Bureau of Design and Environment Manual

Illinois Department of Transportation

Bureau of Design and Environment Manual

Prepared and Published by
Illinois Department of Transportation
Bureau of Design and Environment

Springfield, Illinois Published
September 2010
Revised March 2025

PREFACE

The *Bureau of Design and Environment (BDE) Manual* has been prepared to provide uniform practices for the Department and consultant personnel preparing Phase I studies and reports and contract plans for Department projects. The *BDE Manual* presents most of the information normally required in the development of a typical roadway project. The designer should attempt to meet all criteria and practices presented in the *BDE Manual*; however, the *BDE Manual* should not be considered a standard that must be met regardless of impacts. The designer should develop roadway designs that meet the Department's operational and safety requirements while preserving the environmental resources of an area. Designers must exercise good judgment on individual projects and, frequently, they must be innovative in their approach to roadway design. This may require, for example, additional research into the highway literature or use of other Department Manuals.

MANUAL FORMAT/UPDATE

The *Bureau of Design and Environment Manual* is available as a PDF document on the IDOT's website: It is intended to provide current design and environment policies and procedures for use in developing State highway projects. To ensure that the *BDE Manual* remains up to date and appropriately reflects changes in IDOT's needs and applicable requirements, its contents are updated on an ongoing basis. To aid users in keeping track of revisions and understanding their background, BDE Procedure Memoranda are posted to the *BDE Manual* website; however, the associated policy revisions are incorporated in the relevant chapter(s) of the *BDE Manual* itself.

BDE will be responsible for evaluating changes in the highway design and environmental literature (e.g., the issuance of new research publications, revisions to Federal regulations) and will ensure that those changes are appropriately addressed through the issuance of revisions to the manual. In addition, it is important that users of the *BDE Manual* inform BDE of any inconsistencies, errors, need for clarification, or new ideas to support the goal of providing the best and most up-to-date information practical. A form entitled BDE Manual Comments and/or Corrections (see page iii) has been provided for use in submitting any comments and/or suggestions.

BUREAU OF DESIGN AND ENVIRONMENT MANUAL

Chapter One
ORGANIZATION AND FUNCTIONS
(Program Development)

Table of Contents

Chapter 1
ORGANIZATION AND FUNCTIONS
(Program Development)

Chapter 1 provides a general organizational structure for the Illinois Department of Transportation (IDOT) Office of Program Development and brief discussion of the bureaus comprising the Office of Program Development. The Chapter also provides a detailed discussion of the work functions of the Units within each Section of the Bureau of Design & Environment (BDE). For a complete and updated organizational chart of the entire Department, see the IDOT internet site.

1-1 OFFICE OF PROGRAM DEVELOPMENT

The Office of Program Development (OPD) consists of five central bureaus responsible for developing policies, procedures, standards, and guidelines to accomplish the Department's highway system improvement program. Additionally, the five central bureaus under the Office of Program Development provide guidance to districts to ensure statewide uniformity of policy interpretation, program coordination with Federal, State, and local agencies, and compliance with Federal, State, and local laws and regulations. The five bureaus comprising the Office of Program Development include the Bureau of Bridges and Structures (BB&S), the Central Bureau of Land Acquisition (CBLA), the Central Bureau of Local Roads and Streets (CBLRS), the Bureau of Safety Programs and Engineering (BSPE), and the Bureau of Design and Environment (BDE).

1-2 BUREAU OF DESIGN AND ENVIRONMENT

The Bureau of Design and Environment (BDE) consists of five sections: Aerial Surveys, Location and Environment, Policy and Procedures, Preliminary Engineering, and Project Coordination and Implementation. BDE is responsible for developing highway standards, specifications, and policies for use on the state maintained Federal-aid highway system. Additionally, BDE is responsible for developing policies for the preparation, coordination, final review, and approval of project location studies and environmental documents; providing support services for district highway design programs; coordinating and preparing Federal-aid program documents; and processing plans and contract documents through the letting and contract award stage.

Figure 1-2.A presents the organization of BDE.

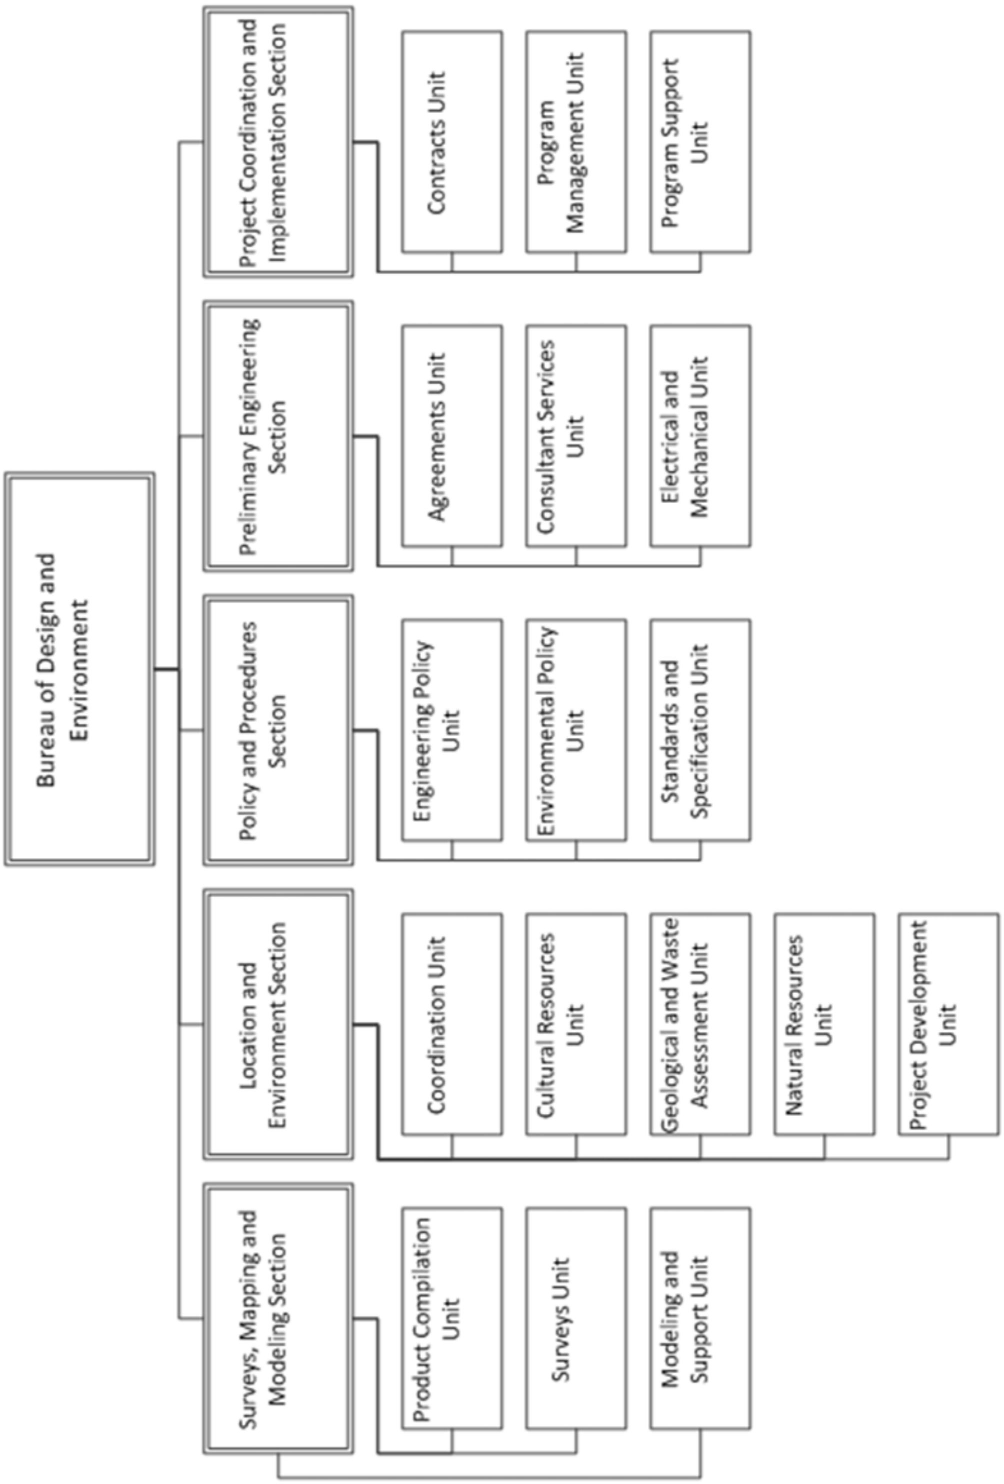
1-2.01 Surveys, Mapping and Modeling Section

The Surveys, Mapping and Modeling Section consists of three units: the Surveys Unit,Product Compilation Unit, and the Modeling and Support Unit.

1-2.01(a) Surveys Unit

The Surveys Unit, in combination with the district field survey crews, is responsible for the following:

- providing aerial photography and other survey services for the Department and other State agencies including scale changes for maps, plans, charts, and photographic plates used for reproduction and printing;
- maintaining survey datums and coordinate systems for a reference or base for all surveys in the State;
- providing technical assistance on surveying as needed to the districts and local jurisdictions;
- assisting with high-order geodetic surveys and field survey work necessary to provide horizontal and vertical control for photogrammetric mapping; and
- maintaining the IDOT *Survey Manual*.



BUREAU OF DESIGN AND ENVIRONMENT

Figure 1-2.A

1-2.01(b) Product Compilation Unit

The Product Compilation Unit is responsible for the following:

- providing aerial photography and photographic services for the Department and other State agencies.
- maintaining the necessary records and filing systems for all Surveys, Mapping and Modeling Section projects;
- providing precise topographic maps in digital format for use with Computer Aided Design and Drafting (CADD) interactive graphic systems;
- providing digital imagery in raster format for use with CADD graphic systems; and
- preparing specifications and agreements for consultant mapping projects and monitoring compliance.

1-2.01(c) Modeling and Support Unit

The Modeling and Support Unit is responsible for the following:

- setting Computer Aided Design & Drafting (CADD) policy statewide;
- maintaining and updating the IDOT *Computer Aided Design, Drafting, Modeling and Deliverables Manual;*
- ensuring engineering policies are developed and fully integrated into CADD software and processes;
- providing liaison activities between bureaus, districts, consultants, and our CADD software vendor(s);
- maintaining the IDOT CADD workspace environment;
- maintaining 2-D and 3-D CADD cell libraries;
- maintaining 3-D civil cell libraries, including supporting and developing additional civil cells;
- supporting survey and design CADD and Geographic Information System (GIS) functions Department-wide;
- developing and maintaining CADD drawings for the IDOT *Highway Standards;*
- communicating CADD best practices and technological advances to district users;
- fostering communication between software application users and developers;

- providing research, development, and management of both CADD and GIS applications used in the scoping, programming, planning and design activities of roadway and structures improvements within the Department;
- providing necessary CADD and GIS training across the Department; and
- supporting innovative survey and design technologies within the Department.

1-2.02 Project Coordination and Implementation Section

The Project Coordination and Implementation Section consists of three units: the Contracts Unit, Program Management Unit, and Program Support Unit. In addition to these units, the Project Coordination group within the Section is responsible for the following:

- reviewing and checking project plans prepared by the districts and consultants for accuracy, completeness, and engineering validity;
- reviewing special provisions;
- facilitating plan coordination with districts, central office bureaus, and print shop; and
- facilitating changes, revisions, addendums, and updates in plans and special provisions.

1-2.02(a) Program Support Unit

The Program Support Unit is responsible for the following:

- determining project letting dates;
- clearing projects for advertising and awarding;
- processing Certification Acceptance (CA)/Project Status forms;
- determining the proper FHWA funding type and assigning project numbers;
- authorizing project funding;
- obtaining authorization from FHWA for all Federally funded projects;
- monitoring the availability of funds within State and Federal funding categories;
- obtaining approvals from the Governor's Office of Management and Budget for all projects under the State's jurisdiction; and
- ensuring that plans are prepared in accordance with agreements with local agencies or other State agencies.

1-2.02(b) Project Management Unit

The Project Management Unit is responsible for the following:

- determining the official engineer's estimate for all projects offered for letting by the Office of Program Development;
- analyzing bids received on lettings and presenting disposition recommendations to the awards committee;
- maintaining data on price trends;
- reviewing and processing plans during preparation of average unit prices used for cost estimates; and
- determining pay item numbers.

1-2.02(c) Contracts Unit

The Contracts Unit is responsible for the following:

- developing and publishing Invitation for Bid/Transportation Bulletin;
- issuing all electronic notifications;
- maintaining lists of bidders and non-bidders;
- conducting bid letting for Office of Program Development, Office of Highways Project Implementation, Bureau of Aeronautics, and Department of Natural Resources projects;
- reviewing identified low bids for responsiveness and responsibility;
- reviewing proposals and legal contract documents through the letting stage; and
- awarding and executing highway construction contracts.

1-2.03 <u>Location and Environment Section</u>

The Location and Environment Section consists of five units: the Coordination Unit, Cultural Resources Unit, Geological and Waste Assessment Unit, Natural Resources Unit, and Project Development Unit.

1-2.03(a) Coordination Unit

The Coordination Unit is responsible for the following:

- administering the central office review of environmental documents, reviewing and commenting on the disciplines assigned to the Unit, compiling comments from all units in the Location and Environment Section into a unified response and issuing State environmental approvals;
- providing expertise for the Department in the disciplines of socio-economics, agriculture, natural resources, air quality, and noise, including providing guidance on Departmental research in these disciplines;
- attending district coordination meetings and special project meetings to participate in project decisions and to guide project development;
- establishing environmental consultant prequalification criteria and reviewing consultants' Statements of Experience and Financial Condition to determine eligibility of firms requesting prequalification in environmental categories;
- reviewing and commenting on consultant advertisements, proposals, selection, and negotiations for projects involving complex environmental documents;
- providing training in environmental matters;
- providing technical advice to the Environmental Policy Unit in the Policy and Procedures Section;
- preparing specific studies and/or sections of text and participating in ad hoc teams to develop or manage environmental documents as requested; and
- providing liaison with other organization units in IDOT and other local, State, and Federal agencies regarding the disciplines assigned to the unit and regarding procedural matters relating to the environmental process.

1-2.03(b) Natural Resources Unit

The Natural Resources Unit is responsible for the following:

- operating and managing the environmental resource surveys for individual projects to identify impacts on biological and wetland resources;
- providing technical expertise on biological resource identification, impact evaluation, mitigation, protection, and management in project development, plan preparation, construction, and operations for such resources as threatened and endangered species, critical habitat for threatened and endangered species, other important ecosystems (e.g., prairies, savannahs, wetlands), and ecological resources in general;

- providing technical expertise and guidance on water resources including wetlands, water quality, flood plains, and Section 404 permits through the planning, design, construction, and operation phases;

- preparing and/or reviewing all or portions of environmental documents including:

  - Environmental Impact Statements,
  - Environmental Assessments,
  - Categorical Exclusions,
  - 4(f) Reports, and
  - 6(f) Reports;

- preparing and/or reviewing specialized environmental documents:

  - biological assessments,
  - wetland technical reports,
  - wetland banking prospectives,
  - conceptual and final wetland compensation plans,
  - wetland site assessment reports,
  - wetland monitoring reports, and
  - draft 404(b)1 guideline reports;

- providing liaison between the districts and the central office and with local, State, and Federal resource and regulatory agencies (e.g., USFWS, IDNR, USACE, USDOI-NPS);

- disseminating technical environmental information regarding biological resources, water resources, wetlands, flood plains, and Section 404 permits;

- participating in the development of policies and guidance related to natural resources;

- providing technical training on biological resource identification, impact evaluation, development of mitigation, habitat and species protection, management of biological resources on Department-owned land, and incorporation of appropriate features into contract plans; and

- serving on IDOT's Storm Water Committee.

1-2.03(c) Cultural Resources Unit

The Cultural Resources Unit is responsible for the following:

- directing and managing the cultural resources portion of the Environmental Resource Surveys and Studies Program;

- providing technical expertise regarding prehistoric and historic archaeological sites, historic buildings and bridges, and historic districts to highway districts, Bureau of Local Roads and Streets and, at the direction of the Office of the Secretary and/or Director of the Office of Program Development, to other divisions and offices and other State agencies. Investigations for possible cultural resources must be conducted for proposed project sites, all borrow pits, economic development sites (DCCA), and for any other site which will involve a State transaction;

- meeting with historic resource agencies at the State and Federal levels to resolve project issues and remaining abreast of regulatory changes;

- providing guidance to district and central offices by:

  - attending district coordination meetings,
  - participating in project field meetings or conducting independent field checks, and
  - providing technical training.

- reviewing environmental documents (EAs, EISs technical reports) prepared by the districts or consultants and preparing sections of environmental documents relating to specific cultural resources; and

- advising districts of appropriate responses including avoidance or preservation of significant resources or specific measures to mitigate negative impacts to cultural properties.

1-2.03(d) Geologic and Waste Assessment Unit

The Geologic and Waste Assessment Unit is responsible for the following:

- managing and directing Geologic and Special Waste Surveys on individual projects to identify potential impacts on special waste sites and geological resources (e.g., groundwater, sand, gravel) and potential impacts from geological hazards (e.g., landslides, mine subsidence, earthquakes);

- providing technical expertise and training on special waste problems and evaluations (e.g., underground storage tanks, public health concerns, asbestos, landfills) and expertise on geologic resources and hazards in Phase I and Phase II project development, construction, and operations;

- developing and promulgating Department criteria on the evaluation of special waste sites and geologic resources/hazards;

- developing and promulgating Department procedures for coordination activities with respect to special waste sites and geologic resources/hazards (e.g., Manual for Preparation of Preliminary Environmental Site Assessment, maintenance of waste site list, CERCLIS);

- managing and directing special waste and geological resource/hazard investigations on individual projects to identify the risk and liabilities of waste/geologic hazard sites and impacts to geological resources that cannot be avoided;

- establishing consultant prequalification criteria and reviewing consultant Statements of Experience and Financial Condition to determine their eligibility for prequalifications, developing Transportation Bulletin advertisements, reviewing statements of interest, and recommending selection priorities for the hazardous waste category; and

- providing liaison between the districts and central office with the appropriate resource and regulatory agencies (e.g., USEPA, IPEA, OSFM, IDNR).

1-2.03(e) Project Development Unit

The Project Development Unit is responsible for the following:

- monitoring, evaluating, and assisting in the development of Phase I engineering studies prepared by district offices and by other transportation modes to ensure uniformity of policy compliance and to assist on special location problems;

- preparing location studies for certain complex, critical, or environmentally sensitive projects;

- attending district coordination meetings to discuss engineering issues and the scope and status of projects;

- reviewing and approving requests for exceptions to design policies;

- assuring Phase I studies are developed and implemented using an interdisciplinary approach to resolve engineering and location problems; and

- reviewing and checking project plans prepared by district offices and consultants for accuracy, completeness, and engineering validity.

1-2.04 Preliminary Engineering Section

The Preliminary Engineering Section consists of three units: the Consultant Services Unit, Agreements Unit, and Electrical and Mechanical Unit.

1-2.04(a) Consultant Services Unit

The Consultant Services Unit is responsible for the following:

- prequalifying of architectural/engineering consultant firms;
- in conjunction with districts/bureaus/offices, compiling, coordinating, and preparing advertisements for publishing the Professional Transportation Bulletin;
- evaluating and preparing data for the selection of consultant firms;
- compiling consultant performance ratings;
- in conjunction with the Agreements Unit, establishing Department policies and procedures for consultant projects; and
- developing statewide policies for design, operations, and monitoring district compliance.

1-2.04(b) Agreements Unit

The Agreements Unit is divided into two sub-units: the Consultant Sub-Unit and the Project Support Sub-Unit.

The Consultant Sub-Unit is responsible for the following:

- developing policies and procedures for the administration of consultant agreements;
- obtaining necessary clearances to proceed with consultant agreements, such as procurements waivers, debt certification, and funding approvals;
- preparing consultant agreements based on the proposal package submitted by the districts, bureaus, and other other State agencies; and
- administering the consultant agreement process within the central office and attaining necessary signatures.

The Project Support Sub-Unit is responsible for the following:

- developing policies and procedures for the administration of the utility, railroad, and local agency agreements;
- reviewing, evaluating, and approving agreements with utility companies, railroad companies, local agencies, other State agencies, and other states submitted by the districts; and
- administering the agreement process within the central office and obtaining necessary signatures.

1-2.04(c) Electrical and Mechanical Unit

The Electrical and Mechanical Unit (E&MU) provides assistance on electrical, lighting, and pump station (EL&P) projects. Work performed by E&MU is for Districts 2 through 9, unless noted otherwise. More specifically, E&MU is responsible for the following:

- designing all in-house EL&P projects. This includes preparing all plans and contract documents as outlined in Section 56-4.04;
- reviewing all EL&P plans and documents for projects designed by consultants;
- reviewing all shop drawings for technical correctness and specification compliance for materials supplied to EL&P projects;
- developing and disseminating statewide design criteria, practices, and policies on EL&P;
- conducting final inspections and issuing approval recommendations to the Bureau of Construction on projects with EL&P work;
- assisting with updating EL&P portions of the Department documents such as the Standard Specifications, BDE Manual, BLRS Manual, Construction Manual, Operations Manual, and pay item list;
- reviewing and commenting on a proposed EL&P legislation and code changes impacting the Department; and
- interfacing with the districts, central office bureaus, suppliers, electrical contractors, and outside agencies on EL&P issues and assisting them in finding solutions to design, construction, maintenance, and operating problems.

1-2.05 Policy and Procedures Section

The Policy and Procedures Section consists of three units: the Environmental Policy Unit, Engineering Policy Unit, and Standards and Specifications Unit.

1-2.05(a) Environmental Policy Unit

The Environmental Policy Unit is responsible for the following:

- maintaining BDE Manual Part III, Environmental Procedures, and Chapter 19 Public Involvement Guidelines;
- remaining abreast of changes in environmental laws and regulations and determining their impact on Department policies and procedures;

- providing technical assistance to the Environment Section in the central office and to the districts on environmental and public involvement policy and procedural issues; and
- as necessary, publishing explanatory guidance (i.e., as Procedure Memoranda or Information Memoranda) on environmental and public involvement topics.

1-2.05(b) Engineering Policy Unit

The Engineering Policy Unit is responsible for the following:

- researching, preparing, and disseminating design policies and procedures for Phase I and Phase II engineering activities, including Phase I engineering studies, to the districts and central bureaus and providing interpretation of the policies and procedures for case-specific situations;
- developing policies and procedures for the geometric design of highways, intersections, and interchanges which includes alignment and profile guidelines, superelevation design, cross section elements, median types, and capacity analyses;
- remaining abreast of new research developments and incorporating this research, where applicable, into the design policies;
- developing and disseminating procedures for pavement design and rehabilitation;
- developing policies and procedures for 3R, 3P, and SMART projects;
- developing Department policies and criteria for access control on freeways and expressways and for access management on arterial highways;
- developing Department policies and criteria for roadside safety issues including barrier selection and layout, cost/benefit analyses, and clear zones;
- developing Department policies and procedures for special design elements including accessibility standards.
- developing and promulgating Department policy and guidance on the accommodation of bicyclists and pedestrians within the highway program;
- remaining abreast of State and national issues on bicyclist and pedestrian accommodation and determining their impact on Department practices;
- providing technical assistance to the districts on bicyclist and pedestrian issues; and
- ensuring that the Department complies with the regulations and policies governing the FHWA Transportation Enhancement Program.

1-2.05(c) Standards and Specifications Unit

The Standards and Specifications Unit is responsible for the following:

- developing and disseminating the *Highway Standards* used in contract plans to districts and central bureaus;
- developing new or revised roadway standards on the basis of internal needs, safety requirements, and new material or product development;
- initiating or reviewing requests for new or revised *Standard Specifications for Road and Bridge Construction* and evaluating their feasibility and impact;
- obtaining FHWA approval for new specifications;
- initiating or reviewing requests for new or revised special provisions and connected details for road and bridge construction and evaluating their applicability; and
- publishing the *Standard Specifications* and *Supplemental Specifications and Recurring Special Provisions* books as required.

Section **Page**

Chapter Two

PROJECT DEVELOPMENT NETWORK
(New Alignment)

Chapters 2 and 3 document the basic approach used by IDOT in its project development process. Chapter 2 presents Phase I and Phase II networks for projects on new alignment. Chapter 3 presents combined Phase I and Phase II networks for projects on existing alignment requiring major right-of-way purchases (e.g., converting a two-lane facility to an expressway), minor right-of-way purchases (e.g., 3R projects), and projects with no right-of-way acquisition (e.g., Interstate Resurfacing, SMART, 3P). Chapters 2 and 3 present networks that graphically illustrate the development of "typical" highway projects.

2-1 GENERAL

Figure 2-2.A presents a network which graphically illustrates the general process for Phase I of a new alignment project which requires separate corridor and design studies. Figure 2-3.A illustrates the Phase II project development. Following each figure is a brief description of each activity within the network. When using these figures, consider the following:

1. Precedence Activity Network. The networks or flowcharts are precedence activity networks. An "activity" occurs when a significant, discrete event occurs and/or when the responsibility for the project (activity) is transferred from one unit to another. The "precedence" nature of the network implies that an activity cannot occur until all activities preceding that one have been completed. However, the user must be aware that some flexibility is necessary to apply this network to project development, especially during Phase I. For example, identifying new information during the public involvement stage may require the project study group to return to a previous activity and gather additional data.

2. Project Application. These networks represent an approximate process for a complex project on new alignment requiring an Environmental Impact Statement (EIS). Not every activity will be applicable to every project and not all activities are shown. However, the user should find that projects that are developed according to this process have fewer management problems.

   The illustrated network assumes a project designed in-house. The process for a consultant-designed project will be similar, except that communication lines exist between IDOT and the consultant for IDOT review and approval.

3. Lines of Communication. The rigid application of the network would lead to predetermined, precise points at which communication occurs between units. This is neither realistic nor desirable. Communication between units must be continuous. This will result in fewer problems and fewer "surprises" in project development.

4. Value Engineering. Refer to Section 11-7.03 for requirements and guidance on value engineering (VE) analyses. Where required, initiate the VE study no later than the time construction plans are 30% complete and allow for the implementation of the recommendations without delaying the project.

5. Project Approval. Districts are responsible for the review and approval of all projects except those projects involving major new alignments addressed by a Corridor Study, Feasibility Study, or Design Report. In these special circumstances, projects are approved by BDE. BDE may also review and approve projects where the Deputy Director/Regional Engineer has requested BDE assistance. See Section 12-5 for a discussion on the processing and approval of phase I reports.

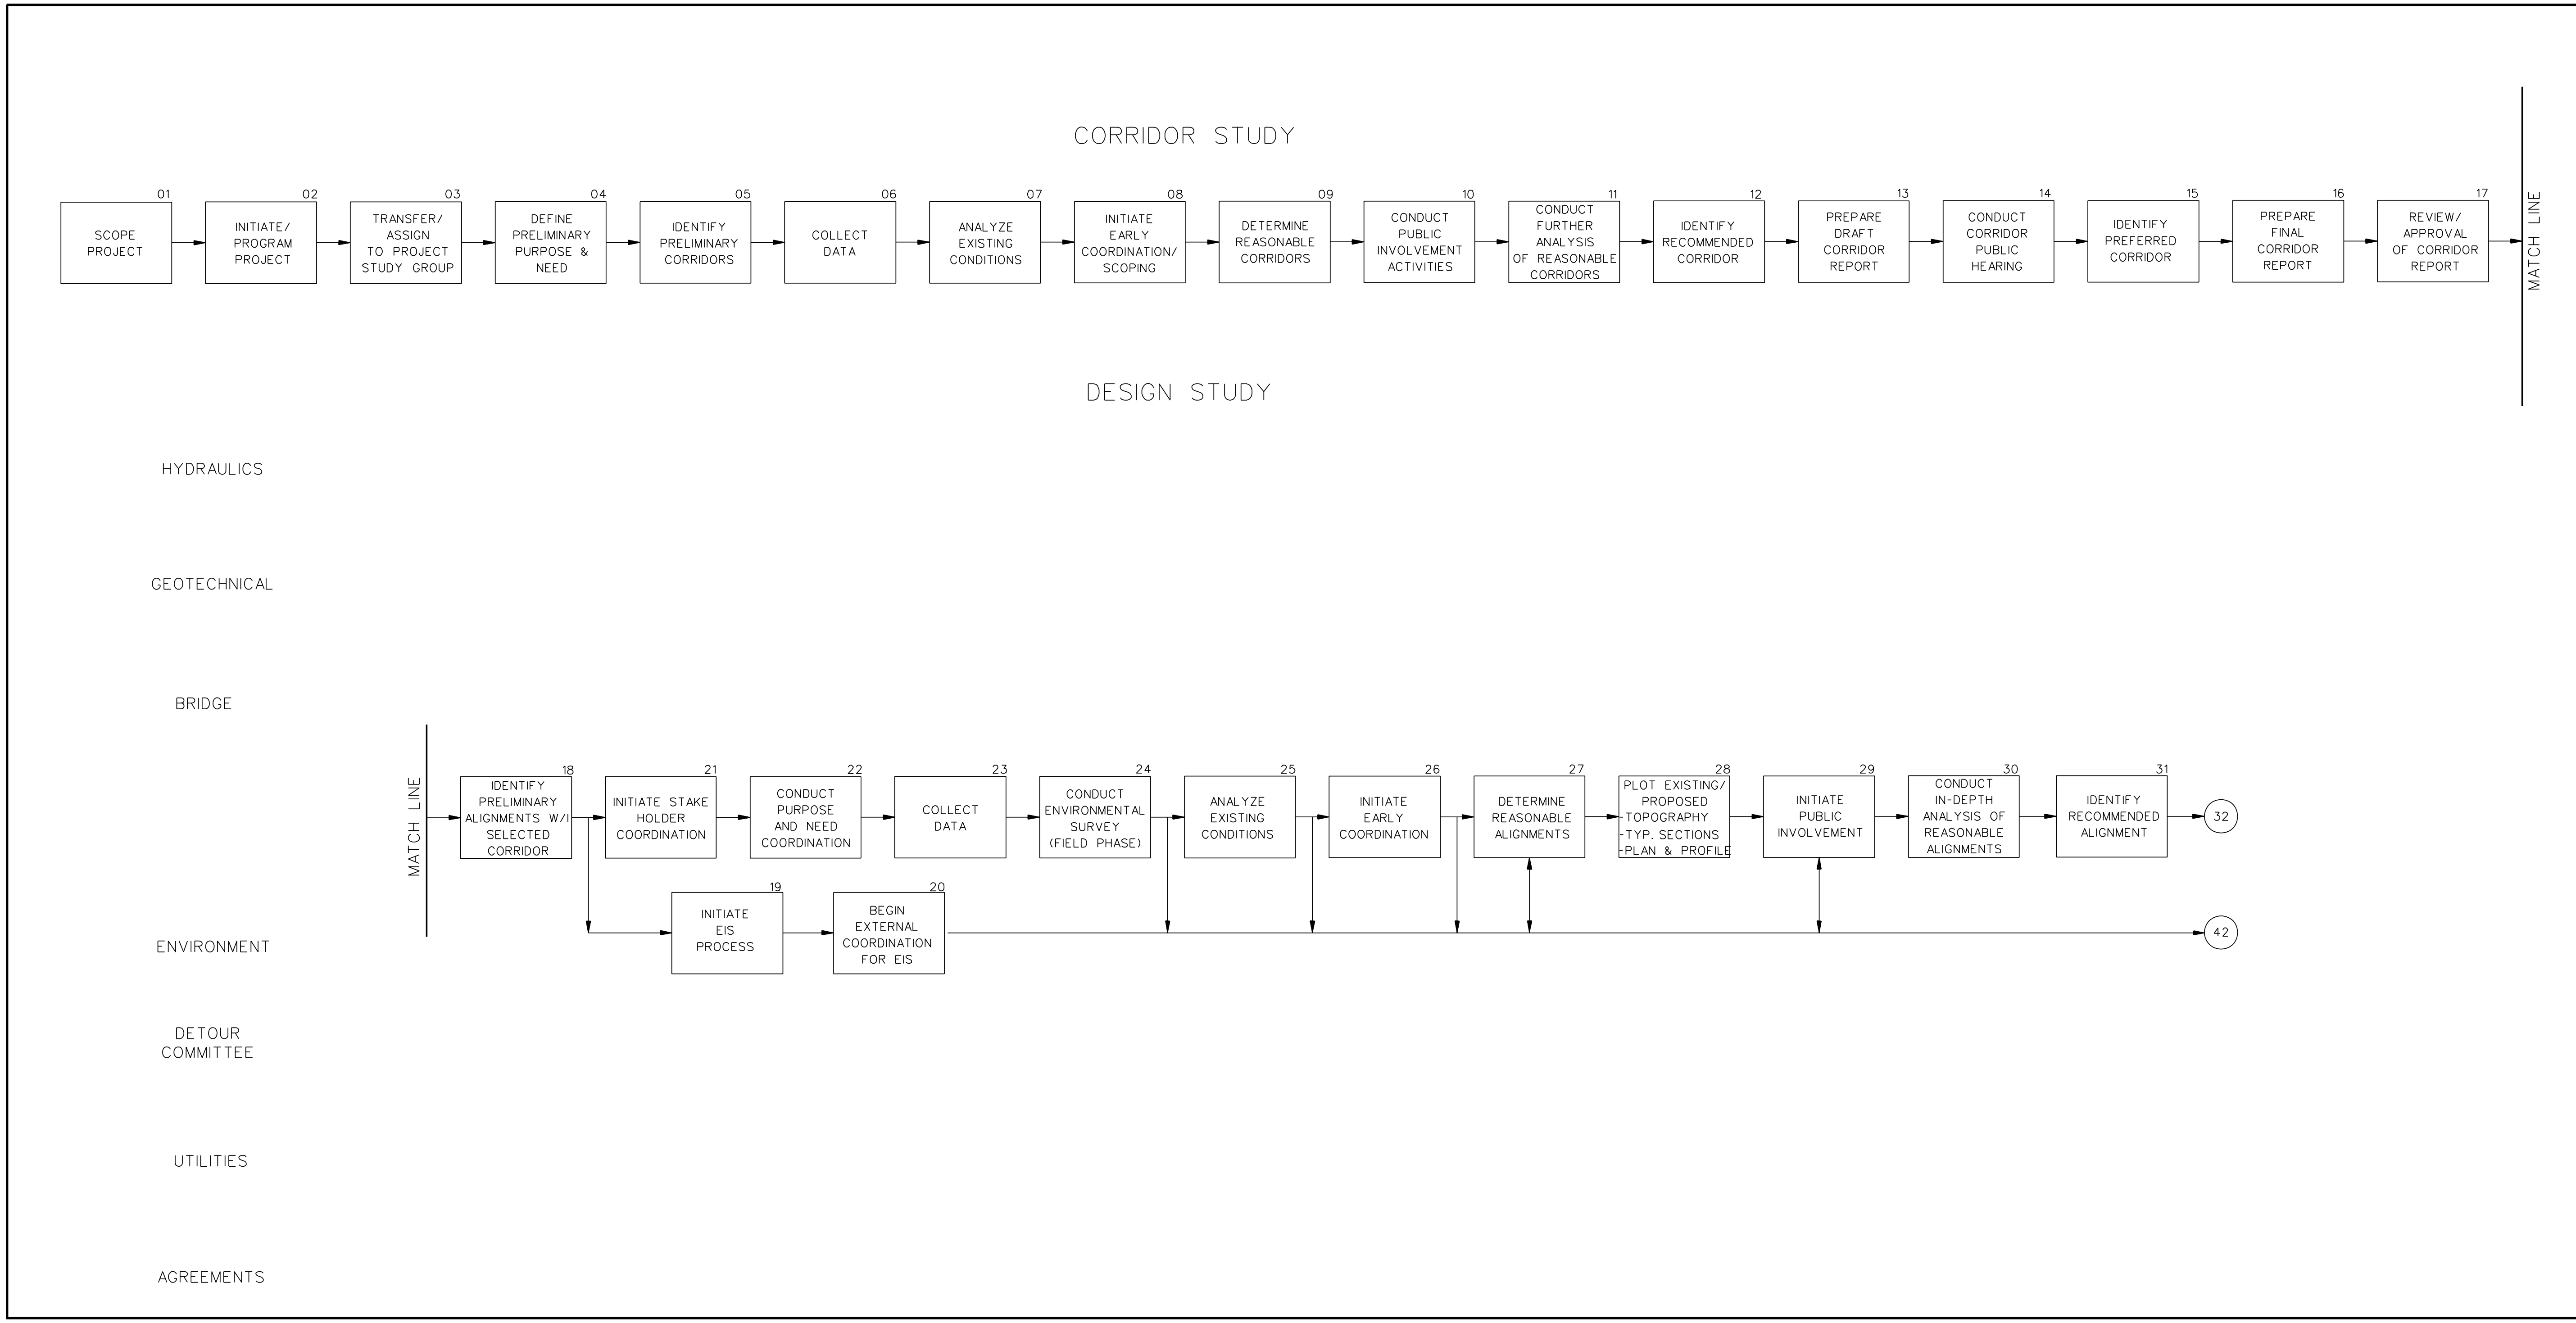
6. Other Manual Chapters. The *BDE Manual* contains several other chapters that provide complementary information to Chapter 2. The designer should review these chapters for more information on the project development process. In particular, Chapter 2 should be used in combination with Chapter 4 “Project Coordination Responsibilities,” Chapter 11 “Phase I Studies,” Chapter 12 “Phase I Engineering Reports,” Chapter 19 “Public Involvement Guidelines,” and Chapter 25 “Environmental Impact Statements.”

2-2 PHASE I STUDIES

Figure 2-2.A illustrates a typical flowchart or network for a project on new alignment that will require both a corridor and a design study. Activities shown along the main axis of the chart represent items which are normally performed by the project study group. The other lines of the chart represent activities by other units or groups. For other project types, see the flowcharts in Chapter 3. Separate corridor studies are usually only prepared for new freeways, for new expressways where two or more existing routes are being considered for upgrading, or for a new two-lane highway proposed on new location. See Chapters 11 and 12. For projects deemed by FHWA as "Major Projects," see Chapter 20.

This network assumes that EIS will be required for a project on new alignment requiring a corridor and a design study. If a project on new alignment does not appear to involve significant environmental impacts, the procedures for development of an Environmental Assessment (Chapter 24) should be followed.

The FHWA's environmental regulations do not require a separate draft and final environmental document and record of decision at the corridor phase. The activity descriptions in this chapter reflect that corridor-phase environmental information will be incorporated in the corridor study report and will be coordinated with interested agencies and the public as a part of that document. Information from the corridor study will be summarized in the draft environmental document at the location-phase so that it will be covered under NEPA.



