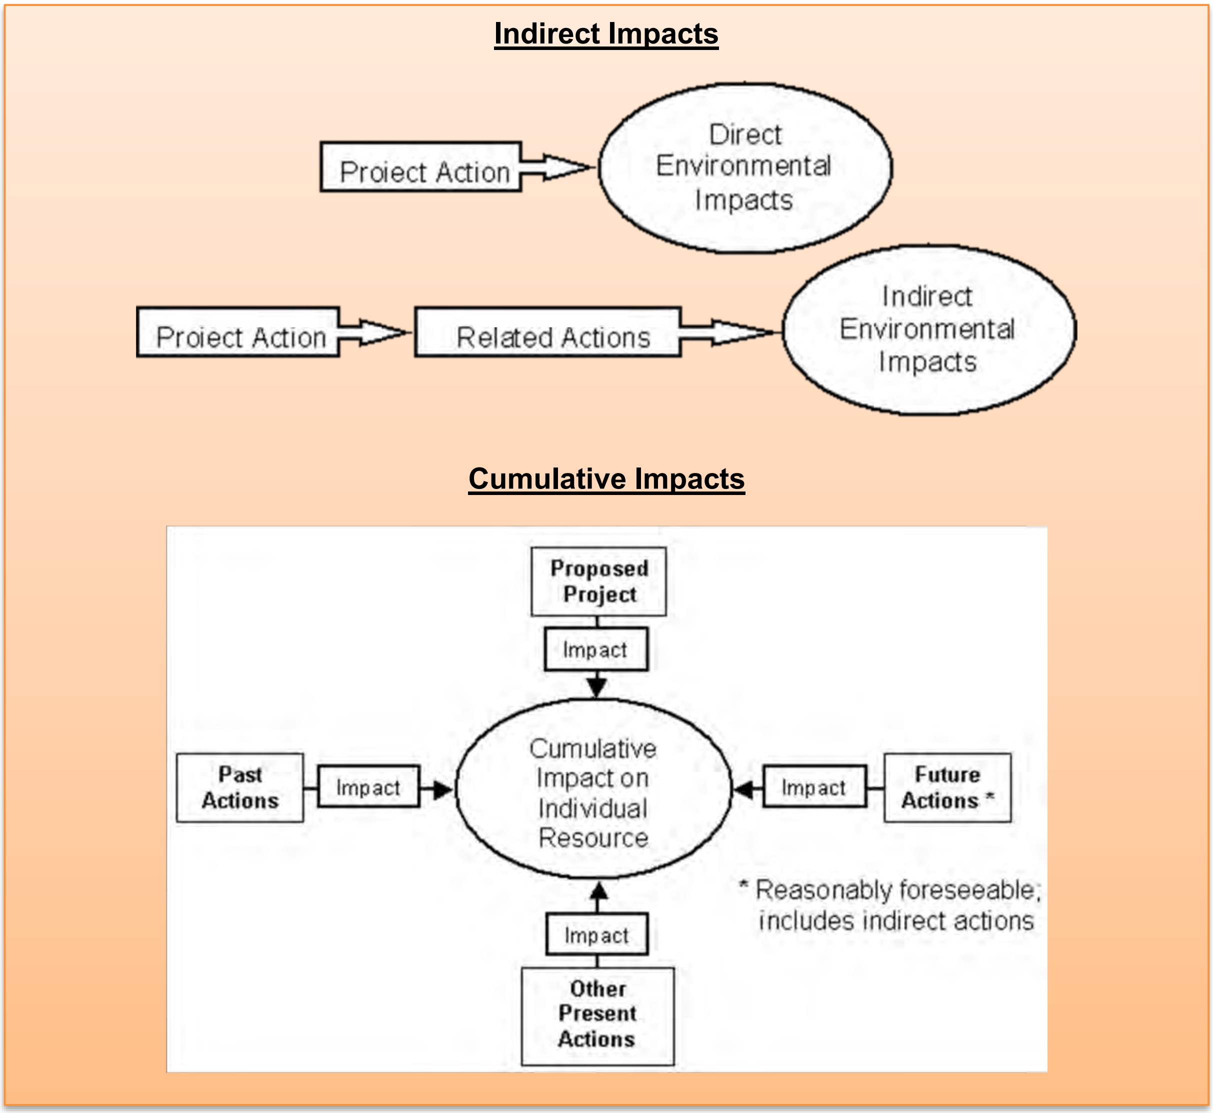

Figure 4 - Illustration of indirect and cumulative impacts

3.16 Greenhouse Gases and Climate Change (EIS only)

Include the following text:

> *Greenhouse gases (GHGs), which contribute to climate change, are both a national and global concern. While the earth has gone through many natural climate variations in its history, there is general agreement that the earth's climate is currently changing at an accelerated rate and will continue to do so for the foreseeable future. Anthropogenic (human-caused) GHG emissions contribute to this rapid change. Carbon dioxide (CO_2) makes up the largest component of these GHG emissions. Other prominent transportation GHGs include methane (CH_4) and nitrous oxide (N_2O).*

Discuss if the project is located in an area considered vulnerable to the effects of climate change. Describe the effect of the alternatives on GHG emissions compared to the no-build.

3.17 Irretrievable and Irreplaceable Resources

Include the following language:

> *Implementation of the proposed action involves a commitment of a range of natural, physical, human, and fiscal resources. Land used in the construction of the proposed facility is considered an irreversible commitment during the time period that the land is used for a highway facility. However, if a greater need arises for use of the land or if the highway facility is no longer needed, the land can be converted to another use. At present, there is no reason to believe such a conversion will ever be necessary or desirable.*
>
> *Considerable amounts of fossil fuels, labor, and highway construction materials such as cement, aggregate, and bituminous material are expended. Additionally, large amounts of labor and natural resources are used in the fabrication and preparation of construction materials. These materials are generally not retrievable. However, they are not in short supply and their use will not have an adverse effect upon continued availability of these resources. Any construction will also require a substantial one-time expenditure of both State and Federal funds which are not retrievable.*
>
> *The commitment of these resources is based on the concept that residents in the immediate area, State, and region will benefit by the improved quality of the transportation system. These benefits will consist of improved accessibility and safety, savings in time, and greater availability of quality services which are anticipated to outweigh the commitment of these resources.*

3.18 Environmental Commitments

Provide a brief description of each environmental commitment associated with the proposed project, including who made the commitment and to whom it was made. Summarize mitigation measures to be provided for unavoidable adverse environmental impacts.

An environmental commitment is a documented promise or obligation concerning an environmental issue made by a representative of IDOT to an entity outside the Department.

Commitments must be listed in the EA, EIS, FONSI, and/or ROD.

3.19 Permits/Certifications Required

List the permits and certifications required for the project and should reference the section(s) and subsection(s) where the related permit/certification issues are discussed.

3.20 Other

If the project would have a substantial visual impact, discuss with BDE if a visual analysis is necessary. Typically, in Illinois, an EA does not warrant an analysis of visual resources and aesthetics.

Chapter 4 – Comments and Coordination

Summarize the coordination that occurred and the results of the coordination. Include in the appendix copies of correspondence sent and received from the agencies.

PART II: HOW TO WRITE A FINDING OF NO SIGNIFICANT IMPACT (FONSI) AND ERRATA

Part II provides guidance on how to write an Errata and Finding of No Significant Impact (FONSI). The purpose of the guidance is to set clear expectations for what information should be included in these documents and how the information should be displayed.

FONSI

For additional information regarding FONSI and associated documentation refer to 23 CFR 771.121, FHWA's regulations for Environmental Impact and Related Procedures, and Chapter 24 of the BDE Manual.

The following provides guidance on how to write a FONSI.

For formatting purposes the header shall appear as the following:

U.S. Department of Transportation

Federal Highway Administration

FINDING OF NO SIGNIFICANT IMPACT

[Project Name, City, County, State]

The body of the FONSI should be organized in the following manner:

Project Description

In a paragraph or two, briefly describe the proposed action, its location (city, county, state), and the preferred alternative, including any changes resulting from the comments received. Do not restate the Purpose and Need. If in an urbanized area, describe the project's inclusion in the metropolitan planning organization's (MPO's) long range plan and transportation improvement program. If not in an urbanized area, describe how the project is consistent with the State's long range plan and where it is included in the statewide transportation improvement program.

Commitments

List the commitments that were included in the EA, and any that have been made since. Commitments are defined in IDOT D&E 19.

PUBLIC HEARING AND COMMENT

Provide general information regarding when and how the EA was made available for comment, e.g., public notice, legal notice, letters, a copy available at IDOT District Office, FHWA office, libraries, project website, etc. Here is an example:

> *The Environmental Assessment was made available for public review on [date]. A public hearing was held on [date]. Comments on the Environmental Assessment*

were accepted at the public hearing and from the date the EA was made available to the public through the comment closing period on [date].

All comments received during the public comment period were responded to and are included in the Errata.

AGENCY DETERMINATIONS

The following findings are always included in the EA, not the FONSI:

- Executive Order 12898, Federal Actions to Address Environmental Justice in Minority
- Relocation Assistance and Real Property Acquisition Policies Act of 1970 as amended;
- Executive Order 11990, Protection of Wetlands;
- Executive Order 11988, Floodplain Management.

Any and all findings not included in the EA must be included in the FONSI.

The following findings establish the project's adherence to applicable laws intended to protect sensitive environmental and socioeconomic resources:

- **Endangered Species Act of 1973**

  Include this section only if a Biological Opinion was required and Section 7 formal consultation was not completed prior to the EA approval. The results of the BO and summary of the BA will be included under this section.

- **Section 106 of the National Historic Preservation Act of 1966**

  Include the finding that was made (no historic properties affected; no adverse effect; adverse effect) and date of concurrence from SHPO. Reference ratified MOA if an MOA was prepared.

- **Section 4(f) of the U.S. DOT Act of 1966**

  Identify if any Section 4(f) resources will be used. Describe any findings (de minimis) or feasible and prudent determinations. Describe any applicable exceptions (e.g., temporary occupancy).

- **Section 176(c) of the Clean Air Act, as amended**

  Include the following language if the project is in a nonattainment or maintenance area:

  This project is located in a nonattainment area for transportation-related criteria pollutants; therefore, the transportation conformity requirements of the Clean Air Act apply. FHWA has determined that the preferred alternative meets project-level conformity requirements because it is included in the conforming metropolitan transportation plans and transportation improvement programs of the appropriate metropolitan planning organization.

Add the following text to the paragraph above if the project is not a project of air quality concern in a $PM_{2.5}$ nonattainment/maintenance area:

The project was determined to be a project that is not an air quality concern under 40 CFR 93.123(b)(1), because it primarily services gasoline operated vehicular traffic. None of the roadways in the study area carry a substantial amount of diesel truck traffic currently nor are they expected to under the 2040 No-Build or Build condition. It has been determined that the project will not cause or contribute to any new localized $PM_{2.5}$ or PM_{10} violations or increase the frequency or severity of any $PM_{2.5}$ or PM_{10} violations.

Add the following text to paragraph above if it is a project of air quality concern in a $PM_{2.5}$ nonattainment/maintenance area:

A quantitative $PM_{2.5}$ hot-spot analysis demonstrated the project would not cause, contribute to, or delay timely attainment of the $PM_{2.5}$ National Ambient Air Quality Standards.

CONCLUSION

Include the following language:

The FHWA has determined that the Preferred Alternative identified in the Environmental Assessment will have no significant impact on the human environment. The Finding of No Significant Impact (FONSI) is based on the attached Environmental Assessment and Errata which has been independently evaluated by the FHWA and determined to adequately and accurately assess the need, environmental issues, and impacts from the proposed project. It provides sufficient evidence and analysis for determining that an Environmental Impact Statement is not required. The FHWA takes full responsibility for the accuracy, scope, and content of the attached Environmental Assessment and Errata.

Date	**[Insert name of IL Division Administrator]**
	Division Administrator

Errata

The Errata shall include the following language:

> *This Errata includes corrections, revisions, and/or additions to the Environmental Assessment (EA) for the [project name and county(ies)], following the signed approval by the Illinois Department of Transportation (IDOT) and the Federal Highway Administration on [date of EA signature].*

Document changes and corrections to the EA in the following format.

Chapter #: Chapter Name

Page #, Section # - *Section name* – Paragraph #, Sentence #, and description of change.

- Include changes and corrections to the EA. The changes to the EA shall include any modifications to the proposed actions or mitigation measures in response to any new information or comments received on the EA or at the public hearing, as well as any impacts of the modifications.

- Include revisions to tables and figures.

Chapter #: Comments and Coordination

- Include a summary of comments and responses received

- List and describe any ongoing coordination and follow-up documentation.

Appendix #: Public Involvement

- Add public hearing documentation, court reporter transcript, all comments received, and responses to comments.

PART III: HOW TO WRITE A RECORD OF DECISION AND FINAL ENVIRONMENTAL IMPACT STATEMENT

Part III provides guidance on how to write a Final Environmental Impact Statements (FEIS) and Record of Decision. The purpose of the guidance is to set clear expectations for what information should be included in these documents and how the information should be displayed.

Cover Pages

The cover page is different if the project will have a combined FEIS and ROD or if the FEIS and ROD are separate. Use the applicable cover page:

- For combined FEIS and ROD
  - + Use the cover sheet outlined in Figure 6 which combines the signatures for the FEIS and ROD.
- For separate FEIS and ROD
  - + Use the cover sheet outlined in Figure 5 for the FEIS.
  - + An approval paragraph must be included in the ROD.

[*Route, Termini, City or County, and State*]
FINAL ENVIRONMENTAL IMPACT STATEMENT
AND
RECORD OF DECISION
Submitted Pursuant to 42 U.S.C. 4332 (2)(c)
(and where applicable, 49 U.S.C. 303) by the
U. S. Department of Transportation
Federal Highway Administration
and
Illinois Department of Transportation

and

[*As applicable, any other joint lead agency*]

Cooperating Agencies

[*Include List Here, as applicable*]

____

Date of Approval of FEIS[1] ____________________________ For IDOT

The following persons may be contacted for additional information concerning this document:

[*Name*]
Division Administrator
Federal Highway Administration
3250 Executive Park Drive
Springfield, Illinois 62703
Telephone: 217-492-4640

[*Name, office address, and phone number of IDOT Regional Engineer*]

[*A one-paragraph abstract of the statement.*]

Based on the analysis and evaluation contained in the Final EIS and after careful consideration of all the social, economic, and environmental factors contained in the Final EIS with input received from other agencies, organization, and the public, it is the decision of the FHWA to approve [[*Selected Alternative Description*]] as the Selected Alternative.

____

Date of Approval of FEIS and ROD ____________________________ For FHWA

[1] IDOT's signature commits it to implement the project as described in the FEIS, including all mitigation measures contained therein, and serves to recommend to FHWA to approve the FEIS and ROD.

[*A one-paragraph abstract of the statement.*]

*FHWA will issue a single FEIS and Record of Decision document pursuant to Public Law 112-141, 126 Statute 405, Section 1319(b) unless FHWA determines statutory criteria or practicability consideration preclude issuance of the combined document pursuant to section 1319.

Comments on this document are due by [*Date*] and should be sent to [<u>*Name and office address of IDOT Regional Engineer*</u>].*

Figure 6

FEIS cover page for separate FEIS and ROD

ROD Format

The purpose of the Record of Decision (ROD) is to explain the reasons for the project decision, summarize any mitigation measures that will be incorporated in the project, and document any required Section 4(f) approval. The following format is recommended for the ROD in order to organize the key items most efficiently:

A. Decision

Identify the selected alternative. Reference to the Final EIS may be used to reduce repetition. The following text is recommended as an introduction to this section:

This Record of Decision is the official decision document that concludes the National Environmental Policy Act process. Through this ROD, FHWA grants IDOT approval to proceed with final design, completion of acquisition of needed property, and construction of the project. This ROD is executed in conformance with the Council on Environmental Quality (CEQ) regulations implementing NEPA (40 CFR Part 1500) as well as FHWA's own regulations (23 CFR Parts 771 and 774). This ROD documents FHWA's compliance with NEPA and identifies additional requirements that must be met to proceed with the project. The decision is based on analyses contained in the Draft EIS issued on [[date]]; the Final EIS issued on [[date]]; and the comments of federal and state agencies, members of the public, and elected officials; and other information in the project record.

This ROD approves [[identify Selected Alternative]] as the Selected Alternative ("the Project").

B. Alternatives Considered

To organize the information most clearly, describe each alternative and explain the balancing of values that led to the final decision. The environmentally preferred alternative must be identified (the alternative that causes the least damage to the biological and physical environment). If the environmentally preferable alternative is not selected, the ROD should clearly state the reason(s) that the environmentally preferred alternative was not selected.

Identify the values that were important in the decision making process, as well as the reason(s) that some values were considered more important than others.

C. Section 4(f)

Briefly describe Section 4(f) resources within the project area that will be avoided and summarize the basis for any Section 4(f) approval. The discussion should include the key information that supports the approval

D. Measures to Minimize Harm

Identify and describe the specific measures adopted to minimize environmental harm (e.g., erosion control, appropriate for the proposed action). State whether all practicable measures to minimize environmental harm have been incorporated into the decision and, if not, why they were not (40 CFR 1505.2(c)).

E. Monitoring or Enforcement Program

Describe any monitoring or enforcement program which has been adopted for specific mitigation measures, as outlined in the final EIS.

F. Comments on Final EIS

If FEIS and ROD are combined do not include this section. If FEIS and ROD are prepared separately, identify all substantive comments received on the FEIS and provide appropriate responses. Other comments should be summarized and responses provided where appropriate.

The following language shall be included in the ROD if the FEIS and ROD are being completed separately.

G. Approval

This section includes a conclusive paragraph followed by a signature block for the Federal approving official. The following conclusive paragraph is recommended:

Based on the analysis and evaluation contained in the FEIS and after careful consideration of all the social, economic, and environmental factors contained in the FEIS with input received from other agencies, organizations, and the public, it is the decision of the FHWA to approve [insert name of the Selected Alternative here] as the Selected Alternative.

The following signature block is required:

____

[Date]

[Name of Illinois Division Administrator]

Division Administrator

H. Appendices

Items that may be included in the appendices are:

- Public and agency comments on the FEIS (separate FEIS and ROD only)
- Responses to FEIS comments (separate FEIS and ROD only)
- FEIS Errata sheet (if applicable)
- Biological Opinion (if applicable)
- Section 106 Memorandum of Agreement or Programmatic Agreement (if applicable)

Final Environmental Impact Statement (FEIS) Preparation

There are three approaches for preparing a Final EIS. The traditional approach (most common) and condensed Final EIS can be used for any EIS. The abbreviated version of the Final EIS is restricted to conditions specified by 40 C.F.R. 1503.4(c).

1. Traditional Approach (most common)

Make changes to the DEIS to add information regarding alternative selection, the selection of mitigation measures, wetland and floodplain findings, the results of coordination, comments received on the DEIS and responses to the comments, and any other relevant information not incorporated in the DEIS. Changes should be marked so that the reader knows that it is new information.

2. Condensed Final EIS

The condensed approach should be much shorter than the traditional approach while still providing the reader a complete overview of the project and its impacts. Incorporate material from the DEIS by reference to avoid repetition of material already presented in the DEIS.

Each major section of the FEIS should briefly summarize the important information contained in the corresponding section of the DEIS, reference the section of the DEIS that provides more detailed information, and discuss any noteworthy changes that have occurred since the draft was circulated. Discussion in the FEIS is focused on new information that was not presented in the DEIS. The format of the condensed FEIS should mimic that of the DEIS.

Items to include are:

- The preferred alternative and the basis for its selection
- Description of any coordination efforts not listed in the DEIS
- Agency and public comments to the DEIS and responses to these comments
- Any required findings or determinations (40 CFR 1502.14(e) and 23 CFR 771.125(a))

3. Abbreviated Version of Final EIS

When the only changes needed in the document are minor and consist of factual corrections and/or an explanation of why the comments received on the DEIS do not warrant further response, 40 CFR 1503.4(c) provides an opportunity to expedite the final EIS preparation. Care should be exercised to assure that the DEIS contains sufficient information to make the findings below and that the number of errata sheets used to make the required changes is small and that these errata sheets together with the DEIS constitute a readable, understandable, full disclosure document.

The Abbreviated FEIS should include the following sections:

- A summary. In the summary state that the FEIS consists of the DEIS and the Errata. And explain that this is consistent with the FHWA's guidance on implementing Section 1319(a) of MAP-21.

- Identify the preferred alternative and a discussion of the reasons it was selected;
- A list of the factual corrections made to the DEIS with references to the relevant page numbers in the DEIS;
- A summary of comments received on the DEIS and at the public hearing, and responses to these comments. Identify any coordination activities that have occurred since the issuance of the DEIS, as well as any specific circumstances that would trigger FHWA/FTA’s reappraisal or further response (when appropriate);
- Discuss effect determination and any mitigation for Final 23 U.S.C. 138/49 U.S.C. 303 (Section 4(f) evaluation). If no 4(f) properties were impacted, state this fact;
- Any agency findings or determinations not included in the DEIS;
- A list of commitments for mitigation measures for the preferred alternative (when applicable); and Copies (or summaries) of comments received from circulation of the draft EIS and public hearing and responses thereto; and
- DEIS (include in full).

(Continued)

Chapter Thirty-one
BASIC DESIGN CONTROLS

Road design is predicated on many basic controls that establish the overall objective of the highway facility and identify the basic purpose of the highway project. Chapter 31, in combination with Chapter 43, presents those basic controls that impact road design. Chapter 31 includes a discussion on speed, sight distance, traffic volume controls, non-highway controls (e.g., the driver), project scope of work, and the design exception process. The application of these items to a project will impact all elements of road design.

31-1 DEFINITIONS

31-1.01 Qualifying Words

Many qualifying words are used in road design and in this *Manual*. For consistency and uniformity in the application of various design criteria, the following definitions apply:

1. Shall, require, will, must. A mandatory condition. Designers are obligated to adhere to the criteria and applications presented in this context or to perform the evaluation indicated. For the application of geometric design criteria, this *Manual* limits the use of these words.

2. Should, recommend. An advisory condition. Designers are strongly encouraged to follow the criteria and guidance presented in this context, unless there is reasonable justification not to do so.

3. May, could, can, suggest, consider. A permissive condition. Designers are allowed to apply individual judgment and discretion to the criteria when presented in this context. The decision will be based on a case-by-case assessment.

4. Desirable, preferred. An indication that the designer should make every reasonable effort to meet the criteria and that the designer should only use a "lesser" design after due consideration of the "better" design.

5. Ideal. Indicating a standard of perfection (e.g., traffic capacity under "ideal" conditions).

6. Minimum, maximum, upper, lower (limits). Representative of generally accepted limits within the design community but not necessarily suggesting that these limits are inviolable. However, where the criteria presented in this context will not be met, the designer will in many cases need approval.

7. Practical, feasible, cost-effective, reasonable. Advising the designer that the decision to apply the design criteria should be based on a subjective analysis of the anticipated

benefits and costs associated with the impacts of the decision. No formal analysis (e.g., cost-effectiveness analysis) is intended, unless otherwise stated.

8. Possible. Indicating that which can be accomplished. Because of its rather restrictive implication, this word is rarely used in this *Manual* for the application of design criteria.

9. Significant, major. Indicating that the consequences from a given action are obvious to most observers and, in many cases, can be readily measured.

10. Insignificant, minor. Indicating that the consequences from a given action are relatively small and not an important factor in the decision-making for road design.

11. Warranted, justified. Indicating that some well-accepted threshold or set of conditions has been met. As used in this *Manual*, "warranted" or "justified" may apply to either objective or subjective evaluations. Note that, once the warranting threshold has been met, this is an indication that the design treatment should be considered and evaluated – not that the design treatment is automatically required.

12. Standard. Indicating a design value that cannot be violated without severe consequences. This suggestion is generally inconsistent with geometric design criteria. Therefore, "standard" will not be used in this *Manual* to apply to geometric design criteria.

13. Guideline. Indicating a design value that establishes an approximate threshold which should be met if considered practical.

14. Criteria. A term typically used to apply to design values, usually with no suggestion on the criticality of the design value. Because of its basically neutral implication, this *Manual* frequently uses "criteria" to refer to the design values presented.

15. Typical. Indicating a design practice that is most often used in application and which is likely to be the "best" treatment at a given site.

16. Target. If practical, criteria the designer should be striving to meet. However, not meeting these criteria will typically not require a justification.

17. Acceptable. Design criteria that may not meet desirable values, but yet is considered to be reasonable and safe for design purposes.

18. Policy. Indicating IDOT practice which the Department generally expects the designer to follow, unless otherwise justified.

31-1.02 Acronyms

The following are acronyms for common terminology, agencies, and publications used in road design:

- AASHTO. American Association of State Highway and Transportation Officials.
- ADA. Americans with Disabilities Act.
- CFR. Code of Federal Regulations.
- FAHP. Federal-aid Highway Program.
- FAST. *Fixing America's Surface Transportation Act* of 2015.
- FEMA. Federal Emergency Management Agency.
- FHWA. Federal Highway Administration.
- HCM. *Highway Capacity Manual*.
- HSM. Highway Safety Manual.
- IDOT. Illinois Department of Transportation.
- ITE. Institute of Transportation Engineers.
- ISTEA. *Intermodal Surface Transportation Efficiency Act* of 1991.
- LOS. Level of Service.
- MAP – 21. *Moving Ahead for Progress in the 21st Century Act* of 2012.
- MASH. *Manual for Addressing Safety Hardware*.
- MUTCD. *Manual of Uniform Traffic Control Devices*.
- NCHRP. National Cooperative Highway Research Program.
- NHS. National Highway System.
- PS&E. Plans, Specifications & Estimates.
- SAFETEA-LU. *Safe, Accountable, Flexible, Efficient Transportation Equity Act — Legacy for Users* of 2005.
- STP. Surface Transportation Program.
- TEA-21. *Transportation Equity Act* for the 21st Century of 1998.

- TRB. Transportation Research Board.
- TRR. Transportation Research Record.
- USC. United States Code.
- USDOT. United States Department of Transportation.

31-2 SPEED

31-2.01 Definitions

1. Design Speed. Design speed is a selected speed used to determine the various geometric design features of the roadway. A design speed is selected for each project which will establish criteria for several design elements including horizontal and vertical curvature, superelevation, and sight distance. Section 31-2.02 discusses the selection of design speed.

2. Low Speed. For geometric design purposes, low speed is defined as 45 mph (70 km/h) or less.

3. High Speed. For geometric design purposes, high speed is defined as 50 mph (80 km/h) or greater.

4. Average Running Speed. Running speed is the average speed of a vehicle over a specified section of highway. It is equal to the distance traveled divided by the running time (the time the vehicle is in motion). The average running speed is the distance summation for all vehicles divided by the running time summation for all vehicles.

5. Average Travel Speed. Average travel speed is the distance summation for all vehicles divided by the total time summation for all vehicles. Note: Average running speed only includes the time the vehicle is in motion. Therefore, on uninterrupted flow facilities where travel is not congested, average running speed, and average travel speed are equal.

6. Operating Speed. Operating speed is the speed at which drivers are observed operating their vehicles during free-flow conditions. In practice, the term "operating speed" is commonly used to characterize prevailing vehicular speeds on a highway segment, either through field measurements of speed or through informal field observations. Although no precise percentile is used to define operating speed, it may be assumed to be between the 80th and 90th percentile of actual travel speeds.

7. 85th-Percentile Speed. The 85th-percentile speed is the speed below which 85 percent of vehicles travel on a given highway. The most common application of the value is its use as one of the factors for determining the posted, legal speed limit of a highway section. In most cases, field measurements for the 85th-percentile speed will be conducted during off-peak hours when drivers are free to select their desired speed.

8. Posted Speed Limit. The posted speed limit on State highways is typically based on traffic and engineering investigations, where statutory requirements do not apply. The district Bureau of Operations conducts traffic speed studies on the State highway system. The selection of a posted speed limit is based on several factors:

- the design speed used during project development;
- median type on multilane facilities;
- the 85th-percentile speed and pace speed;*
- highway functional classification and type of area;
- road surface characteristics, grade, alignment, and sight distance;
- type and density of roadside development;
- use of curb and gutter;
- the crash experience during the previous 12 months;
- the need for traffic signal progression; and
- parking practices and pedestrian and bicycle activity.

**Note: Pace speed is the specified increment of spot speed that includes the greatest number of speed measurements.*

9. Legal Speed Limit. Legal speed limits are those set by the Federal government or by the Illinois Statutes that will apply, for example, to those public roads that do not have a posted speed limit.

31-2.02 Design Speed Selection

A design speed is selected for each project, which will establish criteria for several geometric design elements including horizontal and vertical curvature, superelevation, cross sectional features, and sight distance. Part V, Highway Systems, presents the design speed criteria for new construction and reconstruction projects, 3R non-freeway projects, and 3R freeway projects. In general, the selected design speed is based on the following road design elements:

1. Functional Classification. The higher class facilities (i.e., arterials) are designed with a higher design speed than the lower class facilities (i.e., collectors and locals).

2. Urban/Rural. Design speeds in rural areas are generally higher than those in urban areas. This is consistent with the typically fewer constraints in rural areas (e.g., less development).

3. Terrain. The flatter the terrain, the higher the selected design speed can be. This is consistent with the typically higher construction costs associated with more rugged terrain.

4. Traffic Volumes. On some facilities (e.g., unmarked rural collectors), the design speed varies by traffic volumes; i.e., as traffic volumes increase, higher design speeds are used.

For geometric design application, the relationship between these road design elements and the selected design speed reflects general cost-effective considerations. For example, the higher the traffic volumes, the more benefits to the traveling public from a higher design speed.

In addition to the above, the selected design speed should equal or exceed the anticipated posted/regulatory speed limit of the facility after construction. This applies to all projects. For new construction/reconstruction projects, it is usually desirable practice to use a design speed 5 mph (10 km/h) over posted speed. For 3R, 3P, or SMART projects, the proposed design speed may be relaxed to equate the existing posted speed if practical. The posted speed limit on state highways will be determined based on actual operating speeds of the completed facility and on several factors not directly related to the project design speed. Therefore, to avoid a potential conflict, the designer should coordinate the design speed selection with the district Bureau of Operations early in project development to assist in predicting the posted speed limit of the completed facility. If the proposed design speed will be less than the predicted posted speed limit, the designer must choose one of the following approaches:

- increase the project design speed to equal the anticipated posted speed limit,
- post the project with a legal speed limit equal to the design speed, or
- seek a design exception.

In selecting a design speed, the designer should avoid artificially selecting a design speed low enough to eliminate any design exceptions. For example, if the IDOT criteria yield a design speed of 60 mph (100 km/h) and one or more geometric features are adequate only for 55 mph (90 km/h), the project design speed should be 60 mph (100 km/h) and <u>not</u> 55 mph (90 km/h). The designer will then be required to make project improvements to meet the specific geometric features for a 60 mph design speed or seek design exceptions for the specific 55 mph (90 km/h) geometric features, rather than requesting a single design exception for the 55 mph design speed.

31-3 SIGHT DISTANCE

31-3.01 Stopping Sight Distance

31-3.01(a) Theoretical Discussion (Passenger Cars)

Stopping sight distance (SSD) is the sum of the distance traveled during a driver's perception/reaction (or brake reaction) time and the distance traveled while decelerating to a stop. To calculate SSD, the following formulas are used:

$$SSD = 1.47\ Vt + 1.075\ \frac{V^2}{a}$$ (US Customary) Equation 31-3.1

$$SSD = \frac{Vt}{3.6} + 0.039\ \frac{V^2}{a}$$ (Metric) Equation 31-3.1

where:
SSD = stopping sight distance, ft (m)
V = design speed, mph (km/h)
t = brake reaction time, 2.5 seconds
a = driver deceleration, ft/s^2 (m/s^2)

For calculating adjusted SSD for downgrades, see Equation 31-3.2.

The following briefly discusses the theoretical rationale for each assumption within the SSD model for passenger cars:

1. Brake Reaction Time. This is the time interval between when the obstacle in the road can first be physically seen and when the driver first applies the brakes. Based on several studies of observed driver reactions, the assumed value is 2.5 seconds. This time is considered adequate for approximately 90% of drivers in simple to moderately complex highway environments.

2. Braking Action. The braking action is based on the driver's ability to decelerate the vehicle while staying within the travel lane and maintaining steering control during the braking maneuver. A deceleration rate of 11.2 ft/s^2 (3.4 m/s^2) is considered comfortable for 90% of drivers for passenger cars.

3. Speed. The highway design speed is used to determine the initial driver speed.

AASHTO's *A Policy on Geometric Design of Highways and Streets* presents additional information on the assumptions used to develop the SSD model.

31-3.01(b) Passenger Cars (Level Grade)

Figure 31-3.A provides stopping sight distances for passenger cars on grades less than 3%. When applying the SSD values for passenger cars, the height of eye is assumed to be 3.5 ft (1080 mm) and the height of object 2 ft (600 mm). Except as noted in the following subsections, the SSD values in Figure 31-3.A apply to all projects.

US Customary					Metric				
Design Speed (mph)	Brake[1] Reaction Distance (ft)	Braking[2] Distance On Level (ft)	Stopping Sight Distance		Design Speed (km/h)	Brake[1] Reaction Distance (m)	Braking[2] Distance On Level (m)	Stopping Sight Distance	
			Calculated (ft)	Design (ft)				Calculated (m)	Design (m)
30	110.3	86.4	196.7	200	50	34.8	28.7	63.5	65
35	128.6	117.6	246.2	250	60	41.7	41.3	83.0	85
40	147.0	153.6	300.6	305	70	48.7	56.2	104.9	105
45	165.4	194.4	359.8	360	80	55.6	73.4	129.0	130
50	183.8	240.0	423.8	425	90	62.6	92.9	155.5	160
55	202.1	290.3	492.4	495	100	69.5	114.7	184.2	185
60	220.5	345.5	566.0	570	110	76.5	138.8	215.3	220
65	238.9	405.5	644.4	645	120	83.4	165.2	248.6	250
70	257.3	470.3	727.6	730					
75	275.6	539.9	815.5	820					

Notes:

1. *Brake reaction distance based on a time of 2.5 s.*
2. *Driver deceleration based on a rate of 11.2 ft/s^2 (3.4 m/s^2).*

STOPPING SIGHT DISTANCE
(Passenger Cars – Level Grade)

Figure 31-3.A

31-3.01(c) Trucks

The passenger SSD in Figure 31-3.A are not designed for truck operations. In general, trucks require longer SSD for a given speed than passenger vehicles. However, truck's higher height of eye (7.6 ft (2330 mm)) and driver experience tends to balance the need for additional stopping lengths for trucks than those for passenger cars (e.g., the truck driver can generally see further beyond a crest vertical curve). Consequently, separate truck SSD are generally not used in highway design. However, the designer should still consider providing longer SSD at the following sites:

- weigh stations;
- rest areas;
- in the vicinity of truck terminals;
- industrial parks;

- coal mining and quarry areas;
- where horizontal sight restrictions occur on downgrades;
- highway/railroad grade crossings on high-volume truck routes (e.g., truck DDHV of 250 or greater);
- other facilities with high truck traffic (e.g., routes with truck DDHV of 250 or greater); and
- locations that have a high incidence of truck crashes.

31-3.01(d) Downgrade-Adjusted SSD

The longitudinal gradient of the roadway impacts the distance needed for vehicles to brake to a stop. IDOT practice is to only consider the grade adjustment for downgrades, which increases braking distances. Equation 31-3.1 is modified as follows to calculate the adjusted SSD for downgrades:

$$SSD = 1.47Vt + \frac{V^2}{30\left[\frac{a}{32.2} \pm G\right]}$$ (US Customary) Equation 31-3.2

$$SSD = \frac{Vt}{3.6} + \frac{V^2}{254\left[\frac{a}{9.81} \pm G\right]}$$ (Metric) Equation 31-3.2

where:
- SSD = stopping sight distance, ft (m)
- V = design speed, mph (km/h)
- t = brake reaction time, typically 2.5 seconds
- a = driver deceleration, typically 11.2 ft/s^2 (3.4 m/s^2)
- G = grade expressed as a decimal. Downgrades are expressed as a negative.

Figure 31-3.B presents the downgrade SSDs for passenger cars. The designer should make a reasonable effort to meet these SSD values when downgrades are 3% or steeper. However, the grade-adjusted SSD values do not require a design exception when not met.

31-3.02 Decision Sight Distance

31-3.02(a) Theoretical Discussion

At some sites, drivers may be required to make decisions where the highway environment is difficult to perceive or where unexpected maneuvers are required. These are areas of concentrated demand where the roadway elements, traffic volumes, and traffic control devices

US Customary								
SSD for Downgrades (ft)

120	263	268	275	281	288	296	304	313

1. *Calculated SDDs are not shown. Values in table have been determined by using Equation 31-3.2 and rounding up to the next highest 5 ft (1 m) increment.*

2. *For grades less than 3%, no adjustment is necessary; i.e., use the level SSD values (Figure 31-3.A).*

3. *For grades intermediate between table values, use a straight-line interpolation to determine the SSD or use Equation 31-3.2 and round up to the next highest 5 ft (1 m) increment.*

STOPPING SIGHT DISTANCE
(Passenger Cars — Adjusted for Downgrades)

Figure 31-3.B

may all compete for the driver's attention. This relatively complex environment may increase the required driver perception/reaction time beyond that provided by the SSD values (2.5 seconds) and, in some locations, the desired vehicular maneuver may be a speed/path/direction change rather than a stop. At these locations, the designer should consider providing decision sight distance to provide an additional margin of safety. The various avoidance maneuvers assumed in the development of Figure 31-3.C are:

1. Avoidance Maneuver A. Stop on rural road.
2. Avoidance Maneuver B. Stop on urban road.
3. Avoidance Maneuver C. Speed/path/direction change on rural road.
4. Avoidance Maneuver D. Speed/path/direction change on suburban road.
5. Avoidance Maneuver E. Speed/path/direction change on urban road.

31-3.02(b) Applications

In general, the designer should consider using decision sight distance at any relatively complex location where the driver perception/reaction time may exceed 2.5 seconds. Example locations where decision sight distance may be appropriate include:

- freeway exit/entrance gores;
- freeway lane drops;
- freeway left-side entrances or exits;
- intersections near a horizontal curve;
- highway/railroad grade crossings;
- approaches to detours and lane closures;
- along high-speed, high-volume urban arterials with considerable roadside friction; or
- isolated traffic signals on high-speed rural highways.

As with SSD, the driver height of eye is 3.5 ft (1080 mm) and the height of object is typically 2 ft (600 mm). However, candidate sites for decision sight distance may also be candidate sites for assuming that the "object" is the pavement surface (e.g., freeway exit gores). Therefore, the designer may assume a 0.0 in (0.0 mm) height of object for application at some sites.

31-3.03 Passing Sight Distance

Passing sight distance only applies to two-lane, two-way highways. Therefore, its theoretical derivation and application are discussed in Chapter 47.

31-3.04 Intersection Sight Distance

Intersection sight distance applies to the determination of the sight triangle in the corners of at-grade intersections. Therefore, its theoretical derivation and application are discussed in Chapter 36.

US Customary					
Design Speed (mph)	**Decision Sight Distance for Avoidance Maneuver (ft)**

DECISION SIGHT DISTANCE

Figure 31-3.C

31-4 CAPACITY METHODOLOGY

31-4.01 Definitions

1. Actuated Control. A defined phase sequence in which the presentation of each phase is on recall or the associated traffic movement has submitted a call for service through a detector.

2. Annual Average Daily Traffic (AADT). The total yearly volume in both directions of travel divided by the number of days in a year.

3. Average Daily Traffic (ADT). The calculation of average traffic volumes in both directions of travel in a time period greater than one day and less than one year and divided by the number of days in that time period. Although not precisely correct, ADT is often used interchangeably with AADT. The use of an ADT could produce a bias because of seasonal peaks and, therefore, the user should be aware of this.

4. Back of Queue. The maximum backward extent of queued vehicles during a typical cycle, as measured from the stop line to the last queued vehicle.

5. Capacity. The maximum number of vehicles that can reasonably be expected to traverse a point or uniform section of a lane or roadway during a given time period under prevailing roadway, traffic, and traffic control conditions. The time period most often used for analysis is 15 minutes. “Capacity” corresponds to Level of Service E.

6. Cycle. A complete sequence of signal indications.

7. D-Factor. The portion of traffic moving in the peak direction of travel on a given roadway during the peak hour.

8. Delay. Additional travel time experienced by a driver, passenger, bicyclist, or pedestrian beyond that required to travel at the desired speed. The primary performance measure on interrupted flow facilities

9. Demand Flow Rate. The count of vehicles arriving at the system element during the analysis period, converted to an hourly rate. This manual uses the term design hourly volume (defined below) in a similar manner as demand flow rate.

10. Density. The number of vehicles occupying a given length of lane, averaged over time. It is usually expressed as vehicles per mile (kilometer) per lane.

11. Design Hourly Volume (DHV). The one-hour volume in both directions of travel in the design year selected for determining the dimensions and configuration of the highway design elements. For capacity analyses, the DHV is typically converted to an hourly flow rate based on the maximum 15-minute flow rate during the DHV. The term DHV is not used in the *Highway Capacity Manual*, but its utility is similar to how demand flow rate (defined above) is used.

12. Directional Design Hourly Volume (DDHV). The traffic volume in the peak direction of flow during the design hour.

13. Directional Distribution (D). A characteristic of traffic that volume may be greater in one direction than in the other during any particular hour on a highway.

14. 85th Percentile Speed. A speed value that is exceeded by 15% of the vehicles in a traffic stream.

15. Flow Rate. The equivalent hourly rate at which vehicles or other roadway users pass over a given point or section of a lane or roadway during a given time interval of less than one hour, usually 15 minutes.

16. Free Flow. A flow of traffic unaffected by upstream or downstream conditions.

17. Green Time (g/c) Ratio. The ratio of the effective green time of a phase to the cycle length.

18. Heavy Vehicles. A vehicle with more than four wheels touching the pavement during normal operation.

19. K-Factor. The portion of AADT that occurs during the peak hour. (DHV/AADT)

20. Lane Group. A lane or set of lanes designated for separate analysis.

21. Level of Service (LOS). A quantitative stratification of a performance measure or measures that represent quality of service, measured on an A to F scale, with LOS A representing the best operating conditions from the traveler's perspective and LOS F the worst.

22. Passenger–Car Equivalent. The number of passenger cars that will result in the same operational conditions as a single heavy vehicle of a particular type under specified roadway, traffic, and control conditions.

23. Peak Hour. The hour of the day in which the maximum volume occurs.

24. Peak-Hour Factor (PHF). A ratio of the volume occurring during the peak hour to the maximum rate of flow during a given time period within the peak hour (typically 15 minutes).

25. Pedestrian. An individual traveling on foot.

26. Permitted Turn. A left or right turn at a signalized intersection that is made by a vehicle during a time in the cycle in which the vehicle does not have the right-of-way.

27. Phase. The part of the signal cycle allocated to any combination of traffic movements receiving the right-of-way simultaneously during one or more intervals. A phase includes the green, yellow, and red clearance intervals.

28. Progression. The act of various controllers providing specific green indications in accordance with a time schedule to permit continuous operation of groups of vehicles along the street at a planned speed.

29. Protected Turn. The left or right turns at a signalized intersection that are made by a vehicle during a time in the cycle when the vehicle has the right-of-way.

30. Queue Storage Ratio. The maximum back of queue as a proportion of the available storage on the subject lane or link.

31. Red Clearance Interval. A brief period of time following the yellow indication during which the signal heads associated with the ending phase and all conflicting phases display a red indication.

32. Saturation Flow Rate. The equivalent hourly rate at which previously queued vehicles can traverse an intersection approach under prevailing conditions, assuming that the green signal is available at all times and no lost times are experienced.

33. Semi-Actuated Control. A signal control in which some approaches (typically on the minor street) have detectors and some approaches (typically on the major street) have no detectors.

34. Service Flow Rate. The maximum directional rate of flow that can be sustained in a given segment under prevailing roadway, traffic, and control conditions without violating the criteria for level of service.

35. Service Measure. A performance measure used to define LOS for a transportation system element.

36. Volume-to-Capacity (v/c) Ratio. The ratio of flow rate to capacity for a system element.

37. Weaving. The crossing of two or more traffic streams traveling in the same direction along a significant length of highway, without the aid of traffic control devices (except for guide signs).

31-4.02 Design Year Selection

31-4.02(a) Roadway Design

The geometric design of a highway should be developed to accommodate expected traffic volumes during the life of the facility assuming reasonable maintenance. This involves projecting the traffic volumes to a selected future year. Recommended design years are presented in Figure 31-4.A. The design year is measured from the expected construction completion date. Projected traffic volumes on State highways are provided by each district or from regional transportation studies with support from the OPP, Planning Services Section.

Project Scope Of Work	Typical
New Construction/Reconstruction	20 Years
3R Freeway Projects	Current*
3R Non-Freeway Projects	Current*

* *In general, current traffic volumes may be used. However, if a 3R project will introduce a new geometric design element (e.g., relocation of a horizontal curve), the element should be designed based on reconstruction policies.*

RECOMMENDED DESIGN YEAR SELECTION
(Traffic Volumes for Road Design)

Figure 31-4.A

31-4.02(b) Other Highway Elements

The following presents the recommended criteria for selection of a design year for highway elements other than road design:

1. Bridges. The structural life of a bridge may be 75 years or more. For new bridges, bridge replacement, and bridge reconstruction, the clear roadway width of the bridge will be based on the 20-year traffic volume projection beyond the construction completion date. In addition, the designer may, on selected projects, evaluate if the bridge design will reasonably accommodate structural expansion to meet the clear roadway width across the bridge based on a traffic volume projection beyond 20 years.

   For bridges within the limits of 3R projects, see Chapters 49 and 50.

2. Underpasses. The design year used for the geometric design of underpasses will be determined on a case-by-case basis.

3. Right-of-Way/Grading. The designer may consider potential right-of-way needs for the anticipated long-term corridor growth for a year considerably beyond that used for roadway design, especially in large metropolitan areas. No specific design year is recommended for use. For example, when selecting an initial median width on a divided highway, the designer may evaluate the potential need for future expansion of the facility to add through travel lanes. Other examples include potential future interchanges, potential reconstruction of a two-lane, two-way facility to a multilane highway, and the use of flatter side slopes to provide more future options.

4. Drainage Design. Drainage appurtenances are designed to accommodate a flow rate based on a specific design year (or frequency of occurrence). The selected design year or frequency will be based on the functional class of the facility, the ADT, and the

specific drainage appurtenance (e.g., culvert). The IDOT *Drainage Manual* presents the Department's criteria for selecting the frequency of occurrence. The design life of new drainage structures is typically 50 years.

5. Pavement Design. The pavement structure is designed to withstand the vehicular loads during the design analysis period without falling below a selected pavement serviceability rating. Chapter 54 presents the Department's criteria for selecting a design year for pavements.

6. Environmental Analyses. Some environmental analyses require the selection of a future year for design (e.g., noise analyses). BDE determines the specific criteria for environmental analyses.

31-4.03 Design Hourly Volume Selection

For most geometric design elements that are determined by traffic volumes, the peaking characteristics are most significant. The highway facility should be able to accommodate the design hourly volume (adjusted for the peak-hour factor) at the selected level of service. This design hourly volume (DHV) will affect many design elements including the number of through travel lanes, lane and shoulder widths, and intersection geometrics. The designer should also analyze the proposed design using the a.m. and p.m. DHV's separately. This could have an impact on the geometric design of the highway. The *Highway Capacity Manual* uses the term demand flow rate similarly as design hourly volume.

Traditionally, the 30th highest hourly volume in the selected design year has been used to determine the DHV for design purposes. This is still considered appropriate for rural facilities. However, at the discretion of the district, for urban facilities it may be more appropriate to base the DHV on the 10th to 20th highest hourly volume in the selected design year. Because the design of the project is significantly dependent upon the projected design hourly volumes, these projections must be carefully examined before using for design purposes.

31-4.04 Level of Service

Level of service (LOS) describes a quantitative stratification of a performance measure or measures that represent quality of service, measured on an A to F scale. A designated LOS is described in terms of service measures such as speed, density, delay, or percent time-spent-following.

Because drivers will accept different driving operational conditions, including lower travel speeds on different facilities, it is not practical to establish one level of service for application to every type of highway. Therefore, various levels of service have been established for the different types of highways facilities, location (i.e., rural or urban) and the scope of the improvement.

Part V, Highway Systems, presents LOS criteria for each highway type.

31-4.05 <u>Capacity Analyses</u>

31-4.05(a) Objective

The highway mainline, intersection, or interchange should be designed to accommodate the design hourly volume (DHV) at the selected level of service (LOS). The methodologies in the *Highway Capacity Manual* (HCM) uses the DHV, or demand flow rate, and the various highway factors which affect capacity to determine the LOS.

The maximum directional rate of flow that can be sustained in a given segment for a selected LOS, the definition for service flow rate, should be accommodated by adjusting the various highway factors which affect capacity until a suitable design is determined. The service flow rate of the facility is calculated by applying adjustments such as heavy vehicles and driver population to a base flow rate. By definition, the service flow rate for LOS E is synonymous with capacity for all uninterrupted-flow facilities and their components.

The HCM has established service measures to determine the level of service for various highway elements on different types of highway facilities. These are presented in Figure 31-4.B. For each service measure, the HCM will provide the analytical tools to calculate the numerical value. The designer should note that highway capacity service measures are segregated into two broad categories: (1) uninterrupted flow, or open highway conditions, which occurs on facilities that have no fixed causes of delay or interruption external to the traffic stream such as the influence of an intersection, and (2) interrupted flow which occur on facilities characterized by traffic signals, STOP signs, YIELD signs or other fixed causes of periodic delay or interruption to the traffic stream.

The following presents the simplified procedure for conducting a capacity analysis for the highway mainline:

1. Select the design year (Section 31-4.02).

2. Determine the DHV (Section 31-4.03).

3. Select the design LOS (see Part V, Highway Systems).

4. Document the proposed highway geometric design (lane width, length of weaving section, number and width of approach lanes at intersections, etc.).

5. Using the HCM, analyze the capacity of the highway element for the proposed design:

    - determine the maximum flow rate under ideal conditions;

    - adjust the maximum flow rate for prevailing roadway, traffic, and traffic control conditions; and

    - calculate the service flow rate for the selected level of service.

6. Compare the calculated service flow rate to the DHV. If the DHV is less than or equal to the service flow rate, the proposed design will meet the objectives of the capacity analysis. If the DHV exceeds the service flow rate, the proposed design may need further evaluation. The designer should either adjust the highway design or should adjust one of the capacity elements (e.g., the selected design year or the level-of-service goal).

Type of Facility	Service Measures
Vehicular	
Interrupted Flow	
Urban street segment	travel speed/Base FFS
Signalized intersection	delay
Two-way stop intersection	delay
All-way stop intersection	delay
Interchange ramp terminal	delay
Roundabout	delay
Uninterrupted Flow	
Two-lane highway	average travel speed, percent time-spent-following percent of free-flow speed
Multilane highway	density
Freeway	
Basic segment	density
Ramp merge segment	density
Ramp diverge segment	density
Weaving segment	density
Other Road Users	
Pedestrian	space, delay, LOS score
Bicycle	LOS score

SERVICE MEASURES FOR LEVEL OF SERVICE

Figure 31-4.B

31-4.05(b) Responsibility

For IDOT projects, the district Geometrics Engineer (or sometimes the project engineer) is responsible for performing all capacity analyses required by the project. The Policy and Procedures Section or the Project Development Unit is available as a resource to the district to assist in all capacity analyses. For consultant-designed projects, the consultant is responsible for performing capacity analyses. Consultants must use only highway capacity software that is approved by BDE.

31-4.06 Service Flow Rate

For general design purposes, IDOT uses a volume threshold designated as the service flow rate (SF) for the various highway classes. Service flow rate is taken from the *Highway Capacity Manual* (HCM) and is defined as the maximum volume that can be accommodated at a selected level of service (LOS) based on a typical set of operational assumptions for each facility.

As discussed in the HCM the base capacity of a facility at any LOS varies with the free-flow speed. For example, the base capacity for a basic freeway segment for LOS E ranges from 2250 at 55 mph (90 km/h) to 2400 at 75 mph (120 km/h) passenger cars per hour per lane under base conditions. The maximum service flow rate at LOS E, or MSF_E, is, also considered the capacity of a freeway, expressway, or arterial multilane highway. Base conditions include 12 foot lanes, a minimum of 6 foot right-side clearance, no heavy vehicles, no ramps, and a driver population composed primarily of regular users who are familiar with the facility.

The geometric design criteria tables in Part V, Highway Systems, present the service flow rate volumes for the applicable highway types at the design LOS. Factors which determine SF are the same as the base conditions above exclusive of lane width, lateral clearance and ramp density. Variances from the remaining base conditions causing operational constraints will cause a decrease to the SF. As discussed in the HCM these adjustments include the number of lanes (N), percent of heavy vehicles (f_{HV}), and driver population (f_P). To determine the SF_i at LOS i, use the MSF_i at the desired LOS i (e.g. see Exhibit 11-17 of the HCM). The equation for determining the SF_i for LOS i is:

$$SF_i = (MSF_i)\,(N)\,(f_{HV})\,(f_P). \qquad \text{Equation 31-4.1}$$

This equation is applicable for basic freeway segments (Chapter 44), expressways (Chapter 45), and arterial multilane highways (Chapter 47).

The SF's shown in the tables in Part V for multilane highways are one-way volumes derived from the above equation using appropriate HCM values and assume the following truck percentages for f_{HV}: freeways – 16%, expressways and arterial multilane highways– 8%. A PHF = 1.0 has been assumed, and the SF's found in the Part V tables for multilane highways must be multiplied by the actual PHF.

Capacity for a two lane rural highway (Chapter 47), which also exists at the boundary between LOS E and LOS F, is not determined by a measure of effectiveness. Under base conditions (12 foot or wider lanes, 6 foot or wider shoulders, no no-passing zones, all passenger cars, level terrain, and no impediments to through traffic) the capacity of a two-lane rural highway (in one direction) is 1700 passenger cars per hour (pcph). The capacity of two-lane rural highway under base conditions is 3200 pcph total in both directions.

The equation for determining the SF_i for LOS i for two-lane rural highways is:

$$SF_i = (2800)\,(v/c)_i\,(f_d)\,(f_w)\,(f_{HV}) \text{ where;} \quad \text{Equation 31-4.2}$$

v/c = the ratio of flow rate to an ideal capacity of 2800 pcph in both directions;
f_d = the adjustment factor for the directional distribution of traffic (assumed as 60%/40%);
f_w = the adjustment factor for narrow lanes and shoulders and;
f_{HV} = the adjustment factor for the presence of heavy vehicles.

This equation and method to determine SF are from Chapter 8 of the 1994 HCM. Service flow rates in the 2011 HCM are ancillary to the performance measures for two-lane rural highways; therefore, the method to determine SF for two-lane rural highways is complicated requiring an iterative process giving questionable results. The method to determine SF using the 1994 HCM is accurate enough for planning purposes. The volumes shown in Part V for rural two-lane highways assume 100% passing sight distance, a 60%/40% directional distribution, 6% heavy vehicle percentage, and a PHF = 1. On a project length basis, as much passing sight distance as practical should be provided with approximately 60% available as a minimum for level terrain and approximately 40% as a minimum for rolling terrain.

31-5 NON-HIGHWAY DESIGN CONTROLS

The characteristics of drivers and vehicles significantly influence the selected design criteria. When the driver and vehicle are properly accommodated, the safety and serviceability of the highway system are enhanced. When they are not accommodated, crashes and inefficient operation may result.

31-5.01 Driver

31-5.01(a) Typical Driver

The appropriate considerations for drivers are already built into the applicable geometric design values (stopping sight distance, horizontal curvature, superelevation, roadway widths, etc.). However, a brief discussion of the "typical" driver is warranted.

Drivers vary widely in their operating skills, experience, intelligence, and physical condition. The highway should be as forgiving as practical to minimize the adverse effects of driver errors. The following describes certain principles and driver traits that should be incorporated into the roadway design:

1. Information Processing. Drivers are limited in how quickly they can gather information, make a decision, and take action. They must process information related to lane placement, speed, traffic control devices, highway alignment, roadside conflicts, and weather. If the amount, complexity, or clarity of the information is inappropriate or excessive, driver error leading to a crash can result.

2. Primacy. Certain driving functions are more important than others. In order of importance they are:

   - Control — activities related to the physical control of the vehicle via the steering wheel, brake, or accelerator.

   - Guidance — activities related to selecting a safe speed and vehicular path on the highway.

   - Navigation — activities related to planning and executing a trip from point of origin to destination.

   The roadway designer must be aware of the relative importance of these activities and ensure that the more important highway information is properly conveyed to the driver. This could result in the decision to remove or relocate lower priority information, if it were likely to interfere with the higher priority information.

3. Expectancy. Drivers are conditioned through experience and training to expect and anticipate what lies ahead on the highway. If this driver expectancy is violated, it will increase the time needed by the driver to assess the situation and make the correct

decision. These violations should be avoided. Where they are unavoidable, the designer should allow for increased warning time.

4. Speed. Speed must be considered when accommodating the driver. Higher speeds reduce the visual field and restrict peripheral vision.

A User's Guide to Positive Guidance (FHWA) contains more detailed information related to driver characteristics and highway design accommodations for the driver.

31-5.01(b) Elderly Driver

In general, the median age of drivers in the United States is increasing and, specifically, the age bracket of over 60 years is the fastest growing segment of the driver population. This reality greatly emphasizes the criticality of the relationship between the driver and the highway environment. Although the opinions are not unanimous, there is general agreement that advancing age has a deleterious effect on an individual's perceptual, mental, and motor skills — critical factors in vehicular operation.

The research community has conducted several studies of the elderly driver, including:

- "Older Driver Study of Traffic Control Devices in Illinois," Illinois Department of Transportation, 1991;
- "Highway Design and Traffic Operation Needs of Older Drivers," University of Illinois at Urbana - Champaign, January 1994;
- "Strategies for Improving the Safety of Elderly Drivers," University of Nebraska/Midwest Transportation Center, 1991; and
- "Highway Design Handbook for Older Drivers and Pedestrians," FHWA, 2001.

These four studies were primarily focused on the relationship between the elderly driver and traffic control devices where, arguably, a greater opportunity exists for cost-effective countermeasures than for roadway design. However, it is important for the road designer to be aware of the needs of the elderly driver and, where desirable, factor these needs into the roadway design. The following summarizes the more important observations from these studies:

1. Elderly Driving Characteristics. When compared to younger drivers, the elderly driver often exhibits the following operational deficiencies:

    - slower information processing;
    - slower reaction times;
    - slower decision making;
    - visual deterioration;
    - hearing deterioration;
    - decline in ability to judge time, speed, and depth perception;

- limitations on physical mobility; and
- side effects from prescription drugs.

2. Crash Frequency. Predictably, elderly drivers are involved in a disproportionate number of crashes where there is a higher than average demand imposed on driving skills. The driving maneuvers that most often precipitate higher crash frequencies among older drivers include:

- making left turns across traffic,
- merging with high-speed traffic,
- changing lanes on congested streets,
- crossing high-volume intersections,
- stopping quickly for queued traffic,
- attempting backing maneuvers, and
- parking.

3. Countermeasures. The studies identified several countermeasures to alleviate the potential problems of the elderly driver. These included:

- increasing driver education;
- increasing vehicular clearance times at signalized intersections;
- increasing pedestrian phase times;
- providing wider and brighter pavement markings;
- providing larger and brighter signs;
- reducing sign clutter;
- providing more redundant information (e.g., advance guide signs);
- installing grade separations;
- revising warrants for traffic signals to increase their usage;
- enforcing speed limits;
- widening intersections;
- increasing use of protected left-turn phases; and
- increasing sight distance.

Most of the proposed countermeasures are related to traffic control devices. Perhaps the most practical measure related to road design is increasing sight distance. From an implementation perspective, this recommendation may be related to the warrants for the use of decision sight distance, as discussed in Section 31-3. The gradual aging of the driver population suggests that an increased use of decision sight distance may produce a commensurate reduction in the crash frequency for elderly drivers. These findings suggest that, where decision sight distance cannot physically be provided, an increased use of advance warning signs may be appropriate.

31-5.02 Vehicle

The physical and operational characteristics of vehicles using the highway are important controls in roadway design. Design criteria may vary according to the type of vehicle and the volume of each type of vehicle in the traffic stream.

Vehicular characteristics that impact design include:

1. Size. Vehicular sizes determine lane and shoulder widths, vertical clearances and, indirectly, highway capacity calculations.
2. Off-tracking. The design of intersection turning radii, traveled way widening for horizontal curves, and pavement widths for interchange ramps are usually controlled by the largest design vehicle likely to use the facility with some frequency.
3. Storage Requirements. Turn bay storage lengths, bus turnouts, and parking lot layouts are determined by the number and types of vehicles to be accommodated.
4. Sight Distance. Eye height and braking distances vary for passenger cars and trucks, which can impact sight distance considerations.
5. Acceleration and Deceleration. Acceleration and deceleration rates often govern the dimensioning of such design features as speed-change lanes at intersections and interchange ramps and climbing lanes.
6. Vehicular Stability. Certain vehicles with high centers of gravity may be prone to skidding or overturning, affecting design speed selection and superelevation design elements.

Figures 31-5.A and 31-5.B present vehicular dimensions and minimum turning radii for typical design vehicles. Figures 31-5.C and 31-5.D present two combination trucks to illustrate the application of the basic dimensions.

The selection of appropriate design vehicles for intersections and interchanges are discussed in Chapters 36 and 37, respectively.

31-5.03 Pedestrians

The pedestrian must be considered as an integral part of the highway environment, especially in urban areas. Except on fully access-controlled facilities, pedestrians are legally allowed to use the highway right-of-way consistent with the restrictions placed on pedestrian use. Therefore, the roadway design should provide for the safe and efficient movement of pedestrians, within practical limits, without compromising the accommodation of the vehicles using the highway facility.

The *BDE Manual* presents many specific design criteria for the accommodation of pedestrians as follows:

- Chapter 17 discusses pedestrian accommodation warrants, sidewalk location considerations, pedestrian networks, accommodations on structures, and crosswalks at both intersections and midblock locations.
- Chapter 36 discusses pedestrian accommodation at intersections.
- Chapter 48 discusses sidewalks.
- Chapter 55 discusses the considerations involved in safely accommodating pedestrians through and around work zones.
- Chapter 56 discusses pedestrian accommodation with traffic signals.
- Chapter 58 discusses accessibility criteria.

31-5.04 <u>Bicyclists</u>

Similar to pedestrians, bicyclists are an important element of the highway environment. Chapter 17 discusses the detailed design criteria for bicycle accommodation.

31-6 PROJECT SCOPE OF WORK

The project scope of work will reflect the basic intent of the highway project and will determine the overall level of highway improvement. This decision, in combination with the highway functional classification (see Chapter 43), will determine which criteria in the *Manual* apply to the geometric design of the project. Selection of the scope of work for a project should not be an arbitrary decision, but may be based on such engineering factors including, but not limited to, safety, functional classification, traffic volume, pavement condition, project cost, available funding, funding sources, etc. Note that cost alone should not be the single factor driving project scope.

The following provides general definitions for the project scopes of work, and it references the applicable chapters for determining the related design criteria, which are found in *Part V, "Highway Systems"*, for new construction, reconstruction, or 3R projects, or *Part VI, "Other Highway Design Elements"*, for 3P and SMART projects.

31-6.01 New Construction

Generally, new construction is defined as horizontal and vertical alignment on a new location. Typically, the overall project will have a significant length and will connect major termini, but may be comprised of several smaller contracts due to funding constraints, optimization for type of work, etc. Where an existing two-lane, two-way facility becomes a multilane facility with a rural-type median, the new median and proposed roadway are considered new construction. In addition, new construction also includes any intersection or interchange that falls within the project limits of a new highway mainline or is relocated to a new point of intersection. Freeways, expressways, and bypasses are typical new construction projects.

Because of the significant level of work and the up-front costs associated with a project on new alignment, a 20-year design period is utilized at minimum, and the highest order of design criteria are typically applied.

Chapters 44 through 48 present IDOT criteria for new construction.

31-6.02 Reconstruction

Reconstruction of an existing highway will typically include the addition of travel lanes and/or reconstruction of the existing horizontal and vertical alignment, widening of the roadway, and flattening side slopes, but the highway will remain essentially within the existing highway corridor. These projects will usually require some right-of-way acquisitions. The primary reasons for reconstructing an existing highway are because the facility cannot accommodate its current or future traffic demands, because the existing alignment or cross section is deficient, and/or because the service life of the pavement has been exceeded. In addition, any intersection that falls within the limits of a reconstruction project will be reconstructed as needed to meet policy requirements.

Because of the significant level of work for reconstruction, the design of the project generally will be determined by the criteria for new construction and based on a 20-year design period. However, some existing cross section elements may be allowed to remain in place.

Chapters 44 through 48 will apply to reconstruction projects.

31-6.03 3R Projects (Non-Freeways)

3R projects (resurfacing, restoration, and/or rehabilitation) on non-freeways are primarily intended to extend the service life of the existing facility and to enhance highway safety. In addition, 3R projects should make cost-effective improvements to the existing geometrics, where practical and where existing crash data analyses point to a need. 3R work on the mainline or at an intersection is typically completed within the existing alignment. However, right-of-way acquisition is sometimes justified for flattening of side slopes, changes in horizontal alignment, changes in vertical profile, turn lane additions, intersection radii upgrades, and safety enhancements such as culvert extensions and guardrail length of need.

The overall objective of a 3R non-freeway project is to perform work necessary to return the highway to a condition of acceptable structural and/or functional adequacy. 3R projects may include any number of the following types of improvements:

- providing pavement resurfacing, rehabilitation, and/or short sections of pavement reconstruction;
- providing lane and/or shoulder widening (without adding through lanes);
- adding a two-way, left-turn lane (TWLTL);
- providing intersection improvements (e.g., adding or lengthening turn lanes, improving turning radii, channelization, corner sight distance improvements);
- flattening a horizontal or vertical curve;
- adding auxiliary lanes (e.g., truck-climbing lane);
- converting an existing uncurbed urban street into a curbed street;
- widening and/or resurfacing parking lanes;
- upgrading at-grade railroad crossings;
- rehabilitating and/or widening existing bridges;
- upgrading guardrail and other roadside safety appurtenances to meet current criteria;
- adjusting the roadside clear zone;

- flattening side slopes;
- providing drainage improvements, including pump stations; and/or
- implementing improvements to meet the Department's accessibility criteria (e.g., sidewalks, sidewalk curb ramps).

Any of the above may also be an element of work for a reconstruction project. Chapter 49 presents IDOT criteria for the design of 3R non-freeway projects, including criteria that may be allowed to remain in place.

31-6.04 3R Projects (Freeways)

3R projects (resurfacing, restoration, and/or rehabilitation) on existing freeways are primarily intended to extend the service life of the existing facility and to enhance highway safety. In addition, these projects should make cost-effective improvements to the existing geometrics, where practical. 3R freeway projects may include any number of the following types of improvements:

- providing pavement resurfacing, rehabilitation, and/or short sections of pavement reconstruction;
- realigning or widening an existing ramp or modifying an existing interchange;
- lengthening existing acceleration or deceleration lanes at freeway entrances and exits;
- flattening a horizontal or vertical curve;
- adding auxiliary lanes (e.g., a truck-climbing lane);
- rehabilitating and/or widening existing bridges;
- upgrading guardrail and other roadside safety appurtenances to meet current criteria;
- adjusting the roadside clear zone;
- flattening side slopes; and/or
- providing drainage improvements, including pump stations.

Chapter 50 presents IDOT criteria for the design of 3R freeway projects, including criteria that may be allowed to remain in place.

31-6.05 3P Projects

The Pavement Preservation Program (3P) is a category of projects consisting of repairing and resurfacing existing paved roadways on the State highway system (excluding Interstates). The intent of the program is to cost effectively address specific pavement deficiencies. Besides marked non-interstate routes, unmarked roads including any urban minor arterials (without the need for a jurisdictional transfer) and collector and local roads (as part of a jurisdictional transfer) are eligible to be resurfaced under the program, given certain existing pavement condition criteria are met. The purpose of the 3P Program is to rehabilitate existing roadways and thus extend the roadway's service life. Typically the scope of a 3P project includes only ancillary items beyond resurfacing of the pavement and shoulder and does not include geometric improvements.

3P projects can sometimes provide a low-cost opportunity to reallocate the roadway width to better accommodate bicyclists. Bike lanes or shared lanes can be created by adjusting pavement marking. The possibility of removing traffic through lanes (a road diet) or parking lanes may also be investigated. Refer to Chapter 17 for further discussion.

Chapter 53 presents IDOT criteria for the selection and design of 3P projects.

31-6.06 SMART Projects

Surface Maintenance at the Right Time (SMART) is a category of projects with the intent of cost effectively extending the service life of the pavement without significantly increasing its structural capacity. If the SMART overlay is applied at the correct time, it can delay serious pavement distresses, thereby extending the life of the pavement, and decreasing overall life cycle costs. Typically the scope of a SMART project includes only ancillary items beyond resurfacing of the pavement lanes and does not include geometric improvements.

The selection criteria for SMART projects are presented in Figure 52-5.B. SMART overlays are not allowed on Interstate highways or bare PCC pavements. Four-lane routes, with the exception of Interstates, may be considered if the two-lane truck and patching directional criteria presented in Figure 52-5.B are met. Also, consider ramps and unmarked narrow pavements that do not have excessive rutting or shoving for SMART projects.

Considerations related to bicyclist accommodation may be applied as noted for 3P projects above.

Chapter 52 presents IDOT criteria for the selection and design of SMART projects.

31-7 ADHERENCE TO DESIGN CRITERIA

Parts IV, V, and VI of the *BDE Manual* (Roadway Design Elements, Highway Systems, and Other Highway Design Elements, respectively) present a vast amount of design criteria for application on individual projects. In general, the designer is responsible for making every reasonable effort to meet these criteria in the project design. However, it will not always be practical to meet the criteria. Therefore, this section presents IDOT's procedures for the appropriate action when the design criteria are not met.

31-7.01 Department Intent

The general intent of the Illinois Department of Transportation is that all design criteria in Parts IV, V, and VI be met and that, wherever practical, the proposed design should exceed the lower criteria. In addition, where a range of values is presented, the designer should make every reasonable effort to provide a design that is near the desirable or preferred value. Also, the designer should pay special attention regarding the possible cumulative effects of using more than one minimum design criteria within a particular project's limits; analyze the effects the proposed design has on safety performance; and, when necessary, provide additional design features, if feasible, to mitigate a potential reduction in safety. The overall intent is to ensure that the Department will provide a highway system that meets the transportation needs of the State and provides a reasonable level of safety, comfort, and convenience for the traveling public.

31-7.02 Hierarchy of Design Criteria

The Department, in concert with 23 CFR 625, FHWA's May 5, 2016 policy memorandum on controlling criteria, and the FHWA/IDOT Stewardship and Oversight (S&O) Agreement, has established the following hierarchy of design criteria as they pertain to the potential for design exceptions (see Section 31-7.04 for information on the design exception submittal and approval process):

31-7.02(a) Level One Design Exceptions

Level One design exceptions involve the controlling design criteria established by FHWA, but only on the interstate system, pursuant to the S&O Agreement. When not met, Level One design exceptions require documentation and justification by the district, concurrence by BDE, and formal approval by FHWA. These criteria are judged to be those design elements that are the most critical indicators of an interstate highway's safety and overall serviceability. There are 10 controlling design criteria for interstate routes, per FHWA's May 5, 2016 policy memorandum on controlling criteria and the S&O Agreement. These 10 Level One criteria are listed in form BDE 3107, "Level One Design Criteria Checklist." The appropriate reference chapter of the BDE Manual has been listed along with each criterion on form BDE 3107.

31-7.02(b) Level Two Design Exceptions

Level Two design exceptions involve two distinct sub-sets, per the S&O Agreement. In addition to FHWA controlling design criteria for projects off the interstate system, Level Two design criteria are also additional design criteria identified by IDOT, over and above the FHWA controlling criteria, on both interstate and non-interstate projects. When not met, Level Two design exceptions require documentation and justification by the district and formal approval by BDE only. The additional IDOT criteria are other important indicators of a highway's safety and serviceability. The FHWA controlling design criteria and additional IDOT criteria have been integrated and listed in form BDE 3108, "Level Two Design Criteria Checklist." The appropriate reference chapter of the BDE Manual has been listed along with each criterion on form BDE 3108.

31-7.02(c) ADA Accessibility Criteria – Maximum Extent Practicable

Chapter 58 presents most of the accessibility criteria applicable to an IDOT project and references their sources, which include: the 2010 ADA Standards for Accessible Design, the Public Rights-of-Way Accessibility Guidelines, and the Illinois Accessibility Code. These codified standards and guidelines have the effect of law and as such, design exceptions in the traditional sense, are not possible. That being said, the standards do recognize that in certain situations (e.g. alterations of existing facilities) full compliance will not always be possible within the scope of the project. Where accessibility requirements cannot be fully met, the barriers to full compliance must be well documented as well as the measures taken to comply with the standards to the maximum extent practicable. See Section 31-7.04(b) for more information.

31-7.03 Design Criteria Checklists

The "Level One Design Criteria Checklist" (form BDE 3107) and "Level Two Design Criteria Checklist" (form BDE 3108) were created to ensure designers have considered the relevant design criteria and evaluated the need for design exceptions. The appropriate checklist must be completed for each new construction, reconstruction, or 3R project. The checklist is then included in the Phase I engineering report and becomes a part of the permanent project file. The results from the checklists should also be discussed at the district coordination meetings.

31-7.04 Design Exception Process

31-7.04(a) General Procedures

The design exception process applies to all capital improvement projects considered new construction, reconstruction, 3R, 3P, SMART, HSIP, etc.

Design exceptions are discussed at project coordination meetings held in each district. These meetings are scheduled monthly or bi-monthly, are attended by representatives from FHWA and BDE, and allow for a timely approval process. With sufficient notice in advance of the coordination meeting and with adequate justification, BDE and FHWA can typically inform the district during the meeting if a design exception is denied or granted. In addition to presentation at a coordination meeting, design exceptions require the completion of form BDE 3100 “Design Exception Request – Project Identification” with attachments if needed. The approved Design Exception Request form then becomes part of the permanent project file. As an aide in filling out form BDE 3100, see Figure 31-7.A, “Guidelines for Completion of Design Exception Request – Project Identification.”

The documentation for design exceptions shall be included with the coordination meeting agenda and submitted to BDE two weeks prior to the scheduled meeting. During coordination meetings, the district discusses the design details for each project; and, provides justification as to the need for design exceptions to the design criteria, when necessary. For projects on the interstate highway system that involve FHWA’s controlling criteria, design exceptions (i.e., Level One) are evaluated for a determination by FHWA and BDE in accordance with the FHWA/IDOT Stewardship and Oversight Agreement. For projects on the interstate highway system that do not involve FHWA’s controlling criteria, or for projects off the interstate highway system, design exceptions (i.e., Level Two) are evaluated for a determination by BDE.

The reason for design exceptions shall be clearly justified and documented. The justification may be presented by a combination of crash analysis, safety analysis, cost comparisons, level of social, environmental, and economic impacts, capacity analysis, and other relevant information as to the rationale and basis for the design exception. A benefit/cost analysis may also be included if it will help with the decision making process. Level One design exceptions may require the preparation of a report and a formal request to the FHWA for determination, or submittal of form BDE 3107, in addition to the completion of form BDE 3100.

All discussions and agreements reached at the coordination meeting and relevant to any Level One or Level Two design exception shall be documented by both minutes prepared each time the project is presented and the completed form BDE 3100. The documentation within the meeting minutes, or as an attachment to the minutes, and form BDE 3100 shall include the individual listing of each design exception, the location, the justification, and whether the design exception was approved or denied by BDE and, if necessary, FHWA. The minutes and form BDE 3100, in addition to form BDE 3107 and/or BDE 3108 on all new construction, reconstruction, or 3R projects, shall be included in the Phase I engineering report. Note that safety cannot be compromised through the design exception process to meet scope/schedule/budget.

If the district determines that a design change involving a design exception is required after the Phase I engineering report process is complete, the proposed design change and exception must be coordinated with BDE. In order for the Regional Field Engineer to make an informed determination, the district must prepare either a memo with attachments discussing the design change and exception, or discuss the proposed issue at a District coordination meeting. To expedite the process, if the issue is to be discussed at a coordination meeting, submit a short report addressing the change to the BDE Regional Field Engineer in advance of the meeting.

31-7.04(b) Procedures for Meeting ADA Accessibility Criteria to the Maximum Extent Practicable

The ADA accessibility criteria presented in Chapter 58 and the various Federal and State ADA standards are applicable whenever pedestrian access, circulation, or use is affected, or could be affected, by the project. As described in Section 58-1.01(b), newly constructed facilities and elements added to existing facilities must be fully compliant with the criteria. However, existing elements that are altered must comply with the criteria to the maximum extent practicable within the scope of the project. This typically means that alterations must also be fully compliant unless there are existing physical constraints or qualified historic facilities which make full compliance impracticable. The following steps are the procedure to go by when a feature does not fully meet accessibility guidelines, but will be built to the maximum extent practicable.

1. District Coordination Meetings. Any proposed element not able to be made fully compliant within the scope of the project shall be discussed at the district coordination meetings. The district shall complete form BDE 3101 “Maximum Extent Practicable” and attach any supporting documentation. This documentation shall be included with the coordination meeting agenda and submitted to BDE two weeks prior to the scheduled meeting. The BDE representative should be able to determine, following the presentation at the coordination meeting, whether or not the element is designed to the maximum extent practicable.

2. Documentation. In addition to the general procedures for documentation listed in Section 38-7.04(a), the district shall fully document its evaluation of the non-compliant element and must clearly demonstrate that compliance is not feasible. Furthermore, the district shall document what will be otherwise done to apply the ADA standards to the maximum extent practicable. The documentation in the maximum extent practicable request will vary on a case-by-case basis; however, cost is not a factor. The completed form BDE 3101 and any supporting documentation shall become part of the permanent project file. Include a copy of the completed form BDE 3101 with the District’s inventory until the non-compliant element is improved to full compliance and removed from the transition plan.

Accessibility criteria must be fully considered in the initial scope of a project. As such, most, if not all, of the features in an alteration type of project should be able to be fully compliant and this is the Department’s goal. In other words, if too many requests for a Maximum Extent Practicable determination are being sought for a project, it is likely the project’s scope is too narrow and the scope must be re-evaluated.

31-7.04(c) Vertical Clearances Exceptions on the Interstate System

The integrity of the Interstate System for national defense purposes shall be maintained to meet AASHTO Policy as stated in A Policy on Design Standards - Interstate System. IDOT requires vertical clearances on new construction/reconstruction Interstate sections in rural areas and single routing through or around urban areas to be no less than 16 ft 09 in (5.1 m). The clear height of structures over other urban interstate routes shall not be less than 15 ft 00 in (4.5

meters). This clearance is required over the full roadway width (travel lanes and usable shoulders), including ramps and collector-distributor roadways within Interstate-to-Interstate interchanges.

The FHWA allows a minimum 16 ft 00 in (4.9 m) in rural areas and along the single routing in urban areas. The minimum vertical clearance in other urban areas shall be no less than 14 ft 00 in (4.3 m). The extra clearance IDOT requires allows for future overlays. The urban areas in Illinois where single routing occurs are:

- Peoria,
- Quad Cities,
- Metro-east St. Louis area, and
- the Chicago metropolitan area.

Maps of the single interstate route for these urban areas are shown in the figures in Section 44-6.

Design exceptions must be approved whenever the criteria are not met. These criteria apply whether it is a new construction project, a project that does not provide for correction of an existing substandard condition, or a project which creates a substandard condition at an existing structure.

There is a distinction between FHWA criteria and IDOT criteria for the vertical clearance over the Interstate. If the minimum clearances exceed those required by the FHWA, but are less than that required by IDOT, a design exception shall be presented as in Section 31-7.03(a) as a Level One design exception.

If the minimums required by the FHWA are not met, form BDE 3102 must be used to request approval for substandard vertical clearances over interstate routes. Form BDE 3102 will be filled out by the District and submitted to the Illinois Division of the FHWA. The FHWA will complete the “Date to SDDCTEA,” “Response Requested by,” and FHWA contact information and forward the completed form to the Surface Deployment and Distribution Command Transportation Engineering Agency (SDDCTEA) prior to taking any action on the design exception. If the SDDCTEA does not respond within 10 working days (after receipt by SDDCTEA), it can be concluded that the SDDCTEA does not have any concerns with the proposed exception. If comments are forthcoming, the FHWA and IDOT will consider mitigation to the extent feasible.

Coordination with SDDCTEA, as discussed above, is not required for interstates in urban areas with a minimum vertical clearance of 14 ft 00 in (4.3 m) and also served by a single interstate route, however IDOT policy must be considered.

PROJECT INDENTIFICATION FIELDS

Key Route: This should be the key route number for the facility, if it has one. Typically, this will be an FAI, FAP, FAU, or FAS number, e.g. FAP 341.

Marked Route/Road Name: This should be the interstate, state or U.S. route marking, if the route has one, e.g. Illinois Route 72, followed by the name the route is known as locally, if one exists. Typically, this will be a street, road, avenue or such, e.g. Higgins Road, Main Street.

Contract #: This should be state contract number associated with the project, if any, e.g. 60166.

State Job #: This should be a P-, D- or C- number assigned to the project, e.g. C-91-367-10.

Section: This should be a section number assigned to the project, e.g. 177-2-1A, 177-2B-1, 177-2VB-1.

County(ies): This should be any counties in which the project is located, e.g. Cook, Pike.

Municipality: This should be any municipalities in which the project located, e.g. Schaumburg, Moline.

Local Agency: This should be any local public agency, if it is a primary lead on the project, e.g. Village of Schaumburg.

LRS Section #: This should be the section number assigned to the project by the Bureau of Local Roads and Streets, e.g. 11-00237-10-WR.

Permit Applicant: This should be the name of any entity named as applicant for the Highway Permit associated with the work of the project. This can be a local agency or a private property owner, e.g. City of Rockford or Rubloff Development Group.

Permit #: This should be the number assigned to any associated Highway Permit by district staff, e.g. C-050658.

Project Limits: This should be the specific limits of the project for which an exception is being requested.

Project Length: This should be expressed in miles and feet, if possible.

Estimate of Cost: This should be the construction cost of the entire project for which the exception is being requested.

GUIDELINES FOR COMPLETION OF FORM BDE 3100, "DESIGN EXCEPTION REQUEST- PROJECT IDENTIFICATION"

Figure 31-7.A
(1 of 6)

Design Year: This is the year of the conditions for which the project is being designed. For instance, the design year and construction year is typically 20 years in advance of the construction year for new construction/reconstruction projects.

Functional Classification: This should be the functional classification as described in BDE Manual Chapter 43 and shown on the Getting Around Illinois website at http://www.gettingaroundillinois.com/gai.htm?mt=fc - interstate, non-interstate freeway or expressway, other principal arterial, minor arterial, major collector, minor collector and local road or street. Please note that Strategic Regional Arterial (SRA) is not a functional classification, but a highway type.

Design Traffic: ADT: This should be the average daily traffic for the design year which appears in the field directly above.

Design Traffic: DHV: This should be the design hour traffic for the design year shown above for both the a.m. and p.m. weekday peaks. Non-weekday peak hour design volumes can be added, if appropriate.

Current Posted Speed: This should be the posted speed limit in the vicinity of the requested exception.

On the NHS System? This should indicate the route's presence, or lack thereof, on the National Highway System (NHS). Check applicable box. NHS status can be verified at http://www.gettingaroundillinois.com/gai.htm?mt=fc#.

Structure Numbers: Include the number of any structures included in the project.

Type of Project (Construction, Reconstruction, 3R, 3P, SMART, HSIP): This should be project categories as described in the BDE Manual Chapters 44 through 50, 52, and 53; and Safety Policy 1-06.

Brief Project Description: This should be a brief and concise, yet comprehensive, synopsis of the work to be undertaken for the project.

EXCEPTION DOCUMENTATION FIELDS

Level of Exception: Level One exceptions are the 13 controlling design criteria established by FHWA on the interstate system only, and noted on the "Level One Design Criteria Checklist" form BDE 3107. Exceptions to all other design criteria on the interstate and non-interstate system are considered to be Level Two, and noted on the "Level Two Design Criteria Checklist" form BDE 3108. Check the applicable box.

GUIDELINES FOR COMPLETION OF FORM BDE 3100, "DESIGN EXCEPTION REQUEST- PROJECT IDENTIFICATION"

Figure 31-7.A
(2 of 6)

Design Element for Which an Exception Is Requested: This should be the specific criterion for which the designer is requesting an exception. This should also not typically contain the location of that exception. Each form should have only one design criterion for which an exception is being requested, e.g. guardrail length of need; turn lane taper length; level-of-service. Examples of what this should NOT be: encroachment; RT movements; painted median; isolated ditch cleaning; outside roadway ditch. If there is more than one location which requires the exception, this should be noted in the field, e.g. level-of-service (5).

Design Element Policy Value: This should be the specific value of the criterion noted in the field above from the appropriate design document. For instance, the criterion for which an exception could be requested is turn lane storage at a signalized intersection. The BDE Manual Section 36-3.02.b dictates such minimum storage based on a red-time equation, as an example, say 400 feet. Also, the specific design document for the policy value should also be noted in this field to facilitate review of the form and its associated exception. The proper entry for this field in this case would be: 400 feet, BDE Manual Section 36-3.02.b.

Proposed Design Element Value: This should be the proposed value of the design feature for which the exception is being requested. The designer should arrive at this value by weighing all the project constraints, impacts and costs to optimize the feature’s value. For the example in the field above, the entry could be “300 feet”. Each form should have only one value of a design feature for which an exception is being requested.

Location(s) of Exception: This should include any and all locations of the specific exception noted above.

Crash History and Potential of Exception Location(s): This should be a very brief summary, and should always include the presence of any Five Percent Report Location, or lack thereof. Also, note any specific incidents which might directly affect the design feature for which an exception is being requested.

Cost of Using Policy Value: This should be the cost which would be required if the policy-stipulated design feature value would be used on all locations noted above.

Cost of Using Proposed Exception Value: This should be the cost if the design feature value for which the exception is being requested would be used on all locations noted above on the project. The purpose of this field and the one directly above is to determine both the difference in cost between the two design feature values, as well as that cost compared to the total construction cost of the project.

Impacts Other Than Cost, of Using Policy Value: This should comprise any considerations other than strictly monetary which compelled the designer to choose the excepted design feature value. Typically, this includes impacts to historic or recreational properties or the requirement to increase project scope to accommodate the policy-stipulated design feature value. If there are none, the appropriate response is N/A.

GUIDELINES FOR COMPLETION OF FORM BDE 3100,
“DESIGN EXCEPTION REQUEST- PROJECT IDENTIFICATION”

Figure 31-7.A
(3 of 6)

Proposed Mitigation to Address Exception: This should include any measures added to the project to alleviate the potential effects of the use of the excepted design value. This typically includes augmented traffic control, street lighting or other relatively low cost improvements. If there are none, the appropriate response is N/A.

Geometric Compatibility with Adjacent Sections: This is to ensure that the cross-section of the project containing the excepted design feature is consistent with those into which it will match at its termini. The appropriate text for this field is "Compatible." If this is not the case, the designer should re-evaluate the project's proposed design choices.

Potential Effects on Other Design Elements: This should contain any conceivable impacts to other project design features resulting from the choice of the policy-stipulated design feature value versus the excepted feature value. For instance, there are cases where the choice of a compliant policy value for a turn lane taper would require reducing the needed storage for that lane. Or, establishing both full storage and taper lengths at that location might require relocation of the intersection with consequent effects on the storage and taper lengths of the opposing approach. If there are none, the appropriate response is N/A.

Potential Impacts on Mobility or Traffic Operations: This should contain any possible effects the choice of the excepted value might have on facility safety, capacity or level-of-service. For instance, the choice of an excepted value for turn lane storage could increase queues sufficiently on that approach such that traffic regularly does not clear during a single traffic signal cycle, with consequent reduction in capacity and level-of-service. This excepted value could also possibly increase the likelihood of rear-end crashes on that approach. If there are none, the appropriate response is N/A.

Summary of Justification for Exception: This should be a brief and concise synopsis of why the excepted value would be the best choice given the totality of the pertinent circumstances.

Coordination Meeting Date: This should be the date of the meeting at which the exception was presented to BDE/FHWA representatives and at which the exception was approved or denied. Alternatively, if the exception was processed by e-mail or phone, this should be the date the exception was requested.

Prepared By: This should be the name of the individual who actually filled out the form and did the requisite analysis for the exception. If the person is employed by an outside entity, such as a consulting firm or local agency, that should also be noted in this field, e.g. John Doe, ABC Consulting.

Date: This should be the date the form was completed or revised for final approval or denial.

GUIDELINES FOR COMPLETION OF FORM BDE 3100,
"DESIGN EXCEPTION REQUEST- PROJECT IDENTIFICATION"

Figure 31-7.A
(4 of 6)

PAVEMENT/RESURFACING EXCEPTIONS FIELDS

New Pavement, Pavement Widening, Resurfacing: The appropriate box should be checked, based on the scope of the project in question. All Pavement/Resurfacing Exceptions fields should be blank or contain N/A, unless the exception requested is pavement-related only.

Design Period/Expected Service Life: This should be the result from the design procedures outlined in the BDE Manual Chapters 52, 53, and 54.

Design Year: This should be the result of the design procedures outlined in the BDE Manual Chapters 52, 53, and 54.

Structural Design Traffic: This should be the result of the design procedures outlined in the BDE Manual Chapters 52, 53, and 54.

%PV, %SU, and %MU: This should be the result of the design procedures outlined in the BDE Manual Chapters 52, 53, and 54.

Design Element Policy Value: This should be the specific criterion for which the designer is requesting an exception, from the BDE Manual Chapters 52, 53, and 54.

Proposed Design Element Value: This should be the result of the design procedures outlined in the BDE Manual Chapters 52, 53, and 54.

Location(s) of Exception: This should include any and all locations of the specific exception.

Cost of Using Policy Value: This should be the cost which would be required if the policy-stipulated design feature value would be used on all locations noted above.

Cost of Using Proposed Exception Value: This should be the cost which would be required if the design feature value for which the exception is being requested would be used on all locations noted above on the project. The purpose of this field and the one directly above is to determine both the difference in cost between the two design feature values, as well as that cost compared to the total construction cost of the project.

Summary of Justification: This should be a brief and concise synopsis of why the excepted value would be the best choice given the totality of the pertinent circumstances.

Prepared By: This should be the name of the individual who actually filled out the form and did the requisite analysis for the exception. If the person is employed by an outside entity, such as a consulting firm or local agency, that should also be noted in this field, e.g. John Doe, ABC Consulting.

Date: This should be the date the form was completed or revised for final approval or denial.

GUIDELINES FOR COMPLETION OF FORM BDE 3100,
"DESIGN EXCEPTION REQUEST- PROJECT IDENTIFICATION"

Figure 31-7.A
(5 of 6)

APPROVAL FIELDS

BDE Approval Date: This is the date on which the BDE staff approves the exception. This date may or may not coincide with a date in the Coordination Meeting Date field, from above on the form.

FHWA Approval Date: This is the date on which the FHWA staff approves the exception. Such exceptions are granted pursuant to the BDE Manual Section 31-7.04 and the department's stewardship and oversight agreement with FHWA. This date may or may not coincide with a date in the Coordination Meeting Date field, from above on the form.

GENERAL

Separate forms should be completed for each specific exception. For instance, say the level-of-service criterion for a given location on the project is "C". If the designer determines the best choice for actual design for the project is "D" at the same location, or for the entire project. This will require completion of a single BDE 3100 form. If it happens that precisely the same exception to precisely the same design criterion occurs on other places on the project, those exceptions may be added to this form. This should then be duly noted in the Location(s) of Exception and Design Element for Which an Exception Is Requested fields as previously discussed.

Conversely, say a designer requests an exception for a Turn Lane Storage value of 100 feet. The BDE Manual dictates a minimum value of 135 feet. This exception will require one BDE 3100 form. Say the designer has a similar exception to the 135 feet criterion, but it is 90 feet, not 100 feet as in the first exception. This second exception would require a second BDE 3100 form because the exception is not precisely the same as that requested in the first exception form.

If a request is for an exception to a geometric or drainage design criterion, all fields in the areas of Project Identification and Exception Documentation should be filled. If a specific field does not apply, it should be completed with N/A. In such cases, all fields in the area of Pavement/Resurfacing Exceptions should be left blank.

If a request is for an exception to a pavement or resurfacing design criterion, all fields in the area of Pavement/Resurfacing Exceptions should be filled. If a specific field does not apply, it should be completed with N/A. In such cases, all fields in the area of Exception Documentation should be left blank. Also in such cases, all fields in the areas of Project Identification should be filled. If one of those specific fields does not apply, it should be completed with N/A.

Chapter Thirty-two
HORIZONTAL ALIGNMENT

Chapter 32 presents IDOT criteria for the design of horizontal alignment elements. This includes horizontal curvature, superelevation, sight distance around horizontal curves, and mathematical computations. Chapter 32 presents the information on horizontal alignment that has an application to several functional classes of highway. Where a horizontal alignment treatment only applies to a specific highway type, Part V, Design of Highway Types, presents this information. For example:

- Chapter 48 discusses horizontal alignment for low-speed urban streets ($V \leq 45$ mph (70 km/hr)).
- Each of the functional classification chapters in Part V presents typical superelevated sections.

32-1 DEFINITIONS

This Section presents definitions for basic elements of horizontal alignment. Section 32-6 presents definitions and illustrations for mathematical details for horizontal curves (e.g., deflection angle (Δ), point of curvature (PC)).

1. Axis of Rotation. The line about which the pavement is revolved to superelevate the roadway. This line will maintain the normal highway profile throughout the curve.
2. Broken-Back Curves. Closely spaced horizontal curves with deflection angles in the same direction with an intervening, short tangent section (less than 1500 ft (500 m)).
3. Compound Curves. A series of two or more simple curves with deflections in the same direction immediately adjacent to each other.
4. Low-Speed Urban Streets. All streets within urbanized or small urban areas with a design speed of 45 mph (70 km/hr) or less.
5. Maximum Side Friction (f_{max}). Limiting values selected by AASHTO for use in the design of horizontal curves. The designated f_{max} values represent a threshold of driver discomfort and not the point of impending skid.
6. Maximum Superelevation (e_{max}). The maximum rate of superelevation (e_{max}) is an overall superelevation control used on a widespread basis. Its selection depends on several factors including climatic conditions, terrain conditions, type of area (rural or urban), and highway functional classification.

7. Normal Crown (NC). The typical cross section on a tangent section of roadway (i.e., no superelevation).

8. Open Roadway Conditions. Rural facilities for all design speeds and urban facilities with a design speed ≥ 50 mph (80 km/hr).

9. Relative Longitudinal Slope. For superelevation transition sections on two-lane facilities, the relative gradient between the centerline profile grade and edge of traveled way.

10. Remove Adverse Crown (RC). A superelevated roadway section that is sloped across the entire traveled way in the same direction and at a rate equal to the cross slope on the tangent section (typically, 3/16″/ft or 1/4″/ft (1.5% or 2%)).

11. Reverse Curves. Two simple curves with deflections in opposite directions that are joined by a relatively short tangent distance or that have no intervening tangent (i.e., the PT and PC are coincident).

12. Side Friction (f). The interaction between the tire and the pavement surface to counterbalance, in combination with the superelevation, the centrifugal force or lateral acceleration of a vehicle traversing a horizontal curve.

13. Simple Curves. Continuous arcs of constant radius that achieve the necessary highway deflection without an entering or exiting transition.

14. Spiral Curves. A transitional curve where the rate of curvature begins at $R = \infty$ (tangent) and gradually decreases to R, which is the curvature of a simple curve.

15. Superelevation (e). The amount of cross slope or "bank" provided on a horizontal curve to counterbalance, in combination with the side friction, the centrifugal force of a vehicle traversing the curve.

16. Superelevation Rollover. The algebraic difference (A) between the superelevated travel lane slope and shoulder slope on the high side of a horizontal curve.

17. Superelevation Transition Length. The distance required to transition the roadway from a normal crown section to the design superelevation rate. Superelevation transition length is the sum of the tangent runout (TR) and superelevation runoff (L) distances:

    a. Tangent Runout (TR). Tangent runout is the distance needed to change from a normal crown section to a point where the adverse cross slope of the outside lane or lanes is removed (i.e., the outside lane(s) is level).

    b. Superelevation Runoff (L). Superelevation runoff is the distance needed to change the cross slope from the end of the tangent runout (adverse cross slope removed) to a section that is sloped at the design superelevation rate (e).

32-2 HORIZONTAL CURVES

Horizontal curves are, in effect, transitions between two tangents. These deflectional changes are necessary in virtually all highway alignments to avoid impacts on a variety of field conditions (e.g., right-of-way, natural features, man-made features).

32-2.01 Types of Horizontal Curves

32-2.01(a) General

This section discusses the several types of horizontal curves that may be used to achieve the necessary roadway deflection. For each type, the discussion briefly describes the curve and presents the IDOT usage of the curve type. Section 32-6 presents detailed figures for the basic curve types (simple, compound, and spiral), and it presents the necessary details and mathematical equations for the typical applications of horizontal curves to highway alignment.

32-2.01(b) Simple Curves

Simple curves are continuous arcs of constant radius that achieve the necessary roadway deflection without an entering or exiting taper. The radius (R) defines the circular arc that a simple curve will transcribe. All angles and distances for simple curves are computed in a horizontal plane.

Because of their simplicity and ease of design, survey, and construction, IDOT typically uses the simple curve on highways.

32-2.01(c) Compound Curves

Compound curves are a series of two or more simple curves with deflections in the same direction. IDOT uses compound curves on highway mainline only to meet field conditions (e.g., to avoid obstructions that cannot be relocated) where a simple curve is not applicable and a spiral curve normally would not be used. Where a compound curve is used on a highway mainline, the radius of the flatter circular arc (R_1) should not be more than 50% greater than the radius of the sharper circular arc (R_2). In other words, $R_1 \leq 1.5\ R_2$.

Chapter 36 discusses the use of compound curves for intersections (e.g., for curb radii, for turning roadways). Chapter 37 discusses the use of compound curves on interchange ramps.

32-2.01(d) Spiral Curves

Spiral curves provide an entering transition into a simple curve with a variable rate of curvature along its layout. As an option to a simple curve, a restricted horizontal alignment and high-speed conditions may be conducive to the introduction of a spiral curve. Figure 32-2.A presents the guidelines for the use of spiral curves under these conditions. The parts of a spiral curve may be calculated with the use of the Department's approved computer software.

32-2.01(e) Reverse Curves

Reverse curves are two simple curves with deflections in opposite directions that are joined by a relatively short tangent distance. In rural areas, a minimum of 500 ft (150 m) should be provided between the PT and PC of the two curves for appearance. Superelevation development for reverse curves requires special attention. This is discussed in Section 32-3.

32-2.01(f) Broken-Back Curves

Broken-back curves are closely spaced horizontal curves with deflection angles in the same direction with an intervening, short tangent section (less than 1500 ft (500 m) from PT to PC). Avoid broken-back curves on highway mainline because of the potential for confusing a driver, problems with superelevation development, and the unpleasant view of the roadway that is created. Instead, use a single, flat simple curve or, if necessary, a compound curve.

US Customary		Metric	
Design Speed (mph)	**Maximum Radius (ft)**	**Design Speed (km/hr)**	**Maximum Radius (m)**
50	1265	80	379
55	1530	90	480
60	1820	100	592
65	2140	110	716
70	2480	120	852
75	2846		

Notes:

1. *Spiral curves are typically only used on new construction/reconstruction projects on freeways, expressways, and rural principal arterials.*

2. *Do not use spiral curves on bridges.*

3. *The benefits of spiral curve transitions are likely to be negligible for larger radii.*

4. *Maximum radius for use of a spiral is based on a minimum lateral acceleration rate of 4.25 ft/s² (1.3 m/s²).*

GUIDELINES FOR SPIRAL CURVES

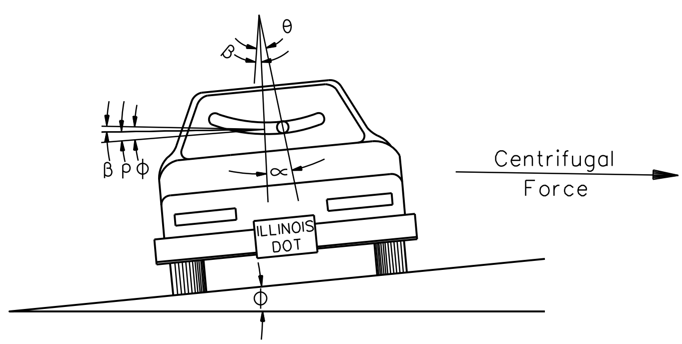
Figure 32-2.A

32-2.02 <u>General Theory</u>

This section summarizes the theoretical basis for the design of horizontal curves. For more information, the designer should refer to the latest edition of *AASHTO A Policy on Geometric Design of Highways and Streets*.

32-2.02(a) Ball-Bank Indicator

When a vehicle moves in a circular path, it is forced radially outward by centrifugal force. Figure 32-2.B illustrates the dynamics of a vehicle negotiating a horizontal curve, and it presents the geometry of the ball-bank indicator. This is a device that can be mounted on a vehicle in motion. The ball-bank reading indicates the combined effect of the body roll angle (ρ), centrifugal force angle (θ), and superelevation angle (ϕ). The centrifugal force is counterbalanced by the vehicle weight component related to the roadway superelevation or by the side friction developed between tires and surface or by a combination of the two.



$\propto$ = *Ball-bank indicator angle*
ρ = *Body roll angle*
θ = *Centrifugal force angle*
ϕ = *Superelevation angle*
β = $\phi - \rho$

GEOMETRY FOR BALL-BANK INDICATOR

Figure 32-2.B

32-2.02(b) Basic Curve Equation

The point-mass formula is used to define vehicular operation around a curve. Where the curve is expressed using its radius, the basic equation for a simple curve is:

$$R = \frac{V^2}{15(e+f)} \quad \text{(US Customary) Equation 32-2.1}$$

$$R = \frac{V^2}{127(e+f)} \quad \text{(Metric) Equation 32-2.1}$$

where:
- R = Radius of curve, ft (m)
- e = Superelevation rate, decimal
- f = Side-friction factor, decimal
- V = Vehicular speed, mph (km/hr)

32-2.02(c) Theoretical Approaches

Establishing horizontal curvature criteria requires a determination of the theoretical basis for the various factors in the basic curvature equation (Equation 32-2.1). These include the set of side-friction factor (f) values and the distribution method between side friction and superelevation. The theoretical basis will be one of the following:

1. Open-Roadway Conditions. Open-roadway conditions apply to all rural facilities and to urban facilities where the design speed (V) ≥ 50 mph (80 km/hr). Open suburban highways may be designed for open roadway conditions if there is a good potential for such a highway becoming closed suburban in 10-15 years. The theoretical basis for horizontal curvature assuming open-roadway conditions includes:

   - relatively low side-friction factors (i.e., a relatively small level of driver discomfort; see Section 32-2.02(e)); and

   - the use of AASHTO Method 5 to distribute side friction and superelevation (see Section 32-2.02(f)).

2. Low-Speed Urban Streets. Low-speed urban streets are defined as streets within an urban or urbanized area where the design speed (V) ≤ 45 mph (70 km/hr). Chapter 48 presents the detailed criteria for horizontal alignment design on these facilities. The theoretical basis for horizontal curvature assuming low-speed urban street conditions includes:

   - relatively high side-friction factors to reflect a high level of driver acceptance of discomfort (see Section (32-2.02(e)); and

   - the use of AASHTO Method 2 to distribute side friction and superelevation (see Section 32-2.02(f)).

3. Turning Roadway Conditions. Turning roadway conditions typically apply to roadways at intersections. See Chapter 36. The theoretical basis for horizontal curvature assuming turning roadway conditions includes:

   - relatively high side-friction factors to reflect a higher level of driver acceptance of discomfort (see Section 32-2.02(e)); and

   - a range of acceptable superelevation rates for combinations of curve radius and design speed to reflect the need for flexibility to meet field conditions for turning roadway design.

32-2.02(d) Superelevation

Superelevation allows a driver to negotiate a curve at a higher speed than would otherwise be comfortable. Superelevation and side friction work together to offset the outward pull of the vehicle as it traverses the horizontal curve. In highway design, it is necessary to establish limiting values of superelevation (e_{max}) based on the operational characteristics of the facility. Section 32-3 discusses e_{max} values for open-roadway conditions on new construction/ reconstruction projects.

32-2.02(e) Side Friction

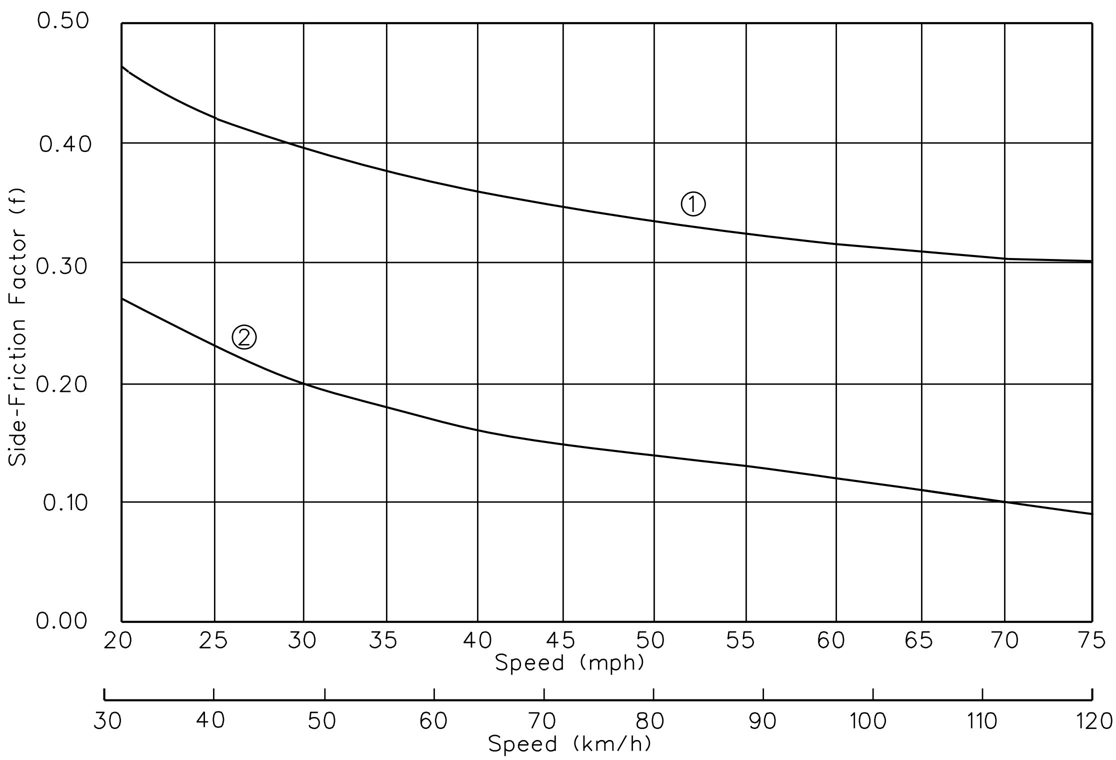
AASHTO has established limiting side-friction factors (f) for various design speeds; see Figure 32-2.C. It is important to realize that the f values used in design represent a threshold of driver discomfort and not the point of impending skid. As indicated in Figure 32-2.C, different sets of f values have been established for different operating conditions; see Section 32-2.02(c). The basis for the distinction is that drivers will accept different levels of discomfort for different operational conditions.

32-2.02(f) Distribution of Superelevation and Side Friction

As discussed above, the minimum radius is based on the e_{max} and f_{max} that apply to the facility. For curvature flatter than the minimum, a methodology must be applied to distribute superelevation and side friction for a given radius and design speed. The following describes the distribution methods:

1. Open-Roadway Conditions. Superelevation and side friction are distributed by AASHTO Method 5, which allows e and f to gradually increase in a curvilinear manner up to e_{max} and f_{max}. This method yields superelevation rates for which the superelevation counteracts nearly all centrifugal force at the average running speed and, therefore, considerable side friction is available for those drivers who are traveling near or above the design speed. Section 32-3 presents the superelevation rates which result from the use of Method 5.

2. Low-Speed Urban Streets. Superelevation and side friction are distributed by AASHTO Method 2, which allows f to increase up to f_{max} before any superelevation is introduced. The practical effect of AASHTO Method 2 is that superelevation is rarely warranted on low-speed urban streets (V ≤ 45 mph (70 km/hr)). Chapter 48 presents the superelevation rates which result from the use of Method 2. For this method of distribution, the superelevation rates may be calculated directly from Equation 32-2.1 using $f = f_{max}$.



① Estimated point of impending skid assuming smooth tires and wet PCC pavement.
② Side-friction factors for design.

COMPARISON OF SIDE-FRICTION FACTORS (f)

Figure 32-2.C

32-2.03 Minimum Radii

The minimum radii is calculated from Equation 32-2.1 using the applicable values of e_{max} and f_{max}. In most cases, the designer should avoid the use of minimum radii because this results in the use of maximum superelevation rates. These rates are not desirable because the highway facility must accommodate vehicles traveling over a wide range of speeds. This is particularly true in Illinois where the entire State is subject to ice and snow, and the rate of superelevation should preclude vehicles that are stopped or traveling slowly from sliding down the cross slope when the pavement is icy. Figures 32-2.D (e_{max} = 8.0%), 32-2.E (e_{max} = 6.0%), and 32-2.F (e_{max} = 4.0%) present the minimum radii for open-roadway conditions.

32-2.04 Maximum Deflection Without Curve

It may be appropriate to omit a horizontal curve where very small deflection angles are present. As a guide, the designer may retain deflection angles of about 1° or less (urban) and 0°15′ or less (rural) on the highway mainline. For these angles, the absence of a horizontal curve should not affect aesthetics.

32-2.05 Minimum Length of Curve

For small deflection angles, horizontal curves should be sufficiently long to avoid the appearance of a kink. For aesthetics, a minimum 550 ft (170 m) length of curve for a 5° central angle will eliminate the sense of abruptness for speeds of 75 mph (120 km/hr). For lower design speeds, however, a 550 ft (170 m) minimum length of curve is not required to eliminate the sense of abruptness, and this length would impose undue requirements on the horizontal curvature. The length of curve required to permit superelevation transition at a speed of 30 mph (50 km/hr) is approximately 100 ft (30 m) at e_{max} = 8.0%. Assuming 100 ft (30 m) for 30 mph (50 km/hr) and 550 ft (170 m) for 75 mph (120 km/hr), Figure 32-2.G is produced by providing logical increments for minimum length of curve for a 5° central angle for the intermediate design speeds.

Where the central angle is less than 5°, the minimum length of curve may be less than the values in Figure 32-2.G. Figure 32-2.H provides approximate adjustments for smaller deflection angles.

For central deflection angles more than 5°, the radius should be used to calculate the length of curve using the following equation:

$$L = \frac{2\pi R\Delta}{360} \qquad \text{Equation 32-2.2}$$

where:
- L = length of curve, ft (m)
- Δ = deflection angle, degrees
- R = radius of curve, ft (m)

ADJUSTMENTS FOR MINIMUM LENGTHS OF CURVE
(Δ < 5°)

Figure 32-2.H

32-3 SUPERELEVATION DEVELOPMENT (Open Roadway Conditions)

This section presents IDOT criteria for superelevation development when using open-roadway conditions. These types of facilities generally exhibit relatively uniform traffic operations. Therefore, for superelevation development, the flexibility normally exists to design horizontal curves with the more conservative AASHTO Method 5 (for distribution of superelevation and side friction) and by providing gentler superelevation transition lengths. This will maximize driver comfort and safety. The following sections present the specific design criteria for superelevation rates and transition lengths assuming open-roadway conditions.

32-3.01 Superelevation Rates

32-3.01(a) Maximum Superelevation Rate

As discussed in Section 32-2, the selection of a maximum rate of superelevation (e_{max}) depends upon several factors. These include urban/rural location, type of existing or expected roadside development, type of traffic operations expected, and prevalent climatic conditions within Illinois. For open-roadway conditions on new construction/reconstruction projects, Figure 32-3.A identifies the selection of e_{max}.

32-3.01(b) Superelevation Tables

Based on the selection of e_{max} and the use of AASHTO Method 5 to distribute e and f, Figures 32-3.B, 32-3.C, and 32-3.D allow the designer to select the appropriate superelevation rate (e) for any combination of curve radius (R) and design speed (V). Note that the superelevation rates in the tables are expressed as percents, which is the accepted presentation on construction plans. For the equations in which superelevation is included (e.g., superelevation runoff equation, point-mass equation for curve radius), e is expressed as a decimal (i.e., (e in %) ÷ 100).

32-3.01(c) Minimum Radii Without Superelevation

A horizontal curve with a very large radius does not require superelevation, and the normal crown section (NC) used on tangent can be maintained throughout the curve. On sharper curves for the same design speed, a point is reached where a superelevation rate of 1.5% across the total traveled way width is appropriate. Figures 32-3.B, 32-3.C, and 32-3.D provide the threshold (or minimum) radius for a normal crown section at various design speeds.

Type of Facility	Design Speed[4]	e_{max}
Rural Highways	V ≥ 60 mph (V ≥ 100 km/hr)	6.0%
Rural Two-Lane Directional or Semi-directional Roadways	V ≥ 55 mph (V ≥ 90 km/hr)	6.0%
Rural Frontage Roads (Type A, B, or C)	V ≤ 55 mph (V ≤ 90 km/hr)	8.0%
Rural Strategic Regional Arterials (SRAs)	V = 60 mph (V = 100 km/hr)	6.0%
High Speed Urban Highways and Urban Two-Lane Directional or Semi-directional Roadways	V ≥ 50 mph (V ≥ 80 km/hr)	6.0%
Open Suburban Likely to Become Closed Suburban Within Next 10 Years [1,2]	V = 50 mph (V = 80 km/hr)	4.0%
Open Suburban Likely to Remain Open Suburban for Next 10 Years [1]	V = 50 or 55 mph (V = 80 or 90 km/hr)	6.0%
Low-Speed, Wrap-Around Frontage Roads (Suburban Areas) and Realigned Township/County Roads Near State Route Intersections	V = 25, 30, 35, 40, 45 mph (V = 40, 50, 60, 70 km/hr)	4.0%
Ramps	km/hrSee Section 37-4.04	6.0% or 8.0% [3]
Last Curve on Stop/Signal Controlled Exit Ramp Tying into Crossroad	V ≤ 40 mph (V ≤ 60 km/hr)	6.0%

Notes:

1. *See Section 43-2 for definitions of suburban types.*

2. *For low-speed urban conditions, see Section 48-5 for values of $e_{max.}$*

3. *With snow and ice conditions and considering stop and go traffic during rush hours, use a maximum superelevation of 6%.*

4. *For more information on selection of design speeds for different highway types, see the chapters in Part V and Chapters 36 and 37.*

Figure 32-3.D

32-3.02 Transition Lengths

As defined in Section 32-1, the superelevation transition length is the distance required to transition the roadway from a normal crown section to the full design superelevation rate. The superelevation transition length is the sum of the tangent runout distance (TR) and superelevation runoff length (L_1).

32-3.02(a) Two-Lane Highways

Superelevation Runoff

Figure 32-3.E presents the superelevation runoff lengths (L_1) for two-lane highways for various combinations of curve radii and design speed. These lengths are calculated using the following equation:

$$L_1 = (e)(W)(RS) \qquad \text{Equation 32-3.1}$$

where:

- L_1 = Calculated superelevation runoff length for a two-lane highway (assuming the axis of rotation is about the roadway centerline), ft (m)
- e = Design superelevation rate, decimal
- W = Width of rotation for one lane (assumed to be 12 ft (3.6 m))
- RS = Reciprocal of relative longitudinal gradient between the profile grade and outside edge of two-lane highway (see Figure 32-3.F)

Tangent Runout

To ensure that the relative longitudinal gradient for the tangent runout (TR) will equal that for the superelevation runoff, the tangent runout distance should be calculated using the following equation:

$$TR = \frac{S_{normal}}{e}(L_1) \qquad \text{Equation 32-3.2}$$

where: S_{normal} = Travel lane cross slope on tangent, decimal

Superelevation Transition Length

Once the tangent runout (TR) distance is calculated, this distance is added to the design superelevation runoff length (L_1). The total equals the theoretical superelevation transition length used for design at an isolated horizontal curve.

Notes:

1. *The relative longitudinal slopes are assumed to be measured between two lines set 12 ft (3.6 m) apart.*

2. *The gradients shown were derived from values contained in the AASHTO* A Policy on Geometric Design of Highways and Streets.

RELATIVE LONGITUDINAL GRADIENTS

Figure 32-3.F

32-3.02(b) Multilane Highways

There is a wide variety of potential typical cross sections for a multilane highway. The variables include:

- number of lanes in each direction;
- type of median;
- use of a uniform cross slope or a crowned section;
- for crowned sections, location of crown point; and
- use of variable cross slopes for individual travel lanes (e.g., the lanes not adjacent to the crown point may be sloped at a steeper rate than those adjacent to the crown).

In all cases, the first objective in superelevation development is to transition the highway from the typical cross section to a section that slopes at a uniform rate across the traveled way in the same direction. Regardless of the typical cross section on tangent, this transition must be achieved to meet certain criteria and principles, including:

1. Rate of Transition. The rate of transition (i.e., the relative longitudinal gradient) should be the same as that for the superelevation runoff. This requires that the runoff be calculated first and the resultant relative gradient be calculated for the runoff. Note that Equation 32-3.4 can be used to calculate the superelevation runoff (L_{ML}) for all multilane highways regardless of the typical section on tangent.

2. Point of Rotation. Section 32-3.03(b) discusses the axes of rotation for multilane highways, which is in many cases the two median edges. However, an “initial” axis of rotation (and sometimes more than one) must be selected to remove any crown and achieve a planar section. This will often be a point other than that used for the “primary” axes of rotation to transition from the uniform cross slope to the design superelevation rate.

3. Tangent Runout. The end of the tangent runout occurs where the outside travel lane(s) are level. Where this involves more than one travel lane, the length of the tangent runout must be consistent with the criteria in Figure 32-3.G, which varies the length of transition according to the number of lanes rotated. Also, note that the initial part of the superelevation runoff is used to transition from the end of the tangent runout to a roadway section with a uniform slope.

Number of Lanes Rotated	"C" Ratio
1	1.0
1.5	1.25
2	1.5
2.5	1.75
3	2.0
3.5	2.25

"C" RATIO
(Adjustment Factor for Number of Lanes Rotated)

Figure 32-3.G

Because of the many variables in superelevation development on multilane highways, the following discussion is predicated on the following roadway characteristics:

- a four-lane divided highway,
- a median type and width where Department practice is to rotate about the two median edges (see Section 32-3.03(b)), and
- a typical section on tangent where each roadway is crowned at the centerline.

Section 48-5 discusses superelevation development for a raised median section where each traveled way has a uniform slope away from the raised median.

Superelevation Runoff

Figure 32-3.E provides the superelevation run off lengths (L_{ML}) for a four-lane divided highway for various combinations of curve radii and design speeds. The superelevation runoff length for a multilane highway is calculated by using the following equation:

$$L_{ML} = C \times L_1 \qquad \text{Equation 32-3.4}$$

where:

L_{ML} = Superelevation runoff length for multilane highway, ft (m)

L_1 = Calculated superelevation runoff length for a two-lane highway (assuming rotation about the centerline), ft (m)

C = Ratio of runoff length for a multilane highway to L_1 (see Figure 32-3.G)

Tangent Runout

For multilane highways, the relative longitudinal gradient for the tangent runout should equal that for the superelevation runoff. This first requires the calculation of the gradient (or its reciprocal, RS) for the runoff:

$$G_{SR} = \frac{(2W)(e) - (S_{normal})(W)}{L_{ML}}$$ Equation 32-3.5

where:

G_{SR}	=	relative longitudinal gradient for superelevation runoff (at the outside edge of the traveled way), decimal
W	=	width of one travel lane, ft (m)
e	=	design superelevation rate, decimal
S_{normal}	=	travel lane cross slope on tangent, decimal
L_{ML}	=	superelevation runoff length for multilane highway, ft (m)

Now, the tangent runout (TR_{ML}) can be calculated from the following equation:

$$TR_{ML} = (S_{normal})(W)(RS_{SR})$$ Equation 32-3.6

where: RS_{SR} = $(1/G_{SR})$ = reciprocal of relative longitudinal for superelevation runoff

Superelevation Transition Length

The theoretical superelevation transition length is the sum of the superelevation runoff and tangent runout distances. This length is used for design at an isolated horizontal curve.

32-3.02(c) Application of Transition Length

Once the superelevation runoff and tangent runout have been calculated, the designer must determine how to fit the length into the horizontal and vertical planes. The following will apply:

1. Simple Curves. Typically for new construction/reconstruction projects, 67% of the superelevation runoff length will be placed on the tangent and 33% on the curve. Exceptions to this practice may be necessary to meet field conditions. The generally accepted range is 60% - 80% on tangent and 40% - 20% on curve. In extreme cases (e.g., to avoid placing any superelevation transition on a bridge or approach slab), the superelevation runoff may be distributed 50% - 100% on the tangent and 50% - 0% on the curve. This will usually occur only in urban or suburban areas with highly restricted right-of-way conditions.

   When considering the tangent runout distance, the result is a distribution of the total superelevation transition length of approximately 75% on the tangent and 25% on the curve. IDOT also uses this approximate distribution ratio at isolated horizontal curves. However, because the distribution of the superelevation transition length is not an exact science, the ratio should be rounded up or down slightly (to the nearest 5 ft (1 m) increment) to simplify design and layout in construction.

2. Spiral Curves. The design superelevation runoff length is typically assumed to fit the spiral curve length (TS to SC and CS to ST). Therefore, all of the tangent runout is placed on the tangent before the TS and after the ST.

3. Field Application (Vertical Profile). At the beginning and end of the superelevation transition length, angular breaks occur in the profile if not smoothed. Field personnel usually smooth these abrupt angular breaks out during construction. This is usually accomplished by visually adjusting the wire used to control the vertical and horizontal position of the bituminous concrete paver or slip-form paver.

   As a guide, the vertical curve transitions, to eliminate angular breaks, should have a length in feet numerically equivalent to approximately the design speed in mph (in meters approximately 20% of design speed in km/hr). In addition, designers should graphically or numerically investigate the transition areas to identify potential flat spots for drainage before finalizing construction plans.

4. Ultimate Development. If the proposed facility is planned for an ultimate development of additional lanes, the designer should, where practical, reflect this length in the initial superelevation transition application. For example, a four-lane divided facility may be planned for an ultimate six-lane divided facility. Therefore, the superelevation transition length for the initial four-lane facility should be consistent with the future requirements of the six-lane facility.

5. Typical Figures/Examples. Section 32-3.08 presents typical figures for superelevation development of tangent runout and superelevation runoff for two-lane highways and different median types on multilane facilities. Section 32-3.09 presents two examples to illustrate superelevation development.

32-3.03 Axis of Rotation

The following discusses the axis of rotation for two-lane, two-way highways and multilane highways. Section 32-3.08 presents typical figures illustrating the application of the axis of rotation in superelevation development.

32-3.03(a) Two-Lane, Two-Way Highways

The axis of rotation will typically be about the centerline of the roadway on two-lane, two-way highways. This method will yield the least amount of elevation differential between the pavement edges and their normal profiles. Occasionally, it may be necessary to rotate the pavement about the inside or outside edge of the traveled way. This may be necessary to meet field conditions (e.g., drainage on a curbed facility, roadside development). Note that, in this case, two travel lane widths will be rotated, and the superelevation runoff should be lengthened according to Figure 32-3.G.

On a two-lane highway with an auxiliary lane (e.g., a climbing lane), the axis of rotation will typically be about the centerline of the two through lanes.

32-3.03(b) Multilane Divided Highways

The axis of rotation will typically be about the two median edges for a multilane divided facility with a concrete barrier, a raised curb median > 16 ft (5.0 m), or a depressed median ≥ 40 ft (12 m). When the median edges are used as the axes of rotation, the median will remain in the same horizontal plane throughout the curve.

Several highway features may significantly influence superelevation development for multilane divided highways. These could include guardrail, median barriers, drainage, and major at-grade intersections. If a major cross road intersection is present where the median width is 18 ft (5.5 m), 22 ft (7.0 m), 30 ft (9.5 m), or 36 ft (10.5 m), it is recommended that the entire cross section of the mainline be rotated about the centerline of the roadway. This method of rotation will provide better operations for cross road traffic.

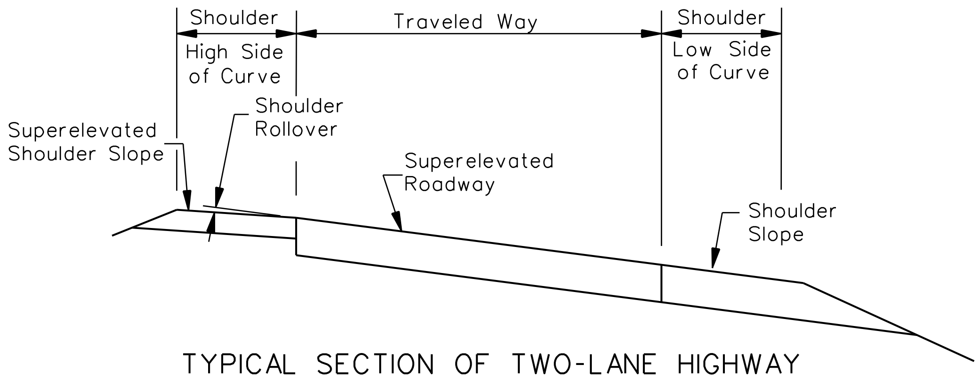
The designer should carefully consider the intended function of all highway features and ensure that the superelevated section and selected axis of rotation does not compromise traffic operations. In addition, the designer should consider the likely ultimate development of the facility and select an axis of rotation that will lend itself to future expansion.

32-3.03(c) Multilane Highways with Narrow/Flush Medians

The following types of multilane highways should develop superelevation by rotating the roadway about its centerline:

- existing 4 ft (1.2 m) wide median or undivided multilane highways not planned for reconstruction;
- multilane highways with flush medians;
- proposed multilane highways with a 16 ft (5.0 m) wide traversable median;
- proposed multilane highways with a raised curb median equal to 16 ft (5 m); or
- all highways with proposed flush two-way, left-turn lane (TWLTL).

The raised curb median 16 ft (5 m) wide should only be considered in the reconstruction category where right-of-way is highly restricted.



SHOULDER TREATMENT THROUGH SUPERELEVATED CURVE

Figure 32-3.H

32-3.04 Shoulder Superelevation

Figure 32-3.H illustrates the shoulder treatment on superelevated sections. The following discusses specific criteria.

32-3.04(a) Shoulder (High Side of Curve)

On the high side of superelevated sections, there will be a break in the cross slopes of the travel lane and shoulder. The following criteria will apply to this shoulder rollover:

1. Algebraic Difference. The rollover should not exceed 8.0% for new construction or reconstruction projects.

2. Minimum Shoulder Slope. On the high side of a curve, the shoulder slope may be designed for 0% so that maximum rollover is not exceeded. However, in this case, the longitudinal gradient at the edge of the traveled way should not be less than 0.5% for proper shoulder drainage.

3. Direction of Slope. If practical, the shoulder should slope away from the travel lane.

4. Shoulder as Deceleration Lane. Figure 36-2.L presents cross slope rollover criteria between a turning roadway and a through travel lane at an intersection. Where turning vehicles might use the shoulder, the designer may want to use the turning roadway rollover criteria (4.0% to 5.0%) rather than the 8.0% maximum rollover.

32-3.04(b) Shoulder (Low Side of Curve)

On the low side of a superelevated section, IDOT's typical practice is to retain the normal shoulder slope (4% typical) until the adjacent superelevated travel lane reaches that slope. The shoulder is then superelevated concurrently with the travel lane until the design superelevation rate is reached (i.e., the inside shoulder and travel lane will remain in a plane section).

32-3.05 Compound Curves

Superelevation development for compound curves requires the consideration of several factors. For two-lane roadways, these are discussed in the following sections for two Cases:

- Case I: The distance between the PC and PCC is 300 ft (90 m) or less.
- Case II: The distance between the PC and PCC is greater than 300 ft (90 m).

32-3.05(a) Case I

For Case I, superelevation development for compound curvature on two-lane roadways should meet the following objectives:

1. Relative Longitudinal Gradient (RS). A uniform RS should be provided throughout the superelevation transition (from normal crown section to design superelevation rate at the PCC).

2. Superelevation at PC. Section 32-3.02 will yield the design superelevation rate (e_1) for the first curve. At the PC, 67% e_1 should be reached.

3. Superelevation at PCC. The criteria in Section 32-3.02 will yield the design superelevation rate (e_2) for the second curve; e_2 should be reached at the PCC.

4. Superelevation Runoff Length. Section 32-3.02 will yield the superelevation runoff (L_1) for the first curve. The superelevation should be developed such that 67% of L_1 is reached at the PC.

5. Tangent Runout Length. TR will be determined as described in Section 32-3.02.

To meet all or most of these objectives, the designer may need to try several combinations of curve lengths, curve radii, and longitudinal gradients to find the most practical design. Section 32-3.08 presents a typical figure for Case I superelevation development for a compound curve.

32-3.05(b) Case II

For Case II, the distance between the PC and PCC (> 300 ft (90 m)) is normally large enough to allow the two curves to be evaluated individually. Therefore, the superelevation development on two-lane roadways should meet the following objectives for Case II:

1. First Curve. Superelevation should be developed assuming the curve is an independent simple curve. Therefore, the criteria in Section 32-3 for superelevation rate, transition length, and distribution between tangent and curve apply.

2. Intermediate Treatment. Superelevation for the first curve (e_1) is reached a distance of 33% of the superelevation runoff length beyond the PC. e_1 is maintained until it is necessary to develop the needed superelevation rate (e_2) for the second curve.

3. Second Curve. Assuming the second curvature has a sharper radius of curve than the first curve, a higher rate of superelevation will be required ($e_2 > e_1$). e_2 should be reached at the PCC. The distance needed for the additional superelevation development is not specified, except that the maximum RS for the highway design speed should not be exceeded. One logical treatment would be to apply the same RS used for the superelevation transition of the first curve. This would provide a uniform change in gradient for the driver negotiating the compound curve.

Section 32-3.08 presents a typical figure for Case II superelevation development for a compound curve.

32-3.05(c) Multilane Highways

Superelevation development for compound curvature on multilane highways should, as practical, be designed to:

- meet the principles of superelevation development for simple curves on multilane highways (see applicable criteria in Section 32-3); and

- meet the objectives for Case I or Case II as described for two-lane roadways.

The treatment for multilane highways will be determined on a case-by-case basis, reflecting individual site conditions.

32-3.06 Reverse Curves

Reverse curves are two closely spaced simple curves with deflections in opposite directions. For this situation, it may not be practical to achieve a normal crown section between the curves. A plane section continuously rotating about its axis (e.g., the centerline) can be maintained between the two curves, if they are close enough together. The designer should adhere to the applicable superelevation development criteria for each curve. The following will apply to reverse curves:

1. Normal Section. The designer should not attempt to achieve a normal tangent section between reverse curves unless the normal section can be maintained for a minimum of two seconds of travel time, and the superelevation transition requirements can be met for both curves. These criteria yield the following minimum tangent distance (between PT of first curve and PC of second curve) by using the following equation:

$$L_{tan} \geq 0.67L_A + TR_A + 2(1.47V) + TR_B + 0.67L_B$$ (US Customary) Equation 32-3.7

$$L_{tan} \geq 0.67L_A + TR_A + 2(0.278V) + TR_B + 0.67L_B$$ (Metric) Equation 32-3.7

where:
- L_{tan} = Tangent distance between PT and PC, ft (m)
- L_A = Superelevation runoff length for first curve, ft (m)
- TR_A = Tangent runout length for first curve, ft (m)
- V = Design speed, mph (km/hr)
- TR_B = Tangent runout length for second curve, ft (m)
- L_B = Superelevation runoff length for second curve, ft (m)

2. Continuously Rotating Plane. If a normal section is not provided, the pavement will be continuously rotated in a plane about its axis. In this case, the minimum distance between the PT and PC will be 67% of each superelevation runoff requirement added together. Use the following equation:

$$L_{tan} = 0.67L_A + 0.67L_B$$ Equation 32-3.8

where terms are as defined in No. 1 above.

Figure 32-3.I illustrates superelevation development for reverse curves designed as a continuously rotating plane.

32-3.07 Bridges

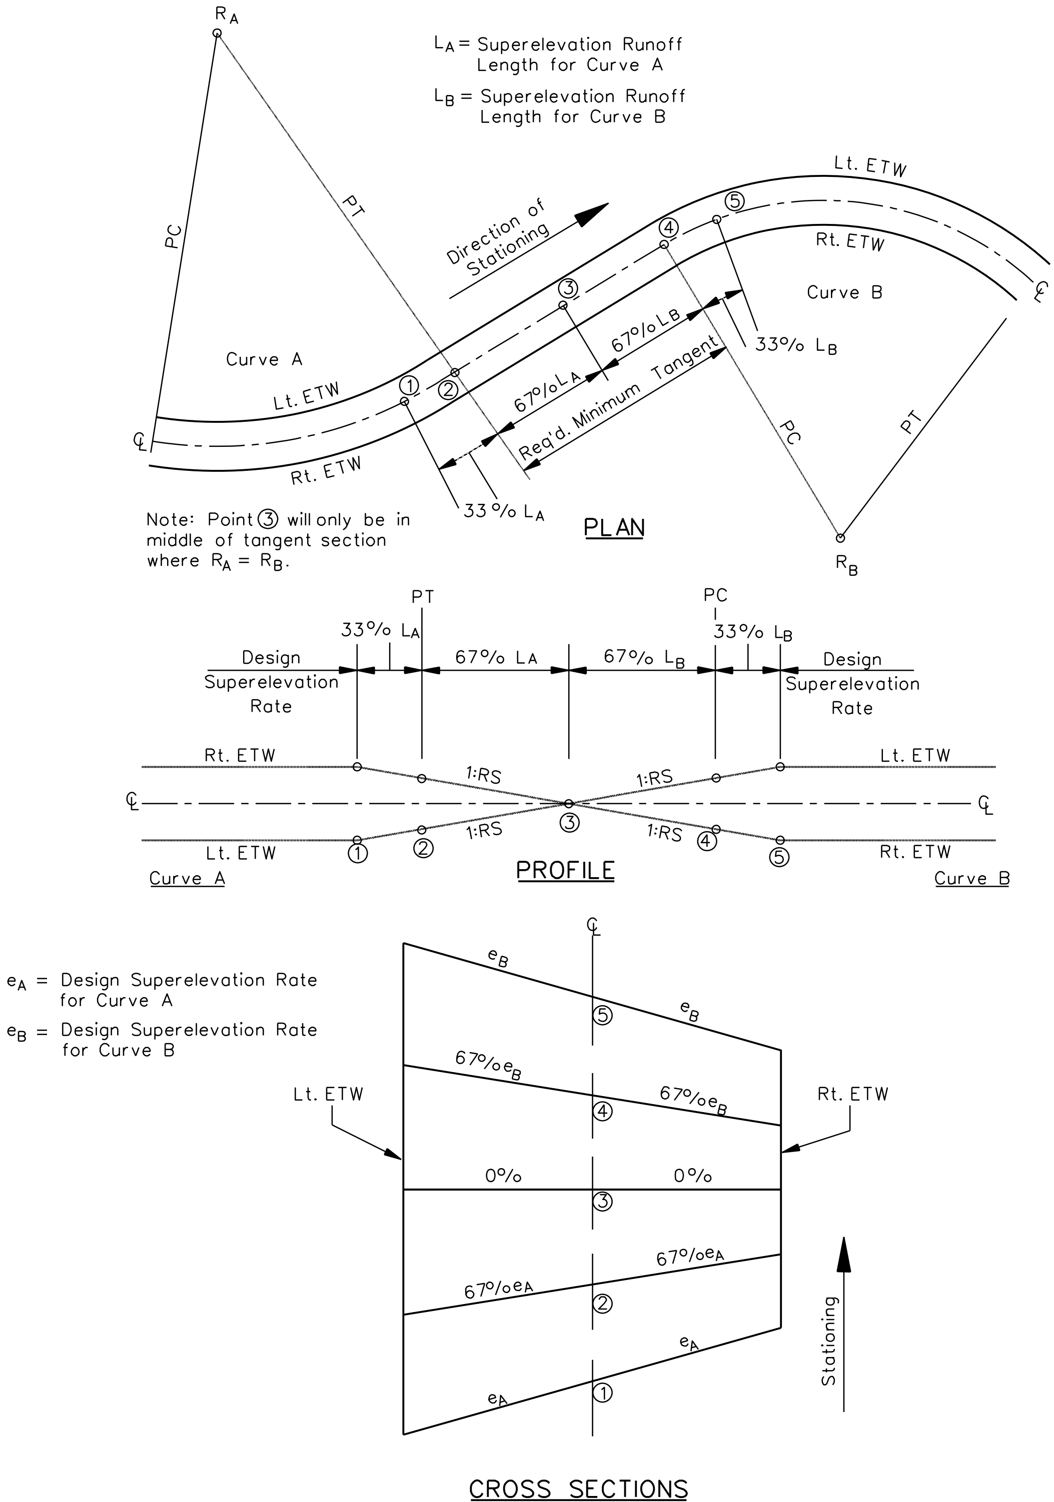
Superelevation transitions should be avoided on bridges and their approaches. To achieve this in rural areas, the beginning of a horizontal curve should usually be a minimum of 400 ft (120 m) from the back of the bridge abutment. Where a curve is necessary on a bridge, the desirable treatment is to place the entire bridge and its approaches on a flat horizontal curve with minimum superelevation. In this case, a uniform superelevation rate is provided throughout (i.e., the superelevation transition is neither on the bridge nor its approaches). In some cases, however, superelevation transitions are unavoidable on urban bridges due to right-of-way constraints.