PHASE I PROJECT DEVELOPMENT NETWORK
(New Alignments)

PHASE I PROJECT DEVELOPMENT NETWORK
(New Alignments)

Figure 2-2.A
(2 of 2)

PROJECT ACTIVITY (Phase I)

Activity Title: Scope Project

Activity No.: 01

Responsible Unit: District Bureau of Program Development

Activity Description:

A roadway project proposal can originate from a variety of sources, including local officials or metropolitan planning organizations (community-based need), directly from the IDOT districts (district-based need), from a bureau in the central office (Office of Planning and Programming, BDE, Operations, Bureau of Safety Programs and Engineering, etc.), and other sources targeting a special need or a Statewide need.

Before a project is entered onto the Department's Proposed Highway Improvement Program, the district Programming Section initially develops and documents the project concept. Developing the project concept will typically involve the following:

- establishing that there is, in fact, a need for the project;
- making a preliminary determination of the project scope of work;
- reviewing any available data and records;
- conducting an initial evaluation of right-of-way, utility, and environmental impacts and the likely level of environmental evaluation;
- developing a rough, preliminary cost estimate;
- determining a proposed schedule (note that, for projects with both corridor and design study phases, the completion schedule may be greater than that of the multi-year program); and
- developing a set of preliminary drawings/plans.

This information is forwarded for review and comment to district Program Development, district Operations, BDE, district Environmental Unit, the Bureau of Bridges and Structures, and other individuals, as appropriate. The district Programming will refine the scope based on the comments received.

Once the scope, cost, and schedule have been defined, district Programming will forward this information to the Office of Planning and Programming for incorporation into the Department's multi-year program (Activity 02).

PROJECT ACTIVITY (Phase I)

Activity Title: Initiate/Program Project

Activity No.: 02

Responsible Unit: Office of Planning and Programming

Activity Description:

Candidate projects are submitted by the districts as a request for project programming to the Office of Planning and Programming. Based on a statewide assessment of highway improvement needs and available funds, the Office of Planning and Programming will develop the Department's Proposed Highway Improvement Program. This will establish an individual project as an active project for further development.

The Office of Planning and Programming annually issues guidelines for multi-year programming criteria. This includes programming criteria for:

- improvement categories,
- pavement surface conditions,
- deficient bridges,
- safety improvements,
- Interstate rehabilitation,
- widening narrow and deteriorated pavements,
- improving intersections and reducing traffic bottlenecks,
- new construction/reconstruction of major facilities,
- transportation enhancement projects,
- Congestion Mitigation Air Quality (CMAQ) projects, and
- bicycle accommodation.

PROJECT ACTIVITY (Phase I)

Activity Title: Transfer/Assign to Project Study Group

Activity No.: 03

Responsible Unit: Studies and Plans Engineer

Activity Description:

At this point, the project will be assigned to a project study group within the district Bureau of Program Development to begin the corridor study. The Studies and Plans Engineer will have the overall day-to-day responsibility for advancing the project through the Phase I study process. The Studies and Plans Engineer, or designee, will:

- coordinate directly with other units within the Department;
- attend all internal meetings and field inspections;
- ensure that the project study meets all Department criteria and procedures;
- report directly to the District Program Development Engineer on all significant project activities, problems, and developments; and
- participate in the public involvement process.

The number and expertise of personnel initially assigned to the project study group will vary with the nature and scope of the proposed improvement. The personnel assigned will also vary over time relative to the priority for completion, the available lead time, and the activity in project development under study.

If the project is one which the Regional Engineer has determined will use the principles of Context Sensitive Solutions (CSS), the public involvement process should commence at this point. The project study group uses the Stakeholder Involvement Process (SIP) as outlined in Section 19-5.01 to conduct public involvement for CSS projects.

PROJECT ACTIVITY (Phase I)

Activity Title:	Define Preliminary Purpose and Need
Activity No.:	04
Responsible Unit:	Project Studies Group/BDE/FHWA/Office of Planning & Programming

Activity Description:

For a major transportation project, the project study group must first define the project purpose and need, which will direct the process for the identification of alternatives, in-depth analyses and, ultimately, selection of the preferred alternative. This will consist of reaffirming the need for the proposed improvement, establishing project goals and objectives, and establishing the study area and logical termini. The feasibility of a corridor depends on the social, economic, environmental, and engineering effects of the proposed highway improvement within each corridor. Previous studies and decisions should be reaffirmed and/or updated as necessary. Other factors that must be considered include:

- adequacy of the existing highway network,
- existing traffic volumes and capacity deficiencies,
- crash information,
- alignment and profile deficiencies,
- transportation demand,
- potential cost savings to the traveling public,
- enhanced economic development potential,
- improved access,
- programming guidelines,
- commitments to elected officials, and
- public input.

Further study may result in revisions to the preliminary purpose and need.

Prepare the purpose and need so that it can be transferred to the NEPA document. See Section 22-6.01 for more information on purpose and need.

PROJECT ACTIVITY (Phase I)

Activity Title: Identify Preliminary Corridors

Activity No.: 05

Responsible Unit: Project Study Group

Activity Description:

Based on the definition of the preliminary purpose and need (Activity 04) and the general design concept (Activity 01), the project study group should identify feasible corridors that could be used. Because this is an evolutionary process, the preliminary list will be narrowed during further evaluations. The evaluation of preliminary corridors should be sensitive to those environmental resources for which the analysis of alternatives for avoidance and minimization of adverse impacts is required (e.g., wetlands, flood plains, Section 4(f) properties, historic sites). All impractical corridors may be removed from the list with a brief description of why they were removed.

County or other area maps and USGS quadrangle topographic maps, combined with aerial photography, will furnish the locations of towns, streams, railroads, and other topographic features that will assist in defining the study area. Review these maps and locate feasible corridors with respect to local terrain, topographic features, and other controlling items.

The study area is determined through an office-based general overview of area maps and through field trips. Field trips may be facilitated by the prudent use of helicopter flights. The study area is defined as that part of the area of influence within which the facility will be investigated. The limits of the study area may not be the same as the area of influence. Lateral limits are dependent on the distance between the major termini, the function of the highway, and the character of the area traversed.

PROJECT ACTIVITY (Phase I)

Activity Title: Collect Data

Activity No.: 06

Responsible Unit: Project Study Group/Environmental Unit/BDE

Activity Description:

Once the preliminary corridors have been identified (Activity 05), the project study group must gather and inventory information and data on each corridor. All types of data, including social, economic, environmental, and engineering should be gathered simultaneously. The amount and type of information to be collected will vary with the nature and scope of the proposed improvement. Note that data collection is a continuous process throughout Phase I studies. As the process evolves, additional information must be collected.

Information can be obtained from the following sources:

- State, county, and city maps;
- ASCS photography or IDOT photography;
- USGS quadrangle topographic maps;
- traffic maps and data;
- functional classification maps;
- Federal agency plans (e.g., Army Corps of Engineers, Coast Guard, Department of Interior, Department of Housing and Urban Development, FEMA);
- special development plans (e.g., conservation, industrial, recreational, resource);
- population growth trends;
- utility maps;
- urban area transportation studies;
- other regional planning studies;
- road inventory data from the Illinois Road and Inventory System (IRIS);
- Illinois Department of Natural Resources;
- meetings with local officials;
- meetings with other IDOT units;
- local agency plans and reports (land use maps); and
- soil maps.

In addition, the project study group should review the additional sources listed in Section 11-4.02(b).

PROJECT ACTIVITY (Phase I)

Activity Title: Collect Data

Activity No.: 06 (*Continued*)

Responsible Unit: Project Study Group/Environmental Unit/BDE

Activity Description:

In gathering environmental inventory data for the corridor study phase, the district will primarily use existing sources of information on known resources in the study area. Environmental inventory data can be obtained using the on-line GIS database or by contacting BDE. These information sources may include the following:

- National Wetland Inventory maps;
- IDNR Natural Heritage database;
- NRCS wetland maps;
- ASCS county soils survey maps;
- flood plain maps;
- listing of Wild and Scenic Rivers;
- information on the locations of parks, recreation areas, and wildlife and waterfowl refuges;
- IEPA stream water quality data; and
- CERCLIS site listings.

This information will be supplemented by data provided by BDE in response to submittal of an environmental survey request form.

For additional guidance, see Chapter 27 "Environmental Surveys."

PROJECT ACTIVITY (Phase I)

Activity Title: Analyze Existing Conditions

Activity No.: 07

Responsible Unit: Project Study Group

Activity Description:

Using county or other area maps, USGS quadrangle topographic maps, aerial photography, and other data collected in Activity 06, review the existing conditions within the proposed corridors. Items that should be reviewed include:

- condition of the existing highway network;
- existing traffic volumes and capacity deficiencies;
- crash information;
- alignment and profile deficiencies;
- the locations of towns, streams, railroads, and other topographic features;
- existing and proposed land use from local governments, MPOs, fire districts, schools, etc.;
- environmental resources; and
- sensitive environmental areas (e.g., wetlands, floodplains, natural areas, nature preserves).

PROJECT ACTIVITY (Phase I)

Activity Title: Initiate Early Coordination/Scoping

Activity No.: 08

Responsible Unit: Project Study Group/BDE

Activity Description:

Coordination with other Department and governmental agencies, as appropriate, is an important aspect during the corridor study process. This coordination should begin as early as practical in project planning.

The project study group and BDE will initiate early coordination with individuals, organizations, and appropriate local, State, and Federal agencies that have an interest in the project or have information or expertise concerning any issues the project may involve. The purpose of this coordination will be to assist in the identification of reasonable corridors and in the gathering of information for evaluating the social, economic, and environmental impacts of the proposed project corridors and possible impact mitigation measures. Early coordination will also identify the cooperating agencies.

Scoping is an early and open process for determining the scope of issues to be addressed in the corridor study and for identifying the significant issues related to the proposed improvement. Scoping is intended to focus the study effort on issues that are truly significant and avoid the collection of needless detailed information on insignificant issues.

Although scoping may be accomplished by a formal meeting, it is more frequently accomplished through less formal meetings and exchanges of written and verbal communications. Scoping is typically not an individual step, but an ongoing process as part of the overall coordination and public involvement process.

PROJECT ACTIVITY (Phase I)

Activity Title: Determine Reasonable Corridors

Activity No.: 09

Responsible Unit: Project Study Group/Environmental Unit

Activity Description:

The determination of the reasonable corridors for further evaluation is an evolutionary process, which may be summarized as follows:

- identify preliminary corridors (Activity 05);
- perform a rough evaluation of the potential impacts of these preliminary corridors on the inventory of the affected environment to identify, for example, “fatal” flaws;
- incorporate input from agencies and/or the public (Activity 08) in the decision-making process;
- estimate the overall reasonableness of each corridor under consideration;
- ensure that each “reasonable” corridor will accommodate alternates that will satisfy the project purpose and need (Activity 04);
- ensure location of connections can be adequately developed (e.g., interchanges, frontage roads) (see Section 11-4.02(e)); and
- based on an appropriate level of re-evaluation and additional coordination, identify those selected reasonable corridors that are worthy of further evaluation considering:
  + the need to identify potential avoidance and minimization alternatives for environmental reasons,
  + that the cost of the studies for each corridor should be commensurate with its probability of implementation;
  + that, collectively, the selected corridors should cover the full spectrum of alternatives; and
  + that, collectively, the selected corridors should gain public acceptance that no reasonable corridor alternative has been omitted.

Typically, this process will yield two or three reasonable corridors for further evaluation. The “no-action” alternative also must be evaluated for presentation as part of the Corridor Study.

PROJECT ACTIVITY (Phase I)

Activity Title:	Conduct Public Involvement Activities
Activity No.:	10
Responsible Unit:	Project Study Group/Environmental Unit

Activity Description:

Once the reasonable corridors have been selected (Activity 09), the public should be provided an opportunity to become acquainted with the project and express its views. The public involvement program is first initiated by advising the public that a study is underway. As the project progresses, the district should offer opportunities for the public to receive updated information on the status of the project and provide input and comment. This will culminate in the corridor phase with Activity 14 "Conduct Corridor Public Hearing" when the public will be offered a formal opportunity to comment on the corridor alternatives under consideration. Public involvement should be an ongoing process as the project development evolves.

For projects which the Regional Engineer has determined will use the principles of CSS, the public involvement process should commence once the project is assigned to the project study group. The project study group uses SIP as outlined in Sections 19-5.01 to conduct public involvement for CSS projects.

For detailed information on public involvement activities, see Chapter 19.

PROJECT ACTIVITY (Phase I)

Activity Title: Conduct Further Analysis of Reasonable Corridors

Activity No.: 11

Responsible Unit: Project Study Group/Environmental Unit

Activity Description:

For each selected reasonable corridor (Activity 09), the project study group will identify and evaluate the socio-economic, environmental, and engineering issues, including those identified through agency coordination and public involvement that would be involved in the development of more detailed alternatives within the corridor. The evaluation of these issues must be presented at a comparable level of detail for each reasonable corridor and in a manner to facilitate comparison among the corridor alternatives. Some of the issues that should be evaluated include:

- land use;
- habitat;
- drainage impacts and construction in flood plains;
- projected ADTs;
- fire districts, mail routes, school districts, drainage districts, and taxing districts;
- recommendations from existing Geotechnical Reports;
- locations of major utility installations;
- other transportation facilities (e.g., commuter and freight railroads, airports, bus and trucking terminals);
- urban area transportation study reports and other data;
- regional planning agency reports;
- interagency comments (Activity 08);
- route planning considerations (see Section 11-3);
- estimated cost for each alternative (See Section 11-4.03(d));
- private and commercial property owner reports;
- location of cemeteries, 4(f) land, wetlands, threatened and endangered species/habitat, historic structures, archaeological sites, and special waste sites;
- water towers;
- coal mines; and
- other similar issues.

PROJECT ACTIVITY (Phase I)

Activity Title: Identify Recommended Corridor

Activity No.: 12

Responsible Unit: Project Study Group/Environmental Unit/BDE

Activity Description:

After conducting the analysis of each reasonable corridor (Activity 11), the project study group in conjunction with the district Environmental Unit will determine the recommended corridor alternative. In identifying a recommended corridor, give careful consideration to cost-effectiveness, potential socio-economic and environmental impacts, system connections, and potential for positive impact on affected communities as well as satisfying the purpose and need. The selected alternative corridor and description of why it was selected should be forwarded to BDE for review and approval prior to beginning the preparation of the draft Corridor Report (Activity 13) and before it is presented at the Corridor Public Hearing (Activity 14).

PROJECT ACTIVITY (Phase I)

Activity Title: Prepare Draft Corridor Report

Activity No.: 13

Responsible Unit: Project Study Group

Activity Description:

Once the analyses have been sufficiently conducted and the information and data gathered, the project study group will prepare the draft Corridor Report. Chapter 12 presents the format that should be used to prepare a Corridor Report. Because the corridor study should be essentially complete, it should be possible to prepare the draft Corridor Report in near-final format. The discovery of new, significant information during the Corridor Public Hearing (Activity 14) should be rare if the corridor study has been properly developed. With the exception of changes necessary to reflect input from the public hearing, a final Report should only need information concerning the public involvement and the final conclusion/recommendation section.

In general, the draft Corridor Report should be submitted to BDE for review prior to its availability to public viewing and inspection at the Corridor Public Hearing. Formal approval by BDE for release is not normally issued. Copies made available to the public should be marked as “draft” or “preliminary.”

The Corridor Report should include:

- a discussion on the purpose and need for the project;
- county maps in 11 in. x 17 in. sheets showing all corridors studied, all acceptable corridors, and existing and proposed land uses;
- USGS quadrangle maps showing topography and other details;
- existing and expected traffic data;
- discussion on prior studies;
- eliminated alternatives;
- advantages and disadvantages of the selected corridor alternative;
- environmental concerns;
- impacts on existing communities;
- results of public involvement and environmental coordination; and
- estimate of costs.

PROJECT ACTIVITY (Phase I)

Activity Title: Conduct Corridor Public Hearing

Activity No.: 14

Responsible Unit: Project Study Group/Environmental Unit

Activity Description:

The Corridor Public Hearing is conducted at this stage of the study to present to the public, and other interested organizations and agencies, the corridor alternative under final consideration, a summary of the analyses of alternatives, and the criteria used to select the recommended corridor.

The project study group and the district Environmental Unit will evaluate all comments from the Public Hearing and will prepare responses to these comments as appropriate. Possible responses include:

- modifying alternatives including the proposed action;
- developing and evaluating alternative corridors previously given serious consideration;
- supplementing, improving, or modifying analyses;
- making factual corrections; or
- explaining why the comments do not warrant further agency response, citing the sources, authorities, or reasons that support that position and, if possible, indicating those circumstances that would trigger reappraisal or further response.

Chapter 19 discusses the requirements for public hearings, public information meetings, and responding to comments received during the public hearing.

PROJECT ACTIVITY (Phase I)

Activity Title: Identify Preferred Corridor

Activity No.: 15

Responsible Unit: Project Study Group

Activity Description:

Based on the results of the Corridor Public Hearing (Activity 14) and previous study analyses, the project study group will select the preferred corridor for the project. The selected corridor, and its advantages and disadvantages, will be documented in the final Corridor Report (Activity 16).

PROJECT ACTIVITY (Phase I)

Activity Title: Prepare Final Corridor Report

Activity No.: 16

Responsible Unit: Project Study Group

Activity Description:

After analyzing the comments received from the public and other agencies, the project study group will determine if any changes are necessary in the draft Corridor Report and if any relevant issues have been overlooked. If an oversight has occurred, additional data and studies may be required to explain the resultant effects and to determine what changes, if any, are necessary.

After the review and analysis of comments is complete and the appropriate revisions incorporated, the final Corridor Report may be prepared. Activity 13 and Chapter 12 present the information and format that should appear in the Report.

PROJECT ACTIVITY (Phase I)

Activity Title: Review/Approval of Corridor Report

Activity No.: 17

Responsible Unit: BDE/Environmental Unit/FHWA

Activity Description:

Once the final Corridor Report has been completed, the project study group will forward the Corridor Report to BDE, the district Environmental Unit, and FHWA, if applicable, for review and approval. When approval is received for the Corridor Report, the corridor study portion of Phase I will be complete.

PROJECT ACTIVITY (Phase I)

Activity Title: Identify Preliminary Alignments within Selected Corridor

Activity No.: 18

Responsible Unit: Project Study Group

Activity Description:

This step initiates the design study portion of Phase I. Typically, some delay will occur between the corridor study and design study. Therefore, the project study group should review the Corridor Report and project files from the corridor study to become familiar with the decisions and determinations, commitments to local officials, and public input made during the corridor study. Also, the project study group will ensure that the corridor decisions are still valid. Throughout the design study process, reaffirm the approved corridor as contacts are made with planning agencies. Also, assess any changes in land use or development plans to determine if corridor modifications should be considered. This is especially important if several years have elapsed between the corridor and design studies or if new information is discovered during the more in-depth design analysis.

Using county maps, USGS quadrangle maps, and aerial photography, identify and lay out possible alignments within the corridor on base maps (see Chapter 11). Also include the no-action alternative in the design study. A possible alternative may include improving existing highways within the corridor. Set interchange locations and determine general horizontal alignment for each alignment. The selection of the preliminary alignments will define what information will be collected in Activity 23 and will initiate the EIS process in Activity 19.

At this stage, request project mapping based on the identified alignments. However, note that many times insufficient information will be available at the time mapping is requested and, therefore, some judgment must be used in deciding the width limits of mapping. Additional mapping can be requested later during the design study if needed for further alignment investigations.

PROJECT ACTIVITY (Phase I)

Activity Title: Initiate EIS Process

Activity No.: 19

Responsible Unit: BDE/Project Study Group/Environmental Unit/FHWA

Activity Description:

Once the information has been received on the preliminary alignments (Activity 18), the following actions are accomplished to initiate the process for preparing EIS. Actions 1 through 4 must be completed before Action 5, publication of a Notice of Intent:

1. The BDE sends a signed Project Initiation Letter to FHWA. FHWA and BDE encourage discussion of project initiation at coordination meetings.

2. The FHWA and IDOT develop negotiated timeframes for the project in accordance with the IDOT/FHWA 2005 Illinois Statewide Implementation Agreement for Establishment of Timeframes for Environmental Impact Statements and Environmental Assessments, giving consideration to input on the timeframes provided during development of the Stakeholder Involvement Plan (see Item 3).

3. The CSS project study group develops a draft plan for stakeholder involvement and coordination. The district contacts BDE for coordination plan examples. The project study group prepares one plan that addresses both requirements to promote a consistent and efficient process. This plan is called the Stakeholder Involvement Plan. FHWA and IDOT must agree on the content of the plan before it is distributed to external stakeholders. See Section 19-5.01(a) for further guidance.

4. The district Environmental Unit prepares a draft Notice of Intent and submits it to BDE for further action.

5. The BDE coordinates the draft Notice of Intent with FHWA for publication in the *Federal Register.* See Appendix B of FHWA Technical Advisory T6640.8A for more detailed information on the format, content, and processing of the Notice of Intent.

PROJECT ACTIVITY (Phase I)

Activity Title: Begin External Coordination for EIS

Activity No.: 20

Responsible Unit: Project Study Group/Environmental Unit/BDE/FHWA

Activity Description:

The project study group and district Environment Unit, in cooperation with BDE and FHWA, initiate the following external coordination actions:

1. The project study group, district Environmental Unit and BDE coordinate with FHWA to invite interested/affected Federal, State, and local agencies to be participating agencies or cooperating agencies. The invitation letters include a draft of the Stakeholder Involvement Plan and request input from the agencies contacted. IDOT and FHWA revisit the need for inviting additional agencies to be participating or cooperating agencies as new stakeholders are identified during project development.

2. The project study group and district Environmental Unit initiate identification of potential environmental resource issues, and may conduct one or more scoping meetings as a part of the identification effort.

3. The project study group and district Environmental Unit obtain input from participating agencies on the methodologies and level of detail planned for analysis of environmental issues for alternatives under study. Coordination with participating agencies on methodologies and level of detail for environmental analyses should be ongoing throughout development of the project. When new information warrants, the methodologies and level of detail may be revisited and modified.

The project study group and district Environmental Unit coordinate with BDE and FHWA to finalize the Stakeholder Involvement Plan after receiving and considering input from participating and cooperating agencies and the public.

PROJECT ACTIVITY (Phase I)

Activity Title: Initiate Stakeholder Coordination

Activity No.: 21

Responsible Unit: Project Study Group

Activity Description:

The project study group coordinates with stakeholders to complete a Context Audit.

The project study group also works with stakeholders to develop a clear statement of the transportation problem(s) the project will address. This problem statement is used in developing the project purpose and need.

See Section 19-5.01(b) for further guidance on Context Audits and development of project problem statements.

PROJECT ACTIVITY (Phase I)

Activity Title: Conduct Purpose and Need Coordination

Activity No.: 22

Responsible Unit: Project Study Group/FHWA

Activity Description:

The project study group, in cooperation with FHWA, accomplishes the following coordination regarding the statement of purpose and need for the project:

1. Provide participating agencies and the public opportunities to provide input for consideration in development of the statement of purpose and need for the project, in accordance with Section 6002 of SAFETEA-LU (23 U.S.C. 139).
2. Achieve consensus with CSS stakeholders on project purpose and need.
3. Obtain concurrence from NEPA/404 Merger Agreement signatories on project purpose and need.

PROJECT ACTIVITY (Phase I)

Activity Title: Collect Data

Activity No.: 23

Responsible Unit: Project Study Group

Activity Description:

In this Activity, the collection of data for each alignment identified in Activity 18 will begin. Note that data collection is an on-going process throughout the design study phase. Data gathering may begin with a review of information available in the district and central offices. Some of the information that is gathered includes:

- roadway, field, aerial, and stream surveys;
- existing roadway classifications and truck routes;
- crash rate maps and collision diagrams;
- pavement and bridge condition reports;
- ADT traffic maps and DHVs for current and design year traffic (all affected routes);
- inventory of posted speed limits;
- detailed transportation maps and plans with all modes of travel included;
- utility installations and detailed maps from utility companies;
- hydraulics survey, drainage survey, sewer atlas, and flooding information tables;
- fire districts, mail and school bus routes, location of churches, drainage districts, historic sites, and field-tile maps;
- commercial, agricultural, industrial, recreational, historic, and residential land use;
- conservation areas, archaeological sites, wetlands, special waste sites, etc.;
- local, State, and Federal agency coordination needs;
- maintenance information on existing routes;
- current topographic mapping at a scale of 1 in. = 50 ft (1:500 metric) in urban areas and 1 in. = 200 ft (1:2500 metric) in rural areas on new alignment or 1 in. = 50 ft (1:500 metric) in rural areas where existing alignment is studied;
- current aerial photographic mosaics at a scale of either 1 in. = 100 ft (1:1000 metric) or 1 in. = 200 ft (1:2500 metric) in urban areas and aerial photography at 1 in. = 400 ft (1:5000 metric) or 1 in. = 600 ft (1:7500 metric) in rural areas;
- geotechnical investigations;
- highway geometrics, development of access control plans, and right-of-way issues;
- joint development uses, scenic easements, and aesthetics of highway (see Chapter 33); and
- cost estimate (see Section 11-2.15) and road-user benefits (see Section 11-7.01).

See Chapters 11 and 12 for further guidance on the information that should be collected for a design study. Also see Section 25-2.

PROJECT ACTIVITY (Phase I)

Activity Title: Conduct Environmental Survey (Field Phase)

Activity No.: 24

Responsible Unit: Project Study Group/Environmental Unit /BDE

Activity Description:

During the corridor study phase, BDE will have conducted a preliminary environmental inventory (Activity 06). For Activity 24, the project study group in conjunction with BDE will determine if further field work is necessary to verify or further evaluate the location, nature, and extent of potential resource involvement. For this Activity, the district forwards a request to BDE to conduct an environmental survey.

Based on the preliminary alignments identified in Activity 18, BDE will determine whether any further work is necessary to delineate the limits of or otherwise evaluate sensitive resources the project may affect. If determined necessary, BDE will coordinate, as appropriate, with the responsible agencies and the project study group for the field survey(s). BDE will provide the results of the reconnaissance survey(s) and any related studies for resource delineation or evaluation to the district.

The district will consider the environmental resource information in further development of the project and, for resources within the project limits (e.g., wetlands, natural areas, archaeological and historical sites), evaluate options for avoiding and minimizing the project's effects on the resources. If adverse effects to environmental resources cannot be avoided, the project study group/Environmental Unit, in cooperation with BDE, will evaluate whether any further studies of the resources are necessary. If further studies are needed, BDE will initiate action to have the studies accomplished, considering program priority and project scheduling.

The BDE will provide information to the district regarding environmental study findings, results of coordination with outside agencies, and any recommendations for further coordination or action by the district. This information will also be used by the district Environmental Unit in preparing the draft EIS.

For additional guidance on field surveys, see Chapter 27.

PROJECT ACTIVITY (Phase I)

Activity Title: Analyze Existing Conditions

Activity No.: 25

Responsible Unit: Project Study Group

Activity Description:

Using county or other area maps, USGS quadrangle topographic maps, aerial photography, the Corridor Report (Activity 17), data collected in Activity 23, and the environmental survey (Activity 24), the project study group will review and identify the following existing conditions:

- the locations of towns, streams, railroads, and other topographic features;
- condition of the existing highway network within the corridor;
- existing traffic and capacity deficiencies;
- crash information;
- alignment and profile deficiencies;
- existing and planned land uses from local governments, MPOs, fire districts, schools, etc.;
- existing drainage patterns;
- sensitive noise receptors;
- wetlands and applicable 4(f), 6(f), and 106 sites, etc.;
- special waste sites; and
- tree and vegetation inventory.

Upon receipt of the topographic mapping, plot the property lines, property names, names of roads, and all other important cultural features. Make paper copies of the mapping sheets and tape together. This procedure allows the project study group to review long lengths of the alignment in one view and to see how lines may best fit together. Begin laying out all feasible alignments.

After an alignment is laid out, determine the State plane coordinates of all control points (POTs and PIs) from the project mapping. Input this information and the radii of horizontal curves into a computer file to mathematically describe each alternative. Once an alignment is mathematized and tied into digitized mapping files, the alignment can then be stationed from west to east or south to north and the information stored as a computer file for further design work.

Provide the results of this activity to the district Environmental Unit to allow them to prepare the draft EIS.

PROJECT ACTIVITY (Phase I)

Activity Title: Initiate Early Coordination

Activity No.: 26

Responsible Unit: Project Study Group

Activity Description:

Activity 08 discusses early coordination within the context of a corridor study; the project study group will engage in a similar early coordinated effort for the design study.

At this stage of the design study process, the project study group will begin early coordination with other Department Units or Bureaus and governmental agencies (e.g., FHWA, Land Acquisition, Construction, Operations, Bridges and Structures, Utilities, environmental resource agencies). The purpose of this coordination will be to assist in the identification of reasonable alignment alternatives and in gathering information to evaluate the social, economic, and environmental impacts of the proposed project and possible impact mitigation measures. This coordination should begin as early as practical.

Provide the results of this activity to the district Environmental Unit to allow them to prepare the draft EIS.

Also see Section 25-2.

PROJECT ACTIVITY (Phase I)

Activity Title: Determine Reasonable Alignments

Activity No.: 27

Responsible Unit: Project Study Group/Environmental Unit/FHWA

Activity Description:

The project study group and district Environmental Unit, in cooperation with FHWA, accomplish the following coordination regarding development of the range of alternatives for the project:

1. Provide participating agencies and the public opportunities to provide input for consideration in development of the range of alternatives for the project, in accordance with Section 6002 of SAFETEA-LU (23 U.S.C. 139).
2. Achieve consensus with CSS stakeholders on the range of alternatives for the project.
3. Obtain concurrence from NEPA/404 Merger Agreement signatories on the range of alternatives to be carried forward.

The project study group in conjunction with the district Environmental Unit considers the results of the coordination in reducing the number of alternatives to a reasonable number that are representative of the spectrum of possible alternatives that satisfy the project purpose and need. This will typically be two to three alternatives, including the no-action alternative. An in-depth analysis will be conducted on each of the remaining alternatives (Activity 30).

Using the base maps prepared in Activity 18, the information gathered in Activities 23 and 24, and the analyses conducted in Activity 25, the project study group and district Environmental Unit revise or eliminate any alternative alignments that are undesirable because of adverse engineering, environmental, economic, or social effects. An estimate of costs may be necessary to further determine which alternatives may warrant elimination. Document the reason(s) why an alignment has been discarded. Include this information in the final Design Report and EIS. Ensure that each of the remaining alternatives still meets the project's defined purpose and need.

Also see Section 25-2.

PROJECT ACTIVITY (Phase I)

Activity Title:	Plot Existing/Proposed Topography, Typical Sections, Plan and Profile
Activity No.:	28
Responsible Unit:	Project Study Group

Activity Description:

For each remaining alternative alignment identified in Activity 27, conduct the following:

- If not already done, plot the existing topography including property lines, property owner names, business names and type, names of roads, and all other important geographic and cultural features.
- Determine the proposed typical sections.
- Determine the detailed horizontal alignment, including radii, stationing, and State plane coordinates of all control points (e.g., POTs, PIs, PCs, PTs).
- Investigate alternative vertical profiles for each alignment. This may require designing two to three trial vertical profiles and performing several complete earthwork calculations; see Sections 11-2.05 and 11-5.04(d).
- Once the geometric elements have been set, determine the preliminary right-of-way limits for each alternative.
- Determine the rough quantities for each alternative and refine the cost estimate for each alternative. If no quantities are available, use a generalized cost (e.g., cost per mile (kilometer)); see Sections 12-4 and 65-1.02.

The IDOT uses the computer software program GEOPAK for laying out alignments, profiles, cross section designs, quantity calculations, and for determining construction limits. The GEOPAK also can be used to generate 3-D and perspective plots for any portion of the roadway. Use 3-D plots in the design process to assess potential safety problems and the aesthetics of each alternative.

PROJECT ACTIVITY (Phase I)

Activity Title: Initiate Public Involvement

Activity No.: 29

Responsible Unit: Project Study Group/Environmental Unit

Activity Description:

This Activity will allow the public an opportunity for input and comment on the alternatives selected in Activity 27. Typically, this will consist of informational letters, advertisements, and/or meetings with local government officials, fire districts, school districts, drainage districts, historic commissions, MPOs, residents, businesses, etc. These meetings or letters may include:

- advising local, State, and Federal officials that a project has been initiated;
- procedures for developing possible coordination and public service involvement;
- a discussion on the project scope;
- a request for information (e.g., MPO plans, drainage problems, transit needs);
- a discussion with businesses, railroads, and utility companies; and
- talking with individuals at public information meetings about individual concerns.

Public coordination must be continuous throughout the project development.

For projects which the Regional Engineer has determined will use the principles of CSS, the public involvement process should commence once the project is assigned to the project study group. The project study group uses the SIP as outlined in Sections 19-5.01 to conduct public involvement for CSS projects.

For guidance on public coordination, see Chapter 19.

PROJECT ACTIVITY (Phase I)

Activity Title: Conduct In-Depth Analysis of Reasonable Alignments

Activity No.: 30

Responsible Unit: Project Study Group

Activity Description:

During the initial development of alignment alternatives, some analyses will have been conducted as attempts to fit various options into the project location. After the reasonable alignments have been identified (Activity 27) and the information is plotted on the plan sheets (Activity 28), further analyses will be necessary to assess the capability of each alternative to accomplish the project goals cost effectively. Conduct an in-depth analysis of each of the proposed alignments considering the social, economic, environmental, and engineering factors discussed in Part II “Project Development” and Part III “Environmental Procedures.”

The engineering and environmental analyses may include:

- intersection design studies,
- interchange type and design studies,
- capacity analysis,
- initial impact and mitigation alternatives,
- wetlands involvement,
- air and noise impacts,
- impacts on cultural resources,
- tree and vegetation evaluation,
- water quality and natural resources impacts, and
- soils evaluation.

After the results of these investigations have been analyzed, there may be legitimate reasons to eliminate one or more of the final alignment alternatives. Discuss the reason why these alignment(s) were not further considered in the Design Report and EIS. For instance, traffic estimates for the no-action alternative may overload existing routes creating unacceptable congestion and, thereby, eliminate this alternative.

The results of this and previous Activities will be submitted to the Hydraulics Unit, Geotechnical Unit, Bureau of Bridges and Structures, Environmental Unit, and Project Support Section to allow these Units to prepare their applicable reports for the Design Report.

Also see Section 25-2.

PROJECT ACTIVITY (Phase I)

Activity Title: Identify Recommended Alignment

Activity No.: 31

Responsible Unit: Project Study Group

Activity Description:

Considering the environmental, social, and economic impacts, engineering factors, and public input, the project study group will identify a preferred alignment through the corridor. If there are two or more alignments with essentially the same impact, the project study group still should select one recommended alignment. The final geometric and right-of-way design will be based on this recommended alignment. Also, this alignment should be presented as the recommended alignment at the public hearing (Activity 42).

PROJECT ACTIVITY (Phase I)

Activity Title:	Prepare Drainage Report
Activity No.:	32
Responsible Unit:	Hydraulics Unit

Activity Description:

Based on the information provided from the project study group (Activity 31), the Hydraulics Unit will perform the hydrology/hydraulics analysis, including the following:

- culvert sizing,
- longitudinal encroachments,
- storm drainage facilities,
- stormwater management, and
- pump stations.

Based on its evaluation, the Hydraulics Unit will prepare a Drainage Report. The project study group will use this information in making the final alignment determinations. It will also incorporate the Drainage Report into the final Design Report. See Chapter 40 and the *IDOT Drainage Manual* for more information on Drainage Reports.

PROJECT ACTIVITY (Phase I)

Activity Title: Prepare Geotechnical Report

Activity No.: 33

Responsible Unit: Geotechnical Unit

Activity Description:

Based on the information provided from the project study group (Activity 31), the Geotechnical Unit will prepare the Geotechnical Report. The analyses may include:

- basic soil properties (e.g., AASHTO soils classification);
- shrink/swell factors;
- properties of subsurface strata;
- potential for slides;
- slope stability at proposed cuts; and
- the development of a boring plan for any proposed bridges (e.g., location, spacing, and depth).

Based on its evaluation, the Geotechnical Unit will prepare a Geotechnical Report. The project study group will use this information in making the final alignment determinations. In addition, the Geotechnical Report will be incorporated into the final Design Report. See the *IDOT Geotechnical Manual* for more information.

PROJECT ACTIVITY (Phase I)

Activity Title: Prepare Bridge Drawings/Hydraulics Report

Activity No.: 34

Responsible Unit: Bureau of Bridges and Structures/Project Study Group

Activity Description:

Based on the information provided from the project study group (Activity 31), the Bureau of Bridges and Structures will prepare the Proposed Structure Sketch for major structures, which will illustrate:

- the type of structures,
- approximate horizontal and vertical alignment and skew,
- approximate pier locations, and
- typical bridge deck section.

The project study group will prepare this sketch for other than major structures.

See Chapter 39 for more information. The Bureau of Bridges and Structures will also prepare the Hydraulics Report for major structures. This will involve:

- the hydraulic analysis to determine the necessary dimensions of the waterway opening to pass the design flood, to meet the backwater allowances, and to satisfy any regulatory flood plain requirements;
- the hydraulic scour analysis to assist in determining the proper foundation design for the bridge; and
- a suggested freeboard elevation.

The project study group will prepare this report for other structures and the Bureau of Bridges and Structures will approve the report.

Incorporate the Structure Sketch and Hydraulics Report into the final Design Report.

PROJECT ACTIVITY (Phase I)

Activity Title: Conduct Preliminary Utility Review

Activity No.: 35

Responsible Unit: Project Support Section

Activity Description:

The project study group will provide the district Project Support Section with copies of the plan sheets for the recommended alignment. The Project Support Section will work with the applicable utility companies to identify project impacts on existing utilities and inform them of environmental issues that may affect their adjustments and relocations. The following items of work are typically performed:

1. Underground. The Project Support Section will coordinate with the district survey crew and will, if needed, request an underground survey to determine the depths and location of existing underground utilities within the project limits, especially fiber optic cables, water supply, and sanitary lines in urban areas.

2. Overhead. Determine if any major above-ground utilities that may be impacted by the project. The Project Support Section may prepare a cost estimate to determine if a special effort should be exercised to avoid certain utilities.

3. Impacts. The Project Support Section will notify any utility companies that will be potentially impacted by the upcoming project, and the Section will request that the Utility contact IDOT if it plans any work in the vicinity of the project.

The Project Support Section will document its findings in a report or memorandum and submit it to the project study group. The project study group will use the information in making the final alignment determinations and document its findings in the Design Report.

For additional guidance on utility coordination, see Chapter 6.