Where a bridge is located within a superelevated horizontal curve, the entire bridge roadway will be sloped in the same direction and at the same rate (i.e., the shoulder and travel lanes will be in a plane section). This also applies to the approach slab and approach slab shoulders before and after the back of the abutment. This is illustrated in Chapter 39. However, as discussed in Section 32-3.04, the high-side shoulder on a roadway section will slope away from the traveled way at a rate such that the maximum rollover does not exceed 8.0%.

Therefore, to not exceed the rollover criteria, it is necessary to transition the longitudinal shoulder slope adjacent to the roadway travel lanes to meet the shoulder slope adjacent to the travel lanes on the bridge. This transition should be accomplished by using a maximum relative longitudinal gradient of 0.40% between the edge of traveled way and outside edge of shoulder.

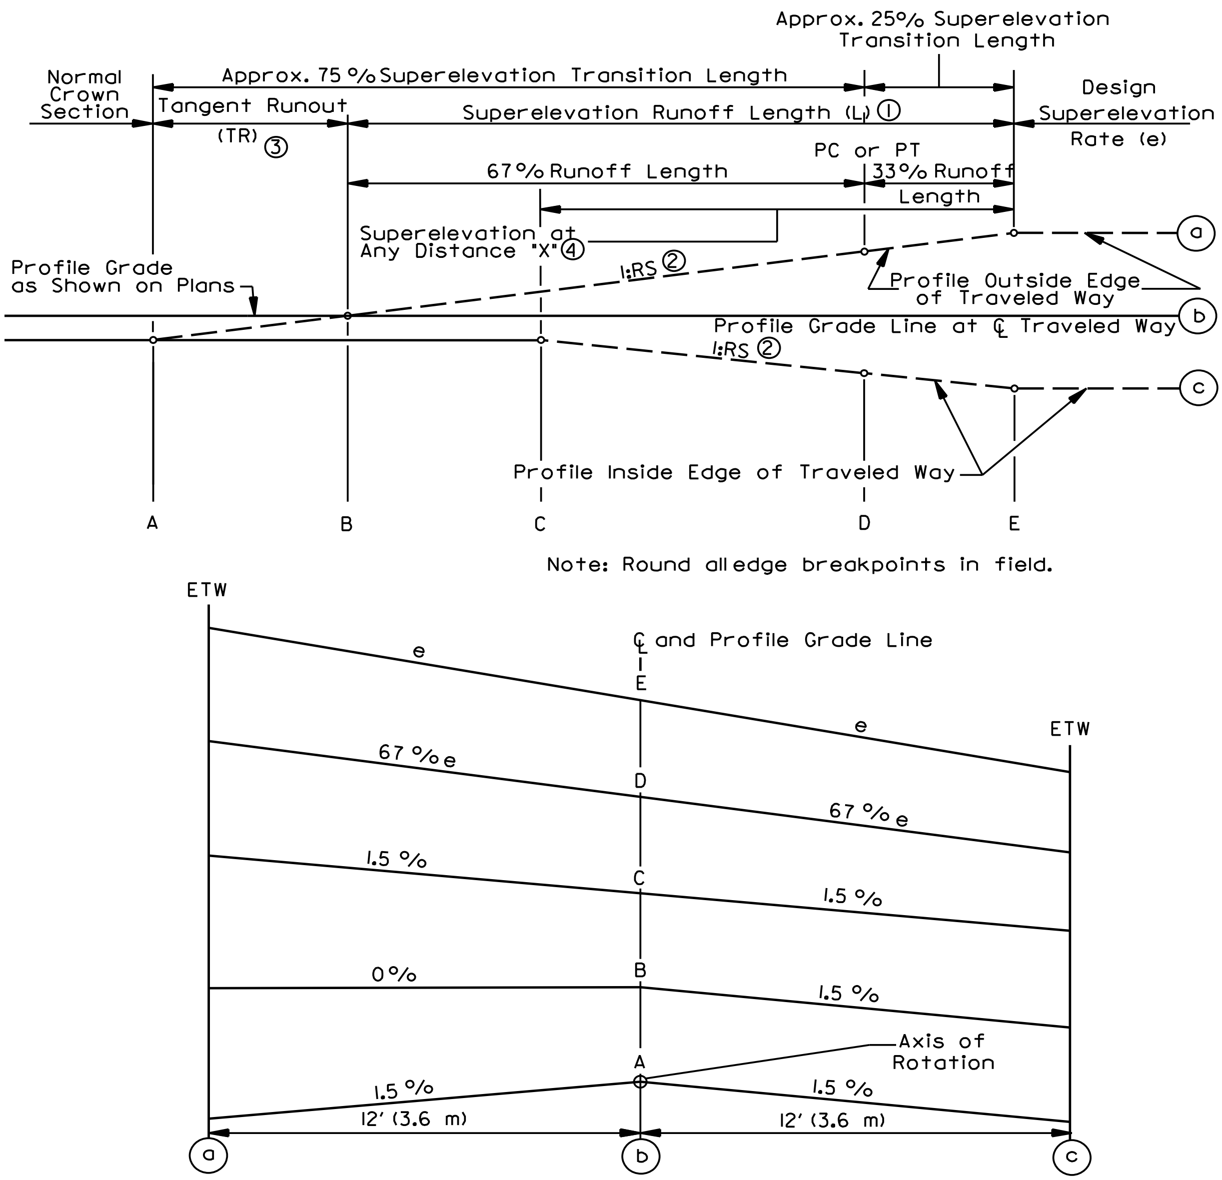
32-3.08 Typical Superelevation Figures

Figures 32-3.J through 32-3.M present superelevation development methods that will often be the most applicable to typical site conditions. Other superelevation methods or strategies may need to be developed on a case-by-case basis to meet specific field conditions. The acceptability of superelevation development methods other than those in the typical figures will be judged individually.



SUPERELEVATION DEVELOPMENT FOR REVERSE CURVES
(Continuously Rotating Plane)

Figure 32-3.I



① $L_1 = e \times W \times RS$

See Section 32-3.02(a) for a discussion on superelevation runoff calculations.

② The relative gradient of the superelevation runoff (G_{SR}, decimal) is:

$G_{SR} = 12e/L_1$ (US Customary)

$G_{SR} = 3.6e/L_1$ (Metric)

$RS = 1/G_{SR}$

③ Tangent Runout = $\frac{S_{normal}}{e}(L_1)$

④ Superelevation rate (e) at any distance “X” up to full superelevation attainment

$$= 0.015 + \frac{G_{SR} \text{ x Distance "X"}}{12} \quad \text{(US Customary)}$$

$$0.015 + \frac{G_{SR} \text{ x Distance "X"}}{3.6} \quad \text{(Metric)}$$

SUPERELEVATION DEVELOPMENT FOR COMPOUND CURVES

Figure 32-3.M

32-3.09 Examples

The following examples illustrate the application of the superelevation development criteria in Section 32-3.

Example 32-3.1

Given: Facility — New four-lane divided freeway with a depressed median
Travel lane cross slope = 3/16″/ft (on tangent) = 0.015 = S_{normal}
Crown at centerline of each roadway
Shoulder cross slope = 1/2″/ft (on tangent) = 0.04
Lane width = 12 ft
Inside shoulder width = 8 ft
Outside shoulder width = 10 ft
Median width = 56 ft
Design speed = 70 mph
R = 2500 ft
PC = Station 65 + 50.00 (Curve to the right)

Note: Cross section A in Figure 32-3.N illustrates the typical tangent section.

Problem: With the axes of rotation about the median edges, determine the following details for superelevation development of the above horizontal curve:

- e_{max}
- design superelevation rate, e
- design superelevation runoff length, L_{ML}
- relative longitudinal gradients for superelevation runoff, G_{SR}
- tangent runout length, TR_{ML}
- shoulder rollover treatment, and
- reciprocal of relative longitudinal gradients (RS) between centerline and median edge of traveled way and between the two edges of the traveled way.

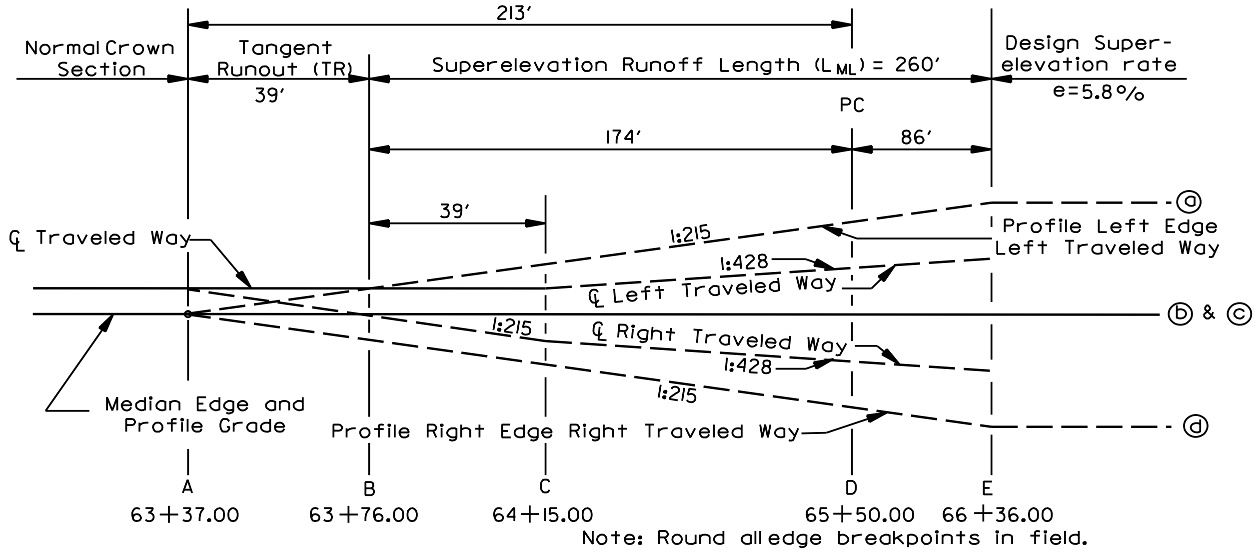
Solution: The details for the superelevated curve are determined as follows, and Figure 32-3.N presents the completed example and shows all stationing:

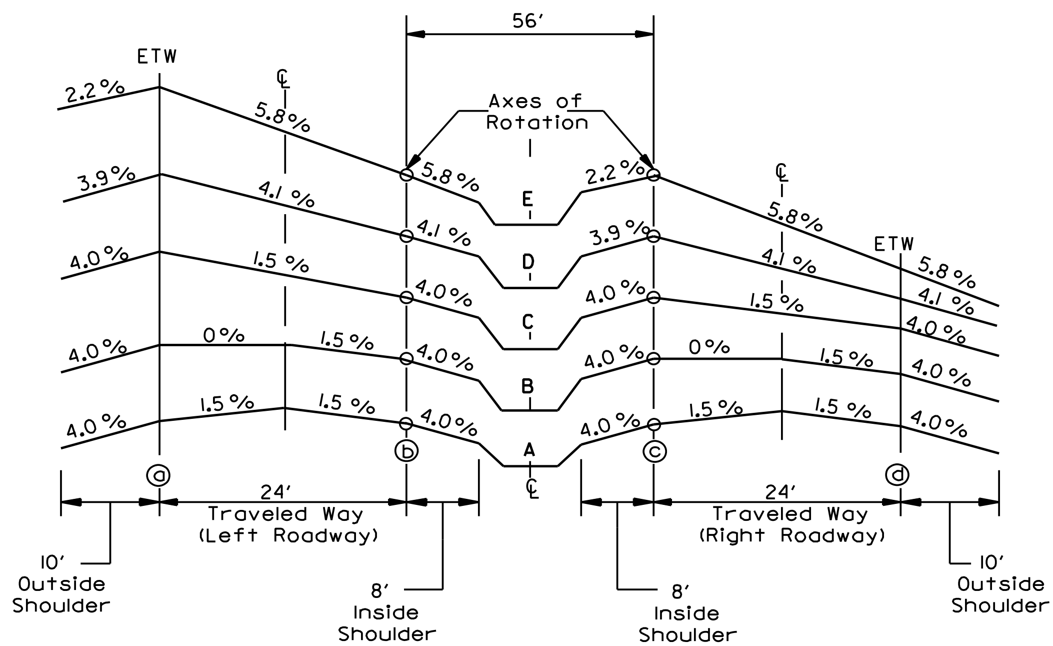
1. Determine e_{max}

   Based on Figure 32-3.A, e_{max} = 6.0% for rural highways with open-roadway conditions (V ≥ 70 mph).

2. Determine Design Superelevation Rate (e).

   From Figure 32-3.C, for R = 2500 ft and V = 70 mph, e = 5.8%.





AXIS OF ROTATION ABOUT MEDIAN EDGES
(Example 32-3.1)

Figure 32-3.N

3. Determine Design Superelevation Runoff Length (L_{ML}).

For a divided highway with a 56 ft depressed median, rotate the travel lanes about the two median edges.

From Figure 32-3.E, for a four-lane divided highway, L_{ML} = 261 ft

To calculate L_{ML} :

Based on Equation 32-3.4, runoff length (L_{ML}) is equal to (L_1) x (C).

Using Equation 32-3.1 to calculate L_1 = (e)(W)(RS)

From Figure 32.3.F, RS = 250

Therefore, L_1 = (0.058)(12)(250) = 174 ft

From Figure 32-3.G, the "C" ratio for rotating two lanes about the median edge is = 1.5.

Therefore: $L_{ML} = (L_1)(C) = (174)(1.5) = 261$ ft Use 260 ft

Distribution of L_{ML} is 67%(260) = 174 ft on tangent and 33%(260) = 86 ft on curve.

4. Determine Tangent Runout Length (TR).

Use Equation 32-3.5 to calculate the relative longitudinal gradient of the superelevation runoff:

$$G_{SR} = \frac{(2W)(e) - (S_{normal})(W)}{L_{ML}}$$

$$G_{SR} = \frac{(2)(12)(0.058) - (0.015)(12)}{260}$$

$G_{SR} = 0.0046615$ $RS_{SR} = (1/G_{SR}) = 215$

Use Equation 32-3.6 to calculate the tangent runout:

$TR_{ML} = (S_{normal})(W)(RS_{SR})$

$TR_{ML} = (0.015)(12)(215)$

$TR_{ML} = 38.7 \text{ ft} \approx 39 \text{ ft}$

5. Determine Shoulder Rollover Treatment.

Desirably, the maximum shoulder rollover on the high side of each curve should not exceed 8.0%. Therefore, with a shoulder cross slope of 4.0% on tangent, begin rotating the high-side shoulder where the travel lanes reach a superelevation rate of -4.0% (negative sign for downward slope away from the shoulder break). To determine where e = 4.0%, use G_{SR} = 0.0046615 for the superelevation runoff length.

Next, use the equation in Note ④ from Figure 32-3.L and set the superelevation rate to 4% to calculate the distance X from Section C:

$$e_X = 0.015 + \frac{G_{SR}\ \text{x Distance "X"}}{24}$$

$$X = \frac{(24)(e_X - 0.015)}{G_{SR}}$$

$$X = \frac{(24)(0.04 - 0.015)}{0.0046615}$$

X = 128.71 ft (from Section C)

On the high-side of each roadway, the shoulder slope remains at 4% until the superelevation rate equals 4%, which will occur at 128.71 ft beyond where the travelways become planar (Section C). Once 4% is attained, the high-side shoulder is rotated such that the shoulder rollover remains at 8% until reaching the design superelevation rate and remains at this slope until the pattern is reversed when superelevation starts transitioning again. Where the superelevation reaches 5.8%, the shoulder will be sloped 2.2% away from the traveled way. See Figure 32-3.N for schematic details.

6. Determine Relative Longitudinal Slopes (RS).

The RS values and relative gradients can be calculated using the basic equation:

$$\text{RS} = \frac{\text{Length of Transition}}{\Delta\ \text{Elevation}};\ \text{G(\%)} = \frac{1}{\text{RS}}\ \text{x } 100$$

a. Between Two Edges of Traveled Way.

As previously calculated in Step 4:

G (%) = 0.0046615 x 100 = 0.47%

RS = 215

b. Between Median Edge and Centerline.

Determine G_{CL}, which is the longitudinal gradient of the centerline relative to the median edge:

$$G_{CL} = \frac{(\text{e x W}) - (\text{cross slope@Section C x W})}{\text{Length of slope along median edge}}$$

$$G_{CL} = \frac{(0.058 \times 12) - (0.015 \times 12)}{(174 + 86) - 39}$$

$$G_{CL} = \frac{0.696 - 0.18}{221} = 0.0023348 = 0.23\%$$

$$RS_{CL} = \left(\frac{1}{G_{CL}}\right) = 428$$

Example 32-3.2

Given: Facility — Four-lane divided highway with raised-curb median (open suburban area likely to become closed suburban within 10 years)
Travel lane width = 12 ft
Travel lane cross slope = 1/4″/ft (on tangent) = 0.02 = S_{normal}
Travel lanes all slope away from median edges
Gutter width = 2 ft
Gutter cross slope = 3/4″/ft (on tangent) = 0.06
Median gutter slopes towards median
Outside gutter slopes away from traveled way
Median width = 22 ft
Design speed = 50 mph and will post at 45 mph.
R = 1800 ft
PC = Station 65 + 50.00 (Curve to Right)
Superelevation runoff is distributed 67% on tangent and 33% on curve.

Note: Cross section A in Figure 32-3.O illustrates the tangent section.

Problem: With the axes of rotation about the median edges, determine the following details for superelevation development of the above horizontal curve:

- e_{max}
- design superelevation rate, e
- design superelevation runoff length, L_{ML}
- relative longitudinal gradient for superelevation runoff, G_{SR}
- tangent runout length, TR_{ML}
- gutter treatment, and
- reciprocal of relative longitudinal gradients (RS) between the two outside edges of traveled way and between the centerline and median edge of traveled way.

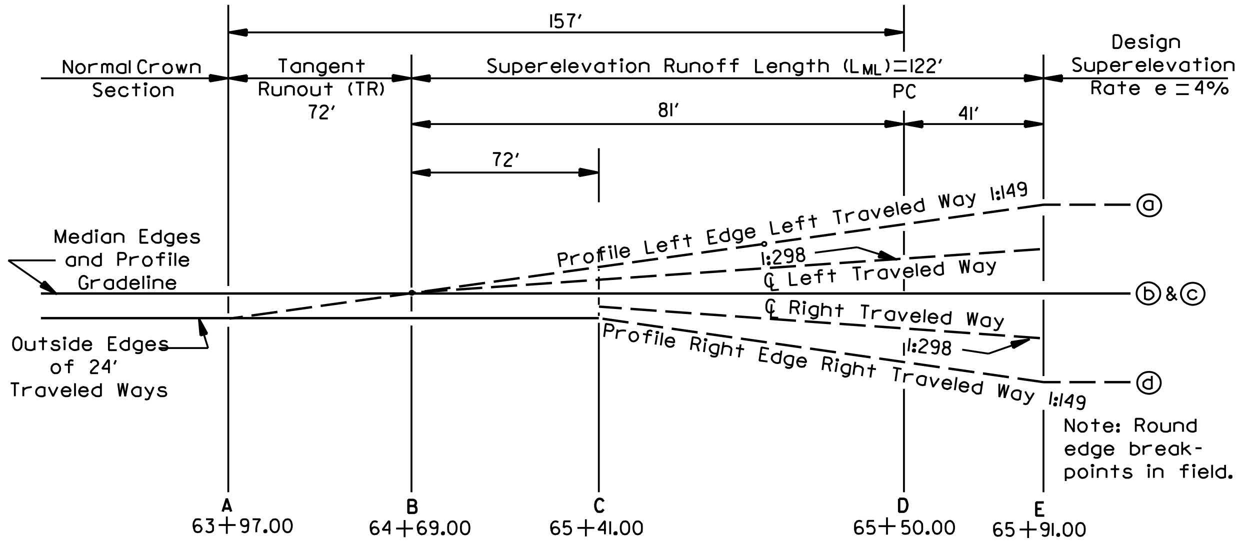
Solution: The details of the superelevated curve are determined as follows, and Figure 32-3.O presents the completed example and shows all stationing:

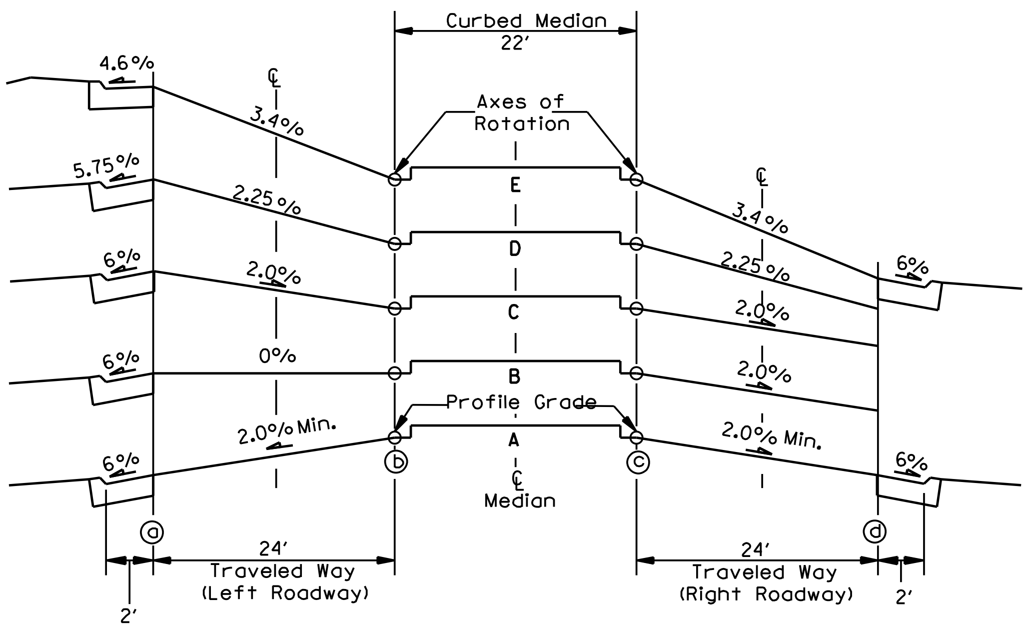
1. Determine e_{max}.

   Based on Figure 32-3.A, e_{max} = 4.0% for an open suburban area likely to become closed suburban within next 10 years (V = 50 mph).

2. Determine Design Superelevation Rate (e).

   From Figure 32-3.D, for R = 1800 ft and V = 50 mph, e = 3.4%.





AXIS OF ROTATION ABOUT MEDIAN EDGES
(Multilane Highway With Curbed Median)
(Example 32-3.2)

Figure 32-3.O

3. Determine Design Superelevation Runoff Length (L_{ML}).

For a divided highway with a 22 ft raised-curb median, rotate the travel lanes about the two median edges.

From Figure 32-3.E, for a four-lane divided highway, L_{ML} = 122 ft

To calculate L_{ML}:

Based on Equation 32-3.4, runoff length (L_{ML}) is equal (L_1) x (C).

Using Equation 32-3.1 to calculate L_1 = (e)(W)(RS)

From Figure 32-3.F, RS = 200

Therefore, L_1= (0.034)(12)(200) = 81.6 ft

From Figure 32-3.G, the "C" ratio for rotating two lanes about the median edge is = 1.5.

Therefore, L_{ML} = (L_1)(C) = 81.6 x 1.5 = 122.4 ft. Use L_{ML} = 122.4 ft.

Distribution of L_{ML} is 67% (122) = 81 ft on tangent and 33% (122) = 41 ft on curve.

4. Determine Tangent Runout Length (TR).

Because the typical section includes a uniform cross slope across the traveled way, modify Equation 32-3.2 for multi-lanes, using the runoff length (L_{ML}), and calculate the tangent runout (TR_{ML}):

$$TR_{ML} = \frac{S_{normal}}{e}(L_{ML})$$

$$TR_{ML} = \frac{0.02}{0.0034}(122)$$

$$TR_{ML} = 71.6\ \text{ft} \approx 72\ \text{ft}$$

5. Determine Outside Gutter Treatment.

On the low side of each traveled way, the slope gutters will remain at the standard 6% throughout the curve. On the high side of each traveled way, the gutters will be set at 6% until an 8% breakover occurs between the gutter pans and the adjacent pavement. From this point, the cross slope of the gutter pans on the high side are rotated with the roadway through the superelevation transition maintaining an 8% breakover. See Figure 48-5.E. Therefore, with a gutter slope of 6%, keep the high side gutter slopes at 6% up to the location where the superelevation rate is 2% downward away from the gutters. To determine where e = 2%, first use the equation in Note ② from Figure 48-5.E to determine the relative longitudinal gradient for the superelevation runoff length:

$$G_{SR} = \frac{24e}{L_{ML}} = \frac{(24)(0.034)}{122}$$

$G_{SR} = 0.00669$ $RS_{SR} = (1/G_{SR}) = 149$

Next, use the equation in Note ④ from Figure 48-5.E and set the superelevation rate to 2%. Calculate distance X:

$$e_X = \frac{G_{SR} \text{ x Distance "X"}}{24}$$

$$X = \frac{(24)(e_X)}{G_{SR}} = \frac{(24)(0.02)}{0.00669}$$

X = 71.75 ft

On the high side of the traveled ways, the gutter slope remains at 6% until the superelevation rate equals 2%, which occurs 71.75 ft beyond the end of the tangent runout. Once 2% is attained on each traveled way, the gutter is rotated up until reaching the location of the design superelevation rate. Where e reaches 3.4%, the gutter is sloped at 4.6% away from the traveled way and remains at this slope until the pattern is reversed when superelevation starts transitioning again. See Figure 32-3.O.

6. Determine Relative Longitudinal Slopes (RS).

The RS values and relative gradients can be calculated using the basic equation:

$$RS = \frac{\text{Length of Transition}}{\Delta \text{ Elevation}};\ G(\%) = \frac{1}{RS} \text{ x } 100$$

a. Outside Edges of the Traveled Way. Previously calculated in Step 5:

G (%) = 0.00669 x 100 = 0.669%
RS = 149

b. Centerline of Each Traveled Way. Determine G_{CL}, which is the longitudinal gradient of the centerline relative to the median edge:

$$G_{CL} = \frac{(e \times W_L) - (\text{cross slope @Section C} \times W_L)}{\text{Length of slope along median edge}}$$

$$G_{CL} = \frac{(0.034 \times 12) - (0.02 \times 12)}{(81 - 72) + 41}$$

$$G_{CL} = \frac{0.408 - 0.24}{50} = 0.00336 = 0.336\%$$

$$RS_{CL} = \left(\frac{1}{G_{CL}}\right) = 298$$

32-4 HORIZONTAL SIGHT DISTANCE

32-4.01 Sight Obstruction (Definition)

Sight obstructions on the inside of a horizontal curve are defined as obstacles of considerable length which interfere with the line of sight on a continuous basis. These include walls, cut slopes, wooded areas, buildings, and high farm crops. In general, point obstacles such as traffic signs and utility poles are not considered sight obstructions on the inside of horizontal curves. The designer must examine each curve individually to determine whether it is necessary to remove an obstruction or adjust the horizontal alignment to obtain the required sight distance.

32-4.02 Length > Sight Distance

Where the length of curve (L) is greater than the sight distance (S) used for design, the needed clearance on the inside of the horizontal curve is calculated using the following equation:

$$HSO = R\left(1 - \cos\left[\frac{28.65S}{R}\right]\right) \qquad \text{Equation 32-4.1}$$

where: HSO = Middle ordinate, or horizontal sightline offset from the center of the inside travel lane to the obstruction, ft (m)

R = Radius of curve, ft (m)

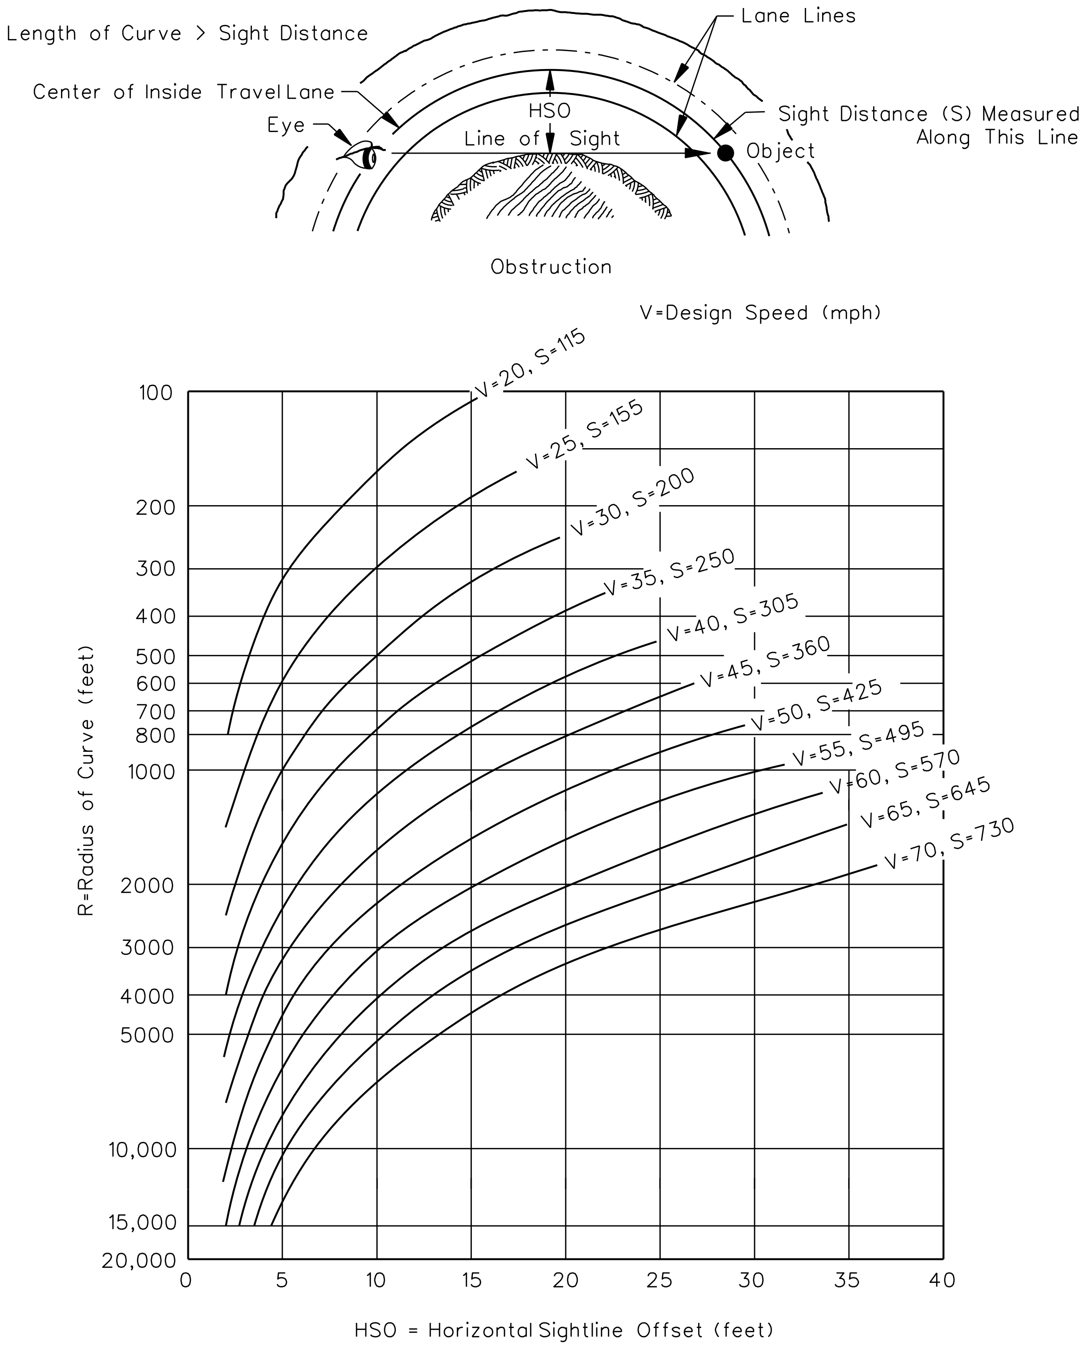
S = Sight distance, ft (m)

32-4.02(a) Stopping Sight Distance (SSD)

At a minimum, SSD will be available throughout the horizontal curve. The following discusses the application of SSD to sight distance at horizontal curves:

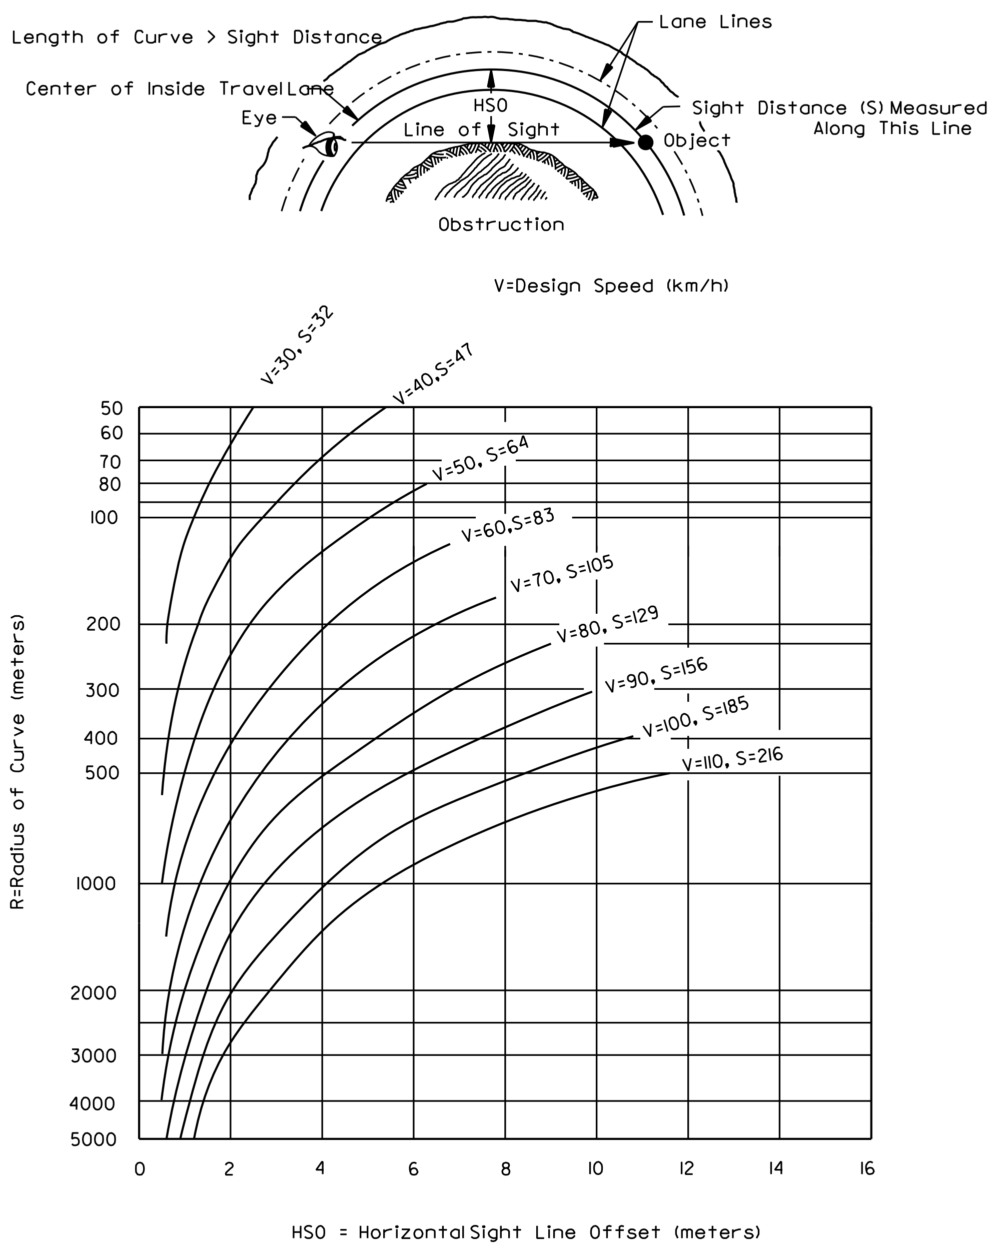
1. Passenger Cars (Level Grade). Figure 32-4.A provides the horizontal clearance criteria (i.e., horizontal sightline offset) for various combinations of stopping sight distance (see Figure 31-3.A) and curve radii for passenger cars on level grades. For those selections of S which fall outside of the figure (i.e., HSO > 40 ft (12 m) and/or R < 100 ft (50 m)), the designer should use Equation 32-4.1 to calculate the needed clearance.

2. Passenger Cars (Downgrade Adjustment). Figure 31-3.B presents SSD values for passenger cars adjusted for 3%-10% downgrades. If the downgrade on the facility is 3% or steeper, the designer should consider providing horizontal clearances adjusted for grade. These SSD values should be used directly in Equation 32-4.1 to calculate the horizontal sightline offset.



SIGHT DISTANCE AT HORIZONTAL CURVES
(SSD) (US Customary)

Figure 32-4.A



SIGHT DISTANCE AT HORIZONTAL CURVES (SSD) (Metric)

Figure 32-4.A

32-4.02(b) Other Sight Distance Criteria

At some locations, it may be warranted to provide SSD for decision sight distance or passing sight distance at the horizontal curve. Section 31-3 discusses candidate sites and provides design values for decision sight distance. Section 47-2 discusses passing sight distance on rural two-lane highways. These “S” values should be used in the basic equation to calculate “HSO” (Equation 32-4.1).

32-4.02(c) Entering/Exiting Portions (Typical Application)

The HSO values from Figure 32-4.A apply between the PC and PT. In addition, some transition is needed on the entering and exiting portions of the curve. The designer should typically use the following steps:

Step 1: Locate the point which is on the outside edge of shoulder and a distance of S/2 before the PC.

Step 2: Locate the point which is a distance HSO measured laterally from the center of the inside travel lane at the PC.

Step 3: Connect the two points located in Steps 1 and 2. The area between this line and the roadway should be clear of all continuous obstructions.

Step 4: A symmetrical application of Steps 1 through 3 should be used beyond the PT.

The example on Figure 32-4.B illustrates the determination of clearance requirements for the entering and exiting portions of a curve.

32-4.03 <u>Length < Sight Distance</u>

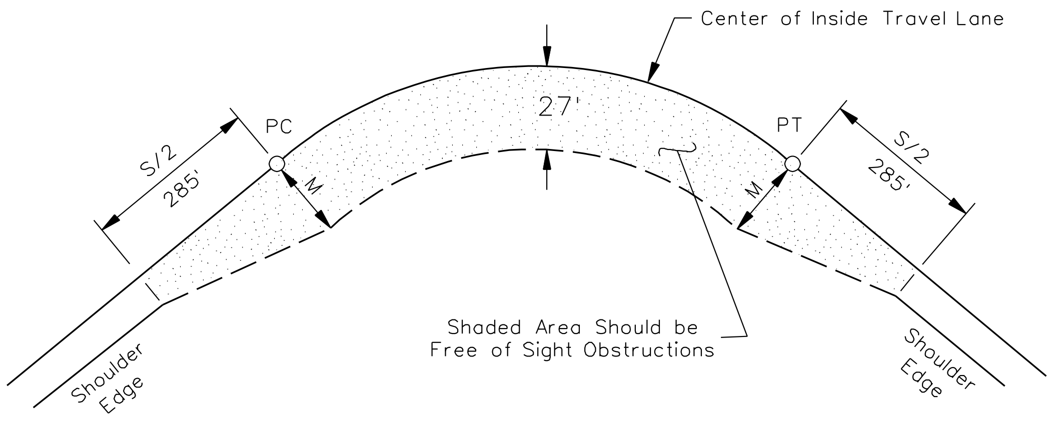
When the length of curve is less than the sight distance used in design, the HSO value from the basic equation will never be reached. As an approximation, the horizontal clearance for these curves should be determined as follows:

Step 1: For the given R and S, calculate HSO assuming L < S.

Step 2: The maximum HSO′ value will be needed at a point of L/2 beyond the PC. Using Equation 32-4.2, HSO′ is calculated from the following proportion:

$$\frac{HSO'}{HSO} = \frac{1.2L}{S}$$

$$HSO' = \frac{1.2(L)(HSO)}{S} \qquad \text{Equation 32-4.2}$$



Example 32-4.1

Given: Design Speed = 60 mph
R = 1500 ft
Level Grade

Problem: Determine the horizontal sightline offset requirements for a horizontal curve on a two-lane highway assuming passenger car SSD.

$$HSO = R\left(1 - \cos\left[\frac{28.65\ S}{R}\right]\right)$$

$$HSO = 1500\left(1 - \cos\left[\frac{(28.65)(570)}{1500}\right]\right) = 27\ ft$$

Solution: Figure 31-3.A yields a SSD = 570 ft. Using Equation 32-4.1 for horizontal clearance (L > S):

This answer is verified by Figure 32-4.A.

The above figure also illustrates the horizontal clearance requirements for the entering and exiting portion of the horizontal curve.

SIGHT CLEARANCE REQUIREMENTS FOR HORIZONTAL CURVES
(L > S)

Figure 32-4.B

where: HSO′ = Horizontal sightline distance for a curve where L < S, ft (m)

HSO = Horizontal sightline distance for the curve based on Equation 32-4.1, ft (m)

L = Length of the curve, ft (m)

S = Sight distance, ft (m)

Step 3: Locate the point which is on the outside edge of shoulder and a distance of S/2 before the PC.

Step 4: Connect the two points located in Steps 2 and 3. The area between this line and the roadway should be clear of all continuous obstructions.

Step 5: A symmetrical application of Steps 2-4 should be used on the exiting portion of curve.

The Example on Figure 32-4.C illustrates the determination of clearance requirements for the entering and exiting portions of a curve where L < S.

32-4.04 Application

For sight distance applications at horizontal curves, the height of eye is 3.5 ft (1080 mm) and the height of object is 2 ft (600 mm). Both the eye and object are assumed to be in the center of the inside travel lane. The line-of-sight intercept with the obstruction is at the midpoint of the sightline and 2.75 ft (840 mm) above the center of the inside lane.

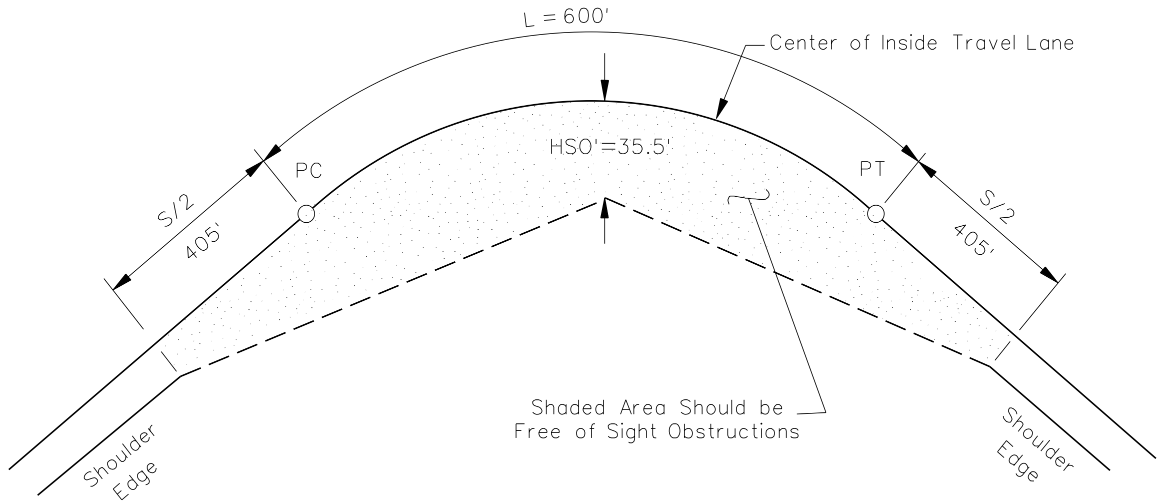
32-4.05 Longitudinal Barriers

Longitudinal barriers (e.g., bridge rails, guardrail, concrete barrier) can cause sight distance problems at horizontal curves because barriers are placed relatively close to the travel lane (often, 10 ft (3 m) or less) and because their height may be greater than 2.75 ft (840 mm).

The designer should check graphically the line of sight over a barrier along a horizontal curve and determine what height of object can actually be discerned. If this is higher than 2.75 ft (840 mm), the designer should attempt, if practical, to locate the barrier so that it does not block the line of sight. The following should be considered:

1. Superelevation. A superelevated roadway will elevate the driver’s eye and, therefore, improve the line of sight over the barrier.

2. Barrier Height. The higher the barrier, the more obstructive it will be to the line of sight.



Example 32-4.2

Given: Design Speed = 70 mph
R = 2050 ft
L = 600 ft
Grade = 5.0% downgrade

Problem: Determine the horizontal sightline offset requirements for the horizontal curve on a two-lane highway assuming passenger car SSD.

Solution: Because the downgrade is greater than 3.0%, the curve should desirably be designed for passenger cars adjusted for grade. Figure 31-3.C yields a SSD of 810 ft for 70 mph and a 5.0% downgrade. Therefore, L < S (600 ft) < 810 ft, and the horizontal clearance is calculated from Equation 32-4.2 as follows:

$$\text{HSO } (L > S) = 2050\left[1 - \cos\frac{(28.65)(810)}{2050}\right] = 39.88 \text{ ft}$$

$$\text{HSO}' \ (L < S) = \frac{1.2(600)(39.88)}{810}$$

$$\text{HSO}' = 35.5 \text{ ft}$$

Therefore, a minimum clearance of 35.5 ft should be provided at a distance of L/2 = 300 ft beyond the PC. The obstruction-free triangle around the horizontal curve would be defined by HSO′ (35.5 ft) at L/2 and by points at the shoulder edge at S/2 = 405 ft before the PC and beyond the PT.

SIGHT CLEARANCE REQUIREMENTS FOR HORIZONTAL CURVES (L < S)

Figure 32-4.C

Each barrier location adjacent to a horizontal curve will require an individual analysis to determine its impacts on the line of sight. The designer must determine the elevation of the driver eye (3.5 ft (1080 mm) above the pavement surface), the elevation of the object (2 ft (600 mm)) above the pavement surface), and the elevation of the barrier where the line of sight intercepts the barrier run. If the barrier does block the line of sight to a 2 ft (600 mm) object, the designer should consider relocating the barrier or revising the horizontal alignment. If the barrier blocks the sight line needed for SSD on the mainline, it will be necessary to obtain a design exception.

32-4.06 Compound Curves

When a compound curve exists or is proposed on mainline highway, the designer should check sight distance across the inside of the curve graphically or, for a more accurate determination, the designer can use the Department's approved software program for cross sections and earthwork. Once detailed cross sections are finalized using the software package, the designer can also request 3D plots of the alignments to determine the view of the roadway ahead, which can then be reviewed for available sight distance.

32-5 DESIGN CONTROLS

As discussed elsewhere in Chapter 32, the design of horizontal alignment involves, to a large extent, complying with specific limiting criteria. These include minimum radii, superelevation rates, and sight distance around curves. In addition, the designer should adhere to certain design principles and controls that will determine the overall safety of the facility and will enhance the aesthetic appearance of the highway. These design principles include:

1. Consistency. Alignment should be consistent. Avoid sharp curves at the ends of long tangents and sudden changes from gentle to sharply curving alignment.

2. Directional. Alignment should be as directional as practical and consistent with physical and economic constraints. On divided highways, a flowing line that conforms generally to the natural contours is preferable to one with long tangents that slash through the terrain. Directional alignment will be achieved by using the smallest practical central angles.

3. Use of Minimum Radii. Avoid the use of minimum radii, if practical, especially in level terrain.

4. High Fills. Avoid sharp curves on long, high fills. Under these conditions, it is difficult for drivers to perceive the extent of horizontal curvature.

5. Alignment Reversals. Avoid abrupt reversals in alignment (reverse curves). Provide a sufficient tangent distance between the curves to ensure proper superelevation transitions for both curves and to allow time for the motorist to perceive the next decision point.

6. Broken-Back Curvature. Avoid where possible. This arrangement is not aesthetically pleasing, violates driver expectancy, and creates undesirable superelevation development requirements.

7. Compound Curves. Do not use compound curves on the highway mainline.

8. Coordination with Natural/Man-Made Features. The horizontal alignment should be properly coordinated with the existing alignment at the ends of new projects, natural topography, available right-of-way, utilities, roadside development, and natural/man-made drainage patterns.

9. Environmental Impacts. Horizontal alignment should be properly coordinated to minimize environmental impacts (e.g., encroachment onto wetlands).

10. Intersections. Horizontal alignment through intersections may present special problems (e.g., intersection sight distance, superelevation development crossover crowns). See Chapter 36 for the design of intersections.

11. Coordination with Vertical Alignment. Chapter 33 discusses general design principles for the coordination between horizontal and vertical alignment.

12. Bridges. Horizontal alignment must be coordinated with the location of bridges. The need for curvature and superelevation development should be evaluated for each bridge location. Crossing angles between the mainline and other features must also be considered. See Chapter 39 for additional information on horizontal alignment at bridges.

32-6 MATHEMATICAL DETAILS FOR HORIZONTAL CURVES

This Section presents mathematical details used by IDOT for various applications to the design of horizontal curves. The chart below summarizes the figures in Section 32-6. For ease of solving any horizontal alignment problems, the designer should refer to the Department's approved software program. The part of the program entitled "Coordinate Geometry" provides the necessary tools to solve most alignment problems.

CURVE SYMBOLS

Δ	=	Deflection angle between tangents or central angle, degrees
T	=	Tangent distance = distance from PC to PI = distance from PI to PT
L	=	Length of curve = distance from PC to PT along curve
R	=	Radius of curve, ft (m)
E	=	External distance (PI to mid-point of curve)
LC	=	Length of long chord: PC to PT
M	=	Middle ordinate (mid-point of arc to mid-point of long chord)
C	=	Mid-point of long chord

CIRCULAR CURVE ABBREVIATIONS

P.C.	=	PC	=	Point of Curvature (Beginning of Curve)
P.T.	=	PT	=	Point of Tangency (End of Curve)
P.I.	=	PI	=	Point of Intersection of Tangents
P.R.C.	=	PRC	=	Point of Reverse Curvature
P.C.C.	=	PCC	=	Point of Compound Curvature
P.O.T.	=	POT	=	Point on Tangent

CURVE FORMULA

$$T = R(\tan\ (\Delta/2)) = R\frac{\sin\ (\Delta/2)}{\cos\ (\Delta/2)}$$

$$L = \frac{\Delta}{360}\,2\pi R = \frac{\Delta R}{57.2958}$$, where Δ is in degrees (decimals) to four places.

$$E = T\tan(\Delta/4)$$

$$E = R\left(\frac{1}{\cos\ (\Delta/2)} - 1\right)$$

$$LC = 2R\,(\sin(\Delta/2)) = 2T\,(\cos(\Delta/2))$$

$$M = R\,(1 - \cos\,(\Delta/2))$$

$$M = E\cos(\Delta/2)$$

$$\pi = 3.141592653$$

To find the deflection angle θ, in degrees, to any point on the curve (see Figure 32-6.C):

$$\frac{2\theta}{L'} = \frac{360^\circ}{2\pi R}$$, where L' is any arc length

To find the deflection angle θ in minutes to any point:

$$\theta = \frac{(360^\circ)\left(\frac{60\ \text{min.}}{\text{deg}}\right)(L')}{(2)(2\pi R)}$$

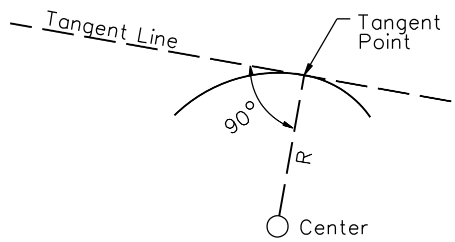
$$\theta = \frac{21,600\ L'}{4\pi\ R}$$

$$\theta = \frac{1718.873\,L'}{R}$$

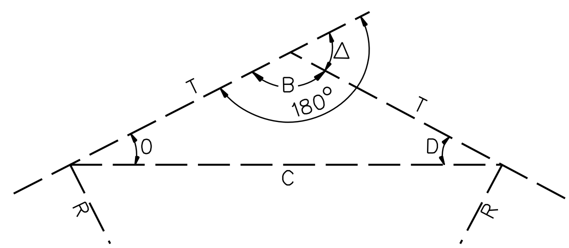
CURVE SYMBOLS, ABBREVIATIONS, AND FORMULAS

Figure 32-6.D

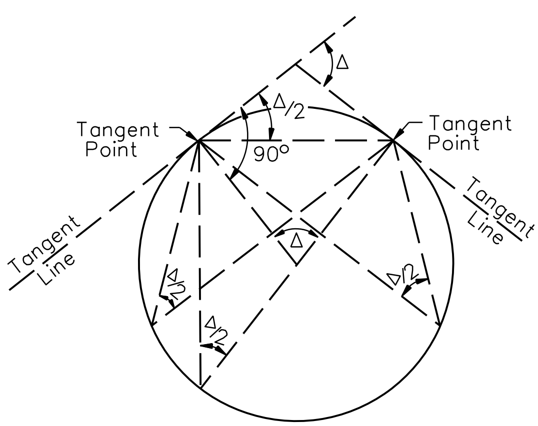
The radius of a circular curve drawn to the tangent point is perpendicular to the tangent at that point.



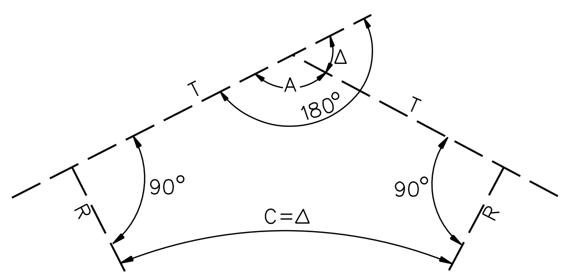
The figure below forms an isosceles triangle. Therefore, Angle O = Angle D. Also B + D + O = 180° (sum of the interior angles of a triangle). Also, Δ + B = 180°(angle around a point forming a straight line). Therefore, Δ = O + D and, having shown that O = D, then Δ = O + O = (2) (O) or O = (Δ/2).



From any point on a circular curve, the angle intercepting a given arc on the same circular curve is equal to ½ the central angle (Δ) for that particular arc.



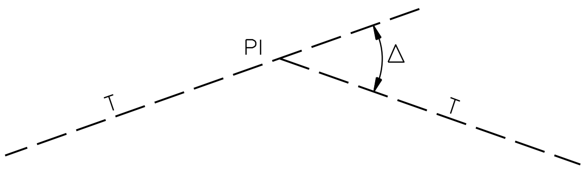
The figure below shows the 2 tangents and 2 radii of a simple curve. A + Δ = 180°. Also, A + 90° + 90° + C = 360° (sum of the interior angles in a 4-sided figure) or A + C = 180°. Therefore, Δ = C. C is also called the central angle but is usually designated by Δ.



SIMPLE CURVES
(Geometric Principles)

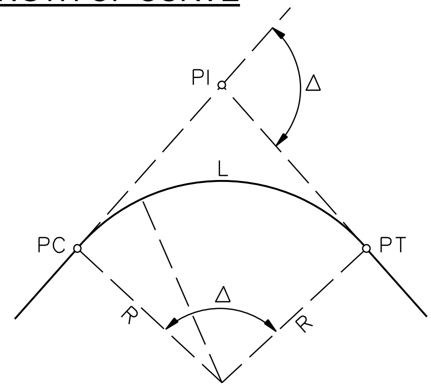
Figure 32-6.E

Δ = DEFLECTION ANGLE



Δ = The deflection angle from the first tangent extended to the second tangent. This is the same angle as the angle between radii (central angle). This should be known before the other parts of the curve are computed.

L = LENGTH OF CURVE



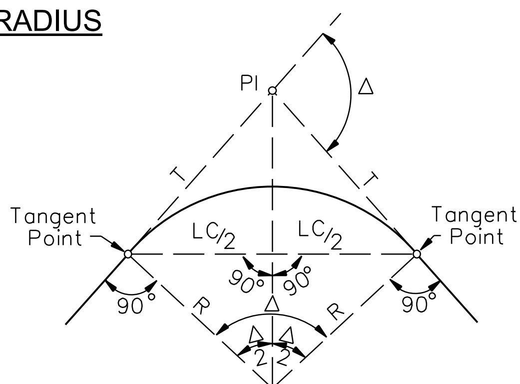
With a constant Δ, L increases or decreases in direct ratio to R. Thus:

$$L = \frac{\Delta}{360}(2\pi R)$$

Reducing to: $L = \Delta R / 57.2958$

Where L and R are in feet (meters) and Δ is in degrees (decimals) to four places.

R = RADIUS



Formulas:

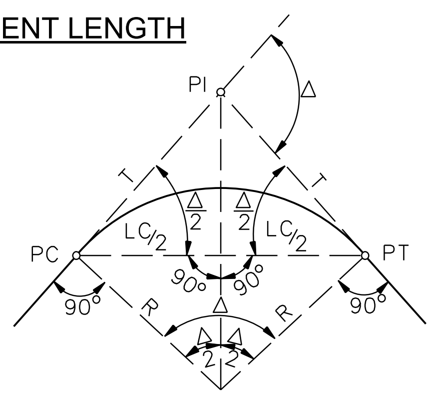
$$R = \frac{T}{\tan(\Delta/2)}$$

OR

$$R = \frac{LC}{2\sin(\Delta/2)}$$

Where R is in feet (meters) and Δ is in degrees (decimals).

T = TANGENT LENGTH



Formulas:

$$T = R\tan(\Delta/2)$$

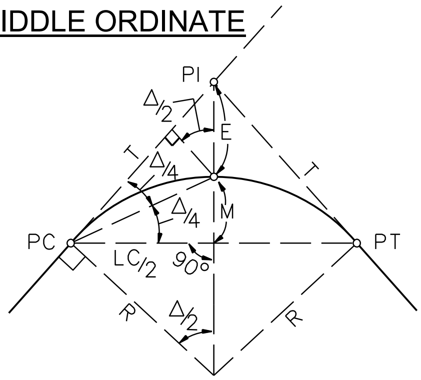
$$T = \frac{LC}{2\cos(\Delta/2)}$$

Where T, LC, & R are in feet (meters).

SIMPLE CURVES
(Various Elements)

Figure 32-6.F
(1 of 2)

M = MIDDLE ORDINATE



Where M, LC, R, and E are in feet (meters).

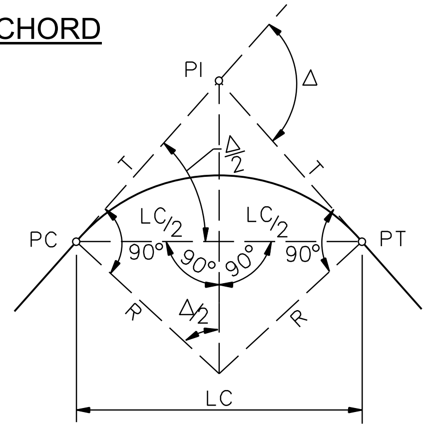
Formulas:

$$M = \frac{LC}{2} \tan(\Delta / 4)$$

$$M = E \cos(\Delta / 2)$$

$$M = R\left(1 - \cos(\Delta / 2)\right)$$

LC = LONG CHORD



Formulas:

$$LC = 2R \sin(\Delta / 2)$$

$$LC = 2T \cos(\Delta / 2)$$

The main chord and short chords are often convenient to use in laying out the curve.

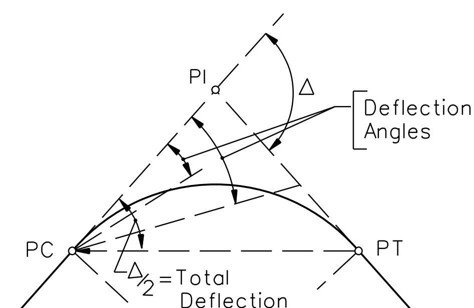
Figure can be applied to the whole chord or to the chord of any part of the curve. Δ would then be the central angle of the arc of whatever part of the curve is being considered.

E = EXTERNAL DISTANCE

Formulas: $E = R\left(\frac{1}{\cos(\Delta / 2)} - 1\right)$

Also: $E = \frac{M}{\cos(\Delta / 2)}$

$$E = T \tan(\Delta / 4)$$

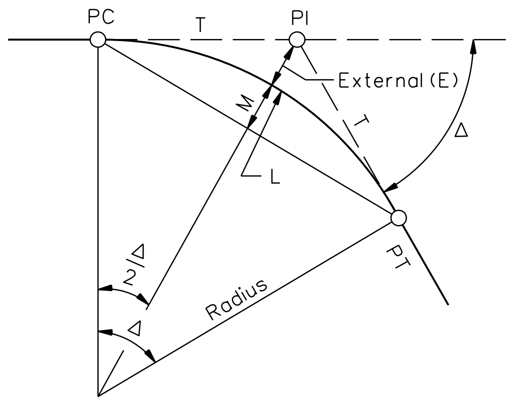


DEFLECTION ANGLES

In circular curves for highways, the deflection angle to a point on a curve is usually turned from the tangent with a set-up on the PC (see figure above).

SIMPLE CURVES
(Various Elements)

Figure 32-6.F
(2 of 2)



Example:

Given:

PI = Sta 161 + 60.36; $\Delta = 62^\circ 10'$; R = 700 ft
To find: Sta. of PC and PT:

Calculate:

1. $T = R \tan(\Delta/2) = (700)\tan(31^\circ 05')$
   $T = 421.99$ ft

2. $L = \Delta R/57.2958 = 759.51$ft

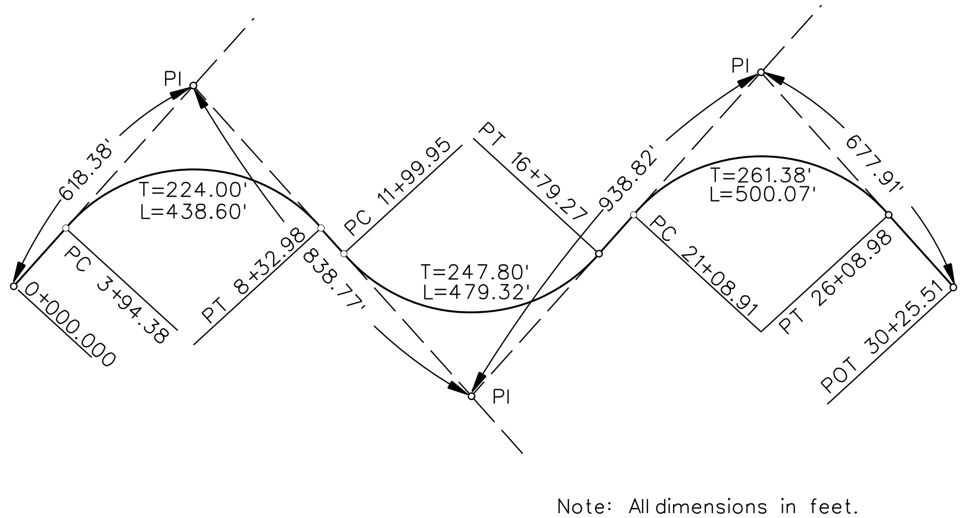
3. Therefore:

PI =	Sta.	161 + 60.36
T =		– 421.99
PC =	Sta.	
L =		+ 759.51
PT =	Sta.	164 + 97.88

SIMPLE CURVE COMPUTATION
(Example)

Figure 32-6.G

STATIONING



1. The station at the first PI is 6 + 18.38.

2. The station at the first PC = 6 + 18.38 – 224.00 = 3 + 94.38.

3. The station at the first PT = 3 + 94.38 + 438.60 = 8 + 32.98.

4. The station at the second PC = 8 + 32.98 + (838.77 – 224.00 – 247.80) = 11+ 99.95.

5. The station at the second PI = 11 + 99.95 + 247.80 = 14 + 47.75.

6. The station at the second PT = 11 + 99.95 + 479.32 = 16 + 79.27.

7. The station at the third PC = 16 + 79.27 + (938.82 – 247.80 – 261.38) = 21 + 08.91.

8. The station at the third PI = 21 + 08.91 + 261.38 = 23 + 70.29.

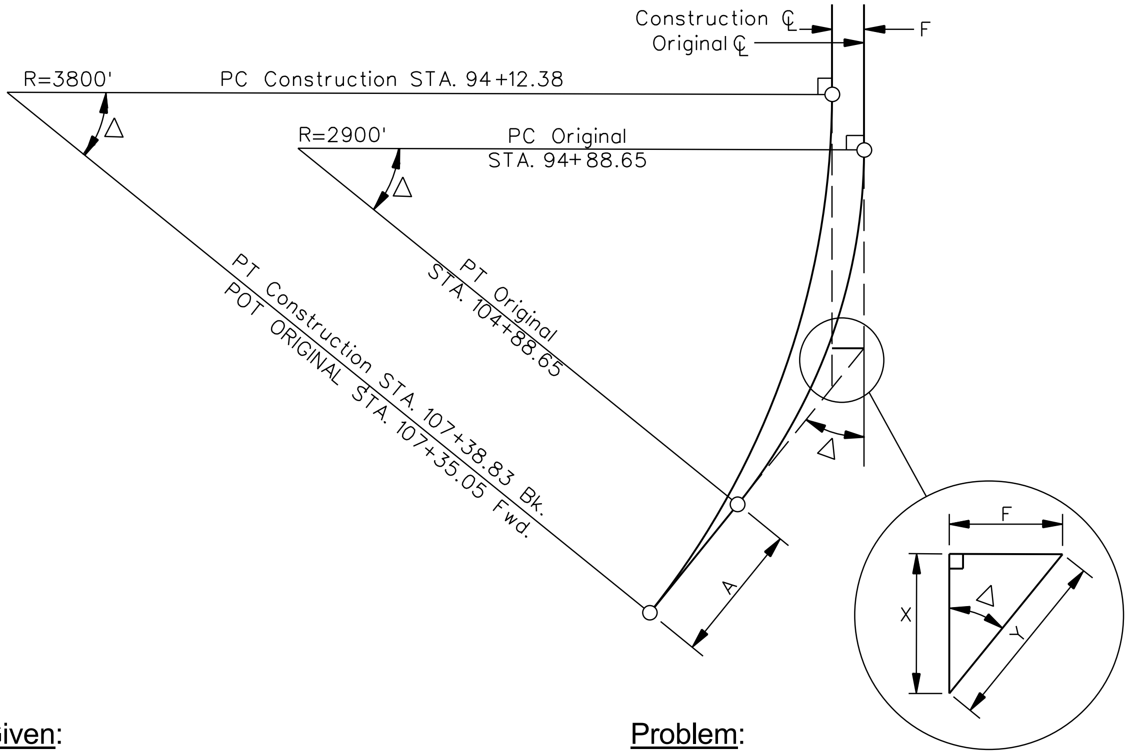
9. The station at the third PT = 21 + 08.91 + 500.07 = 26 + 08.98.

10. The station at the final POT = 26 + 08.98 + (677.91 – 261.38) = 30 + 25.51.

11. Check: (618.38 + 838.77 + 938.82 + 677.91) – (2 (224.00) + 2 (247.80) + 2 (261.38) – 438.60 – 479.32 – 500.07) = 30 + 25.51.

SIMPLE CURVE
(Stationing)

Figure 32-6.H



Given:

Simple Curve

Original PI	=	100 + 00.00
Δ	=	20°00′ Rt.
T	=	511.35 ft
L	=	1000 ft
R	=	2900 ft

Problem:

Compute: Simple curve of different radius where one tangent is offset a specified distance from and parallel to the original tangent.

R = 3800 ft, F = 30 ft Rt.

Solution:

Y = F/sin Δ = 30/sin 20° = 87.71 ft

X = F/tan Δ = 30/tan 20° = 82.42 ft

T = (R)tan (Δ/2) = (3800) (tan 10°) = 670.04 ft

L = Δ 2πR / 360 = 1326.45 ft

CONSTRUCTION CURVE DATA

PI	=	100 + 82.42
Δ	=	20°00′ Rt.
T	=	670.04 ft
L	=	1326.45 ft
R	=	3800 ft

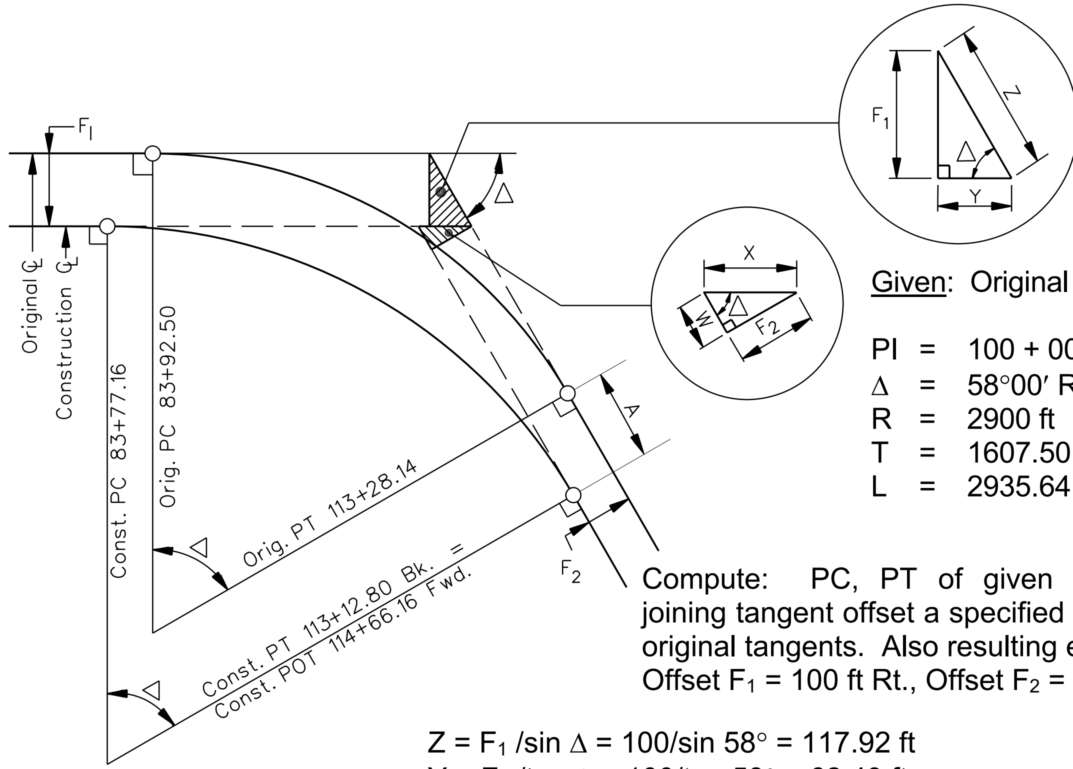
STATIONING

Orig. PI =	100 + 00.0	Const. T =	670.04
+X =	82.42	+Y =	+ 87.71
Const. PI =	100 + 82.42		757.75
–T =	– 670.04	–Orig. T =	– 511.35
Const. PC =	94 + 12.38	A =	246.40
+L =	+ 1326.45	Orig. PT =	104 + 88.65
Const. PT =	107 + 38.83	Orig. POT =	107 + 35.05

Equation: Const. PT 107 + 38.83 Bk = Orig. POT 107 + 35.05 Fwd

CURVE COMPUTATION
(Different Radius, Tangent Offset & Parallel)

Figure 32-6.I



Given: Original Curve Data:

PI = 100 + 00.00
Δ = 58°00′ Rt.
R = 2900 ft
T = 1607.50 ft
L = 2935.64 ft

Compute: PC, PT of given simple curve joining tangent offset a specified distance from original tangents. Also resulting equation: Offset F_1 = 100 ft Rt., Offset F_2 = 66 ft Rt.

$Z = F_1 / \sin \Delta = 100/\sin 58° = 117.92$ ft
$Y = F_1 / \tan \Delta = 100/\tan 58° = 62.49$ ft
$X = F_2 / \sin \Delta = 66/\sin 58° = 77.83$ ft
$W = F_2 / \tan \Delta = 66/\tan 58° = 41.24$ ft
Const. PI = Orig. PI + Y - X = 99 + 84.66

Note: In many cases, Y > X & W > Z or offsets may be to other side of original tangents causing the problem to look different, but the principles of the problem remain the same.

Const. PI	=	99 + 84.66	
–T	=	– 1607.50	
Const. PC	=	83 + 77.16	
+L	=	+ 2935.64	
Const. PT	=	113 + 12.80	
A = Z – W =	=	+ 76.68	
Orig. PT	=	113 + 89.48	
+A	=	+ 76.68	
		114 + 66.16	(Orig. POT 66 ft Lt. of PT 114 + 66.16)

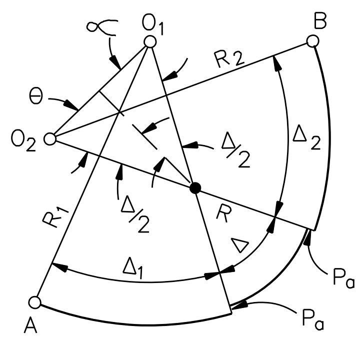
Equation: Const. PT 113 + 12.80 Bk = Sta. 114 + 66.16 Fwd

CURVE COMPUTATION
(Compute PC & PT, Joining Parallel Tangent Offsets)

Figure 32-6.J

INTRODUCE A CURVE OF SELECTED RADIUS BETWEEN TWO FIXED CURVES

Part A: Fixed curves of equal radii.



Given:

R_1 and R_2 = Radii of fixed curves with radials AO_1 and BO_2 fixed on coordinate system.

R = Radius selected for intermediate curve.

P_a, P_{a1} and P_{a2} = Offset ("p" distance) to permit insertion of selected spirals; without spirals, P_a = 0.

Problem:

To determine Δ, Δ_1 and Δ_2 and the remaining properties of each curve.

Solution:

Determine length and bearing of O_1O_2 from given coordinates of O_1 and O_2:

$$\Delta = 2\sin^{-1}\frac{O_1O_2}{2(R_1 - R - P_a)}\,*$$

$$\propto = \theta = 90^\circ - \frac{\Delta}{2}$$

Determine bearing O_1O by applying $\propto$ to bearing O_1O_2.

Determine bearing O_2O by applying θ to bearing O_1O_2.

Δ_1 = difference in bearings of O_1O and O_1A.
Δ_2 = difference in bearings of O_2O and O_2B.

Determine remaining properties of each curve through usual procedures.

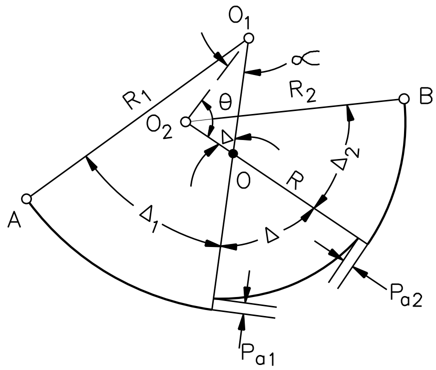
* Where R is greater than R_1 and/or R_2:

$$\Delta = 2\sin^{-1}\frac{O_1O_2}{2(R - R_1 - P_a)}$$

CURVE COMPUTATION
(Between Two Fixed Curves)

Figure 32-6.K
(1 of 2)

Part B: Fixed curves of unequal radii.



Given:

R_1 and R_2 = Radii of fixed curves with radials AO_1 and BO_2 fixed on coordinate system.

R = Radius selected for intermediate curve.

P_a, P_{a1} and P_{a2} = Offset ("p" distance) to permit insertion of selected spirals; without spirals, $P_a = 0$.

Problem:

To determine Δ, Δ_1 and Δ_2 and the remaining properties of each curve.

Solution:

Determine length and bearing of O_1O_2 from given coordinates of O_1 and O_2.

$OO_1 = R_1 - (R + P_{a1})^*$

$OO_2 = R_2 - (R + P_{a2})^*$

$$\Delta = \cos^{-1} \frac{OO_1^{\,2} + OO_2 - O_1O_2^{\,2}}{2 \times OO_1 \times OO_2}$$

$$\propto = \cos^{-1} \frac{OO_1^2 + OO_2^2 - O_1O_2^2}{2 \times OO_1 \times O_1O_2}$$

$\theta = 180° - (\Delta + \propto)$

Determine bearing O_1O by applying $\propto$ to bearing O_1O_2.

Determine bearing O_2O by applying θ to bearing O_1O_2.

Δ_1 = difference in bearings of O_1O and O_1A.
Δ_2 = difference in bearings of O_2O and O_2B.

Determine remaining properties of each curve through usual procedures.

* Where R is greater than R_1 and/or R_2:

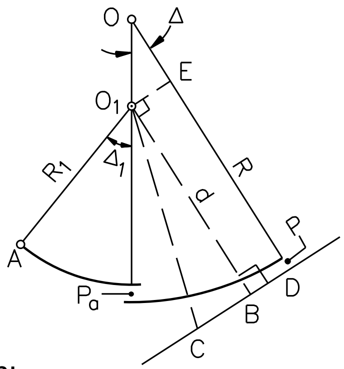
$OO_1 = R - (R_1 + P_{a1})$
$OO_2 = R - (R_2 + P_{a2})$

CURVE COMPUTATION
(Between Two Fixed Curves)

Figure 32-6.K
(2 of 2**)**

INTRODUCE A CURVE OF SELECTED RADIUS BETWEEN A FIXED CURVE AND A FIXED TANGENT

Part A: Selected curve of flatter radius than the fixed curve.



Given:

R_1 = Radius of fixed curve with coordinates of radial AO_1.

C = Any coordinate point on fixed tangent of known bearing.

R = Radius of selected curve.

P & P_a = Offset ("p" distance) to permit insertion of selected spirals; without spirals, P and P_a = 0.

Problem:

To determine Δ (deflection angle of selected curve) and remaining properties of each curve.

Solution:

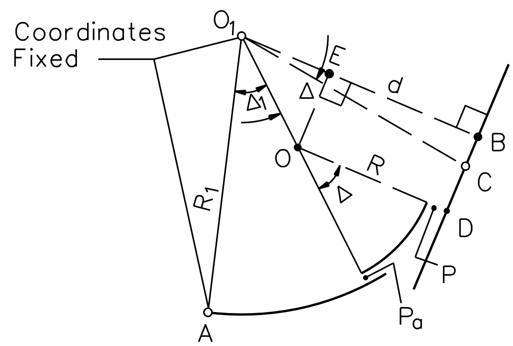
In triangle O_1CB, solve for O_1B, or d.

OE = OD – ED = (R + P) – d

$$\Delta = \cos^{-1}\frac{OE}{OO_1} = \cos^{-1}\frac{(R+P)-d}{R-(R_1+P_a)}$$

Determine remaining properties of each curve through usual procedures.

Part B: Selected curve of sharper radius than the fixed curve.



Given:

R_1 = Radius of fixed curve with coordinates of radial AO_1.

C = Any coordinate point on fixed tangent of known bearing.

R = Radius of selected curve.

P & P_a = Offset ("p" distance) to permit insertion of selected spirals; without spirals, P and P_a = 0

Problem:

To determine Δ (deflection angle of selected curve) and remaining properties of each curve.

Solution:

In triangle O_1CB, solve for O_1B, or d.

O_1E = d – (R + P)

$$\Delta = \cos^{-1}\frac{O_1E}{O_1O} = \cos^{-1}\frac{d-(R+P)}{R_1-(R+P_a)}$$

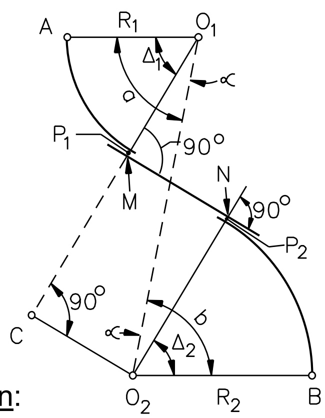
Determine remaining properties of each curve through usual procedure.

CURVE COMPUTATION
(Between a Fixed Curve and Fixed Tangent)

Figure 32-6.L

ESTABLISH A TANGENT BETWEEN TWO CURVES

Part A: Curves in reverse direction.



Given:

R_1 & R_2 = Radii of fixed curves with coordinates of radials AO_1 & BO_2.

P_1 & P_2 = Offset ("p" distance) to permit insertion of selected spirals; without spirals, P_1 and P_2 = 0.

Problem:

To determine length and bearing of tangent MN, Δ_1, Δ_2 and the remaining properties of each curve.

Solution:

Determine length and bearing of O_1O_2 from known coordinates; then, in triangle O_1O_2C:

$$\propto = \cos^{-1}\frac{(R_1+P_1)^* + (R_2+P_2)^*}{O_1O_2}$$

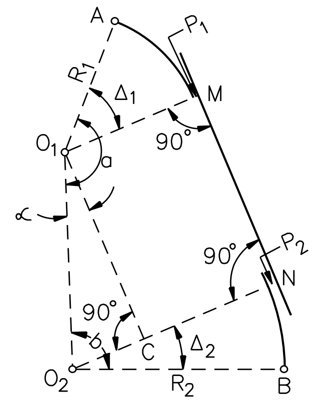
$CO_2 = MN = [(R_1 + P_1)^* + (R_2 + P_2)^*] \tan \propto$

Determine angles a and b from bearings of O_1A, O_2B and O_2O_1:

$\Delta_1 = a - \propto$; $\Delta_2 = b - \propto$

Determine remaining properties of each curve through usual procedures.

Part B: Curves in same direction.



Given:

R_1 & R_2 = Radii of fixed curves with coordinated radials AO_1 & BO_2.

P_1 & P_2 = Offset ("p" distance) to permit insertion of selected spirals; without spirals, P_1 and P_2 = 0.

Problem:

To determine length and bearing of tangent MN, Δ_1, Δ_2 and the remaining properties of each curve.

Solution:

Determine length and bearing of O_1O_2 from known coordinates; then, in triangle O_1O_2C:

$$\propto = \sin^{-1}\frac{(R_2+P_2)^* - (R_1+P_1)^*}{O_1O_2}$$

$O_1C = MN = [(R_2 + P_2)^* - (R_1 + P_1)^*] / \tan \propto$

Determine angles a and b from bearings of O_1A, O_2B and O_2O_1:

$\Delta_1 = a - 90° - \propto$; $\Delta_2 = b - 90° + \propto$

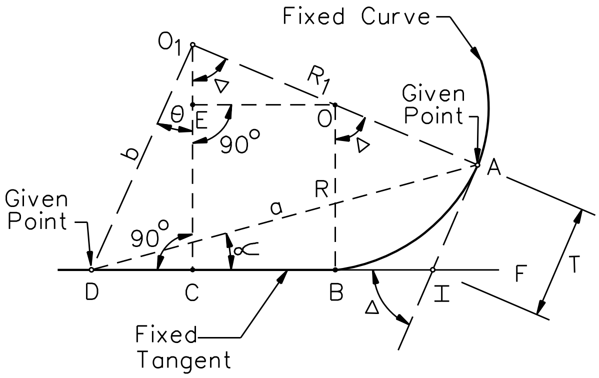
Determine remaining properties of each curve through usual procedures.

*P_1 and P_2 = 0 when spirals are not used.

CURVE
(Establish a Tangent Between Two Curves)

Figure 32-6.M

INTRODUCE A CURVE, AND DETERMINE ITS RADIUS, BETWEEN A GIVEN POINT ON A FIXED CURVE AND SOME POINT ON A FIXED TANGENT



Given:

Tangent DF, its bearing and coordinates of D.

R_1 and coordinates of O_1 and A.

Problem:

To determine R and Δ.

Solution:

Method 1: Determine bearing and length of DA or *a* from known coordinates. Determine $\propto$ from bearings DA and DF. Determine Δ from bearings O_1A and O_1C.

From solution for side of oblique triangle DIA and equation for tangent, T, of simple curve:

$$R = \frac{a \sin \propto}{\sin(180° - \Delta)\tan(\Delta/2)}$$

$$T = R\tan(\Delta/2)$$

$$T = \frac{a \sin \propto}{\sin(180° - \Delta)}$$

Method 2: Determine bearing and length of DO_1, or b, from known coordinates. Determine θ from bearings O_1D and O_1C. Determine Δ from bearings O_1A and O_1C. From solution of right triangles DO_1C and EO_1O:

$$R = \frac{b\cos\theta - R_1\cos\Delta}{1 - \cos\Delta}$$

Note: If spiral is used at B, Method 2 must be employed; then:

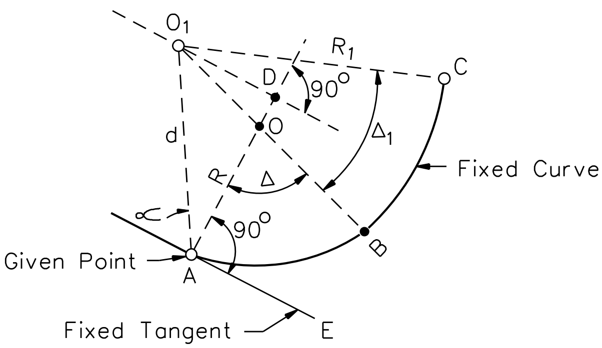
$$R = \frac{b\cos\theta - R_1\cos\Delta - P}{1 - \cos\Delta}$$

Where P is offset of curve for spiral at B, use expression for R without P first, and find approximate R; then substitute in latter equation, using value of P for the approximate R and find new R. Same formulas apply whether R < or > R_1.

CURVE INTRODUCTION

Figure 32-6.N

INTRODUCE A CURVE AND TO DETERMINE ITS RADIUS BETWEEN A GIVEN POINT ON A FIXED TANGENT AND SOME POINT ON A FIXED CURVE



Given:

R_1 and coordinates of O_1 and C. Tangent AE, its bearing, and coordinates of A.

Problem:

To determine R, Δ, and Δ_1.

Solution:

Erect right triangles AO_1D and O_1OD. Determine length and bearing of AO_1 or d from known coordinates of A and O_1. From solution of triangles AO_1D and O_1OD:

$$R = \frac{d^2 - R_1^{\,2}}{2\ (d\ \cos\ \propto - R_1)}$$

and

$$\Delta = \sin^{-1} \frac{d\ \sin\ \propto}{R_1 - R}$$

Determine bearing BO_1 by application of Δ to bearing AD_1, then Δ_1 = difference in bearings of BO_1 and CO_1.

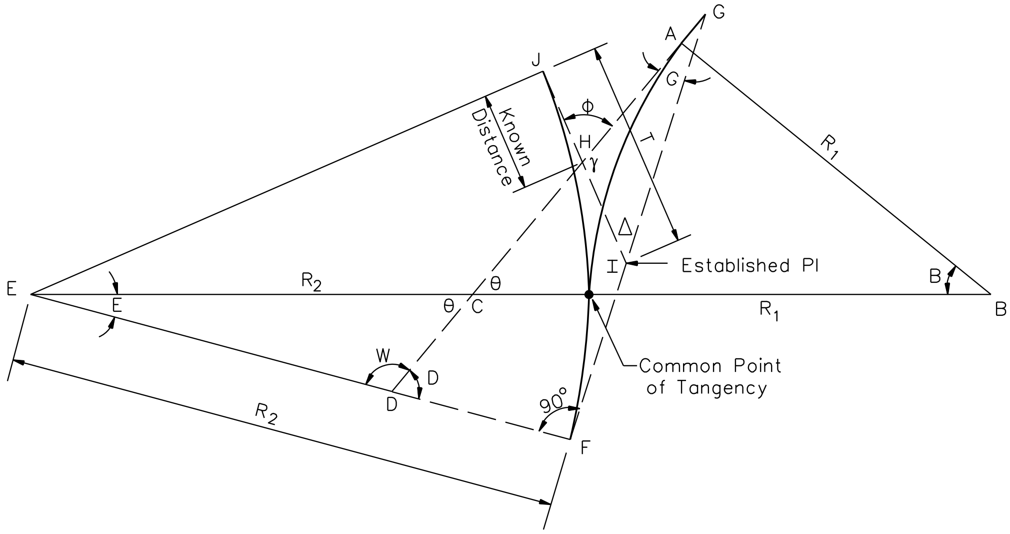
Note: This solution is applicable whether $R <$ or $> R_1$.

CURVE INTRODUCTION

Figure 32-6.O

Triangles Involved:

1. GHI
2. DFG
3. ABC & CDE



Given:

One of the curves already established (JF, Δ, T): Radii of curves (R_1 & R_2). Intersection point and angle of the two centerlines (H & ϕ).

Distance JH is thereby known and HI can be determined by subtracting JH from T for established curve.

Distance between curve centers (BE = R_1 + R_2).

Triangle No. 1, GHI

Find: $\angle$G & GI

1. $\gamma = 180° - \phi$
2. $\angle G = 180° - (\gamma + \Delta)$
3. HI = T (est. curve) – JH
4. $GI = \dfrac{HI \sin \gamma}{\sin \angle G}$

Triangle No. 2, DGF

Find: $\angle$D & DF

5. FG = T (est. curve) + GI
6. DF = FG tan $\angle$G
7. $\angle D = 90° - \angle G$

Triangles No. 3, ABC & CDE

Find: $\angle\theta$ (Angles at B & E are thus determined)

BC + CE = R_1 + R_2

In triangle ABC:

$$BC = \frac{R_1}{\sin \theta}$$

$$BC + CE = \frac{R_1}{\sin \theta} + \frac{DE \sin W}{\sin \theta} = R_1 + R_2$$

In triangle CDE:

8. $DE = R_2 - DF$
9. $W = 180° - \angle D$

$$CE = \frac{DE \sin W}{\sin \theta}$$

10. $\sin \theta = \dfrac{R_1 + DE \sin W}{R_1 + R_2}$

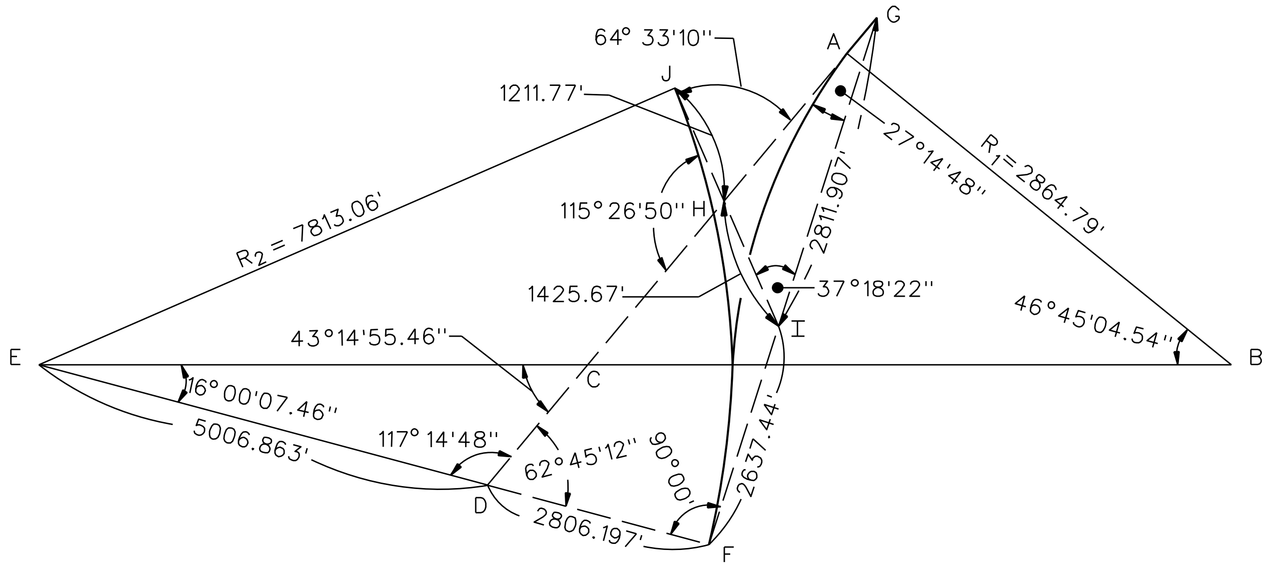
11. $\angle B = 90° - \theta$

12. $\angle E = 180° - (\theta + W)$

Length of curves, tangent length, etc., are determined.

ALIGNMENT
(Common Point Of Tangency For Two Curves)

Figure 32-6.P



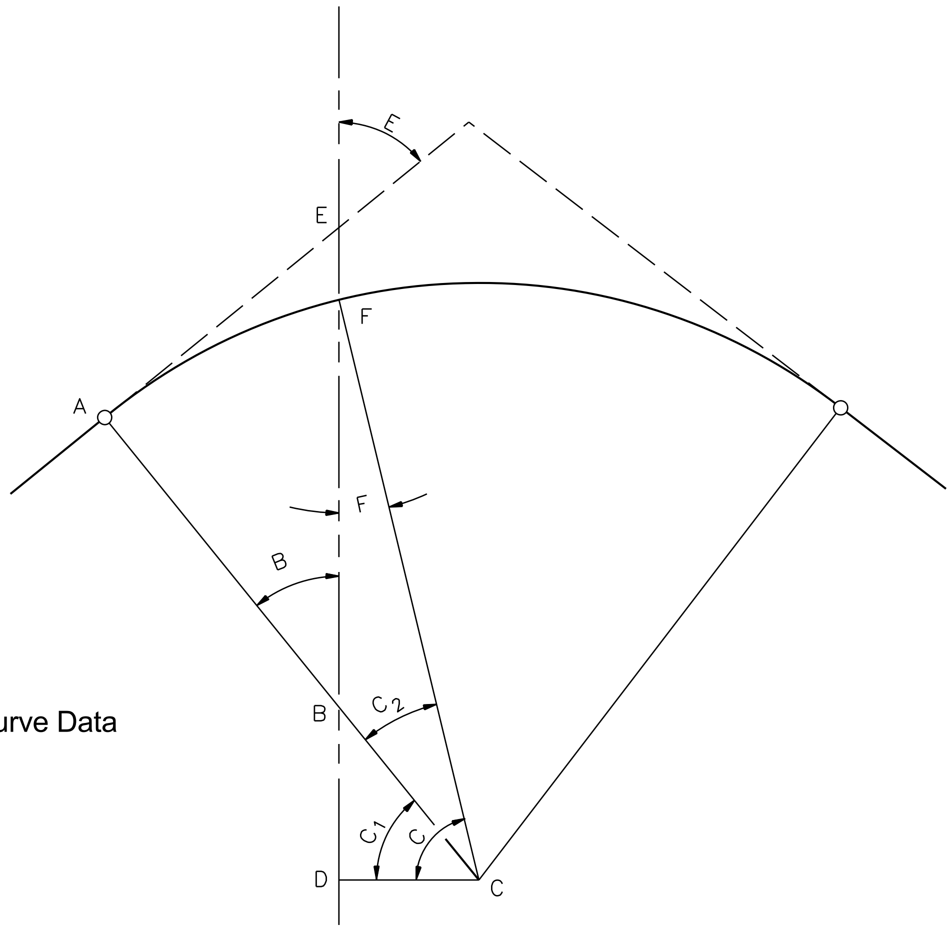
<u>Given:</u>

ϕ = 64°33′10″
JH = 1211.77 ft
Δ = 37°18′22″
T = 2637.44 ft
R_2 = 7813.06 ft
R_1 = 2864.79 ft

1. γ = 180°00′00″ – 64°33′10″ = 115°26′50″
2. $\angle$G = 180°00′00″ – (115°26′50″ + 37°18′22″) = 27°14′48″
3. HI = 2637.44 – 1211.77 = 1425.67 ft
4. GI = (1425.67) (0.90298146 / (0.45782219) = 2811.907 ft
5. FG = 2637.44 + 2811.907= 5449.357 ft
6. DF = (5449.347) (0.5149602) = 2806.197 ft
7. $\angle$D = 90°00′00″ – 27°14′48″ = 62°45′12″
8. DE = 7813.06 – 2806.197 = 5006.863 ft
9. $\angle$W = 180°00′00″ – 62°45′12″ = 117°14′48″
10. sin θ = (2864.79 + (5006.863) (0.88904378)) / (2864.79 + 7813.06) = 0.68516695
    θ = 43°14′55.46″
11. $\angle$B = 90°00′00″ – 43°25′55.46″ = 46°45′04.54″
12. $\angle$E = 180°00′00″ – (46°45′04.54″ + 117°14′48″) = 16°00′07.46″

COMMON POINT OF TANGENCY FOR TWO CURVES
(Sample Problem)

Figure 32-6.Q



Given:

AE, Angle E, and Curve Data

Required:

EF and Arc Dist. AF

Solution:

From triangle ABE:

1. B = 90° – E
2. BE = $\frac{AE}{\sin B}$
3. AB = BE cos B

From triangle BCD:

4. BC = Radius – AB
5. CD = BC sin B
6. BD = BC cos B
7. C_1 = 90° – B

From triangle CDF:

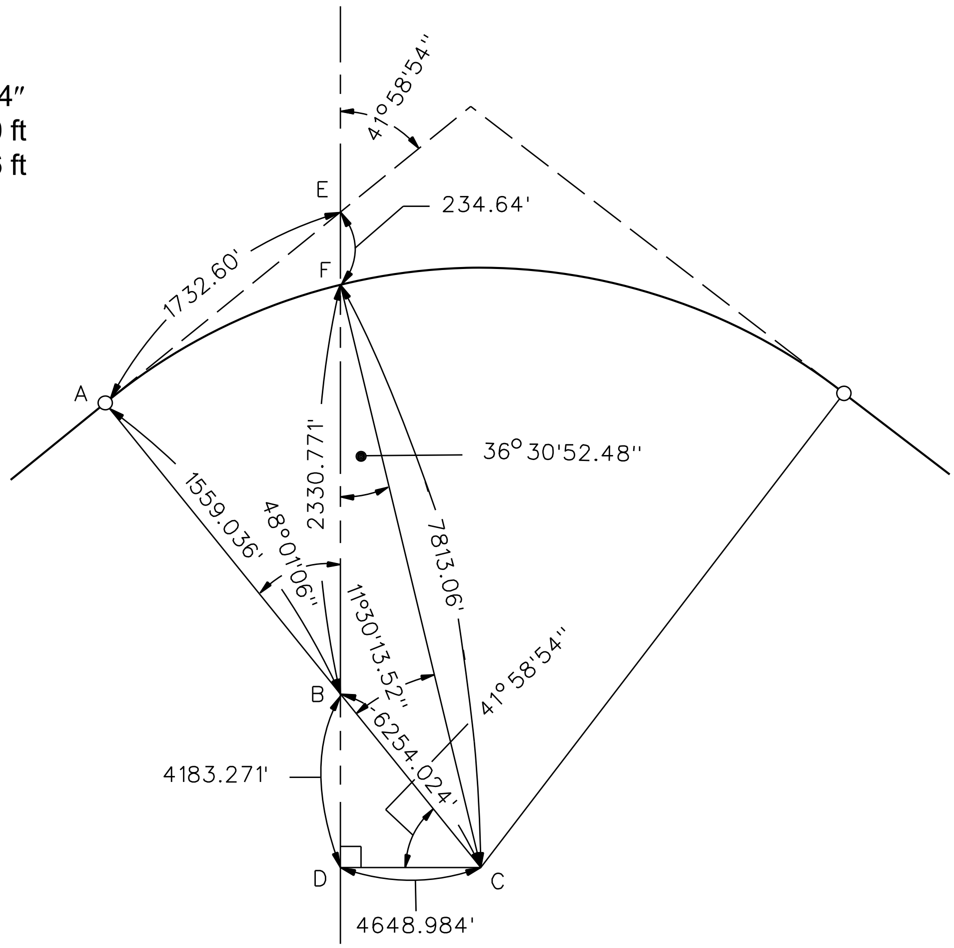
8. CF = Radius
9. sin F = $\frac{DC}{CF}$
10. C = 90° – F
11. C_2 = C – C_1
12. DF = CF cos F
13. EF = BD + BE – DF
14. Arc Dist. AF = $\frac{C_2}{360} 2\pi R$

POC COMPUTATION USING RIGHT TRIANGLES

Figure 32-6.R

Given:

Angle E	=	41°58′54″
AE	=	1732.60 ft
Radius	=	7813.06 ft



1. B = 90°00′00″ – 41°58′54″ = 48°01′06″
2. BF = 1732.60 / 0.74335889 = 2330.771
3. AB = (2330.771) (0.66889278) = 1559.036
4. BC = 7813.06 – 1559.036 = 6254.024
5. CD = (6254.024) (0.74335889) = 4648.984 ft
6. BD = (6254.024) (0.66889278) = 4183.271 ft
7. C_1 = 90°00′00″ – 48°01′06″ = 41°58′54″
8. CF = 7813.06 ft
9. sin F = 4648.984 / 7813.06 = 0.59502730 F = 36°30′52.48″
10. C = 90°00′00″ – 36°30′52.48″ = 53°29′07.52″
11. C_2 = 53°29′07.52″ – 41°58′54″ = 11°30′13.52″
12. DF = (7813.058) (0.80370550) = 6279.399 ft
13. EF = 4183.271 + 2330.771 – 6279.399 = 234.64 ft
14. Arc AF = (11.5037556) (2π) (7813.06) / 360 = 1568.69 ft

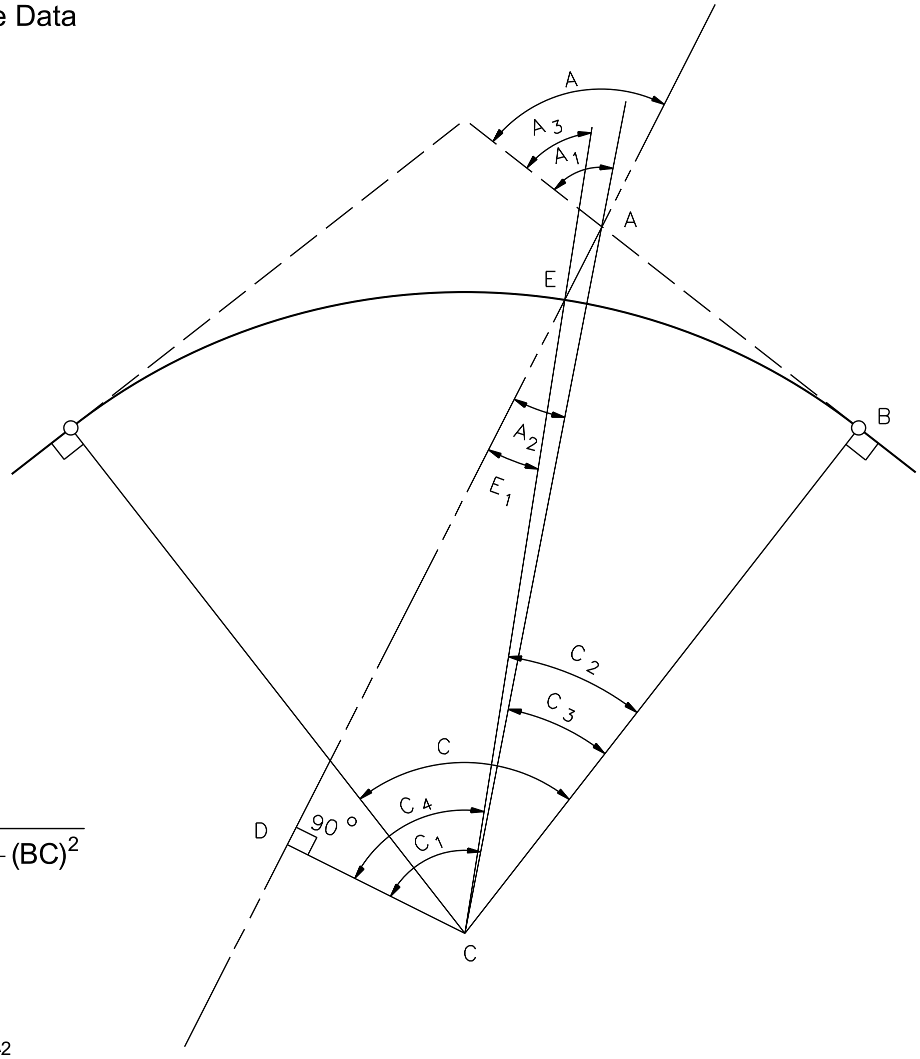
POC COMPUTATION USING RIGHT TRIANGLES
(Sample Problem)

Figure 32-6.S

Given:

AB, Angle A, and Curve Data

Required:
AE and Arc Dist. BE



Solution:

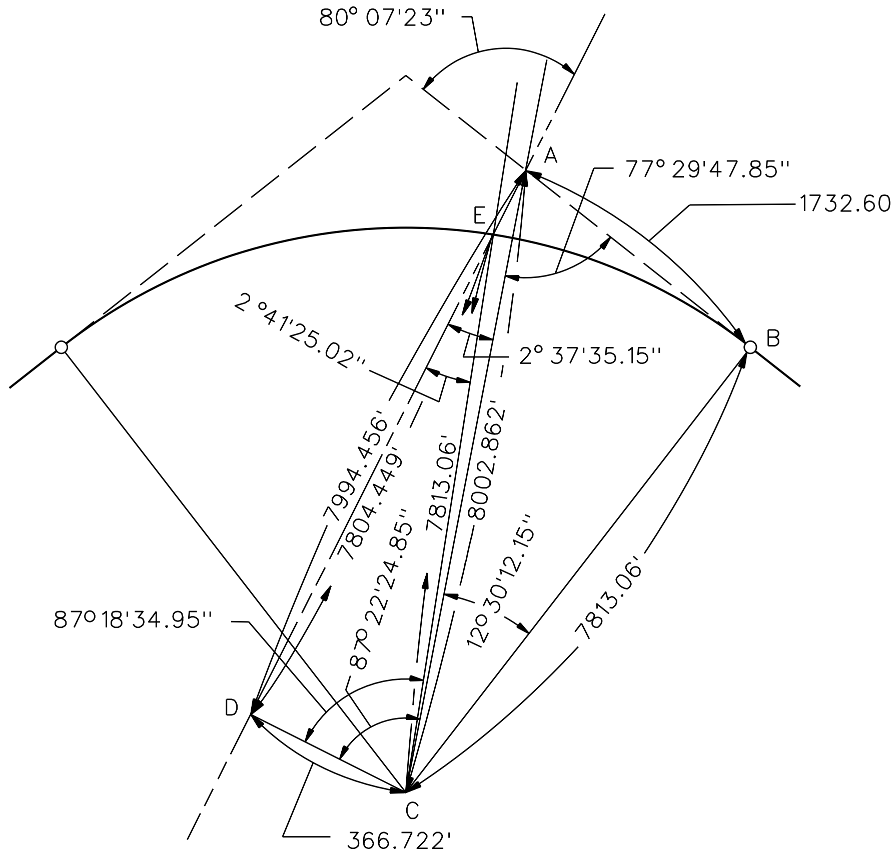
1. BC = Radius
2. AC = $\sqrt{(AB)^2 + (BC)^2}$
3. $\sin C_3 = \dfrac{AB}{AC}$
4. $A_1 = 90° - C_3$
5. $A_2 = A - A_1$
6. $CD = AC \sin A_2$
7. $AD = AC \cos A_2$
8. EC = Radius
9. $\sin E_1 = \dfrac{CD}{EC}$
10. $DE = EC \cos E_1$
11. $C_1 = 90° - A_2$
12. $C_4 = 90° - E_1$
13. $C_2 = C_3 + C_1 - C_4$
14. $AE = AD - DE$
15. Arc Dist. BE = $\dfrac{C_2}{360} 2\pi R$

POC COMPUTATION USING RIGHT TRIANGLES

Figure 32-6.T

Given:

Angle A = 80°07′23″
AB = 1732.60 ft
Radius = 7813.06 ft



1. BC = 7813.06 ft
2. AC = $\sqrt{(1732.60)^2 + (7813.06)^2} = 8002.862$ ft
3. sin C_3 = 1732.60 / 8002.86 = 0.2164975 C_3 = 12°30′12.15″
4. A_1 = 90°00′00″ – 12°30′12.15″ = 77°29′47.85″
5. A_2 = 80°07′23.00″ – 77°29′47.85″ = 2°37′35.15″
6. CD = (8002.862) (0.04582381) = 366.722 ft
7. AD = (8002.862) (0.99894954) = 7994.456 ft
8. EC = 7813.06 ft
9. sin E_1 = 366.722 / 7813.06 = 0.04693705 E_1 = 2°41′25.02″
10. DE = (7813.06) (0.99889785) = 7804.449 ft
11. C_1 = 90°00′00″ – 2°37′35.15″ = 87°22′24.85″
12. C_4 = 90°00′00″ – 2°41′25.02″ = 87°18′34.95″
13. C_2 = 12°30′12.15″ + 87°22′24.85″ – 87°18′34.98″ = 12°34′02.02″
14. AE = 7994.456 – 7804.449 = 190.02 ft
15. Arc BE = (12.567228) (2π) (7813.06) / 360 = 1713.71 ft

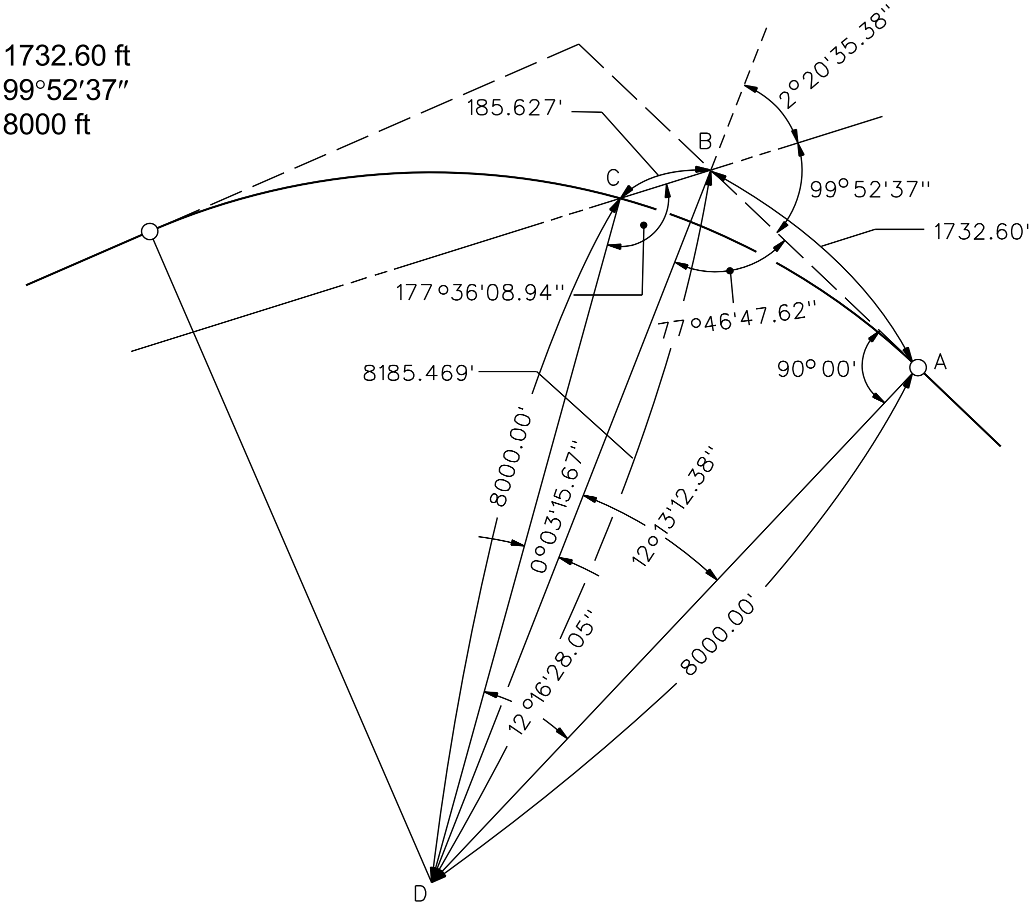
3. sin D = $\frac{AB}{BD}$
4. B_1 = 90°00′ – D
5. B_2 = 180°00′ – (B + B_1)
6. sin C = $\frac{BD \sin B_2}{\text{Radius}}$
7. D_1 = 180° – (B_2 + C)
8. BC = $\frac{R \sin D_1}{\sin B_2}$
9. I = D + D_1
10. Arc Dist. AC = $\frac{I}{360} 2\pi R$

POC COMPUTATION USING OBLIQUE TRIANGLE

Figure 32-6.V

Given:

AB = 1732.60 ft
Angle B = 99°52′37″
Radius = 8000 ft

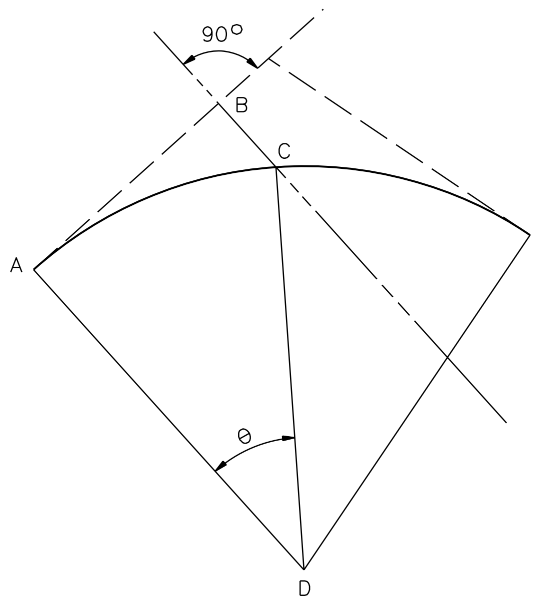


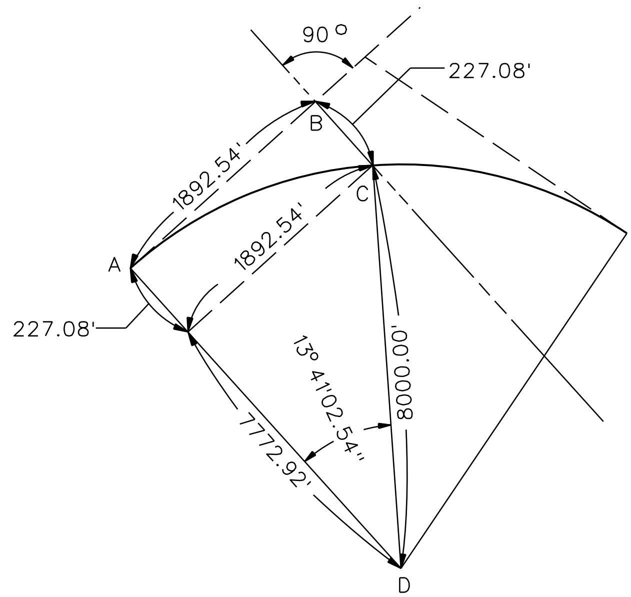
Solution:

1. AD = 8000.00 ft
2. BD = $\sqrt{(1732.60)^2 + (8000.00)^2} = 8185.469\text{ ft}$
3. sin D = 1732.60 / 8185.469 = 0.211667773 D = 12°13′12.38″
4. B_1 = 90°00′ – 12°13′12.38″ = 77°46′47.62″
5. B_2 = 180°00′ – (99°52′37″ + 77°46′47.62″) = 2°20′35.38″
6. sin C = (8185.469) (0.04088448) / 8000.00 = 0.041832334 C = 177°36′08.94″
7. D_1 = 180°00′ – (2°20′35.38″ + 177°36′08.94″) = 0°03′15.67″
8. BC = (8000.00) (0.00094866) / (0.040884478) = 185.627 ft
9. I = 12°13′12.38″ + 0°03′15.67″ = 12°16′28.05″
10. Arc AC = (12.2744583) (2π) (8000.00) / 360 = 1713.838 ft

POC COMPUTATION USING OBLIQUE TRIANGLE
(Sample Problem)

Figure 32-6.W





<u>Given</u>:

AB and Curve Data.

<u>Required</u>:

BC and Arc Dist. AC.

<u>Solution</u>:

1. CD = Radius
2. $\sin\theta = \dfrac{AB}{CD}$
3. $BC = CD - \sqrt{(CD)^2 - (AB)^2}$
4. Arc $AC = \dfrac{\theta}{360} 2\pi R$

<u>EXAMPLE</u>

<u>Given</u>:

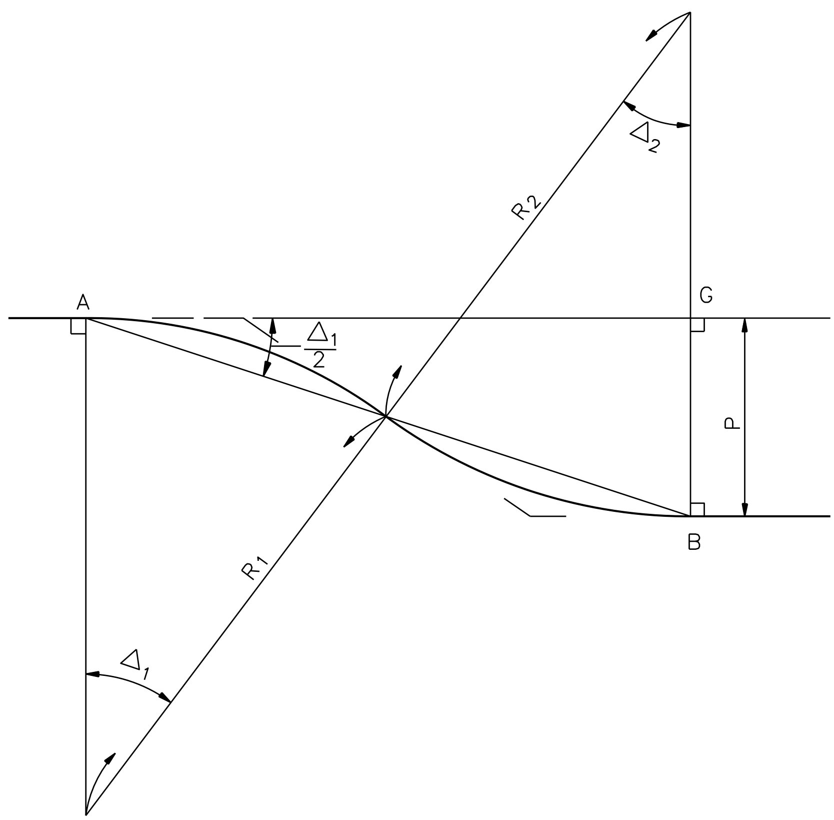
AB = 1892.54 ft
Radius = 8000.00 ft

<u>Solution</u>:

1. CD = 8000.00 ft
2. $\sin\theta$ = 1892.54 ft / 8000.00 = 0.2365675
   $\theta = 13°41'02.54''$
3. $BC = 8000.00 - \sqrt{(8000.00)^2 - (1892.54)^2}$
   = 227.08 ft
4. Arc AC = $(13.68403956)\,(2\pi)\,(8000.00) / 360$
   = 1910.65 ft

POC OF LINE 90° TO CURVE TANGENT

Figure 32-6.X



EQUAL RADII

Given: Radius & BG

1. $R_1 = R_2$
2. $\Delta_1 = \Delta_2$
3. $BG = P$
4. $\cos \Delta_1 = \dfrac{R_1 - \frac{1}{2}P}{R_1}$
5. $AG = \sqrt{4PR_1 - P^2}$
6. $\sin \Delta_1 = \dfrac{AG}{R_1 + R_2}$
7. $\tan \Delta_1 = \dfrac{AG}{R_1 + R_2 - P}$

UNEQUAL RADII

Given: R_1, AG, & P

1. $\Delta_1 = \Delta_2$
2. $AB = \sqrt{AG^2 + P^2}$
3. $R_2 = \dfrac{(AB)^2}{2P} - R_1$
4. $\sin \Delta_1 = \dfrac{AG}{R_1 + R_2}$
5. $\cos \Delta_1 = \dfrac{R_1 + R_2 - P}{R_1 + R_2}$
6. $\tan \Delta_1 = \dfrac{AG}{R_1 + R_2 - P}$

REVERSE CURVES TO PARALLEL TANGENTS
Figure 32-6.Y

EQUAL RADII

Given:
R_1 = R_2 = 2000.00 ft
P = 12 ft

Required:
Find Δ_1 and Δ_2

Solution:

1. $\cos \Delta_1 = (2000 - 6) / 2000 = 0.997$
   $\Delta_1 = \Delta_2 = 4°26'21.20''$

2. $AG = \sqrt{(4)(12)(2000) - (12)^2} = 309.606\,\text{ft}$

3. $\sin \Delta_1 = 309.606 / (2)(2000) = 0.07740155$
   $\Delta_1 = 4°26'21.20''$

4. $\tan \Delta_1 = 309.606 / ((2)(2000) - 12) = 0.077634403$
   $\Delta_1 = 4°26'21.20''$

UNEQUAL RADII

Given:
R_1 = 2000.00 ft
P = 12 ft
AG = 300 ft

Required:
Find Δ_1 and Δ_2

Solution:

1. $AB = \sqrt{(300)^2 + (12)^2} = 300.24\,\text{ft}$

2. $R_2 = (300.24)^2 / (2)(12) - 2000 = 1756.00$ ft

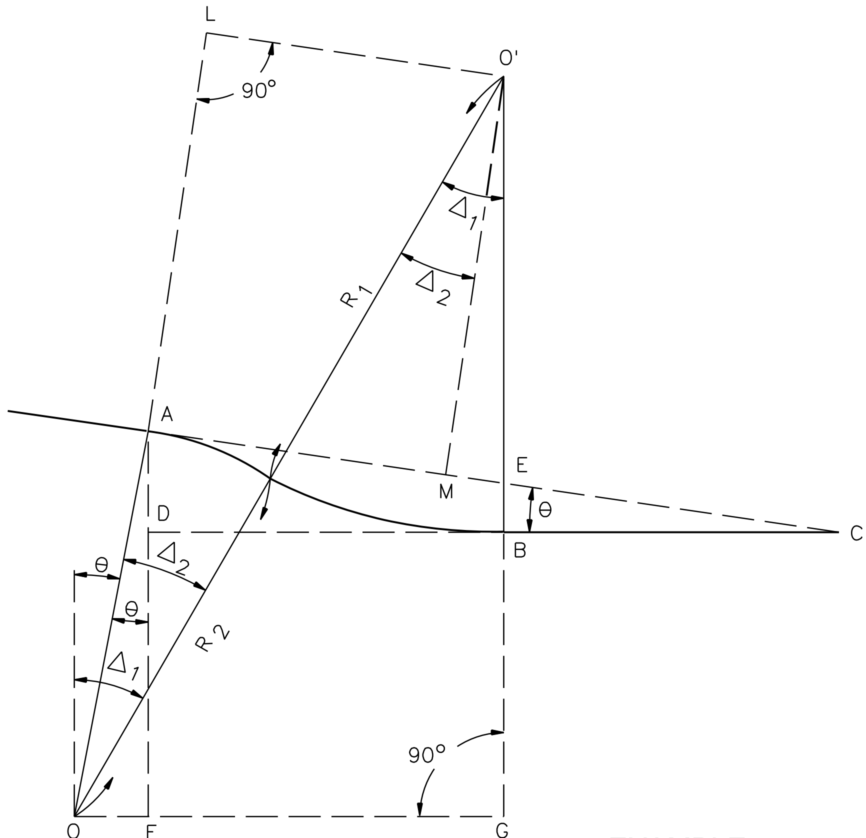
3. $\sin \Delta_1 = (300) / (2000.00 + 1756.00) = 0.079872204$
   $\Delta_1 = \Delta_2 = 4°34'52.39''$

4. $\cos \Delta_1 = (2000.00 + 1756.00 - 12.00) / (2000.00 + 1756.00) = 0.99680511$
   $\Delta_1 = \Delta_2 = 4°34'52.39''$

5. $\tan \Delta_1 = 300 / (2000.00 + 1756.00 - 12.00) = 0.080128205$
   $\Delta_1 = \Delta_2 = 4°34'52.39''$

REVERSE CURVES TO PARALLEL TANGENTS
(Sample Problem)

Figure 32-6.Z



EXAMPLE

Given:

θ, AD, R_1, and R_2

Required:

Δ_1 and Δ_2

1. AC = $\frac{AD}{\sin\theta}$

2. BG = DF = $R_2 \cos\theta - AD$

3. $\cos\Delta_1 = \frac{R_1 + BG}{R_1 + R_2}$

4. $\Delta_2 = \Delta_1 - \theta$

Given:

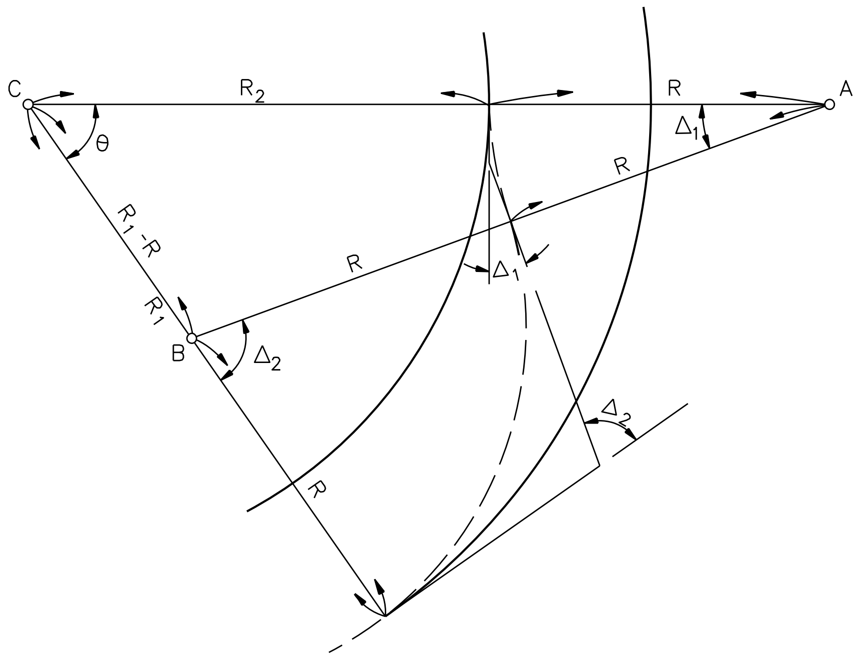
θ = 2°13′16″
AD = 54.00 ft
R_1 = 17,200.00 ft
R_2 = 21,500.00 ft

Solution:

1. AC = 54.00 / 0.038755993 = 1393.33 ft
2. BG = (21500.00) (0.99924874) – 54.00
= 21,429.85 ft
3. cos Δ_1 = (17,220.00 + 21,429.85) / (17,200.00 +21,500.00) = 0.998187261
Δ_1 = 3°27′01.48″
4. Δ_2 = 3°27′01.48″ – 2°13′16″
= 1°13′45.48″

REVERSE CURVES
(Tangents Not Parallel)

Figure 32-6.AA



EQUATIONS:

1. $\frac{\sin \Delta_1}{2} = \sqrt{\frac{(s-b)(s-c)}{bc}}$

Where: $a = R_1 - R$
$b = R_2 + R$
$c = 2R$
$s = \frac{1}{2}(a + b + c)$

2. $\sin\theta = \frac{2R \sin\Delta_1}{R_1 - R}$

3. $\Delta_2 = \Delta_1 + \theta$

Given:

R_2 = Inside Curve Radius
R_1 = Outside Curve Radius
R = Equal Radii of Reverse Curve

Required:

Δ_1 & Δ_2

EXAMPLE:

R_2 = 10,700.00 ft, R_1 = 10,800.00 ft,
R = 2000.00 ft

a = 10,800.00 – 2000.00 = 8800.00 ft
b = 10,700.00 + 2000.00 = 12,700.00 ft
c = (2) (2000.00) = 4000.00 ft
s = 12,750.00 ft

1. $\frac{\sin \Delta_1}{2} = \sqrt{\frac{(12{,}750 - 12{,}700)(12{,}750 - 4000)}{(12{,}700)(4000)}}$

$= 0.092801965$

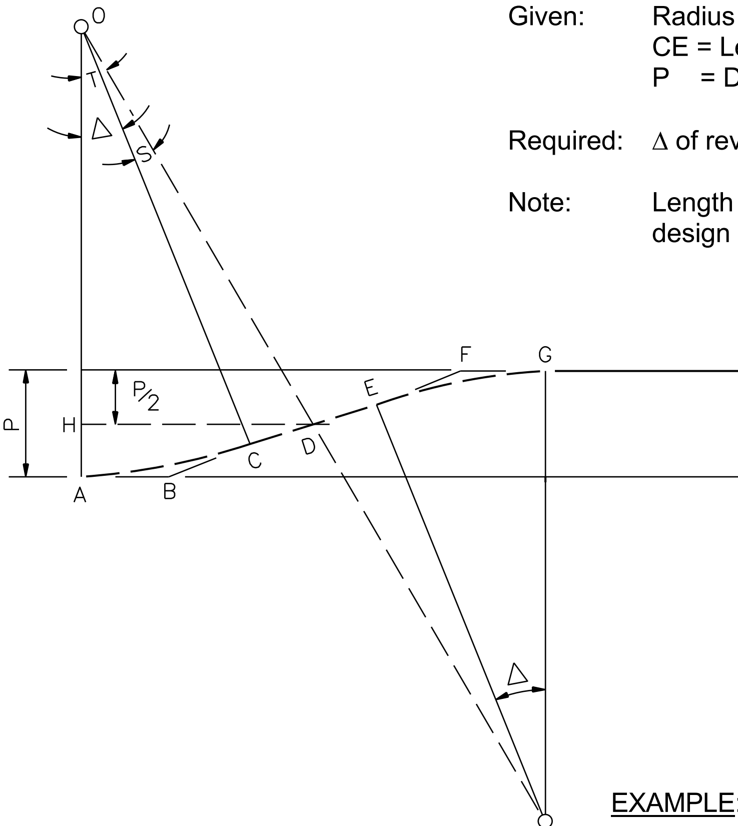
$\Delta_1 = 10°41'46.84''$

2. $\sin\theta$ = (2) (2000.00) (0.18560393) / (10,800.00 – 2000.00)
= 0.084365422
$\theta = 4°50'22.33''$

3. $\Delta_2 = 10°41'46.84'' + 4°50'22.33''$
$= 15°32'09.17''$

REVERSE CURVES
(Between Parallel Curves)

Figure 32-6.BB



Given: Radius of Reverse Curve
CE = Length of tangent between curves
P = Distance between parallel tangents

Required: Δ of reverse curves

Note: Length CE is governed by superelevation runoff design criteria for each curve.