PROJECT ACTIVITY (Phase I)

Activity Title: Develop Transportation Management Plan

Activity No.: 36

Responsible Unit: Project Study Group

Activity Description:

The maintenance of traffic flow during construction of a State highway will involve traffic and worker safety, public relations, and capital costs to the Department. A well-planned method for maintaining traffic flow can minimize complaints from the traveling public and from residents and businesses along the affected route. Each construction site must be evaluated on its own merits as to the appropriate method for maintaining traffic. The Design Report should contain a Transportation Management Plan (TMP) indicating an overall strategy for accommodating traffic during construction. Chapter 13 presents the goals and objectives for a TMP. The TMP should address the preferred traffic control method, alternative traffic control applications, geometric design criteria, the impact traffic will have on other facilities, local concerns, cost effectiveness of various alternatives, etc. Chapter 55 and the *Highway Standards* provide the design criteria to use when designing a traffic control plan. In addition, consider the following:

- The TMP not only must address the alternatives confined to the project site, but it must also evaluate the impact traffic will have on the entire corridor.
- For large projects, a TMP team may be organized during Phase I to study the traffic control alternatives and their effect on the corridor. Section 13-1.08 provides guidance on the makeup and responsibilities of the TMP team.
- If improvements are required to other facilities (e.g., widening of detour routes), it is important that these improvements be implemented as soon as practical prior to construction of the mainline facility. Allow local agencies sufficient opportunity to complete their improvements before construction on the State route begins. Agreements or concurrence may be necessary between the State and local agencies to determine cost sharing arrangements and/or approval of a local road as a detour route (Activity 38).
- No formal public involvement activity (e.g., design hearing) should occur until the recommended alternative in the TMP Report has been approved by district Detour Committee. However, informal public involvement will be necessary during the analysis of alternatives.

PROJECT ACTIVITY (Phase I)

Activity Title: Obtain Detour Approval (if required)

Activity No.: 37

Responsible Unit: Project Study Group

Activity Description:

In general, TMP (Activity 36) will be approved as part of the Design Report. Exceptions to the approved TMP must be approved by the Bureau of Safety Programs and Engineering. For all marked and unmarked detours or for a road proposed to remain open by either stage construction or a runaround, TMP will be approved by the district Detour Committee. For a closed unmarked State highway, also coordinate with the local county officials prior to the submittal of the Design Report.

PROJECT ACTIVITY (Phase I)

Activity Title: Initiate Local Agency Letters of Intent/Understanding

Activity No.: 38

Responsible Unit: Project Support Section

Activity Description:

Based on the public involvement, decisions made in Activity 29, and the selection of the recommended alignment (Activity 31), the Project Support Section will initiate the preparation of any necessary letters of intent or letters of understanding with local officials. These may be prepared for:

- concurrence between the State and local agencies to determine cost sharing arrangements,
- approval of a local road as a detour route,
- determining maintenance responsibilities once the project is completed, and/or
- letters of support for the improvement.

For additional guidance, see Chapter 5.

PROJECT ACTIVITY (Phase I)

Activity Title: Set Pre-Final Geometry and Right-of-Way

Activity No.: 39

Responsible Unit: Project Study Group

Activity Description:

Based on the previous analyses for the recommended alignment (Activity 31) and information provided by others (Activities 32, 33, 34, and 35), the project study group will:

- make any necessary adjustments to the selected vertical and horizontal alignments;
- make any necessary adjustments to the typical sections;
- develop access control plans for freeways, expressways, and by-passes (see Section 11-5.04(f) and Chapter 35);
- set preliminary construction limits;
- set preliminary right-of-way limits;
- determine any easement requirements; and
- determine if any utility adjustments or displacements are necessary.

See Part IV “Roadway Design Elements” and Part V “Design of Highway Types” for detailed information on geometric design and the *IDOT Land Acquisition Manual* for guidance on right-of-way impacts.

PROJECT ACTIVITY (Phase I)

Activity Title: Prepare and Circulate Draft EIS

Activity No: 40

Responsible Unit: Environmental Unit/BDE/FHWA

Activity Description:

The district Environmental Unit, in cooperation with BDE and FHWA prepares the Draft EIS. To provide NEPA coverage of the corridor-phase study information, that information is summarized in the draft EIS.

When satisfied with the content, FHWA approves the Draft EIS for public availability. The district Environmental Unit coordinates with BDE and FHWA to have a Notice of Availability for the Draft EIS published in the *Federal Register,* which begins the minimum 45-day public comment period. See Chapter 25 for additional guidance on preparation of the Draft EIS, approval for public availability, and the *Federal Register* Notice of Availability.

PROJECT ACTIVITY (Phase I)

Activity Title: Prepare Draft Design Report

Activity No.: 41

Responsible Unit: Project Study Group

Activity Description:

Once the analyses have been conducted and the information gathered, the project study group will prepare the draft Design Report. Chapter 12 presents the format that should be used when preparing a Design Report. Because the design study should be essentially complete, it should be possible to prepare the draft Design Report in its near-final format. The discovery of new, significant information during the Public Hearing (Activity 42) should be rare if the design study has been properly developed. With the exception of changes necessary to reflect input from the public hearing (Activity 42), a final Design Report should only need information concerning the public involvement and the final conclusion/recommendation section.

In general, the draft Design Report for major new alignment projects should be submitted to BDE for review prior to its availability for public viewing and inspection at the Public Hearing. Formal approval by BDE for release is not normally issued. Copies made available to the public should be marked as “draft” or “preliminary.”

The Design Report should include:

- a summary of purpose and need of the project;
- a list and results of prior studies;
- a list of all alternative alignments eliminated earlier and the reasons for their elimination;
- a summary of major design features and policies;
- a discussion on the compatibility of the alternatives with existing streets and highways;
- a summary of the environmental factors considered;
- a discussion on the advantages and disadvantages of the reasonable alignments studied in-depth;
- the results of public involvement;
- the proposed maintenance and protection of traffic plan;
- a list of commitments made to the public;
- the reasons and determination for selecting the preferred alignment;
- plan and profile of the preferred alignment;
- the estimate of costs for each alternative;
- exhibits showing typical sections, aerial photography, mapping, etc.;
- copies of analyses; and
- documentation for approval of other reports conducted during the design study.

For further guidance on information to be included in the Design Report, see Chapter 12.

PROJECT ACTIVITY (Phase I)

Activity Title: Conduct Public Hearing

Activity No.: 42

Responsible Unit: Project Study Group/Environmental Unit

Activity Description:

No sooner than 15 days after publication of the Notice of Availability for the Draft EIS in the *Federal Register*, the project study group and district Environmental Unit conduct a Public Hearing. The purpose of the Public Hearing is to present to the public, and other interested organizations and agencies, the alignment alternatives under consideration and their anticipated social, economic, and environmental effects, a summary of the analyses for the various alternatives determined not to be feasible, and the criteria used to select the recommended alignment. Other Department Sections or Bureaus (e.g., Land Acquisition), as necessary, may attend the Public Hearing to answer specific questions relative to their expertise.

Corridor protection should also be addressed at the Public Hearing. Chapter 12 and the IDOT *Land Acquisition Manual* provide guidance on corridor protection.

The project study group and the district Environmental Unit evaluate all comments from the Public Hearing and prepare responses to these comments as appropriate. Possible responses include:

- modifying alternatives including the proposed action;
- developing and evaluating alternatives not previously given serious consideration;
- supplementing, improving, or modifying analyses;
- making factual corrections; or
- explaining why the comments do not warrant further agency response, citing the sources, authorities, or reasons that support that position and, if possible, indicating those circumstances that would trigger reappraisal or further response.

Chapter 19 discusses the requirements for public hearings, public information meetings, and responding to comments received during the public hearing.

Also see Section 25-2.

PROJECT ACTIVITY (Phase I)

Activity Title: Select Preferred Alignment

Activity No.: 43

Responsible Unit: Project Study Group/FHWA

Activity Description:

Based on the results of the public hearing, circulation of documents, and written and verbal comments received, the project study group will select the preferred alignment within the corridor. This may require additional analyses to resolve issues and questions raised during the Public Hearing.

The project study group, in cooperation with FHWA, conducts CSS coordination to achieve consensus with stakeholders on the preferred alignment and coordinates with NEPA/404 Merger Agreement signatories to obtain their concurrence on the preferred alignment.

The selected preferred alignment is used to prepare the final Design Report (Activity 46) and, consequently, for the detailed Phase II design.

PROJECT ACTIVITY (Phase I)

Activity Title: Prepare/Circulate Final EIS (FEIS)

Activity No.: 44

Responsible Unit: Environmental Unit

Activity Description:

The district Environmental Unit, in cooperation with BDE and FHWA, prepares the Final EIS. The FHWA conducts a legal sufficiency review and, when satisfied with the content, approves the Final EIS. The district Environmental Unit coordinates with BDE and FHWA to file the Final EIS with USEPA for publication of a Notice of Availability in the *Federal Register.*

The district Environmental Unit has the primary responsibility for circulating the FEIS which, basically, will be distributed to any entity which made substantive comments on the Draft EIS or requested a copy of the FEIS. See Chapter 25 for IDOT-specific information on circulating the FEIS and the procedures for processing the FEIS by FHWA and USEPA.

PROJECT ACTIVITY (Phase I)

Activity Title: Obtain Record of Decision

Activity No.: 45

Responsible Unit: Environmental Unit/FHWA

Activity Description:

The FHWA will complete and sign a Record of Decision no sooner than 30 days after publication of the Final EIS notice in the *Federal Register* or 90 days after publication of a notice for the Draft EIS, whichever is later. See Chapter 25 for further guidance on preparation and processing of the Record of Decision.

For projects with a high potential of litigation, FHWA in consultation with the Regional Engineer and Office of the Chief Counsel may publish a notice in the *Federal Register* regarding the 180-day Statute of Limitations (§139(l) notice), established in Section 6002 of SAFETEA-LU (23 U.S.C. 139), on claims against USDOT and other Federal agencies for certain environmental and other approval actions. A notice may be very useful in cases where there are no known potential litigants, but where there are complex or controversial issues or impacts that may generate opposition in the future, as the project moves into an implementation phase. A §139(l) notice will define the time period during which such "newly" interested parties must act on their views. If a project has no substantial known or likely opposition, then there may be little benefit from publication of a §139(l) notice.

PROJECT ACTIVITY (Phase I)

Activity Title: Prepare Final Design Report

Activity No.: 46

Responsible Unit: Project Study Group

Activity Description:

The comments received from the public and other agencies should be analyzed to determine if any changes are necessary in the draft Design Report and if any relevant issues have been overlooked. If an oversight has occurred, additional studies may be required to explain the resultant effects and determine what project design changes, if any, are necessary. After the review and analysis of comments is complete and appropriate revisions effected, the final Design Report may be prepared. Activity 41 and Chapters 11 and 12 list the appropriate format, reports, and discussions that should be included in the Design Report. The final Design Report will also include or reference a copy of the FEIS received from the district Environmental Unit.

After completing all public involvement and environmental requirements, the original scaled mapping is reduced for insertion into an appendix of the Design Report. Prepare the reduced mapping sheets and other engineering exhibits on 11 in x 17 in sheets and place them in an Appendix. In addition, place the aerial photography (access control plans) showing the alternatives advanced for environmental analysis and any other environmental exhibits on 11 in x 17 in sheets and place them in an Appendix. This Appendix can be used in conjunction with a draft and final EIS. Use the 11 in x 17 in format in all cases. This size format provides for ease of use of all final exhibits by Planning, Design, and Land Acquisition personnel.

PROJECT ACTIVITY (Phase I)

Activity Title: Obtain Design Approval

Activity No.: 47

Responsible Unit: Project Study Group

Activity Description:

The Regional Engineer reviews and approves most Phase I Engineering Reports. BDE reviews and approves Phase I Engineering Reports for those projects involving a major new alignment addressed by a Corridor Study, Feasibility Study, or Design Report, or where the Deputy Director/Regional Engineer has requested BDE assistance. See Section 12-5 for a discussion on the processing and approval of phase I reports.

Before submitting the final report for approval to the BDE/Regional Engineer, ensure that the following has been completed:

- the corridor has been approved;
- the applicable requirements in Part II “Project Development” and Part III Environmental Procedures” have been met;
- public involvement activities as described in Chapter 19 have been completed;
- the FEIS and Record of Decision have been approved by the appropriate agencies;
- if applicable, coordination with and approval from FHWA has been completed; and
- all design exceptions have been approved by BDE and, where necessary, FHWA.

Submit the following to the Regional Engineer or BDE:

- two copies of the Design Report and Appendices;
- the applicable number of copies of the FEIS as discussed in Figure 25-2.G;
- two copies of the Public Involvement Document;
- two copies of the Advisory Committee/Working Groups Document; and
- a memorandum describing the reasons for selecting the preferred alignment and design features, the items submitted, and the request for design approval.

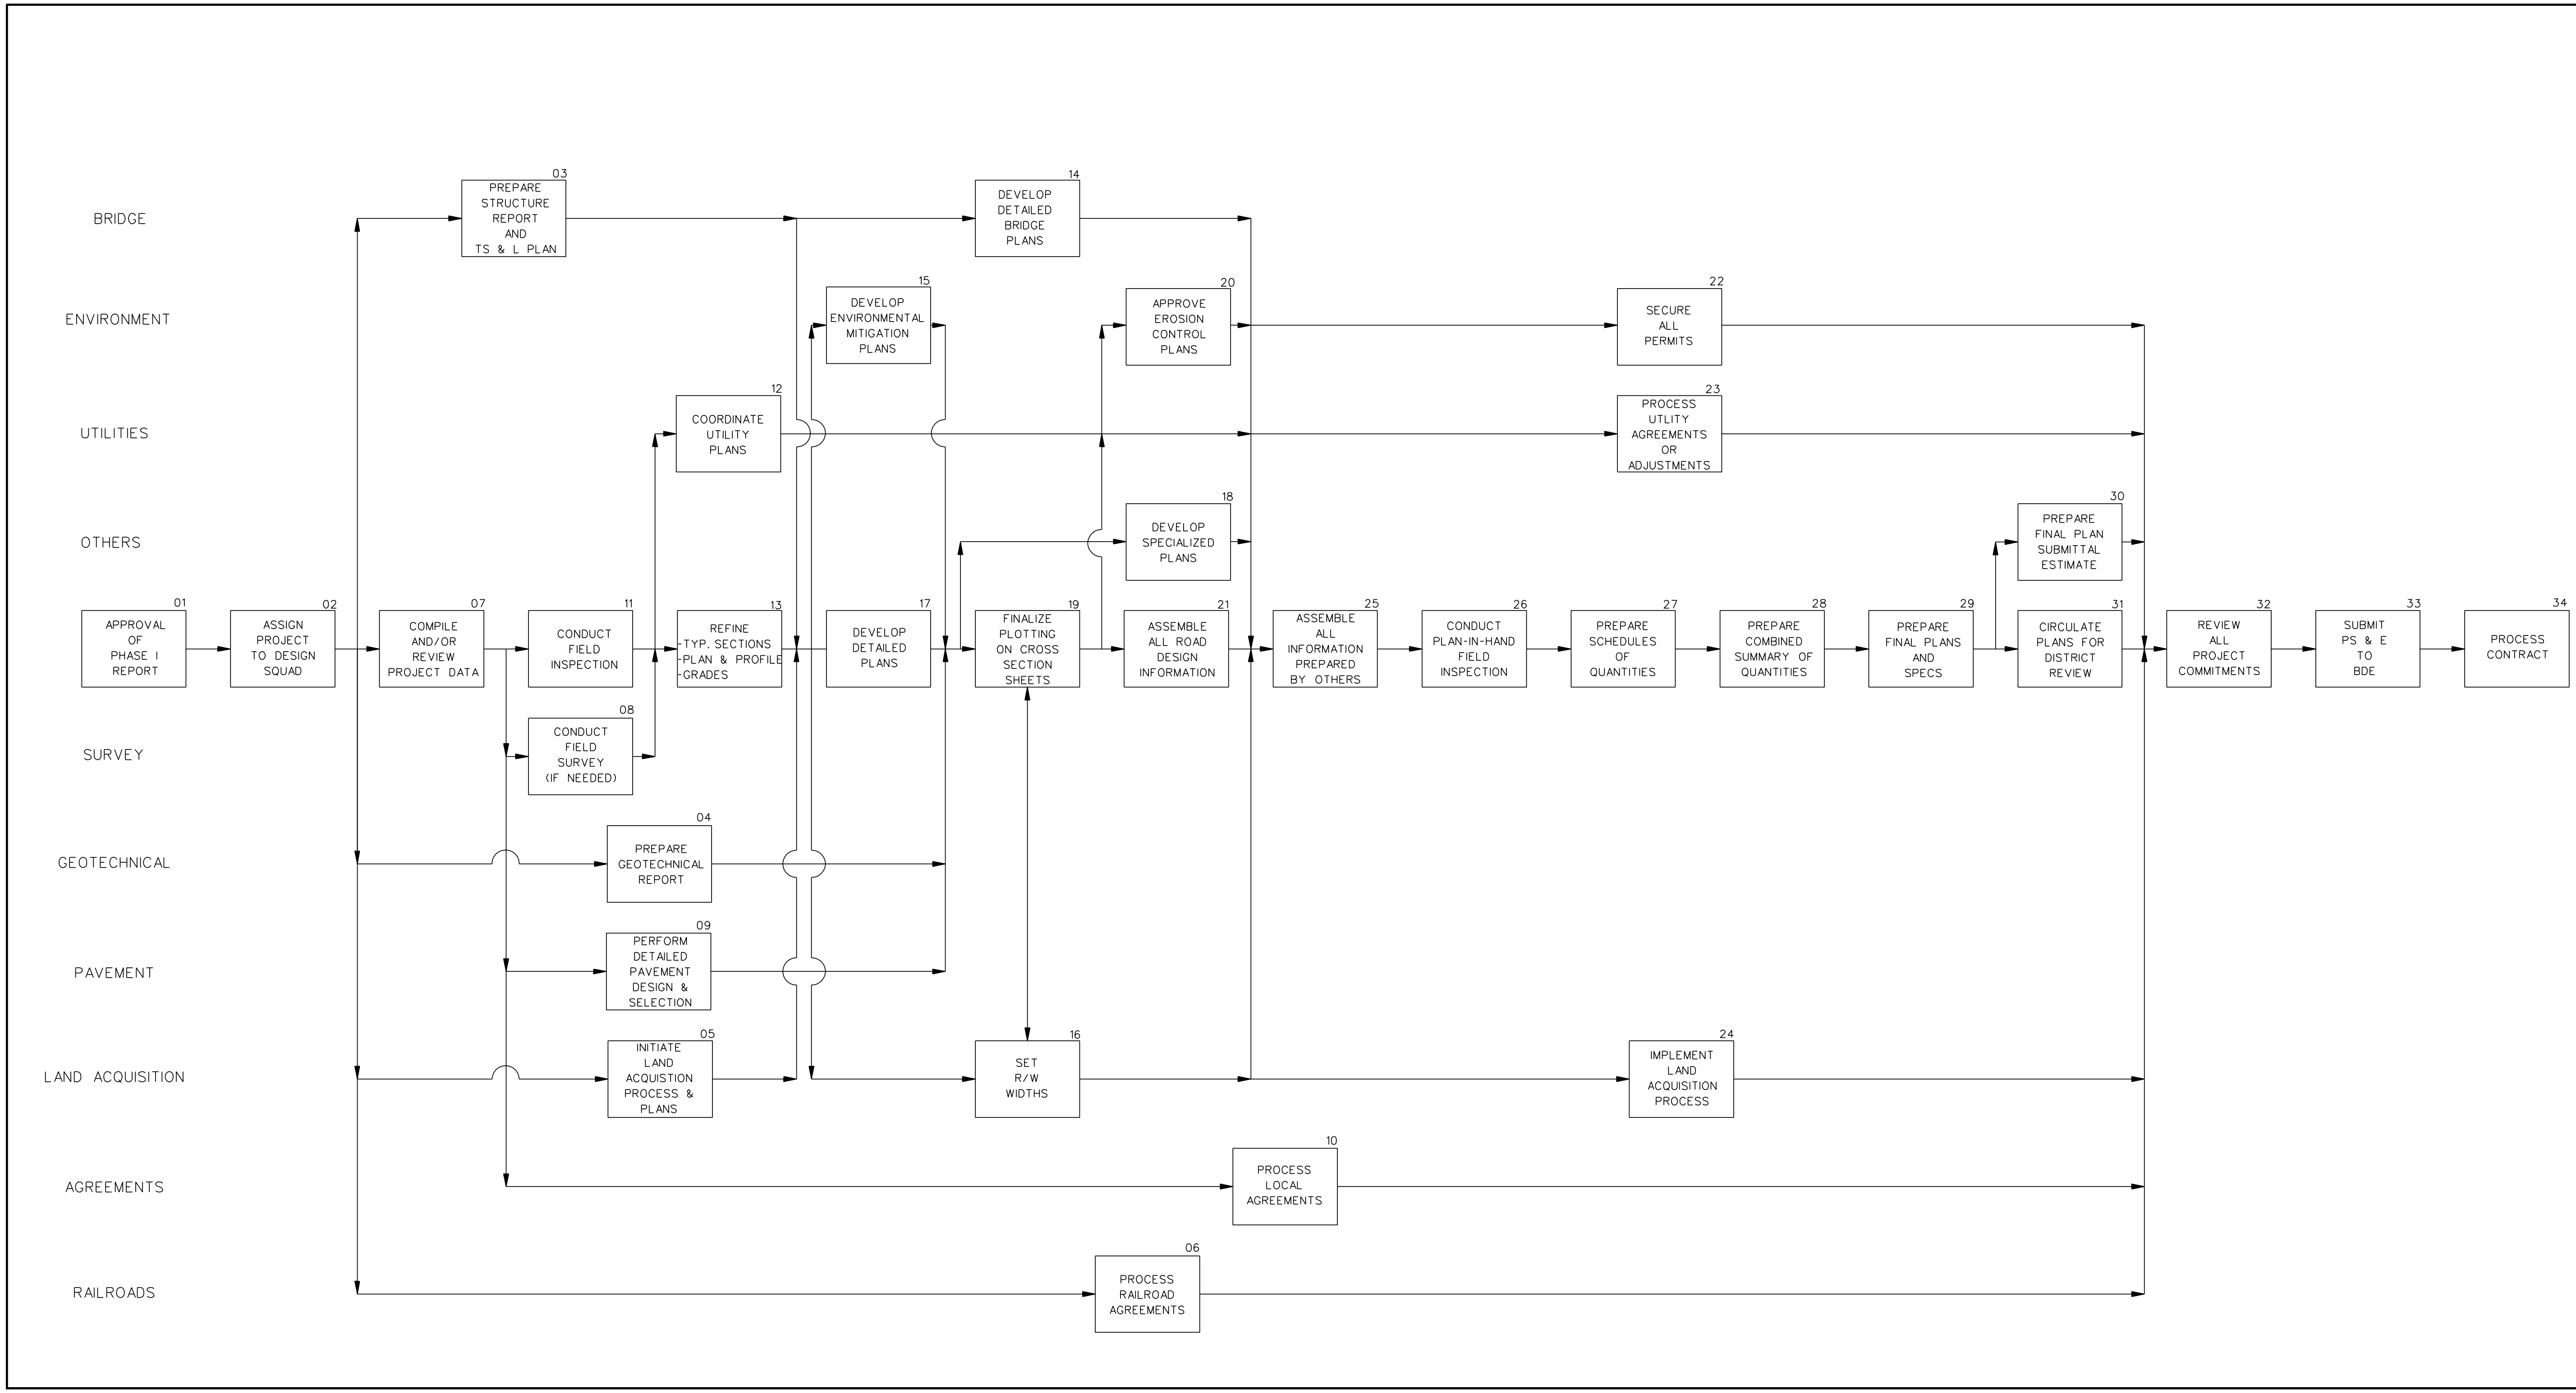
For projects requiring the approval of the Bureau Chief of Design and Environment, approval will be granted with concurrence of the Director of the Office of Program Development. The Secretary of IDOT and the Director of the Office of Planning and Programming will also be contacted on their desire for a briefing meeting before design approval will be granted.

2-3 PHASE II DESIGN

Figure 2-3.A illustrates a typical Phase II flowchart or network for a complex project on new alignment. Following Figure 2-3.A are brief write-ups for each activity. For other project types, see the flowcharts in Chapter 3. Activities along the main axis are normally performed by the project design squad. The other lines of the chart represent activities performed by other units or groups.

Refer to Section 11-7.03 for requirements and guidance on value engineering (VE) analyses. Where required, initiate the VE study no later than the time construction plans are 30% complete and allow for the implementation of the recommendations without delaying the project. The designer should review any VE studies conducted during Phase I and update them as necessary.

For projects deemed by FHWA as “Major Projects,” see Chapter 20.



PHASE II PROJECT DEVELOPMENT NETWORK
(New Alignments)

Figure 2-3.A

PROJECT ACTIVITY (Phase II)

Activity Title: Approval of Phase I Report

Activity No.: 01

Responsible Unit: Regional Engineer (or BDE)

Activity Description:

Once the Phase I report has been approved, this will signify that Phase I is complete and that Phase II can begin. See Figure 2-2.A and the corresponding write-ups for Phase I work. For guidance on the approval of Phase I reports, see Section 12-5.

PROJECT ACTIVITY (Phase II)

Activity Title: Assign Project to Design Squad

Activity No.: 02

Responsible Unit: Studies and Plans Engineer

Activity Description:

This Activity begins Phase II of the project. At this point, the project will either be assigned to a design squad within the district Bureau of Program Development or to a consultant. The Studies and Plans Engineer will have the overall day-to-day responsibility for advancing the project through the Phase II project development process. The Studies and Plans Engineer, or designee, will:

- coordinate directly with other units or sections within the Department;
- attend all internal meetings and field inspections;
- be responsible for ensuring that the project meets all Department criteria and procedures;
- ensure the project is on schedule for the expected letting date;
- report directly to the Program Development Engineer on all significant project activities, problems, and developments; and
- participate in the public involvement process.

PROJECT ACTIVITY (Phase II)

Activity Title: Prepare Structures Report and TS&L Plans

Activity No.: 03

Responsible Unit: Bureau of Bridges and Structures/Design Squad

Activity Description:

Based on the approved Phase I report (Activity 01) and notification by the design squad that Phase II has begun (Activity 02), the district will prepare the Structures Report and the Bureau of Bridges and Structures will prepare the Type, Size, and Location (TS&L) Plans for any bridges within the project limits. TS&L Plans are detailed bridge configuration plans that are used to develop the detailed bridge construction plans. The TS&L Plans will present the following:

- plan and profile of the bridge showing the proposed type of superstructure and foundation, bridge end elevations, location of expansion and fixed ends, highway approaches, and existing contours at the bridge site;
- superstructure cross section showing pertinent structural details (e.g., number of beams, depth and width of bridge deck);
- bridge curb, sidewalk, and/or shoulders;
- design loadings, stresses, specifications, and other structural criteria;
- controlling horizontal and vertical clearances;
- hydraulic data, high and low water elevations, drift, ice, etc.; and
- a small-scale location map to identify the location of the proposed bridge.

The Structures Report and TS&L Plans will be used in developing the detailed roadway plans (Activity 17). See Chapter 39 for more information on TS&L Plans and bridge sizing/geometrics.

For Phase II plans prepared by a Consultant, these activities may be the responsibility of the Consultant and approved by the Bureau of Bridges and Structures.

PROJECT ACTIVITY (Phase II)

Activity Title: Prepare Geotechnical Report

Activity No.: 04

Responsible Unit: Geotechnical Unit

Activity Description:

After being assigned the project (Activity 02), the design squad will request the Geotechnical Unit to investigate the geotechnical characteristics within the project limits based on the information provided in the approved Phase I report (Activity 01). The nature and depth of the investigation will be determined on a project-by-project basis. One of the primary factors which will determine the scope of the investigation will be the anticipated amount of earthwork for the project. The geotechnical investigation may include:

- an in-depth subsurface investigation (e.g., to determine the hydrogeologic characteristics of the subsurface);
- an evaluation of the potential for slides;
- an investigation of any wetlands in the vicinity of the project;
- for proposed cuts, a determination of the slope stability characteristics and the need for any special treatments (e.g., benching);
- testing of materials from the site by Department laboratory tests;
- an evaluation of any erosion potential within the project limits; and
- an evaluation of foundations for bridges and long culverts.

The Geotechnical Unit will prepare a Geotechnical Report documenting the findings from its investigation. The Report will be submitted to the design squad for input into the final typical section design for the facility.

PROJECT ACTIVITY (Phase II)

Activity Title: Initiate Land Acquisition Process and Plans

Activity No.: 05

Responsible Unit: Land Acquisition Section

Activity Description:

Based on the approved Phase I report (Activity 01) and notification by the design squad that Phase II has begun (Activity 02), the Land Acquisition Section will initiate the land acquisition process and the preparation of the right-of-way plans. This includes obtaining the existing right-of-way plans and researching the existing right-of-way status within the project limits, including:

- right-of-way titles and deeds,
- permanent easements,
- property lines and owners, and
- existing limits of access.

The preparation of right-of-way plans will include:

- setting up the sheets and stationing for the right-of-way plans,
- recording the section corner information,
- recording property ownership information,
- plotting the existing right-of-way, and
- developing parcel plats.

The Land Acquisition Section will forward this information to the design squad for use in preparation of the detailed roadway plans (Activity 17).

PROJECT ACTIVITY (Phase II)

Activity Title: Process Railroad Agreements

Activity No.: 06

Responsible Unit: Project Support Section

Activity Description:

The district provides information to BDE for the preparation and negotiation of formal agreements between the Department and the Railroad. This includes both railroad grade separation and at-grade crossing projects on the State highway system. Based on the approved Phase I report, the design squad should submit the necessary crossing data with sufficient lead time to allow for negotiations. Typically, a year or more is required.

The Agreement will cover:

- division of work and expense involved between IDOT and the Railroad for the crossing improvement;
- responsibilities for the future maintenance of the improvement;
- establishment of the Railroad's share of the cost as determined under the provisions of any one of the several classifications provided in the *Federal-Aid Policy Guide* and Section 7-1.02;
- reference to the acquisition of property rights (see Section 7-1.06);
- reimbursement of the costs incurred by the Railroad according to the requirements of the *Federal-Aid Policy Guide*;
- coverage of liability during construction operations; and
- reference to or identification of plans and plan approval.

The Project Support Section will coordinate the transfer of information and plans between the design squad and the railroad companies. This will be a continuous process as the design plans are developed during the Phase II design. This process should be completed prior to the review of all project commitments (Activity 32).

For additional guidance on coordinating with railroads, see Chapter 7.

PROJECT ACTIVITY (Phase II)

Activity Title: Compile and/or Review Project Data

Activity No.: 07

Responsible Unit: Design Squad

Activity Description:

The design squad may or may not include the same personnel as the project study group for Phase I. Also, there typically will be some delay between the Phase I and the Phase II portions of a project. Therefore, the design squad should review the Phase I report(s) and project files to become familiar with the decisions and determinations made during Phase I. Some of the information and decisions that should be reviewed may include:

- any design variances,
- alignment and typical section plans developed during Phase I,
- any technical reports prepared for the Phase I study,
- crash and traffic data,
- aerial photographs,
- the commitment file,
- the proposed TMP,
- documentation on public hearings and/or private meetings,
- letters of understanding and/or letters of intent sent to local officials,
- any utility involvement,
- any railroad involvement, and
- existing conditions to assess any changes in land use or development plans.

Based on this review, the design squad should evaluate what additional information and coordination with other units may be required to complete the project. The design squad also should ensure that other units as appropriate have initiated their work (e.g., Bureau of Bridges and Structures (Activity 03), Land Acquisition Section (Activity 05)). At this stage of the project, the design squad should request:

- if necessary, the Surveys and Photo Services Unit to conduct additional surveys (Activity 08);
- the Pavement Design Section to begin the pavement design and type selection (Activity 09); and
- the Project Support Section to begin processing any necessary local agency agreements (Activity 10).

PROJECT ACTIVITY (Phase II)

Activity Title: Conduct Field Survey (If Needed)

Activity No.: 08

Responsible Unit: Surveys and Photo Services Unit

Activity Description:

In general, a survey should have been conducted during the development of the Phase I study. However, based on the review of the project data (Activity 07), the design squad may conclude that additional surveys are required. The needed survey information may include:

- existing field conditions (topography, vegetation, existing structures and road design features, etc.);
- drainage features (bodies of water, open channels, channel slopes and cross sections, existing drainage appurtenances, etc.);
- existing field landmarks;
- existing utilities (above and below ground);
- existing right-of-way markers and property lines; and
- alignment and cross section of any existing roads and driveways.

PROJECT ACTIVITY (Phase II)

Activity Title: Perform Detailed Pavement Design and Selection

Activity No.: 09

Responsible Unit: Pavement Design Section

Activity Description:

Based on the information provided by the design squad (Activity 07) and Phase I report (i.e., Geotechnical Report), the Pavement Design Section will perform the detailed pavement design analysis. For new or full-depth reconstruction, the objectives of the analysis will be to:

- select the design methodology, pavement type, and design criteria (see Chapter 54);
- determine the overall pavement thickness and thicknesses of individual layers; and
- determine any special surfacing design features (e.g., high-stress intersections, subdrainage design, use of geotextiles).

The objective of Activity 09 is to develop and compare pavement design options. See Chapter 54 for additional guidance on pavement design and approval.

PROJECT ACTIVITY (Phase II)

Activity Title: Process Local Agreements

Activity No.: 10

Responsible Unit: Project Support Section

Activity Description:

The district Project Support Section is responsible for the preparation and negotiation of formal agreements between the Department and local governments. These agreements may cover:

- division of work and expense involved between IDOT and the local agency in connection with the improvement,
- responsibilities for the future maintenance of the improvement,
- reference to the acquisition of property rights,
- reimbursement of the costs incurred by the local agency,
- coverage of liability during construction operations, and
- reference to or identification of plans and plan approval.

The Project Support Section also will be responsible for coordinating the transfer of information and plans between the design squad and the local agency. This will be a continuous process throughout the design phase as the design plans are developed. The district Project Support Section also will coordinate with BDE for review and approval of any agreements. This process should be completed prior to the review of all project commitments (Activity 32).

For additional guidance on coordinating with local agencies, see Chapter 5.

PROJECT ACTIVITY (Phase II)

Activity Title: Conduct Field Inspection

Activity No.: 11

Responsible Unit: Design Squad

Activity Description:

After completing the in-house review of the Phase I report and other project data, the design squad should conduct a field inspection of the project. The objective is to review major design features and project-related issues and to identify any potential problems. The design squad will arrange the field inspection and invite, as appropriate, individuals from the following units to the field inspection:

- district Bureau of Project Implementation,
- BDE,
- Bureau of Bridges and Structures,
- district Environmental Unit,
- district Bureau of Operations,
- Land Acquisition Section,
- FHWA,
- local officials, and
- others as deemed appropriate.

The design squad will document the findings and decisions in the minutes of the field inspection.

PROJECT ACTIVITY (Phase II)

Activity Title: Coordinate Utility Plans

Activity No.: 12

Responsible Unit: Project Support Section

Activity Description:

After conducting the field inspection (Activity 11) and any additional field surveys (Activity 08), the design squad will forward the preliminary construction plans with any known utilities plotted to the district Project Support Section. The design squad will also notify the Project Support Section of any unique issues (e.g., environmental, commitments). The Project Support Section will coordinate the transfer of information and plans between the design squad and the utility companies. The utility companies will review IDOT's plans, plot their facilities if not already shown, and prepare the necessary utility adjustment/relocation plans. As the design squad refines the construction plans, this information will be submitted to the Project Support Section to be forwarded to the utility companies.

For guidance on preparing utility plans and coordinating with utility companies, see Chapter 6.

PROJECT ACTIVITY (Phase II)

Activity Title:	Refine Typical Sections, Plan and Profiles, Grades
Activity No.:	13
Responsible Unit:	Design Squad

Activity Description:

Based on the review of the plans (Activity 07), the field inspection (Activity 11), the field survey (Activity 08), the Phase I report, and the project's commitment file, the design squad will refine and/or prepare the project's:

- cover sheet;
- general notes sheet;
- typical sections;
- the plan and profile sheets;
- alignment, ties, and benchmark sheet, and
- construction limits.

Section 63-4 provides guidance on the information that should be included on these plan sheets.

PROJECT ACTIVITY (Phase II)

Activity Title: Develop Detailed Bridge Plans

Activity No.: 14

Responsible Unit: Bureau of Bridges and Structures

Activity Description:

Based on the Phase I report (Activity 01), the Structure Report and TS&L Plans (Activity 03), and other information provided by the design squad, the Bureau of Bridges and Structures will perform the detailed structural design for any bridges and/or major structures on the project. The basic objective of the detailed design phase is to perform the in-depth structural analyses that are necessary to prepare a set of construction plans for any structures. The structural analyses, as applicable, may include the:

- superstructure design (e.g., framing details, deck slab, camber diagram);
- substructure design (e.g., piers, abutments);
- foundation design;
- approach slab design; and
- bridge rail design.

Once the structural plan sheets are completed, the Bureau of Bridges and Structures will submit the full set of bridge plan sheets and the quantities, pay items, and specifications to the design squad for direct insertion into the final project plans. Activity 14 must be completed before the assembly of information prepared by others (Activity 25).

For Phase II plans prepared by a Consultant, these activities may be the responsibility of the Consultant and approved by the Bureau of Bridges and Structures.

PROJECT ACTIVITY (Phase II)

Activity Title: Develop Environmental Mitigation Plans

Activity No.: 15

Responsible Unit: Environmental Unit

Activity Description:

Based on the approved Phase I report (Activity 01) and the typical sections and plan and profiles sheets (Activity 13), the district Environmental Unit, in consultation with BDE, as appropriate, will prepare the environmental mitigation plans, quantities, and specifications for direct insertion into the final construction plans. This may include wetlands compensation plans, Special Provisions for management and monitoring of special wastes, purchase of replacement lands, memorandums of agreements, etc. The Environmental Unit will ensure that the commitments made in Phase I of the project are incorporated into the plans.

See Section 25-2.

PROJECT ACTIVITY (Phase II)

Activity Title: Set Right-of-Way Widths

Activity No.: 16

Responsible Unit: Land Acquisition Section

Activity Description:

Based on the information gathered in developing the Right-of-Way Plan Sheets (Activity 05) and the submittal of the construction limits by the design squad (Activity 13), the Land Acquisition Section will determine the right-of-way widths for the project. The Land Acquisition Section will forward this information to the design squad, which will incorporate this information on the plan and profile sheets.

This information also will be used to initiate the land acquisition process (Activity 24).

PROJECT ACTIVITY (Phase II)

Activity Title: Develop Detailed Plans

Activity No.: 17

Responsible Unit: Design Squad

Activity Description:

Once the design squad has received the Structure Report and TS&L Plans from the Bureau of Bridges and Structures (Activity 03) and the right-of-way plans from the Land Acquisition Section (Activity 05), the design squad can prepare the detailed sheets which will be incorporated into the construction plans. This may include the following:

- stages of construction and temporary traffic control sheets;
- drainage sheets, including special drainage details;
- intersection details;
- interchange details;
- pavement marking details;
- grading plans;
- transition details;
- proposed cross sections, not including pavement template;
- special bikeway and trails plans;
- signing plans, if not prepared by the Bureau of Operations;
- environmental mitigation plans, if not prepared by others;
- highway lighting plans, if not prepared by others; and
- any other special details.