EQUATIONS:

1. $OC = OA = \text{Radius}$
2. $CD = \dfrac{CE}{2}$
3. $OH = OA - \dfrac{P}{2}$
4. $OD = \sqrt{(CD)^2 + (OC)^2}$
5. $\sin S = \dfrac{CD}{OD}$
6. $HD = \sqrt{(OD)^2 - (OH)^2}$
7. $\sin T = \dfrac{HD}{OD}$
8. $\Delta = T - S$

EXAMPLE:

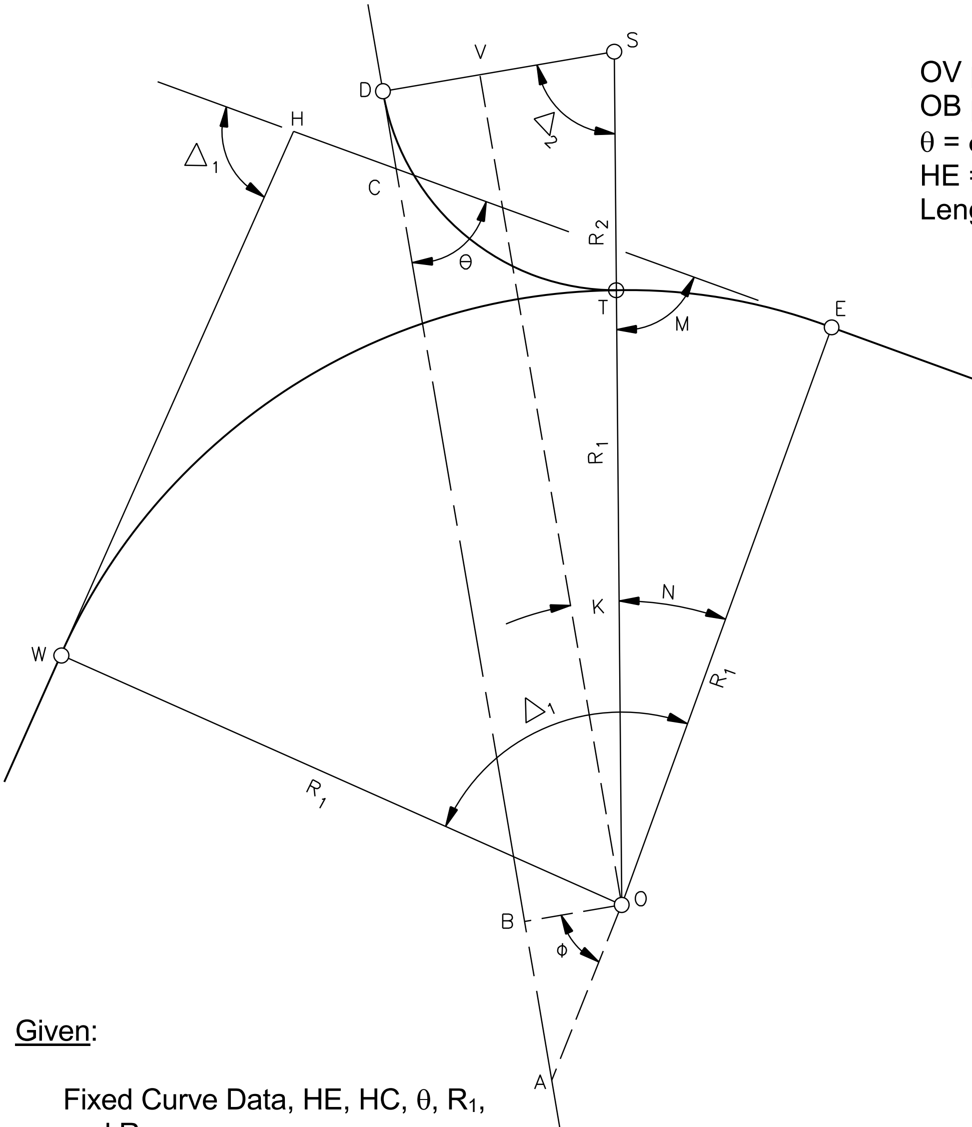
Given: R = 5800.00 ft
Tangent Length = CE = 200.00 ft
P = 130.00 ft

Solution:

1. OA = 5800.00 ft
2. CD = 200.00/2 = 100.00 ft
3. OH = 5800.00 – 130.00/2 = 5735.00 ft
4. OD = $\sqrt{(100.00)^2 + (5800.00)^2}$
   = 5800.86 ft
5. sin S = 100.00 / 5800.86 = 0.017238817
   S = 0°59′15.94″
6. HD = $\sqrt{(5800.00)^2 - (5735.00)^2} = 865.90$ ft
7. sin T = 865.90 / 5800.00 = 0.149292325
   T = 8°37′01.23″
8. Δ = 8°35′09.30″ – 0°59′15.94″
   = 7°35′53.37″

REVERSE CURVES
(Parallel Tangents with Tangent Segment Between

Figure 32-6.CC



OV parallel to BD &
OB parallel to SD
$\theta = \phi$
HE = Fixed Curve Tangent Length

<u>Given</u>:

Fixed Curve Data, HE, HC, θ, R_1, and R_2

<u>Note</u>:

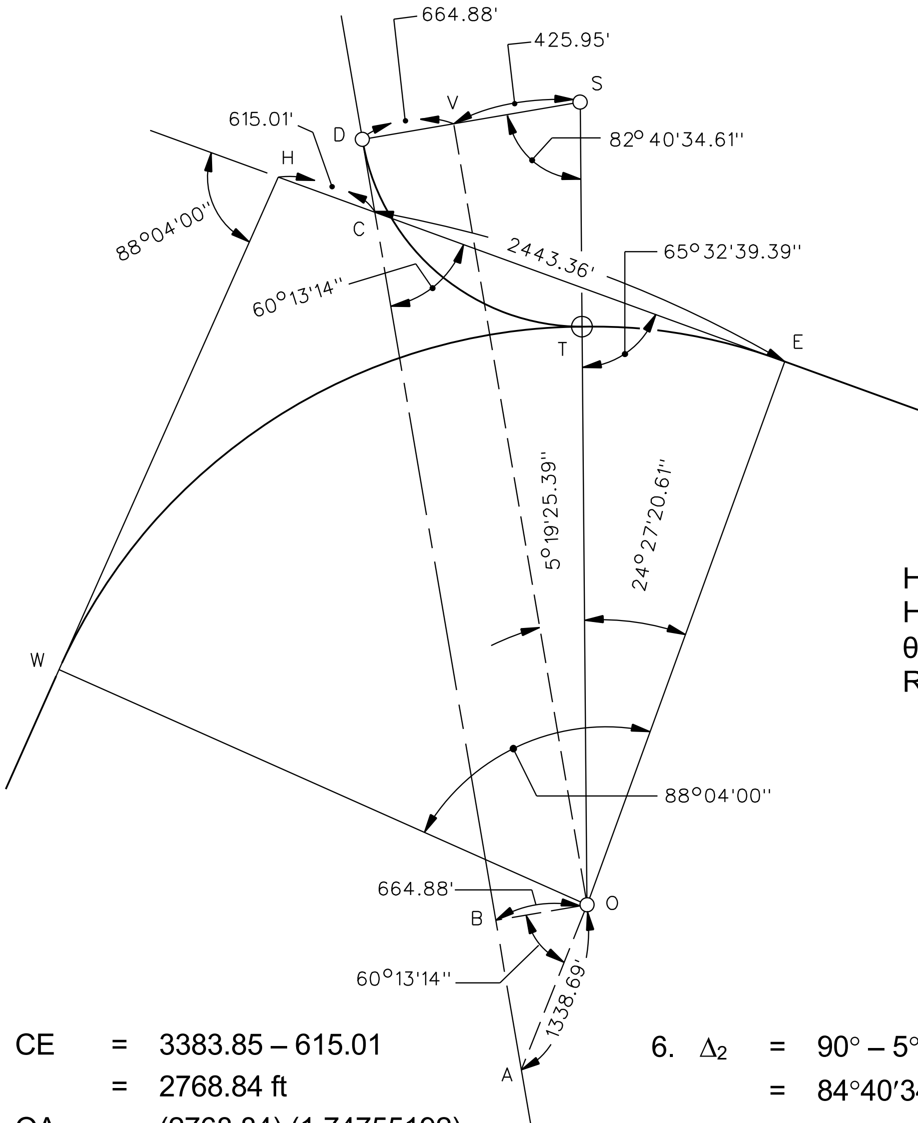
θ must be less than 90° for this solution.
WE = fixed curve

<u>Equations</u>:

1. CE = HE – HC
2. OA = CE tan θ – R_1
3. OB = DV = OA cos ϕ
4. SV = R_2 – DV
5. $\sin K = \frac{SV}{R_1 + R_2}$
6. $\Delta_2 = 90° - K$
7. $M = \theta + K$
8. $N = 90° - M$
9. $\text{Arc Length ET} = \frac{N}{360} 2\pi R_1$

CURVE BETWEEN FIXED TANGENT AND FIXED CURVE
(Case 1)

Figure 32-6.DD



PI Sta. 116 + 82.47
Δ_1 = 88°04′00″
R_1 = 3500.00 ft
T = 3383.85 ft
L = 5000.00 ft

HE = 3058.37 ft
HC = 615.01 ft
θ = ϕ = 60°13′14″
R_2 = 1090.83 ft

1. CE = 3383.85 – 615.01
   = 2768.84 ft
2. OA = (2768.84) (1.74755192) – 3500.00
   = 1338.69 ft
3. OB = DV = (1338.69) (0.49666261)
   = 664.88 ft
4. SV = 1090.83 – 664.88 ft
   = 425.95 ft
5. sin K = (425.95) / (3500.00 + 1090.83)
   = 0.092782786
   K = 5°19′25.39″
6. Δ_2 = 90° – 5°19′25.39″
   = 84°40′34.61″
7. M = 60°13′14.00″ + 5°19′25.39″
   = 65°32′39.39″
8. N = 90° – 65°32′39.39″
   = 24°27′20.61″

Arc Length ET = (24.45572531) (2) (π) (3500) / 360
= 1493.92 ft

11. $\Delta_2 \quad = \quad 90° + S$
12. $M \quad = \quad 90° - G$
13. $N \quad = \quad 90° - S$
14. $P \quad = \quad \Delta_1 - M - N$
15. $\text{Arc Length WT} = \dfrac{P}{360} 2\pi R_1$

CURVE BETWEEN FIXED TANGENT & FIXED CURVE
(Case V)

Figure 32-6.II

Given:

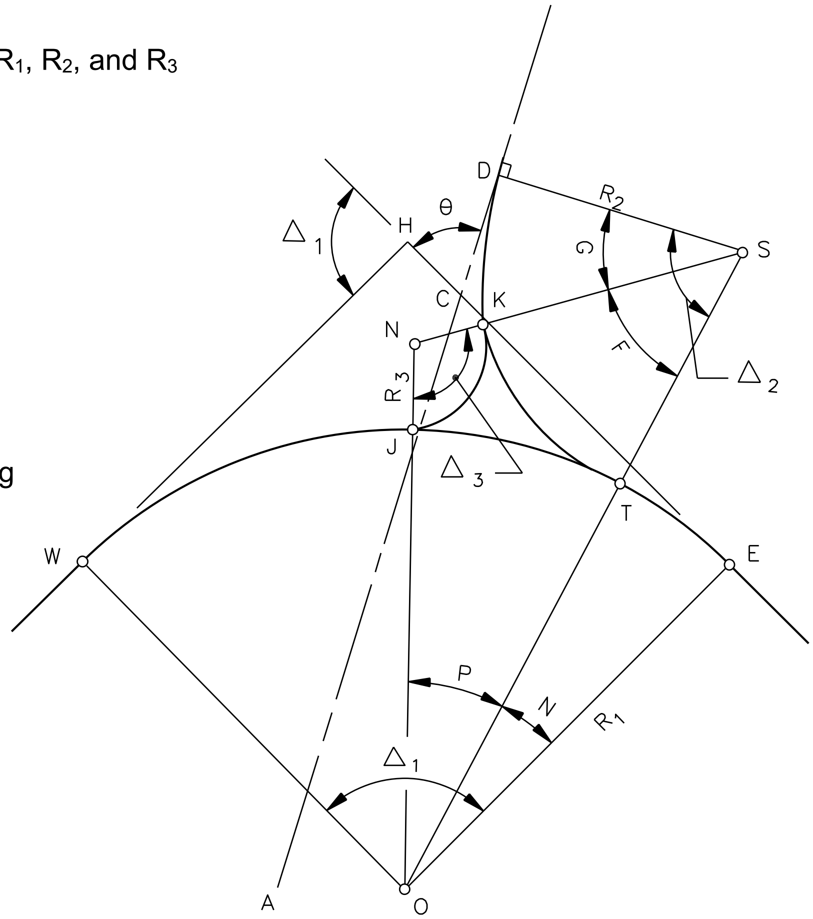
"WE" Curve Data, HC, θ, R_1, R_2, and R_3

Note:

θ must be less than 90°

AD = Fixed Tangent
WE= Fixed Curve

Δ_2 & N computed according to example in Case I



Equations:

1. $\dfrac{\sin \Delta_2}{2} = \sqrt{\dfrac{(s-b)(s-c)}{bc}}$

2. $\sin P = \dfrac{(R_2 + R_3)\sin \Delta_2}{R_1 + R_2}$

3. $\sin F = \dfrac{(R_1 + R_3)\sin \Delta_2}{R_1 + R_2}$

4. $\text{Arc Length EJ} = \dfrac{(N + P)}{360}\, 2\pi R_1$

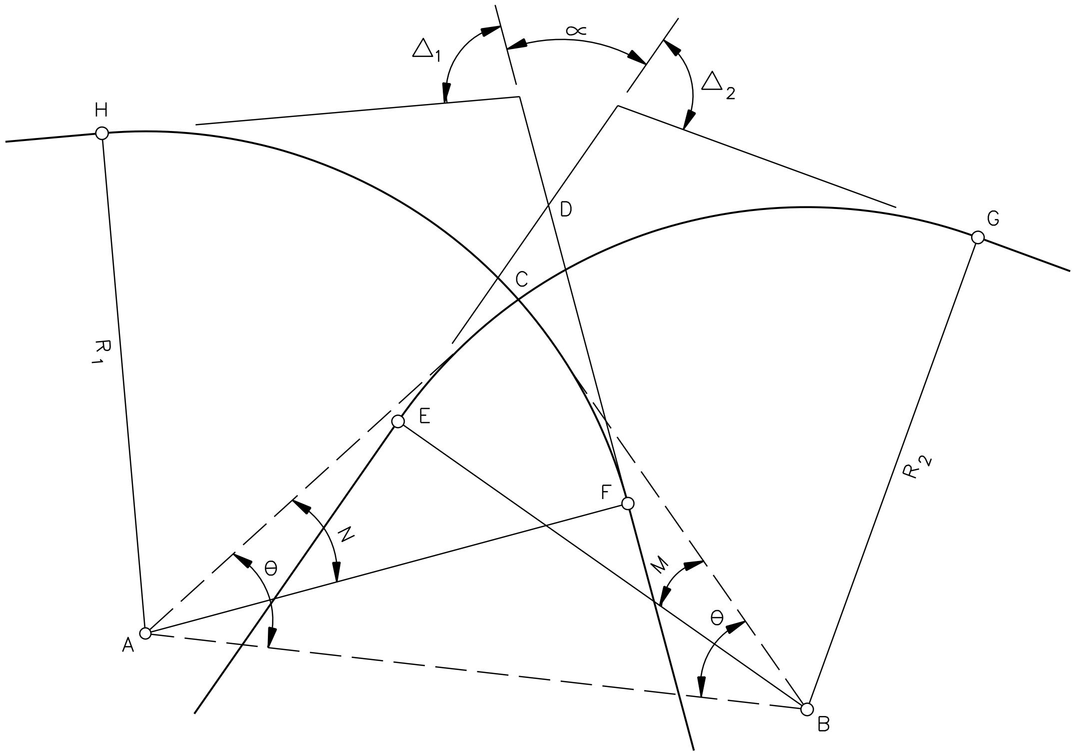
5. $G = \Delta_2 - F$

6. $\text{Arc Length DK} = \dfrac{G}{360}\, 2\pi R_2$

7. $\text{Arc Length KJ} = \dfrac{\Delta_3}{360}\, 2\pi R_3$

where:
a = OS = $R_1 + R_2$
b = NS = $R_2 + R_3$
c = ON = $R_1 + R_3$
s = ½ (a + b + c)

THREE CURVES TANGENT TO EACH OTHER
Figure 32-6.JJ



Given:

Curve data, azimuth, or bearing of curve tangents, DE, DF, & $\propto$.

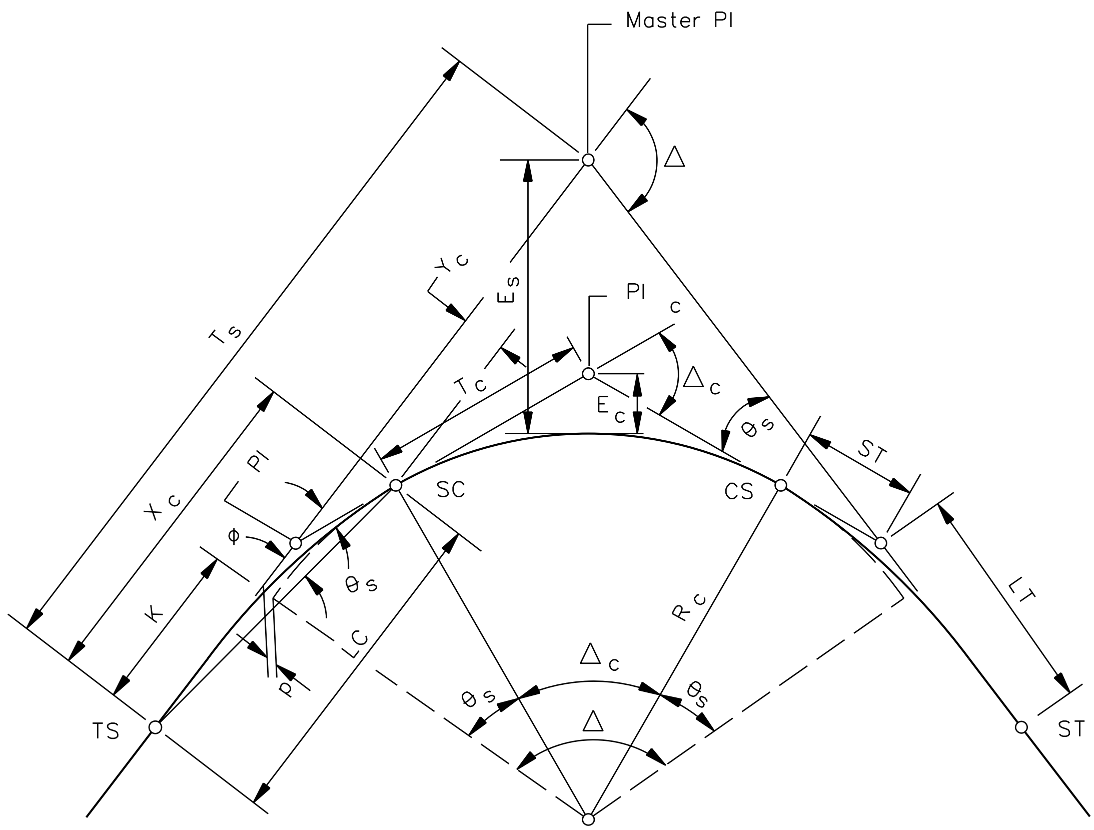
Required:

Arc EC and Arc FC

1. Coordinates at D either given or assume grid system
2. Determine coordinates at centers of curves (A & B)
3. Determine length and bearing AB
4. $BC = R_2 = a$, $AC = R_1 = b$, $AB = c$
5. $s = \frac{1}{2}(a + b + c)$
6. $\frac{\sin\ \theta}{2} = \sqrt{\frac{(s-b)(s-c)}{bc}}$
7. $\sin \phi = \frac{R_1 \sin\ \theta}{R_2}$
8. Determine bearings of AC & BC
9. Determine N & M from bearings
10. $\text{Arc}\,EC = \frac{M}{360}\,2\pi R_2$
11. $\text{Arc}\,FC = \frac{N}{360}\,2\pi R_1$

INTERSECTION OF TWO CURVES

Figure 32-6.KK



Notes:

1. All highway spirals to be computed with Department's approved software.

2. PI_c to circular curve must be set on External (E_s) and not from spiral PI (PI_s) and spiral end point (SC or CS).

3. A simple method for locating the points on a spiral transition is to divide the length of spiral into 10 or 20 equal parts, set up on the TS or SC, and locate the points by calculating deflection angles and using equal chord lengths.

4. See Figure 32-6.MM for definition of terms.

SIMPLE CURVE WITH SPIRALS

Figure 32-6.LL

SPIRAL TRANSITION CURVE NOMENCLATURE

Master PI = Point of intersection of the main tangents.

PI_c = Point of intersection of circular curve tangents.

PI_s = Point of intersection of the main tangent and tangent of circular curve.

TS = Tangent to spiral, common point of spiral and near transition.

SC = Spiral to curve, common point of spiral and circular curve of near transition.

CS = Curve to spiral, common point of circular curve and spiral of far transition.

ST = Spiral to tangent, common point of spiral and tangent of far transition.

R_c = Radius of the circular curve.

L_s = Length of spiral.

L_c = Length of circular curve.

T_s = Tangent distance from Master PI to TS or ST, or tangent distance of completed combination of curves.

T_c = Tangent distance from SC or CS to PI_c.

E_s = External distance from Master PI to midpoint of circular curve portion

LT = Long tangent of spiral only.

ST = Short tangent of spiral only.

LC = Long chord of spiral.

p = Offset distance from the main tangent to the PC or PT of the circular curve extended.

k = Distance from TS to point on main tangent opposite the PC of the circular curve produced.

Δ = Intersection angle between main tangents of the entire curve.

Δ_c = Intersection angle between tangents at the SC and the CS or the central angle of the circular curve.

θ_s = Intersection angle between the tangent of the complete curve and the tangent at the SC, the spiral tangents intersection angle.

ϕ = Deflection angle from main tangent at TS to SC along the line of the long chord.

$x_c y_c$ = Coordinates of SC from the TS.

L' = Length of spiral arc from the TS to any point on the spiral.

θ = The central angle of spiral arc L'. θ equals θ_s when L' equals L_s. Note: The θ referred to in Table II of *Transition Curves for Highways* is actually θ_s.

SPIRAL CURVE NOMENCLATURE

Figure 32-6.MM

CURVE FUNCTIONS

1. $\theta_s = (L_s / R_c)(90/\pi)$
2. $\Delta_c = \Delta - 2\theta_s$
3. $L_c = \frac{\Delta_c}{360} 2\pi R_c$
4. $T_s = (R_c + p)\tan(\Delta/2) + k$
5. $E_s = (R_c + p)(1/\cos(\Delta/2) - 1) + p =$

$$\left[\frac{(R_C + p)}{\cos(\Delta/2)} - (R_C + p)\right] + p$$

Where Δ, R_C, and L_S are givens. To find p and k, calculate θ_s and use Table II from *Transition Curves for Highways* or use tables in the Department's approved software.

SPIRAL FUNCTIONS

Corrections for C in Formula $\phi = \frac{\theta}{3} - C$

θ_s in Degrees	15	20	25	30	35	40	45	50
C in Minutes	0.2	0.4	0.8	1.4	2.2	3.4	4.8	6.6

6. $\phi = \frac{\theta}{3}$, if $\theta_s < 15°00'$ (approx. value)
7. $\varphi = \frac{\theta}{3} - C$, if $\theta_s \geq 15°00'$ (approx. value)
8. Deflection angle from TS or ST to any point "n" on spiral curve:

$$\phi = \frac{\theta_s}{3}\left[\frac{L'}{L_s}\right]^2$$

9. The exact values of ϕ can be determined by coordinates:

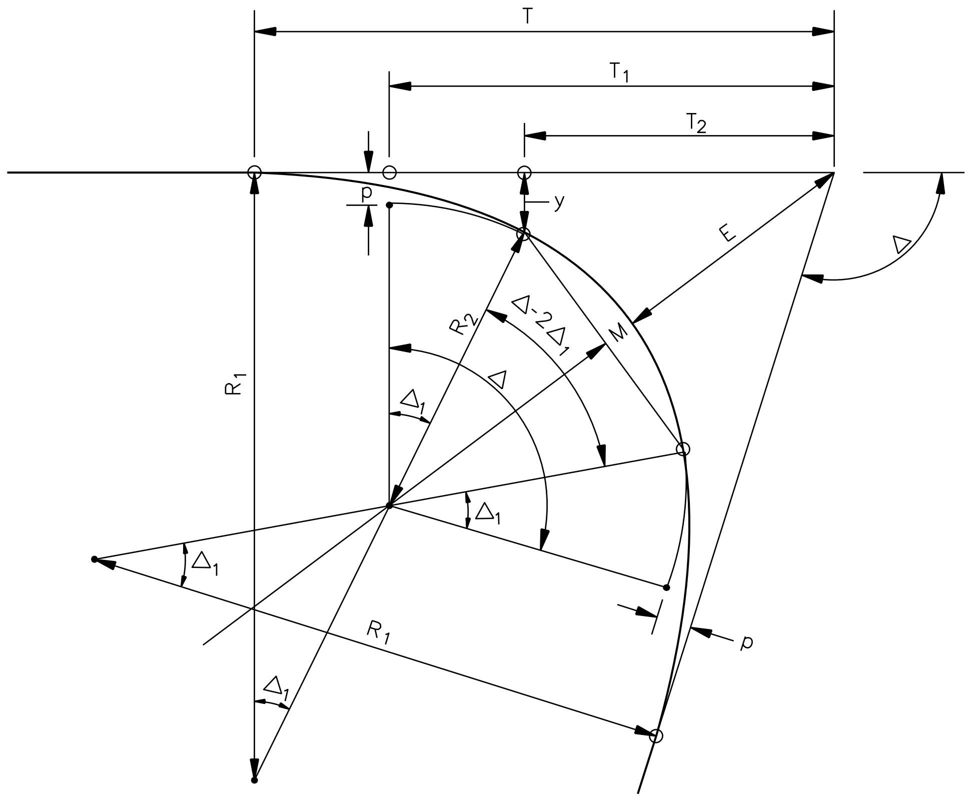
$$\tan\phi = \frac{y_c}{x_c}$$

10. $ST = \frac{y_c}{\sin\theta_s}$
11. $LT = x_c - \left(\frac{y_c}{\tan\theta_s}\right)$
12. $LC = \frac{x_c}{\cos\phi}$
13. $x_c = LC\cos\phi$
14. $y_c = LC\sin\phi$
15. $\theta = \frac{(L')^2}{L_s^2}\theta_s$

Note: These equations are based on Transition Curves for Highways by Joseph Barnett.

SPIRAL CURVE FORMULAS

Figure 32-6.NN



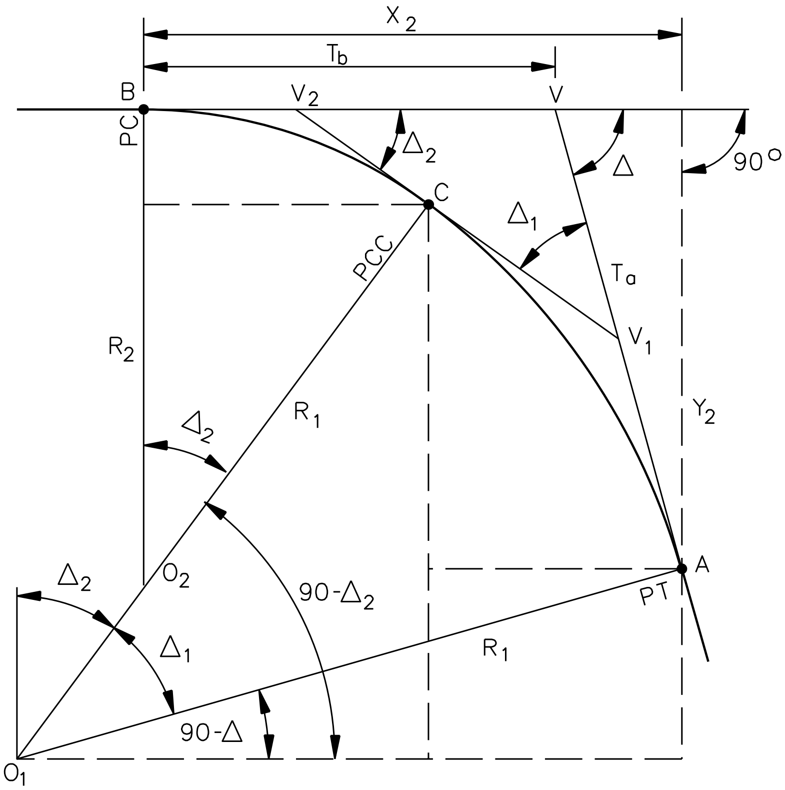
Given: R_1, R_2, Δ_1, and p

1. $T_1 = (R_2 + p)\tan\dfrac{\Delta}{2}$
2. $\Delta_1 = \cos^{-1}\left[\dfrac{R_1 - R_2 - p}{R_1 - R_2}\right]$
3. $T = T_1 + (R_1 - R_2)\sin\Delta_1$
4. $T_2 = T_1 - R_2\sin\Delta_1$
5. $E = \dfrac{R_2 + p}{\cos(\Delta/2)} - R_2$
6. $M = R_2 - [R_2\cos(\Delta/2 - \Delta_1)]$
7. $y = (R_2 + p) - R_2\cos\Delta_1$

Note: "p" is the offset location between the interior curve (extended) to a point where it becomes parallel with the tangent line.

THREE-CENTERED COMPOUND CURVE

Figure 32-6.OO



Given: R_1, R_2, Δ

Equations:

Δ = Total Deflection Angle = $\Delta_1 + \Delta_2$
X_2 = $R_1 \sin \Delta - (R_1 - R_2) \sin \Delta_2$
Y_2 = $R_2 - R_1 \cos \Delta + (R_1 - R_2) \cos \Delta_2$
T_a = $AV = Y_2 / \sin \Delta$
T_b = $BV = X_2 - T_a \cos \Delta$

$$\tan(\Delta_2/2) = \frac{R_1(1-\cos\Delta) - T_a \sin\Delta}{R_1(\sin\Delta) - T_a \cos\Delta - T_b}$$

TWO-CENTERED COMPOUND CURVE

Figure 32-6.PP

32-7 CURVE DATA

32-7.01 Rounding

The following will apply to rounding the radii of horizontal curves:

1. New Horizontal Curve. Radii will be expressed in multiples of 5 ft (1 m) increments.

2. Existing Horizontal Curve. Alignments that incorporate a previously defined horizontal curve should continue to use the same existing radius, and the radius will be re-defined to the nearest 0.01 ft (0.001 m). For example, a 3-degree curve which is a re-creation of a previously established curve will be assigned a 1909.86 ft (582.125 m) radius.

* * * * * * * * * *

Example 32-7.1

Shown below are three possible cases defining horizontal curvature. In all three cases, it is assumed the curve starts at PC Sta 300 + 59.41 (English units) or the equivalent PC station in metric units of kilometer Sta 9 + 162.126.

Case A: English curve definition.

Case B: Metric definition assuming that Case A curve data defines the roadway centerline from a previous survey and will be retained. All curve data is a direct or soft conversion from English to metric units.

Case C: Metric definition of a paper relocation on mapping. The PC location will start at metric Sta 9 + 162.125 and have approximately the same curvature as the Case A curve. Therefore, R will be set at 580 m.

The following table illustrates the curve data for all three Cases.

Case A	Case B	Case C
PI Sta = 302 + 68.57	PI Sta = 9 + 225.879	PI Sta 9 + 225.646
$\Delta = 12°30'$	$\Delta = 12°30'$	$\Delta = 12°30'$
D = 3°00′	R = 582.125 m	R = 580.000 m
T = 209.16 ft	T = 63.753 m	T = 63.520 m
L = 416.67 ft	L = 127.000 m	L = 126.536 m

* * * * * * * * * *

32-7.02 Chord Distances

When laying out a horizontal curve, the following guidelines are recommended for measuring chord distances around a curve. Where the radius is greater than 2000 ft (600 m), use 100 ft (25 m) chords. For radii between 2000 ft (600 m) and 800 ft (250 m), use 50 ft (15 m) chords. For radii between 800 ft (250 m) and 400 ft (125 m), use 25 ft (10 m) chords.

Chapter Thirty-three
VERTICAL ALIGNMENT

The vertical alignment contributes significantly to a highway's safety, aesthetics, operations, and costs. Long, gentle vertical curves provide greater sight distances and a more pleasing appearance for the driver. Chapters 43 through 50 provide numerical criteria for various vertical alignment elements based on highway functional class, project scope of work, and urban/rural location. Chapter 33 provides additional guidance on these and other vertical alignment elements, including maximum and minimum grades, critical lengths of grade, truck-climbing lanes, vertical curvature, vertical clearances, aesthetics, and developing a profile gradeline.

33-1 DEFINITIONS

1. Broken-Back Curves. A gradeline with two vertical curves in the same direction separated by a short section of tangent grade.

2. Bus. A heavy vehicle involved in the transport of passengers on a for-hire, charter, or franchised transit basis. Also, can be called a motor coach in rural areas.

3. Critical Length of Grade. The maximum length of a specific upgrade on which a loaded truck can operate without an unreasonable reduction in speed.

4. Grade Slopes. The rate of slope expressed as a percent between two adjacent VPI's. The numerical value for the grade is the vertical rise or fall in feet (meters) for each foot (meter) of horizontal distance. The numerical value is multiplied by 100 and is expressed as a percent. Upgrades in the direction of stationing are identified as plus (+). Downgrades are identified as minus (–).

5. Heavy Vehicles. Any vehicle with more than four wheels touching the pavement during normal operation. Heavy vehicles collectively include trucks, recreational vehicles, and buses.

6. K-Values. The horizontal distance needed to produce a 1% change in gradient.

7. Level Terrain. Level terrain generally is considered to be flat and has minimal impact on vehicular performance. Highway sight distances are either long or could be made long without major construction expense.

8. Momentum Grade. A site where an upgrade is preceded by a downgrade. These locations may allow a truck to increase its speed on the downgrade before ascending the upgrade.

9. Performance Curves. A set of curves which illustrate the effect grades will have on the design vehicle's acceleration and/or deceleration.

10. Profile Gradeline. A series of tangent lines connected by vertical curves. Typically, the gradeline is located along the roadway centerline of undivided multilane facilities and two-lane, two-way highways. For divided highways, it is typically located at the median edge of the traveled way for each roadway.

11. Recreational Vehicle. A heavy vehicle, generally operated by a private motorist, engaged in the transportation of recreational equipment or facilities; examples include campers, boat trailers, motorcycle trailers, etc.

12. Rolling Terrain. The natural slopes consistently rise above and fall below the roadway gradeline and, occasionally, steep grades present some restriction to the desirable horizontal and vertical alignment. In general, rolling terrain generates steeper grades causing trucks to reduce speeds below those of passenger cars.

13. Rugged Terrain. Longitudinal and transverse changes in elevation are abrupt, and benching and side hill excavation are usually required to provide the desirable horizontal and vertical alignment. Rugged terrain aggravates the performance of trucks relative to passenger cars and results in some trucks operating at crawl speeds.

14. Truck. A heavy vehicle engaged primarily in the transport of goods and materials or in the delivery of services other than public transportation. For geometric design and capacity analyses, trucks are defined as vehicles with six or more tires. Trucks may be defined as either single units (SU) or multiple units (MU). Data on trucks is compiled and reported by the district with assistance from the Office of Planning and Programming.

15. VPC (Vertical Point of Curvature). The point at which a tangent grade ends and the vertical curve begins.

16. VPI (Vertical Point of Intersection). The point where the extension of two tangent grades intersect.

17. VPT (Vertical Point of Tangency). The point at which the vertical curve ends and the tangent grade begins.

33-2 GRADES

33-2.01 Terrain

The topography throughout most of Illinois is considered to be either level or rolling. However, the northwest corner of the State, southern Illinois, and bluff areas near major rivers may be considered rugged. In general, if the terrain designation is not clear (e.g., level versus rolling), select the flatter of the two terrains. Where a multilane divided highway is proposed in rugged terrain, independent alignments with separate profiles are recommended.

33-2.02 Maximum Grades

Chapters 44 through 50 present Department criteria for maximum grades based on functional classification, urban/rural location, type of terrain, design speed, and project scope of work. Only use the maximum grades where it is absolutely necessary. Wherever practical, use grades flatter than the maximum.

33-2.03 Minimum Grades

The following provides the Department's criteria for minimum grades:

1. Uncurbed Roadways. It is desirable to provide a minimum longitudinal gradient of approximately 0.5%. This allows for the possibility of alterations to the original pavement cross slope due to swell, consolidation, maintenance operations, or resurfacing. Longitudinal gradients of approximately 0% may be acceptable on some pavements that have adequate cross slopes. These locations typically occur where a highway traverses a wide flood plain. In these cases, check the flow lines of the outside ditches for adequate drainage.

2. Curbed Streets. The median edge or centerline profile of streets with curb and gutter desirably should have a minimum longitudinal gradient of 0.5%. Where the adjacent development or flatter terrain precludes the use of a profile with a 0.5% grade, provide a minimum longitudinal gradient of at least 0.3%.

   On curbed facilities, the longitudinal gradient at the gutter line will have a significant impact on the pavement drainage characteristics (e.g., water encroaching on traveled ways, flow captures rates by grates). See Chapter 40 of the *BDE Manual* and the *IDOT Drainage Manual* for more information on pavement drainage.

3. New Bridges. For bridges on new construction and reconstruction projects, provide a minimum longitudinal gradient of 0.5% across the bridge.

33-2.04 Critical Length of Grade

The critical length of grade is the maximum length of a specific upgrade on which a truck can operate without an unreasonable reduction in speed. The highway gradient in combination with the length of the grade will determine the truck speed reduction on upgrades. For additional guidance, see the *Highway Capacity Manual* and the AASHTO *Policy on Geometric Design of Highways and Streets*.

The following will apply to the critical length of grade:

1. Design Vehicle. Figure 33-2.A presents the critical length of grade for a 200 lb/hp (120 kg/kW) truck. This vehicle applies to all truck routes in Illinois.

   For additional guidance on truck routes, see Sections 36-1.08 and 43-5 and the latest IDOT Designated State Truck Route System Map.

2. Criteria. Figure 33-2.A provides the critical lengths of grade for a given percent grade and acceptable truck speed reduction. Although these figures are based on an initial truck speed of 70 mph (110 km/h), they apply to any design or posted speed. For design purposes, use the 10 mph (15 km/h) speed reduction curve in the figure to determine if the critical length of grade is exceeded.

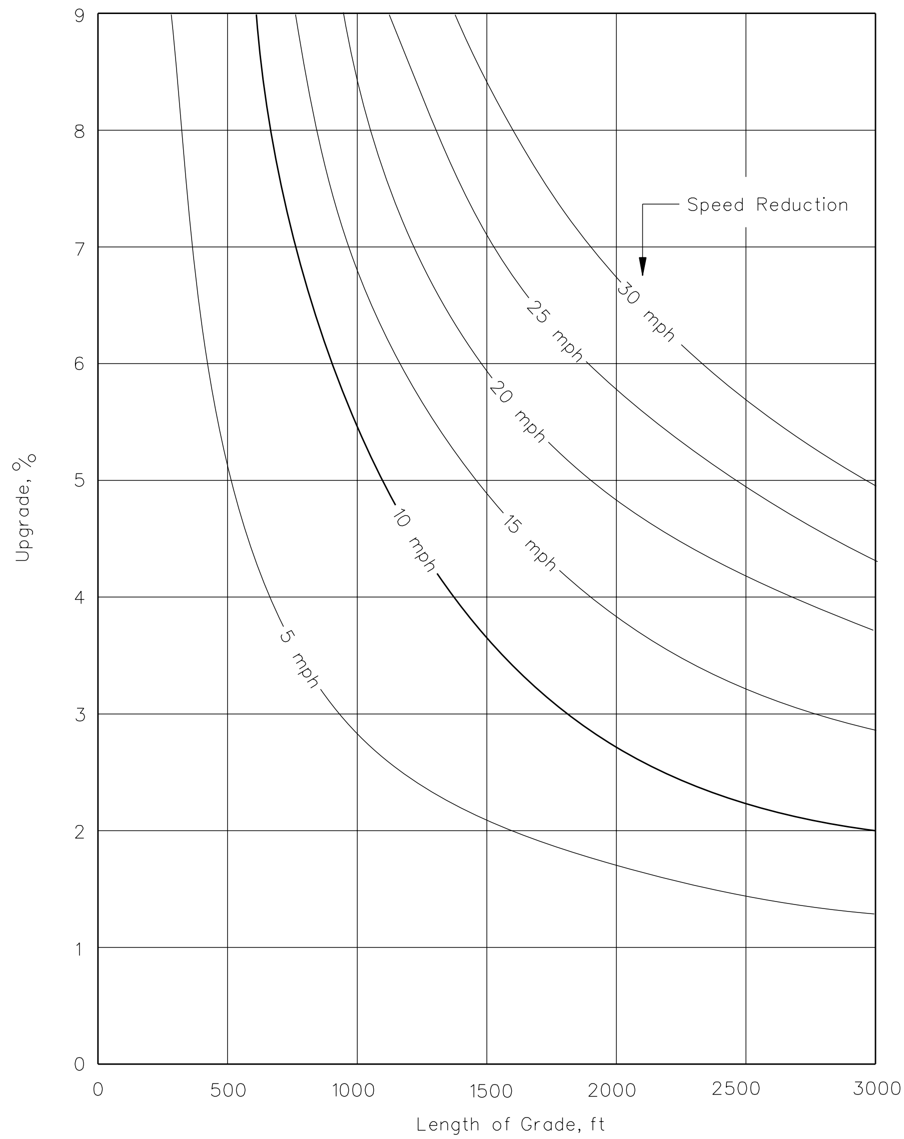
3. Momentum Grades. Where an upgrade is preceded by a downgrade, trucks will often increase their speed to ascend the upgrade. A speed increase of 5 mph (10 km/h) on moderate downgrades (3%-5%) and 10 mph (15 km/h) on steeper downgrades (6%-8%) of sufficient length are reasonable adjustments to the initial speed. This assumption allows the use of a higher speed reduction curve in Figure 33-2.A. However, the designer should also consider that these speed increases may not always be attainable. If traffic volumes are sufficiently high, a truck may be behind another vehicle when descending the momentum grade thereby restricting the increase in speed. Therefore, only consider these increases in speed if the highway has a Level of Service C or better.

4. Measurement. Vertical curves are part of the length of grade. Figure 33-2.B illustrates how to measure the length of grade to determine the critical length of grade using Figure 33-2.A.

5. Application. If the critical length of grade is exceeded, flatten the grade, if practical, or evaluate the need for a truck-climbing lane; see Section 33-3. Typically, only two-lane highways have operational problems that require truck-climbing lanes.

6. Highway Types. The critical-length-of-grade criteria applies equally to two-lane or multilane highways and applies equally to urban and rural facilities.

7. Example Problems. Examples 33-2.1 and 33-2.2 illustrate the use of Figure 33-2.A to determine the critical length of grade. Example 33-2.3 illustrates the use of Figures 33-2.A and 33-2.B. In the examples, the use of subscripts 1, 2, etc., indicate the successive gradients and lengths of grade on the highway segment.



Notes:

1. *Typically, the 10 mph curve will be used.*

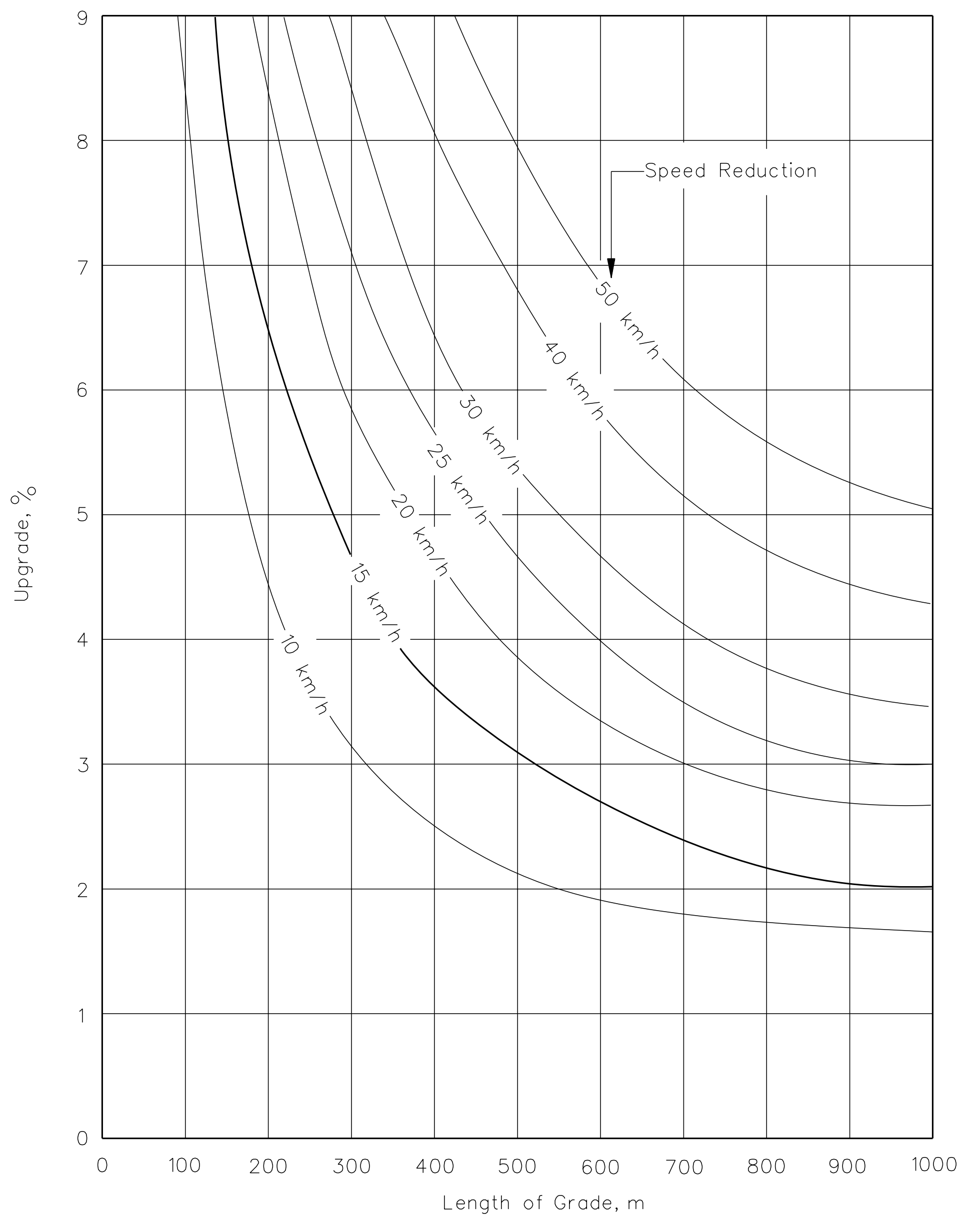
2. *See examples in Section 33-2.04 for use of figure.*

3. *Figure is based on a truck with initial speed of 70 mph. However, it may be used for any design or posted speed.*

4. *This figure is based on a 200 lb/hp truck.*

CRITICAL LENGTH OF GRADE
(US Customary)

Figure 33-2.A

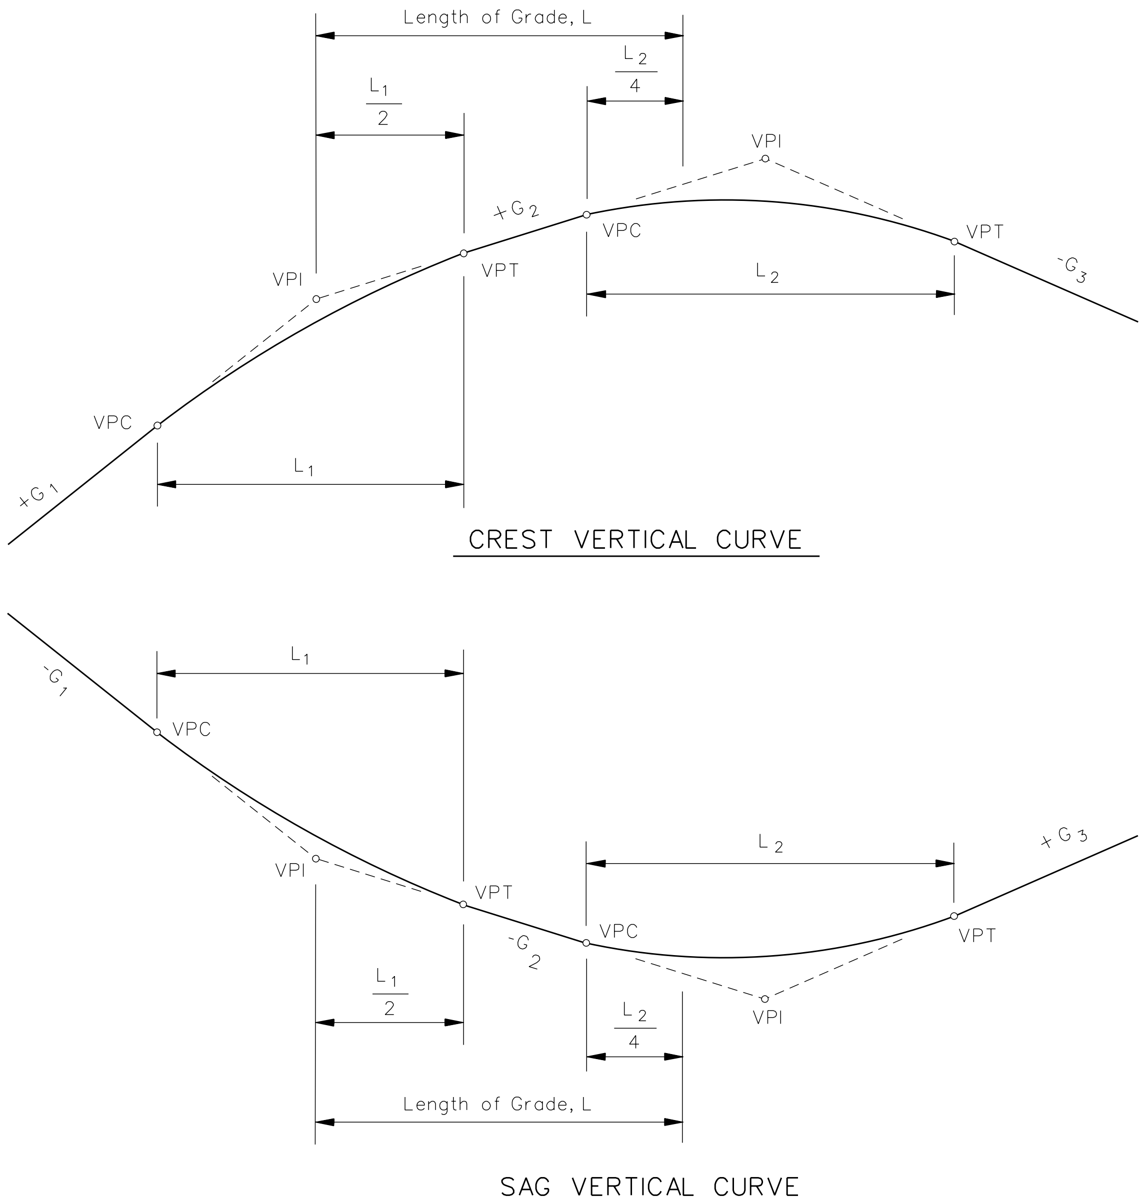


Notes:

1. *Typically, the 15 km/h curve will be used.*
2. *See examples in Section 33-2.04 for use of figure.*
3. *Figure based on a truck with initial speed of 110 km/h. However, it may be used for any design or posted speed.*
4. *This figure is based on a 120 kg/kW truck.*

CRITICAL LENGTH OF GRADE
(Metric)

Figure 33-2.A



Notes:

1. *For vertical curves where the two tangent grades are in the same direction (both upgrades or both downgrades), 50% of the curve length will be part of the length of grade.*
2. *For vertical curves where the two tangent grades are in opposite directions (one grade up and one grade down), 25% of the curve length will be part of the length of grade.*
3. *The above diagram is included for illustrative purposes only. Broken back vertical curves are to be avoided where practical. Distances less than 1500 ft (500 m) between VPI's are considered to be broken back.*

MEASUREMENT FOR LENGTH OF GRADE

Figure 33-2.B

* * * * * * * * * *

Example 33-2.1

Given: Level Approach
$G = +4\%$
$L = 1500$ ft (length of grade)
Rural Principal Arterial (Class II Highway)

Problem: Determine if the critical length of grade is exceeded.

Solution: For a Class II Highway, Figure 33-2.A yields a critical length of grade of 1200 ft for a 10-mph speed reduction. The length of grade (L) exceeds this value. Therefore, flatten the grade, if practical, or evaluate the need for a truck-climbing lane.

Example 33-2.2

Given: Level Approach
$G_1 = +4.5\%$
$L_1 = 500$ ft
$G_2 = +2\%$
$L_2 = 700$ ft
Marked Route Rural Collector with a significant number of heavy trucks

Problem: Determine if the critical length of grade is exceeded for the combination of grades G_1 and G_2.

Solution: From Figure 33-2.A, G_1 yields a truck speed reduction of 5 mph. G_2 yields a speed reduction of approximately 3 mph. The total of 8 mph is less than the maximum 10 mph speed reduction. Therefore, the critical length of grade is not exceeded.

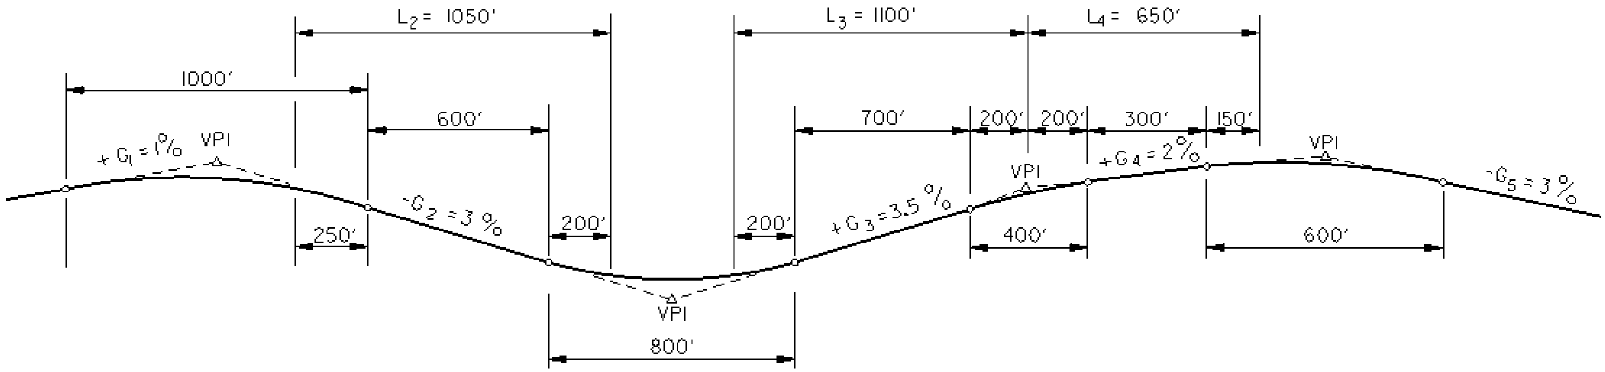
Example 33-2.3

Given: Figure 33-2.C illustrates the vertical alignment on a low-volume, two-lane rural collector highway with no large trucks. It is a Class II Highway.

Problem: Determine if the critical length of grade is exceeded for G_2 or for the combination upgrade G_3 and G_4.

Solution: Use the following steps:

Step 1. Determine the length of grade using the criteria in Figure 33-2.B. For this example, these are calculated as follows:



CRITICAL LENGTH OF GRADE CALCULATIONS
(Example 33-2.3)

Figure 33-2.C

$$L_2 = \frac{1000}{4} + 600 + \frac{800}{4} = 1050\text{ ft}$$

$$L_3 = \frac{800}{4} + 700 + \frac{400}{2} = 1100\text{ ft}$$

$$L_4 = \frac{400}{2} + 300 + \frac{600}{4} = 650\text{ ft}$$

Step 2. Determine the critical length of grade in both directions. On a Class II Highway, use Figure 33-2.A to determine the critical length of grade.

- For trucks traveling left to right, enter into Figure 33-2.A the value for G_3 (3.5%) and L_3 = 1100 ft. The speed reduction is 7.0 mph. For G_4 (2%) and L_4 = 650 ft, the speed reduction is approximately 3.5 mph. The total speed reduction on the combination upgrade G_3 and G_4 is 10.5 mph. This exceeds the maximum 10 mph speed reduction. However, on low-volume roads, one can assume a 5 mph increase in truck speed for the 3% "momentum" grade (G_2) which precedes G_3. Therefore, a speed reduction may be as high as 15 mph before concluding that the combination grade exceeds the critical length of grade. Assuming the benefits of the momentum grade, this leads to the conclusion that the critical length of grade is not exceeded.

- For trucks traveling in the opposite direction using Figure 33-2.A and a grade of G_2 = 3%, the critical length of grade for the 10 mph speed reduction is 1700 ft. Because L_2, (1050 ft) is less than 1700 ft, the critical length of grade for this direction is not exceeded.

* * * * * * * * * *

33-3 TRUCK-CLIMBING LANES

33-3.01 Warrants

A truck-climbing lane may be warranted to allow a specific upgrade to operate at an acceptable level of service (LOS). The following criteria will apply.

33-3.01(a) Two-Lane Highways

On a two-lane, two-way highway, a truck-climbing lane generally will be warranted if the following conditions are satisfied:

- the critical length of grade is exceeded for the 10 mph (15 km/h) speed reduction curve (see Figure 33-2.A); and
- the heavy-vehicle volume (i.e., trucks, buses, and recreational vehicles) exceeds 20 veh/h during the design hour; and
- one of the following conditions exists:
  + the LOS on the upgrade is E or F, or
  + there is a reduction of two or more LOS when moving from the approach segment to the upgrade; and
  + the construction costs and the construction impacts (e.g., environmental, right-of-way) are considered reasonable.

Also, truck-climbing lanes may be warranted where the above criteria are not met and if there is an adverse crash experience on the upgrade related to slow-moving trucks.

33-3.01(b) Multilane Highways

A truck-climbing lane generally will be warranted on a multilane highway if the following conditions are satisfied:

- the critical length of grade is exceeded for the 10 mph (15 km/h) speed reduction curve (see Figure 33-2.A); and
- the directional service volume exceeds 1000 veh/h; and
- one of the following conditions exists:
  + the LOS on the upgrade is E or F, or
  + there is a reduction of one or more LOS when moving from the approach segment to the upgrade; and

+ the construction costs and the construction impacts (e.g., environmental, right-of-way) are considered reasonable.

Also, truck-climbing lanes may be warranted where the above criteria are not met and if there is an adverse crash experience on the upgrade related to slow-moving trucks.

33-3.02 Capacity Analysis

See the *Highway Capacity Manual* for guidance on conducting capacity analyses for climbing lanes on two-lane and multilane highways.

33-3.03 Design Guidelines

Figure 33-3.A summarizes the design criteria for a truck-climbing lane. Also consider the following:

1. Design Speed. For entering speeds equal to or greater than 55 mph (90 km/h), use 55 mph (90 km/h) for the truck design speed. For speeds less than 55 mph (90 km/h), use the roadway design speed or the posted speed limit, whichever is less. Under restricted conditions, the designer may want to consider the effect a momentum grade will have on the entering speed. See Section 33-2.04 for additional information on momentum grades. However, the maximum speed will be 55 mph (90 km/h).

2. Superelevation. For horizontal curves, superelevate the truck-climbing lane at the same rate as the adjacent travel lane. When selecting the superelevation rate, consider the following:

   a. Snow and Ice Conditions. Where snow and ice conditions are expected, the selected superelevation rate should not exceed 6%.

   b. New Construction. The maximum superelevation rate should not exceed 6%.

   c. Reconstruction and 3R Projects. The maximum superelevation rate is 8%. However, where practical, select a horizontal curve radii so that the actual superelevation rate is 6% or less.

   d. Curves to the Left. Where there is a curve to the left, use as flat of a curve as practical to minimize superelevation and reduce the possibility of vehicles sliding down the cross slope during icy conditions into opposing traffic.

3. Performance Curves. Figure 33-3.B presents the deceleration and acceleration rates for a 200 lb/hp (120 kg/kW) truck.

Design Element	Desirable	Minimum
Lane Width	12 ft (3.6 m)	Freeway/Expressway: 12 ft (3.6 m) Other Facilities: 11 ft (3.3 m)
Shoulder Width	6 ft (1.8 m)	4 ft – 6 ft (1.2 m – 1.8 m)
Cross Slope on Tangent	¼″/ft (2%)	¼″/ft (2%)
Beginning of Full-Width Lane (1)	Location where the truck speed has been reduced to 10 mph (15 km/h) below the posted speed limit.	Location where the truck speed has been reduced to 45 mph (70 km/h).
End of Full-Width Lane (2)	Location where truck has reached highway posted speed or 55 mph (90 km/h), whichever is less.	Location where truck has reached 10 mph (15 km/h) below highway posted speed limit.
Entering Taper	25:1	300 ft (90 m)
Exiting Taper	600 ft (180 m)	50:1
Minimum Full-Width Length	1000 ft (300 m) or greater	1000 ft (300 m)

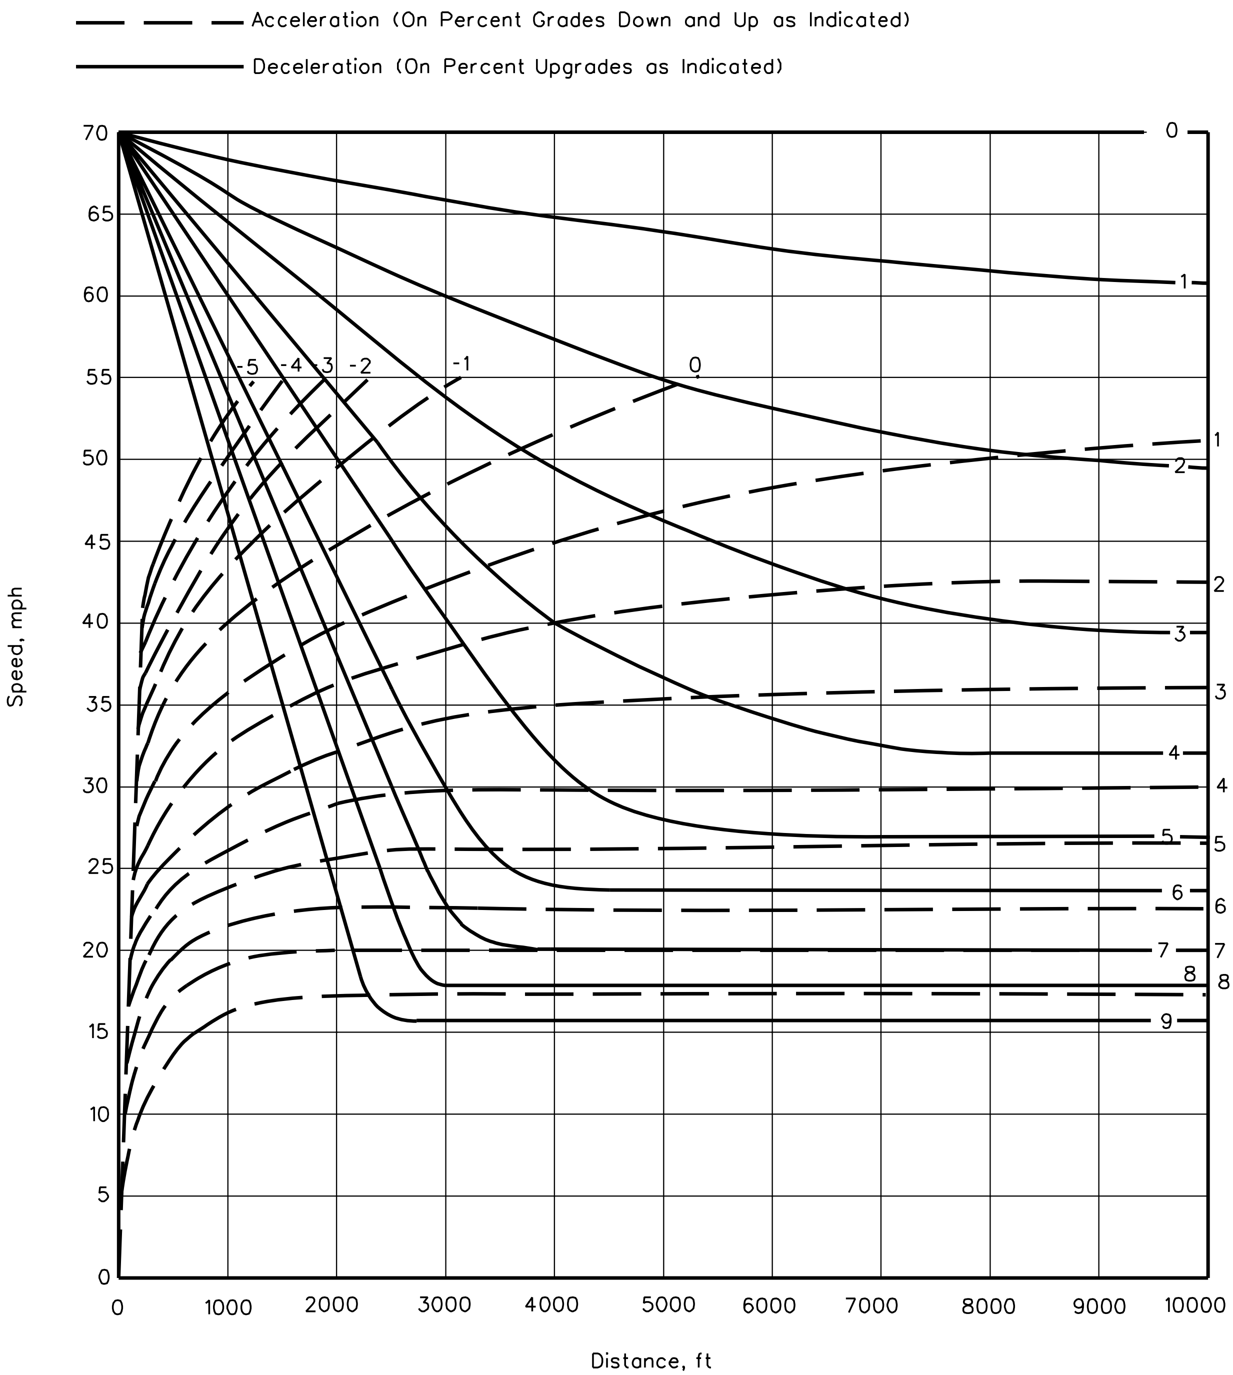
Notes:

1. *Use Figure 33-3.B to determine truck deceleration rates. In determining the applicable truck speed, the designer may consider the effect of momentum grades.*

2. *Use Figure 33-3.B to determine truck acceleration rates. Also, see Comment 4 in Section 33-3.03.*

DESIGN CRITERIA FOR TRUCK-CLIMBING LANES

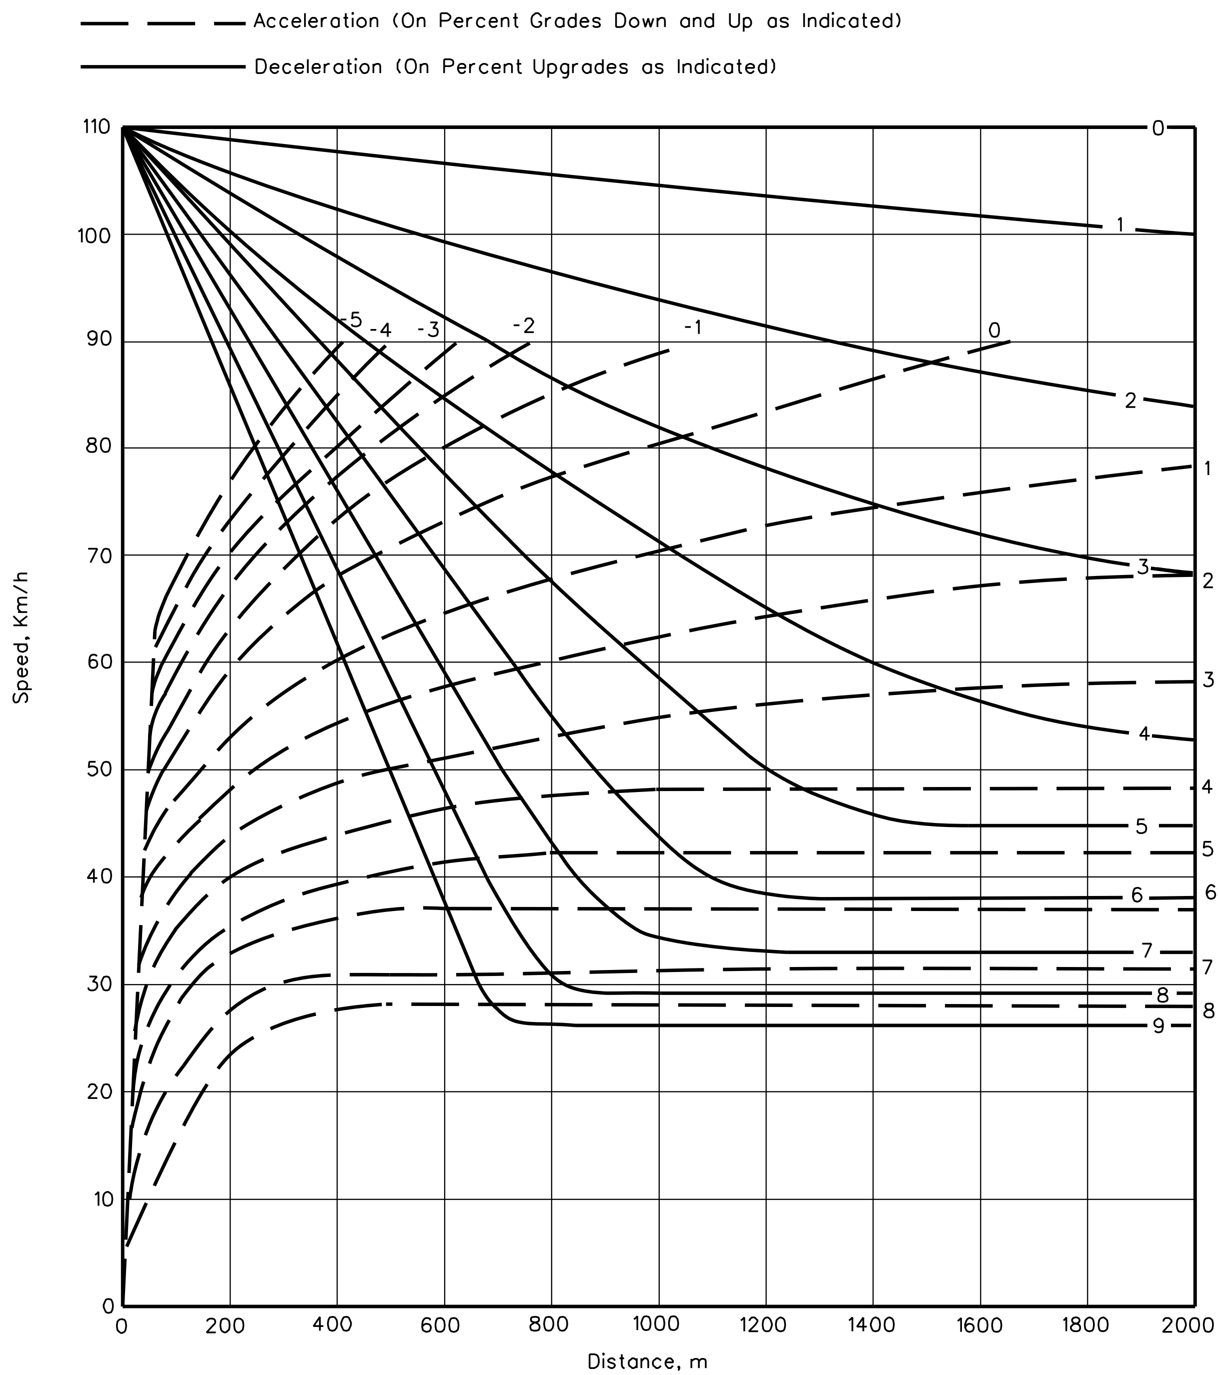
Figure 33-3.A



Note: For entering speeds equal to or greater than 70 mph, use an initial speed of 70 mph. For speeds less than 70 mph, use the design speed or posted speed limit as the initial speed.