Section 63-4 presents guidance on what information should be included on each detail or plan sheet.

In addition, the design squad will:

- determine the appropriate level of access control for the facility;
- determine the need for construction permits, permanent right-of-way easements, and/or temporary easements;
- perform the detailed drainage design;
- perform a roadside safety analysis; and
- incorporate any special experimental features into the plans.

PROJECT ACTIVITY (Phase II)

Activity Title: Develop Specialized Plans

Activity No.: 18

Responsible Unit: Various Units

Activity Description:

Based on the typical sections, plan and profile sheets (Activity 13), and detailed plan sheets (Activity 17), various other units within IDOT will prepare their applicable plan sheets, quantities, and special provisions. This may include:

- district Bureau of Operations preparing the landscaping details;
- district Bureau of Operations preparing the signing plans, if included within the project;
- district Bureau of Operations (or Bureau of Electrical Operations in District 1) preparing the traffic signal plans;
- Bureau of Operations, BDE, and design squad developing rest area plans (see Section 16-1);
- Bureau of Operations, BDE, Bureau of Bridges and Structures, Capital Development Board, and the design squad developing weigh stations and weigh-in-motion plans; and/or
- BDE (or Bureau of Electrical Operations in District 1) preparing the highway lighting plans.

In addition, the following units may review the detailed plans prepared by the design squad (Activity 17):

- district Bureau of Operations will review the pavement marking details and stage construction and traffic control plans.
- district Bureau of Project Implementation will review the stage construction and traffic control plans.
- district Hydraulics Section will review the drainage plans and special drainage detail sheets.
- BDE will review bikeway and trail plans.
- district Environmental Unit will review the environmental mitigation plans, if prepared by the design squad.

PROJECT ACTIVITY (Phase II)

Activity Title: Finalize Plotting on Cross Sections

Activity No.: 19

Responsible Unit: Design Squad

Activity Description:

During Phase I, the cross sections may have been generated using GEOPAK to determine the earthwork quantities. Using the following information, update and plot the revised cross sections:

- the TS&L Plans from the Bureau of Bridges and Structures (Activity 03);
- the environmental mitigation plans from the district Environmental Unit (Activity 15);
- information received from the Project Support Section on utility plans (Activity 12);
- the refined typical sections and plan and profile sheets (Activity 13);
- the detailed plans (Activity 17);
- the Geotechnical Report from the Geotechnical Section (Activity 04);
- the final pavement design from the Pavement Design Section (Activity 09); and
- right-of-way information provided by the Land Acquisition Section (Activity 16).

Also during Activity 19, develop the erosion control plans and specifications according to the criteria in Chapter 41 and the information provided in the Phase I report. These plans and specifications will be submitted to the district Environmental Unit for review and approval (Activity 20).

PROJECT ACTIVITY (Phase II)

Activity Title: Approve Erosion Control Plans

Activity No.: 20

Responsible Unit: Environmental Unit

Activity Description:

The district Environmental Unit will review and approve the erosion control plans and specifications prepared by the design squad (Activity 19). Once approval has been granted, the erosion control plans will be incorporated into the construction plans (Activity 25). Also, once the erosion control plans have been approved, the Environmental Unit can initiate the process of securing the necessary project permits (Activity 22).

PROJECT ACTIVITY (Phase II)

Activity Title: Assemble All Road Design Information

Activity No.: 21

Responsible Unit: Design Squad

Activity Description:

Throughout the design process, the design squad will have prepared the various plan sheets separately. In Activity 21, conduct the following:

- plot a complete set of plans developed to date (e.g., cover sheet, typical plans, plan and profile sheets, detail plans, cross sections);
- assemble the sheets in the recommended order as noted in Chapter 63;
- review the plans and details to ensure that all necessary information has been included and that the plans and details are compatible with each other;
- calculate the quantities for roadway design elements according to the criteria in Chapter 64 of the *BDE Manual*, the *Coded Pay Items*, and the *Standard Specifications for Road and Bridge Construction* for pay items, units of measurement, rounding conventions, etc.; and
- prepare all required special provisions.

At this time, the Schedules of Quantities and the Summary of Quantities will not yet be prepared. For assembly purposes, blank Schedule of Quantities and Summary of Quantities may be included.

PROJECT ACTIVITY (Phase II)

Activity Title: Secure All Permits

Activity No.: 22

Responsible Unit: Environmental Unit

Activity Description:

After the cross sections have been finalized, the erosion control plans have been completed (Activity 19) and approved (Activity 20), the typical sections and plan and profiles sheets have been completed (Activity 13), and the detailed bridge plans have been completed (Activity 14), the district Environmental Unit will ensure all applicable permits and approvals required by the project are obtained. Depending upon the project-specific impacts, this may include any or all of the following:

- Section 401 water quality certification and 402 permits from the Illinois Environmental Protection Agency;
- U.S. Army Corps of Engineers, Section 404/Section 10 permit(s);
- U.S. Coast Guard, Section 9 permit; and
- permits issued by Illinois State agencies.

All permits, certifications, and approvals should be received by the Department prior to the review of all project commitments (Activity 32).

Chapter 28 provides a brief description of all Federal and State environmental permits and certifications.

PROJECT ACTIVITY (Phase II)

Activity Title:	Process Utility Agreements or Adjustments
Activity No.:	23
Responsible Unit:	Project Support Section

Activity Description:

Based on the roadway plans (Activities 13, 17, and 19), the detailed bridge plans (Activity 14), and the initial utility plans (Activity 12), the Project Support Section will work with the impacted utility companies and municipalities to implement the utility process. This process may include the following:

1. Plan Preparation. The utility companies are responsible for preparing all utility adjustment/relocation plans. The plans will be developed according to the criteria in Chapter 6.

2. Funding. Depending on the right-of-way ownership for existing and proposed utility locations, transportation funds may be eligible for utility adjustments/relocations required by the highway project; see Chapter 6. The Utilities pay for all betterments.

3. Agreements. The Project Support Section will prepare a Utility Agreement for each affected utility and will work with the utility companies to gain their input and approval. The Project Support Section will coordinate with BDE for review and approval of the agreements.

The Project Support Section will ensure that the utility process is completed before the review of all project commitments (Activity 32).

PROJECT ACTIVITY (Phase II)

Activity Title: Implement Land Acquisition Process

Activity No.: 24

Responsible Unit: Land Acquisition Section

Activity Description:

Based on the right-of-way plans (Activity 05), the final typical section and plan and profile sheets (Activity 13), and the right-of-way width determination (Activity 16), the Land Acquisition Section will implement the land acquisition procurement process. This will include the land acquisition functions of appraisal, negotiation, acquisition and, if necessary, condemnation. The Land Acquisition Section will also negotiate the terms of any construction permits, permanent easements, and/or temporary easements.

The Land Acquisition Section will ensure that the land acquisition procurement process is completed before the final review of all project commitments (Activity 32).

The Land Acquisition Section should coordinate with the design squad to ensure any negotiated considerations/commitments are included in the contract plans.

PROJECT ACTIVITY (Phase II)

Activity Title: Assemble All Information Prepared by Others

Activity No.: 25

Responsible Unit: Design Squad

Activity Description:

At this stage of project development, the design squad will have received the following completed plans, special provisions, pay items, and quantities from other IDOT units:

- the bridge/structure plans from the Bureau of Bridges and Structures (Activity 14);
- the landscaping details from the district Bureau of Operations (Activity 18);
- if included in the project, the signing plans from the district Bureau of Operations (Activity 18);
- the traffic signal plans from the district Bureau of Operations (or Bureau of Electrical Operations in District 1) (Activity 18);
- rest area plans from the Bureau of Operations and BDE (Activity 18);
- weigh stations and weigh-in-motion plans from the Bureau of Operations, BDE, Bureau of Bridges and Structures, and Capital Development Board (Activity 18); and
- the highway lighting plans from BDE (or Bureau of Electrical Operations in District 1) (Activity 18).

In addition, the design squad will have received approval of the erosion control plans from the district Environmental Unit (Activity 20) and right-of-way widths from the Land Acquisition Section (Activity 16).

The design squad will review these materials 1) to identify and incorporate any information which must be incorporated directly into the detailed road design plans and 2) to assemble those plan sheets prepared by others into the overall set of construction plans.

PROJECT ACTIVITY (Phase II)

Activity Title: Conduct Plan-in-Hand Field Inspection

Activity No.: 26

Responsible Unit: Design Squad

Activity Description:

At this stage of project development, all major design work has been completed, including roadway design, traffic items, structural elements, erosion control plans, right-of-way design, etc. The design squad is responsible for scheduling the Plan-in-Hand (PIH) review of the project. The PIH review is an in-depth office and on-site review of all project elements to ensure that all details and commitments have been satisfactorily incorporated into the construction plans and specifications, and that the project is nearly ready to advance to construction.

As applicable, the design squad will invite the following to conduct an office and PIH field inspection:

- district Bureau of Project Implementation,
- BDE,
- district Bureau of Operations,
- Bureau of Bridges and Structures,
- FHWA,
- local officials, and
- others as deemed appropriate.

Once the PIH office and field inspection has been completed, the design squad will prepare the PIH minutes to document all significant decisions made during the PIH review. After approval by the Program Development Engineer, distribute the PIH minutes to:

- all applicable Bureau Chiefs;
- Regional Engineer;
- all parties involved in the field review;
- FHWA, if applicable; and
- any other individuals or sections as deemed appropriate.

All parties receiving a copy of the PIH minutes are requested to provide comments on the minutes. Concurrence of the minutes will be assumed if no comments are received by the specified date.

PROJECT ACTIVITY (Phase II)

Activity Title: Prepare Schedules of Quantities

Activity No.: 27

Responsible Unit: Design Squad

Activity Description:

Based on any modifications due to the Plan-in-Hand field inspection (Activity 26), the design squad will refine the project quantities for the roadway design items developed during Activity 21. Using these quantities and those provided by other IDOT units (Activity 25), the design squad will prepare the Schedule of Quantities sheets according to the criteria presented in Chapter 64. These quantities will be incorporated onto the Summary of Quantities Sheet (Activity 28).

PROJECT ACTIVITY (Phase II)

Activity Title: Prepare Combined Summary of Quantities

Activity No.: 28

Responsible Unit: Design Squad

Activity Description:

Using the quantities developed in Activity 21, refined in Activity 27, and those provided by other IDOT units (Activity 25), the design squad will prepare the Summary of Quantities sheets, which will summarize all pay items necessary to construct the improvement. It also should include the applicable construction and safety code items, pay item code numbers, units of measurement, total quantities, and quantity breakdown for each section. One or more summary sheets typically will be included in each set of plans. Do not show other data on the summary sheets (e.g., general notes). When preparing the Summary of Quantities sheets, it is important that all quantities be calculated and segregated accordingly prior to completing the Summary of Quantities.

The Design Squad should coordinate with the Project Support Section to ensure that the percentages and cost breakdown in the Summary of Quantities and the Local Agency agreements are identical.

For additional guidance on preparing the Summary of Quantities, see Section 63-4.

PROJECT ACTIVITY (Phase II)

Activity Title: Prepare Final Plans and Specifications

Activity No.: 29

Responsible Unit: Design Squad/Others

Activity Description:

Based on the Plan-in-Hand Review and minutes (Activity 26), all bureaus and sections responsible for their respective project plans will make all necessary plan and specifications revisions. This will produce the final set of project plans ready for construction. Specifically for the design squad, the design squad will be responsible for revising the roadway plans and specifications. Once completed, the plans will be distributed for district review (Activity 31) and will allow the District Estimating Engineer to prepare the Final Plan Submittal Estimate.

Complete quality control/quality assurance (QC/QA) prior to the plans being circulated for district review.

PROJECT ACTIVITY (Phase II)

Activity Title: Prepare Final Plan Submittal Estimate

Activity No.: 30

Responsible Unit: District Estimating Engineer

Activity Description:

Based on the information from the final plans and specifications (Activity 29), the District Estimating Engineer will prepare the final district cost estimate. This may be a new estimate or an update of an earlier cost estimate prepared during Phase I or a revised cost estimate prepared during Phase II. This estimate will be submitted to the BDE Project Management Unit, which will use it to develop the Engineer's Estimate.

Chapter 65 provides guidance on the preparation of project cost estimates.

PROJECT ACTIVITY (Phase II)

Activity Title: Circulate Plans for District Review

Activity No.: 31

Responsible Unit: Design Squad

Activity Description:

Once all revisions from the Plan-in-Hand Review and minutes have been made to the plans and specifications, the design squad will submit a completed set of construction plans to the district units involved with the project for final review and comment. Typically, this review will consist of:

- reviewing the plans to ensure the reviewer's comments from previous reviews have been incorporated;
- ensuring that the changes do not conflict with the bureau's commitments; and
- ensuring that the plans conform to the Department's design criteria.

If changes are requested at this point which are desirable, but not mandatory, the Studies and Plans Engineer will determine if they should be incorporated. This will depend on other factors which may preclude the changes from being added to the plans. If another bureau determines the changes still should be incorporated, an appeal can be made to the Program Development Engineer for their incorporation.

PROJECT ACTIVITY (Phase II)

Activity Title: Review all Project Commitments

Activity No.: 32

Responsible Unit: Design Squad

Activity Description:

At this point in project development, the project design is essentially complete. The design squad must ensure that the following elements have been completed and/or have been incorporated into the plans:

- all environmental permits have been secured (Activity 22);
- all utility agreements and adjustments have been processed and signed (Activity 23);
- the final district cost estimate has been completed (Activity 30);
- the land acquisition process has been completed (Activity 24);
- all local agreements and letters of understanding have been processed and signed (Activity 10);
- all railroad agreements have been processed and signed (Activity 06); and
- all commitments made during the project development, including those made during Phases I and II, have been incorporated.

The design squad must carefully review all minutes of meetings, transcripts of public hearings, and the project study files to ensure that all commitments have been incorporated. If there are any questions, the design squad should contact the preparer of the Phase I report or the Unit making the commitment during Phase II.

If it is discovered during the plan development that a change is required to the approved Phase I report or a commitment cannot be met, the design squad must immediately notify BDE and all other applicable units so that the appropriate action can be taken. Failure to provide the appropriate notification and review may result in project delay.

PROJECT ACTIVITY (Phase II)

Activity Title: Submit PS&E to BDE

Activity No.: 33

Responsible Unit: Design Squad

Activity Description:

Once the plans are complete and the design squad has ensured all commitments, agreements, permits, etc., are complete or have been incorporated, the design squad will submit the following items to the BDE Program Support Unit:

- the Certification Acceptance/Project Status form, signed by the Regional Engineer;
- a cover sheet signed by the Regional Engineer indicating his/her approval of the plans;
- one complete set of full-size plans on reproducible paper, mylar, or vellum (see Chapter 63 for the Department's guidelines on preparing plan sheets);
- one copy of each special provision required for the project, including a copy of the electronic file in Microsoft Word format (see Section 66-1.04 for the procedures on developing special provisions);
- a completed Recurring Special Provision check sheet (see Chapter 66);
- the project quantities on Form BD-213 or BDE approved equal (see Chapter 64 for the procedures on determining plan quantities);
- the expected construction time for the project (see Section 66-2.03 for the Department's guidelines on determining the expected construction time); and
- copies or originals of all permits and agreements.

To place an improvement on any specific letting, it is imperative that the plans and supporting documents be submitted according to the schedules established in Section 66-2 which indicate the minimum number of weeks prior to the letting date for the submittal or completion of a particular phase of work.

PROJECT ACTIVITY (Phase II)

Activity Title: Process Contract

Activity No.: 34

Responsible Unit: BDE

Activity Description:

Once BDE has received the plans and other information from the district (Activity 33), it will conduct the following:

- prepare the Engineer’s Estimate;
- verify that the plans are on the list of recommended projects;
- check the Certification Acceptance /Project Status Form;
- verify the project is programmed and the scope of work is correct;
- determine the final funding source;
- check all agreements to ensure they are consistent with the project;
- submit the plans, special provisions, quantities, etc., for review and comment;
- prepare the Transportation Bulletin and advertise the project;
- if necessary, submit the PS&E to FHWA for approval;
- prepare the contract proposal;
- submit the proposal and plans to bidders;
- implement the letting process;
- review all bids; and
- execute the contract.

For additional guidance on the contract process, see Chapter 66.

Chapter Three

PROJECT DEVELOPMENT NETWORK
(Existing Alignment)

Chapters 2 and 3 document the basic approach used by IDOT in its project development process. Chapter 2 presents Phase I and Phase II networks for projects on new alignment. Chapter 3 presents Phase I and Phase II networks for projects on existing alignment requiring major right-of-way acquisitions (e.g., converting a two-lane facility to an expressway), minor right-of-way acquisitions (e.g., 3R projects), and projects with no right-of-way acquisition (e.g., Interstate Resurfacing, SMART, 3P). Chapters 2 and 3 present networks that graphically illustrate the development of "typical" highway projects.

3-1 GENERAL

The flowcharts in this chapter present networks that graphically illustrate the general process for Phase I and Phase II projects on existing alignments. Following each flowchart is a brief description of each activity within the network. When using these flowcharts, consider the following:

1. Precedence Activity Network. The networks or flowcharts are precedence activity networks. An "activity" occurs when a significant, discrete event occurs and/or when the responsibility for the project (activity) is transferred from one unit to another. The "precedence" nature of the network implies that an activity cannot occur until all activities preceding that one have been completed. However, the user must be aware that some flexibility is necessary to apply this network to project development, especially during Phase I. For example, identifying new information during the public involvement stage may require the project study group to return to a previous activity and gather additional data.

2. Project Application. These networks represent an approximate process for a complex project on existing alignment. Not every activity will be applicable to every project and not all activities are shown. However, the user should find that projects developed according to this process have fewer management problems.

   The illustrated network assumes a project designed in-house. The process for a consultant-designed project will be similar, except that communication lines exist between IDOT and the consultant for IDOT review and approval.

3. Lines of Communication. The rigid application of the network would lead to predetermined, precise points at which communication occurs between units. This is neither realistic nor desirable. Communication between units must be continuous. This will result in fewer problems and fewer "surprises" in project development.

4. Value Engineering. Refer to Section 11-7.03 for requirements and guidance on value engineering (VE) analyses. Where required, initiate the VE study no later than the time construction plans are 30% complete and allow for the implementation of the recommendations without delaying the project.

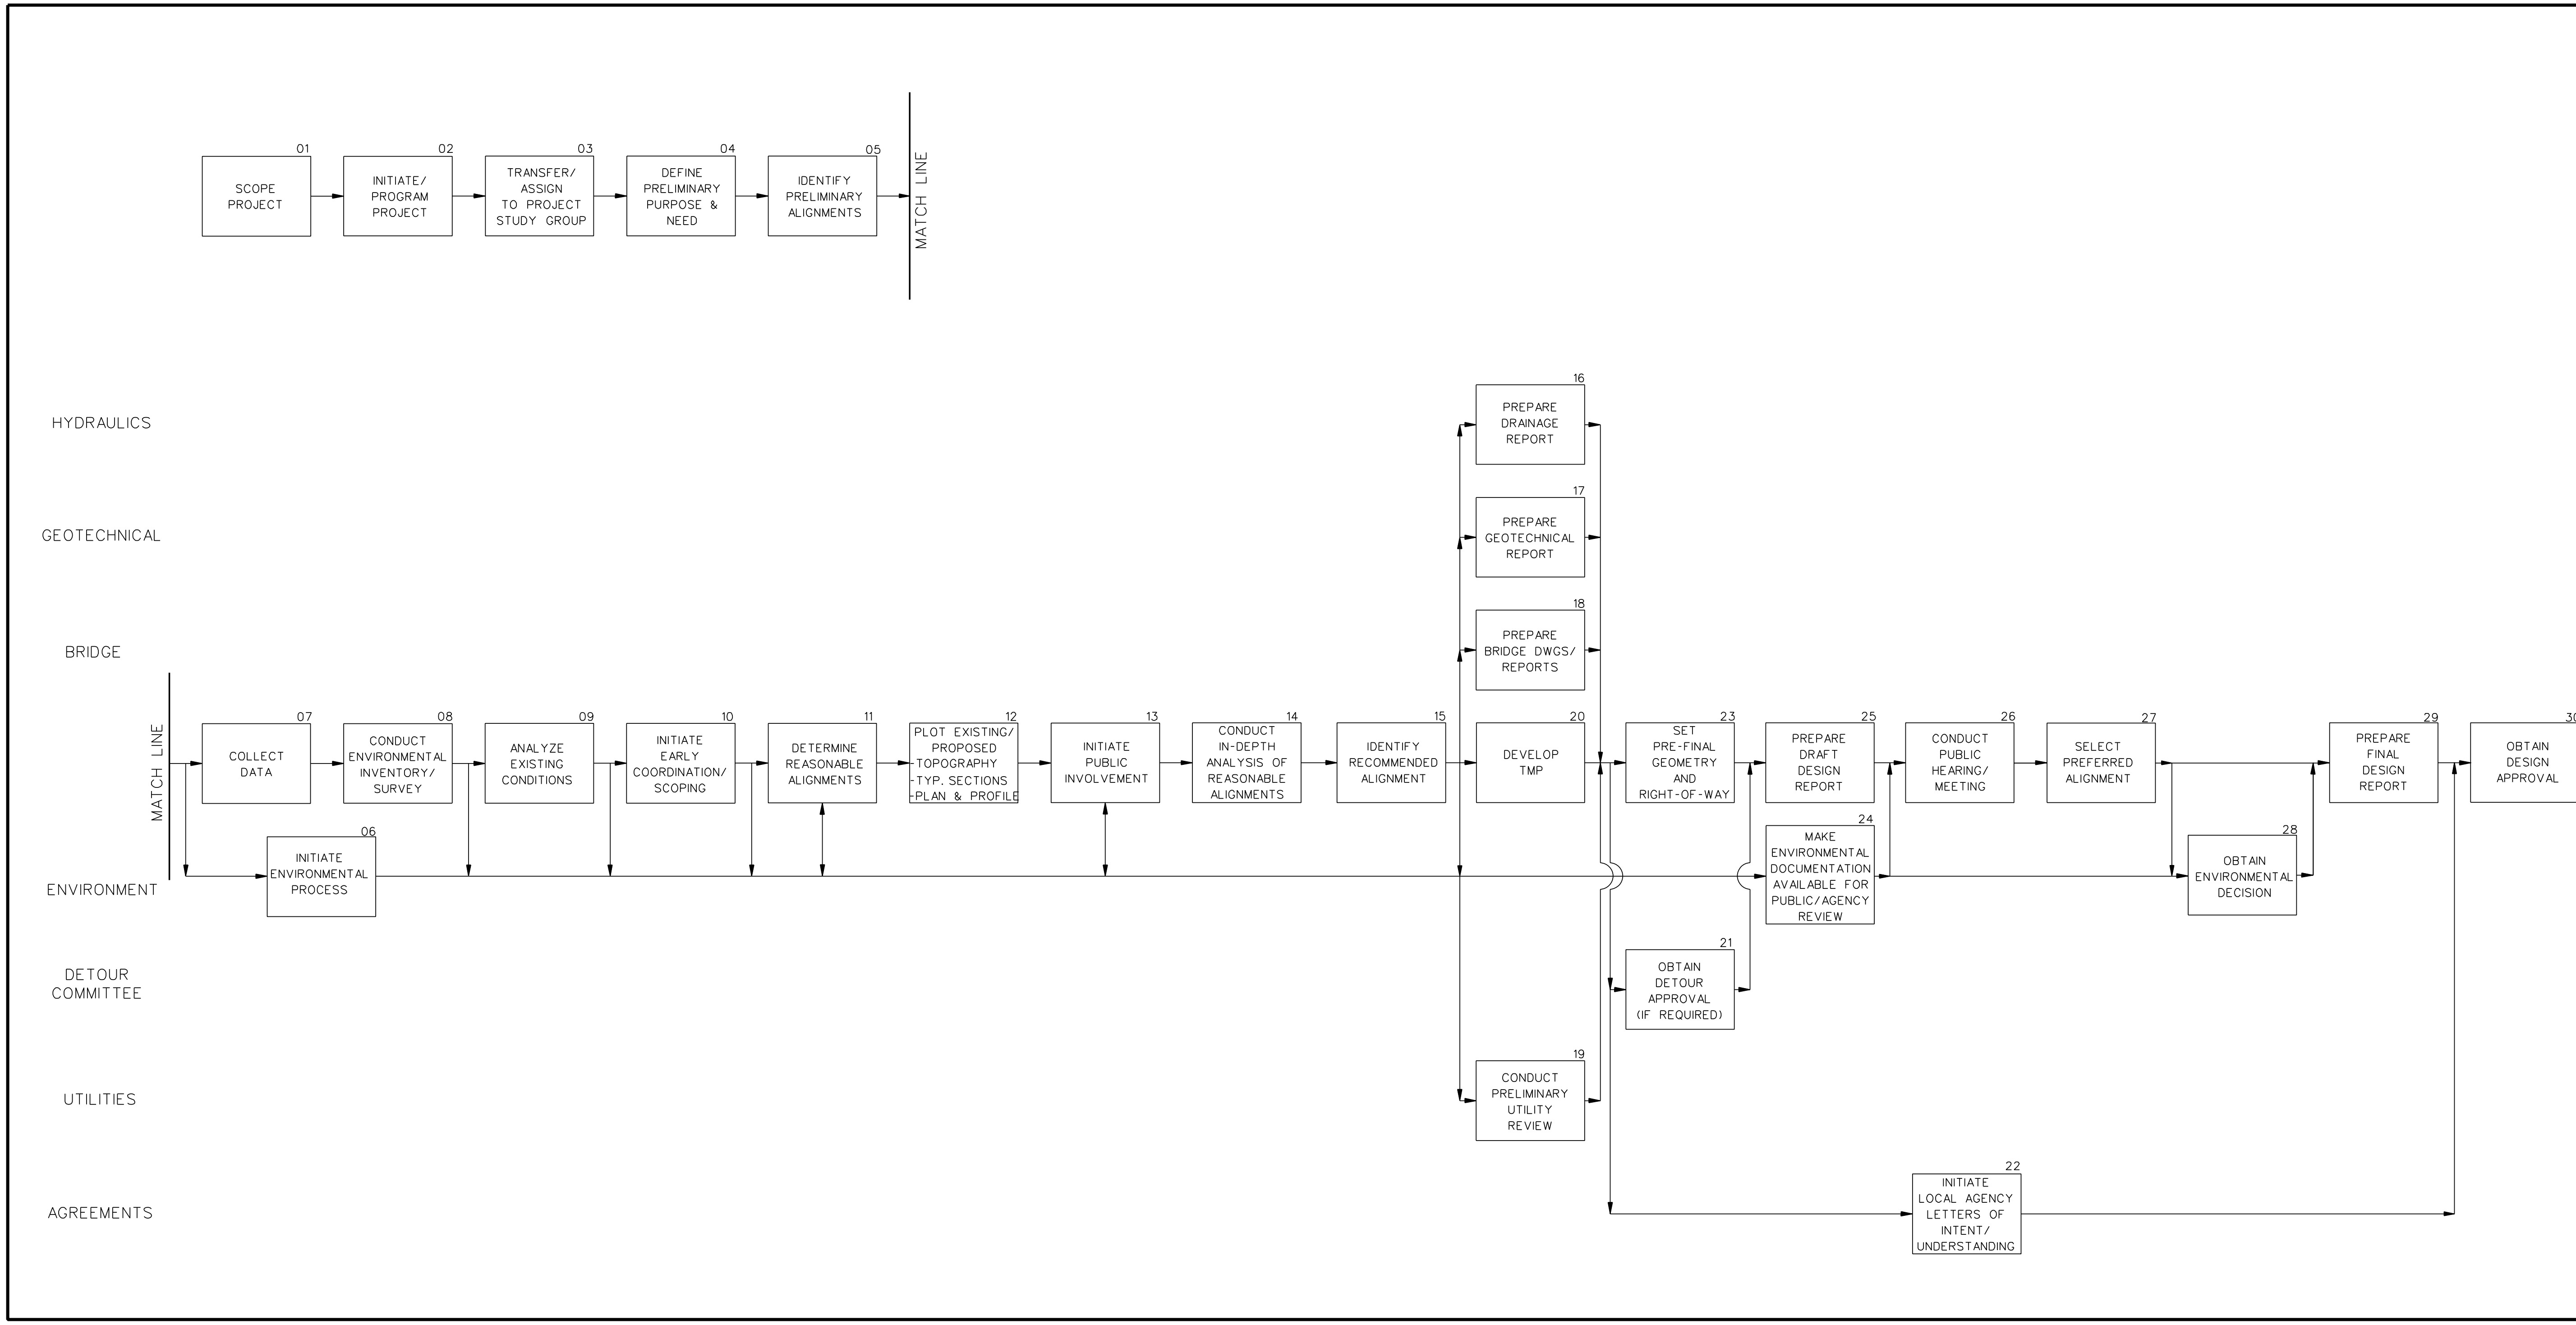
5. Project Approval. Districts are responsible for the review and approval of all projects except those involving major new alignments addressed by a Corridor Study, Feasibility Study, or Design Report. In these special circumstances, projects are approved by BDE. BDE may also review and approve projects where the Deputy Director/Regional Engineer has requested BDE assistance. See Section 12-5 for a discussion on the processing and approval of phase I reports.

6. Other Manual Chapters. The *BDE Manual* contains several other chapters that provide complementary information to Chapter 3. The designer should review these chapters for more information on the project development process. In particular, Chapter 3 should be used in combination with Chapter 4 “Project Coordination Responsibilities,” Chapter 11 “Phase I Studies,” Chapter 12 “Phase I Engineering Reports,” Chapter 19 “Public Involvement Guidelines,” and Part III “Environmental Procedures.”

3-2 PROJECTS WITH MAJOR RIGHT-OF-WAY ACQUISITIONS

3-2.01 Phase I Studies

Figure 3-2.A illustrates a typical Phase I flowchart or network for a project on existing alignment that will require major ROW acquisitions and typically an Environmental Assessment. Those activities shown along the main axis of the chart represent those items that are normally performed by the project study group. The other lines of the chart represent activities by other units or groups. These projects typically will require a Design Report, Combined Design Report, or a State Improvement Report. For guidance on the preparation and format of these reports, see Chapters 11 and 12. For other project types, see the flowcharts in Chapter 2, Section 3-3, and Section 3-4. Following Figure 3-2.A are brief write-ups for each activity.



PHASE I PROJECT DEVELOPMENT NETWORK
(Project on Existing Alignment with Major ROW Acquisitions)

Figure 3-2.A

PROJECT ACTIVITY (Phase I)

Activity Title: Scope Project

Activity No.: 01

Responsible Unit: District Bureau of Program Development

Activity Description:

A roadway project proposal can originate from a variety of sources, including local officials or metropolitan planning organizations (community-based need), directly from the IDOT district (district-based need), from a Bureau in the central office (Office of Planning and Programming, BDE, Operations, Bureau of Safety Programs and Engineering, etc.), and other sources targeting a special need or statewide need.

Before a project is entered onto the Department's Proposed Highway Improvement Program, the district Programming Section initially develops and documents the project concept. Developing the project concept will typically involve the following:

- establishing that there is, in fact, a need for the project;
- making a preliminary determination of the project scope of work;
- reviewing any available data and records;
- conducting an initial evaluation of right-of-way, utility, and environmental impacts and the likely level of environmental evaluation;
- developing a rough, preliminary cost estimate;
- determining a proposed alignment; and
- developing a set of preliminary drawings/plans.

This information is forwarded for review and comment to Program Development, Operations, BDE, district Environmental Unit, Bridges and Structures, and other individuals, as appropriate. Programming will refine the scope based on the comments received.

Once the scope, cost, and schedule have been defined, district Programming will forward this information to the Office of Planning and Programming for incorporation into the Department's multi-year program (Activity 02).

PROJECT ACTIVITY (Phase I)

Activity Title:	Initiate/Program Project
Activity No.:	02
Responsible Unit:	Office of Planning and Programming

Activity Description:

Candidate projects are submitted by the districts as a request for project programming to the Office of Planning and Programming. Based on a Statewide assessment of highway improvement needs and available funds, the Office of Planning and Programming will develop the Department's Proposed Highway Improvement Program. This will establish an individual project as an active project for further development.

The Office of Planning and Programming annually issues guidelines for multi-year programming criteria. This includes programming criteria for:

- improvement categories,
- pavement surface conditions,
- deficient bridges,
- safety improvements,
- Interstate rehabilitation,
- widening narrow and deteriorated pavements,
- improving intersections and reducing traffic bottlenecks,
- new construction/reconstruction of major facilities,
- transportation enhancement projects,
- Congestion Mitigation Air Quality (CMAQ) projects, and
- bicycle accommodation.

PROJECT ACTIVITY (Phase I)

Activity Title:	Transfer/Assign to Project Study Group
Activity No.:	03
Responsible Unit:	Studies and Plans Engineer

Activity Description:

At this point the project will either be assigned to a project study group within the district Bureau of Program Development to begin the design study. The Studies and Plans Engineer will have the overall day-to-day responsibility for advancing the project through the Phase I study process. The Studies and Plans Engineer, or designee, will:

- coordinate directly with other units within the Department;
- attend all internal meetings and field inspections;
- ensure that the project study meets all Department criteria and procedures;
- report directly to the District Program Development Engineer on all significant project activities, problems, and developments; and
- participate in the public involvement process.

The number and expertise of personnel initially assigned to the project study group will vary with the nature and scope of the proposed improvement. The personnel assigned will also vary over time relative to the priority for completion, the available lead time, and the activity in project development under study.

If the project is one which the Regional Engineer has determined will use the principles of Context Sensitive Solutions (CSS), the public involvement process should commence at this point. The project study group uses the Stakeholder Involvement Process (SIP) as outlined in Sections 19-5.01 to conduct public involvement for CSS projects.

PROJECT ACTIVITY (Phase I)

Activity Title: Define Preliminary Purpose and Need

Activity No.: 04

Responsible Unit: Project Study Group/BDE/FHWA/Office of Planning & Programming

Activity Description:

For a major transportation project, the project study group must first define the project purpose and need, which will direct the process for the identification of alternatives, in-depth analyses and, ultimately, selection of the preferred alternative. This will consist of reaffirming the need for the proposed improvement, establishing project goals and objectives, and establishing the study area and logical termini. The feasibility of an alignment depends on the social, economic, environmental, and engineering effects of the proposed highway improvement. Previous studies and decisions should be reaffirmed and/or updated as necessary. Other factors that must be considered include:

- adequacy of the existing highway network;
- existing traffic volumes and capacity deficiencies;
- crash information;
- alignment and profile deficiencies;
- structural integrity of existing pavements, bridges, and culverts;
- transportation demand;
- potential cost savings to the traveling public;
- enhanced economic development potential;
- improved access;
- programming guidelines;
- commitments to elected officials; and
- public input.

The project study group will document the preliminary purpose and need so that it can be transferred to the NEPA document. Further study may result in revisions to the preliminary purpose and need.

See Section 22-6.01 for more information on purpose and need.

PROJECT ACTIVITY (Phase I)

Activity Title: Identify Preliminary Alignments

Activity No.: 05

Responsible Unit: Project Study Group

Activity Description:

Based on the definition of the preliminary purpose and need (Activity 04) and the general design concept (Activity 01), the project study group should identify feasible alignments that could be used. Because this is an evolutionary process, the preliminary list will be narrowed during further evaluations. The evaluation of preliminary alternatives should be sensitive to those environmental resources for which the analysis of alternatives for avoidance and minimization of adverse impacts is required (e.g., threatened and endangered species, natural areas, nature reserves, wetlands, flood plains, Section 4(f) properties, historic sites). All impractical alignments may be removed from the list with a brief description of why they were removed.

Using county maps, USGS quadrangle maps, and aerial photography, identify and lay out possible alignments on base maps (see Chapter 11). Also include the no-action alternative in the design study. General horizontal alignment should be determined for each alignment. The selection of the preliminary alignments will define what information will be collected in Activity 07 and the potential environmental impacts of the alignment will determine the type of environmental documentation that will be required on the project.

At this stage, request project mapping based on the identified alignments. However, note that many times insufficient information will be available at the time mapping is requested and, therefore, some judgment must be used in deciding the width limits of mapping. Additional mapping can be requested later during the design study if needed for further alignment investigations.

PROJECT ACTIVITY (Phase I)

Activity Title: Initiate Environmental Process

Activity No.: 06

Responsible Unit: Environmental Unit

Activity Description:

Once the preliminary alignments have been identified (Activity 05), the district Environmental Unit will initiate the environmental process. Depending on the project impact, this may involve either a:

- Categorical Exclusion (see Chapter 23),
- Environmental Assessment (see Chapter 24), or
- Environmental Impact Statement (see Chapter 25).

If the project will require an EIS, review the Phase I activities in Section 2-2 for guidance on processes for the Project Initiation Letter to FHWA, negotiated timeframes, Notice of Intent, invitation and involvement of participating agencies, stakeholder coordination, coordination on purpose and need and reasonable alignments, etc. As reflected in the Phase I activities in Section 2-2, these processes applicable to an EIS occur at key points throughout project development.

This Activity will include:

- discussing the project at a coordination meeting and obtaining verbal or written FHWA concurrence as to the type of environmental processing;
- assembling and analyzing the necessary information (see Part III "Environmental Procedures");
- evaluating alternatives; and
- preparing the preliminary draft of the environmental documentation.

PROJECT ACTIVITY (Phase I)

Activity Title: Collect Data

Activity No.: 07

Responsible Unit: Project Study Group

Activity Description:

Once the preliminary alignments have been identified (Activity 05), the project study group must gather and inventory information and data on each alignment. All types of data, including social, economic, environmental, and engineering, should be gathered simultaneously. The amount and type of information to be collected will vary with the nature and scope of the proposed improvement. Some of the information that is gathered includes:

- roadway, field, aerial, and stream surveys;
- existing roadway classifications and truck routes;
- existing as-built plans and maintenance records;
- existing on-street parking;
- crash rate maps and collision diagrams;
- pavement and bridge condition reports;
- existing ROW information and any encroachments;
- ADT traffic maps and DHVs for current and design year traffic (all affected routes);
- inventory of posted speed limits;
- detailed transportation maps and plans with all modes of travel included;
- utility installations and detailed maps from utility companies;
- hydraulics survey, drainage survey, sewer atlas, and flooding information tables;
- fire districts, mail and school bus routes, location of churches, drainage districts, historic sites, and field-tile maps;
- commercial, agricultural, industrial, recreational, historic, and residential land use;
- conservation areas, archaeological sites, wetlands, special waste sites, etc.;
- local, State, and Federal agency coordination needs;
- current topographic mapping and aerial photographic mosaics;
- geotechnical investigations;
- highway geometrics, development of access control plans, and right-of-way issues;
- joint development uses, scenic easements, and aesthetics of highway (see Chapter 33);
- estimate of cost (see Section 11-2.15) and road-user benefits (see Section 11-7.01); and
- maintenance agreements with locals.