PERFORMANCE CURVES FOR TRUCKS
(200 lb/hp) (US Customary)

Figure 33-3.B



Note: *For entering speeds equal to or greater than 110 km/h, use an initial speed of 110 km/h. For speeds less than 110 km/h, use the design speed or posted speed limit as the initial speed.*

PERFORMANCE CURVES FOR TRUCKS
(120 kg/kW) (Metric)

Figure 33-3.B

4. End of Full-Width Lane. In addition to the criteria in Figure 33-3.A, ensure that there is sufficient sight distance available to the point where the truck, RV, or bus will begin to merge back into the through travel lane. At a minimum, this will be stopping sight distance. Desirably, the driver should have decision sight distance available to the end of the taper. See Section 31-3 for decision sight distance values.

   Do not end the full lane width just beyond a crest vertical curve, but instead extend it beyond the crest vertical curve. The full lane width should not end on a horizontal curve.

5. Signing and Pavement Markings. Figure 33-3.C illustrates the Department's practice for signing and marking climbing lanes. Where deemed necessary, contact the district Bureau of Operations for additional information.

33-3.04 Downgrades

Truck lanes on downgrades are not typically considered. However, steep downhill grades may also have a detrimental effect on the capacity and safety of facilities with high traffic volumes and numerous heavy trucks. Although specific criteria have not been established for these conditions, trucks descending steep downgrades in low gear may produce nearly as great an effect on operations as an equivalent upgrade. The need for a truck lane for downhill traffic will be considered on a site-by-site basis.

33-3.05 Truck Speed Profile

For highways with a single grade, the critical length of grade and deceleration and acceleration rates can be directly determined from Figure 33-3.B. However, most highways have a continuous series of grades. Often, it is necessary to find the impact of a series of significant grades in succession. If several different grades are present, then a speed profile may need to be developed.

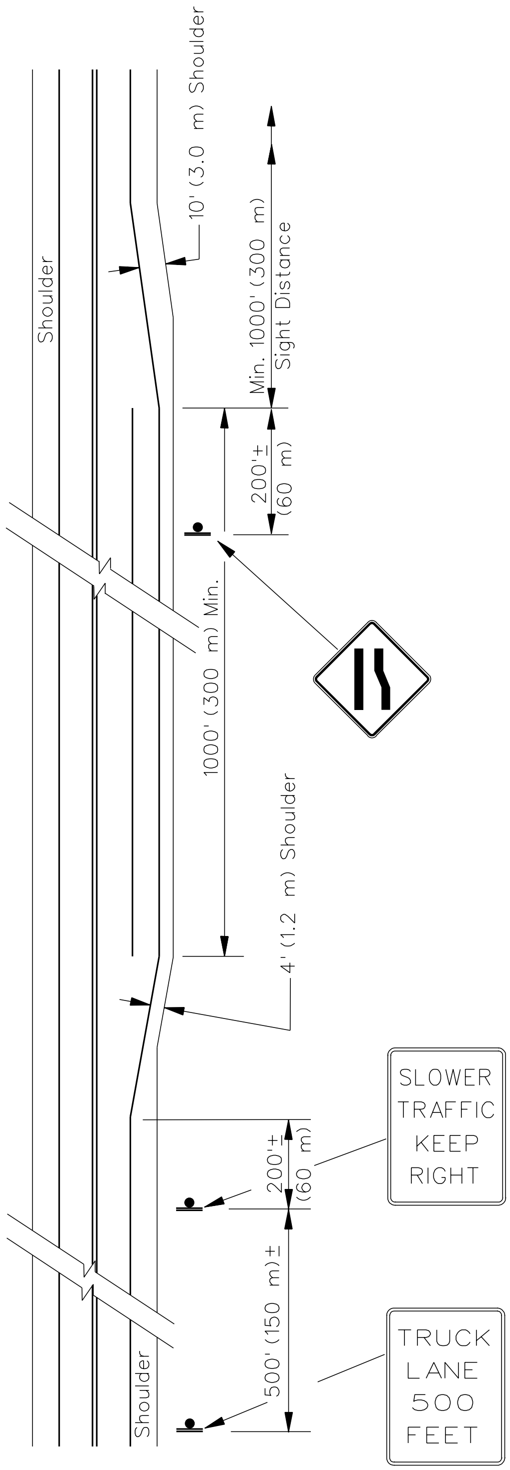
The following example illustrates how to construct a truck speed profile and how to use Figure 33-3.B.

* * * * * * * * * *

Example 33-3.2

Given: Level Approach
G_1 = +3% for 800 ft (VPI to VPI)
G_2 = +5% for 3200 ft (VPI to VPI)
G_3 = -2% beyond the composite upgrade (G_1 and G_2)
V = 60 mph design speed with a 55 mph posted speed limit
Rural Principal Arterial (Class I Highway)

Problem: Using the criteria in Figure 33-3.A and Figure 33-3.B, construct a truck speed profile and determine the beginning and ending points of the full-width climbing lane.



CLIMBING LANE MARKINGS

Figure 33-3.C

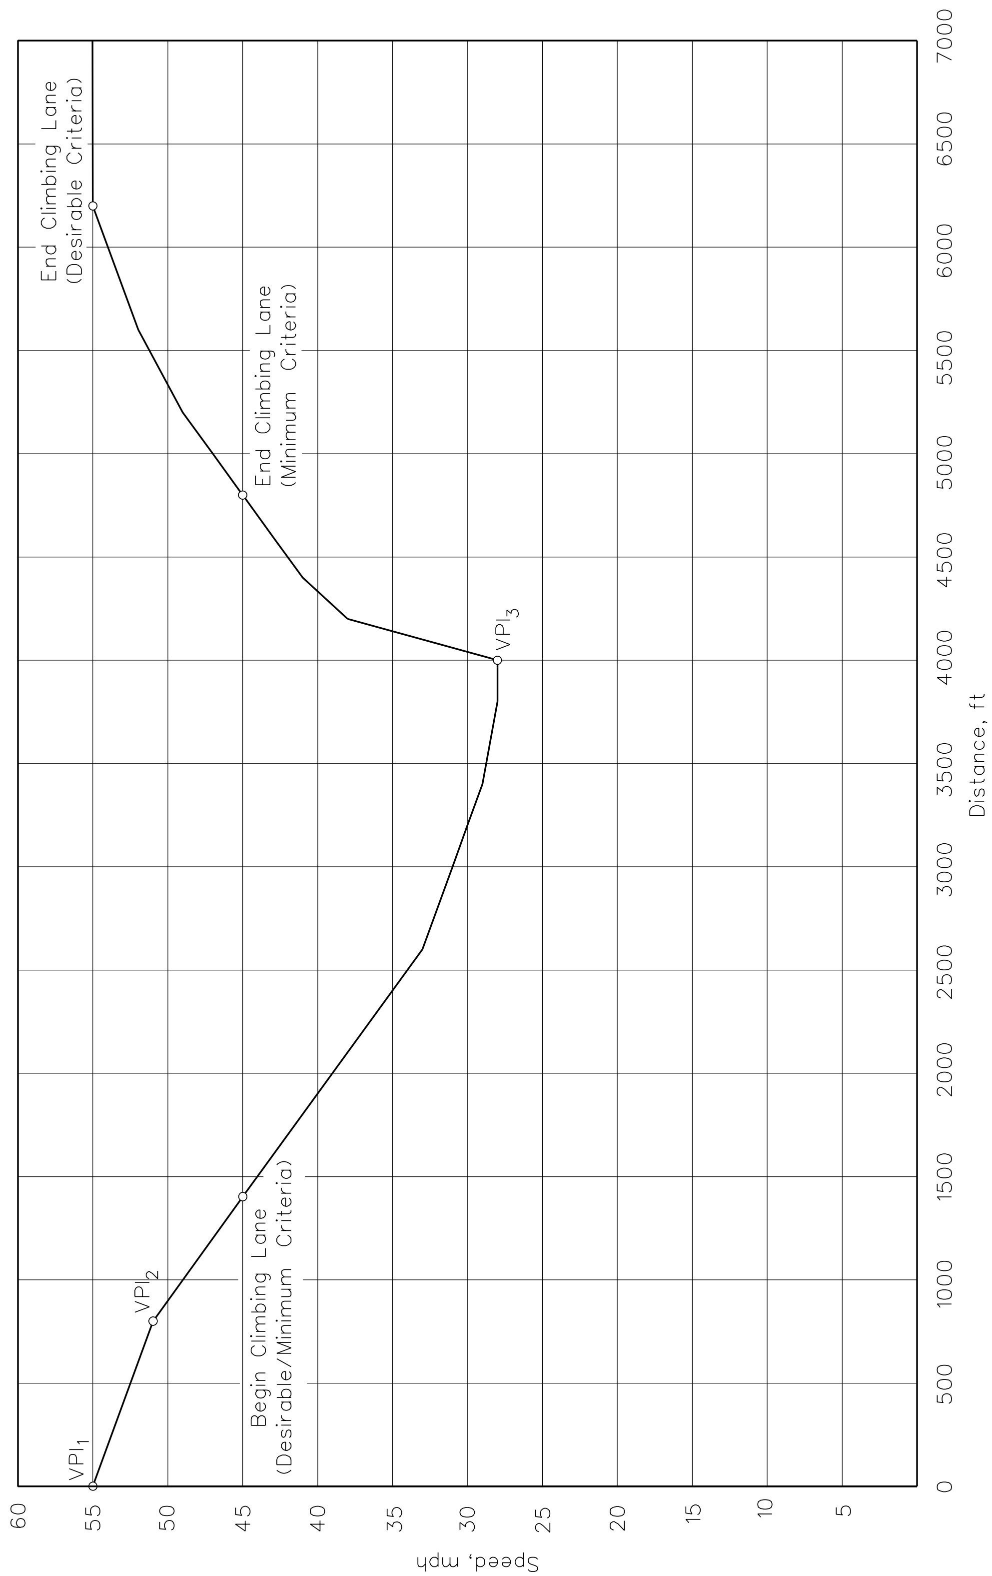
Solution: Apply the following steps:

Step 1: Determine the truck speed on G_1 using Figure 33-3.B and plot the truck speed at 200 ft increments in Figure 33-3.D. Assume an initial truck speed of 55 mph. Move horizontally along the 55 mph line to the 3% deceleration curve. This is approximately 2800 ft along the horizontal axis. This is the starting point for G_1.

Distance From VPI_1 (ft)	Horizontal Distance on Figure 33-3.B(ft)	Truck Speed (mph)	Comments
0	2800	55	VPI_1
200	3000	54	
400	3200	53	
600	3400	52	
800	3600	51	VPI_2

Step 2: Determine the truck speed on G_2 using Figure 33-3.B and plot the truck speed at 200 ft increments in Figure 33-3.D. From Step 1, the initial speed on G_2 is the final speed from G_1 (i.e., 51 mph). Move right horizontally along the 51 mph line to the 5% deceleration curve. This is approximately 1900 ft along the horizontal axis. This is the starting point for G_2.

Figure 33-3.D Distance From VPI_1 (ft)	Horizontal Distance on Figure 33-3.B (ft)	Truck Speed (mph)	Comments
800	1900	51	VPI_2
1000	2100	49	
1200	2300	47	
1400	2500	45	
1600	2700	43	
1800	2900	41	
2000	3100	39	
2200	3300	37	
2400	3500	35	
2600	3700	33	
2800	3900	32	
3000	4100	31	
3200	4300	30	
3400	4500	29	
3600	4700	29	
3800	4900	28	
4000	5100	28	VPI_3



TRUCK SPEED PROFILE
(Example 33-3.2)

Figure 33-3.D

Step 3: Determine the truck speed on G_3 using Figure 33-3.B until the truck has fully accelerated to 55 mph and plot the truck speed at 200 ft increments in Figure 33-3.D. The truck will have a speed of 28 mph as it enters the 2% downgrade at VPI_3. Read into Figure 33-3.B at the 28 mph point on the vertical axis and move over horizontally to the -2% line. This is approximately 150 ft along the horizontal axis. This is the starting point for G_3.

Figure 33-3.D Distance From VPI_1 (ft)	Horizontal Distance on Figure 33-3.B (ft)	Truck Speed (mph)	Comments
4000	150	28	VPI_3
4200	350	38	
4400	550	41	
4600	750	43	
4800	950	45	
5000	1150	47	
5200	1350	49	
5400	1550	50	
5600	1750	52	
5800	1950	53	
6000	2150	54	
6200	2350	55	

Step 4: Determine the beginning and end of the full-width climbing lane. From Figure 33-3.A, the desirable and minimum beginning of the full-width lane will be where the truck has reached a speed of 45 mph (10 mph below the posted speed). This point occurs 1400 ft beyond VPI_1.

For ending the full-width climbing lane, the desirable criteria from Figure 33-3.A is where the truck speed has reached the posted speed limit (55 mph) or 6200 ft beyond the VPI_1. The minimum criteria is where the truck has reached a speed of 45 mph (10 mph below the posted speed). This occurs at 4800 ft beyond VPI_1.

33-4 VERTICAL CURVES

33-4.01 Crest Vertical Curves

Crest vertical curves are in the shape of a parabola. The basic equations for determining the minimum length of a crest vertical curve are:

$$L = \frac{AS^2}{200\left(\sqrt{h_1} + \sqrt{h_2}\right)^2} \qquad \text{Equation 33-4.1}$$

$$K = \frac{S^2}{200\left(\sqrt{h_1} + \sqrt{h_2}\right)^2} \qquad \text{Equation 33-4.2}$$

$$L = KA \qquad \text{Equation 33-4.3}$$

where:
- L = length of vertical curve, ft (m)
- A = algebraic difference between the two tangent grades, %
- S = sight distance, ft (m)
- h_1 = height of eye above road surface, ft (m)
- h_2 = height of object above road surface, ft (m)
- K = horizontal distance needed to produce a 1% change in gradient

The length of a crest vertical curve will depend upon "A" for the specific curve and upon the selected sight distance, height of eye, and height of object. Equation 33-4.1 and the resultant values of K are predicated on the sight distance being less than the length of vertical curve. However, these values can also be used, without significant error, where the sight distance is greater than the length of vertical curve. The following sections discuss the selection of K-values. For design purposes, round the calculated length up to the next highest 50 ft (10 m) increment.

33-4.01(a) Stopping Sight Distance

The principal control in the design of crest vertical curves is to ensure that minimum stopping sight distance (SSD) is available throughout the vertical curve. The following discusses the application of K-values for various operational conditions:

1. Passenger Cars (Level Grade). Figure 33-4.A presents K-values for passenger cars on a level grade. Level conditions are assumed where the grade on the far side of the vertical curve is less than 3%. These are calculated by assuming h_1 = 3.5 ft (1.080 m), h_2 = 2 ft (600 mm) and S = SSD in the basic equation for crest vertical curves (Equation 33-4.1). The values represent the lowest acceptable sight distance on a facility. Where cost effective, use higher stopping sight distances.

2. Passenger Cars (Grade Adjusted). For a given speed, the safe stopping distance on downgrades is greater than that for a level roadway. Where grades on the far side of a crest vertical curve are –3% or greater, design the length of curve using K-values that have been adjusted for the increased braking distances resulting from the downgrade. No adjustment is necessary for grades less than 3% or for upgrades. Figure 33-4.B presents minimum and desirable K-values adjusted for downgrades for passenger cars. Make every reasonable effort to meet these values where the grade is –3% or greater. However, the grade-adjusted K-values do not require a design exception when not met. The level K-values in Figure 33-4.A apply when determining whether or not a design exception for stopping sight distance will be required; see Section 31-7.

3. Minimum Length. For design speeds of 60 mph (100 km/h) or less, the minimum length of a crest vertical curve in feet (meters) should be 3V (0.6V), where V is the design speed in mph (km/h). For design speeds greater than 60 mph (100 km/h), the minimum length of a crest vertical curve in feet (meters) should be 5V (1V). These distances apply regardless of the calculated length of vertical curve. For aesthetics, the suggested minimum length of a crest vertical curve on a rural highway is 1000 ft (300 m).

33-4.01(b) Decision Sight Distance

At some locations, decision sight distance may be warranted in the design of crest vertical curves. Section 31-3.02 discusses candidate sites and provides design values for decision sight distance. In complex environments, decision sight distance provides drivers with additional time to adjust their speed and additional distance to make unexpected maneuvers. Crest vertical curve designed with decision sight distance will be longer than those using stopping sight distance. These "S" values should be used in the basic equation for crest vertical curves (Equation 33-4.1). In addition, the following will apply:

1. Height of Eye (h_1). For passenger cars, h_1 = 3.5 ft (1.080 m).

2. Height of Object (h_2). Decision sight distance, in many cases, is predicated upon the same principle as stopping sight distance; i.e., the driver needs sufficient distance to see a 2 ft (600 mm) object. Therefore, h_2 = 2 ft (600 mm) at many locations. However, at some elevations, decision sight distance may be determined assuming the pavement surface (e.g., freeway exit gores). At these locations, h_2 = 0.0 ft (0.0 mm).

3. K-Values. Figure 33-4.C presents the K-values for passenger cars using the decision sight distances presented in Section 31-3.02.

K-VALUES FOR CREST VERTICAL CURVES — DECISION SIGHT DISTANCE (Passenger Cars)

Figure 33-4.C

33-4.01(c) Passing Sight Distance

At some locations, it may be desirable to provide passing sight distance in the design of crest vertical curves. Section 47-2.03 discusses the application and design values for passing sight distance on two-lane, two-way highways. These "S" values are used in the basic equation for crest vertical curves (Equation 33-4.1). In addition, the following will apply:

1. Height of Eye (h_1). For passenger cars, h_1 = 3.5 ft (1.080 m).

2. Height of Object (h_2). Passing sight distance is predicated upon the passing driver being able to see a sufficient portion of the top of the oncoming car. Therefore, h_2 = 3.5 ft (1.080 m).

3. K-Values. Figure 33-4.D presents the K-values for passenger cars using the passing sight distances presented in Section 47-2.03.

33-4.01(d) Drainage

Proper drainage must be considered in the design of crest vertical curves on curbed sections, bridges, and medians with concrete barriers. Typically, drainage problems will not be experienced if the vertical curvature is sharp enough so that a minimum longitudinal gradient of at least 0.3% is reached at a point about 50 ft (15 m) from either side of the apex. To ensure that this objective is achieved, determine the length of the crest vertical curve assuming a K-value of 167 (51) or less. Where a crest vertical curve lies within a curbed section or bridge and where the maximum drainage K-value is exceeded, carefully evaluate the drainage design near the apex. If a bridge is within a crest vertical curve and the design speed is greater than 60 mph (90 km/h), the design speed consideration will override the drainage maximum. However, to adequately handle the shoulder drainage, it may be necessary to provide drainage scuppers on the bridge. See the *IDOT Drainage Manual* for more information.

For uncurbed sections of highway, drainage should not be a problem at crest vertical curves. However, it still may be desirable to provide a longitudinal gradient of at least 0.15% at points about 50 ft (15 m) on either side of the high point. To achieve this, K must equal 334 (100) or less.

K-VALUES FOR CREST VERTICAL CURVES — PASSING SIGHT DISTANCES (Passenger Cars)

Figure 33-4.D

33-4.02 Sag Vertical Curves

Sag vertical curves are in the shape of a parabola. Typically, they are designed to allow the vehicular headlights to illuminate the roadway surface (i.e., the height of object = 0.0 ft (0.0 mm)) for a given distance "S." The light beam from the headlights is assumed to have a 1° upward divergence from the longitudinal axis of the vehicle. These assumptions yield the following basic equations for determining the minimum length of sag vertical curves:

$$L = \frac{AS^2}{200[h_3 + S(\tan 1°)]} = \frac{AS^2}{200h_3 + 3.5S} \qquad \text{Equation 33-4.4}$$

$$K = \frac{S^2}{200h_3 + 3.5S} \qquad \text{Equation 33-4.5}$$

$$L = KA \qquad \text{Equation 33-4.6}$$

where:
- L = length of vertical curve, ft (m)
- A = algebraic difference between the two tangent grades, %
- S = sight distance, ft (m)
- h_3 = height of headlights above pavement surface, ft (m)
- K = horizontal distance needed to produce a 1% change in gradient

The length of a sag vertical curve will depend upon "A" for the specific curve and upon the selected sight distance and headlight height. Equation 33-4.4 and the resultant values of K are predicated on the sight distance being less than the length of vertical curve. However, these values can also be used, without significant error, where the sight distance is greater than the length of vertical curve. The following sections discuss the selection of K-values.

33-4.02(a) Stopping Sight Distance

The principal control in the design of sag vertical curves is to ensure a minimum stopping sight distance (SSD) is available for headlight illumination throughout the sag vertical curve. The following discusses the application of K-values for various operational conditions:

1. Passenger Cars (Level Grade). Figure 33-4.E presents K-values for passenger cars. These are calculated by assuming h_3 = 2 ft (600 mm) and S = SSD in the basic equation for sag vertical curves (Equation 33-4.4). The minimum values represent the lowest acceptable sight distance on a facility. However, because sag vertical curves greatly affect the aesthetics of a highway alignment, use longer than the minimum lengths of curves to provide a more aesthetically pleasing design.

2. Passenger Cars (Grade Adjusted). For a given speed, the safe stopping sight distance on downgrades is greater than that for a level surface. For sag vertical curves, only consider grade adjustments when the sag curve is between two downgrades and where the downgrades are -3% or greater. Figure 33-4.F presents K-values adjusted for grades for passenger cars. However, grade-adjusted K-values do not require a design exception when not met. The level K-values in Figure 33-4.E apply when determining whether or not a design exception for stopping sight distance will be required; see Section 31-7.

K-VALUES FOR SAG VERTICAL CURVES — STOPPING SIGHT DISTANCES
(Passenger Cars — Adjusted For Downgrades)

Figure 33-4.F

3. Minimum Length. For design speeds of 60 mph (100 km/h) or less, the minimum length of a sag vertical curve in feet (meters) should be 3V (0.6V), where V is the design speed in mph (km/h). For design speeds greater than 60 mph (100 km/h), the minimum length of a sag vertical curve in feet (meters) should be 5V (1V). For aesthetics on rural highways, the minimum length of a sag vertical curve is dependent upon the driver's view of the highway. The greater the distance a highway can be seen ahead, the longer the sag vertical curve should be.

   One exception to the minimum length on sag vertical curves applies in curbed sections and on bridges. If the sag is in a low point, the use of the minimum length criteria may produce longitudinal slopes too flat to drain stormwater without ponding. For additional guidance, see Chapter 40 of the *BDE Manual* and the *IDOT Drainage Manual*.

33-4.02(b) Decision Sight Distance

At some locations, decision sight distance may be warranted in the design of sag vertical curves. Section 31-3.02 discusses candidate sites and provides design values for decision sight distance. In complex environments, decision sight distance provides drivers with additional time to adjust their speed or additional distance to make unexpected maneuvers. Sag vertical curves designed with decision sight distance will be longer than those using stopping sight distance. These "S" values should be used in the basic equation for sag vertical curves (Equation 33-4.4). The height of headlights h_3 = 2 ft (600 mm). Figure 33-4.G provides K-values for sag vertical curves using decision sight distance.

33-4.02(c) Comfort Criteria

On fully lighted, continuous sections of highway and where it is impractical to provide stopping sight distance, a sag vertical curve may be designed to meet the comfort criteria. These criteria are based on the effect of change in the vertical direction of a sag vertical curve due to the combined gravitational and centrifugal forces. The general consensus is that riding is comfortable on sag vertical curves when the centripetal acceleration does not exceed 1 ft/s^2 (0.3 m/s^2). The length-of-curve equation for the comfort criteria is:

$$L = \frac{AV^2}{46.5}$$ (US Customary) Equation 33-4.7

$$L = \frac{AV^2}{395}$$ (Metric) Equation 33-4.7

where: L = length of vertical curve, ft (m)
A = algebraic difference between the two tangent grades, %
V = design speed, mph (km/h)

33-4.02(d) Underpasses

Check sag vertical curves through underpasses to ensure that the underpass structure does not obstruct the driver's visibility. Use the following equation to check sag vertical curves through underpasses:

$$L = \frac{AS^2}{800(C - 4.25)}$$ (US Customary) Equation 33-4.8

$$L = \frac{AS^2}{800(C - 1.3)}$$ (Metric) Equation 33-4.8

where:
- L = length of vertical curve, ft (m)
- A = algebraic difference between the two tangent grades, %
- S = sight distance, ft (m)
- C = vertical clearance of underpass, ft (m)

Compare the L calculated from Equation 33-4.8 for underpasses with the L calculated based on headlight illumination (Equation 33-4.4). The larger of the two lengths will govern.

33-4.02(e) Drainage

Proper drainage must be considered in the design of sag vertical curves on curbed sections, bridges, and medians with concrete barriers. Drainage problems are minimized if the sag vertical curve is sharp enough so that both of the following criteria are met:

- a minimum longitudinal gradient of at least 0.3% is reached at a point about 50 ft (15 m) from either side of the low point, and
- there is at least a 4 in (100 mm) elevation differential between the low point in the sag and the two points 50 ft (15 m) to either side of the low point.

To ensure that the first objective is achieved, base the length of the vertical curve upon a K-value of 167 (51) or less. For most design speeds, the K-values are less than 167 (51); see Figure 33-4.E. However, for higher design speeds and/or where longer sag vertical curves are required in curbed sections or on bridges, it may be necessary to install flanking inlets on either side of the low point.

For uncurbed sections of highway, drainage should not be a problem at sag vertical curves.

K-VALUES FOR SAG VERTICAL CURVES — DECISION SIGHT DISTANCES (Passenger Cars)

Figure 33-4.G

33-4.03 Vertical Curve Computations

The following will apply to the mathematical design of vertical curves:

1. Definitions. Figure 33-4.H presents the common terms and definitions used in vertical curve computations.

2. Measurements. All measurements for vertical curves are made on the horizontal or vertical plane, not along the profile gradeline. With the simple parabolic curve, the vertical offsets from the tangent vary as the square of the horizontal distance from the VPC or VPT. Elevations along the curve are calculated as proportions of the vertical offset at the point of vertical intersection (VPI). The necessary equations for computing a symmetrical vertical curve are shown in Figure 33-4.I. Example 33-4.03(1) is a sample problem using these formulas.

3. Unsymmetrical Vertical Curve. Occasionally, it is necessary to use an unsymmetrical vertical curve to obtain clearance on a structure or to meet other existing field conditions. This curve is similar to the parabolic vertical curve, except the curve does not vary symmetrically about the VPI. Note that, with the unsymmetrical vertical curve, the curve is treated as two separate parabolas. The necessary equations for computing an unsymmetrical vertical curve are shown in Figure 33-4.J.

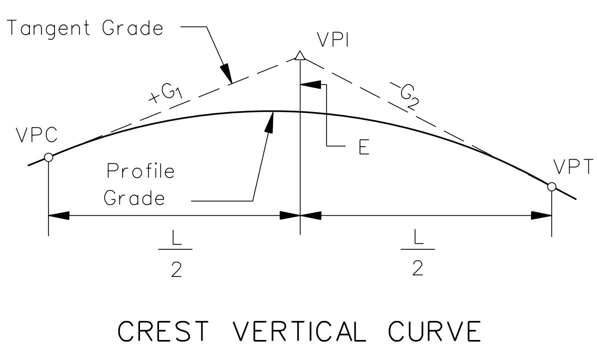
4. Vertical Curve Through Fixed Point. A vertical highway curve often must be designed to pass through an established elevation and location. For example, it may be necessary to tie into an existing side road or to clear existing structures. Figure 33-4.K provides the procedure for determining how to pass a vertical curve through a fixed point. Example 33-4.03(2) illustrates how to use these equations.

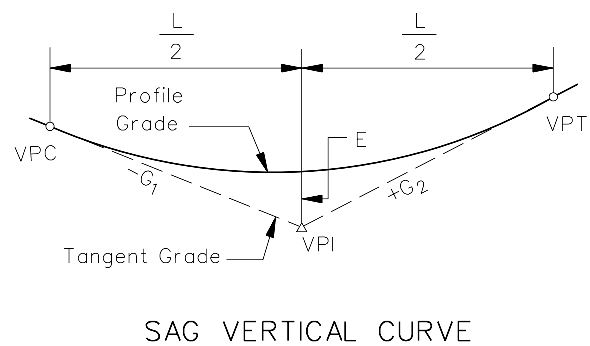
5. Vertical Curve Gradient Percents. Occasionally, the designer may want to determine the gradient percent of a point on a vertical curve or to determine at what location a given gradient percent occurs on the vertical curve. Figure 33-4.L provides the equations for making these determinations. Examples 33-4.03(3) and 33-4.03(4) illustrate how to use these equations.

6. Vertical Curve Extension. During a reconstruction project, it may be necessary to extend an existing vertical curve to ensure that the new profile gradeline will pass through a critical point (e.g., new bridge clearance). Figure 33-4.M provides the equations for determining the required vertical curve length extension and the new gradient. Example 33-4.03(5) illustrates how to use these equations.

7. VPI Stationing. The designer may need to determine the VPI station between two known VPI's. Figure 33-4.N illustrates how to determine the intermediate VPI given the gradients, stations, and elevations of the other VPI's.

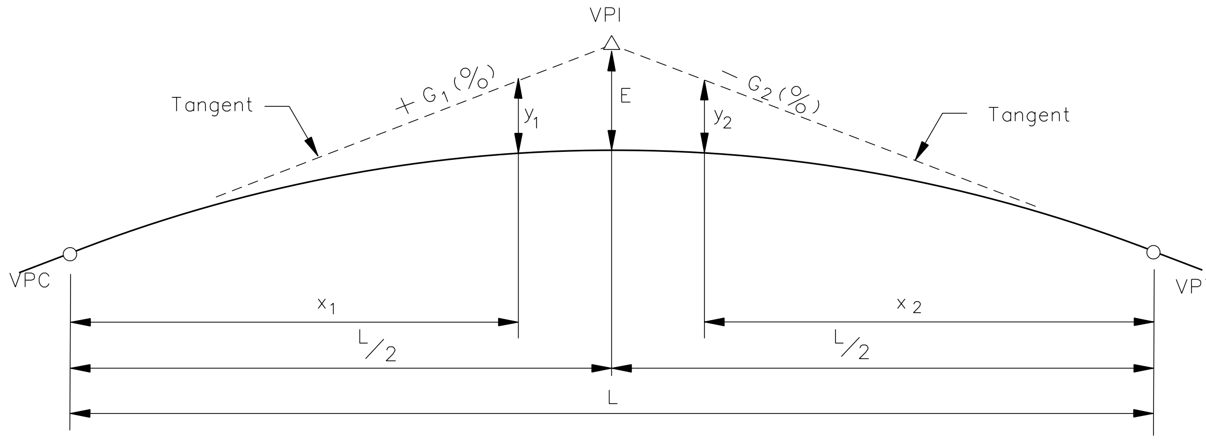
Element	Abbreviation	Definition
Vertical Point of Curvature	VPC	The point at which a tangent grade ends and the vertical curve begins.
Vertical Point of Tangency	VPT	The point at which the vertical curve ends and the tangent grade begins.
Vertical Point of Intersection	VPI	The point where the extension of two tangent grades intersect.
Grade	G_1, G_2	The rate of slope between two adjacent VPI's expressed as a percent. The numerical value for percent of grade is the vertical rise or fall in feet (meters) for each 100 ft (100 m) of horizontal distance. Upgrades in the direction of stationing are identified as plus (+). Downgrades are identified as minus (–).
External Distance	E	The vertical distance (offset) between the VPI and the roadway surface along the vertical curve.
Algebraic Difference in Grade	A	The value of A is determined by the deflection in percent between two tangent grades ($G_2 – G_1$).
Length of Vertical Curve	L	The horizontal distance in feet (meters) from the VPC to the VPT.
Tangent Elevation	Tan. Elev.	The elevation on the tangent line between the VPC and VPI and the VPI and VPT.
Elevation on Vertical Curve	Curve Elev.	The elevation of the vertical curve at any given point along the curve.
Horizontal Distance	x	Horizontal distance measured from the VPC or VPT to any point on the vertical curve, in feet (meters).
Tangent Offset	y	Vertical distance from the tangent line to any point on the vertical curve, in feet (meters).
Low/High Point	x_T	The station at the high point for crest curves or the low point for sag curves. At this point, the slope of the tangent to the curve is equal to 0%.
Symmetrical Curve	—	The VPI is located at the mid-point between VPC and VPT stationing
Unsymmetrical Curve	—	The VPI is not located at the mid-point between VPC and VPT stationing.





VERTICAL CURVE DEFINITIONS

Figure 33-4.H



E = External distance @VPI, ft (m)
y = Any tangent offset, ft (m)
L = Horizontal length of vertical curve, ft (m)
x = Horizontal distance from VPC or VPT to any ordinate "y", ft (m)
G_1 & G_2 = Rates of grade, expressed algebraically, %

NOTE: All expressions to be calculated algebraically. (Use algebraic signs of grades; grades in percent.)

1. Elevations of VPC and VPT:

2.

$$\text{VPC Elev.} = \text{VPI Elev.} - \left(\frac{G_1}{100} \text{ x } \frac{L}{2}\right)$$ Equation 33-4.9

$$\text{VPT Elev.} = \text{VPI. Elev.} + \left(\frac{G_2}{100} \text{ x } \frac{L}{2}\right)$$ Equation 33-4.10

For the elevation of any point "x" on a vertical curve:

$$\text{Curve Elev.} = \text{Tan Elev.} \pm y$$ Equation 33-4.11

Where:

Left of VPI (x_1 measured from VPC):

(a) $$\text{Tan Elev.} = \text{VPC Elev.} + \left(\frac{G_1}{100}\right)x_1$$ Equation 33-4.12

(b) $$y_1 = x_1^2 \frac{(G_2 - G_1)}{200\ L}$$ Equation 33-4.13

SYMMETRICAL VERTICAL CURVE EQUATIONS

Figure 33-4.I
(Continued)

Right of VPI (x_2 measured from VPT):

(a) $\text{Tan Elev.} = \text{VPT Elev.} - \left(\frac{G_2}{100}\right) x_2$ Equation 33-4.14

(b) $y_2 = {x_2}^2 \frac{(G_2 - G_1)}{200\ L}$ Equation 33-4.15

At the VPI:

$y = E$ and $x = L / 2$

(a) $\text{Tan Elev.} = \text{VPC Elev.} + \frac{G_1 L}{200}$

or $\text{Tan Elev.} = \text{VPT Elev.} - \frac{G_2 L}{200}$ Equation 33-4.16

(b) $E = \frac{L(G_2 - G_1)}{800}$ Equation 33-4.17

3. Calculating high or low point on the vertical curve:

(a) To determine distance "x_T" from VPC:

$x_T = - \frac{L\ G_1}{G_2 - G_1}$ Equation 33-4.18

(b) To determine high or low point stationing:

$\text{High or Low Point Sta.} = \text{VPC Sta.} + x_T$ Equation 33-4.19

(c) To determine high or low point elevation on a vertical curve:

$\text{High or Low Point Elev.} = \text{VPC Elev.} - \frac{L\ G_1^2}{(G_2 - G_1)\ 200}$ Equation 33-4.20

SYMMETRICAL VERTICAL CURVE EQUATIONS

Figure 33-4.I

Example 33-4.03(1) Symmetrical Vertical Curve Computations

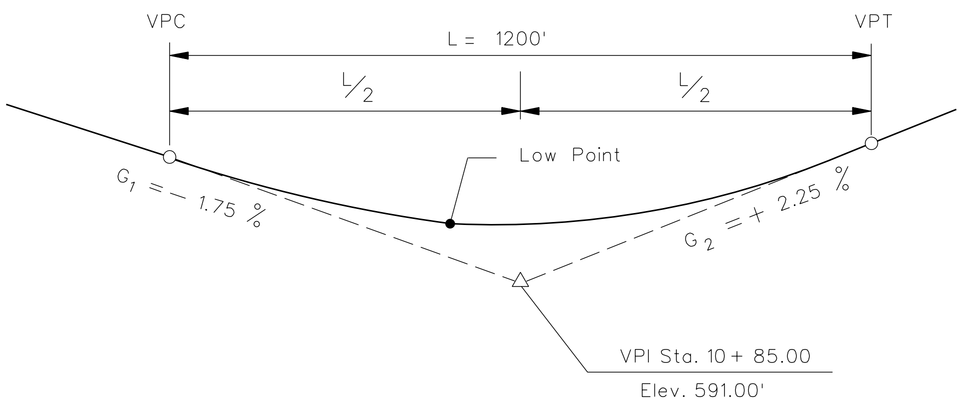
Given: G_1 = –1.75%
G_2 = +2.25%
Elev. of VPI = 591.00 ft
Station of VPI = 10 + 85.00
L = 1200 ft
Symmetrical Vertical Curve
Rural Area

Problem: Compute the vertical curve elevations for each 100 ft station. Compute the low point elevation and stationing.

Solution:

1. Draw a diagram.

Show the vertical curve and determine the stationing at the beginning (VPC) and the end (VPT) of the curve.



VPC Station = VPI Sta – ½L = (Sta. 10 + 85) – 600 = Sta. 4 + 85.00
VPT Station = VPI Sta + ½L = (Sta. 10 + 85) + 600 = Sta. 16 + 85.00

2. Elevations of VPC and VPT:

$$\text{VPC Elev.} = 591.00 - \left(\frac{-1.75}{100} \text{ x } \frac{1200}{2}\right) = 601.50 \text{ ft} \qquad \text{Equation 33-4.9}$$

$$\text{VPT Elev.} = 591.00 + \left(\frac{2.25}{100} \text{ x } \frac{1200}{2}\right) = 604.50 \text{ ft} \qquad \text{Equation 33-4.10}$$

3. Set up a table.

Show the vertical curve elevations at the 100 ft stations, substituting the values into Equations 33-4.12 through 33-4.15. Calculate the elevation to the nearest 0.01 ft.

Station	Control Point	Tangent Elevation (ft)	x	x^2	$y = x^2/60{,}000$	Grade Elevation (ft)
4+85	VPC	601.50	0	0	0.00	601.50
5+00		601.24	15	225	0.00	601.24
6+00		599.49	115	13,225	0.22	599.71
7+00		597.74	215	46,225	0.77	598.51
8+00		595.99	315	99,225	1.65	597.64
9+00		594.24	415	172,225	2.87	597.11
10+00		592.49	515	265,225	4.42	596.91
10+85	VPI	591.00	600	360,000	6.00	597.00
11+00		591.34	585	342,225	5.70	597.04
12+00		593.59	485	235,225	3.92	597.51
13+00		595.84	385	148,225	2.47	598.31
14+00		598.09	285	81,225	1.35	599.44
15+00		600.34	185	34,225	0.57	600.91
16+00		602.59	85	7,225	0.12	602.71
16+85	VPT	604.50	0	0	0.00	604.50

4. <u>Calculate the station and elevation of the low point</u>:

$$x_T = -\frac{1200\ (-1.75)}{2.25 - (-1.75)} = -\frac{-2100}{4.00} = 525 \text{ ft from VPC} \qquad \text{Equation 33-4.18}$$

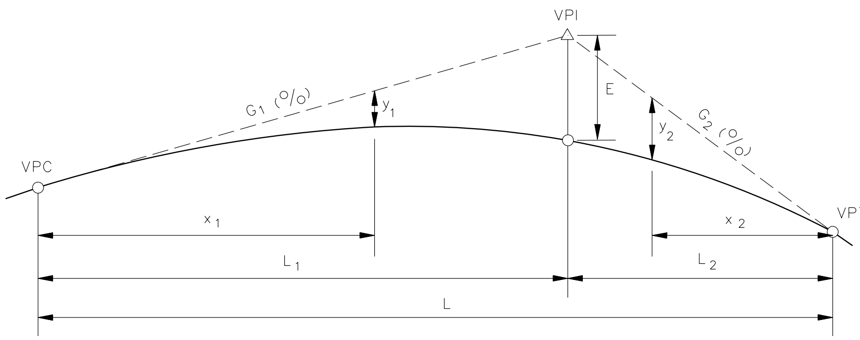
Therefore, the station at the low point is:

$$VPC_{STA} + x_T = (\text{Sta. } 4 + 85) + (525) = \text{Sta. } 10 + 10.00 \qquad \text{Equation 33-4.19}$$

The elevation at the low point on curve is:

$$\text{Elev. of low point} = 601.50 - \frac{1200\ (-1.75)^2}{(2.25 - (-1.75))\ 200} \qquad \text{Equation 33-4.20}$$

$$\text{Elev. of low point} = 601.50 - 4.59 = 596.91 \text{ ft}$$



E = Offset from the VPI to the curve (external distance), ft (m)
y = Any tangent offset, ft (m)
L = Horizontal length of vertical curve, ft (m)
L_1 = Horizontal distance from VPC to VPI, ft (m)
L_2 = Horizontal distance from VPT to VPI, ft (m)
x = Horizontal distance from VPC or VPT to any ordinate "y", ft (m)
G_1 & G_2 = Rates of grade, expressed algebraically, %

Note: All expressions to be calculated algebraically. (Use algebraic signs of grades; grades in percent.)

1. Elevations of VPC and VPT:

$$\text{VPT Elev.} = \text{VPI Elev.} + \left(\frac{G_2}{100}\right)L_2$$ Equation 33-4.21

$$\text{VPC Elev.} = \text{VPI Elev.} - \left(\frac{G_1}{100}\right)L_1$$ Equation 33-4.22

2. For the elevation of any point "x" on a vertical curve:

$$\text{Curve Elev.} = \text{Tan. Elev.} \pm y$$ Equation 33-4.23

Where:

Left of VPI (x_1 measured from VPC):

(a) $$\text{Tan Elev.} = \text{VPC Elev.} + \left(\frac{G_1}{100}\right)x_1$$ Equation 33-4.24

(b) $$y_1 = x_1^2\left(\frac{L_2}{L_1}\right)\left(\frac{G_2 - G_1}{200\,L}\right)$$ Equation 33-4.25

Right of VPI (x_2 measured from VPT):

(a) $$\text{Tan Elev.} = \text{VPT Elev.} - \left(\frac{G_2}{100}\right)x_2$$ Equation 33-4.26

(b) $$y_2 = x_2^2\left(\frac{L_1}{L_2}\right)\left(\frac{G_2 - G_1}{200\,L}\right)$$ Equation 33-4.27

UNSYMMETRICAL VERTICAL CURVE EQUATIONS

Figure 33-4.J
(Continued)

At the VPI:

$y = E$ and $x = L_1$

(a) $$\text{Tan Elev.} = \text{VPC Elev.} + \left(\frac{G_1}{100}\right) L_1 \text{ or}$$ Equation 33-4.28

$$\text{Tan Elev.} = \text{VPT Elev.} - \left(\frac{G_2}{100}\right) L_2$$

(b) $$E = L_1 L_2 \left(\frac{G_2 - G_1}{200\ L}\right)$$ Equation 33-4.29

3. Calculating High or Low Point Station and Elevation on a Curve:

Note: Where $x_T < L_1$ the high or low point is on the left side of the VPI or where $x_T > L_1$ the high or low point is on the right side of the VPI.

a. Assume high or low point occurs left of VPI to determine the distance, x_T, from VPC:

$$x_T = \left(\frac{L_1}{L_2}\right)\left(\frac{G_2 L}{G_1 - G_2}\right)$$ Equation 33-4.30

Note: Is $x_T < L_1$?
If yes, the high or low point is on the left side of the VPI. Proceed to Steps b. and c. to solve for the high or low point elevation. If no, then skip to Steps d., e., and f. below to solve for the high or low point station and elevation.

b. To determine the high or low point stationing where $x_T < L_1$:

High or Low Point Sta = VPC Sta. + x_T Equation 33-4.31

c. To determine the high or low point elevation when $x_T < L_1$:

$$\text{High or Low Point Elev.} = \text{VPC Elev.} - \left(\frac{L_1}{L_2}\right)\left(\frac{L G_1^2}{(G_2 - G_1)200}\right)$$ Equation 33-4.32

d. If $x_T > L_1$ from Step a., the high or low point occurs right of the VPI. Determine the distance x_T from the VPT:

$$x_T = \left(\frac{L_2}{L_1}\right)\left(\frac{G_2 L}{(G_2 - G_1)}\right)$$ Equation 33-4.33

e. To determine high or low point stationing:

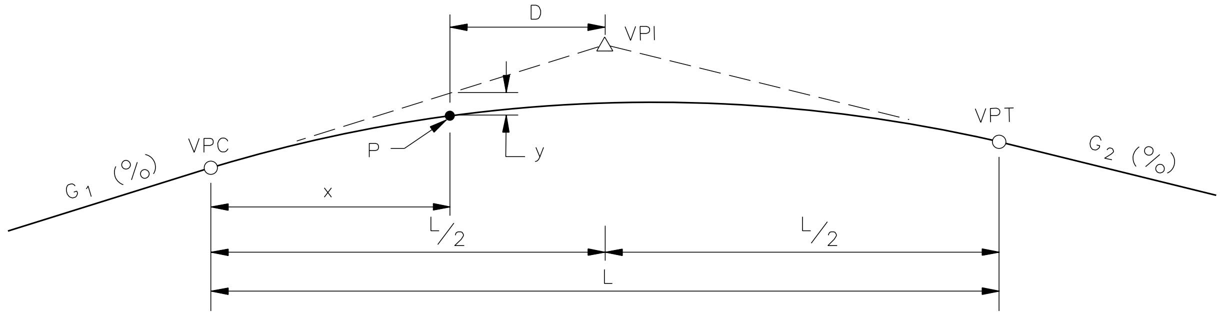
High or Low Point Sta = VPT Sta. − x_T Equation 33-4.34

f. To determine high or low point elevation on a vertical curve:

$$\text{High or Low Point Elev.} = \text{VPT Elev.} - \left(\frac{L_2}{L_1}\right)\left(\frac{L G_2^2}{(G_2 - G_1)200}\right)$$ Equation 33-4.35

UNSYMMETRICAL VERTICAL CURVE EQUATIONS

Figure 33-4.J



G_1 = Grade in, %
G_2 = Grade out, %
A = Algebraic difference between the grades, %
y = Vertical curve correction at point “P”, ft (m)
x = Distance from VPC to “P”, ft (m)
D = Distance from "P" to VPI, ft (m)
L = Length of the vertical curve, ft (m)

Given: G_1, G_2, D

Problem: Determine the length of a vertical curve required to pass through a given point “P”.

Solution:

1. Find the algebraic difference between the grades, G_2 and G_1:

   $A = G_2 - G_1$

2. Find the tangent offset at Point P:

   From inspection of the above diagram:

   $x + D = L / 2$

   and solving for “L” gives:

   $L = 2(x + D)$ Equation 33-4.36

   Use Equation 33-4.13 to determine the tangent offset:

   $$y = x^2 \left(\frac{G_2 - G_1}{200\ L} \right)$$

3. Solve for “x” by using the quadratic equation. Substituting 2 (x + D) for L, and A for ($G_2 - G_1$) into Equation 33-4.13 from Step 2 above yields:

   $0 = A x^2 + (-400\ y)\ x + (-400\ Dy)$ Equation 33-4.37

SYMMETRICAL VERTICAL CURVE THROUGH A FIXED POINT

Figure 33-4.K
(Continued)

Fill in the quadratic equation:

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} = \frac{400y \pm \sqrt{160000\ y^2 + 1600ADy}}{2A} \qquad \text{Equation 33-4.38}$$

Solving for "x" will result in two answers. If both answers are positive, there are two solutions. If one answer is negative, the negative answer can be eliminated and only one solution exists.

4. Substitute x and D into Equation 33-4.36 and solve for L:

Note: Two positive x values, will result in two L solutions. Desirably, use the longer vertical curve solution provided it meets the sight distance criteria (based on the selected design speed and algebraic difference in grades).

SYMMETRICAL VERTICAL CURVE THROUGH A FIXED POINT

Figure 33-4.K

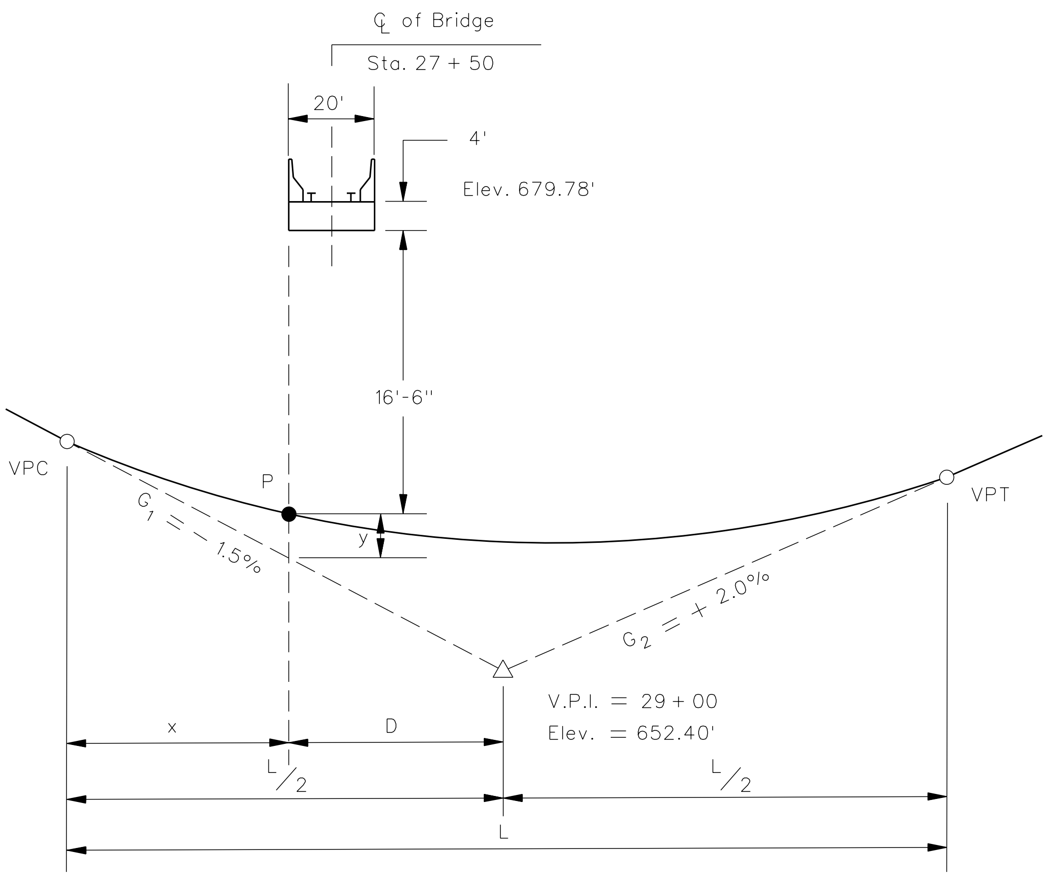
Example 33-4.03(2) SYMMETRICAL VERTICAL CURVE THROUGH A FIXED POINT

Given: Design Speed = 55 mph
G_1 = –1.5%
G_2 = +2.0%
A = 3.5%
VPI Station = 29 + 00.00
VPI Elevation = 652.40 ft

Problem: At Station 27 + 50, a new highway must pass under the center of an existing railroad which is at elevation 679.78 ft at the highway centerline. The railroad bridge that will be constructed over the highway will be 4 ft in depth, 20 ft in width, and at right angles to the highway. Determine the length of the symmetrical vertical curve that would be required to provide a 16 ft 6 in clearance under the railroad bridge.

Solution:

1. Sketch the problem with known information labeled.



2. Determine the station where the minimum 16 ft 6 in vertical clearance will occur (Point P):

   From inspection of the sketch, the critical location is on the left side of the railroad bridge. The critical station is:

   Sta. P = Bridge Centerline Station – ½ (Bridge Width)
   Sta. P = Sta. 27 + 50 – ½ (20)
   Sta. P = Sta. 27 + 40

3. Determine the elevation of Point P:

   Elev. P = Elev. of the top of the Railroad Bridge – Bridge Depth – Clearance
   Elev. P = 679.78 – 4.0 – 16.5
   Elev. P = 659.28 ft

4. Determine distance, D, from Point P to VPI:

   D = Sta. VPI – Sta. P = (29 + 00) – (27 + 40) = 160 ft

5. Determine the tangent elevation at Point P:

   $$\text{Tangent Elev. at P} = \text{VPI Elev.} - \left(\frac{G_1}{100}\right)D = 652.40 - \left(\frac{-1.5}{100}\right)160 = 654.80\text{ ft}$$

6. Determine the tangent offset (y) at Point P:

   y = Elev. on Curve – Elev. of Tangent = 659.28 – 654.80 = 4.48 ft

7. Solve for x using the quadratic equation, Equation 33-4.38:

   $$x = \frac{400\,(4.48) \pm \sqrt{(160000)(4.48)^2 + 1600(3.5)(160)(4.48)}}{2(3.5)}$$

   x = 640 ft and x = –128 ft (Disregard negative solutions)

8. Using Equation 33-4.36, solve for L:

   L = 2(x + D)
   L = 2(640 + 160)
   L = 1600 ft

9. <u>Check stopping sight distance</u>.

Determine if the solution meets the desirable passenger car stopping sight distance for the 55 mph design speed. From Figure 33-4.E, the design K-value:

$K = 115$

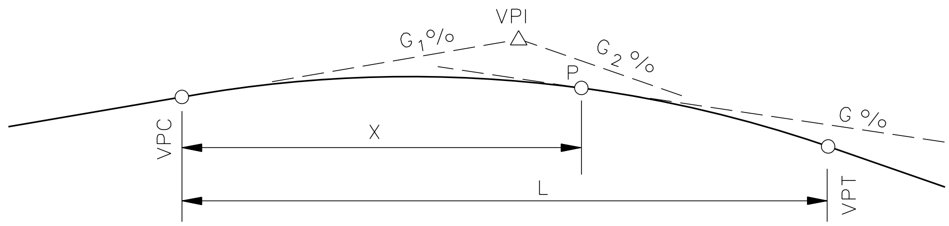
The algebraic difference in grades:

$A = G_2 - G_1 = (+2.0) - (-1.5) = 3.5$

From Equation 33-4.6, determine the minimum length of vertical curve which meets the desirable stopping sight distance:

$L_{MIN} = KA$
$L_{MIN} = (115)\ 3.5 = 402.5$ ft

L = 1600 ft which exceeds the design stopping sight distance.



L = Horizontal length of vertical curve, ft (m)
x = Horizontal distance from VPC, ft (m)
G_1 and G_2 = Rates of grade, expressed algebraically, %

1. Rate of change of vertical curve per foot:

$$a = \frac{G_2 - G_1}{L}$$ Equation 33-4.39

2. Gradient at a point on curve at "x" distance from the VPC:

$$G = G_1 + ax$$ Equation 33-4.40

3. To find the horizontal distance "x" from VPC to point of a selected gradient, use Equation 33-4.40 and solve for x:

$$x = \frac{G - G_1}{a}$$ Equation 33-4.41

FIND THE PERCENT GRADE AT ANY POINT ON A VERTICAL CURVE

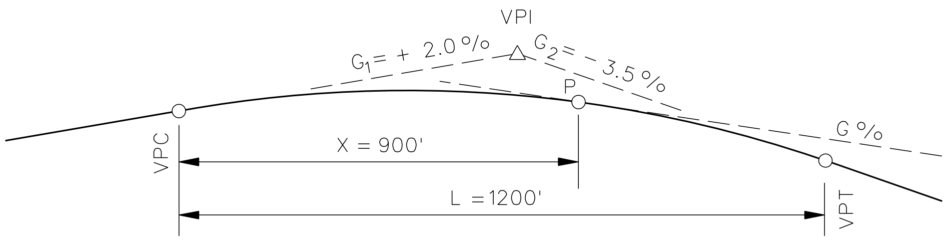
Figure 33-4.L

Example 33-4.03(3) GRADE AT A SPECIFIC LOCATION ON A VERTICAL CURVE

Given: $G_1 = +2.0\%$
$G_2 = -3.5\%$
$L = 1200$ ft

Problem: Find the gradient at a point 900 ft from the VPC.

Solution:



To determine the gradient at Point P, use Equations 33-4.39 and 33-4.40:

$$a = \frac{-3.5\% - 2.0\%}{1200} = -0.00458\%/\text{ft}$$

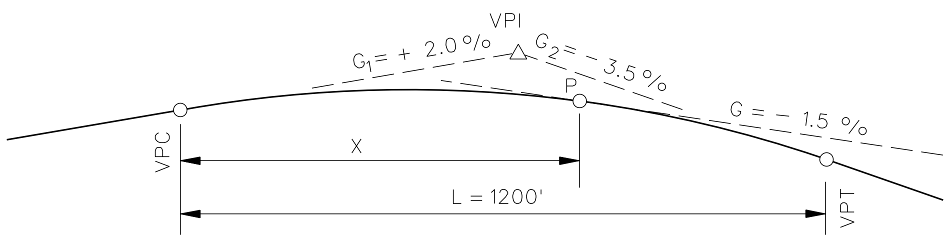
$$G = +2.0\% - 0.00458(900) = -2.125\%$$

Example 33-4.03(4) LOCATION ON A VERTICAL CURVE OF A SPECIFIC GRADE

Given: G_1 = +2.0%
G_2 = –3.5%
L = 1200 ft

Problem: Find the point on the vertical curve where the gradient is –1.5% (G = 1.5%).

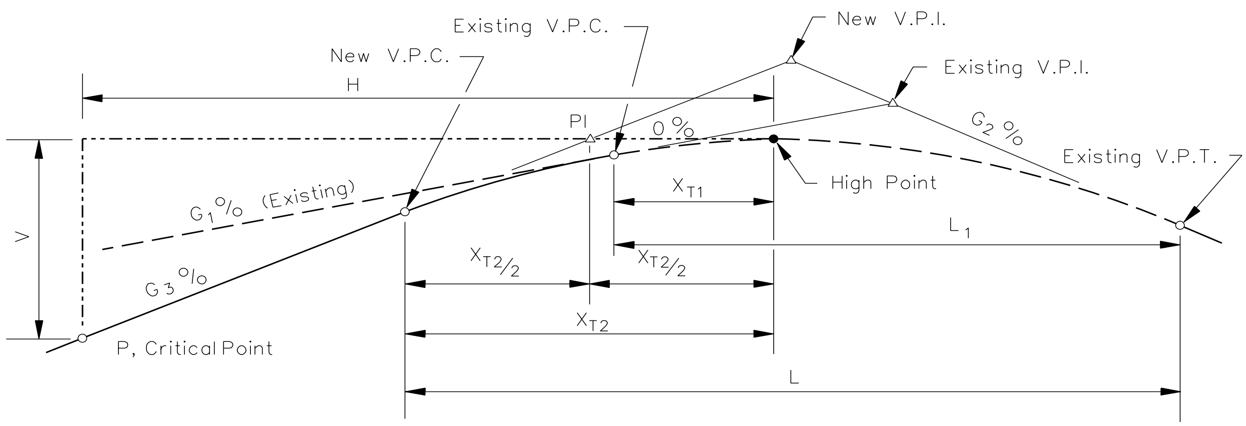
Solution:



To find the point on the vertical curve where the gradient is –1.5%, use Equations 33-4.39 and 33-4.41:

$$a = \frac{3.5\% \quad 2.0\%}{1200} = 0.00458\%/ft$$

$$x = \frac{-1.5\% - 2.0}{-0.00458} = 764.19 \text{ ft from the VPC}$$



L = Horizontal length of new vertical curve, ft (m)
L_1 = Horizontal length of old vertical curve, ft (m)
x_{T1} = Horizontal distance from the old VPC to high point, ft (m)
x_{T2} = Horizontal distance from the new VPC to high point, ft (m)
P = Critical point outside of the vertical curve
G_1, G_2 & G_3 = Rates of grade, expressed algebraically, %

Note: New vertical curve is symmetrical.

Given: G_1, G_2, L_1, Station and Elevation of P, and Station and Elevation of old VPC

Find: Location of new VPC and G_3

Solution:

1. Find the algebraic difference in grades:

   $A = G_2 - G_1$

2. Calculate the high point of existing vertical curve. The elevation and station of the high point can be determined by using Equations 33-4.18, 33-4.19, and 33-4.20.

$$x_T = -\frac{L\ G_1}{G_2 - G_1} \qquad \text{Equation 33-4.18}$$

EXTENSION OF A VERTICAL CURVE THROUGH A POINT

Figure 33-4.M
(Continued)

$$\text{High or Low Point Sta.} = \text{VPC Sta.} + x_T \qquad \text{Equation 33-4.19}$$

$$\text{High or Low Point Elev.} = \text{VPC Elev.} - \frac{L\,G_1^2}{(G_2 - G_1)\,200} \qquad \text{Equation 33-4.20}$$

3. <u>Determine the distance from Point P to the vertical curve high point</u>:

   H = Station of high point – Station of Point P

4. <u>Determine elevation difference between the vertical curve high point and Point P</u>:

   V = Elevation of high point – Elevation of Point P

5. <u>Determine the distance from the vertical curve high point to the new VPC</u>:

$$x_{T2} = H - \frac{\sqrt{(AH/L_1)^2 - 200(AV/L_1)}}{(A/L_1)} \qquad \text{Equation 33-4.42}$$

6. <u>Determine Station of new VPC</u>:

   Station of new VPC = Station of high point – x_{T2}

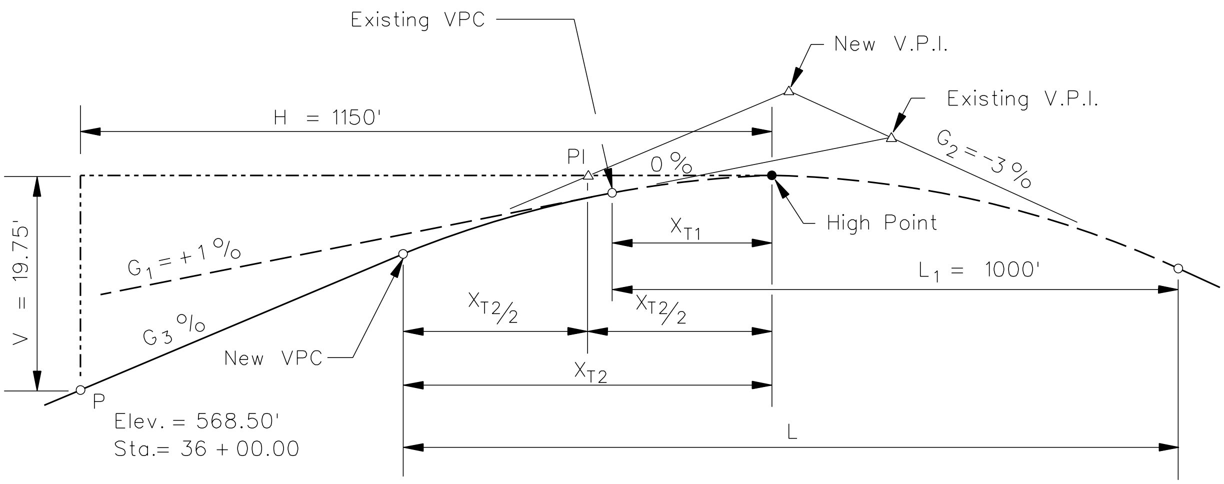
7. <u>Determine the required new gradient</u>:

$$G_3 = \frac{A\,X_{T2}}{L_1} \quad \text{or} \quad G_3 = \frac{V}{H \quad \frac{x_{T2}}{2}} \times 100 \qquad \text{Equation 33-4.43}$$

EXTENSION OF A VERTICAL CURVE THROUGH A POINT

Figure 33-4.M

Example 33-4.03(5) EXTENSION OF A VERTICAL CURVE THROUGH A POINT



Given: G_1 = +1.0%
G_2 = –3.0%
L_1 = 1000 ft
Elev. of existing VPC = 587.00 ft
Station of existing VPC = 45 + 00.00

Problem: An existing highway with an at-grade railroad crossing is being converted to a railroad underpass. The critical clearance point "P" is at Station 36 + 00 with an elevation of 568.50 ft. It is desirable to maintain the shape of existing vertical curve. Determine the location of the new VPC and new gradient required for the railroad underpass.

Solution:

1. Find the algebraic difference between the existing grades:

A = –3.0% – 1.0% = – 4%

2. Calculate the existing vertical curve high point station and elevation:

$$X_{T1} = -\frac{L_1 G_1}{G_2 \quad G_1} = -\frac{1000(1)}{-4} = 250 \text{ ft from the VPC}$$ Equation 33 - 4.18

Station of high point is:

High Point Sta. = $VPC_{STA.}$ + X_{T1} = (Sta. 45 + 00) + 250 = Sta. 47 + 50 Equation 33-4.19

Elevation of high point:

$$\text{High Point Elev.} = \text{VPC Elev.} - \frac{L\,G_1^2}{(G_2 - G_1)\,200}$$ Equation 33-4.20

$$\text{High Point Elev.} = 587.00 - \frac{1000(1)^2}{(-3-1)200} = 587.00 + 1.25 = 588.25 \text{ ft}$$

3. <u>Determine the distance from Point P to the vertical curve high point</u>:

   H = (Sta. 47 + 50) – (Sta. 36 + 00) = 1150 ft

4. <u>Determine the elevation difference between Point P and the high point</u>:

   V = 588.25 ft – 568.50 ft = 19.75 ft

5. <u>Determine the location of the new VPC using Equation 33-4.42</u>:

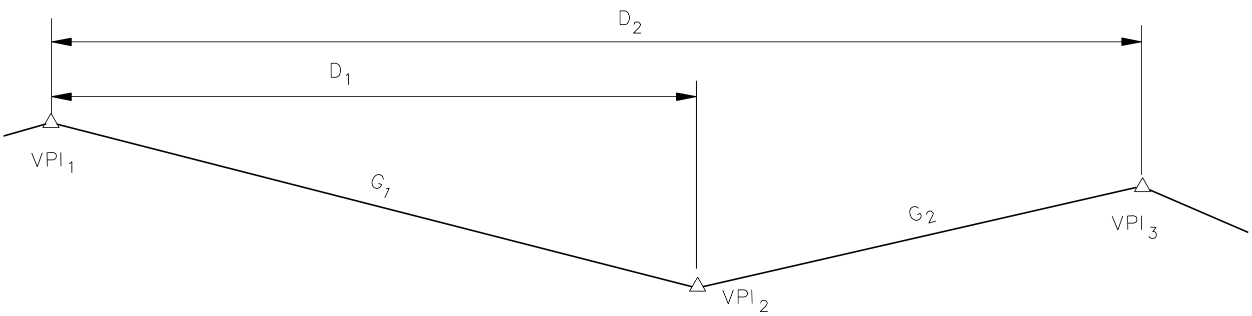
$$X_{T2} = H - \frac{\sqrt{(AH/L_1)^2 - 200(AV/L_1)}}{(A/L_1)} = 1150 - \frac{\sqrt{\left(\frac{4 \text{ x } 1150}{1000}\right)^2 - 200\left(\frac{4 \text{ x } 19.75}{1000}\right)}}{(4/1000)}$$

   X_{T2} = 1150 – 578.79 = 571.21 ft

   New VPC_{STA} = (Sta. 47 + 50) – 571.21 = Sta. 41 + 78.79

6. <u>Determine the new gradient (G_3), using Equation 33-4.43</u>:

$$G_3 = \frac{AX_{T2}}{L_1} = \frac{4 \text{ x } 571.21}{1000} = +2.285\%$$



D_1 = Distance between VPI_1 and VPI_2, ft
D_2 = Distance between VPI_1 and VPI_3, ft

Given: Station and Elevation at VPI_1
Station and Elevation at VPI_3
G_1, G_2 (%)

Problem: Find Station and Elevation of VPI_2.

Solution:

1. Find the station of VPI_2:

$$D_1 = \frac{(\text{Elev. VPI}_3 - \text{Elev. VPI}_1) - G_2 D_2}{G_1 - G_2}$$ Equation 33-4.44

Sta. VPI_2 = Sta. VPI_1 + D_1

2. Find the elevation of VPI_2:

Elev. VPI_2 = Elev. VPI_1 + $G_1 D_1$ Equation 33-4.45

VERTICAL CURVE COMPUTATION
(Intermediate VPI)

Figure 33-4.N

33-5 VERTICAL CLEARANCES

Figure 33-5.A provides a table with the minimum roadway vertical clearances for newly constructed and reconstructed structures, for structures allowed to remain-in-place, and for structures impacted by 3R projects. The vertical clearances in Figure 33-5.A cover the travel lanes, usable shoulders, and usable medians. The vertical clearances account for future resurfacing of roadways under the structures when the scope is new construction or reonstruction. Vertical clearances should always be verified in advance of all roadway projects which have structutes within their limits. Section 39-5 provides typical sections for highway and railway underpasses and illustrates where to measure vertical clearances.