See Chapters 11 and 12 for further guidance on the information that should be collected for a Phase I study.

PROJECT ACTIVITY (Phase I)

Activity Title: Conduct Environmental Inventory/Survey

Activity No.: 08

Responsible Unit: Project Study Group/Environmental Unit/BDE

Activity Description:

The project study group will request BDE to conduct an environmental inventory by submitting an environmental survey request and Special Waste Assessment Screen/Survey Request Form, as appropriate, to BDE. Based on the preliminary alignments identified in Activity 05, BDE's review will include evaluating environmental databases, discussing the project at a district coordination meeting, and conducting field checks, as necessary. If determined necessary, BDE will coordinate, as appropriate, with the responsible agencies and the project study group for the field survey(s). BDE will provide the results of the reconnaissance survey(s) and any related studies for resource delineation or evaluation to the district.

After the inventory has been prepared, the project study group should perform a preliminary evaluation of the magnitude and importance of the potential environmental impacts precipitated by the proposed action. The project study group will consider the environmental resource information in further development of the project and, for resources within the project limits (e.g., wetlands, natural areas, archaeological and historical sites), the district will evaluate options for avoiding and minimizing the project's effects on the resources. This will assist in initiating the early coordination process (Activity 10) and establishing the significance of project impacts. When the district has determined the likely effects the project will have on resources, subject to requirements for Special Environmental Analyses (see Chapter 26), it notifies BDE.

If adverse effects to environmental resources cannot be avoided, BDE will evaluate whether any further studies of the resources are necessary. If further studies are needed, BDE will advise the district and will initiate action to have the studies accomplished, considering program priority and project scheduling.

BDE will provide information to the district regarding environmental study findings, results of coordination with outside agencies, and any recommendations for further coordination or action by the district. This information will also be used by the district Environmental Unit in preparing the environmental documentation.

For additional guidance, see Chapter 27 "Environmental Surveys."

PROJECT ACTIVITY (Phase I)

Activity Title: Analyze Existing Conditions

Activity No.: 09

Responsible Unit: Project Study Group

Activity Description:

Using county or other area maps, as-built plans, USGS quadrangle topographic maps, aerial and/or field surveys, previously prepared reports, data collected in Activity 07, and the environmental inventory/survey (Activity 08), the project study group will review and identify the following existing conditions:

- the locations of towns, streams, railroads, and other topographic features;
- condition of the existing highway network within the corridor;
- existing traffic and capacity deficiencies;
- pavement, bridge, and culvert structural integrity;
- crash information;
- alignment and profile deficiencies;
- existing lane and shoulder widths;
- existing ROW, ROW constraints, and encroachments;
- existing and planned land uses from local governments, MPOs, fire districts, schools, etc.;
- existing agreements with utilities, railroads, local agencies, etc.;
- existing drainage patterns and drainage systems;
- sensitive noise receptors;
- wetlands, applicable 4(f), 6(f), and 106 sites, etc.;
- special waste sites; and
- tree and vegetation inventory.

Upon receipt of the topographic mapping, plot the property lines, property names, names of roads, and all other important cultural features. Make paper copies of the mapping sheets and tape together. This procedure allows the project study group to review long lengths of the alignment in one view and to see how lines may best fit together. Begin laying out all feasible alignments.

After an alignment is laid out, determine the State plane coordinates of all control points (POTs and PIs) from the project mapping. Input this information and the radii of horizontal curves into a computer file to mathematically describe each alternative. Once an alignment is mathematized and tied into digitized mapping files, the alignment can then be stationed from west to east or south to north and the information stored as a computer file for further design work.

Provide the results of this activity to the district Environmental Unit for use in preparing the environmental documentation.

PROJECT ACTIVITY (Phase I)

Activity Title: Initiate Early Coordination/Scoping

Activity No.: 10

Responsible Unit: Project Study Group/BDE

Activity Description:

Coordination with other Department and governmental agencies, as appropriate, is an important aspect during the design study process. This coordination should begin as early as practical in project planning.

At this stage of the design study process, the project study group will initiate early coordination with other Department Units or Bureaus and governmental agencies (e.g., FHWA, Land Acquisition, Construction, Operations, Bridges and Structures, Utilities, environmental resource agencies) that have an interest in the project or have information or expertise concerning any issues the project may involve. The purpose of this coordination will be to assist in the identification of reasonable alignment alternatives and in gathering information to evaluate the social, economic, engineering, and environmental impacts of the proposed project and possible impact mitigation measures. This coordination should begin as early as practical. Early coordination will also identify the cooperating agencies. For projects involving preparation of an EIS, see Phase I Activities 20, 21 and 22 in Section 2-2 for guidance on participating agencies, stakeholder involvement, and purpose and need coordination.

Scoping is an early and open process for determining the scope of issues to be addressed in the design study and for identifying the significant issues related to the proposed improvement. Scoping is intended to focus the study effort on issues that are truly significant and avoid the collection of needless detailed information on insignificant issues. For these types of projects, a formal scoping process may or may not be necessary. This depends, in part, on the number and magnitude of issues potentially involved and the probability that the proposed improvement may involve significant issues.

Although scoping may be accomplished by a formal meeting, it is more frequently accomplished through less formal meetings and exchanges of written and verbal communications. Scoping is typically not an individual step but an ongoing process as part of the overall coordination and public involvement process.

The results of this activity should be forwarded to the district Environmental Unit so that it can be incorporated into the environmental documentation.

PROJECT ACTIVITY (Phase I)

Activity Title: Determine Reasonable Alignments

Activity No.: 11

Responsible Unit: Project Study Group/Environmental Unit

Activity Description:

The project study group, in conjunction with the district Environmental Unit, considers the results of the coordination in reducing the number of alternatives to a reasonable number that are representative of the spectrum of possible alternatives that satisfy the project purpose and need. This will typically be two or three alternatives, including the no-action alternative. An in-depth analysis will be conducted on each of the remaining alternatives (Activity 14). For projects involving preparation of an EIS, see Phase I Activity 27 in Section 2-2 for further guidance on development of the range of alternatives.

The determination of the reasonable alignments for in-depth evaluation, which is an evolutionary process, may be summarized as follows:

- identify preliminary alignments (Activity 05);
- achieve consensus with CSS stakeholders on the range of alternatives for the project;
- perform a rough evaluation of the potential impacts of these preliminary alignments on the inventory of the affected environment to identify, for example, “fatal” flaws;
- incorporate input from agencies and/or the public (Activities 07, 08, and 10) in the decision-making process;
- estimate the overall reasonableness of each alignment under consideration;
- ensure that each reasonable alignment can satisfy the project purpose and need (Activity 04);
- ensure location of connections can be adequately developed (e.g., interchanges, frontage roads; see Section 11-4.02(e)); and
- based on an appropriate level of re-evaluation and additional coordination, identify those selected reasonable alignments which are worthy of in-depth evaluation considering:
  + the need to identify potential avoidance and minimization alternatives for environmental reasons;
  + that the cost of the studies for each alignment should be commensurate with its probability of implementation;
  + that, collectively, the selected alignment should cover the full spectrum of alternatives; and
  + that, collectively, the selected alignment should gain public acceptance that no reasonable alternative has been omitted.

Document the reason(s) why an alignment has been discarded. Include this information in the final Design Report.

PROJECT ACTIVITY (Phase I)

Activity Title: Plot Existing/Proposed Topography, Typical Sections, Plan and Profile

Activity No.: 12

Responsible Unit: Project Study Group

Activity Description:

For each remaining alternative alignment identified in Activity 11, conduct the following:

- If not already done, plot the existing topography including property lines, property owner names, business names and type, names of roads, driveways/access roads, and all other important geographic and cultural features.
- Plot existing cross sections.
- Determine the proposed typical sections.
- Determine the detailed horizontal alignment, including radii, stationing, and State plane coordinates of all control points (e.g., POTs, PIs, PCs, PTs).
- Investigate alternative vertical profiles for each alignment. This may require designing two to three trial vertical profiles and performing several complete earthwork calculations; see Sections 11-2.05 and 11-5.04(d).
- Once the geometric elements have been set, determine the preliminary right-of-way limits for each alternative.
- Determine the rough quantities for each alternative and refine the cost estimate for each alternative. If no quantities are available, use a generalized cost (e.g., cost per mile (kilometer)); see Sections 12-4 and 65-1.02.

IDOT uses the computer software program GEOPAK for laying out alignments, profiles, cross section designs, quantity calculations, and for determining construction limits. GEOPAK also can be used to generate 3-D and perspective plots for any portion of the roadway. Use 3-D plots in the design process to assess potential safety problems and the aesthetics of each alternative.

PROJECT ACTIVITY (Phase I)

Activity Title: Initiate Public Involvement

Activity No.: 13

Responsible Unit: Project Study Group/Environmental Unit

Activity Description:

This Activity will allow the public an opportunity for input and comment on the alternatives selected in Activity 11. Typically, this will consist of informational letters, advertisements, and/or meetings with local government officials, fire districts, school districts, drainage districts, historic commissions, MPOs, residents, businesses, etc. These meetings or letters may include:

- advising local, State, and Federal officials that a project has been initiated and that a study is underway;
- procedures for developing possible coordination and public service involvement;
- a discussion on the project scope;
- a request for information (e.g., MPO plans, drainage problems, transit needs);
- a discussion with businesses, railroads, and utility companies; and
- talking with individuals at public information meetings about individual concerns.

Public coordination must be continuous throughout the project development. For guidance on public coordination, see Chapter 19.

For projects which the Regional Engineer has determined will use the principles of Context Sensitive Solutions (CSS), the public involvement process should commence once the project is assigned to the project study group. The project study group uses the Stakeholder Involvement Process (SIP) as outlined in Sections 19-5.01 to conduct public involvement for CSS projects.

PROJECT ACTIVITY (Phase I)

Activity Title: Conduct In-Depth Analysis of Reasonable Alignments

Activity No.: 14

Responsible Unit: Project Study Group

Activity Description:

During the initial development of alignment alternatives, some analyses will have been conducted as attempts are made to fit various options into the project location. After the reasonable alignments have been identified (Activity 11) and the information is plotted on the plan sheets (Activity 12), further analyses will be necessary to assess the capability of each alternative to accomplish the project goals cost-effectively. Conduct an in-depth analysis of each of the proposed alignments considering the social, economic, environmental, and engineering factors discussed in Part II "Project Development" and Part III "Environmental Procedures."

The engineering and environmental analyses may include:

- intersection design studies,
- interchange type and design studies,
- capacity analysis,
- initial impact and mitigation alternatives,
- wetlands involvement,
- air and noise impacts,
- impacts on cultural resources,
- tree and vegetation evaluation,
- water quality and natural resources impacts, and
- soils evaluation.

After the results of these investigations have been analyzed, there may be legitimate reasons to eliminate one or more of the final alignment alternatives. Discuss the reason why these alignment(s) were not further considered in the Design Report. For instance, traffic estimates for the no-action alternative may overload existing routes creating unacceptable congestion, thereby eliminating this alternative.

The results of this and previous Activities will be submitted to the Hydraulics Unit, Geotechnical Unit, Bureau of Bridges and Structures, district Environmental Unit, and Project Support Section to allow these Units to prepare their applicable reports for the Design Report.

PROJECT ACTIVITY (Phase I)

Activity Title: Identify Recommended Alignment

Activity No.: 15

Responsible Unit: Project Study Group

Activity Description:

After conducting the analysis of each reasonable alignment (Activity 14), considering the environmental, social, and economic impacts, engineering factors, and public input, the project study group will identify a recommended alignment through the corridor. If there are two or more alignments with essentially the same impact, the project study group still should select one recommended alignment. The final geometric and right-of-way design will be based on this recommended alignment. The selected alternative alignment and description of why it was selected should be forwarded to BDE for review prior to beginning the preparation of the draft Design Report (Activity 25) and before it is presented at the Public Hearing/Meeting (Activity 26).

PROJECT ACTIVITY (Phase I)

Activity Title: Prepare Drainage Report

Activity No.: 16

Responsible Unit: Hydraulics Unit

Activity Description:

Based on the information provided from the project study group (Activity 15), the Hydraulics Unit will perform the hydrology/hydraulics analysis, including the following:

- culvert sizing,
- longitudinal encroachments,
- existing and proposed storm drainage facilities,
- stormwater management, and
- pump stations.

Based on its evaluation, the Hydraulics Unit will prepare a Drainage Report. The project study group will use this information in making the final alignment determinations. It will also incorporate the Drainage Report into the final Design Report. See Chapter 40 and the *IDOT Drainage Manual* for more information on Drainage Reports.

PROJECT ACTIVITY (Phase I)

Activity Title: Prepare Geotechnical Report

Activity No.: 17

Responsible Unit: Geotechnical Unit

Activity Description:

Based on the information provided from the project study group (Activity 15), the Geotechnical Unit will prepare the Geotechnical Report. The analyses may include:

- basic soil properties (e.g., AASHTO soils classification);
- shrink/swell factors;
- properties of subsurface strata;
- potential for slides;
- slope stability at proposed cuts; and
- the development of a boring plan for any proposed bridges (e.g., location, spacing, and depth).

Based on its evaluation, the Geotechnical Unit will prepare a Geotechnical Report. The project study group will use this information in making the final alignment determinations. In addition, the Geotechnical Report will be incorporated into the final Design Report. See the *IDOT Geotechnical Manual* for more information.

PROJECT ACTIVITY (Phase I)

Activity Title: Prepare Bridge Drawings/Reports

Activity No.: 18

Responsible Unit: Bureau of Bridges and Structures/Project Study Group

Activity Description:

Based on the information provided from the project study group (Activity 15), the Bureau of Bridges and Structures (BB&S) will prepare the Proposed Structure Sketch for major structures, which will illustrate:

- the type of structures,
- approximate horizontal and vertical alignment and skew,
- approximate pier locations, and
- typical bridge deck section.

The project study group will prepare this sketch for other than major structures.
In addition, prepare the Bridge Condition Report for existing bridges which will include:

- a description of the physical conditions and deficiencies that mandate repair or replacement,
- a verification of the apparent soundness of any structure elements recommended for reuse plus the economic advantage gained by their reuse,
- a statement of any geometric or hydraulic improvement requirements, and
- a recommendation for the scope of the proposed work.

For additional information on the Proposed Structure Sketch and Bridge Condition Reports, see Chapter 39. The BB&S will also prepare the Hydraulics Report for major structures which will involve:

- the hydraulic analysis to determine the necessary dimensions of the waterway opening to pass the design flood, to meet the backwater allowances, and to satisfy any regulatory flood plain requirements;
- the hydraulic scour analysis to assist in determining the proper foundation design for the bridge; and
- a suggested freeboard elevation.

The project study group will prepare this report for other structures and the BB&S will approve the report.

The Structure Sketch and Hydraulics Report will be incorporated into the final Design Report.

PROJECT ACTIVITY (Phase I)

Activity Title: Conduct Preliminary Utility Review

Activity No.: 19

Responsible Unit: Project Support Section

Activity Description:

The project study group will provide the district Project Support Section with copies of the plan sheets for the recommended alignment. The Project Support Section will work with the applicable utility companies to identify project impacts on existing utilities and inform them of environmental issues that may affect their adjustments and relocations. The following items of work are typically performed:

1. Underground. The Project Support Section will coordinate with the district survey crew and will, if needed, request an underground survey to determine the depths and location of existing underground utilities within the project limits, especially fiber optic cables, water supply, and sanitary lines in urban areas.
2. Overhead. Any major above-ground utilities that may be impacted by the project. The Project Support Section may prepare a cost estimate to determine if a special effort should be exercised to avoid certain utilities.
3. Impacts. The Project Support Section will notify any utility companies that will be potentially impacted by the upcoming project, and the Section will request that the Utility contact IDOT if it plans any work in the vicinity of the project.

The Project Support Section will document its findings in a report or memorandum and submit it to the project study group. The project study group will use the information in making the final alignment determinations and document its findings in the Design Report.

For additional guidance on utility coordination, see Chapter 6.

PROJECT ACTIVITY (Phase I)

Activity Title: Develop Transportation Management Plan

Activity No.: 20

Responsible Unit: Project Study Group

Activity Description:

The maintenance of traffic flow during construction of a State highway will involve traffic and worker safety, public relations, and capital costs to the Department. A well-planned method for maintaining traffic flow can minimize complaints from the traveling public and from residents and businesses along the affected route. Each construction site must be evaluated on its own merits as to the appropriate method for maintaining traffic. The Design Report should contain a Transportation Management Plan (TMP) indicating an overall strategy for accommodating traffic during construction. Chapter 13 presents the goals and objectives for a TMP. The TMP should address the preferred traffic control method, alternative traffic control applications, geometric design criteria, the impact traffic will have on other facilities, local concerns, cost effectiveness of various alternatives, etc. Chapter 55 and the *Highway Standards* provide the design criteria to use when designing a traffic control plan. In addition, consider the following:

- The TMP not only must address the alternatives confined to the project site, but it must also evaluate the impact traffic will have on the entire corridor.
- For large projects, a TMP team may be organized during Phase I to study the traffic control alternatives and their effect on the corridor. Section 13-1.08 provides guidance on the makeup and responsibilities of the TMP team.
- If improvements are required to other facilities (e.g., widening of detour routes), it is important that these improvements be implemented as soon as practical prior to construction of the mainline facility. Allow local agencies sufficient opportunity to complete their improvements before construction on the State route begins. Agreements or concurrence may be necessary between the State and local agencies to determine cost sharing arrangements and/or approval of a local road as a detour route (Activity 22).
- No formal public involvement activity (e.g., design hearing) should occur until the recommended alternative in the TMP Report has been approved by the district Detour Committee. However, informal public involvement will be necessary during the analysis of alternatives.

PROJECT ACTIVITY (Phase I)

Activity Title: Obtain Detour Approval (If Required)

Activity No.: 21

Responsible Unit: Project Study Group

Activity Description:

In general, the TMP (Activity 20) will be approved as part of the Design Report. For all marked and unmarked detours, or for a road proposed to remain open by either stage construction or a runaround, the TMP will be approved by the district Detour Committee. Exceptions to the TMP as discussed in Chapter 13 shall be through the Bureau of Safety Programs and Engineering. For a closed unmarked State highway, also coordinate with the local county officials prior to the submittal of the Design Report.

PROJECT ACTIVITY (Phase I)

Activity Title: Initiate Local Agency Letters of Intent/Understanding

Activity No.: 22

Responsible Unit: Project Support Section

Activity Description:

Based on the public involvement (Activity 13), analyses conducted (Activity 14), the selection of the recommended alignment (Activity 15), and the proposed traffic control (Activity 20), the Project Support Section will initiate the preparation of any necessary letters of intent or letters of understanding with local officials. These may be prepared for:

- concurrence between the State and local agencies to determine cost sharing arrangements,
- approval of a local road as a detour route,
- determining maintenance responsibilities once the project is completed, and/or
- letters of support for the improvement.

For additional guidance, see Chapter 5.

PROJECT ACTIVITY (Phase I)

Activity Title: Set Pre-Final Geometry and Right-of-Way

Activity No.: 23

Responsible Unit: Project Study Group

Activity Description:

Based on the previous analyses for the recommended alignment (Activity 15) and information provided by others (Activities 16, 17, 18, and 19), the project study group will:

- make any necessary adjustments to the selected vertical and horizontal alignments;
- obtain design exception approval (if needed) from BDE and, where necessary, FHWA;
- make any necessary adjustments to the typical sections;
- develop access control plans for freeways, expressways, and by-passes (see Section 11-5.04(f) and Chapter 35);
- set preliminary construction limits;
- set preliminary right-of-way limits;
- determine any easement requirements; and
- determine if any utility adjustments or displacements are necessary.

See Part IV "Roadway Design Elements" and Part V "Design of Highway Types" for detailed information on geometric design and the *IDOT Land Acquisition Manual* for guidance on right-of-way impacts.

PROJECT ACTIVITY (Phase I)

Activity Title:	Make Environmental Documentation Available for Public/Agency Review
Activity No.:	24
Responsible Unit:	Environmental Unit

Activity Description:

The applicable process presented in Chapters 23, 24, or 25, will apply to the preparation and processing of the environmental documentation for review.

PROJECT ACTIVITY (Phase I)

Activity Title: Prepare Draft Design Report

Activity No.: 25

Responsible Unit: Project Study Group

Activity Description:

Once the analyses have been conducted and the information gathered, the project study group will prepare the draft Design Report. Chapter 12 presents the format that should be used when preparing a Design Report. Because the design study should be essentially complete, it should be possible to prepare the draft Design Report in its near-final format. The discovery of new, significant information during the public hearing/meeting (Activity 26) should be rare if the design study has been properly developed. With the exception of changes necessary to reflect input from the public hearing/meeting (Activity 26), a final Design Report should only need information concerning the public involvement and the final conclusion/recommendation section.

In general, the draft Design Report should be submitted to BDE for review prior to its availability for public viewing and inspection at the public hearing/meeting. Formal approval by BDE for release is not normally issued. Copies made available to the public should be marked as "draft" or "preliminary."

The Design Report should include:

- a summary of purpose and need of the project;
- a list and results of prior studies;
- a list of all alternative alignments eliminated earlier and the reasons for their elimination;
- a summary of major design features and policies;
- a discussion on the compatibility of the alternatives with existing streets and highways;
- a summary of the environmental factors considered;
- a discussion on the advantages and disadvantages of the reasonable alignments studied in-depth;
- the results of public involvement;
- the proposed transportation management plan;
- a list of commitments made to the public;
- the reasons and determination for selecting the preferred alignment;
- plan and profile of the preferred alignment;
- the estimate of costs for each alternative;
- exhibits showing typical sections, aerial photography, mapping, etc.;
- copies of analyses; and
- documentation for approval of other reports conducted during the design study.

For further guidance on information to be included in the Design Report, see Chapter 12.

PROJECT ACTIVITY (Phase I)

Activity Title: Conduct Public Hearing

Activity No.: 26

Responsible Unit: Project Study Group/Environmental Unit

Activity Description:

As required by the project, a public hearing or public meeting will be held at this stage of the design study to present to the public, and other interested organizations and agencies, the alignment alternative under consideration, a summary of the analyses for the various alternatives determined not to be feasible, and the criteria used to select the recommended alignment. Other Department Sections or Bureaus (e.g., Land Acquisition), as necessary, may attend the public hearing/meeting to answer specific questions relative to their expertise.

For CSS projects, public meetings will occur throughout the Phase I process.

The project study group and the district Environmental Unit will evaluate all comments from the public hearing/meeting and will prepare responses to these comments as appropriate. Possible responses include:

- modifying alternatives including the proposed action;
- developing and evaluating alternatives not previously given serious consideration;
- supplementing, improving, or modifying analyses;
- making factual corrections; or
- explaining why the comments do not warrant further agency response, citing the sources, authorities, or reasons which support that position and, if possible, indicating those circumstances which would trigger reappraisal or further response.

Chapter 19 discusses the requirements for public hearings and public information meetings and for responding to comments received during the public hearing/meeting.

See the activity descriptions in Sections 23-2, 24-2, or 25-2, as appropriate, for additional information about public involvement in the environmental process.

PROJECT ACTIVITY (Phase I)

Activity Title:	Select Preferred Alignment
Activity No.:	27
Responsible Unit:	Project Study Group

Activity Description:

Based on the results of the public hearing/meeting, circulation of documents, and written and verbal comments received, the project study group will select the preferred alignment. This may require additional analyses to resolve issues and questions raised during the public hearing/meeting. The selected preferred alignment is used to prepare the final Design Report (Activity 29) and, consequently, the detailed Phase II design.

PROJECT ACTIVITY (Phase I)

Activity Title: Obtain Environmental Decision

Activity No.: 28

Responsible Unit: Environmental Unit

Activity Description:

Based on the environmental document for the project (e.g., EIS, FONSI, CE) (Activity 06), the district Environmental Unit will take the necessary actions to secure the final environmental decision. This will be one of the following:

1. CE Projects. The district Environmental Unit must obtain approval of the Federal Approved CE from FHWA; see Chapter 23. Districts are not required to seek BDE review of Federal Approved CEs unless BDE's expertise is desired.
2. EA Projects. For an EA project which does not uncover any significant environmental impacts, the district Environmental Unit must prepare and obtain approval of the Finding of No Significant Impact (FONSI); see Chapter 24. BDE will continue to review and approve all EAs and FONSIs prior to submittal to FHWA.
3. EIS Projects. The district Environmental Unit must obtain approval of the Record of Decision (ROD) from FHWA and/or BDE; see Chapter 25.

PROJECT ACTIVITY (Phase I)

Activity Title: Prepare Final Design Report

Activity No.: 29

Responsible Unit: Project Study Group

Activity Description:

The comments received from the public and other agencies should be analyzed to determine if any changes are necessary in the draft Design Report and if any relevant issues have been overlooked. If an oversight has occurred, additional studies may be required to explain the resultant effects and determine what project design changes, if any, are necessary. After the review and analysis of comments is complete and appropriate revisions made, the final Design Report may be prepared. Activity 25 and Chapters 11 and 12 list the appropriate format, reports, and discussions that should be included in the Design Report. The final Design Report will also include a copy or reference the final environmental documentation received from the district Environmental Unit.

After completing all public involvement and environmental requirements, the original scaled mapping is reduced for insertion into an appendix of the Design Report. Prepare the reduced mapping sheets and other engineering exhibits on 11 in x 17 in sheets and place them in an appendix. In addition, place the aerial photography (access control plans) showing the alternatives advanced for environmental analysis and any other environmental exhibits on 11 in x 17 in sheets and include them in an appendix. The 11 in x 17 in format provides for ease of use of all final exhibits by Planning, Design, and Land Acquisition personnel.

PROJECT ACTIVITY (Phase I)

Activity Title: Obtain Design Approval

Activity No.: 30

Responsible Unit: Project Study Group

Activity Description:

Section 12-5.05 provides information on whether the Regional Engineer, or BDE will approve the Project Report. Generally for these types of projects, the Regional Engineer will approve the Project Report. If the proposed improvement requires approval by BDE, submit two copies of the report to BDE for review and approval.

Before submitting the final Design Report for approval to the Regional Engineer or BDE ensure that the following has been completed:

- the alignment has been approved;
- the applicable requirements in Part II “Project Development” and Part III “Environmental Procedures” have been met;
- public involvement activities as described in Chapter 19 have been completed;
- the environmental documentation and environmental decision have been received with the appropriate approvals;
- if applicable, coordination with FHWA has been completed; and
- all design exceptions have been approved by BDE, and where necessary, FHWA.

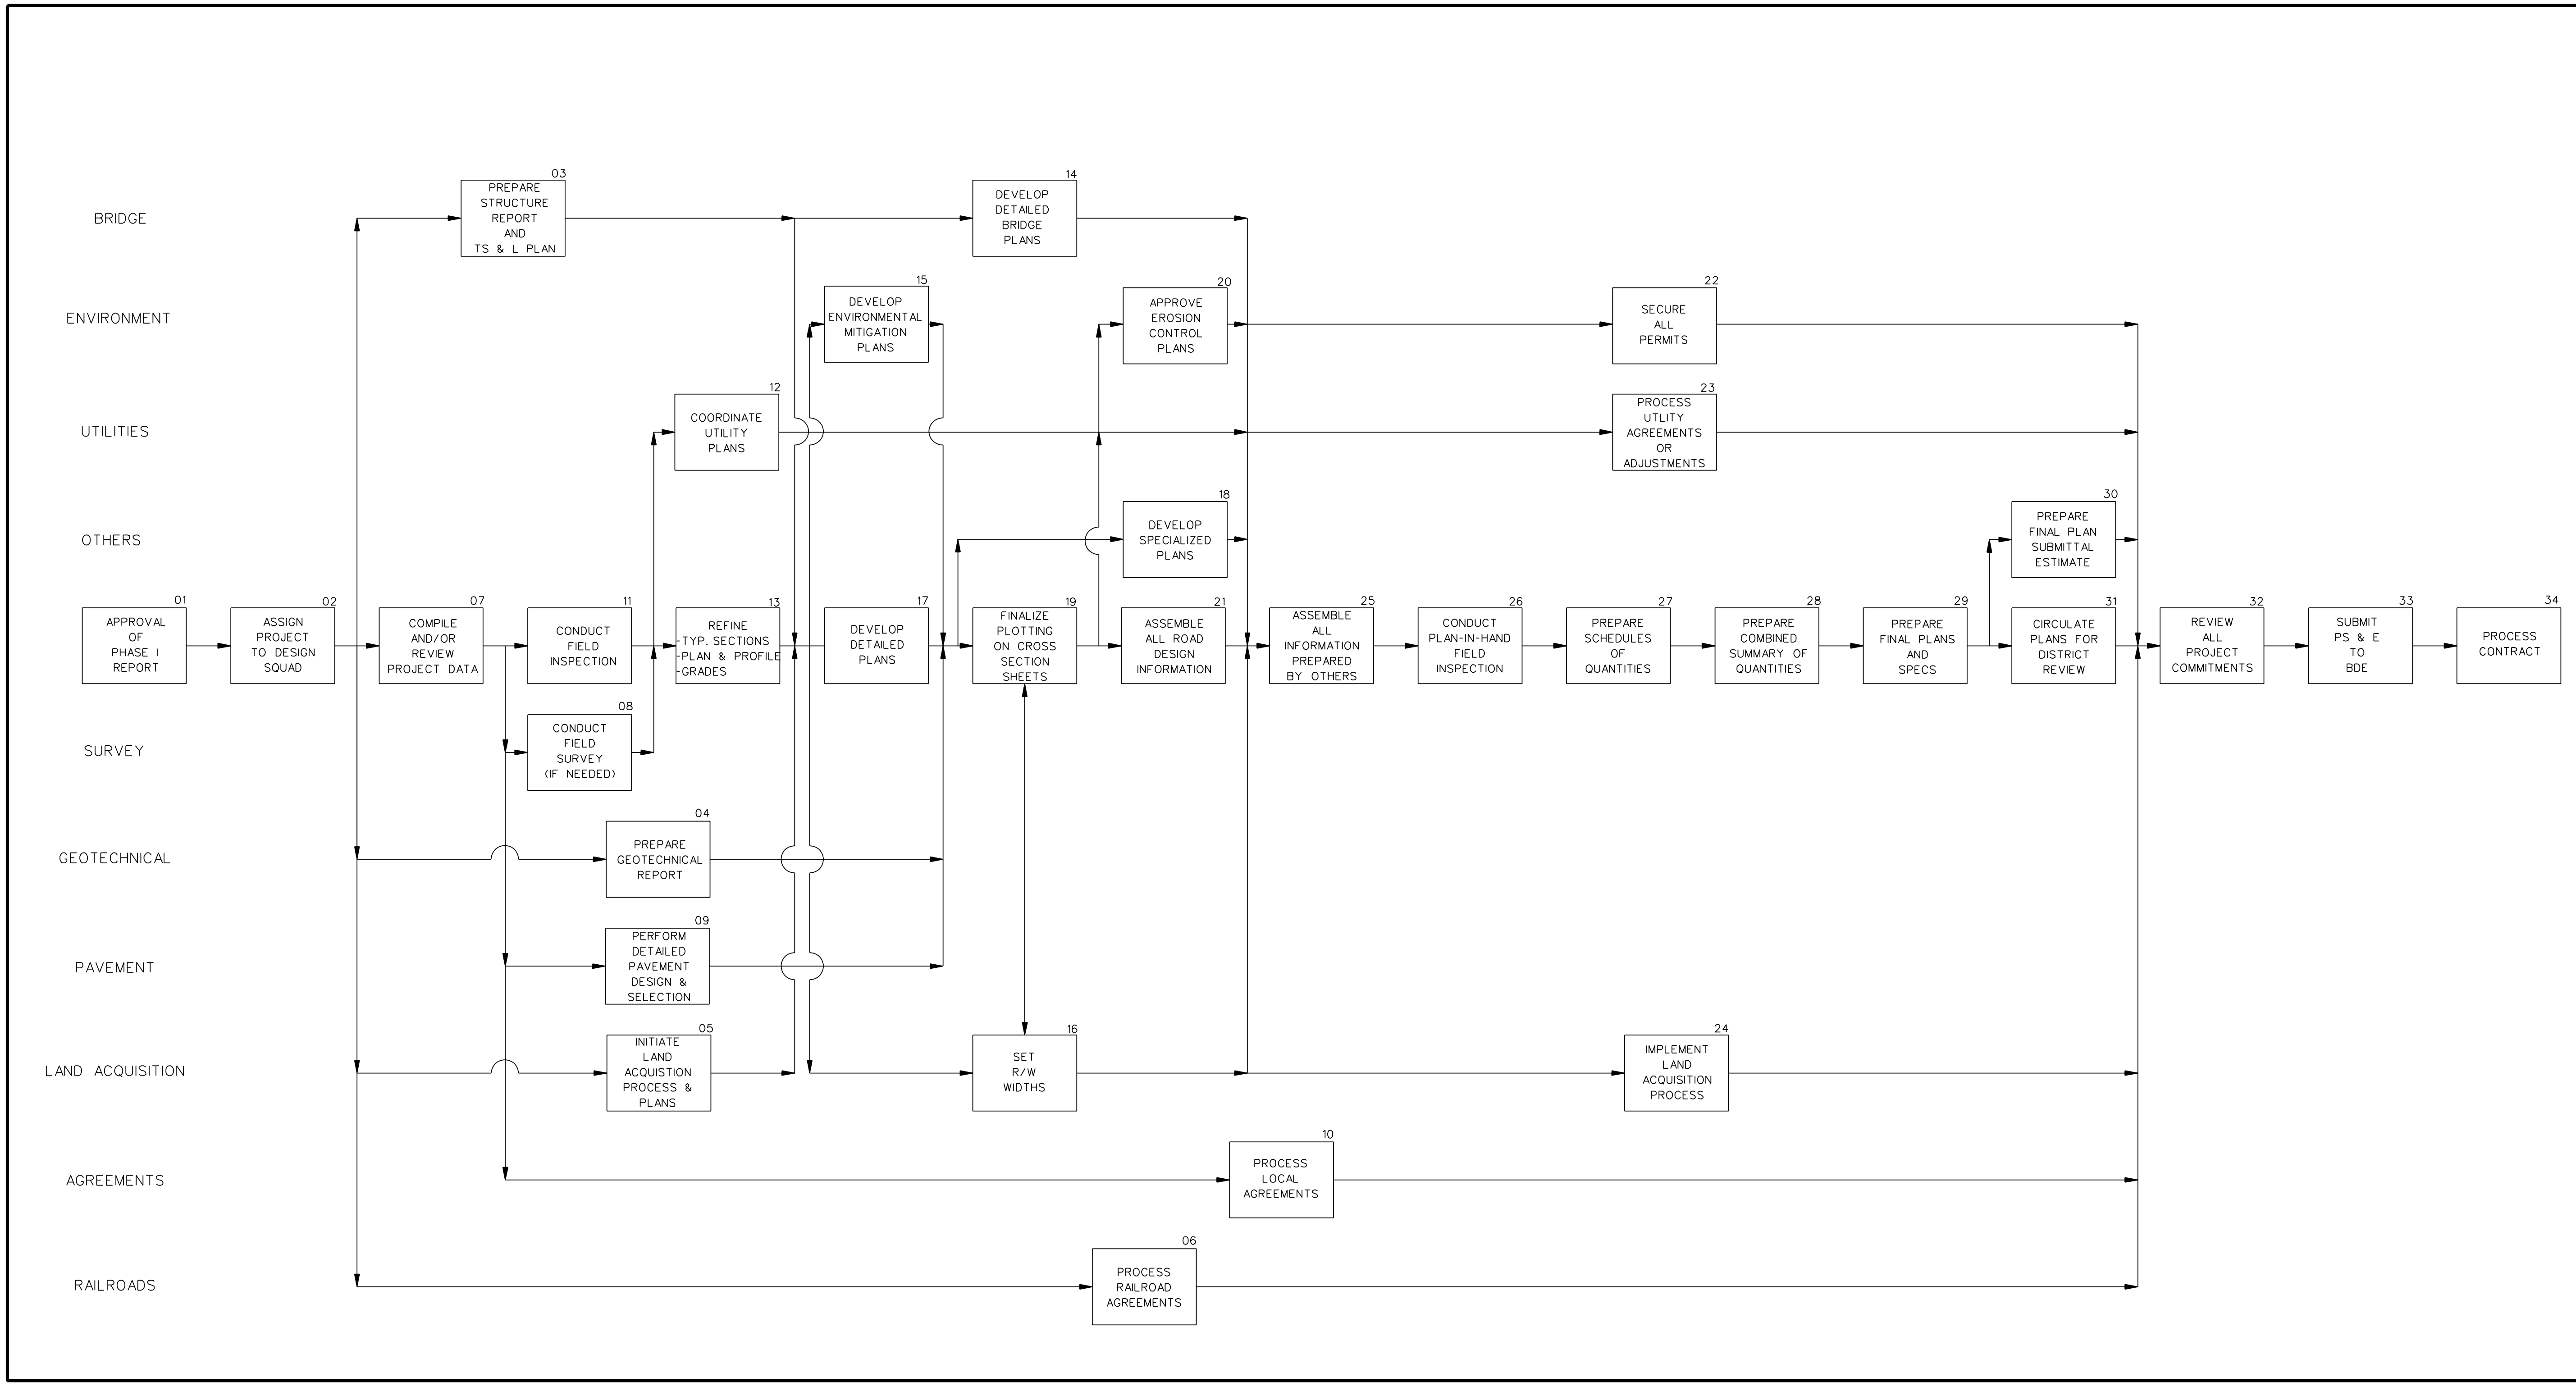
Submit the following to the Regional Engineer:

- two copies of the Design Report and Appendices;
- the applicable number of copies of the environmental documentation as discussed in Part III;
- two copies of the Public Involvement Document;
- two copies of the Advisory Committee/Working Groups Document; and
- a memorandum describing the reasons for selecting the preferred alignment and design features, the items submitted, and the request for design approval.

3-2.02 Phase II Design

Figure 3-2.B illustrates a typical Phase II flowchart or network for a project on existing alignment that will require major ROW acquisitions. Following Figure 3-2.B are brief write-ups for each activity. For other project types, see the flowcharts in Chapter 2, Section 3-3, or Section 3-4. Activities along the main axis are normally performed by the design squad. The other lines of the chart represent activities by other units or groups.

Refer to Section 11-7.03 for requirements and guidance on value engineering (VE) analyses. Where required, initiate the VE study no later than the time construction plans are 30% complete and allow for the implementation of the recommendations without delaying the project. The designer should review any VE studies conducted during Phase I and update them as necessary.



PHASE II PROJECT DEVELOPMENT NETWORK
(Project on Existing Alignment with Major ROW Acquisitions)

Figure 3-2.B

PROJECT ACTIVITY (Phase I)

Activity Title:	Approval of Phase I Report
Activity No.:	01
Responsible Unit:	Regional Engineer

Activity Description:

Once the Phase I report has been approved, this will signify that Phase I is complete and that Phase II can begin. See Figure 3-2.A and the corresponding write-ups for Phase I work. For guidance on the approval of Phase I reports, see Section 12-5.

PROJECT ACTIVITY (Phase II)

Activity Title: Assign Project to Design Squad

Activity No.: 02

Responsible Unit: Studies and Plans Engineer

Activity Description:

This Activity begins Phase II of the project. At this point, the project will either be assigned to a design squad within the district Bureau of Program Development or to a consultant. The Studies and Plans Engineer will have the overall day-to-day responsibility for advancing the project through the Phase II project development process. The Studies and Plans Engineer will:

- coordinate directly with other units or sections within the Department;
- attend all internal meetings and field inspections;
- be responsible for ensuring that the project meets all Department criteria and procedures;
- ensure the project is on schedule for the expected letting date;
- report directly to the Program Development Engineer on all significant project activities, problems, and developments; and
- participate in the public involvement process.

PROJECT ACTIVITY (Phase II)

Activity Title: Prepare Structures Report and TS&L Plans

Activity No.: 03

Responsible Unit: Bureau of Bridges and Structures/Design Squad

Activity Description:

Based on the approved Phase I report (Activity 01) and notification by the design squad that Phase II has begun (Activity 02), the district will prepare the Structures Report and the Bureau of Bridges and Structures will prepare the Type, Size, and Location (TS&L) Plans for any bridges within the project limits. TS&L Plans are detailed bridge configuration plans that are used to develop the detailed bridge construction plans. The TS&L Plans will present the following:

- plan and profile of the bridge showing the proposed type of superstructure and foundation, bridge end elevations, location of expansion and fixed ends, highway approaches, and existing contours at the bridge site;
- superstructure cross section showing pertinent structural details (e.g., number of beams, depth and width of bridge deck);
- bridge curb, sidewalk, and/or shoulders;
- design loadings, stresses, specifications, and other structural criteria;
- controlling horizontal and vertical clearances;
- hydraulic data, high and low water elevations, drift, ice, etc.; and
- a small scale location map to identify the location of the proposed bridge.

The Structures Report and TS&L Plans will be used in developing the detailed roadway plans (Activity 17). See Chapter 39 for more information on TS&L Plans and bridge sizing/geometrics.

For Phase II plans prepared by a Consultant, these activities may be the responsibility of the Consultant and approved by the Bureau of Bridges and Structures.

PROJECT ACTIVITY (Phase II)

Activity Title: Prepare Geotechnical Report

Activity No.: 04

Responsible Unit: Geotechnical Unit

Activity Description:

After being assigned the project (Activity 02), the design squad will request the Geotechnical Unit to investigate the geotechnical characteristics within the project limits based on the information provided in the approved Phase I report (Activity 01). The nature and depth of the investigation will be determined on a project-by-project basis. One of the primary factors that will determine the scope of the investigation will be the anticipated amount of earthwork for the project. The geotechnical investigation may include:

- an in-depth subsurface investigation (e.g., to determine the hydrogeologic characteristics of the subsurface);
- an evaluation of the potential for slides;
- an investigation of any wetlands in the vicinity of the project;
- for proposed cuts, a determination of the slope stability characteristics and the need for any special treatments (e.g., benching);
- testing of materials from the site by Department laboratory tests;
- an evaluation of any erosion potential within the project limits; and
- an evaluation of foundations for bridges and long culverts.

The Geotechnical Unit will prepare a Geotechnical Report documenting the findings from its investigation. The Report will be submitted to the design squad for input into the final typical section design for the facility.

PROJECT ACTIVITY (Phase II)

Activity Title: Initiate Land Acquisition Process and Plans

Activity No.: 05

Responsible Unit: Land Acquisition Section

Activity Description:

Based on the approved Phase I report (Activity 01) and notification by the design squad that Phase II has begun (Activity 02), the Land Acquisition Section will initiate the land acquisition process and the preparation of the right-of-way plans. This includes obtaining the existing right-of-way plans and researching the existing right-of-way status within the project limits, including:

- right-of-way titles and deeds,
- permanent easements,
- property lines and owners, and
- existing limits of access.

The preparation of right-of-way plans will include:

- setting up the sheets and stationing for the right-of-way plans,
- recording the section corner information,
- recording property ownership information,
- plotting the existing right-of-way, and
- developing parcel plats.

The Land Acquisition Section will forward this information to the design squad for use in preparation of the detailed roadway plans (Activity 17).

PROJECT ACTIVITY (Phase II)

Activity Title: Process Railroad Agreements

Activity No.: 06

Responsible Unit: Project Support Section

Activity Description:

The district provides information to BDE for the preparation and negotiation of formal agreements between the Department and the Railroad. This includes both railroad grade separation and at-grade crossing projects on the State highway system. Based on the approved Phase I report, the design squad should submit the necessary crossing data with sufficient lead time to allow for negotiations. Typically, a year or more is required.

The Agreement will cover:

- division of work and expense involved between IDOT and the Railroad for the crossing improvement;
- responsibilities for the future maintenance of the improvement;
- establishment of the Railroad's share of the cost as determined under the provisions of any one of the several classifications provided in the *Federal-Aid Policy Guide* and Section 7-1.02;
- reference to the acquisition of property rights (see Section 7-1.06);
- reimbursement of the costs incurred by the Railroad according to the requirements of the *Federal-Aid Policy Guide*;
- coverage of liability during construction operations; and
- reference to or identification of plans and plan approval.

The Project Support Section will coordinate the transfer of information and plans between the design squad and the railroad companies. This will be a continuous process as the design plans are developed during the Phase II design. This process should be completed prior to the review of all project commitments (Activity 32).

For additional guidance on coordinating with railroads, see Chapter 7.

PROJECT ACTIVITY (Phase II)

Activity Title: Compile and/or Review Project Data

Activity No.: 07

Responsible Unit: Design Squad

Activity Description:

The design squad may or may not include the same personnel as the project study group for Phase I. Also, there typically will be some delay between the Phase I and the Phase II portions of a project. Therefore, the design squad should review the Phase I report(s) and project files to become familiar with the decisions and determinations made during Phase I. Some of the information and decisions that should be reviewed may include:

- any design variances,
- alignment and typical section plans developed during Phase I,
- any technical reports prepared for the Phase I study,
- crash and traffic data,
- aerial photographs,
- the commitment file,
- the proposed TMP,
- documentation on public hearings and/or private meetings,
- letters of understanding and/or letters of intent sent to local officials,
- any utility involvement,
- any railroad involvement, and
- existing conditions to assess any changes in land use or development plans.

Based on this review, the design squad should evaluate what additional information and coordination with other units may be required to complete the project. The design squad also should ensure that other units as appropriate have initiated their work (e.g., Bureau of Bridges and Structures (Activity 03), Land Acquisition Section (Activity 05)). At this stage of the project, the design squad should request:

- if necessary, the Surveys and Photo Services Unit to conduct additional surveys (Activity 08);
- the Pavement Design Section to begin the pavement design and type selection (Activity 09); and
- the Project Support Section to begin processing any necessary local agency agreements (Activity 10).

PROJECT ACTIVITY (Phase II)

Activity Title: Conduct Field Survey (If Needed)

Activity No.: 08

Responsible Unit: Surveys and Photo Services Unit

Activity Description:

In general, a survey should have been conducted during the development of the Phase I study. However, based on the review of the project data (Activity 07), the design squad may conclude that additional surveys are required. The needed survey information may include:

- existing field conditions (topography, vegetation, existing structures and road design features, etc.);
- drainage features (bodies of water, open channels, channel slopes and cross sections, existing drainage appurtenances, etc.);
- existing field landmarks;
- existing utilities (above and below ground);
- existing right-of-way markers and property lines; and
- alignment and cross section of existing roads and driveways.

PROJECT ACTIVITY (Phase II)

Activity Title: Perform Detailed Pavement Design and Selection

Activity No.: 09

Responsible Unit: Pavement Design Section

Activity Description:

Based on the information provided by the design squad (Activity 07) and Phase I report (i.e., Geotechnical Report), the Pavement Design Section will perform the detailed pavement design analysis. For new or full-depth reconstruction, the objectives of the analysis will be to:

- select the design methodology, pavement type, and design criteria (see Chapter 54);
- determine the overall pavement thickness and thicknesses of individual layers; and
- determine any special surfacing design features (e.g., high-stress intersections, subdrainage design, use of geotextiles).

For existing pavements, the Pavement Design Section will develop a rehabilitation strategy. This may include, for example, determining pavement overlay thickness, patching needs, crack repair, joint repair, etc. See Chapter 53 for additional information.

The objective of Activity 09 is to develop and compare pavement design options. See Chapter 54 for additional guidance on pavement design and approval.

PROJECT ACTIVITY (Phase II)

Activity Title:	Process Local Agreements
Activity No.:	10
Responsible Unit:	Project Support Section

Activity Description:

The district Project Support Section is responsible for the preparation and negotiation of formal agreements between the Department and local governments. These agreements may cover:

- division of work and expense involved between IDOT and the local agency in connection with the improvement,
- responsibilities for the future maintenance of the improvement,
- reference to the acquisition of property rights,
- reimbursement of the costs incurred by the local agency,
- coverage of liability during construction operations, and
- reference to or identification of plans and plan approval.

The Project Support Section also will be responsible for coordinating the transfer of information and plans between the design squad and the local agency. This will be a continuous process throughout the design phase as the design plans are developed. The district Project Support Section also will coordinate with BDE for review and approval of any agreements. This process should be completed prior to the review of all project commitments (Activity 32).

For additional guidance on coordinating with local agencies, see Chapter 5.

PROJECT ACTIVITY (Phase II)

Activity Title: Conduct Field Inspection

Activity No.: 11

Responsible Unit: Design Squad

Activity Description:

After completing the in-house review of the Phase I report and other project data, the design squad should conduct a field inspection of the project. The objective is to review major design features and project-related issues and to identify any potential problems. The design squad will arrange the field inspection and invite, as appropriate, individuals from the following units to the field inspection:

- district Bureau of Project Implementation,
- BDE,
- Bureau of Bridges and Structures,
- district Environmental Unit,
- district Bureau of Operations,
- Land Acquisition Section,
- FHWA,
- local officials, and
- others as deemed appropriate.

The design squad will document the findings and decisions in the minutes of the field inspection.

PROJECT ACTIVITY (Phase II)

Activity Title: Coordinate Utility Plans

Activity No.: 12

Responsible Unit: Project Support Section

Activity Description:

After conducting the field inspection (Activity 11) and any additional field surveys (Activity 08), the design squad will forward the preliminary construction plans with any known utilities plotted to the district Project Support Section. The design squad will also notify the Project Support Section of any unique issues (e.g., environmental, commitments). The Project Support Section will coordinate the transfer of information and plans between the design squad and the utility companies. The utility companies will review IDOT's plans, plot their facilities, if not already shown, and prepare the necessary utility adjustment/relocation plans and specifications. As the design squad refines the construction plans, this information will be submitted to the Project Support Section to be forwarded to the utility companies.

For guidance on preparing utility plans and coordinating with utility companies, see Chapter 6.

PROJECT ACTIVITY (Phase II)

Activity Title: Refine Typical Sections, Plan and Profiles, Grades

Activity No.: 13

Responsible Unit: Design Squad

Activity Description:

Based on the review of the plans (Activity 07), the field inspection (Activity 11), the field survey (Activity 08), the Phase I report, and the project's commitment file, the design squad will refine and/or prepare the project's:

- cover sheet;
- general notes sheet;
- typical sections;
- the plan and profile sheets;
- alignment, ties, and benchmark sheet; and
- construction limits.

Section 63-4 provides guidance on the information that should be included on these plan sheets.

PROJECT ACTIVITY (Phase II)

Activity Title: Develop Detailed Bridge Plans

Activity No.: 14

Responsible Unit: Bureau of Bridges and Structures

Activity Description:

Based on the Phase I report (Activity 01), the Structure Report and TS&L Plans (Activity 03), and other information provided by the design squad, the Bureau of Bridges and Structures will perform the detailed structural design for any bridges and/or major structures on the project. The basic objective of the detailed design phase is to perform the in-depth structural analyses that are necessary to prepare a set of construction plans for any structures. The structural analyses, as applicable, may include the:

- superstructure design (e.g., framing details, deck slab, camber diagram);
- substructure design (e.g., piers, abutments);
- foundation design;
- approach slab design;
- bridge rail design; and
- existing physical conditions and deficiencies.

Once the structural plan sheets are completed, the Bureau of Bridges and Structures will submit the full set of bridge plan sheets and the quantities, pay items, and specifications to the design squad for direct insertion into the final project plans. Activity 14 must be completed before the assembly of information prepared by others (Activity 25).

For Phase II plans prepared by a Consultant, these activities may be the responsibility of the Consultant and approved by the Bureau of Bridges and Structures.

PROJECT ACTIVITY (Phase II)

Activity Title: Develop Environmental Mitigation Plans

Activity No.: 15

Responsible Unit: Environmental Unit

Activity Description:

Based on the approved Phase I report (Activity 01) and the typical sections and plan and profiles sheets (Activity 13), the district Environmental Unit, in consultation with BDE, as appropriate, will prepare the environmental mitigation plans, quantities, and specifications for direct insertion into the final construction plans. This may include wetlands compensation plans, Special Provisions for management and monitoring of special wastes, purchase of replacement lands, memorandums of agreements, etc. The district Environmental Unit will ensure that the commitments made in Phase I of the project are incorporated into the plans.

See Section 24-2 or Section 25-2, as appropriate.

PROJECT ACTIVITY (Phase II)

Activity Title: Set Right-of-Way Widths

Activity No.: 16

Responsible Unit: Land Acquisition Section

Activity Description:

Based on the information gathered in developing the Right-of-Way Plan Sheets (Activity 05) and the submittal of the construction limits by the design squad (Activity 13), the Land Acquisition Section will determine the right-of-way widths for the project. The Land Acquisition Section will forward this information to the design squad, which will incorporate this information on the plan and profile sheets.

This information also will be used to initiate the land acquisition process (Activity 24).

PROJECT ACTIVITY (Phase II)

Activity Title: Develop Detailed Plans

Activity No.: 17

Responsible Unit: Design Squad

Activity Description:

Once the design squad has received the Structure Report and TS&L Plans from the Bureau of Bridges and Structures (Activity 03) and the right-of-way plans from the Land Acquisition Section (Activity 05), the design squad can prepare the detailed sheets which will be incorporated into the construction plans. This may include the following:

- stages of construction and temporary traffic control sheets;
- drainage sheets, including special drainage details;
- intersection details;
- interchange details;
- pavement marking details;
- grading plans;
- transition details;
- proposed cross sections, not including pavement template;
- special bikeway and trails plans;
- signing plans, if not prepared by the district Bureau of Operations;
- environmental mitigation plans, if not prepared by others;
- highway lighting plans, if not prepared by others; and
- any other special details.

Section 63-4 presents guidance on what information should be included on each detail or plan sheet.

In addition, the design squad will:

- determine the appropriate level of access control for the facility;
- determine the need for construction permits, permanent right-of-way easements, and/or temporary easements;
- perform the detailed drainage design;
- perform a roadside safety analysis; and
- incorporate any special experimental features into the plans.

PROJECT ACTIVITY (Phase II)

Activity Title: Develop Specialized Plans

Activity No.: 18

Responsible Unit: Various Units

Activity Description:

Based on the typical sections, plan and profile sheets (Activity 13), and detailed plan sheets (Activity 17), various other units within IDOT will prepare their applicable plan sheets, quantities, and special provisions. This may include:

- district Bureau of Operations preparing the landscaping details;
- district Bureau of Operations preparing the signing plans, if included within the project;
- district Bureau of Operations (or Bureau of Electrical Operations in District 1) preparing the traffic signal plans;
- Bureau of Operations, BDE, and design squad developing rest area plans (see Section 16-1);
- Bureau of Operations, BDE, Bureau of Bridges and Structures, Capital Development Board, and the design squad developing weigh stations and weigh-in-motion plans; and/or
- BDE (or Bureau of Electrical Operations in District 1) preparing the highway lighting plans.

In addition, the following units may review the detailed plans prepared by the design squad (Activity 17):

- district Bureau of Operations will review the pavement marking details and stage construction and traffic control plans.
- district Bureau of Project Implementation will review the stage construction and traffic control plans.
- district Hydraulics Section will review the drainage plans and special drainage detail sheets.
- BDE will review bikeway and trail plans.
- district Environmental Unit will review the environmental mitigation plans, if prepared by the design squad.

PROJECT ACTIVITY (Phase II)

Activity Title:	Finalize Plotting on Cross Sections
Activity No.:	19
Responsible Unit:	Design Squad

Activity Description:

During Phase I, the cross sections may have been generated using GEOPAK to determine the earthwork quantities. Using the following information, update and plot the revised cross sections:

- the TS&L Plans from the Bureau of Bridges and Structures (Activity 03);
- the environmental mitigation plans from the district Environmental Unit (Activity 15);
- information received from the Project Support Section on utility plans (Activity 12);
- the refined typical sections and plan and profile sheets (Activity 13);
- the detailed plans (Activity 17);
- the Geotechnical Report from the Geotechnical Section (Activity 04);
- the final pavement design from the Pavement Design Section (Activity 09); and
- right-of-way information provided by the Land Acquisition Section (Activity 16).

Also during Activity 19, develop the erosion control plans and specifications according to the criteria in Chapter 41 and the information provided in the Phase I report. These plans and specifications will be submitted to the district Environmental Unit for review and approval (Activity 20).

PROJECT ACTIVITY (Phase II)

Activity Title: Approve Erosion Control Plans

Activity No.: 20

Responsible Unit: Environmental Unit

Activity Description:

The district Environmental Unit will review and approve the erosion control plans and specifications prepared by the design squad (Activity 19). Once approval has been granted, the erosion control plans will be incorporated into the construction plans (Activity 25). Also, once the erosion control plans have been approved, the Environmental Unit can initiate the process of securing the necessary project permits (Activity 22).

PROJECT ACTIVITY (Phase II)

Activity Title: Assemble All Road Design Information

Activity No.: 21

Responsible Unit: Design Squad

Activity Description:

Throughout the design process, the design squad will have prepared the various plan sheets separately. In Activity 21, conduct the following:

- plot a complete set of plans developed to date (e.g., cover sheet, typical plans, plan and profile sheets, detail plans, cross sections);
- assemble the sheets in the recommended order as noted in Chapter 63;
- review the plans and details to ensure that all necessary information has been included and that the plans and details are compatible with each other;
- calculate the quantities for roadway design elements according to the criteria in Chapter 64 of the *BDE Manual*, the *Coded Pay Items*, and the *Standard Specifications for Road and Bridge Construction* for pay items, units of measurement, rounding conventions, etc.; and
- prepare all required special provisions.

At this time the Schedules of Quantities and the Summary of Quantities will not yet be prepared. For assembly purposes, blank Schedule of Quantities and Summary of Quantities may be included.

PROJECT ACTIVITY (Phase II)

Activity Title: Secure All Permits

Activity No.: 22

Responsible Unit: Environmental Unit

Activity Description:

After the cross sections have been finalized, the erosion control plans have been completed (Activity 19) and approved (Activity 20), the typical sections and plan and profiles sheets have been completed (Activity 13), and the detailed bridge plans have been completed (Activity 14), the district Environmental Unit will ensure all applicable permits and approvals required by the project are obtained. Depending upon the project-specific impacts, this may include any or all of the following:

- Section 401 water quality certification and 402 permits from the Illinois Environmental Protection Agency;
- US Army Corps of Engineers, Section 404/Section 10 permit(s);
- US Coast Guard, Section 9 permit; and
- permits issued by Illinois State agencies.

All permits, certifications, and approvals should be received by the Department prior to the review of all project commitments (Activity 32).

Chapter 28 provides a brief description of all Federal and State environmental permits and certifications.

PROJECT ACTIVITY (Phase II)

Activity Title: Process Utility Agreements or Adjustments

Activity No.: 23

Responsible Unit: Project Support Section

Activity Description:

Based on the roadway plans (Activities 13, 17, and 19), the detailed bridge plans (Activity 14), and the initial utility plans (Activity 12), the Project Support Section will work with the impacted utility companies and municipalities to implement the utility process. This process may include the following:

1. Plan Preparation. The utility companies are responsible for preparing all utility adjustment/relocation plans. The plans will be developed according to the criteria in Chapter 6.
2. Funding. Depending on the right-of-way ownership for existing and proposed utility locations, transportation funds may be eligible for utility adjustments/relocations required by the highway project; see Chapter 6. The Utilities pay for all betterments.
3. Agreements. The Project Support Section will prepare a Utility Agreement for each affected utility and will work with the utility companies to gain their input and approval. The Project Support Section will coordinate with BDE for review and approval of the agreements.

The Project Support Section will ensure that the utility process is completed before the review of all project commitments (Activity 32).

PROJECT ACTIVITY (Phase II)

Activity Title:	Implement Land Acquisition Process
Activity No.:	24
Responsible Unit:	Land Acquisition Section

Activity Description:

Based on the right-of-way plans (Activity 05), the final typical section and plan and profile sheets (Activity 13), and the right-of-way width determination (Activity 16), the Land Acquisition Section will implement the land acquisition procurement process. This will include the land acquisition functions of appraisal, negotiation, acquisition and, if necessary, condemnation. The Land Acquisition Section will also negotiate the terms of any construction permits, permanent easements, and/or temporary easements.

The Land Acquisition Section will ensure that the land acquisition procurement process is completed before the final review of all project commitments (Activity 32).

The Land Acquisition Section should coordinate with the design squad to ensure any negotiated considerations/commitments are included in the contract plans.

PROJECT ACTIVITY (Phase II)

Activity Title: Assemble All Information Prepared by Others

Activity No.: 25

Responsible Unit: Design Squad

Activity Description:

At this stage of project development, the design squad will have received the following completed plans, special provisions, pay items, and quantities from other IDOT units:

- the bridge/structure plans from the Bureau of Bridges and Structures (Activity 14);
- the landscaping details from the district Bureau of Operations (Activity 18);
- if included in the project, the signing plans from the district Bureau of Operations (Activity 18);
- the traffic signal plans from the district Bureau of Operations (or Bureau of Electrical Operations in District 1) (Activity 18);
- rest area plans from the Bureau of Operations and BDE (Activity 18);
- weigh stations and weigh-in-motion plans from the Bureau of Operations, BDE, Bureau of Bridges and Structures, and Capital Development Board (Activity 18); and
- the highway lighting plans from BDE (or Bureau of Electrical Operations in District 1) (Activity 18).

In addition, the design squad will have received approval of the erosion control plans from the district Environmental Unit (Activity 20) and right-of-way widths from the Land Acquisition Section (Activity 16).

The design squad will review these materials 1) to identify and incorporate any information which must be incorporated directly into the detailed road design and 2) to assemble those plan sheets prepared by others into the overall set of construction plans.

PROJECT ACTIVITY (Phase II)

Activity Title: Conduct Plan-in-Hand Field Inspection

Activity No.: 26

Responsible Unit: Design Squad

Activity Description:

At this stage of project development, all major design work has been completed, including roadway design, traffic items, structural elements, erosion control plans, right-of-way design, etc. The design squad is responsible for scheduling the Plan-in-Hand (PIH) review of the project. The PIH review is an in-depth office and on-site review of all project elements to ensure that all details and commitments have been satisfactorily incorporated into the construction plans and specifications, and that the project is nearly ready to advance to construction.

As applicable, the design squad will invite the following to conduct an office and PIH field inspection:

- district Bureau of Project Implementation,
- BDE,
- district Bureau of Operations,
- Bureau of Bridges and Structures,
- FHWA,
- local officials, and
- others as deemed appropriate.

Once the PIH office and field inspection have been completed, the design squad will prepare the PIH minutes to document all significant decisions made during the PIH review. After approval by the Program Development Engineer, distribute the PIH minutes to:

- all applicable Bureau Chiefs;
- Regional Engineer;
- all parties involved in the field review;
- FHWA, if applicable; and
- any other individuals or sections as deemed appropriate.

All parties receiving a copy of the PIH minutes are requested to provide comments on the minutes. Concurrence of the minutes will be assumed if no comments are received by the specified date.

PROJECT ACTIVITY (Phase II)

Activity Title: Prepare Schedules of Quantities

Activity No.: 27

Responsible Unit: Design Squad

Activity Description:

Based on any modifications due to the Plan-in-Hand field inspection (Activity 26), the design squad will refine the project quantities for the roadway design items developed during Activity 21. Using these quantities and those provided by other IDOT units (Activity 25), the design squad will prepare the Schedule of Quantities sheets according to the criteria presented in Chapter 64. These quantities will be incorporated onto the Summary of Quantities Sheet (Activity 28).

PROJECT ACTIVITY (Phase II)

Activity Title: Prepare Combined Summary of Quantities

Activity No.: 28

Responsible Unit: Design Squad

Activity Description:

Using the quantities developed in Activity 21, refined in Activity 27, and those provided by other IDOT units (Activity 25), the design squad will prepare the Summary of Quantities sheets, which will summarize all pay items necessary to construct the improvement. It also should include the applicable construction and safety code items, pay item code numbers, units of measurement, total quantities, and quantity breakdown for each section. One or more summary sheets typically will be included in each set of plans. Do not show other data on the summary sheets (e.g., general notes). When preparing the Summary of Quantities sheets, it is important that all quantities be calculated and segregated accordingly prior to completing the Summary of Quantities.

The design squad should coordinate with the Project Support Section to ensure that the percentages and cost breakdown in the Summary of Quantities and the Local Agency agreements are identical.

For additional guidance on preparing the Summary of Quantities, see Section 63-4.

PROJECT ACTIVITY (Phase II)

Activity Title: Prepare Final Plans and Specifications

Activity No.: 29

Responsible Unit: Design Squad/Others

Activity Description:

Based on the Plan-in-Hand Review and minutes (Activity 26), all bureaus and sections responsible for their respective project plans will make all necessary plan and specifications revisions. This will produce the final set of project plans ready for construction. Specifically for the design squad, the design squad will be responsible for revising the roadway plans and specifications. Once completed, the plans will be distributed for district review (Activity 31) and will allow the District Estimating Engineer to prepare the Final Plan Submittal Estimate.

Complete quality control/quality assurance (QC/QA) prior to the plans being circulated for district review.

PROJECT ACTIVITY (Phase II)

Activity Title: Prepare Final Plan Submittal Estimate

Activity No.: 30

Responsible Unit: District Estimating Engineer

Activity Description:

Based on the information from the final plans and specifications (Activity 29), the District Estimating Engineer will prepare the final district cost estimate. This may be a new estimate or an update of an earlier cost estimate prepared during Phase I or a revised cost estimate prepared during Phase II. This estimate will be submitted to the BDE Project Management Unit, which will use it to develop the Engineer's Estimate.

Chapter 65 provides guidance on the preparation of project cost estimates.

PROJECT ACTIVITY (Phase II)

Activity Title: Circulate Plans for District Review

Activity No.: 31

Responsible Unit: Design Squad

Activity Description:

Once all revisions from the Plan-in-Hand Review and minutes have been made to the plans and specifications, the design squad will submit a completed set of construction plans to the district units involved with the project for final review and comment. Typically, this review will consist of:

- reviewing the plans to ensure the reviewer's comments from previous reviews have been incorporated;
- ensuring that the changes do not conflict with the bureau's commitments; and
- ensuring that the plans conform to the Department's design criteria.

If changes are requested at this point which are desirable, but not mandatory, the Studies and Plans Engineer will determine if they should be incorporated. This will depend on other factors that may preclude the changes from being added to the plans. If another bureau determines the changes still should be incorporated, an appeal can be made to the Program Development Engineer for their incorporation.

PROJECT ACTIVITY (Phase II)

Activity Title:	Review all Project Commitments
Activity No.:	32
Responsible Unit:	Design Squad

Activity Description:

At this point in project development, the project design is essentially complete. The design squad must ensure that the following elements have been completed and/or have been incorporated into the plans:

- all environmental permits have been secured (Activity 22);
- all utility agreements and adjustments have been processed and signed (Activity 23);
- the final district cost estimate has been completed (Activity 30);
- the land acquisition process has been completed (Activity 24);
- all local agreements and letters of understanding have been processed and signed (Activity 10);
- all railroad agreements have been processed and signed (Activity 06); and
- all commitments made during the project development, including those made during Phases I and II, have been incorporated.

The design squad must carefully review all minutes of meetings, transcripts of public hearings, and the project study files to ensure that all commitments have been incorporated. If there are any questions, the design squad should contact the preparer of the Phase I report or the Unit making the commitment during Phase II.

If it is discovered during the plan development that a change is required to the approved Phase I report or a commitment cannot be met, the design squad must immediately notify BDE and all other applicable units so that the appropriate action can be taken. Failure to provide the appropriate notification and review may result in project delay.

PROJECT ACTIVITY (Phase II)

Activity Title: Submit PS&E to BDE

Activity No.: 33

Responsible Unit: Design Squad

Activity Description:
Once the plans are complete and the design squad has ensured all commitments, agreements, permits, etc., are complete or have been incorporated, the design squad will submit the following items to the BDE Program Support Unit:

- the Certification Acceptance/Project Status Form, signed by the Regional Engineer;
- a cover sheet signed by the Regional Engineer indicating his/her approval of the plans;
- one complete set of full-size plans on reproducible paper, mylar, or vellum (see Chapter 63 for the Department's guidelines on preparing plan sheets);
- one copy of each special provision required for the project, including a copy of the electronic file in Microsoft Word format (see Section 66-1.04 for the procedures on developing special provisions);
- a completed Recurring Special Provision check sheet (see Chapter 66);
- the project quantities on Form BD-213 or BDE-approved equal (see Chapter 64 for the procedures on determining plan quantities);
- the expected construction time for the project (see Section 66-2.03 for the Department's guidelines on determining the expected construction time); and
- copies or originals of all permits and agreements.

To place an improvement on any specific letting, it is imperative that the plans and supporting documents be submitted according to the schedules established in Section 66-2 which indicate the minimum number of weeks prior to the letting date for the submittal or completion of a particular phase of work.

PROJECT ACTIVITY (Phase II)

Activity Title: Process Contract

Activity No.: 34

Responsible Unit: BDE

Activity Description:

Once BDE has received the plans and other information from the district (Activity 33), it will conduct the following:

- prepare the Engineer's Estimate;
- verify that the plans are on the list of recommended projects;
- check the Certification Acceptance /Project Status Form;
- verify the project is programmed and the scope of work is correct;
- determine the final funding source;
- check all agreements to ensure they are consistent with the project;
- submit the plans, special provisions, quantities, etc., for review and comment;
- prepare the Transportation Bulletin and advertise the project;
- if necessary, submit the PS&E to FHWA for approval;
- prepare the contract proposal;
- submit the proposal and plans to bidders;
- implement the letting process;
- review all bids; and
- execute the contract.

For additional guidance on the contract process, see Chapter 66.

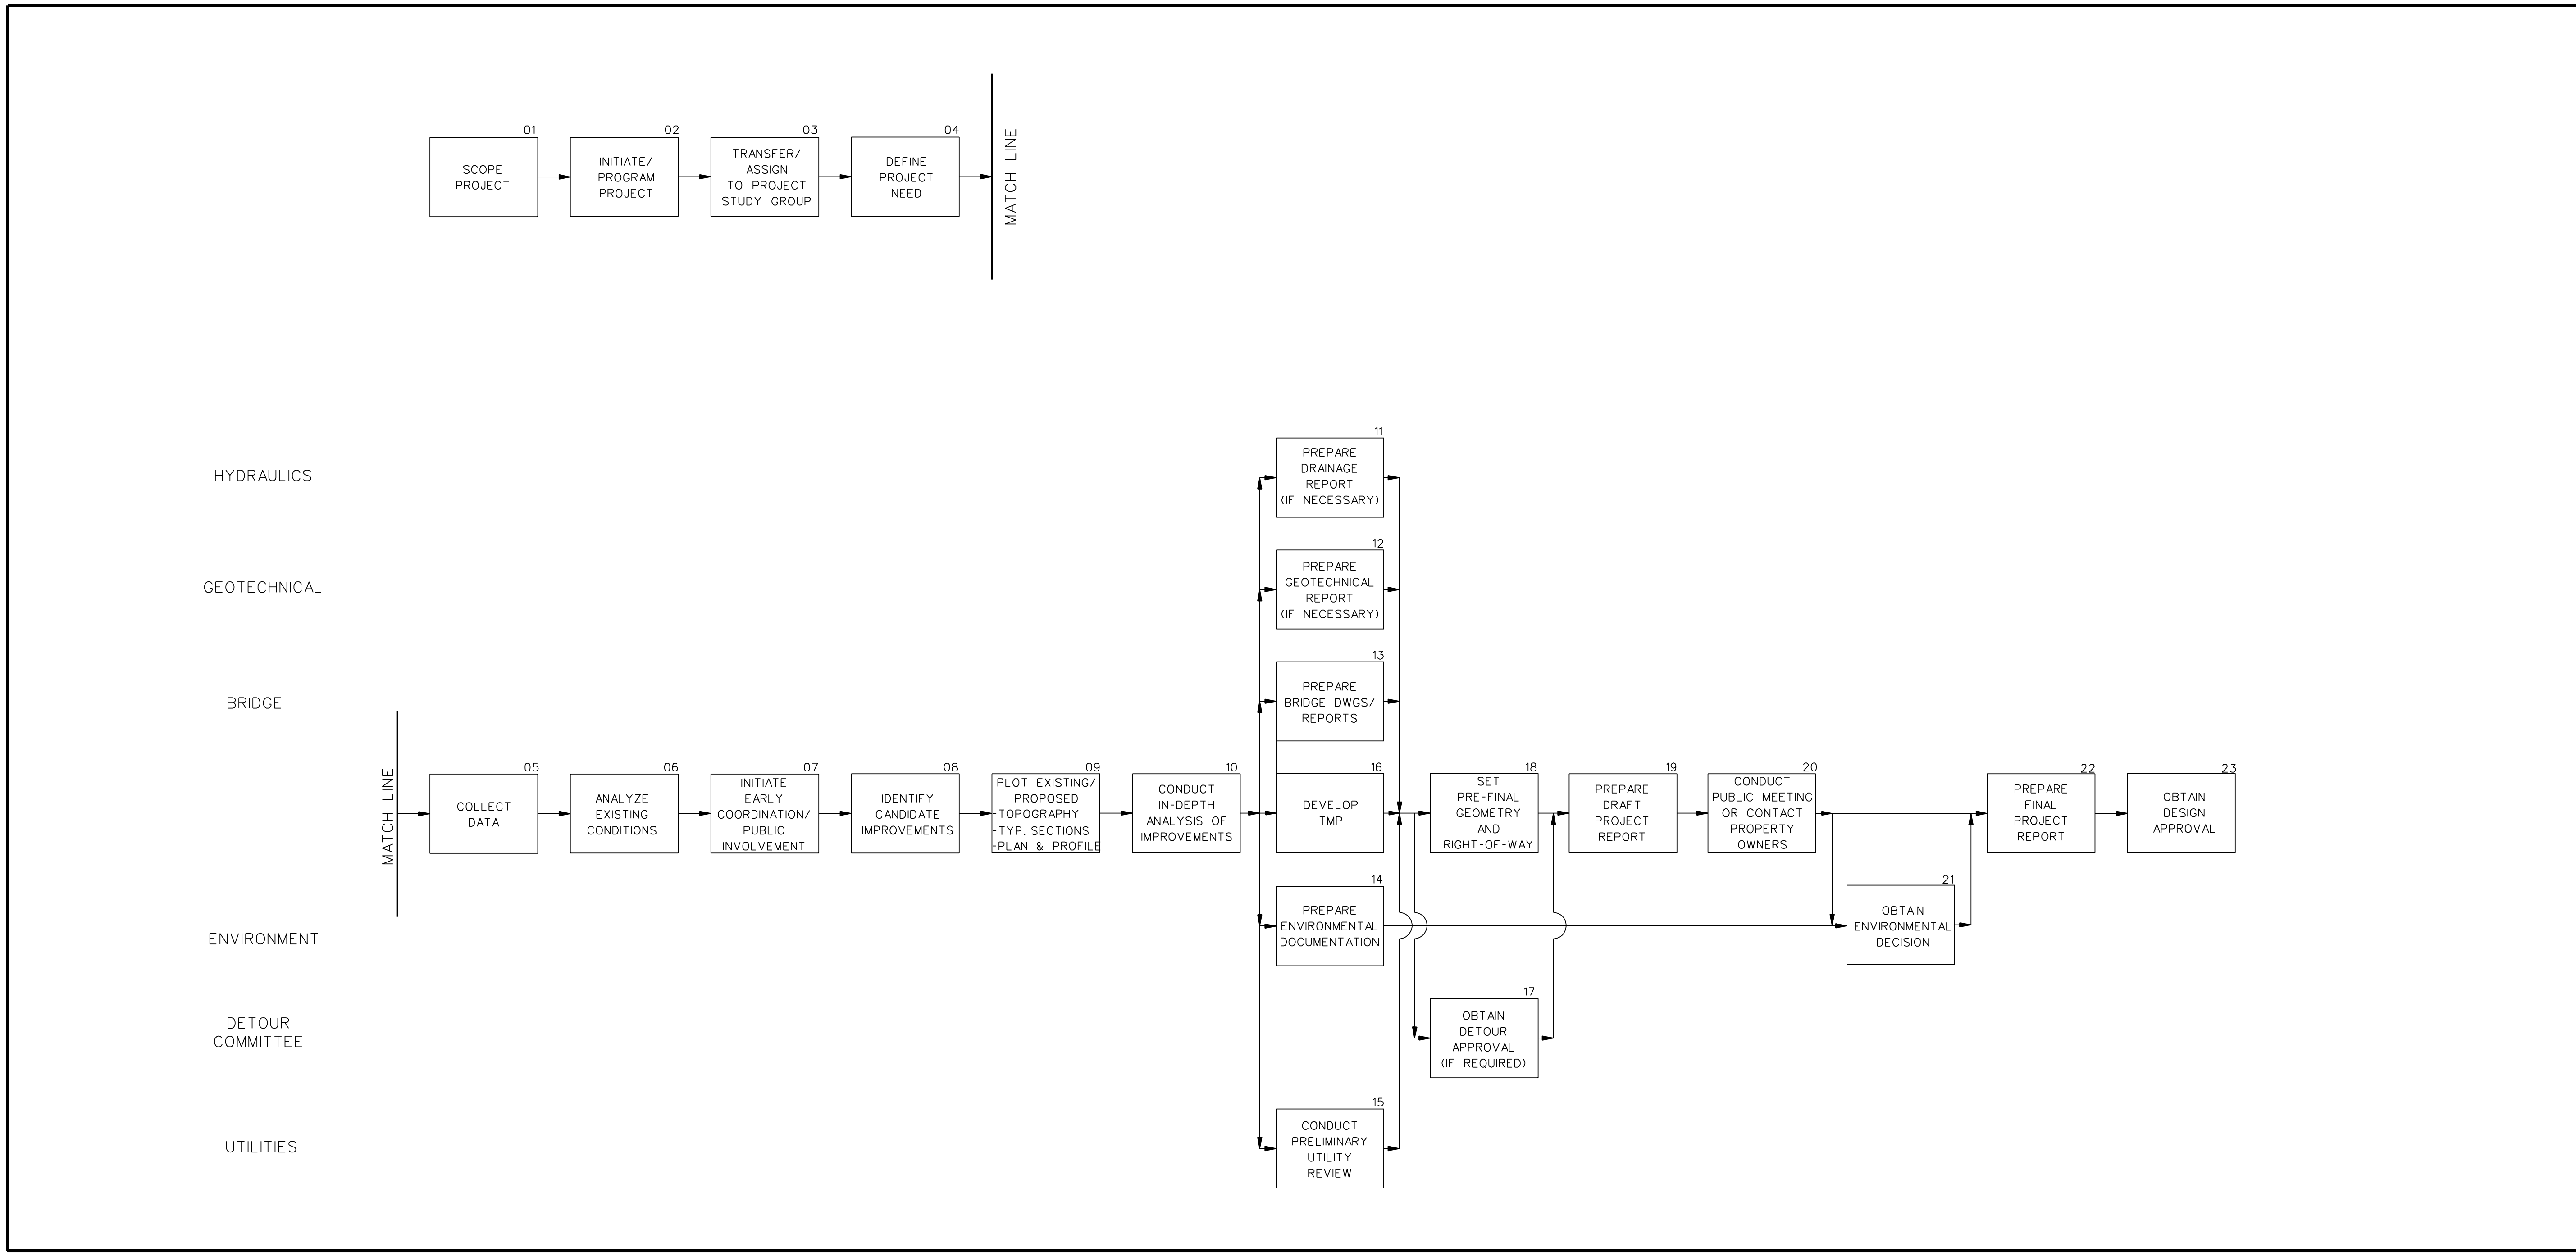
3-3 PROJECTS WITH MINOR RIGHT-OF-WAY ACQUISITIONS

3-3.01 Phase I Studies

Figure 3-3.A illustrates a typical Phase I flowchart or network for a 3R or minor widening project on existing alignment that will require minimal or no ROW acquisitions. These projects typically are classified as Categorical Exclusions and require a Project Report. For guidance on the preparation and format of Project Reports, see Chapters 11 and 12. For other project types, see the flowcharts in Chapter 2, Section 3-2, and Section 3-4. Following Figure 3-3.A are brief write-ups for each activity.