Functional Classification	**Newly Constructed and Reconstructed Structures[1]**	**Existing Structures Allowed to Remain in Place[1]**	**3R Projects Under Structures[1]**
Interstates (rural and single routing[2] around urban areas)	16'-09" (5.1 m)	16'-00" (4.9 m)	16'-00" (4.9 m)
Interstates (urban interstates other than single routing[2])	15'-00" (4.5 m)	15'-00" (4.5 m)	15'-00" (4.5 m)
Expressways[3]	16'-06" (5.0 m)	16'-00" (4.9 m)	16'-00" (4.9 m)
Strategic Regional Arterial (Urban/suburban)	14'-09" (4.5 m)	14'-00" (4.3 m)	14'-00" (4.3 m)
Strategic Regional Arterial (Rural)	16'-06" (5.0 m)	16'-00" (4.9 m)	14'-00" (4.3 m)
Rural Principal or Minor Arterial or Marked Collector[4]	16'-06" (5.0 m)	16'-00" (4.9 m)	14'-00" (4.3 m)
Urban/Suburban Principal or Minor Arterial	14'-09" (4.5 m)	14'-00" (4.3 m)	14'-00" (4.3 m)
Urban One-way and Urban Two-way Streets	14'-09" (4.5 m)	14'-00" (4.3 m)	14'-00" (4.3 m)
Local Roads or Unmarked Collectors[4]	14'-09" (4.5 m)	14'-00" (4.3 m)	14'-00" (4.3 m)
Frontage Road A	16'-00" (4.9 m)	14'-00" (4.3 m)	14'-00" (4.3 m)
Frontage Road B or C	14'-09" (4.5 m)	14'-00" (4.3 m)	14'-00" (4.3 m)
Railroads under Highway	23'-00" (7.0 m)	21'-06" (6.6 m)	21'-06" (6.6 m)
Traffic Signal Heads[5]	16'-00" (5.0 m)	16'-00" (5.0m)	16'-00" (5.0m)
Pedestrian Overpasses	17'-03" (5.25 m)	17'-00" (5.2 m)	17'-00" (5.2 m)
Cross bracing on Through Truss Structures	17'-03" (5.25 m)	17'-03" (5.25 m)	17'-00" (5.2 m)
Sign Trusses[6]	17'-03" (5.25 m)	17'-00" (5.2 m)	17'-00" (5.2 m)
Bicycle Underpass[7]	10'-00" (3.0 m)	10'-00" (3.0 m)	10'-00" (3.0 m)

Vertical Clearances

Figure 33-5.A

1. The minimum required vertical clearance must be available over the traveled way, any usable shoulder, and usable median, or measured from the top of the rail for clearances above railroad tracks.
2. Single routing around or through an urban area is defined in Section 31-7.04(c). Maps of urban areas in Illinois with a single routing are shown in Section 44-6.
3. A 15'-00" (4.5 m) vertical clearance may be used in an urban area where an alternative route is available with a 16'-00" (4.9 m) vertical clearance.
4. Includes unmarked rural and urban collectors and local highways on the State highway system.
5. Vertical clearances are for mast arm mounted signal heads. Provide 17'-00" (5.2 m) vertical clearance for all spanwire mounted signal heads and spanwire mounted flashing beacons.
6. On interstate routes with less than 16'-0" (4.9 m) clearance, the vertical clearance to sign trusses shall be 1 ft (0.3 m) greater than the minimum clearance of other structures.
7. An 8'-00" (2.4 m) vertical clearance is permitted in constrained areas.

Footnotes to Figure 33-5.A

33-6 DESIGN PRINCIPLES AND PROCEDURES

33-6.01 General Controls for Vertical Alignment

As discussed elsewhere in Chapter 33, the design of vertical alignment involves, to a large extent, complying with specific limiting criteria. These include maximum and minimum grades, sight distance at vertical curves, and vertical clearances. In addition, the designer should adhere to certain general design principles and controls which will determine the overall safety and operation of the facility and will enhance the aesthetic appearance of the highway. These design principles for vertical alignment include:

1. Consistency. Use a smooth gradeline with gradual changes, consistent with the type of highway and character of terrain, rather than a line with numerous breaks and short lengths of tangent grades.

2. Coordination with Natural/Man-Made Features. The vertical alignment should be properly coordinated with the natural topography, available right-of-way, utilities, roadside development, and natural/man-made drainage patterns. This is especially important in rugged terrain.

3. Roller Coaster. Avoid a “roller-coaster” type of profile, especially where the horizontal alignment is relatively straight. This type of profile may be proposed in the interest of the economy, but it is aesthetically undesirable and may be hazardous. To avoid this type of profile, incorporate into the design horizontal curvature and/or flatter grades that may require greater excavations and higher embankments.

4. Broken-Back Curvature. Avoid “broken-back” gradelines (two crest or sag vertical curves separated by a short tangent). This alignment is particularly noticeable on divided highways with open-ditch median sections. One long vertical curve is more desirable. In rural areas, any distance less than 1500 ft (500 m) between VPI’s is considered to be a broken-back profile.

5. Long Grades. On a long ascending grade, it is preferable to place the steepest grade at the bottom and flatten the grade near the top. It is also preferable to break the sustained grade with short intervals of flatter grades. Evaluate substantial lengths of grades for their effect on traffic operations (e.g., trucks).

6. Sags. Avoid sag vertical curves in cuts unless adequate drainage can be provided. Also, to avoid drainage problems on bridges, do not place the low point of sag vertical curves on a bridge.

7. Intersections. Maintain moderate grades through intersections to facilitate braking and turning movements. See Chapter 36 for specific information on vertical alignment through intersections.

8. Environmental Impacts. Vertical alignment should be properly coordinated with environmental impacts. However, the safety of the highway should not be compromised.

33-6.02 Coordination of Horizontal and Vertical Alignment

Do not design the horizontal and vertical alignments independently. Instead they should complement each other. This is especially true for new construction projects. Poorly coordinated designs can detract from the benefits and emphasize the deficiency of each alignment. A thorough study of the alignment is always warranted.

Horizontal alignments and vertical profiles are among the most important permanent design elements for a highway. Excellence in their design and coordination increases the highway's utility and safety, encourages uniform speeds, and can greatly improve the highway's appearance. This usually can be accomplished with little additional costs. The designer should coordinate the layout of the horizontal and vertical alignment as early as practical in the design process. Alignment layouts are typically completed after the topography and ground line have been drafted. Use the computer visualization program within CADD (e.g., GEOPAK) to visualize how the layout will appear in the field. Review several alternatives to ensure that the most pleasing and practical design is selected.

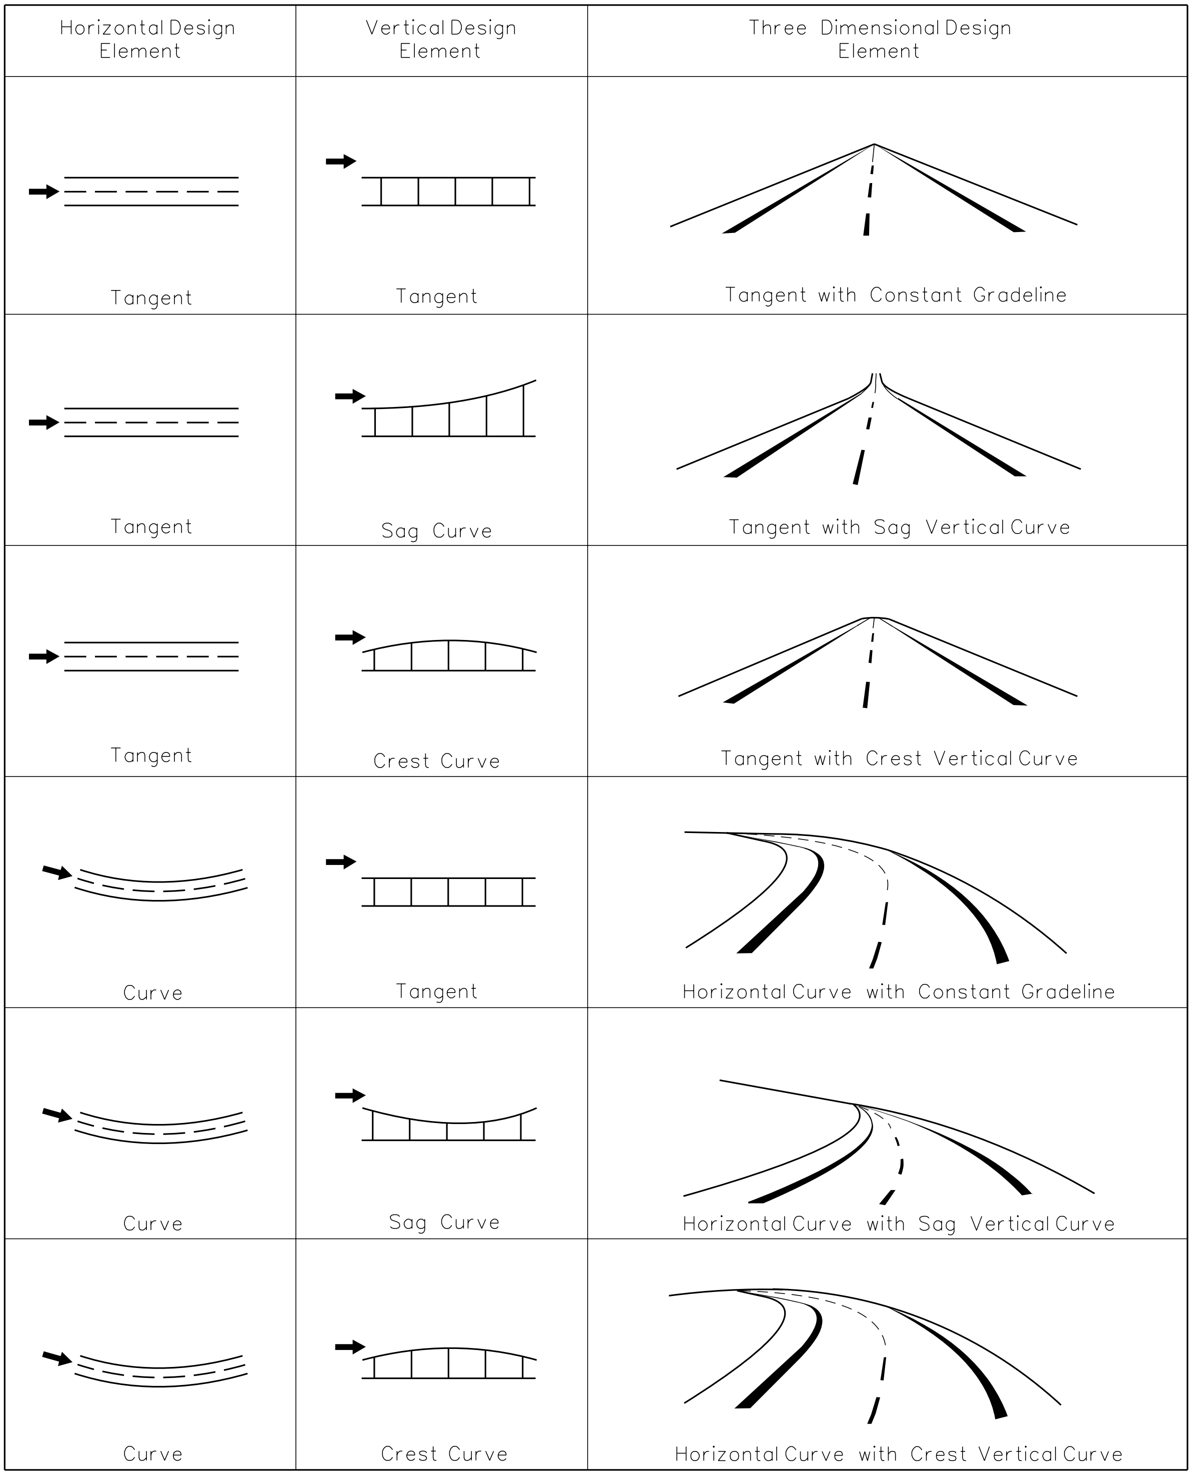
It is difficult to discuss the combination of horizontal alignment and vertical profile without reference to the broader subject of highway location. The subjects are mutually interrelated and what may be said about one generally is applicable to the other. The physical controls or influences that act singularly or in combination that determine the type of alignment are:

- the character of highway, justified by traffic volumes;
- topography and subsurface conditions;
- existing highway and cultural developments;
- likely future developments; and
- suitable locations for intersections and interchanges.

Figures 33-6.A through 33-6.E illustrate poor and preferred examples of horizontal and vertical alignment coordination. In addition, consider the following when coordinating horizontal and vertical alignment on rural and suburban highways:

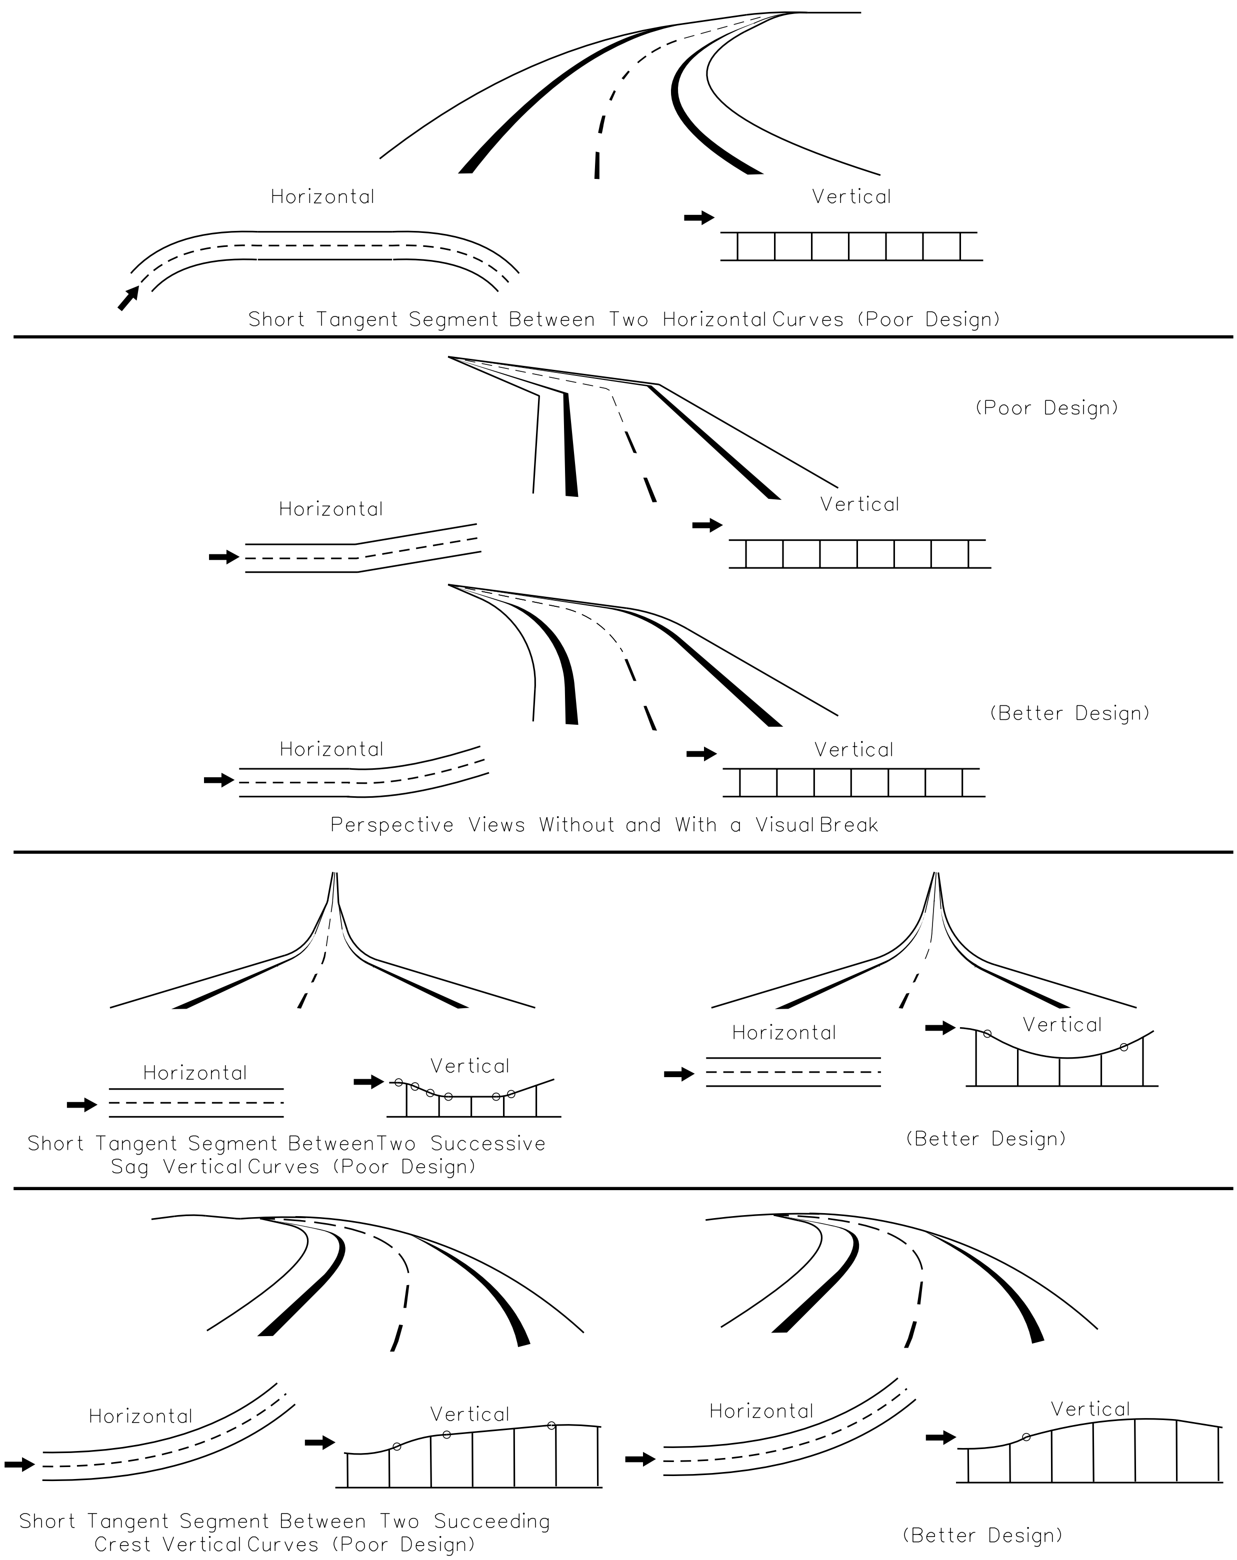
1. Balance. Horizontal curvature and grades should be in proper balance. Maximum curvature with flat grades or flat curvature with maximum grades does not achieve this desired balance. A compromise between the two extremes produces the best design relative to safety, capacity, ease, uniformity of operations, and aesthetics.

2. Coordination. Vertical curvature superimposed upon horizontal curvature (i.e., vertical and horizontal P.I.'s at approximately the same stations) generally results in a more pleasing appearance and reduces the number of sight distance restrictions. Successive changes in profile, not in combination with horizontal curvature, may result in a series of humps visible to the driver for some distance, which may produce an unattractive design. However, under some circumstances, superimposing the horizontal and vertical alignment must be tempered somewhat by Items 3 and 4 below.



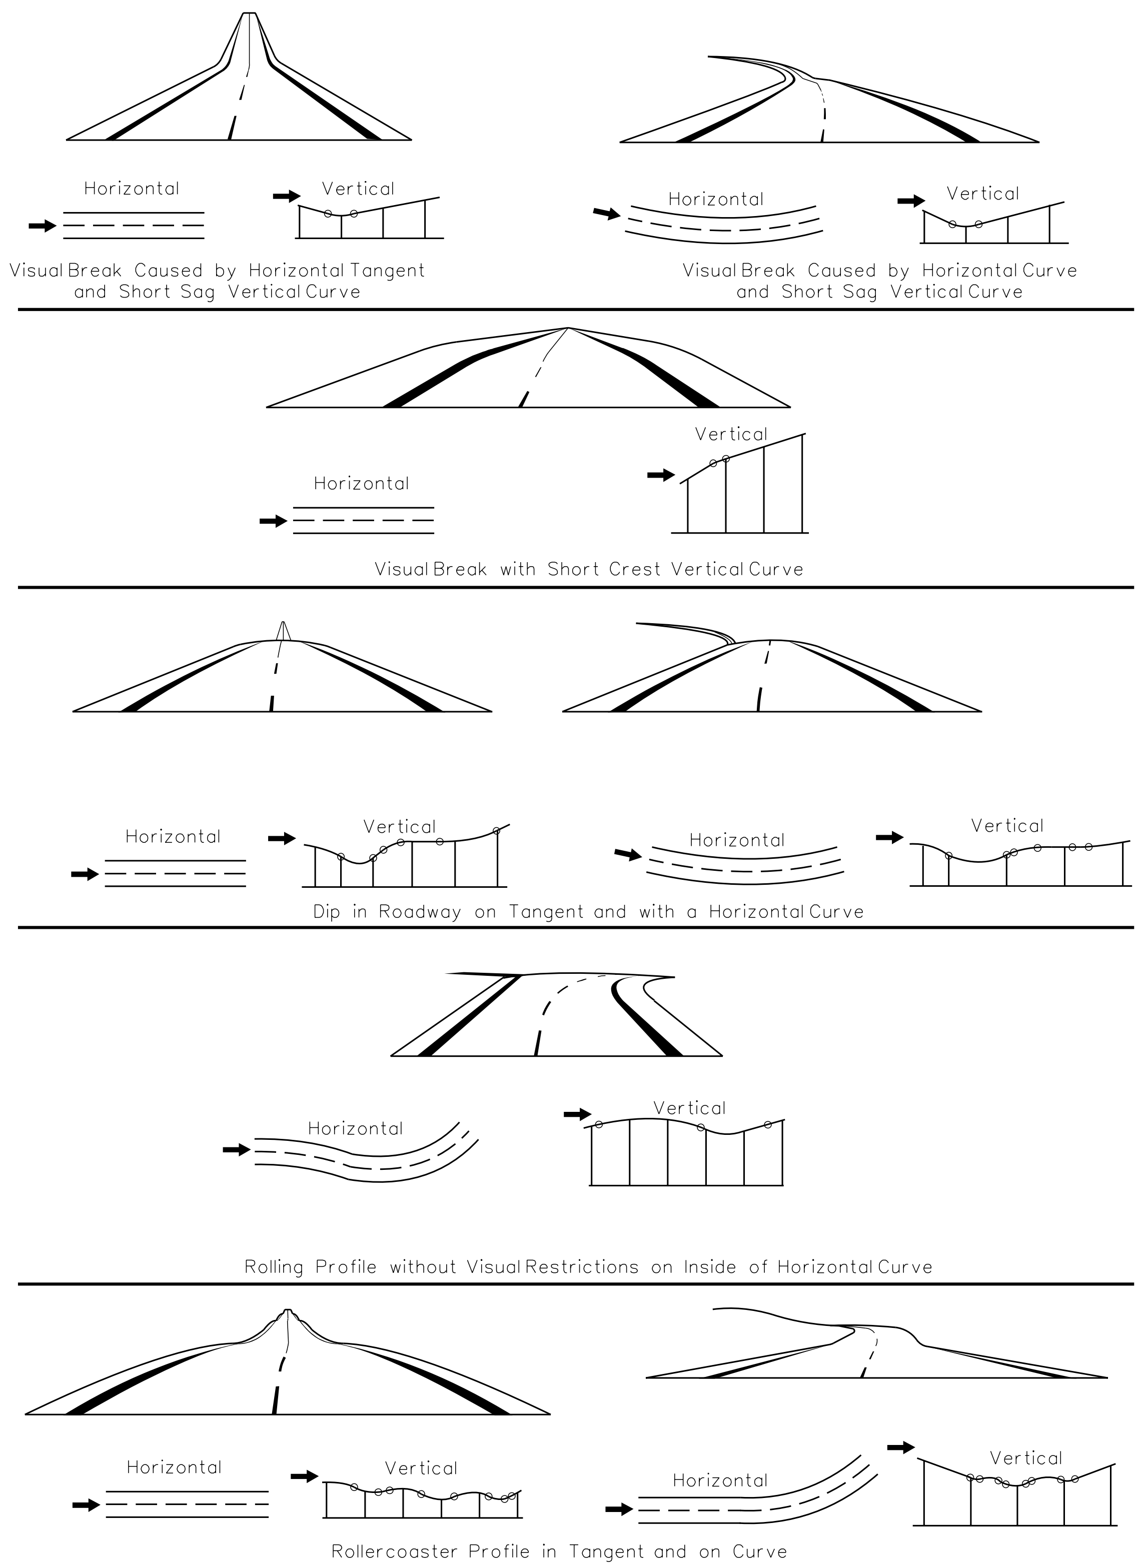
HORIZONTAL AND VERTICAL ALIGNMENT COORDINATION

Figure 33-6.A



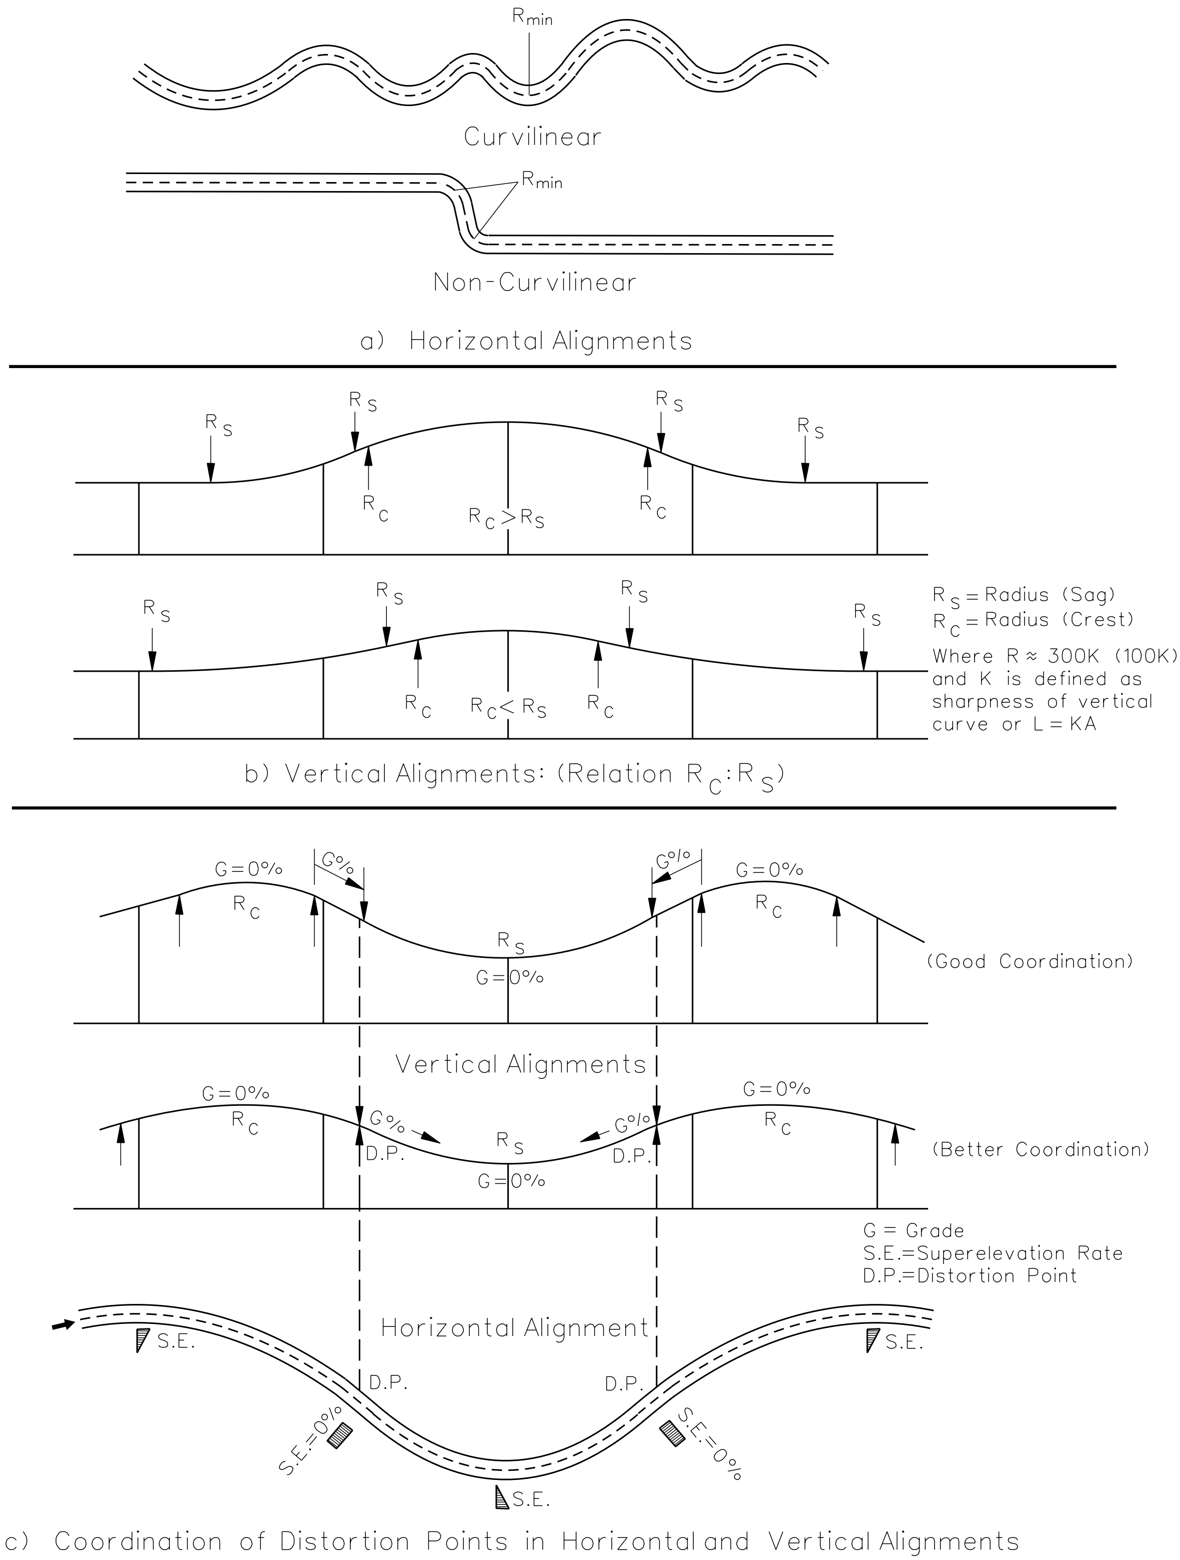
EXAMPLES OF UNDESIRABLE AND GOOD ALIGNMENT COORDINATION

Figure 33-6.B



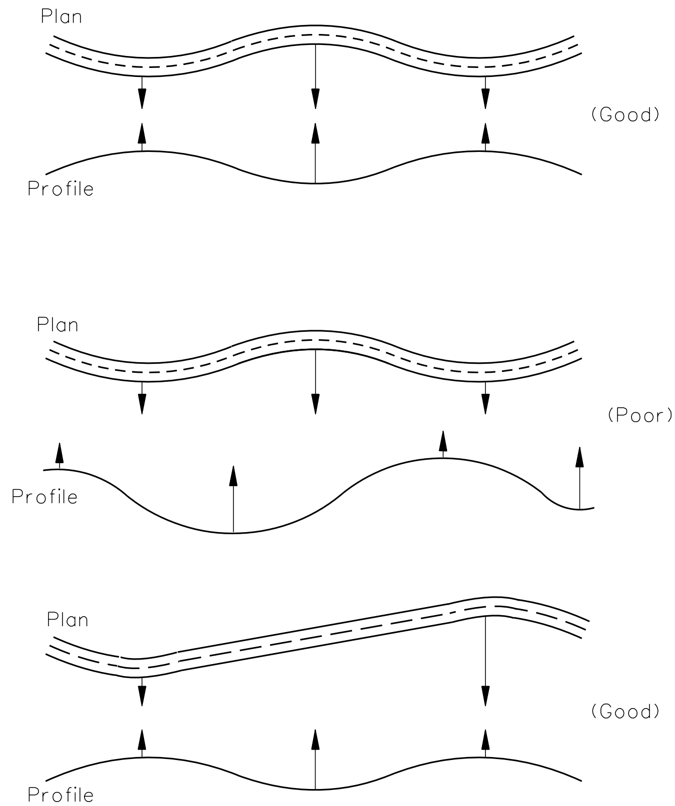
COMBINED ALIGNMENT DESIGNS TO AVOID

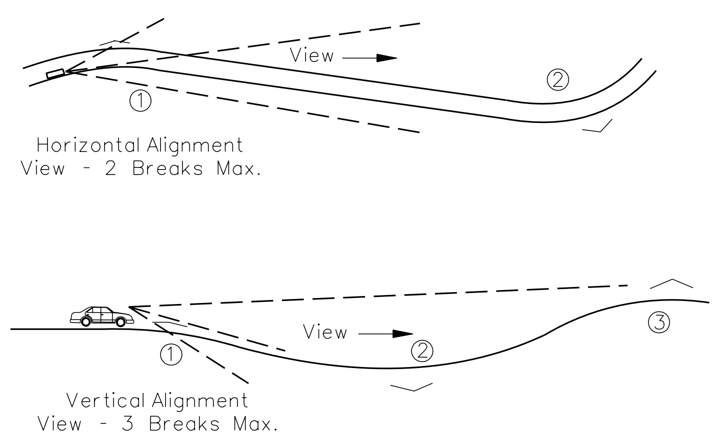
Figure 33-6.C



SUPERIMPOSITION OF HORIZONTAL AND VERTICAL ALIGNMENTS

Figure 33-6.D





EXAMPLES OF SUPERIMPOSITION OF HORIZONTAL AND VERTICAL ALIGNMENTS

Figure 33-6.E

3. Crest Vertical Curves. Do not introduce sharp horizontal curvature at or near the top of pronounced crest vertical curves. This is undesirable because the driver cannot perceive the horizontal change in alignment, especially at night when headlight beams project straight ahead into space. This problem can be avoided if the horizontal curvature leads the vertical curvature or by using design values which well exceed the minimums.

4. Sag Vertical Curves. Do not introduce sharp horizontal curves at or near the low point of pronounced sag vertical curves or at the bottom of steep grades. Because visibility to the road ahead is foreshortened, only flat horizontal curvature will avoid an undesirable, distorted appearance. At the bottom of long grades, vehicular speeds often are higher, particularly for trucks, and erratic operations may occur, especially at night and during icy conditions.

5. Passing Sight Distance. In some cases, the need for frequent passing opportunities and a higher percentage of passing sight distance may supersede the desirability of combining horizontal and vertical alignment. In these cases, it may be necessary to provide long tangent sections to secure sufficient passing sight distance.

6. Intersections. At intersections, horizontal and vertical alignment should be as flat as practical to provide a design which produces sufficient sight distance and gradients for vehicles to slow, stop, or turn; see Chapter 36.

7. Divided Highways. On divided facilities with wide medians, it is frequently advantageous to provide independent alignments for the two one-way roadways. Where traffic volumes justify a divided facility, and where rolling or rugged terrain exists, a superior design can result from the use of independent alignments and profiles.

8. Residential Areas. For highways near subdivisions, design the alignment and profile to minimize nuisance factors to neighborhoods. For freeways, a depressed facility can make the highway less visible and reduce the noise to adjacent residents. Also, for all highway types, minor adjustments to the horizontal alignment may increase the buffer zone between the highway and residential areas.

33-6.03 Aesthetics

The coordination of the horizontal and vertical alignment should be designed to enhance the aesthetics of the facility. A proper layout as discussed in Section 33-6.02 will generally provide an attractive facility. In addition, the designer should consider the effect the cross section will have on the facility's aesthetics. The following sections present several ideas that may enhance the attractiveness of a facility.

33-6.03(a) General

A major problem may develop with the layout of a new highway if the designer attempts to superimpose a linear roadway configuration onto nonlinear land forms. A properly developed alignment will reduce driver monotony, provide a positive visual experience, and integrate the roadway into the landscape without providing unsightly visual impacts. To accomplish this, design the vertical and horizontal alignment to:

- fit the landscape with minimal land form modifications;
- enhance the area's landscape character;
- direct the driver's attention to positive visual features in the landscape (e.g., the highway should lead into, rather than away from those views considered aesthetically pleasing); and
- capitalize on other opportunities that will create a pleasant visual experience (e.g., the roadway should descend towards those features of interest at a low elevation and rise toward those features which are best viewed from below or in silhouette against the sky).

Often the use of various impact reduction methods described in the following sections are in conflict with each other (e.g., slope rounding versus vegetation retainage). To resolve these conflicts, the designer must determine for whom the visual impact reductions are made (e.g., the driver, local residents, tourists). Some of the factors that should be considered include the:

- number of potential viewers;
- location of the viewer;
- duration of the view (length and number of times the view is seen);
- type of potential viewers (tourists, local residents, pass-throughs);
- type of area from which it is viewed (recreational areas, farms, major highways, urban); and
- other focal points that will draw attention from the road.

The designer should use the Department's computerized visualization CADD program (i.e., GEOPAK) to review the design from both the perspective view of the driver and the perspective view from outside the roadway.

33-6.03(b) Rural Visual Impacts

One of the goals of producing an aesthetically pleasing design is to reduce the visual impact the roadway has on the landscape. The following presents several ideas for reducing this impact:

1. Horizontal and Vertical Alignment Coordination. Properly coordinated horizontal and vertical alignments can lead to aesthetically pleasing designs. Section 33-6.02 discusses the coordination of the vertical and horizontal alignments.

2. <u>Cut and Fill Slopes</u>. Explore possible alternatives that will reduce the magnitude of exposed cut and fill slopes. Some of these alternatives include moving the alignment slightly or changing the geometric design through a specific area. For example, reducing the ditch width by 3 ft (1.0 m) and increasing the slope rates, say, for 3000 ft (1000 m) on the project may significantly reduce the amount of exposed cut slope and thereby enhance the visual impact of the facility on the landscape. Figure 33-6.F illustrates examples of poor and good alignments for reducing exposed cut and fill slopes.

3. <u>Reducing Earthwork Modifications</u>. Once measures have been adopted to reduce the magnitude of exposed cut and fill slopes, additional earthwork modifications can be used to further improve visual impacts. Some of these modifications include:

   a. <u>Slope Rounding</u>. Slope rounding allows the fill and cut slopes to blend naturally into the existing landscape. It reduces the sharp, unnatural edges formed by the junction of a constant pitch cut or fill slope with the naturally rounded landscape. Figure 33-6.G illustrates an example of slope rounding.

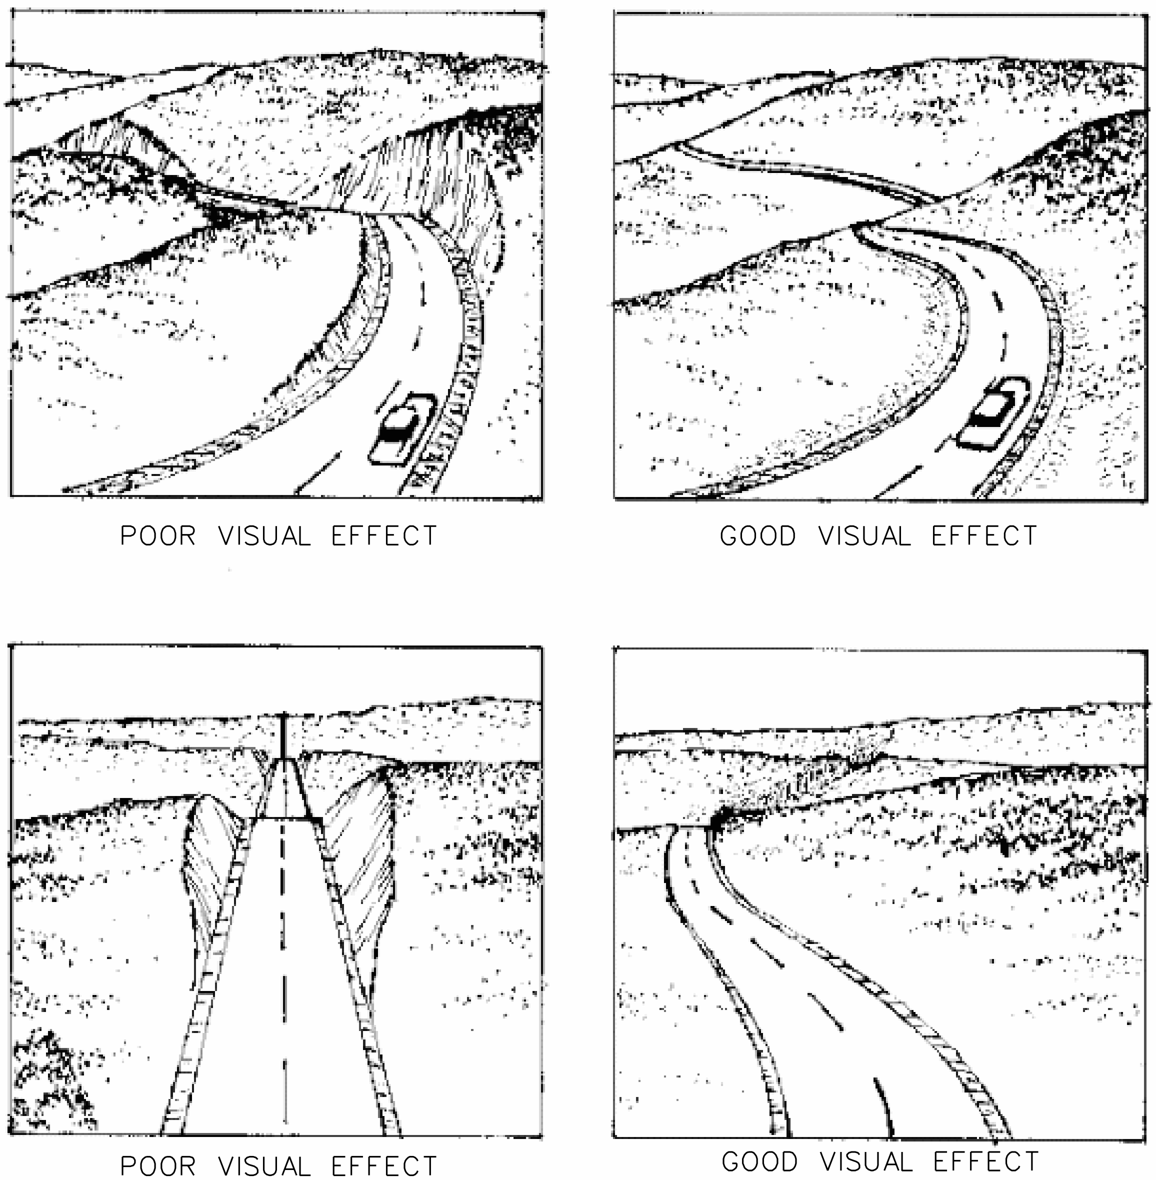
   b. <u>Warping Slopes</u>. Warping slopes allows the designer to vary the slope pitch to more closely match the surrounding land form and to present a more natural landscape.

   c. <u>Waste Materials</u>. Positive utilization of waste materials can enhance the visual impacts of the facility. On freeways and expressways with independent alignments, contrasts can be reduced by creating low-earth mounds or by filling unnatural looking depressions.

4. <u>Color</u>. Freshly cut rock faces often produce very sharp contrasts to the surrounding landscape. “Aging” the rock cut or fill slope can be accomplished with replanting vegetation or by covering the rock cut or fill slope with asphalt emulsions, paints, etc.

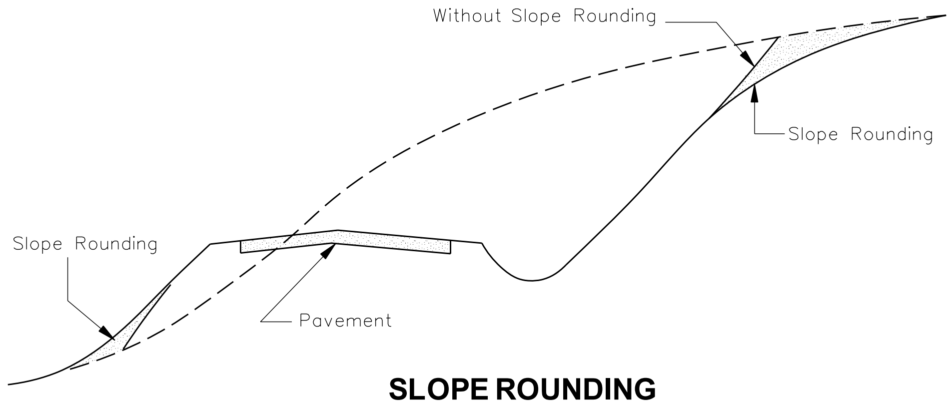
5. <u>Texture</u>. Rock cuts should be textured to match the local rock faces. This may require using smooth cuts or broken-face cuts. Broken-face cuts also provide pockets which allow for a more rapid natural revegetation of the face. Another way to provide texture is to scarify cut slopes. A random pattern of scarification is the most desirable.

6. <u>Vegetation</u>. One of the easiest ways to reduce the visual impact of the roadway is to retain as much of the existing vegetation and riparian habitat as practical. Figure 33-6.H illustrates an example of the advantages of retaining vegetation. However, retaining vegetation is often limited by roadside safety factors, sight distance requirements, the desire to open views and vistas (see Figure 33-6.I), construction requirements, maintenance requirements, etc.



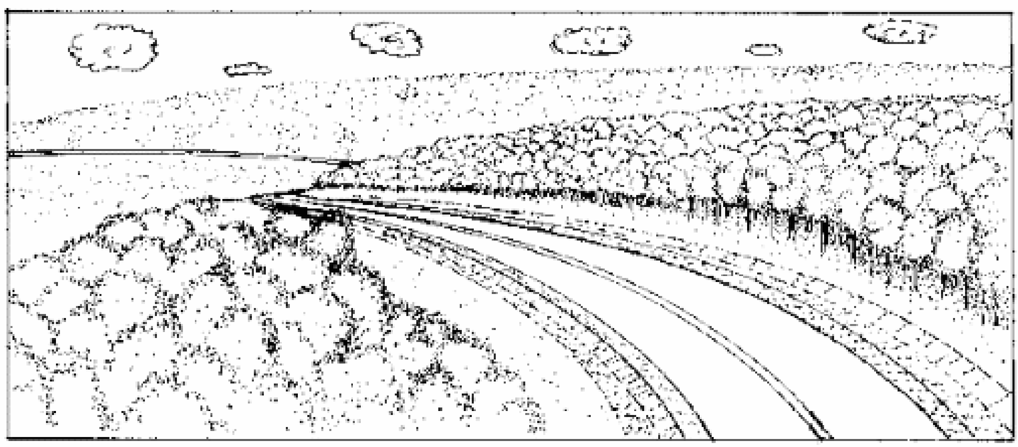
ALIGNMENT EFFECTS ON FILL AND CUT SLOPES

Figure 33-6.F

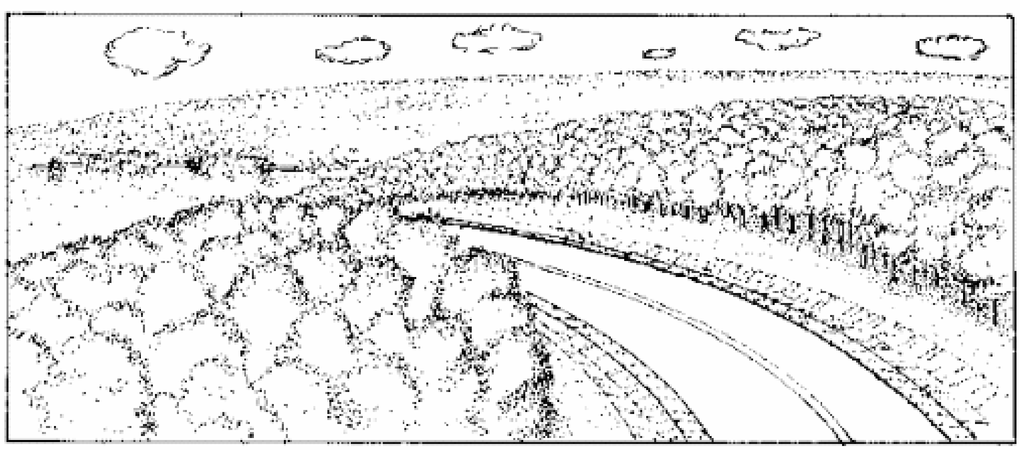


SLOPE ROUNDING

Figure 33-6.G



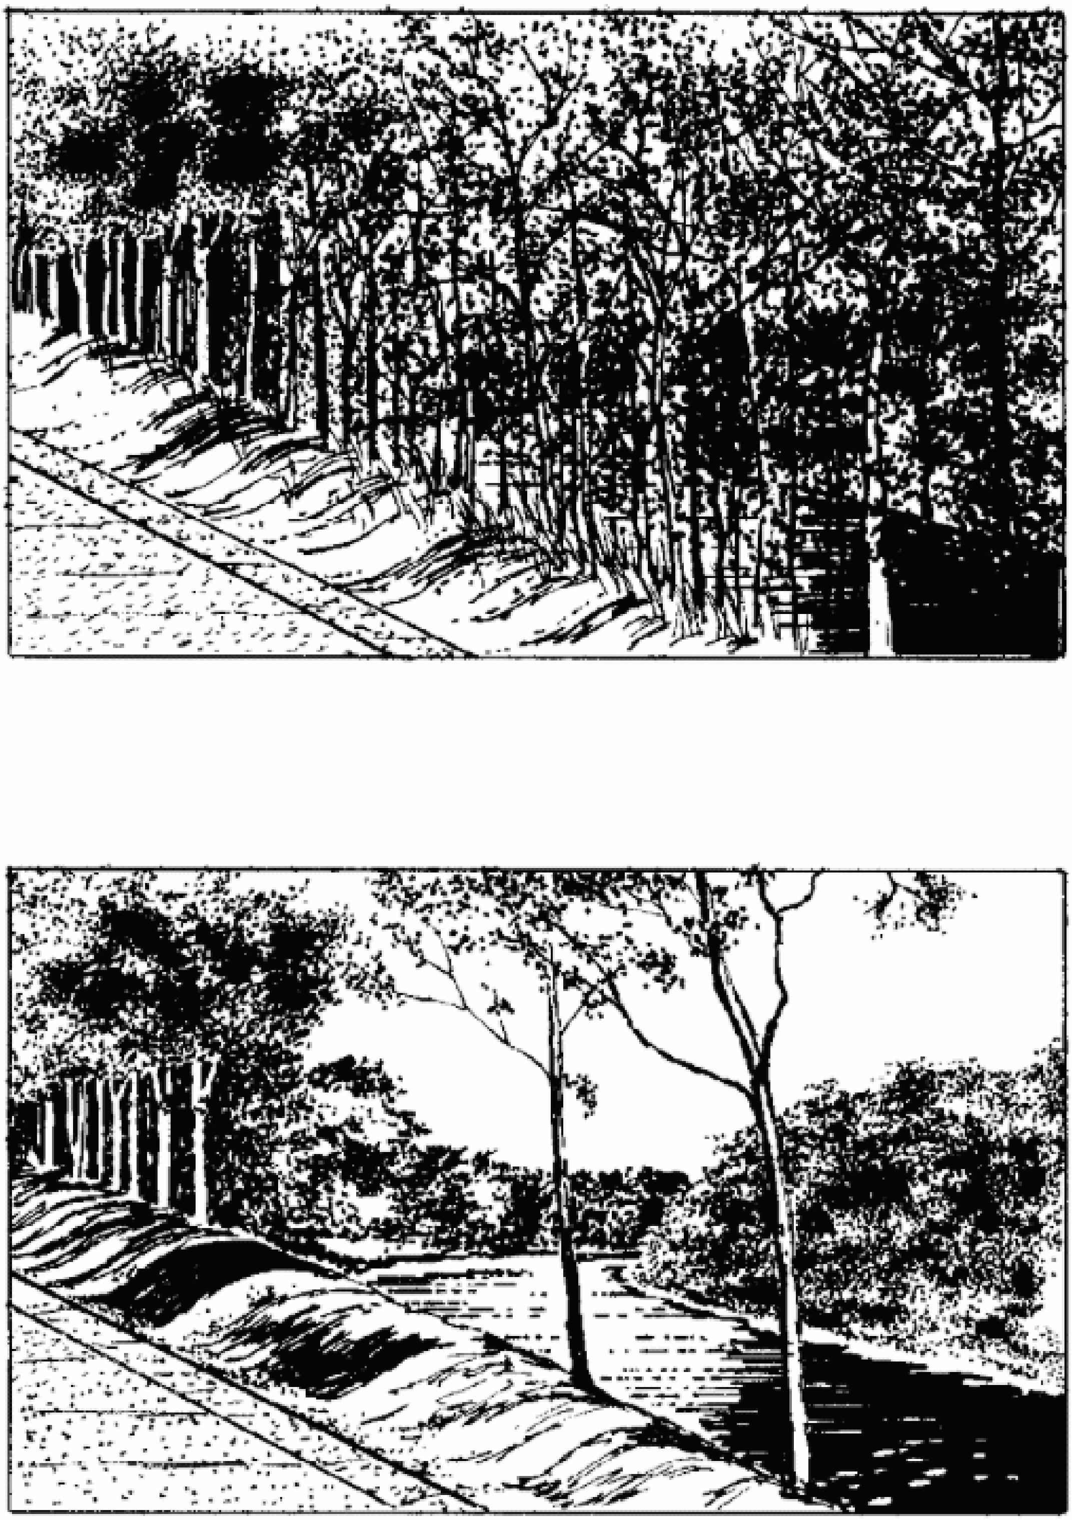
POOR VISUAL EFFECT



GOOD VISUAL EFFECT

DISAPPEARING FOCAL POINT AND VEGETATION RETAINAGE

Figure 33-6.H



SELECTIVE THINNING

Figure 33-6.I

Wildflowers can significantly improve the roadway aesthetics with minimal effort and may reduce the roadside maintenance requirements. Freeway medians, interchanges, and large open roadside areas are common locations for wildflowers. Give special attention to selecting the color, texture, soil conditions, and flower types to ensure successful plantings.

7. Daylighting. Daylighting can be used to open the roadway to broad panoramic views which otherwise may be hidden by cuts. However, do not use daylighting if the desire is to hide the road from other viewers or if the desire is to retain the existing vegetation and wildlife habitat.

33-6.03(c) Urban Visual Impacts

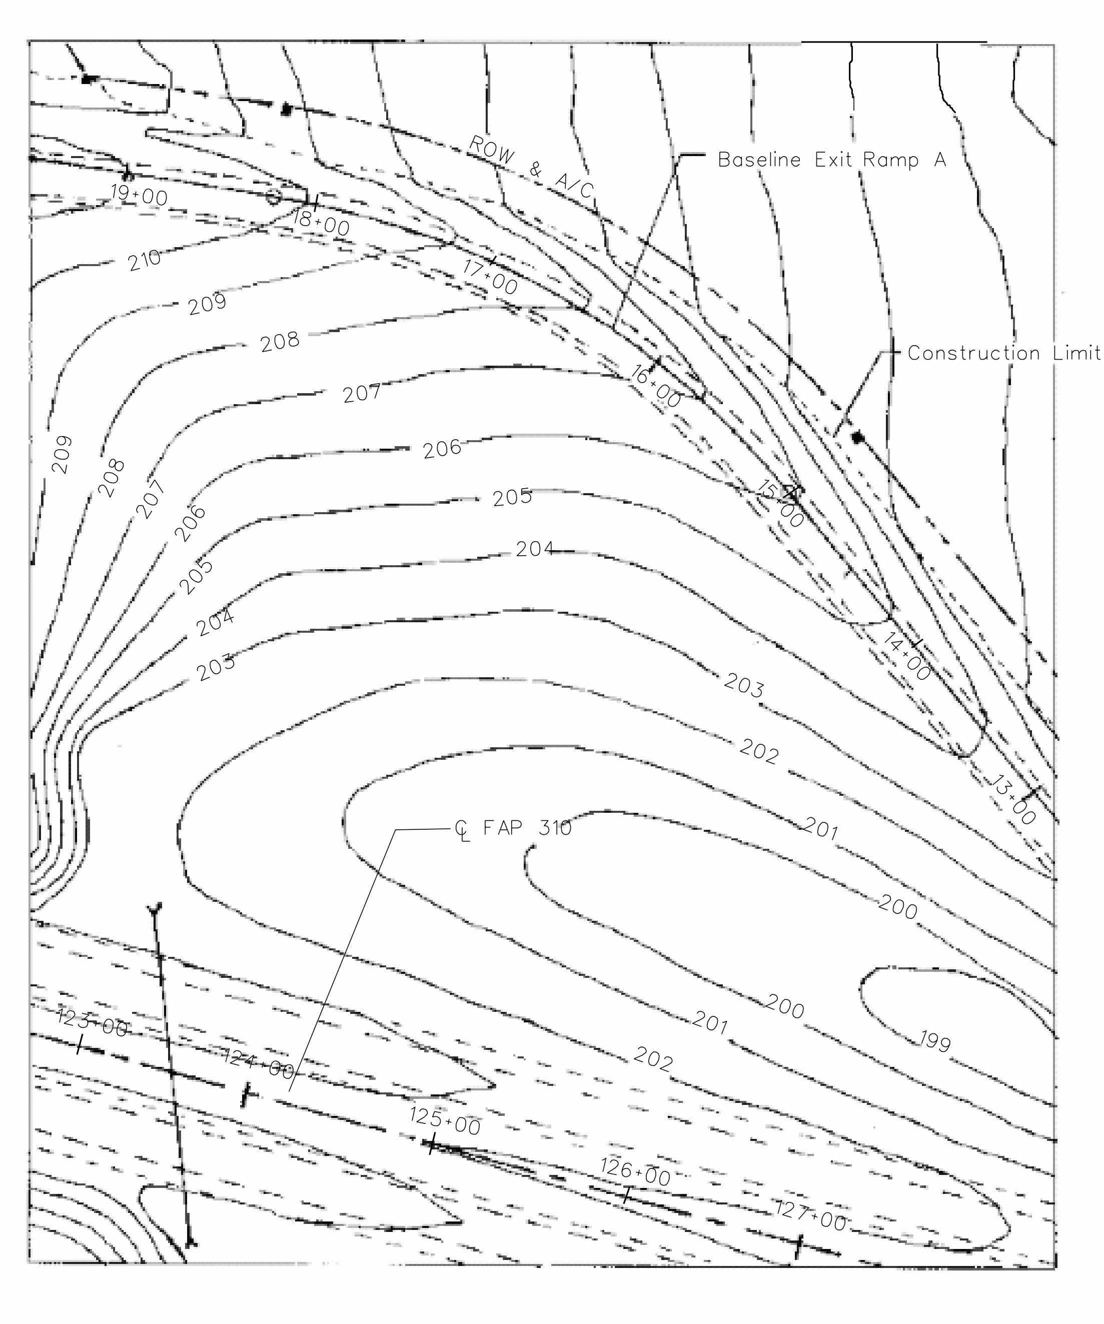
Generally, it is more difficult to obtain aesthetically pleasing designs in urban areas due to limited right-of-way, limited design options, and competing distractions. However, as practical, the designer should work with local officials to produce an aesthetically pleasing design. The following presents several options for improving the visual impact of roadways in urban areas:

1. Structures. Structure aesthetics do not necessarily require ornamentation or decoration. However, giving special attention to scale, proportion, form, line, material, texture, color, and other principles of art and architecture can produce aesthetically pleasing structures. Also, consider views from bridges. For example, views of rivers, lakes, or city centers from high bridges can often present spectacular views.

2. Medians. Because of right-of-way restrictions in urban areas, the use of wide medians on arterial streets are seldom practical. However, raised-curb or depressed medians in the suburban areas may allow some type of landscaping in the median. Where landscaping is proposed, ensure that it will not affect the roadside safety or restrict sight distances.

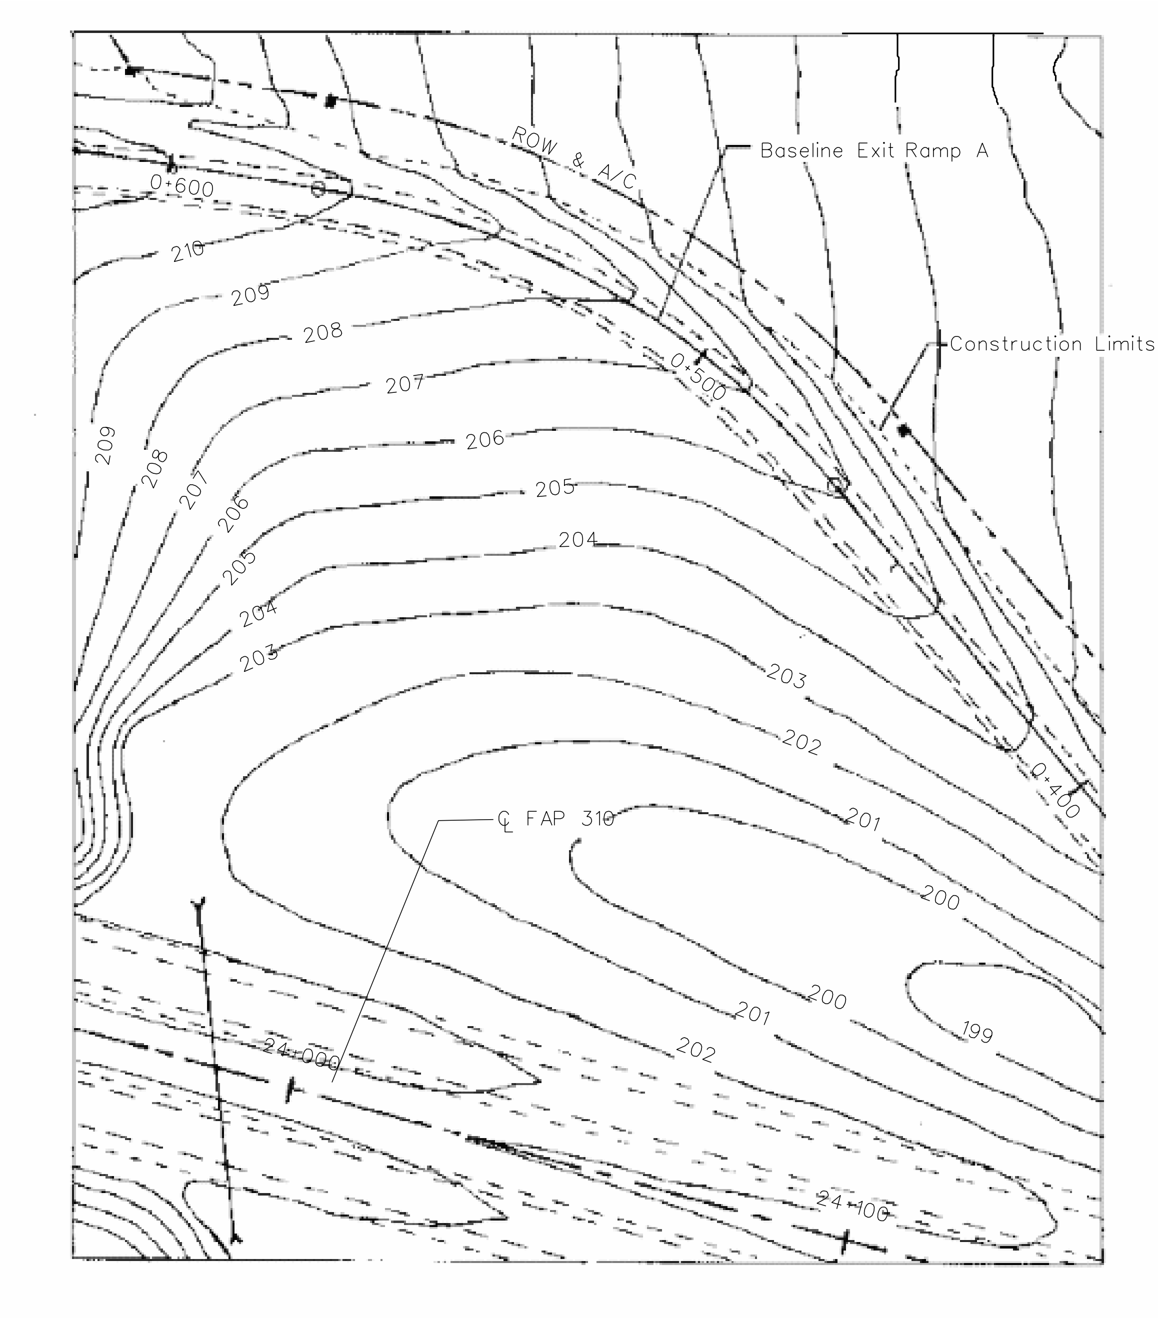
3. Sound Walls. On many urban freeways and expressways, sound walls are an integral part of the highway cross section. However, sound walls can often produce a tunnel-like effect. To reduce this effect, give special consideration to changing the alignment and profile of the wall. This can be accomplished by changing material types and texture, stepping the top of the wall, providing curvilinear designs, and providing plantings along the wall. Also, give special care to adjacent properties behind the wall to ensure satisfied property owners.

4. Grading. Use of contour grading on urban freeways and expressways can significantly reduce the highway impact on the surrounding area. Figure 33-6.J illustrates a good contour grading plan at an interchange. In addition, lowering urban freeways below grade can often reduce the noise and visual impacts of the highway to nearby neighborhoods.



CONTOUR GRADING
(US Customary)

Figure 33-6.J



CONTOUR GRADING
(Metric)

Figure 33-6.J

5. Sidewalks and Other Amenities. The use of varied sidewalk widths, material types, and street furniture can significantly improve the appearance of the urban street. Traffic signals, luminaires, benches, planting boxes, ornamental trees, bus stops, etc., can be artistically designed to meet the local decor and to improve the streets' visual impact on the surrounding neighborhood. These elements should be coordinated with the municipalities with appropriate agreement on cost-sharing. For additional guidance, see Chapters 5, 17, and 48.

6. Bicycle Facilities. In addition to increasing the safety of bicyclists, separate bicycle facilities often allow the designer to enhance the roadside aesthetics by providing additional room for plantings, aesthetically pleasing barriers, etc. Chapter 17 provides additional information on bicycle facilities.

7. Utilities. Desirably, place all utilities underground. This removes unsightly poles and lines and generally improves the safety of the urban facility. However, because of installation costs and limited right-of-way, this option may not always be practical.

33-6.04 Design of Profile Gradelines

33-6.04(a) General

The profile gradeline of a highway typically has the greatest impact on a facility's cost, aesthetics, safety, and operation. The profile is a series of tangent lines connected by parabolic vertical curves. It is typically placed along the roadway centerline of undivided facilities and at the two median edges of the traveled way on divided facilities.

The designer must carefully evaluate many factors when establishing the profile gradeline of a highway. These include:

- maximum and minimum gradients;
- sight distance criteria;
- earthwork balance;
- location of bridges and drainage structures;
- high-water levels (flood frequency);
- drainage considerations;
- water table elevations;
- location of highway intersections and interchanges;
- snow drifting;
- frost penetration;
- highway/railroad crossings;
- types of soil;
- adjacent land use and values;
- highway safety;
- coordination with other geometric features (e.g., the cross section);
- topography/terrain;

- truck performance;
- available right-of-way;
- type and location of utilities;
- urban/rural location;
- aesthetics/landscaping;
- construction costs;
- environmental impacts;
- driver expectations;
- airport flight paths (e.g., grades and lighting); and
- pedestrian and disabled accessibility in urban areas.

The following sections discuss the establishment of the profile gradeline in more detail. Section 11-5.04(d) discusses the procedures for establishing the profile gradeline during Phase I studies.

33-6.04(b) Design of Urban Profile Gradelines

Laying out profile gradelines in urban areas often is more complicated than in rural areas due to limited right-of-way, closely spaced intersections, existing roadside development, and accommodation of drainage on curbed streets including drainage from outside the street. Evaluate the following factors when developing a profile gradeline on an urban project:

1. Vertical Curves. Long vertical curves on urban streets are generally impractical. The designer will typically need to lay out the profile gradeline to meet existing field conditions. Therefore, the minimum vertical curve lengths generally are provided on urban streets. Where practical, locate VPI's at or near the centerlines of cross streets. For flat urban areas where the algebraic difference in grades is between 0.6% and 1%, use the minimum length of sag or crest curve as discussed in Sections 33-4.01(a) and 33-4.02(b) (i.e., L = 3V (L = 0.6V)). At signalized and stop-controlled intersections, some flattening of the approaches also may be required for better traffic operations.