Depending on the project, particularly those requiring structural work and/or right-of-way acquisitions, it may be desirable to begin the Phase II work prior to obtaining the approval of the Project Report. Typically, some Phase II activities can be started after the draft of the Project Report has been prepared.

Refer to Section 11-7.03 for requirements and guidance on value engineering (VE) analyses. Where required, initiate the VE study no later than the time construction plans are 30% complete and allow for the implementation of the recommendations without delaying the project.



PHASE I PROJECT DEVELOPMENT NETWORK
(3R or Minor Widening Project on Existing Alignment)

Figure 3-3.A

PROJECT ACTIVITY (Phase I)

Activity Title: Scope Project

Activity No.: 01

Responsible Unit: District Bureau of Program Development

Activity Description:

A roadway project proposal can originate from a variety of sources, including local officials or metropolitan planning organizations (community-based need), directly from the IDOT district (district-based need), from a Bureau in the central office (Office of Planning and Programming, BDE, Operations, Bureau of Safety Engineering, etc.), or other sources targeting a special need or a Statewide need.

Before a project is entered onto the Department's Proposed Highway Improvement Program, the district Programming Section initially develops and documents the project concept. Developing the project concept will typically involve the following:

- establishing that there is, in fact, a need for the project;
- making a preliminary determination of the project scope of work;
- reviewing any available data and records;
- reviewing existing plans;
- conducting an initial evaluation of right-of-way, utility, and environmental impacts and the likely level of environmental evaluation;
- developing a rough, preliminary cost estimate; and
- developing a set of review plans.

This information is forwarded for review and comment to district Program Development, district Operations, BDE, district Environmental Unit, the Bureau of Bridges and Structures, and other individuals, as appropriate. District Programming will refine the scope based on the comments received.

Once the scope, cost, and schedule have been defined, district Programming will forward this information to the Office of Planning and Programming for incorporation into the Department's multi-year program (Activity 02).

PROJECT ACTIVITY (Phase II)

Activity Title:	Initiate/Program Project
Activity No.:	02
Responsible Unit:	Office of Planning and Programming

Activity Description:

Candidate projects are submitted by the districts as a request for project programming to the Office of Planning and Programming. Based on a Statewide assessment of highway improvement needs and available funds, the Office of Planning and Programming will develop the Department's Proposed Highway Improvement Program. This will establish an individual project as an active project for further development.

The Office of Planning and Programming annually issues guidelines for multi-year programming criteria. This includes programming criteria for:

- improvement categories,
- pavement surface conditions,
- deficient bridges,
- safety improvements,
- Interstate rehabilitation,
- widening narrow and deteriorated pavements,
- improving intersections and reducing traffic bottlenecks,
- new construction/reconstruction of major facilities,
- transportation enhancement projects,
- Congestion Mitigation Air Quality (CMAQ) projects, and
- bicycle accommodation.

PROJECT ACTIVITY (Phase I)

Activity Title: Transfer/Assign to Project Study Group

Activity No.: 03

Responsible Unit: Studies and Plans Engineer

Activity Description:

At this point the project will either be assigned to a project study group within the district Bureau of Program Development or to a consultant to begin the design study. The Studies and Plans Engineer will have the overall day-to-day responsibility for advancing the project through the Phase I study process. The Studies and Plans Engineer, or designee, will:

- coordinate directly with other units within the Department;
- attend all internal meetings and field inspections;
- ensure that the project study meets all Department criteria and procedures;
- report directly to the District Program Development Engineer on all significant project activities, problems, and developments; and
- participate in the public involvement process.

The number and expertise of personnel initially assigned to the project study group will vary with the nature and scope of the proposed improvement. The personnel assigned will also vary over time relative to the priority for completion, the available lead time, and the activity in project development under study.

If the project is one, which the Regional Engineer has determined will use the principles of Context Sensitive Solutions (CSS), the public involvement process should commence at this point. The project study group uses the Stakeholder Involvement Process (SIP) as outlined in Sections 19-5.01 to conduct public involvement for CSS projects.

PROJECT ACTIVITY (Phase I)

Activity Title: Define Project Need

Activity No.: 04

Responsible Unit: Project Study Group/BDE/FHWA/Office of Planning & Programming

Activity Description:

For a transportation project, the project study group must first define the project need, which will direct the process for the identification of design alternatives, in-depth analyses and, ultimately, selection of the preferred design. This will consist of reaffirming the need for the proposed improvement, establishing project goals and objectives, and establishing the study area and logical termini. The feasibility of a design depends on the social, economic, environmental, and engineering effects of the proposed highway improvement. Previous studies and decisions should be reaffirmed and/or updated as necessary. Other factors that must be considered include:

- existing traffic volumes and capacity deficiencies;
- crash information;
- alignment and profile deficiencies;
- structural integrity of bridges, pavements, and culverts;
- lane and shoulder widths;
- roadside safety;
- transportation demand;
- potential cost savings to the traveling public;
- enhanced economic development potential;
- programming guidelines;
- commitments to elected officials; and
- public input.

Further study may result in revisions to the preliminary need.

PROJECT ACTIVITY (Phase I)

Activity Title: Collect Data

Activity No.: 05

Responsible Unit: Project Study Group

Activity Description:

Once the project need has been identified (Activity 04), the project study group must gather and inventory information and data for the project. All types of data, including social, economic, environmental, and engineering, should be gathered simultaneously. The amount and type of information to be collected will vary with the nature and scope of the proposed improvement. Some of the information that is gathered includes:

- roadway, field, aerial, and stream surveys;
- existing roadway classifications and truck routes;
- existing as-built plans and maintenance records;
- existing highway geometrics;
- existing on-street parking;
- crash rate maps and collision diagrams;
- pavement and bridge condition reports;
- existing ROW information and any encroachments;
- ADT traffic maps and DHVs for current and design year traffic (all affected routes);
- inventory of posted speed limits;
- detailed transportation maps and plans with all modes of travel included;
- utility installations and detailed maps from utility companies;
- hydraulics survey, drainage survey, sewer atlas, and flooding information tables;
- fire districts, mail and school bus routes, location of churches, drainage districts, historic sites, and field-tile maps;
- commercial, agricultural, industrial, recreational, historic, and residential land use;
- conservation areas, archaeological sites, wetlands, special waste sites, etc.;
- local, State, and Federal agency coordination needs;
- current topographic mapping and aerial photographic mosaics;
- geotechnical investigations;
- joint development uses and scenic easements;
- estimate of cost (see Section 11-2.15) and road-user benefits (see Section 11-7.01); and
- maintenance agreements with locals.

See Chapters 11 and 12 for further guidance on the information that should be collected for a Phase I study. See Section 23-2 for further guidance on the collection of environmental information for the project.

PROJECT ACTIVITY (Phase I)

Activity Title: Analyze Existing Conditions

Activity No.: 06

Responsible Unit: Project Study Group

Activity Description:

Using as-built plans, aerial and/or field surveys, previously prepared reports, and data collected in Activity 05, the project study group will review and identify the following existing conditions:

- the locations of streams, railroads, and other topographic features;
- existing traffic and capacity deficiencies;
- pavement, bridge, and culvert structural integrity;
- crash information;
- alignment and profile deficiencies;
- existing lane and shoulder widths;
- existing ROW, ROW constraints, and encroachments;
- roadside safety concerns;
- existing and planned land uses from local governments, MPOs, fire districts, schools, etc.;
- existing agreements with utilities, railroads, local agencies, etc.;
- existing drainage patterns and drainage systems;
- sensitive noise receptors;
- wetlands, applicable 4(f), 6(f), and 106 sites, etc.;
- special waste sites; and
- tree and vegetation inventory.

If not already done, determine the State plane coordinates of all control points (POTs and PIs) from the project mapping/survey. Input this information and the radii of horizontal curves into a computer file to mathematically describe the alignment. Once an alignment is mathematized and tied into digitized mapping files, the alignment can then be stationed from west to east or south to north and the information stored as a computer file for further design work.

PROJECT ACTIVITY (Phase I)

Activity Title: Initiate Early Coordination/Public Involvement

Activity No.: 07

Responsible Unit: Project Study Group

Activity Description:

Coordination with other Department and governmental agencies, as appropriate, is an important aspect during the design study process. This coordination should begin as early as practical in project planning.

At this stage of the design study process, the project study group will initiate early coordination with other Department Units or Bureaus and governmental agencies (e.g., Environmental, FHWA, Land Acquisition, Construction, Operations, Bridges and Structures, Utilities) that have an interest in the project or have information or expertise concerning any issues the project may involve. The purpose of this coordination will be to assist in the identification of reasonable design alternatives and in gathering information to evaluate the social, economic, engineering, and environmental impacts of the proposed project and possible impact mitigation measures. This coordination should begin as early as practical. Early coordination will also identify the cooperating agencies.

Also, this Activity will allow the public an opportunity for input and comment on the project. Typically, this will consist of informational letters, advertisements, and/or meetings with local government officials, fire districts, school districts, drainage districts, historic commissions, MPOs, residents, businesses, etc. These meetings or letters may include:

- advising local, State, and Federal officials that a project has been initiated and that a study is underway;
- procedures for developing possible coordination and public service involvement;
- a discussion on the project scope;
- a request for information (e.g., MPO plans, drainage problems, transit needs);
- a discussion with businesses, railroads, and utility companies; and
- talking with individuals at public information meetings about individual concerns.

For projects which the Regional Engineer has determined will use the principles of CSS, the public involvement process should commence once the project is assigned to the project study group. The project study group uses the SIP as outlined in Sections 19-5.01 to conduct public involvement for CSS projects.

Public coordination must be ongoing throughout the project development. For guidance on public involvement, see Chapter 19.

PROJECT ACTIVITY (Phase I)

Activity Title: Identify Candidate Improvements

Activity No.: 08

Responsible Unit: Project Study Group

Activity Description:

Based on the information gathered (Activity 05) and analyzed (Activity 06), the project study group will review the types of improvements that meet the defined need for the project (Activity 04) and determine which designs are reasonable and cost effective. Some of the improvements that can be considered may include the following:

- increasing lane and shoulder widths;
- improving sight distance (e.g., stopping, decision, intersection);
- upgrading or realigning horizontal curves;
- improving superelevation rates and/or transition lengths;
- upgrading or realigning vertical curves;
- flattening grades;
- rehabilitating, reconstructing, or resurfacing the pavement;
- adding turn lanes or other improvements at intersections;
- upgrading, widening, or replacing structures;
- flattening side slopes;
- improving the clear zone;
- replacing and/or upgrading guardrail, impact attenuators, and end sections;
- replacing or upgrading signs, traffic signals, and lighting supports;
- adding or upgrading traffic signals;
- adding or upgrading highway lighting;
- upgrading pavement markings, including reflectorized pavement markings;
- upgrading culverts and/or other drainage systems;
- adding or removing curbs and gutters;
- adding mailbox turnouts;
- relocating utilities;
- upgrading railroad crossings and signals; and
- replacing or adding sidewalks, curb ramps, or bicycle facilities.

PROJECT ACTIVITY (Phase I)

Activity Title: Plot Existing/Proposed Topography, Typical Sections, Plan and Profile

Activity No.: 09

Responsible Unit: Project Study Group

Activity Description:

For this Activity, conduct the following:

- If not already done, plot the existing topography including property lines, property owner names, business names and type, names of roads, driveways/access roads, and all other important geographic and cultural features.
- Plot existing horizontal and vertical alignments and cross sections.
- Determine the proposed typical sections.
- Once the geometric elements have been set, determine the preliminary right-of-way limits.
- Determine the rough quantities for the proposed design and refine the cost estimate. If no quantities are available, use a generalized cost (e.g., cost per mile (kilometer)); see Sections 12-4 and 65-1.02.

IDOT uses the computer software program GEOPAK for laying out alignments, profiles, cross section designs, quantity calculations, and for determining construction limits. GEOPAK also can be used to generate 3-D and perspective plots for any portion of the roadway. Use 3-D plots in the design process to assess potential safety problems and the aesthetics of the design.

PROJECT ACTIVITY (Phase I)

Activity Title: Conduct In-Depth Analysis of Improvements

Activity No.: 10

Responsible Unit: Project Study Group

Activity Description:

For each of the candidate improvements identified in Activity 08, the project study group will conduct an analysis to determine if the improvement can be practically and cost effectively incorporated into the design. For example, the project study group will review the existing horizontal curvature against the criteria presented in Chapter 49 to determine if the existing curvature can be retained or should be upgraded. For each design improvement, the project study group should conduct a road user benefit analysis; see Section 11-7.01. Often, incorporating all the improvements found to be cost effective will exceed the proposed construction cost estimate for the project. Therefore, the project study group will need to prioritize the improvements to fit within the proposed construction funds or request additional funds to incorporate the changes. For CSS project, the project study group achieves consensus with CSS stakeholders on the range of improvements for the project.

The results of this and previous Activities will be submitted, as applicable, to the Hydraulics Unit, Geotechnical Unit, Bureau of Bridges and Structures, district Environmental Unit, and Project Support Section to allow these Units to prepare their applicable reports for the Project Report.

PROJECT ACTIVITY (Phase I)

Activity Title: Prepare Drainage Report (If Necessary)

Activity No.: 11

Responsible Unit: Hydraulics Unit

Activity Description:

Based on the information provided from the project study group (Activity 10), the Hydraulics Unit will perform the hydrology/hydraulics analysis, including the following:

- culvert sizing,
- longitudinal encroachments,
- existing and proposed storm drainage facilities,
- stormwater management, and
- pump stations.

Based on its evaluation, the Hydraulics Unit will prepare a Drainage Report. The project study group will use this information in making the final design determinations. It will also incorporate the Drainage Report into the final Project Report. See Chapter 40 and the *IDOT Drainage Manual* for more information on Drainage Reports.

PROJECT ACTIVITY (Phase I)

Activity Title: Prepare Geotechnical Report (If Necessary)

Activity No.: 12

Responsible Unit: Geotechnical Unit

Activity Description:

Based on the information provided from the project study group (Activity 10), the Geotechnical Unit will prepare the Geotechnical Report. The analyses may include:

- basic soil properties (e.g., AASHTO soils classification);
- shrink/swell factors;
- properties of subsurface strata;
- potential for slides; and
- slope stability at proposed cuts.

Based on its evaluation, the Geotechnical Unit will prepare a Geotechnical Report. The project study group will use this information in making the final design determinations. In addition, the Geotechnical Report will be incorporated into the final Project Report. See the *IDOT Geotechnical Manual* for more information.

PROJECT ACTIVITY (Phase I)

Activity Title: Prepare Bridge Drawings/Reports

Activity No.: 13

Responsible Unit: Bureau of Bridges and Structures/Project Study Group

Activity Description:

Based on the information provided from the project study group (Activity 10), the Bureau of Bridges and Structures (BB&S) will prepare the Proposed Structure Sketch for major structures, which will illustrate:

- the type of structures,
- approximate horizontal and vertical alignment and skew,
- approximate pier locations, and
- typical bridge deck section.

The project study group will prepare this sketch for other than major structures.

In addition, prepare the Bridge Condition Report for existing bridges which will include:

- a description of the physical conditions and deficiencies that mandate repair or replacement,
- a verification of the apparent soundness of any structure elements recommended for reuse plus the economic advantage gained by their reuse,
- a statement of any geometric or hydraulic improvement requirements, and
- a recommendation for the scope of the proposed work.

For additional information on the Proposed Structure Sketch and Bridge Condition Reports, see Chapter 39. The BB&S will also prepare the Hydraulics Report for major structures which will involve:

- the hydraulic analysis to determine the necessary dimensions of the waterway opening to pass the design flood, to meet the backwater allowances, and to satisfy any regulatory flood plain requirements;
- the hydraulic scour analysis to assist in determining the proper foundation design for the bridge; and
- a suggested freeboard elevation.

The project study group will prepare this report for other structures and the BB&S will approve the report.

The Structure Sketch and Hydraulics Report will be incorporated into the final Project Report.

PROJECT ACTIVITY (Phase I)

Activity Title: Prepare Environmental Documentation

Activity No.: 14

Responsible Unit: Environmental Unit

Activity Description:

Once the preliminary design improvements have been identified (Activity 08) and analyzed (Activity 10), the district Environmental Unit will initiate the environmental process. Typically, these projects will be classified as Categorical Exclusions (see Chapter 23).

This Activity will include:

- discussing the project at a coordination meeting, which may include obtaining FHWA concurrence in the appropriateness of the proposed environmental document processing type;
- assembling and analyzing the necessary information on environmental issues;
- determining and evaluating potential environmental impacts, mitigation measures, and applicable compliance requirements; and
- preparing the environmental documentation.

See Part III "Environmental Procedures" for further guidance on environmental documentation requirements and procedures.

PROJECT ACTIVITY (Phase I)

Activity Title: Conduct Preliminary Utility Review

Activity No.: 15

Responsible Unit: Project Support Section

Activity Description:

The project study group will provide the district Project Support Section with copies of the plan sheets for the proposed project. The Project Support Section will work with the applicable utility companies to identify project impacts on existing utilities and inform them of environmental issues that may affect their adjustments and relocations. The following items of work are typically performed:

1. Underground. The Project Support Section will coordinate with the district survey crew and will, if needed, request an underground survey to determine the depths and location of existing underground utilities within the project limits, especially fiber optic cables, water supply, and sanitary lines in urban areas.
2. Overhead. For any major above-ground utilities that may be impacted by the project, the Project Support Section may prepare a cost estimate to determine if a special effort should be exercised to avoid certain utilities.
3. Impacts. The Project Support Section will notify any utility companies that will be potentially impacted by the upcoming project, and the Section will request that the Utility contact IDOT if it plans any work in the vicinity of the project.

The Project Support Section will document its findings in a report or memorandum and submit it to the project study group. The project study group will use the information in making the final design determinations and document its findings in the Project Report.

For additional guidance on utility coordination, see Chapter 6.

PROJECT ACTIVITY (Phase I)

Activity Title: Develop Transportation Management Plan

Activity No.: 16

Responsible Unit: Project Study Group

Activity Description:

The maintenance of traffic flow during construction of a State highway will involve traffic and worker safety, public relations, and capital costs to the Department. A well-planned method for maintaining traffic flow can minimize complaints from the traveling public and from residents and businesses along the affected route. Each construction site must be evaluated on its own merits as to the appropriate method for maintaining traffic. The Project Report should contain a Transportation Management Plan (TMP) indicating an overall strategy for accommodating traffic during construction. Chapter 13 presents the goals and objectives for a TMP. The TMP should address the preferred traffic control method, alternative traffic control applications, geometric design criteria, the impact traffic will have on other facilities, local concerns, cost effectiveness of various alternatives, etc. Chapter 55 and the *Highway Standards* provide the design criteria to use when designing a traffic control plan. In addition, consider the following:

- The TMP not only must address the alternatives confined to the project site, but it must also evaluate the impact traffic will have on the entire corridor.
- No formal public involvement activity (e.g., design hearing) should occur until a recommended alternative has been decided upon based on the TMP Report. However, informal public involvement will be necessary during the analysis of alternatives.

PROJECT ACTIVITY (Phase I)

Activity Title: Obtain Detour Approval (If Required)

Activity No.: 17

Responsible Unit: Project Study Group

Activity Description:

In general, the TMP (Activity 16) will be approved as part of the Project Report. For all marked and unmarked detours, or for a road proposed to remain open by either stage construction or a runaround, the TMP will be approved by the district Detour Committee. Exceptions to the TMP, as discussed in Chapter 13, will be through the Bureau of Safety Programs and Engineer. For a closed unmarked State highway, also coordinate with the local county officials prior to the submittal of the Project Report.

PROJECT ACTIVITY (Phase I)

Activity Title: Set Pre-Final Geometry and Right-of-Way

Activity No.: 18

Responsible Unit: Project Study Group

Activity Description:

Based on the previous analyses for the recommended design improvements and information provided by others (Activities 10, 11, 12, 13, 14, and 15), the project study group will:

- make any necessary adjustments to the selected vertical and horizontal alignments;
- obtain approval of all design exceptions by BDE and, where necessary, FHWA.
- make any necessary adjustments to the typical sections;
- set preliminary construction limits;
- set preliminary right-of-way limits;
- determine any easement requirements; and
- determine if any utility adjustments or displacements are necessary.

See Part IV "Roadway Design Elements" and Part V "Design of Highway Types" for detailed information on geometric design and the *IDOT Land Acquisition Manual* for guidance on right-of-way impacts.

PROJECT ACTIVITY (Phase I)

Activity Title:	Prepare Draft Project Report
Activity No.:	19
Responsible Unit:	Project Study Group

Activity Description:

Once the analyses have been conducted and the information gathered, the project study group will prepare the draft Project Report. Chapter 12 presents the format that should be used when preparing a Project Report. Because the design study should be essentially complete, it should be possible to prepare the draft Project Report in its near-final format. The discovery of new, significant information during the public meeting (Activity 20) should be rare if the design study has been properly developed. The only changes necessary to prepare the final Project Report should be the addition of information concerning the public meeting (Activity 20), incorporation of revisions, if necessary, to respond to comments received at the public meeting, and inclusion of final conclusions/recommendations.

In general, the draft Project Report should be submitted to FHWA and BDE for review prior to its availability for public viewing and inspection at the public meeting. Formal approval by BDE for release is not normally issued. Copies made available to the public should be marked as “draft” or “preliminary.”

The Project Report should include:

- Project Report approval form;
- a summary of need and location of the project;
- description of the proposed improvements;
- a list of all design improvements eliminated and the reasons for their elimination;
- a summary of the environmental sign-offs obtained;
- the results of public involvement;
- the proposed temporary traffic plan;
- a list of commitments made to the public, Federal, and local agencies, etc.;
- the estimate of costs;
- an appendix showing typical sections, aerial photography, mapping, etc.; and
- reference to analyses and other reports conducted during the design study, including the environmental document, if applicable.

For further guidance on information to be included in the Project Report, see Chapter 12.

PROJECT ACTIVITY (Phase I)

Activity Title: Conduct Public Meeting

Activity No.: 20

Responsible Unit: Project Study Group

Activity Description:

As required by the project, a public meeting will be held at this stage of the project study to present to the public, and other interested organizations and agencies, the proposed design, a summary of the analyses for the various design improvements determined not to be feasible, and the criteria used to select the final design. Other Department Sections or Bureaus (e.g., Land Acquisition), as necessary, may attend the public meeting to answer specific questions relative to their expertise. When a project will require minimal amounts of land from a small number of property owners (e.g., 10 or fewer) and the project is not anticipated to be controversial, contacts with individual landowners may be sufficient to address public involvement needs. See Section 19-3.02 for further guidance on this option.

For CSS projects, public meetings will occur throughout the Phase I process.

The project study group will evaluate all comments from the public meeting and will prepare responses to these comments as appropriate. Possible responses include:

- modifying the design;
- developing and evaluating alternatives not previously given serious consideration;
- supplementing, improving, or modifying analyses;
- making factual corrections; or
- explaining why the comments do not warrant further agency response, citing the sources, authorities, or reasons which support that position and, if possible, indicating those circumstances that would trigger reappraisal or further response.

Chapter 19 discusses the requirements for public information meetings and for responding to comments received during the public meeting.

PROJECT ACTIVITY (Phase I)

Activity Title: Obtain Environmental Decision

Activity No.: 21

Responsible Unit: Environmental Unit

Activity Description:

As stated in Activity 14, most 3R projects are Categorical Exclusions (CE). For CE projects, the district Environmental Unit must obtain CE approval from FHWA unless the project qualifies as a State Approved CE; see Chapter 23.

PROJECT ACTIVITY (Phase I)

Activity Title: Prepare Final Project Report

Activity No.: 22

Responsible Unit: Project Study Group

Activity Description:

The comments received from the public and other agencies should be analyzed to determine if any changes are necessary in the draft Project Report and if any relevant issues have been overlooked. If an oversight has occurred, additional studies may be required to explain the resultant effects and determine what project design changes, if any, are necessary. After the review and analysis of comments is complete and appropriate revisions made, the final Project Report may be prepared. Activity 19 and Chapters 11 and 12 list the appropriate format, reports, and discussions that should be included in the Project Report. The final Project Report will also include or reference the final environmental documentation received from the district Environmental Unit.

After completing all public involvement and environmental requirements, the original scaled mapping is reduced for insertion into an appendix of the Project Report. Prepare the reduced mapping sheets and other engineering exhibits on 11 in. x 17 in. sheets and place them in an appendix. In addition, place the aerial photography (access control plans) showing the alternatives advanced for environmental analysis and any other environmental exhibits on 11 in. x 17 in. sheets and place them in an appendix. The 11 in. x 17 in. format provides for ease of use of all final exhibits by Planning, Design, and Land Acquisition personnel.

PROJECT ACTIVITY (Phase I)

Activity Title: Obtain Design Approval

Activity No.: 23

Responsible Unit: BDE

Activity Description:

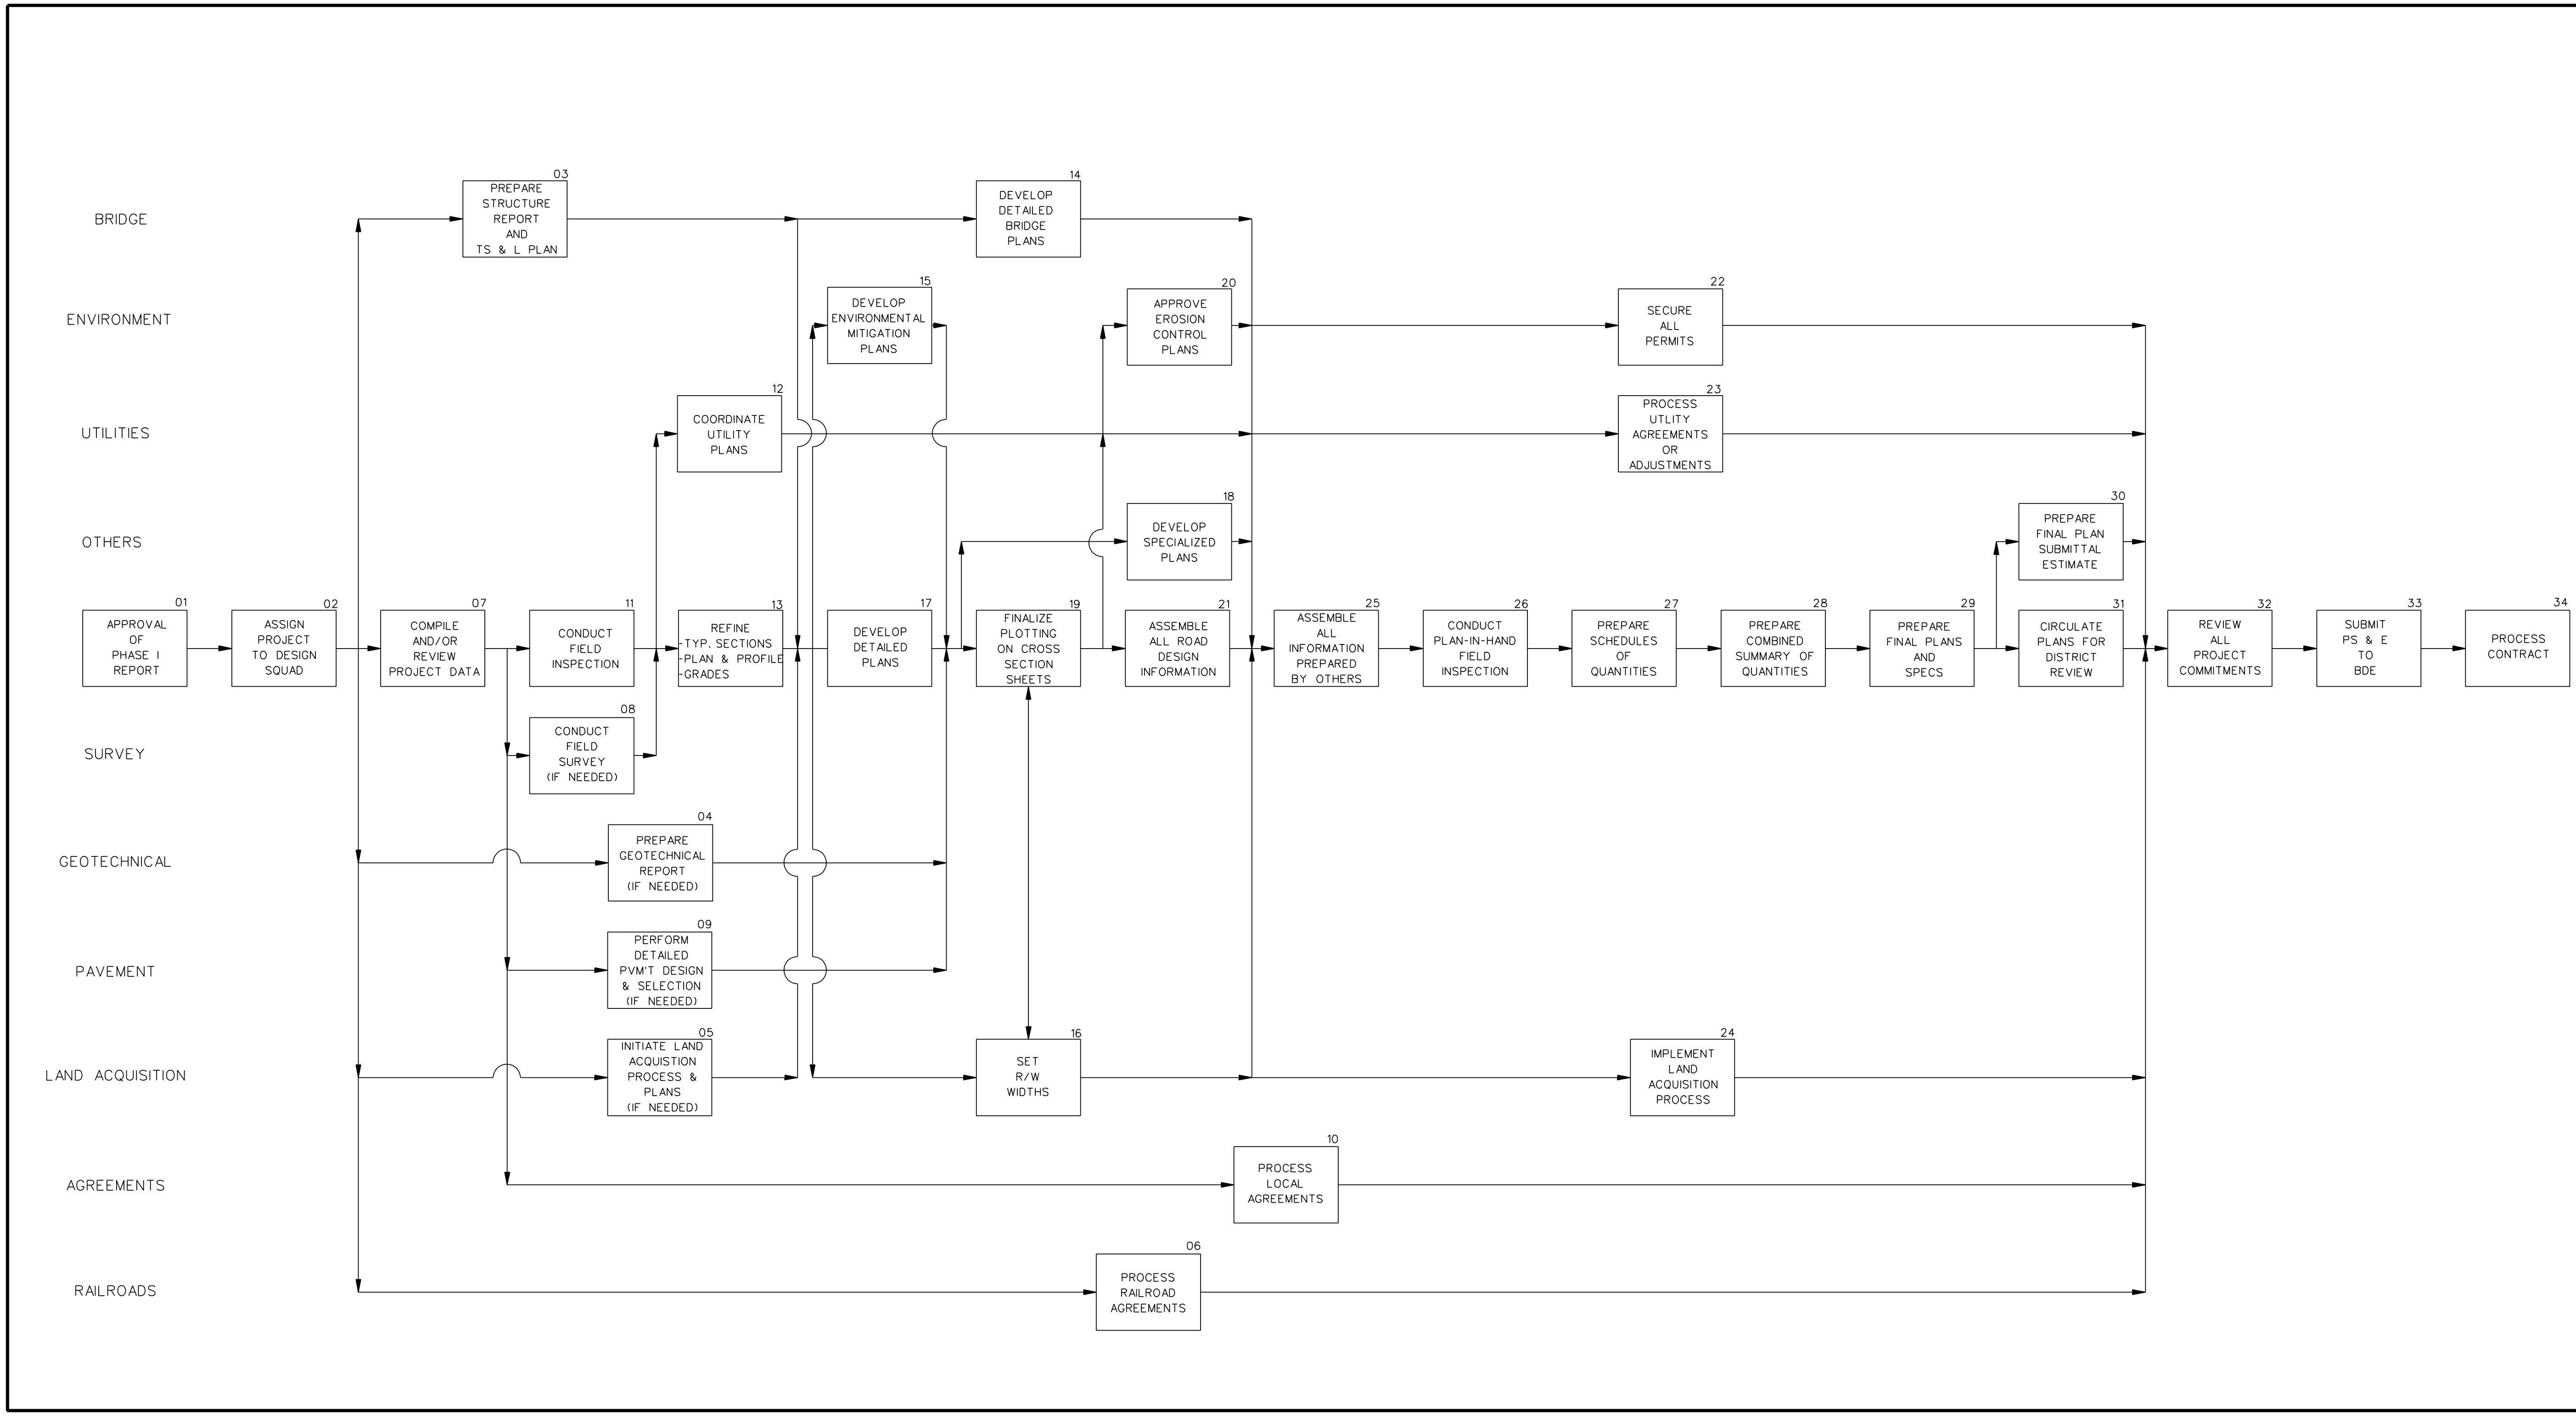
Section 12-5.05 provides information on whether the Regional Engineer, or BDE will approve the Project Report. Generally for these types of projects, the Regional Engineer will approve the Project Report. If the proposed improvement requires approval by BDE submit two copies of the report to BDE for review and approval.

Before any reports can be finalized and submitted to BDE, the district must ensure:

- the applicable requirements in Part II "Project Development" and Part III "Environmental Procedures" have been met;
- public involvement activities as described in Chapter 19 have been completed;
- the environmental documentation and environmental decision have been received with the appropriate approvals;
- if applicable, coordination with FHWA has been completed; and
- all design exceptions have been approved by BDE, and, where necessary, FHWA.

3-3.02 Phase II Design

Figure 3-3.B illustrates a typical Phase II flowchart or network for a minor widening or 3R project on existing alignment. Because the design procedures are essentially the same as that for a project on existing alignment that will require major ROW acquisitions, the activity write-ups for Figure 3-2.B also apply to Figure 3-3.B and are not presented here; see Section 3-2.02. However, some judgment must be used when reviewing the activities in Section 3-2.02 as not all activities or all elements of an activity may apply. For example, if the proposed pavement resurfacing thickness matches the criteria in Section 53-4.02, it will not be necessary to request the Pavement Design Section to conduct a pavement design and selection (Activity 09). As another example, it will not be necessary to prepare access control plans for these types of projects (Activity 17). Note that, to expedite the design process, some activities may have already begun during Phase I (e.g., bridge replacement designs, land acquisition).



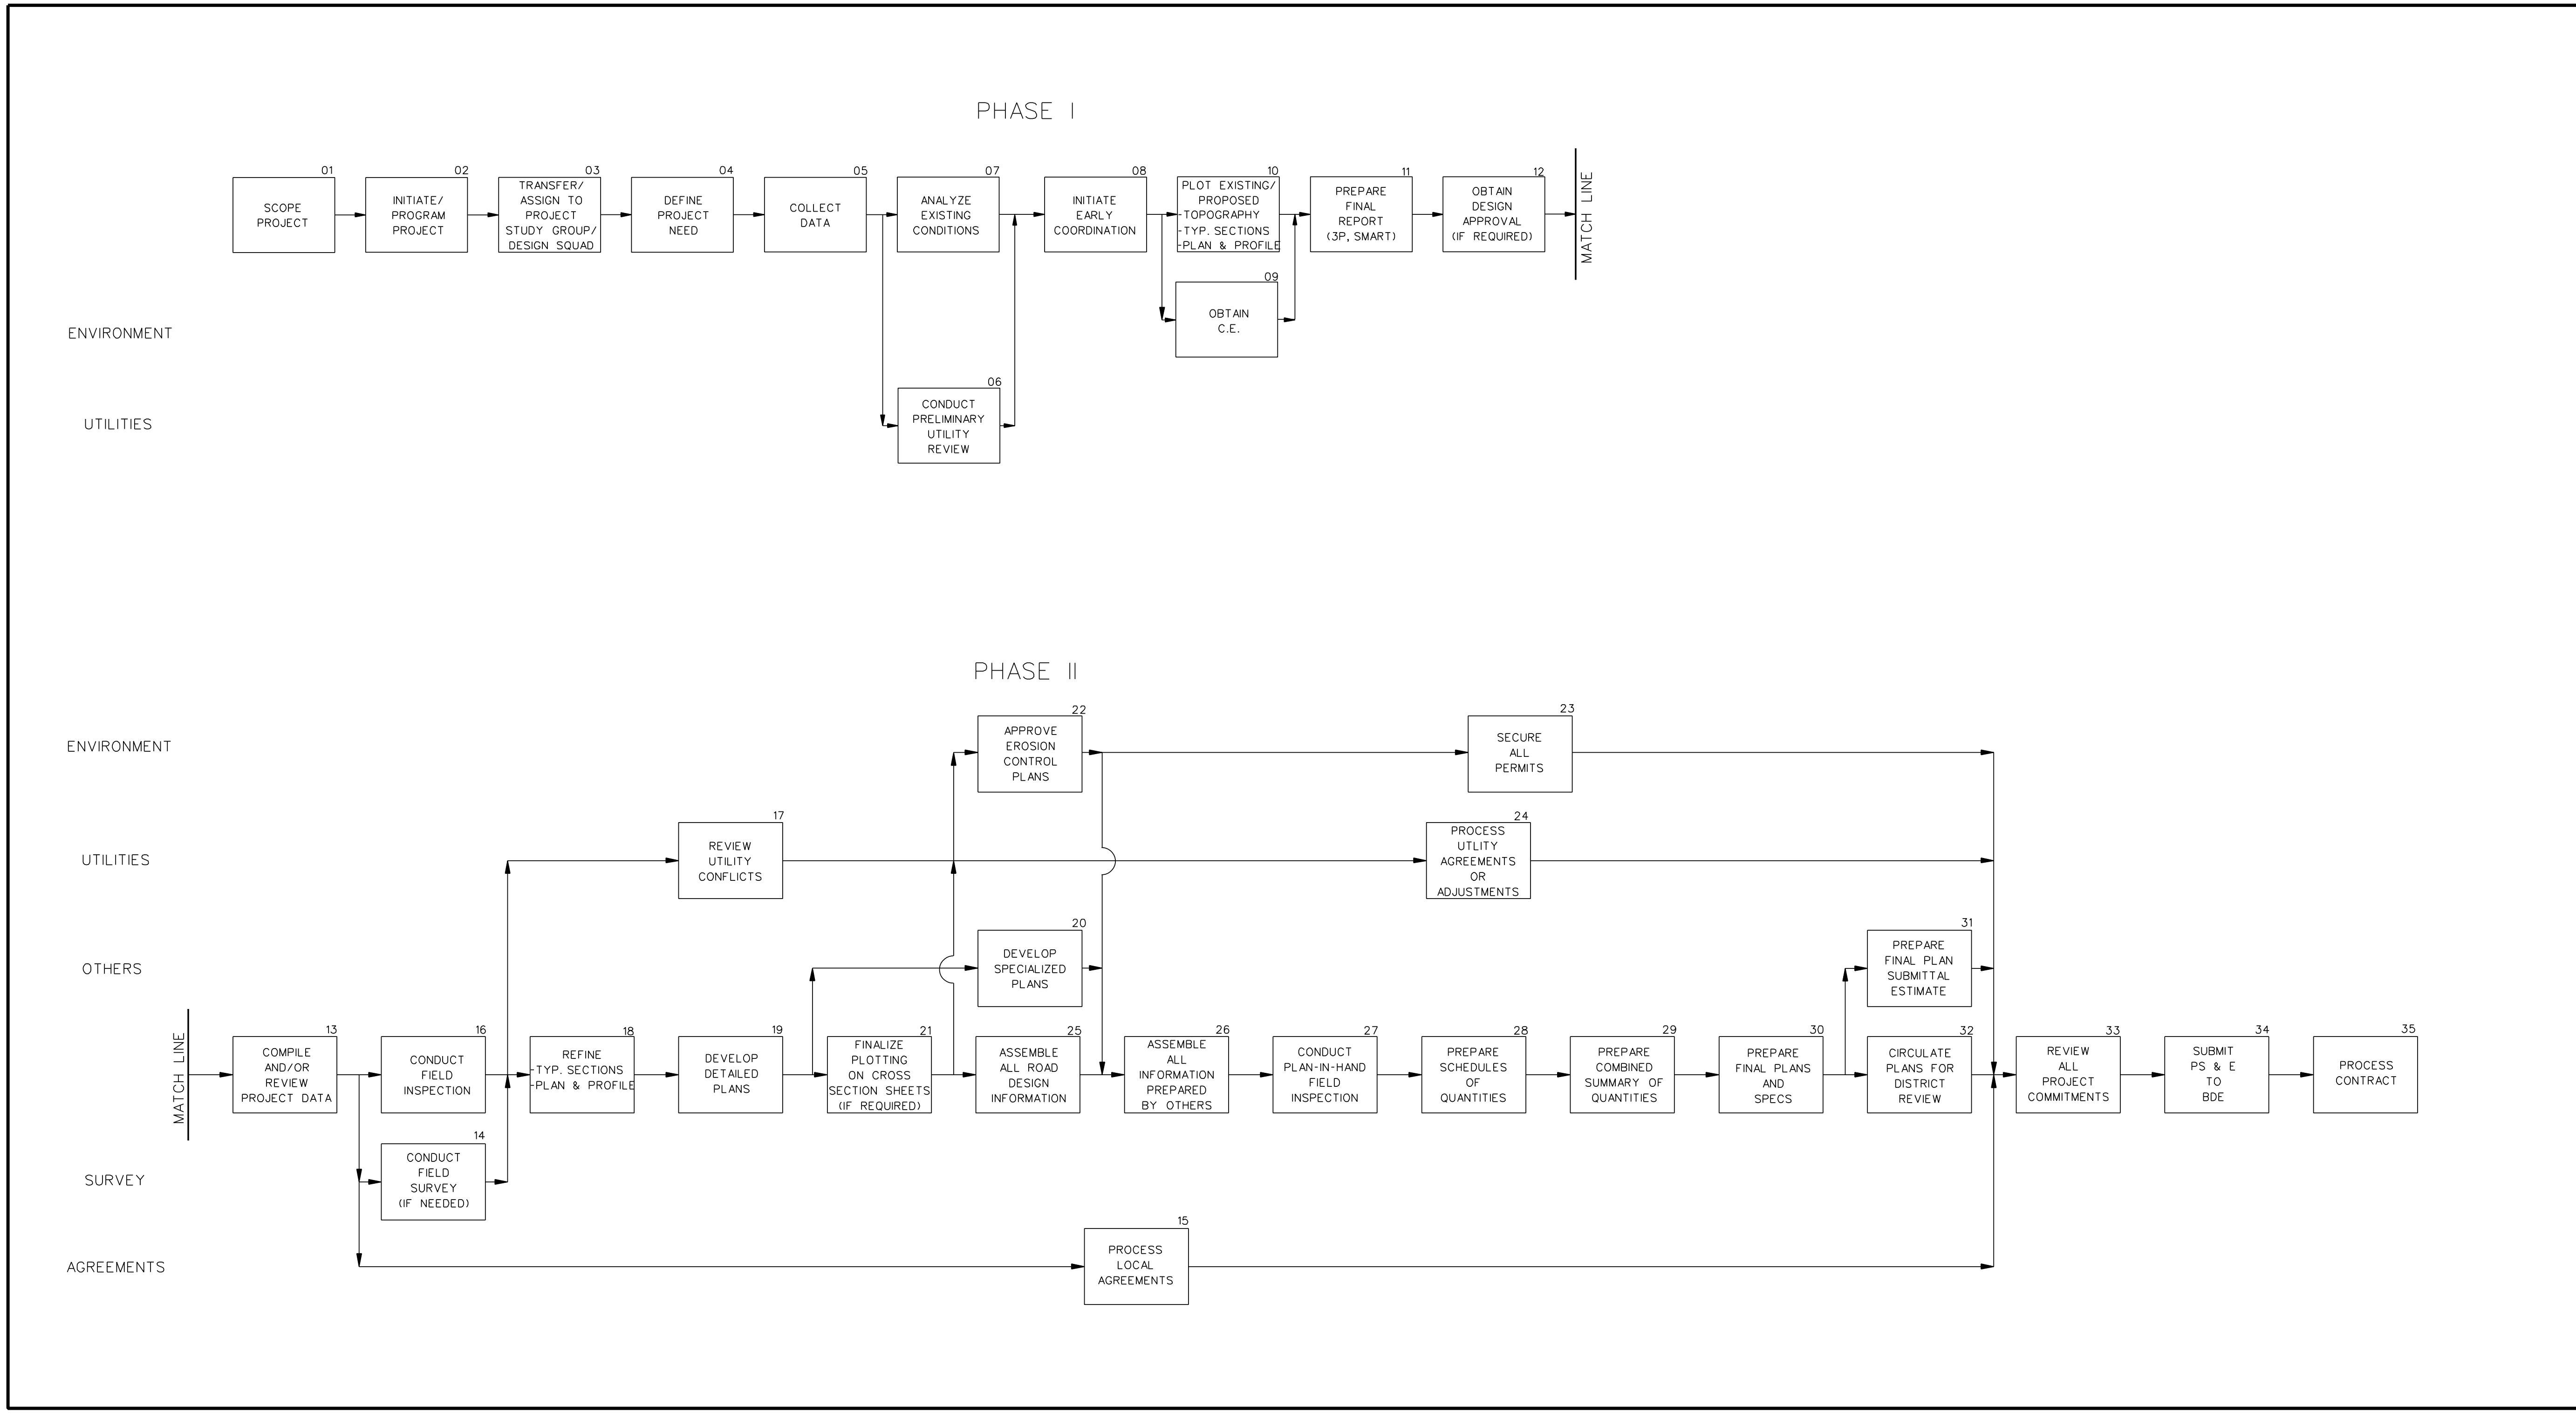
PHASE II PROJECT DEVELOPMENT NETWORK
(3R or Minor Widening Project on Existing Alignment)

Figure 3-3.B

3-4 PROJECT WITH NO RIGHT-OF-WAY ACQUISITIONS

Figure 3-4.A illustrates a combined Phase I and Phase II flowchart or network for SMART, 3P, or Interstate resurfacing projects on existing alignment not requiring additional right-of-way. These projects are classified as Categorical Exclusion projects and will require a Project Report, Abbreviated Project Report, 3P Report, or SMART Report. For guidance on the preparation and format of these reports, see Chapters 11 and 12. For other project types, see the flowcharts in Chapter 2, Section 3-2, and Section 3-3. See Chapter 52 for information on SMART projects. See Chapter 53 for information on 3P projects.

Following Figure 3-4.A are brief write-ups for each activity. Because of the variety of the project types that apply to this flowchart, some judgment must be used because not all activities or all elements of an activity may apply. Also note that, to expedite the design process, some activities may start prior to the completion of Phase I.



PHASE I & PHASE II PROJECT DEVELOPMENT NETWORK
(Projects Requiring No Right-of-Way)

Figure 3-4.A

PROJECT ACTIVITY (Phase I)

Activity Title: Scope Project

Activity No.: 01

Responsible Unit: District Bureau of Program Development

Activity Description:

A roadway project proposal can originate from a variety of sources, including local officials or metropolitan planning organizations (community-based need), directly from the IDOT district (district-based need), from a Bureau in the central office (Office of Planning and Programming, BDE, Operations, Bureau of Safety Programs and Engineering, etc.), or other sources targeting a special need or a statewide need.

Before a project is entered onto the Department's Proposed Highway Improvement Program, the district Programming Section initially develops and documents the project concept. Developing the project concept will typically involve the following:

- establishing that there is, in fact, a need for the project;
- making a preliminary determination of the project scope of work;
- reviewing any available data and records;
- reviewing existing plans;
- conducting an initial evaluation of right-of-way, utility, and environmental impacts; and
- developing a rough, preliminary cost estimate.

This information is forwarded for review and comment to district Program Development, district Operations, BDE, district Environmental Unit, the Bureau of Bridges and Structures, and other individuals, as appropriate. District Programming will refine the scope based on the comments received.

Once the scope, cost, and schedule have been defined, district Programming will forward this information to the Office of Planning and Programming for incorporation into the Department's multi-year program (Activity 02).

PROJECT ACTIVITY (Phase I)

Activity Title: Initiate/Program Project

Activity No.: 02

Responsible Unit: Office of Planning and Programming

Activity Description:

Candidate projects are submitted by the districts as a request for project programming to the Office of Planning and Programming. Based on a Statewide assessment of highway improvement needs and available funds, the Office of Planning and Programming will develop the Department's Proposed Highway Improvement Program. This will establish an individual project as an active project for further development.

The Office of Planning and Programming annually issues guidelines for multi-year programming criteria. This includes programming criteria for:

- improvement categories,
- pavement surface conditions,
- deficient bridges,
- safety improvements,
- Interstate rehabilitation,
- widening narrow and deteriorated pavements,
- improving intersections and reducing traffic bottlenecks,
- new construction/reconstruction of major facilities,
- transportation enhancement projects,
- Congestion Mitigation Air Quality (CMAQ) projects, and
- bicycle accommodation.

PROJECT ACTIVITY (Phase I)

Activity Title:	Transfer/Assign to Project Study Group/Design Squad
Activity No.:	03
Responsible Unit:	Studies and Plans Engineer

Activity Description:

At this point the project will either be assigned to a project study group/design squad within the district Bureau of Program Development or to a consultant to begin the design study. Because of the length and type of activity for these projects, typically the same unit which conducts the Phase I study will also perform the Phase II design. The Studies and Plans Engineer will have the overall day-to-day responsibility for advancing the project through plan submittal. The Studies and Plans Engineer, or designee, will:

- coordinate directly with other units within the Department;
- attend all internal meetings and field inspections;
- ensure that the project study meets all Department criteria and procedures;
- report directly to the District Program Development Engineer on all significant project activities, problems, and developments; and
- participate in the public involvement process.

The number and expertise of personnel initially assigned to the project will vary with the nature and scope of the proposed improvement. The personnel assigned will also vary over time relative to the priority for completion, the available lead time, and the activity in project development under study.

If the project is one which the Regional Engineer has determined will use the principles of Context Sensitive Solutions (CSS), the public involvement process should commence at this point. The project study group uses the Stakeholder Involvement Process (SIP) as outlined in Sections 19-5.01 to conduct public involvement for CSS projects.

PROJECT ACTIVITY (Phase I)

Activity Title: Define Project Need

Activity No.: 04

Responsible Unit: Project Studies Group/Design Squad

Activity Description:

For a transportation project, the project study group/design squad must first define the project need, which will direct the process for the identification of design alternatives, in-depth analyses and, ultimately, selection of the preferred design. This will consist of reaffirming the need for the proposed improvement, establishing project goals and objectives, and establishing the study area and logical termini. Previous studies and decisions should be reaffirmed and/or updated as necessary. Other factors that must be considered include:

- existing traffic volumes;
- crash information;
- alignment and profile deficiencies;
- structural integrity of bridges, pavements, and culverts;
- lane and shoulder widths;
- roadside safety;
- transportation demand;
- potential cost savings to the traveling public;
- programming guidelines;
- commitments to elected officials; and
- public input.

PROJECT ACTIVITY (Phase I)

Activity Title: Collect Data

Activity No.: 05

Responsible Unit: Project Study Group/Design Squad

Activity Description:

Once the project need has been identified (Activity 04), the project study group/design squad must gather and inventory information and data for the project. Environmental and engineering data, should be gathered simultaneously. The amount and type of information to be collected will vary with the nature and scope of the proposed improvement. Depending on the project type, information gathered may include:

- roadway, field, aerial, and stream surveys;
- existing roadway classifications and truck routes;
- existing as-built plans and maintenance records;
- existing highway geometrics;
- existing on-street parking;
- crash rate maps and collision diagrams;
- pavement and bridge condition reports;
- existing ROW information and any encroachments;
- ADT traffic maps and DHVs for current traffic (all affected routes);
- inventory of posted speed limits;
- detailed transportation maps and plans with all modes of travel included;
- utility installations and detailed maps from utility companies;
- hydraulics survey, drainage survey, sewer atlas, and flooding information tables;
- fire districts, mail and school bus routes, location of churches, drainage districts, historic sites, and field-tile maps;
- commercial, agricultural, industrial, recreational, historic, and residential land use;
- endangered and threatened species, wetlands in right-of-way, special waste sites, etc.;
- local, State, and Federal agency coordination needs;
- geotechnical investigations; and
- estimate of cost (see Section 11-2.15) and road-user benefits (see Section 11-7.01).

See Chapters 11 and 12 for further guidance on the information that should be collected for a Phase I study.

PROJECT ACTIVITY (Phase I)

Activity Title: Conduct Preliminary Utility Review

Activity No.: 06

Responsible Unit: Project Support Section

Activity Description:

The project study group/design squad will provide the district Project Support Section with information on the proposed project. The Project Support Section will work with the applicable utility companies to identify project impacts on existing utilities. The following items of work are typically performed:

1. Underground. The Project Support Section will coordinate with the district survey crew and will, if needed, request an underground survey to determine the depths and location of existing underground utilities within the project limits, especially fiber optic cables, water supply, and sanitary lines in urban areas.
2. Overhead. Any major above-ground utilities that may be impacted by the project. The Project Support Section may prepare a cost estimate to determine if a special effort should be exercised to avoid certain utilities.
3. Impacts. The Project Support Section will notify any utility companies that will be potentially impacted by the upcoming project, and the Section will request that the Utility contact IDOT if it plans any work in the vicinity of the project.

The Project Support Section will document its findings in a report or memorandum and submit it to the project study group/design squad. The project study group/design squad will use the information in making the final design determinations and document its findings in the final report.

For additional guidance on utility coordination, see Chapter 6.

PROJECT ACTIVITY (Phase I)

Activity Title: Analyze Existing Conditions

Activity No.: 07

Responsible Unit: Project Study Group/Design Squad

Activity Description:

Using as-built plans, aerial and/or field surveys, previously prepared reports, and data collected in Activity 05, the project study group/design squad will review and identify the following existing conditions:

- the locations of streams, railroads, and other topographic features;
- existing traffic and capacity deficiencies;
- pavement, bridge, and culvert structural integrity;
- crash information;
- alignment and profile deficiencies;
- existing lane and shoulder widths;
- existing ROW, ROW constraints, and encroachments;
- roadside safety concerns;
- existing and planned land uses from local governments, MPOs, fire districts, schools, etc.;
- existing agreements with utilities, railroads, local agencies, etc.;
- existing drainage patterns and drainage systems;
- sensitive noise receptors;
- wetlands in the right-of-way;
- special waste sites; and
- tree and vegetation inventory.

PROJECT ACTIVITY (Phase I)

Activity Title: Initiate Early Coordination

Activity No.: 08

Responsible Unit: Project Study Group/Design Squad

Activity Description:

Coordination with other Department and governmental agencies, as appropriate, is an important aspect during the design study process. This coordination should begin as early as practical in project planning.

At this stage of the design study process, the project study group/design squad will initiate early coordination with other Department Units or Bureaus (e.g., Environmental, Land Acquisition, Construction, Operations, Bridges and Structures, Utilities), CSS stakeholders, and governmental agencies (e.g., FHWA, MPOs) that have an interest in the project or have information or expertise concerning any issues the project may involve. The purpose of this coordination will be to assist in the identification of reasonable design alternatives and in gathering information to evaluate the engineering and environmental impacts of the proposed project and possible impact mitigation measures. This coordination should begin as early as practical. Early coordination will also identify the cooperating agencies.

Also, if applicable, this Activity should allow the public an opportunity for input and comment on the project. Typically, this will consist of informational letters, advertisements, and/or meetings with local government officials, fire districts, school districts, drainage districts, historic commissions, MPOs, residents, businesses, etc. These meetings or letters may include:

- advising local, State, and Federal officials that a project has been initiated and that a study is underway;
- procedures for developing possible coordination and public service involvement;
- a discussion on the project scope;
- a request for information (e.g., MPO plans, drainage problems, transit needs);
- a discussion with businesses, railroads, and utility companies; and
- talking with individuals about individual concerns.

For projects which the Regional Engineer has determined will use the principles of Context Sensitive Solutions (CSS), the public involvement process should commence once the project is assigned to the project study group. The project study group uses the Stakeholder Involvement Process (SIP) as outlined in Sections 19-5.01 to conduct public involvement for CSS projects.

Public coordination must be continuous throughout the project development. For guidance on public coordination, see Chapter 19.

PROJECT ACTIVITY (Phase I)

Activity Title: Obtain CE

Activity No.: 09

Responsible Unit: Environmental Unit

Activity Description:

Once the type of design improvements have been identified (Activity 04), analyzed (Activity 07), and the early coordination initiated (Activity 08), the district Environmental Unit will initiate the environmental process. Typically, these projects will be Categorical Exclusions (see Chapter 23).

This Activity will include:

- assigning a team to the project;
- discussing the project at a district coordination meeting, as appropriate, which may include obtaining FHWA concurrence, if necessary, in the appropriateness of the proposed environmental processing type;
- assembling and analyzing information on any potential environmental effects;
- determining and evaluating alternatives;
- preparing the appropriate environmental documentation;
- coordinating the environmental documentation for review, as appropriate; and
- obtaining/documenting the environmental decision.

PROJECT ACTIVITY (Phase I)

Activity Title:	Plot Existing/Proposed Topography, Typical Sections, Plan and Profile
Activity No.:	10
Responsible Unit:	Project Study Group/Design Squad

Activity Description:

For this Activity, conduct the following:

- If not already done, plot the existing topography including property lines, property owner's names, names of roads, driveways/access roads, and all other important geographic and cultural features.
- Plot existing horizontal and vertical alignments and cross sections.
- Determine the proposed typical sections.
- Determine the rough quantities for the proposed design and refine the cost estimate. If no quantities are available, use a generalized cost (e.g., cost per mile (kilometer)); see Sections 12-4 and 65-1.02.

PROJECT ACTIVITY (Phase I)

Activity Title:	Prepare Final Report
Activity No.:	11
Responsible Unit:	Project Study Group/Design Squad

Activity Description:

Once the analyses have been conducted and the information gathered, the project study group/design squad will prepare the final report. The type of report will depend on the project type; see Chapter 12, which also presents the format that should be used when preparing these reports.

The final report should include:

- approval form;
- a summary of need and location of the project;
- description of the proposed improvements;
- a summary of the environmental sign-offs obtained;
- the results of public involvement;
- a list of commitments made to the public, Federal and local agencies, etc.;
- the estimate of costs;
- exhibits showing typical sections, etc.; and
- copies of analyses and other reports conducted during the design study, including any environmental sign-offs, if applicable.

PROJECT ACTIVITY (Phase I)

Activity Title: Obtain Design Approval

Activity No.: 12

Responsible Unit: Project Study Group

Activity Description:

Generally for these types of projects, the Regional Engineer will approve the Report. If the proposed improvement requires approval by BDE, submit two copies of the Report to BDE for review and approval.

Before any reports can be finalized , the district must ensure:

- the applicable requirements in Part II "Project Development" and Part III "Environmental Procedures" have been met;
- if applicable, public involvement activities as described in Chapter 19 have been completed;
- the environmental documentation has been reviewed and the environmental decision obtained/documented;
- if applicable, coordination with FHWA has been completed; and
- all design exceptions have been approved by BDE, and, where necessary, FHWA.

PROJECT ACTIVITY (Phase II)

Activity Title: Compile and/or Review Project Data

Activity No.: 13

Responsible Unit: Design Squad/Project Study Group

Activity Description:

This Activity begins Phase II. The design squad/project study group should review the Phase I report and project files to become familiar with the decisions and determinations made during Phase I. Some of the information and decisions that should be reviewed may include:

- typical sections developed during Phase I,
- any technical reports prepared for the Phase I study,
- crash and traffic data,
- aerial/field surveys,
- the commitment file,
- any utility involvement, and
- any railroad involvement.

Based on this review, the design squad/project study group should evaluate what additional information and coordination with other units may be required to complete the project. At this stage of the project, the design squad/project study group should request:

- if necessary, the Surveys and Photo Services Unit to conduct additional surveys (Activity 14); and
- the Project Support Section to begin processing any necessary local agency agreements (Activity 15).

PROJECT ACTIVITY (Phase II)

Activity Title: Conduct Field Survey (If Needed)

Activity No.: 14

Responsible Unit: Surveys and Photo Services Unit

Activity Description:

In general, a survey should have been conducted during the development of the Phase I study. However, based on the review of the project data (Activity 13), the design squad/project study group may conclude that additional surveys are required. The needed survey information may include:

- existing field conditions (topography, vegetation, existing structures and road design features, etc.);
- drainage features (bodies of water, open channels, channel slopes and cross sections, existing drainage appurtenances, etc.);
- existing field landmarks;
- existing utilities (above and below ground);
- existing right-of-way markers and property lines; and
- alignment and cross section of existing roads and driveways.

PROJECT ACTIVITY (Phase II)

Activity Title: Process Local Agreements

Activity No.: 15

Responsible Unit: Project Support Section

Activity Description:

The district Project Support Section is responsible for the preparation and negotiation of formal agreements between the Department and local governments. These agreements may cover:

- division of work and expense involved between IDOT and the local agency in connection with the improvement,
- responsibilities for the future maintenance of the improvement,
- reimbursement of the costs incurred by the local agency,
- coverage of liability during construction operations, and
- reference to or identification of plans and plan approval.

The Project Support Section also will be responsible for coordinating the transfer of information and plans between the design squad/project study group and the local agency. This will be a continuous process throughout the design phase as the design plans are developed. The district Project Support Section also will coordinate with BDE for review and approval of any agreements. This process should be completed prior to the review of all project commitments (Activity 33).

For additional guidance on coordinating with local agencies, see Chapter 5.

PROJECT ACTIVITY (Phase II)

Activity Title: Conduct Field Inspection

Activity No.: 16

Responsible Unit: Design Squad/Project Study Group

Activity Description:

After completing the in-house review of the Phase I report and other project data, the design squad/project study group should conduct a field inspection of the project. The objective is to review major design features and project-related issues and to identify any potential problems. The design squad/project study group will arrange the field inspection and invite, as appropriate, individuals from the following units to the field inspection:

- district Bureau of Project Implementation,
- BDE,
- Bureau of Bridges and Structures,
- district Environmental Unit,
- district Bureau of Operations,
- district Geotechnical Unit,
- FHWA,
- local officials, and
- others as deemed appropriate.

The design squad/project study group will document the findings and decisions in the minutes of the field inspection.

PROJECT ACTIVITY (Phase II)

Activity Title: Review Utility Conflicts

Activity No.: 17

Responsible Unit: Project Support Section

Activity Description:

After conducting the field inspection (Activity 16) and any additional field surveys (Activity 14), the design squad/project study group will forward the preliminary construction plans with any known utilities plotted to the district Project Support Section. The Project Support Section will coordinate the transfer of information and plans between the design squad/project study group and the utility companies. The utility companies will review IDOT's plans, plot their facilities if not already shown, and determine any necessary utility adjustments/relocations. As the design squad/project study group refines the construction plans, this information will be submitted to the Project Support Section to be forwarded to the utility companies.

For guidance on preparing utility plans and coordinating with utility companies, see Chapter 6.

PROJECT ACTIVITY (Phase II)

Activity Title: Refine Typical Sections, Plan and Profiles

Activity No.: 18

Responsible Unit: Design Squad/Project Study Group

Activity Description:

Based on the review of the plans (Activity 13), the field inspection (Activity 16), the field survey (Activity 14), the Phase I report, and the project's commitment file, the design squad/project study group will refine and/or prepare the project's:

- cover sheet;
- general notes sheet;
- typical sections; and
- the plan and profile sheets.

Section 63-4 provides guidance on the information that should be included on these plan sheets.

PROJECT ACTIVITY (Phase II)

Activity Title: Develop Detailed Plans

Activity No.: 19

Responsible Unit: Design Squad/Project Study Group

Activity Description:

The design squad/project study group will prepare the detailed sheets that will be incorporated into the construction plans. This may include the following:

- temporary traffic control sheets;
- drainage sheets, including special drainage details;
- intersection details;
- pavement marking details;
- transition details;
- proposed cross sections, not including pavement template;
- signing plans, if not prepared by the district Bureau of Operations;
- highway lighting plans, if not prepared by others; and
- any other special details.

Section 63-4 presents guidance on what information should be included on each detail or plan sheet.

In addition, the design squad/project study group will:

- determine the proposed TMP for the project;
- determine the need for construction permits and/or temporary easements;
- perform a roadside safety analysis; and
- incorporate any special experimental features into the plans.

PROJECT ACTIVITY (Phase II)

Activity Title: Develop Specialized Plans

Activity No.: 20

Responsible Unit: Various Units

Activity Description:

Based on the typical sections, plan and profile sheets (Activity 18), and detailed plan sheets (Activity 19), various other units within IDOT will prepare their applicable plan sheets, quantities, and special provisions. This may include:

- district Bureau of Operations preparing the landscaping details;
- district Bureau of Operations preparing the signing plans, if included within the project;
- district Bureau of Operations (or Bureau of Electrical Operations in District 1) preparing the traffic signal plans; and/or
- BDE (or Bureau of Electrical Operations in District 1) preparing the highway lighting plans.

In addition, the following units may review the detailed plans prepared by the design squad/project study group (Activity 19):

- district Bureau of Operations will review the pavement marking details and temporary traffic control plans, and/or
- district Bureau of Project Implementation will review the temporary traffic control plans.

PROJECT ACTIVITY (Phase II)

Activity Title: Finalize Plotting on Cross Sections

Activity No.: 21

Responsible Unit: Design Squad/Project Study Group

Activity Description:

During Phase I, the cross sections may have been generated using GEOPAK to determine the initial quantities. Using the following information, update and plot the revised cross sections:

- information received from the Project Support Section on utility plans (Activity 06);
- the refined typical sections and plan and profile sheets (Activity 18); and
- the detailed plans (Activity 19).

Also during Activity 21, develop the erosion control plans and specifications according to the criteria in Chapter 41 and the information provided in the Phase I report. These plans and specifications will be submitted to the district Environmental Unit for review and approval (Activity 22).

PROJECT ACTIVITY (Phase II)

Activity Title: Approve Erosion Control Plans

Activity No.: 22

Responsible Unit: Environmental Unit

Activity Description:

The district Environmental Unit will review and approve the erosion control plans and specifications prepared by the design squad/project study group (Activity 21). Once approval has been granted, the erosion control plans will be incorporated into the construction plans (Activity 26). Also, once the erosion control plans have been approved, the Environmental Unit can initiate the process of securing the necessary project permits (Activity 23).

PROJECT ACTIVITY (Phase II)

Activity Title: Secure All Permits

Activity No.: 23

Responsible Unit: Environmental Unit

Activity Description:

After the cross sections have been finalized, the erosion control plans have been completed (Activity 21) and approved (Activity 22), and the typical sections and plan and profiles sheets have been completed (Activity 18), the district Environmental Unit will ensure all applicable permits and approvals required by the project are obtained. Depending upon the project-specific impacts, this may include any or all of the following:

- Section 401 water quality certification and Section 402 permit (NPDES) from the Illinois Environmental Protection Agency;
- U.S. Army Corps of Engineers, Section 404/Section 10 permit(s); and
- permits issued by Illinois State agencies.

All permits, certifications, and approvals should be received by the Department prior to the review of all project commitments (Activity 33).

Chapter 28 provides a brief description of all Federal and State environmental permits and certifications.

PROJECT ACTIVITY (Phase II)

Activity Title: Process Utility Agreements or Adjustments

Activity No.: 24

Responsible Unit: Project Support Section

Activity Description:

Based on the roadway plans (Activities 18, 19, and 21), the Project Support Section will work with the impacted utility companies and municipalities to implement the utility process. This process may include the following:

1. Plan Preparation. The utility companies are responsible for preparing all utility adjustment/relocation plans. The plans will be developed according to the criteria in Chapter 6.
2. Funding. Depending on the right-of-way ownership for existing and proposed utility locations, transportation funds may be eligible for utility adjustments/relocations required by the highway project; see Chapter 6. The Utilities pay for all betterments.
3. Agreements. The Project Support Section will prepare a Utility Agreement for each affected utility and will work with the utility companies to gain their input and approval. The Project Support Section will coordinate with BDE for review and approval of the agreements.

The Project Support Section will ensure that the utility process is completed before the review of all project commitments (Activity 33).

PROJECT ACTIVITY (Phase II)

Activity Title:	Assemble All Road Design Information
Activity No.:	25
Responsible Unit:	Design Squad/Project Study Group

Activity Description:

Throughout the design process, the design squad/project study group will have prepared the various plan sheets separately. In Activity 25, conduct the following:

- plot a complete set of plans developed to date (e.g., cover sheet, typical plans, plan and profile sheets, detail plans, cross sections);
- assemble the sheets in the recommended order as noted in Chapter 63;
- review the plans and details to ensure that all necessary information has been included and that the plans and details are compatible with each other;
- calculate the quantities for roadway design elements according to the criteria in Chapter 64 of the *BDE Manual*, the *Coded Pay Items*, and the *Standard Specifications for Road and Bridge Construction* for pay items, units of measurement, rounding conventions, etc.; and
- prepare all required special provisions.

At this time the Schedules of Quantities and the Summary of Quantities will not yet be prepared. For assembly purposes, blank Schedule of Quantities and Summary of Quantities may be included.

PROJECT ACTIVITY (Phase II)

Activity Title:	Assemble All Information Prepared by Others
Activity No.:	26
Responsible Unit:	Design Squad/Project Study Group

Activity Description:

Depending on the project, the design squad/project study group will have received the following completed plans, special provisions, pay items, and quantities from other IDOT units:

- the landscaping details from the district Bureau of Operations (Activity 20);
- the signing plans from the district Bureau of Operations (Activity 20);
- the traffic signal plans from the district Bureau of Operations (or Bureau of Electrical Operations in District 1) (Activity 20); and
- the highway lighting plans from BDE (or Bureau of Electrical Operations in District 1) (Activity 20).

In addition, the design squad/project study group will have received approval of the erosion control plans from the district Environmental Unit (Activity 22).

The design squad/project study group will review these materials 1) to identify and incorporate any information, which must be incorporated directly into the detailed road design plans, and 2) to assemble those plan sheets prepared by others into the overall set of construction plans.

PROJECT ACTIVITY (Phase II)

Activity Title: Conduct Plan-in-Hand Field Inspection

Activity No.: 27

Responsible Unit: Design Squad/Project Study Group

Activity Description:

At this stage of project development, all major design work has been completed, including roadway design, traffic items, erosion control plans, etc. The design squad/project study group is responsible for scheduling the Plan-in-Hand (PIH) review of the project. The PIH review is an in-depth office and on-site review of all project elements to ensure that all details and commitments have been satisfactorily incorporated into the construction plans and specifications, and that the project is nearly ready to advance to construction.

As applicable, the design squad/project study group will invite the following to conduct an office and PIH field inspection:

- district Bureau of Project Implementation,
- BDE,
- district Bureau of Operations,
- FHWA,
- local officials, and
- others as deemed appropriate.

Once the PIH office and field inspection have been completed, the design squad/project study group will prepare the PIH minutes to document all significant decisions made during the PIH review. After approval by the Program Development Engineer, distribute the PIH minutes to:

- all applicable Bureau Chiefs;
- Regional Engineer;
- all parties involved in the field review;
- FHWA, if applicable; and
- any other individuals or sections as deemed appropriate.

All parties receiving a copy of the PIH minutes are requested to provide comments on the minutes. Concurrence of the minutes will be assumed if no comments are received by the specified date.

PROJECT ACTIVITY (Phase II)

Activity Title: Prepare Schedules of Quantities

Activity No.: 28

Responsible Unit: Design Squad/Project Study Group

Activity