2. Surface Drainage. Urban streets will usually have curbs and gutters, which may complicate the layout of the profile gradeline to facilitate drainage. Take special care to avoid flat spots where water may pond, especially through radius returns. Section 33-2 provides the minimum gradients for curbed streets. In very flat areas, the profile gradeline may be rolled up and down at 0.3% to 0.5% to provide the necessary drainage. Also, see the *IDOT Drainage Manual* for guidance on encroachment of water onto the traveled way. At intersections, the surface drainage preferably should be intercepted upstream of an intersection.

3. Spline Curves. Spline curves can be helpful in laying grades in urban areas where it is necessary to meet numerous elevation restrictions in relatively short distances. Spline curves are thin, flexible pieces of plastic that can be bent into any curved shape. The designer will need to tie these curves to the profile gradeline at the beginning and end. Show the elevations along a spline curve at 20 ft (5 m) intervals.

4. Existing Roadside Development. Where roadside development is extensive, the cross-section design of a curb and gutter street is critical. Ensure adequate drainage is provided behind curbs, that the profiles for existing driveways are acceptable, and that sidewalk elevations match existing development in built-up areas.

5. Earthwork Balance. Balancing earthwork is typically impractical in urban areas; see Section 33-6.04(g). An excess of excavation is preferable to the need for borrow, due to the generally higher cost of borrow in urban areas. The designer should account for excavation from storm sewer installation when suitable soil is available.

6. Underground Utilities. On existing streets, ensure that any change in the profile gradeline will still provide the minimum coverage for utilities. For additional guidance on minimum utility clearances, see Chapter 6.

7. Limited Right-of-Way. Careful consideration is warranted when substantially lowering or raising the profile gradeline. This will often result in more right-of-way impacts (e.g., steeper driveways, removing parking, reducing front lawns, adding retaining walls).

33-6.04(c) Design of Rural Profile Gradelines

When developing rural profile gradelines, the designer should review the following sections:

- Section 11-5.04(d) for the procedures of establishing the profile gradeline,
- Section 33-6.01 for the general controls for vertical alignment, and
- Section 33-6.02 for the coordination of horizontal and vertical alignments.

33-6.04(d) Soils

The type of earth material encountered often influences the profile gradeline at certain locations. For example, if rock is encountered, it may be more economical to raise the gradeline and reduce the rock excavation. Soils that are unsatisfactory for embankment or cause a stability problem in cut areas may also be determining factors in establishing the profile gradeline.

During Phase I studies, review the preliminary Geotechnical Report before determining the final profile gradeline. The Geotechnical Report describes the effects soils and geology may have on the selected profile gradeline. Figure 33-6.K can be used to determine the effected various profiles and roadway designs may have on subsurface drainage and, subsequently, pavement performance. To reduce possible stability problems, coordinate the development of the profile gradeline with the district materials staff during Phase I and again during the preparation of construction plans in Phase II. For more detailed information on soils, see the *Geotechincal Manual*.

Profile				Soil Type																								
Less Than 3 ft (900 mm) Fill to Less Than 6 ft (1.8 m) Cut		6 ft (1.8 m) or Greater Cut		A-4					A-7-6 (15) to (20)					A-7-6 Less than (15) or A-6					Fine Sand or Sandy Soil					Gravel and/ or Coarse Sand

Notes:

1. *Fills greater than 3 ft (900 mm) are classified as good drainage situations.*
2. *Adjust the moisture rating if other than normal rainfall precedes survey.*
3. *To use table, determine soil types, proposed profile, cross section type, and ditch grades. The values obtained from table provide the expected subgrade drainage.*

DRAINAGE CLASSIFICATIONS

Figure 33-6.K

33-6.04(e) Drainage/Snow

Proper placement of the pavement structure above the surrounding topography in rural areas can significantly enhance the life and serviceability of the roadway. Consequently, the profile gradeline should be compatible with the roadway drainage design and should minimize snow drifting problems. Consider the following:

1. Culverts. The roadway elevation should meet the Department criteria for minimum cover at culverts and minimum freeboard above the headwater level at culverts. See the *IDOT Drainage* and *Culvert Manuals* for more information on the hydraulic and structural design of culverts, respectively.

2. Coordination with Geometrics. The profile gradeline must reflect compatibility between drainage design and roadway geometrics. These include the design of sag and crest vertical curves, spacing of inlets on curbed facilities, impacts on adjacent properties, superelevated curves, intersection design elements, and interchange design elements. For example, avoid placing sag vertical curves in cuts or placing long crest vertical curves on curbed pavements or on bridges.

3. Snow Drifting. Where practical, in level terrain, the profile gradeline should be at least 3 ft (1.0 m) above the natural ground level to prevent snow from drifting onto the roadway and to promote snow blowing off the roadway. Slope rounding and tree planting adjacent to the right-of-way line may also help to prevent drifting in cut areas. For additional guidance, see the SHRP-H-381 *Design Guidelines for the Control of Blowing and Drifting Snow*.

4. Water Tables. Establish the profile gradeline so that the top of the subgrade elevation is not less than 3 ft (1.0 m) above the water table at all points along any cross section within the paved roadway surface. The elevation of the water table is typically documented in the Geotechnical Report. If it is not practical to provide the 3 ft (1.0 m) clearance, coordinate the profile design with the District Studies and Plans Engineer and the District Geotechnical Engineer to develop an alternative solution.

5. Frost Penetration. The minimum embankment height should not be less than the anticipated maximum depth of frost penetration, unless the drainage classification of the underlying soil is rated "good" as described in Figure 33-6.K. However, if the roadway is essentially at ground level, this could cause a problem. In cut sections or with shallow embankments, the roadside ditch depth should be equal to the expected maximum level of frost penetration but not less than 3 ft (1.0 m).

6. Flooding. For highways within a floodplain area and which have a DHV of 100 or more, the profile gradeline should be at least 3 ft (1.0 m) higher than the high water mark for the design flood frequency. For flood frequencies to be used on highways, review the *IDOT Drainage Manual* and Chapter 39 of the *BDE Manual*.

33-6.04(f) Erosion Control

To minimize erosion, consider the following relative to the profile gradeline:

- Minimize the number of deep cuts and high fill sections.
- On high fill sections (e.g., over railroads where 1V:2H slopes are used), provide a mountable curb at the edge of shoulder to collect the drainage.
- Conform the highway to the contour and drainage patterns of the area.
- Use natural land barriers and contours to channelize runoff and confine erosion and sedimentation.
- Minimize the amount of disturbance.
- Preserve and use existing vegetation.
- Reduce the slope length by benching and ensure that erosion is confined to the right-of-way and does not deposit sediment on or erode away adjacent lands.
- Avoid locations having high erosion potential (e.g., loess soils).
- Avoid cut or fill sections in seepage areas.

33-6.04(g) Earthwork Balance

Where practical and where consistent with other project objectives, design the profile gradeline to provide a balance of earthwork. However, this should not be achieved at the expense of smooth grade lines, aesthetics, or sight distance requirements at vertical curves, or where there is excessive land acquisition costs. Ultimately, a project-by-project assessment will determine whether a project will be borrow, waste, or balanced.

Consider the following when determining earthwork balance:

1. Basic Approach. The best approach to laying grade and balancing earthwork is to provide a significant length of roadway in embankment and to limit the number and amount of excavation areas. As practical, avoid long lengths of roadway in excavation and several short balance distances. Use topographic mapping to layout profile gradelines.
2. Urban/Rural. Earthwork balance is typically a practical objective only in rural areas. In urban areas, other project objectives (e.g., limiting right-of-way impacts) typically have a higher priority than balancing earthwork. In addition, excavated materials from urban projects are often unsuitable for embankments (e.g., near gas stations).
3. Borrow Sites. The availability and quality of borrow sites in the vicinity of the project will impact the desirability of balancing the earthwork. Triangular shaped remainders or landlocked right-of-way parcels usually provide potential locations for borrow sites.

4. Earthwork Computations. On large projects (e.g., freeways or expressways, bypasses, horizontal curve relocations) preliminary earthwork is calculated during Phase I using topographic mapping and is later refined during the preparation of construction plans. Section 64-2 discusses the proper methods to compute and record the project earthwork quantities.

33-6.04(h) Bridges

Carefully coordinate the design of the profile gradeline with any bridges within the project limits. The following will apply:

1. Vertical Clearances. The criteria in Chapters 44 through 50 must be met. When laying the preliminary grade line, an important element in determining the available vertical clearance is the assumed structure depth. This will be based on the structure type, span lengths, and depth/span ratio. For preliminary designs, see the *Bridge Manual* and Chapter 39. For final design, the designer must coordinate with the Bureau of Bridges and Structures to determine the roadway and bridge gradelines. This is typically accomplished with a Type, Size, and Location (TS&L) Drawing.

2. Bridges Over Waterways. Where a proposed facility will cross a body of water, the bridge elevation must be consistent with the necessary waterway opening to meet the Department's hydraulic requirements. The elevation of the bottom of the superstructure must meet the requirements of Chapter 39. The designer must coordinate with the Hydraulics Unit in the Bureau of Bridges and Structures to determine the appropriate bridge elevation. In addition, where a bridge over a waterway is located in a sag curve, desirably, locate the low point of the sag vertical curve off the bridge deck, and provide at least a 0.5% grade on the bridge deck.

3. Railroad Bridges. Any proposed highway over a railroad must meet the applicable criteria (e.g., vertical clearances, structure type and depth). For rural freeways and expressways over railroads, the approach grades are usually set at 3%. Use the K-value, as discussed in Section 33-4.01, for the crest vertical curve. Use a long sag vertical curve at the bottom of each 3% grade to provide a smooth and aesthetically pleasing profile. In addition, if the alignment of the highway over the railroad will have a horizontal curve near the crest of the vertical curve, do not place the P.C. of the horizontal curve any closer than 400 ft (120 m) from the back of the bridge abutment. This guideline will ensure proper sight distance to the beginning of the horizontal curve.

4. Highway Under Bridge. Where practical, the low point of a roadway sag vertical curve should not be within the shadow of the bridge. This will help minimize ice accumulations, and it will reduce the ponding of water beneath the bridge. To achieve these objectives, the low point of a roadway sag should be approximately 100 ft (30 m) or more from the side of the bridge.

5. High Embankments. Consider the impact that high embankments will have on bridges and culverts. High embankments will increase the span length thus increasing structure costs and increase the length and type of culvert to carry the overburden.

6. Bridges Over Another Highway. Typically, the overpassing bridge will be located on a crest vertical curve. For bridges on crossroads through an interchange, use the desirable K-value for the crest vertical curve. For other bridges, the use of minimum K-values is acceptable.

33-6.04(i) At-Grade Railroad Crossings

The profile gradeline should be essentially level across the railroad tracks and extend level for a minimum distance of 2 ft (600 mm) on either side of the outermost rails. After this point, the grade should not exceed ± 1% for a distance of at least 26 ft (8 m) or to the railroad right-of-way line. Profile gradelines outside of the railroad right-of-way but within the jurisdiction of the Illinois Commerce Commission should be as flat as practical and should not exceed 5%. Where superelevated tracks make strict compliance with this criteria impractical, construct the grade of the approaches to provide the best (smoothest) profile practical.

33-6.04(j) Distance Between Vertical Curves

A desirable objective on rural facilities is to provide at least 1500 ft (500 m) between two successive VPI's. This objective only applies to projects which have a considerable length and where implementation is judged to be practical.

33-6.04(k) Ties With Existing Highways

A smooth transition is needed between the proposed profile gradeline of the project and the existing gradeline of an adjacent highway section. Consider existing gradelines for a sufficient distance beyond the beginning and end of a project to ensure adequate sight distances. Connections should be made that are compatible with the design speed of the new project and that can be used if the adjoining road section is reconstructed. For example, do not transition a four-lane highway section to two lanes just beyond a crest vertical curve but, instead, locate the transition away from the high point of the crest vertical curve.

Chapter Thirty-four
CROSS SECTION ELEMENTS

This Chapter provides guidance to consider in the design of cross section elements including lane and shoulder widths, cross slopes, width and type of medians, side slopes, right-of-way, and utilities. Part V, Design of Highway Types, provides criteria for various cross section elements on new construction, reconstruction, and 3R projects. Where a cross section element applies to a specific highway type, Part V presents this information. For example:

- Cross sectional widths for bridges and underpasses are discussed in Chapter 39.
- Median widths and median openings for freeways and expressways are discussed in Chapters 44 and 45, respectively.
- Typical cross section figures for the various functional classifications are presented in Chapters 44 through 48.
- For definitions on area classifications, see Chapter 43.
- Chapter 48 discusses sidewalk and on-street parking design criteria.
- Cross section criteria for 3R projects are discussed in Chapters 49 and 50.
- For surface type and structural design of pavements, see Chapter 54.

34-1 GENERAL

34-1.01 Definitions

The following definitions apply to the highway cross section:

Auxiliary Lane. The portion of the roadway adjoining the traveled way for purposes supplementary to through traffic movement including parking, speed change, turning, storage for turning, weaving, or truck climbing.

Back Slope. The side slope created by connecting the ditch bottom, shelf, or shoulder at the hinge point, upward and outward, to the natural ground line.

Barrier (Vertical) Curb. A longitudinal element placed at the edge of the traveled way for delineation, to control drainage, to manage access, and to minimize right-of-way acquisitions. Vertical curbs range in height between 6 in. (150 mm) and 9 in. (225 mm) and are vertical or nearly vertical.

Buffer Area. The space between the back of curb and sidewalk.

Cross Slope. The slope in the cross sectional view of the traveled way, travel lanes, shoulders, median surface, or gutters, expressed as inch(es) per foot (percent) based on the change in vertical compared to the change in horizontal.

Concrete Barrier. A rigid barrier constructed in a narrow median where no or minimal deflection distance is available and which can accommodate most vehicle impacts without penetration.

Depressed Median. The area located between opposing directions of the traveled ways which is designed with shoulders and fill slopes and is lower in elevation than the traveled ways. Its main function is to provide a safe distance between opposing traffic. It is also designed to carry a certain portion of roadway drainage and for snow storage.

Flush Median. A median which is in the same plane as the surface of the adjacent traveled ways.

Front Slope. The side slope created by connecting the shoulder or shelf at the hinge point, downward and outward, to the ditch bottom or natural ground.

Hinge Point. The point from which the fill height or depth of cut is determined. For fills, the point is located at the intersection of the shoulder and the fill slope. For cuts, the hinge point is located at the toe of the back slope.

Maintenance Border Area. Additional width which is set aside for right-of-way purposes adjacent to each side of the construction limits. This clear width provides an area for maintenance operations, retention of natural growth, erosion control, slope rounding and, in some cases, for accommodating public utilities.

Median. The portion of a cross section which separates the opposing directions of the traveled ways. The median width includes the inside shoulders or curb and gutters.

Median Slope. The slope in the cross section view of a median beyond the inside shoulders, expressed as a ratio of the change in vertical to the change in horizontal (V:H).

Mountable (Sloping) Curb. A longitudinal element placed at the edge of the traveled way for delineation, to control drainage, to manage access, and to outline corner islands. Sloping curbs have a height of 6 in (150 mm) or less with a slope face of approximately 45 degrees.

Raised-Curb Median. A median which contains a raised-curb, greater than 2 inches (50 mm) in height, within its limits.

Roadside. A general term denoting the area adjoining the outer edge of the roadway.

Roadside Clear Zone. The distance beyond the edge of traveled way that should be clear of any non-traversable hazards or fixed objects.

Roadway. The combination of the traveled way, both shoulders or curb and gutters, and any auxiliary lanes on the mainline highway. Traveled ways separated by a depressed median have two or more roadways.

<u>Shelf</u>. On curbed facilities, the relatively flat area (2% to 5% slope) located between the back of the curb and the break for the fill slope or back slope.

<u>Shoulder</u>. The portion of the roadway contiguous to the traveled way for the accommodation of stopped vehicles, for emergency use, and for lateral support of subbase, base, and surface courses.

<u>Side Slope</u>. A ratio used to express the steepness of a slope adjacent to the roadway. The ratio is expressed as vertical to horizontal (V:H).

<u>Sidewalk</u>. That portion of the highway cross section separated from the roadway and constructed for the use of pedestrians.

<u>Toe of Slope</u>. The intersection of the front slope or back slope with the natural ground or ditch bottom.

<u>Top of Slope</u>. The intersection of the back slope with the natural ground, before any rounding is applied.

<u>Traveled Way</u>. The portion of the roadway for the movement of vehicles, exclusive of shoulders, curb and gutter, and auxiliary lanes.

<u>Traversable Median</u>. A median which is outlined with 2 in. (50 mm) high mountable curb and gutter and used as a direct substitute for the flush two-way, left-turn lane (TWLTL). It is not designed to be a physical barrier nor is it intended to impede left-turn movements across the median.

34-1.02 <u>Nomenclature</u>

Figures 34-1.A, 34-1.B, and 34-1.C provide the basic nomenclature for cross section elements of freeways and expressways, rural highways, and urban streets.

34-1.03 <u>Classification by Area Type</u>

The functional classification system is divided into urban and rural categories. However, the urban designation is not sufficiently specific to determine the appropriate project design. Therefore, IDOT has divided its urban design classifications into “suburban” and “urban” based on the extent of roadside development. IDOT has further subdivided these categories into central business districts and fringe area/outlying business district for urban areas, and open and closed subcategories for suburban areas. These subcategories are discussed in Chapter 43.

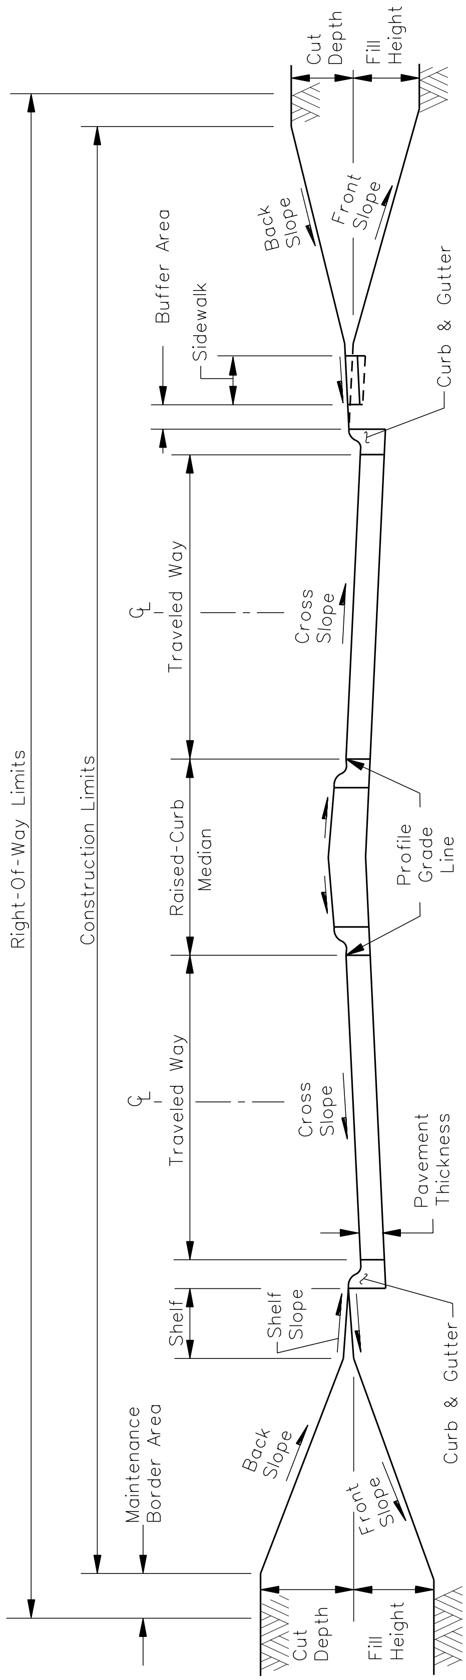
(Two-Lane Highways)

Figure 34-1.B



URBAN STREET NOMENCLATURE

Figure 34-1.C

34-2 ROADWAY SECTION

34-2.01 Travel Lanes

34-2.01(a) Width

Travel lane widths can vary between 9 ft (2.7 m) and 14 ft (4.2 m), depending upon the functional classification, traffic volumes, design speed, rural/urban location, and project scope of work. The tables in Chapters 44 through 50 provide specific travel lane widths for these conditions. The traveled way width is the combined width of all travel lanes. For divided highways, the traveled way width is the combined width in one direction.

The use of wider travel lanes generally increases the operational safety and efficiency of the facility. In general, 12 ft (3.6 m) wide travel lanes are preferable for most rural and high-speed urban facilities. Lane widths of 11 ft (3.3 m) are acceptable for restricted urban areas and may be considered on reconstruction projects. Lane widths may need to be increased to accommodate bicycles; see Chapter 17.

34-2.01(b) Cross Slopes

Surface cross slopes are required for proper drainage of the traveled way on tangent sections. A sufficient cross slope reduces the hazards of wet pavements by quickly removing water from the surface. On State highways, the following will apply for tangent roadway sections:

1. Two-Lane Highways with Shoulders. Crown the traveled way pavement at the centerline and use a cross slope of 3/16″/ft (1.5%) away from the centerline. Where an open-graded friction course is used, the minimum cross slope should be 1/4″/ft (2%).

2. Two-Lane Curbed Streets. Crown the traveled way pavement at the centerline and use a cross slope of 1/4″/ft (2%) away from the centerline.

3. Multilane Curbed Streets. On multilane streets with raised-curb medians, the pavement cross slope of a two-lane traveled way should be 1/4″/ft (2%) sloping away from the median curb. If there are three lanes in one direction, provide a 5/16″/ft (2.5%) cross slope on the third lane from the median curb.

4. Multilane Streets with a Traversable Curbed Median. The traveled way cross slopes are the same as discussed in Item 3 above. Crown the traversable median surface at the centerline of the median and use a cross slope of 3/16″/ft (1.5%) away from the centerline.

5. Four-Lane Streets with a Flush Median. Crown the entire paved surface of the roadway about the centerline of the flush median and use a cross slope of 1/4″/ft (2%) away from the centerline to the outside curb and gutter.

6. Highways without Curbed Medians. For roadways divided by a median, the following cross slopes will apply:

a. Two-Lane Traveled Ways. For highways with two lanes in each direction and either a depressed median or narrow median with a concrete barrier, each traveled way is crowned at its centerline with a cross slope of 3/16″/ft (1.5%) sloping away from the centerline.

b. Three-Lane Traveled Ways (New Construction/Reconstruction). For highways with three lanes in each direction and either a depressed median or a narrow median with a concrete barrier, the traveled way is typically crowned along the lane edge between the middle lane and outside lane. The inside and middle lanes are sloped towards the median. The two lanes adjacent to the crown are sloped at 3/16″/ft (1.5%) away from the crown line and the lane adjacent to the median is sloped at 1/4″/ft (2%) toward the median.

c. Three- or Four-Lane Traveled Ways (Adding Lanes to Existing Facilities). When adding new lanes in the median or on the outside of the traveled way, the existing crown is typically maintained. The added travel lane cross slope generally will be the same direction as the adjacent lane. The rate of cross slope for each added lane will be 1/16″/ft (0.5%) steeper than that of the adjacent lane, but not greater than 5/16″/ft (2.5%). See Chapter 44 for typical sections.

For service drives, access roads, side roads, frontage roads, etc., the traveled way cross slopes will vary depending upon the pavement surface and local practices. For paved surfaces (including chip seal), the cross slope is generally the same as for State highways (i.e., 3/16″/ft (1.5%)). For gravel surfaces, the cross slopes can range from 1/4″/ft to1/2″/ft (2% to 4%).

34-2.01(c) Stage Construction

The 30th highest hourly traffic volumes, measured 10 years from the anticipated date of construction, may be significantly less than those for the design year (e.g., 20 years) such that initial construction may consist of one less lane in each direction. In this case, the designer may want to consider using stage construction. For rural expressways, this may initially include only providing one roadway of the four-lane divided facility. In urban areas, this may initially include only providing four lanes instead of six. For these situations, sufficient right-of-way for the ultimate improvement should be acquired at the time of the initial improvement. See the Corridor Preservation section in the *IDOT Land Acquisition Policies and Procedures Manual* for additional guidance. For urban facilities, also include the appropriate earthwork and consideration for placement and sizing of drainage structures in the initial construction to allow for the additional lanes in the median area in the future.

34-2.02 Shoulders

34-2.02(a) Functions

Shoulder widths can vary between 4 ft (1.2 m) to 12 ft (3.6 m) depending upon the highway classification. They also provide many structural and operational advantages. Where shoulders are not available, a stopped vehicle often disrupts traffic in all lanes in that direction. The following are some of the important functions of shoulders:

- provides structural support for the traveled way;
- provides support for guardrail and prevents erosion around guardrail posts;
- prevents or minimizes pavement edge drop-offs;
- increases highway capacity;
- encourages uniform travel speeds;
- provides space for emergency and discretionary stops;
- improves roadside safety by providing more recovery area for run-off-the-road vehicles;
- provides lateral clearance for encroaching vehicles (e.g., during construction or maintenance operations);
- provides a sense of openness;
- improves sight distance around horizontal curves;
- enhances highway aesthetics;
- facilitates maintenance operations (e.g., snow removal and storage);
- provides additional lateral clearance to roadside appurtenances (e.g., guardrail, parapet walls, traffic signals, highway signs);
- facilitates pavement drainage, water is discharged farther from the traveled way;
- provides space for pedestrian and bicycle use; and
- provides space for bus stops and mailbox turnouts.

34-2.02(b) Widths

Shoulder widths will vary according to functional classification, traffic volumes, urban/rural location, curbed/uncurbed, and the project scope of work. The tables in Chapters 44 through 50 present the shoulder width criteria for these conditions. A vehicle stopped on the shoulder should clear the traveled way edge by at least 1 ft (300 mm) and preferably 2 ft (600 mm). Therefore, a width of 8 ft (2.4 m) is desirable along high-type facilities to accommodate passenger vehicles and 10 ft (3.0 m) for trucks. Where bicyclists will be accommodated, see Chapter 17 for guidance.

Where right-of-way is severely restricted, shoulders may be designed with a curb and gutter or a Type B gutter at the outer shoulder edge. This helps to minimize construction costs and to confine drainage runoff to the shoulder area. Gutters also may be used on the outside of shoulders along long cut sections.

34-2.02(c) Additional Shoulder Thickness

For all new construction or reconstruction projects on the State system, increase the shoulder pavement thickness to allow the shoulders to be used to carry traffic during current and future construction improvements. Design the shoulder pavement using the following guidelines:

1. 2-Lane Major Principal Arterials. These highways should normally have 8 ft to 10 ft (2.4 m to 3.0 m) paved shoulders. These shoulders could be used to carry traffic when needed. When the 20-year projected traffic exceeds 2000 multiple unit trucks (MU) per day or 10,000 Average Daily Traffic (ADT), construct the shoulders to the same thickness as the traveled way pavement. The 2000 MU threshold is based on the traffic that would require a shoulder thickness greater than 8 in. (200 mm) to handle the occasional load.

2. 4-Lane Highways. When the 20-year projected traffic exceeds 3000 MUs per day or 25,000 ADT, design the shoulders pavement using the same thickness as the adjoining traveled way pavement. The MU threshold is based on the traffic that would require thicker pavement to carry the load. While the inside shoulder is only 6 ft (1.8 m) wide and would not normally be used as a lane, it will still allow traffic to be shifted away from the closed lane for patching and paving operations. At locations where the 20 year projected ADT is less than 25,000, the traffic should be examined at peak times. If the expected one-way Vehicles Per Hour (VPH) exceeds 1700, design the shoulder pavement using the same thickness as that of the adjacent traveled way pavement. Where it is anticipated that the shoulders will be used for an extended period of time (more than 3 years) during the design life of the pavement, design the shoulder pavement using the same pavement design, details, and materials as the traveled way pavement.

3. Highways of 6 or More Lanes. Build all shoulder pavements using the same pavement design, details and materials as the traveled way pavement. This will allow for keeping at least two, and in some cases, three lanes open at all times, as warranted by the high ADT on these types of highways.

34-2.02(d) Cross Slopes

The cross slope of a shoulder depends on the type of shoulder and the construction project type. The following summarizes typical practices:

1. Paved Shoulders. On new construction projects, full-width paved shoulders on tangent sections are sloped at 1/2″/ft (4%). On reconstruction and 3R projects, the shoulder slopes range from 1/4″/ft to 3/4″/ft (2% to 6%).

2. Combination Shoulders. Combination paved/aggregate shoulders are sloped at 1/2″/ft (4%).

3. Aggregate Shoulders. Aggregate shoulders are sloped from 1/2″/ft to 3/4″/ft (4% to 6%).

4. Sodded Shoulders. Sodded shoulders are sloped from 5/8″/ft to 1″/ft (5% to 8%).

5. Superelevated Sections. Chapter 32 and the *IDOT Highway Standards* discuss the application of shoulder cross slopes on superelevated sections for new construction and reconstruction projects. For allowable shoulder rollover values on 3R projects, see Chapters 49 and 50.

34-2.02(e) Rumble Strips

1. Shoulder Rumble Strips. Shoulder rumble strips are an effective way to reduce run-off-the-road crashes. They provide a very cost effective means of alerting motorists that they have drifted off the pavement. The greatest benefit is from the installation of milled rumble strips on rural expressways, freeways, and other facilities in which a significant number of run-off-the-road crashes occur.

   Shoulder rumble strips shall be:

   - installed on all Interstates and other freeways built to Interstate criteria and on all rural expressways with posted speeds > 50 mph (80 km/h);

   - installed along all highways that have high-crash locations, as identified in the Bureau of Safety Engineering's Highway Safety Improvement Program (HSIP), in which run-off-the-road crashes are a concern and have an adequate paved shoulder width; and

   - considered at other locations where run-off-the-road crashes are a concern.

   On facilities in which bicyclists are prohibited or the paved shoulders are wider than 6 ft (1.8 m), the 16 in. (400 mm) rumble strip design should be used. On facilities in which bicyclists are permitted and the paved shoulder width is 6 ft (1.8 m) or less, the 8 in. (200 mm) rumble strip design should be used to maximize the clear shoulder width available for cyclists. See Section 17-2.02(a) for a discussion of bicycle accommodations utilizing paved shoulders.

   Milling is the preferred method for installing rumble strips; however a formed-in option is allowed for installing the 16 in. (400 mm) rumble strips in Portland Cement Concrete shoulders. When the shoulder will be used for traffic during construction, the formed-in option should be reviewed and not allowed if conflicts will occur. It may also be necessary to specify when the milled shoulder rumble strips may be installed if they conflict with the staging of traffic.

2. Centerline Rumble Stripes. The primary purpose of centerline rumble stripes (CLRS) is to warn drivers whose vehicles are crossing the centerline of two-lane, two-way

roadways (and, in some cases, four-lane undivided highways) to avoid potential crashes with opposing traffic.

CLRS address the problem of drowsy or inattentive drivers drifting left out of their lane and striking an oncoming vehicle. Two types of crashes are generally considered correctable by CLRS—head-on and opposite-direction sideswipes often referred to as cross-over or cross-centerline crashes.

The use of CLRS can be an effective countermeasure on roadways where there are a high number of crashes with opposing traffic. Consult with the Bureau of Safety Programs and Engineering if CLRS are being considered for the project. The BSPE will provide details for the CLRS.

3. Shoulder Rumble Stripes. Shoulder rumble stripes are similar to shoulder rumble strips, but include an edge line pavement marking installed within the rumble strip. There is evidence that shoulder rumble stripes provide a better wet pavement marking and actually provide a more durable pavement marking than just a regular flat pavement marking. Shoulder rumble strips are considered an experimental feature. Consult with the Bureau of Safety Programs and Engineering for further guidance on their use.

34-2.03 Auxiliary Lanes

Auxiliary lanes are lanes adjacent to the basic through traveled way. They are intended for use by vehicular traffic for specific functions. Auxiliary lanes include:

- single left- and right-turn lanes at intersections;
- double left-turn lanes at intersections;
- truck-climbing lanes;
- acceleration/deceleration lanes at interchanges or intersections;
- weaving lanes within an interchange;
- continuous auxiliary lanes between two closely spaced interchanges;
- two-way, left-turn lanes (TWLTL) (flush-type median);
- parking lanes; and
- passing lanes.

Desirably, auxiliary lanes should be the same width as the adjacent through lanes, although in many cases a greater or lesser width may be appropriate. The tables in Chapters 44 through 50 present specific width criteria for auxiliary lanes and curb type or shoulder widths adjacent to auxiliary lanes.

Normally, the rate of cross slope for an auxiliary lane will be 1/16″/ft (0.5%) steeper than that of the adjacent through lane except for curbed left-turn lane and TWLTL. Single left-turn lanes with curb and gutter are usually sloped at 1/8″/ft to 3/16″/ft (1.0% to 1.5%) away from the median to allow for snow plowing. TWLTL and flush left-turn lanes are crowned at the centerline and sloped at 1/4″/ft (2%) in each direction.

34-2.04 Curbs and Curbed Sections

Curbs are used on urban and suburban facilities due to restricted right-of-way conditions and to control drainage, delineate pavement edges, channelize vehicular movements, manage access, provide separation between vehicles and pedestrians, and present an attractive appearance. In urban areas, curbs have a major benefit in containing the drainage within the pavement area and in channelizing or controlling traffic into and out of adjacent properties. In rural areas, curbing may be applicable where restricted right-of-way prohibits the use of a ditch section, or to channelize traffic at isolated intersections.

34-2.04(a) Warrants

Selecting a curbed section or section with shoulders and outside ditches depends upon many variables, including vehicular speeds, urban/rural location, drainage, and construction costs. The following discusses some of the factors the designer should consider when determining whether or not a curbed section is warranted:

1. Urban Location. Because of restricted right-of-way, the need to control drainage, and other constraints, curb and gutter sections on the outside edges of the traveled way are almost always used in urban areas.

2. Suburban Location. The use of curbs and/or gutters will depend upon whether the suburban area is considered closed or open. Section 43-2 defines open and closed suburban areas. For closed suburban areas, the street will have outside curb and gutter sections based on drainage requirements, pedestrian activities, channelization needs, and the desire to manage access to the street. For open suburban areas, the outside edge of the traveled way may have either shoulders or curb and gutter depending on the proposed median type and the preferred design speed. The exceptions listed under Item 3 for rural locations also apply to open suburban streets.

3. Rural Location. In general, the use of mountable type curbs and/or gutters along rural high-speed highways is limited to the edge of shoulder and to the following special conditions:

    - for roadway delineation in conjunction with channelization at intersections;
    - where there is sufficient development along the highway and there is a need to channelize traffic into and out of properties;
    - where drainage control is required;
    - where right-of-way is restricted for roadside ditches; and/or
    - at other sites deemed necessary (e.g., interchange crossroads, major intersections with restricted sight distance, where the route turns, offset left-turn lanes).

34-2.04(b) Curb Types

IDOT uses two basic types of curbs – barrier (vertical) and mountable (sloping). The *IDOT Highway Standards* provide information on design details and placement for various curb types used by the Department. For most situations, an integral concrete curb and gutter (CC&G) is used. The following notations are used by the Department to define the various curb types (e.g., M-10.60):

1. Initial Letter. The initial letter "B" or "M" is used to denote whether the curb is barrier (vertical) type or mountable (sloping) type.

2. Numbers Prior to the Decimal Point. The first set of numbers indicates the height of the curb in inches (centimeters).

3. Numbers After the Decimal Point. The second set of numbers, if used, indicates the width of the gutter in inches (centimeters).

34-2.04(c) Curb Type Selection

The designer should consider the following factors when selecting a curb type:

1. Low-Speed Facilities (Outside Edge of Traveled Way). Where the design speed is 45 mph (70 km/h) or less, use B-6.24 (B-15.60) CC&G along the right edge of the traveled way or parking lane. A lesser gutter width may be used adjacent to a right-turn lane, parking lane, or where highly restricted right-of-way conditions exist.

2. High-Speed Facilities (Outside Edge of Shoulder). Where a high-speed facility (≥ 50 mph (80 km/h)) is proposed with shoulders and side slopes, there may be occasional locations where the right-of-way is restricted. In these cases, use an M-4 (M-10) curb and gutter along the right edge of the shoulder. Do not place curb and gutter immediately adjacent to the edge of the traveled way.

3. Pedestrians. In urban and suburban areas, consider the use of B-9 (B-22) curb along the right edge of the traveled way where some additional protection is desired for pedestrians (e.g., adjacent to school yards, playgrounds). Use the B-9 (B-22) curb on sidewalks across bridges. Where the B-9 (B-22) curb is used, the design speed on the street should be 45 mph (70 km/h) or less. The gutter width may vary depending on drainage requirements or type of lane; however, the preferred gutter width is 2 ft (600 mm).

4. Two-Lane Facilities (Raised-Curb Median). Use M-4 (M-10) curb with a preferred gutter width of 6 in. (150 mm) on two-lane approaches where curbed channelization is required and where the design speed is 50 mph (80 km/h) or greater. This may include some rural intersections and all channelizing islands through rural interchange areas.

5. Multi-Lane Facilities (Raised-Curb Median). The main function of a raised-curb median is to manage access to and from the street or to channelize traffic. The following will apply:

- Use Type-M CC&G on channelizing islands and medians where the design speed is 30 to 40 mph (50 or 60 km/h). The selection of the appropriate gutter pan width will be based on the proposed cross-slope and drainage needs for the specific location, available overall median top width, and safety considerations.

- Use Type-B CC&G on channelizing islands and medians where the design speed is 40 or 45 mph (60 or 70 km/h). The selection of the appropriate gutter pan width will be based on the proposed cross-slope and drainage needs for the specific location, available overall median top width, and safety considerations. For corner islands see Item 7 below.

- For the design speed of 40 mph (60 km/h), the designer has the option to use either an M-6 or B-6 (M-15 or B-15) curb depending upon the aggressiveness of drivers in a particular area and upon the 85th percentile speeds of similar type streets in the area. For corner islands see Item 7 below.

- Use M-4 (M-10) curb on channelizing islands or medians where the design speed is 50 mph (80 km/h) or greater. Typically, curbing is only used at locations that would be channelized (e.g., offset left-turn lanes), near at-grade intersections where a concrete barrier is terminated, or on the crossroad through an interchange. Section 36-4 provides additional details for curbing at intersections.

- Where posted speeds will exceed 45 mph, raised-curb medians are generally not considered an appropriate type of median cross section.

6. Traversable Medians. Use M-2.12 (M-5.30) CC&G where there is a need to provide a continuous two-way, left-turn lane (TWLTL) along the street and where raised delineation of the center turn lane is desirable. This is usually applicable only in major metropolitan areas where painted or thermoplastic turn lanes are quickly worn by vehicular use and maintenance of such pavement markings is a potential hazard to striping crews. The traversable TWLTL median should be marked with directional turn arrows to enhance proper traffic operations. See Figure 48-4.B for a typical traversable TWLTL detail.

7. Corner Islands. On streets or highways with a design speed of 45 mph (70 km/h) or less, use the M-6 (M-15) curb on all corner islands. On facilities with design speeds of 50 mph (80 km/h) or greater, the following will apply relative to corner islands and traffic signals:

   - Where traffic signals are not proposed, use an M-4 (M-10) curb with a specified gutter width on all corner islands adjacent to the high-speed facility.

   - Where traffic signals are present or proposed, use an M-6 (M-15) curb with a specified gutter width on corner islands adjacent to high-speed facilities.

8. Freeway Over Crossroad. Figure 34-2.A illustrates part of a diamond interchange where an existing freeway overpasses the crossroad. In this case, it may be necessary to

place a pier in the crossroad channelization, or a pier may already exist in the median. Under these circumstances, and if the design speed is 50 mph (80 km/h) or greater, the bridge pier will require shielding with an impact attenuator. For this situation, use an M-4 (M-10) curb as shown in Figure 34-2.A and reduce the curb height to an M-2 (M-5) curb for a minimum of 30 ft (9 m) in front of the attenuator. This special condition could occur on either a two-lane or multilane channelized cross section where the design speed is 50 mph (80 km/h) or greater.

9. Special Median Conditions. There are certain special conditions where the median curb selection in the above guidelines is not appropriate. These may include:

   a. Railroads. Where a highway approaches an at-grade railroad crossing and the design speed is 45 mph (70 km/h) or less, provide B-6.24 or B-9.24 (B15.60 or B-22.60) CC&G along the median edges for a short distance adjacent to the crossing. This barrier curb type will discourage motorists from driving around the railroad gates. See Figure 7-3.E for guidance.

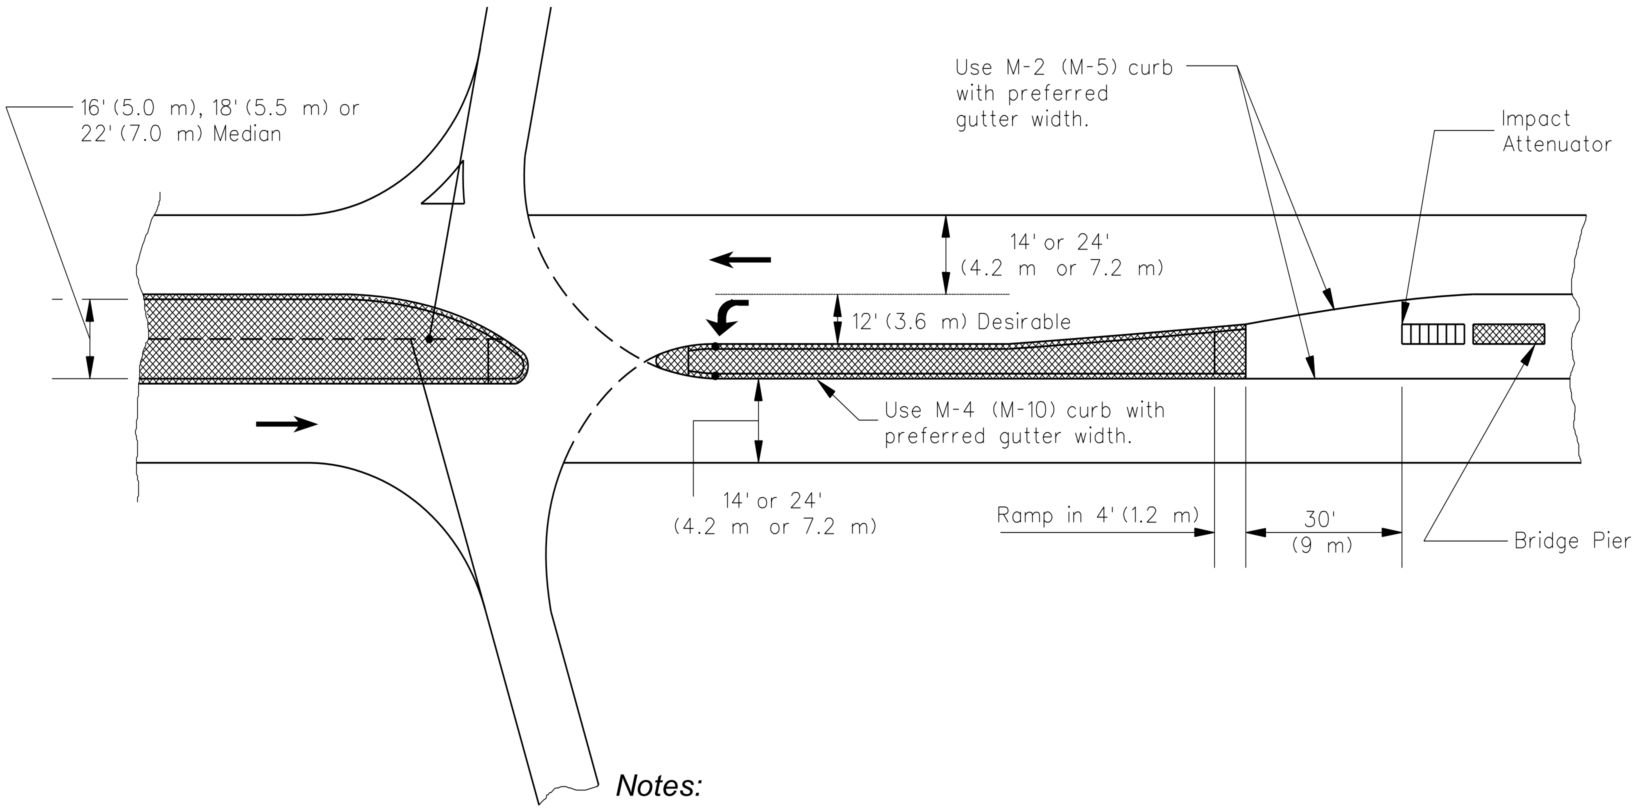
      Where a highway departs an at-grade railroad crossing and the design speed is 45 mph (70 km/h) or less, provide M-4 (M-10) CC&G along the median edges for a short distance adjacent to the crossing. When the design speed is 50 mph (80 km/h) or greater, provide M-2 (M-5) CC&G. These mountable curb types will provide an escape area for vehicles. See Figure 7-3.E for guidance.

   b. Median Piers. Where a street approaches a bridge pier in the median island and the design speed is 45 mph (70 km/h) or less, a B-9.24 (B-22.60) CC&G may be used along the median edges for a short distance adjacent to the pier.

   c. Bridge Decks (Icing). In areas of the State where bridge decks are subject to frequent icing and where curbed medians are proposed, either the B-6 or B-9 (B-15 or B-22) curb may be used on the bridge deck median depending on the proposed design speed of the street. The B-6 (B-15) may be used with 30 to 40 mph (50 or 60 km/h) design speeds and the B-9 (B-22) for 40 or 45 mph (60 or 70 km/h) design speeds.

   d. Curbed Medians on Bridge Decks. Where a center channelizing island is used on a rural high-speed highway (e.g., on the crossroad through an interchange), use the B-6 (B-15) curb rather than the M-4 (M-10) curb across the structure. Because the curbed median is doweled to the completed bridge deck, the 6 in. (150 mm) height and barrier face of the curb is needed for proper attachment to the deck and for long-term stability of the concrete median.

   e. Other Uses. Where landscaping, traffic control devices, or light standards are located in the median, B-6.24 (B-15.60) CC&G may be used on the median.



Notes:

- *The design speed on crossroad is 50 mph (80 km/h) or greater.*
- *With 2 @ 14 ft (4.2 m) wide through lanes and an 18 ft (5.5 m) wide median, use an M-4.6 and M-2.6 (M-10.15 and M-5.15) CC&G.*
- *With 2 @ 24 ft (7.2 m) wide through lanes and a 22 ft (7.0 m) wide median, use an M-4.24 and M-2.24 (M-10.60 and M-5.60) CC&G.*

FREEWAY OVER CROSSROAD
(Existing Interchange)

Figure 34-2.A

34-2.04(d) Design Considerations

The use of a curbed section requires the consideration and implementation of many design elements. The following discussion includes the major design considerations:

1. Drainage. Water ponding on the traveled way should be limited by using a closed drainage system. A complete hydraulic analysis will consider the pavement cross slopes adjacent to the gutter, the gutter slope, shape of the curb face, and the gradeline of the gutter. See Chapter 40 in the *BDE Manual* and the *IDOT Drainage Manual* for specific criteria and procedures for drainage analysis.

2. Cross Slopes. Where an integral curb and gutter section is used, the gutter has a steeper cross slope, typically 3/4″/ft (6%), than the adjacent pavement surface. For curb and gutter sections along the outside of the roadway, the gutter is sloped away from the roadway. For raised-curb medians, the direction of slope for the gutter will depend upon the width of the median. Section 34-3.03(c) discusses this criteria.

3. Gutter Width. Where cross section space is critical, the normal gutter width adjacent to the left edge of a left-turn lane or right edge of a right-turn lane may be narrowed or eliminated adjacent to 12 ft (3.6 m) lanes and narrowed adjacent to 11 ft (3.3 m) lanes.

4. Design Speed. Relative to curbing and design speeds, the following will apply:

   a. High Speed. Facilities with high design speeds (≥ 50 mph (80 km/h)) should not be designed with continuous curbs. However, if necessary for drainage, a mountable curb may be used if it is placed at the outside shoulder edge.

   b. Low Speed. Depending on the specific conditions, streets may be designed with either a mountable or barrier curb. Curb and gutters may be placed at the edge of the traveled way.

5. Running Speeds. Curb and gutter is used along the outside edges of traveled ways in urban areas because of restricted right-of-way, to contain drainage, and to provide for access management. In addition, the more compact cross section of outside curb and gutter tends to provide motorists with a subtle message of restricted space. Consequently, there is a tendency to travel at a lower running speed than the posted speed. This is especially true in open and closed suburban areas.

6. Vehicular Encroachment. Where sidewalks, roadside appurtenances, etc., are present, it is desirable to minimize the probability of vehicular encroachment beyond the curb. Although no curb type will prohibit encroachments, barrier curbs tend to discourage motorists from driving too close to the curb. Note that barrier curbs are not used on facilities with design speeds of 50 mph (80 km/h) or greater.

7. Roadside Safety. When examining curbs relative to roadside safety, the designer should review Chapter 38 for clear zone and roadside barrier guidance.

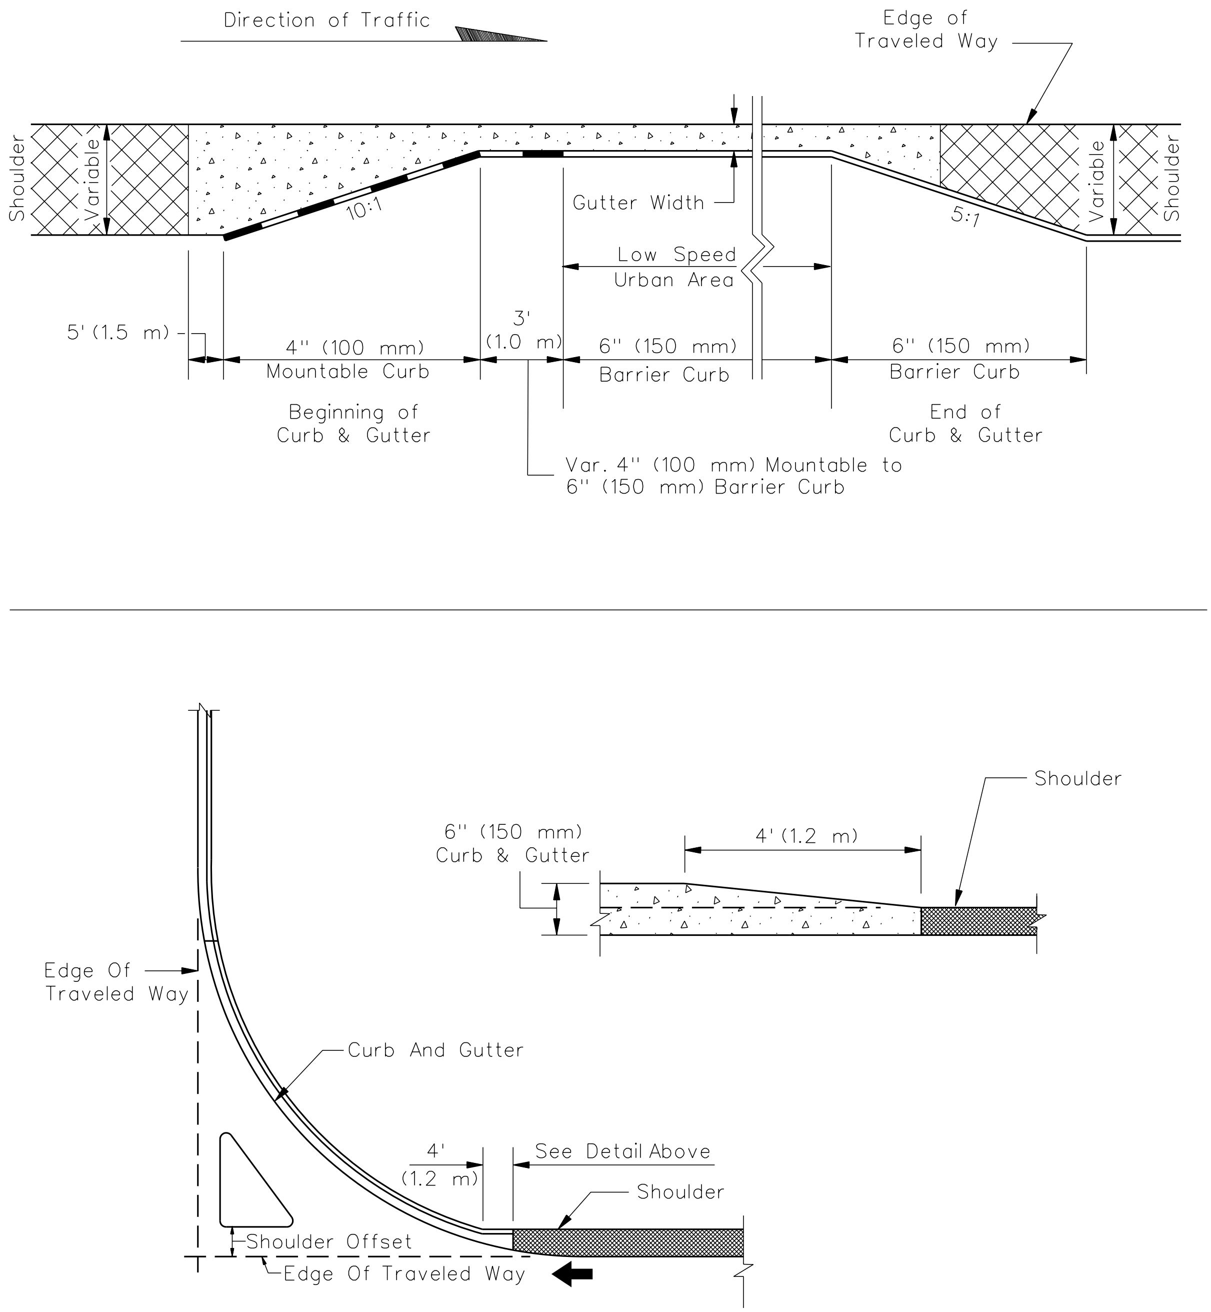
8. Transitions. Figure 34-2.B illustrates two situations where a shoulder section is transitioned to a curbed section.

9. Driveways. The IDOT *Policy on Permits for Access Driveways to State Highways* presents the design details for the use of curbs at driveways. Also review Section 36-7.

10. Mail Delivery. In many cases where a roadway is changed from a rural cross section with shoulders to a curb and gutter section (e.g., through a small town or adjacent to the urban development of a city), the designer must consider how the curb and gutter might affect mail delivery. One option requires the construction of mailbox turnouts along the street. Another is the construction of a continuous 6 ft (1.8 m) shoulder with a curb and a 2 ft (600 mm) gutter behind the shoulder. See Chapter 58 for design details.

11. Accessibility. Curbs shall be designed with sidewalk ramps at all pedestrian crosswalks to provide access for the safe and convenient movement of individuals with disabilities. Chapter 58 and the *IDOT Highway Standards* provide details on the design and location of sidewalk ramps.

12. Parking Considerations. Curb heights adjacent to on-street parking should be 6 in. (150 mm) or less. If a 9 in. (225 mm) curb height is used, provide a wider gutter width. Curb heights on streets and parking lots with diagonal or perpendicular parking should be limited to a 6 in. (150 mm) maximum height.



CURB TRANSITIONS

Figure 34-2.B

34-3 MEDIANS

34-3.01 Functions

A median is defined as the portion of a cross section that separates the opposing directions of the traveled ways. The principal functions of a median are:

- to provide a separation between opposing traveled ways;
- to provide a recovery area for out-of-control vehicles;
- to provide a storage area for emergencies;
- to prevent undesirable turning movements (manage access to the highway), provided the median is non-traversable;
- to provide areas for deceleration and storage of left-turning and U-turning vehicles;
- to minimize headlight glare;
- to provide an area for storage of vehicles crossing the mainline highway at intersections;
- to facilitate drainage and snow collection (raised-curb or depressed medians);
- to permit the use of shorter span lengths for overhead structures;
- to provide an area for pedestrian refuge (raised-curb median); and
- to provide width for future expansion of the roadway.

34-3.02 Median Widths

Median widths should be based upon economic, operational, and environmental considerations. The median width is measured from the inside edge of the two traveled ways and includes both inside shoulders and/or median curb and gutters. A median must be at least 4 ft (1.2 m) wide to meet the minimum functional requirements; however, this minimum width is not used on State highways. Section 34-3.03 presents several median schematics which define the width for the basic median types. The design width will depend on the functional class of the highway, design speed, type of access management proposed, availability of right-of-way, construction costs, maintenance considerations, acceptable median slopes, the anticipated ultimate development of the facility, operations at crossroad intersections, and field conditions. Chapters 44 through 48 present specific numerical criteria for median widths on new construction and reconstruction projects for arterial highways. In addition, the designer should consider the following:

1. Unsignalized Intersections. In urban areas, curbed median widths preferably should be a minimum of 22 ft (7.0 m) to safely allow a crossing passenger vehicle to stop between

the two traveled ways. In rural areas where trucks and/or buses are commonly present (e.g., truck terminals, light industrial), depressed median widths of 60 ft to 65 ft (18 m to 19 m) are recommended to allow trucks to stop between roadways.

2. Signalized Intersections. Wide medians may lead to increased clearance times and inefficient traffic operations at signalized intersections.

3. Median Barriers. With narrow medians, a median barrier may be warranted. See Section 38-7. Desirably, select a median width which will be wide enough to eliminate the need for a barrier.

4. Operations. Several vehicular maneuvers at intersections are partially dependent on the median width of the mainline highway (e.g., U-turns, left turns). Evaluate these likely maneuvers at intersections and provide a median width that will accommodate the selected design vehicle. Also, consider the need for single or dual left-turn lanes. For more information on designing intersections, see Chapter 36.

5. Uniformity. In general, a uniform median width is desirable. However, variable-width medians may be advantageous where right-of-way is restricted, intersections are widely spaced (3000 ft (1 km) or more), and/or where independent alignments are practical.

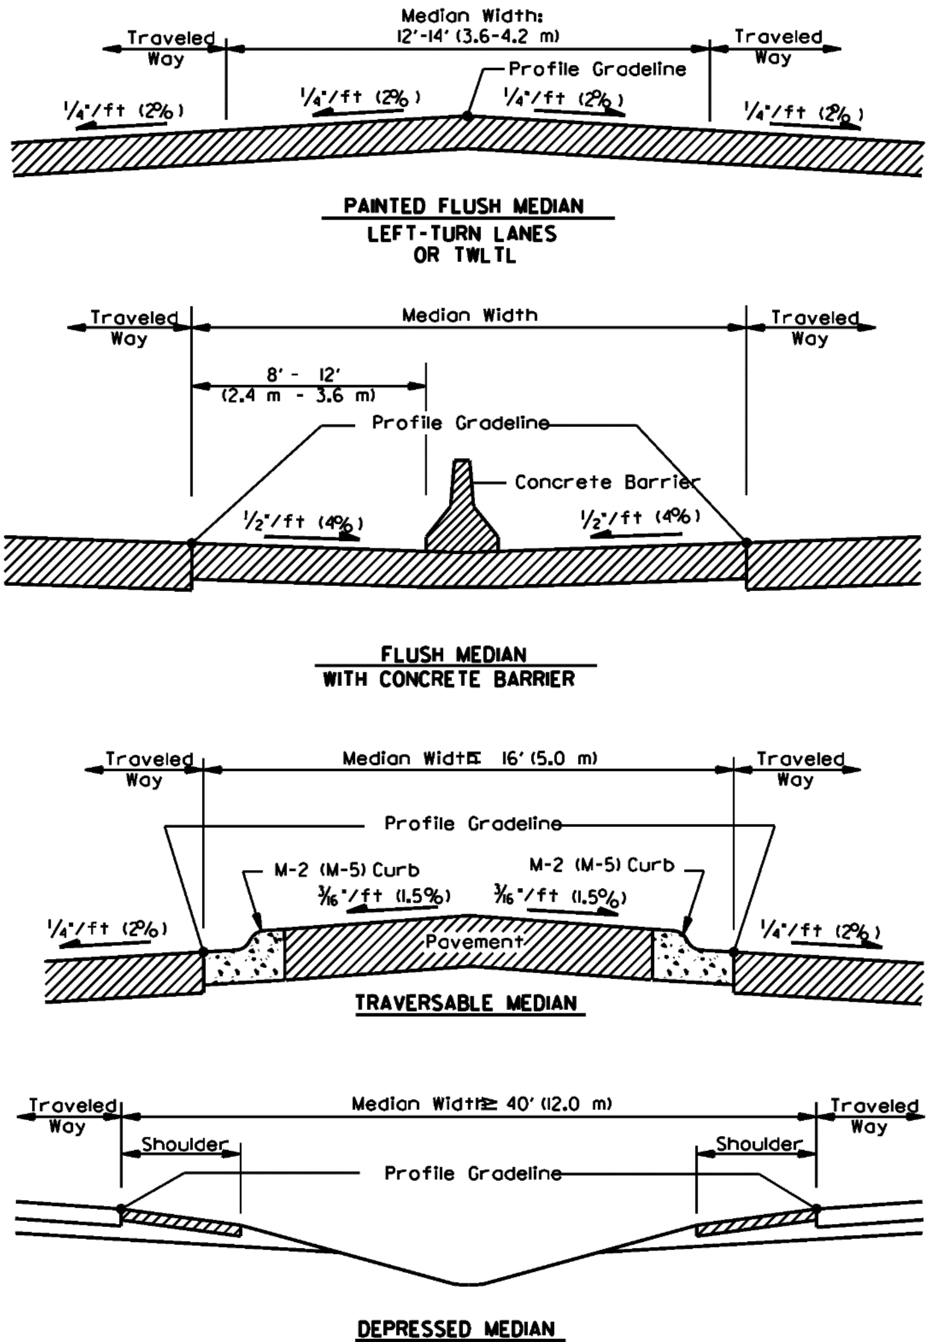
6. Sight Distance. Where a median barrier is proposed at a horizontal curve, the median width may be a factor in whether or not adequate sight distance is available around the horizontal curve. Section 32-4 discusses horizontal sight distance.

7. Separation. Median widths of 40 ft (12 m) or greater, from the driver's perspective, are considered to be physically and psychologically separated from the opposing traffic.

8. Maintenance. If glare screens, light poles, or other appurtenances are placed on a median barrier, use a 22 ft (7.0 m) wide median. This provides sufficient clearance for emergency or maintenance vehicles to stop on the shoulders without blocking the traveled way.

34-3.03 Median Types

Figure 34-3.A provides typical sections for various median type—flush, flush with concrete barriers, traversable TWLTL and depressed. Figure 34-3.B provides illustrations of raised-curb medians.



TYPICAL MEDIAN TYPES
(Flush/Traversable/Depressed)

Figure 34-3.A

(B) MEDIAN WIDTH > 22' (7.0 m)

MEDIAN TYPES
(Raised-Curb Medians)

Figure 34-3.B

34-3.03(a) Flush Medians

A flush median is defined where the surface is constructed as a smooth plane in conjunction with the adjacent roadway pavement. Flush medians are used most often on low-speed urban highways and streets. This flush type median should be slightly crowned to avoid ponding water in the median area. However, with high-speed conditions, flush medians can also be used with the placement of concrete barriers. In this case, the flush median should be depressed to collect water within a closed drainage system. The following discusses the various types of flush medians:

1. Painted Flush Median. Widths for painted flush medians can range from 4 ft (1.2 m) to 14 ft (4.2 m). Such medians serve as a buffer between opposing traffic, or for the development of dedicated left-turn lanes at median crossovers. To accommodate a separate left-turn lane, a flush median should desirably be between 12 ft (3.6 m) and 14 ft (4.2 m) wide. This will allow for separation between left-turning vehicles and the opposing traffic.

2. Two-Way Left-Turn Lanes (TWLTL). TWLTL's are also considered flush medians. Design criteria, advantages, and disadvantages of a TWLTL are discussed in Chapter 48. Note that where a TWLTL is used, provide curb and gutter along the outside edges of the traveled way. Operating speeds, truck and bus volumes, number and spacing of entrances and intersections, availability of right-of-way, character of abutting property, parking facilities, etc., should be considered when determining appropriate TWLTL widths for specific projects.

   The usual design width of a TWLTL is between 12 ft (3.6 m) and 14 ft (4.2 m). There is some evidence that a wide TWLTL encourages drivers to place their vehicles in an angular, rather than parallel, turning position and thereby cause encroachments on adjacent through lanes. Evidence also suggests an increased probability for head-on crashes for a TWLTL less than 12 ft (3.6 m) or greater than 14 ft (4.2 m) in width. Therefore, maximum widths for flush TWLTL medians should be 14 ft (4.2 m) in order to discourage opposing side by side operations within the TWLTL.

3. Flush Median with Concrete Barrier. A flush median with a concrete barrier may be used on urban freeways and expressways where the right-of-way does not allow for the use of a depressed median. For new construction and reconstruction projects, the minimum width of a flush median for an urban freeway is 20 ft (6.0 m). This allows for the use of two 8 ft (2.4 m) wide left shoulders and provides space for the width of the concrete barrier.

34-3.03(b) Traversable TWLTL Medians

Where an M-2 (M-5) curb is used to delineate the edges of a median, this median is designated as a traversable median and traffic is allowed to turn left across the median. On certain streets in large metropolitan areas where traffic volumes and mid-block left turns are unusually high, the traversable median with an M-2.12 (M-5.30) CC&G, although having a slightly higher initial cost than a flush TWLTL median, may be the appropriate design option. This median type eliminates the frequent and somewhat hazardous striping operations and yet provides for TWLTL movements. Because the traversable TWLTL median was developed as a direct substitute for the flush TWLTL, the M-2.12 (M-5.30) CC&G is not designed to be a physical barrier nor is it intended to impede left-turn movements across the median.

The normal traversable TWLTL median width for new construction is 16 ft (5.0 m). As discussed for the flush TWLTL, wide traversable TWLTL medians also may encourage drivers to store in an angular position or encourage opposing side by side operations. Therefore, wider widths should not be provided.

34-3.03(c) Raised-Curb Medians

A median is defined as a raised-curb median if it contains a curb height greater than 2 in. (50 mm) within its limits. Usually, a raised-curb median is proposed when the Department needs to manage access to the street and to control left-turn movements. Chapter 48 discusses several advantages and disadvantages of raised-curb medians compared to TWLTL medians. If a raised-curb median is proposed, consider the following in the design of the median:

1. Widths. The minimum raised-curb median width on urban and suburban streets is 18 ft (5.5 m). This width is used only where the majority of intersections along the street will be signalized. If many intersections do not need to be signalized, then the recommended minimum width is 22 ft (7.0 m), assuming no right-of-way restrictions. The 22 ft (7.0 m) median width allows passenger vehicles to comfortably store within median crossovers at unsignalized intersections when making a maneuver in two moves. Where dual left-turn lanes are required, the minimum raised-curb median width is 30 ft (9.5 m) and desirably 36 ft (10.5 m).

2. Tapered versus Parallel Left-turn Lanes. Consider the use of tapered left-turn lanes within the median to provide additional sight distance to on-coming traffic at both signalized and unsignalized median crossings.

3. Cross Slopes. For raised-curb medians, the following cross slopes will apply:

    a. Median Width Less Than or Equal to 22 ft (7.0 m). Slope the median surface or median pavement towards the through traveled way; see Illustration “A” in Figure 34-3.B. Slope the gutter towards the median to capture median runoff and ice melt and provide a closed drainage system.

    b. Median Width Greater Than 22 ft (7.0 m). The median surface typically will be sloped toward the centerline of the median; see Illustration “B” in Figure 34-3.B. The gutter will typically be sloped toward the traveled way because median runoff and ice melt are insignificant considerations.

4. Median Island (Paved Surface). For raised-curb medians up to 22 ft (7.0 m) wide, pave the island according to the details in the *IDOT Highway Standards*. A 4 in. (100 mm) thickness typically is used. At the noses of islands where vehicles frequently ride over the nose, ramp the median nose and construct it as one solid element. See the *IDOT Highway Standards*.

5. Median Island (Sodded Surface). For raised-curb medians greater than 22 ft (7.0 m), the area between the curbs may be backfilled and sodded. However, where there are numerous signs, median barriers, bridge piers, etc., in the island or where median crossovers are closely spaced with left-turn lanes, it may be more economical to pave the island to eliminate excessive hand mowing.
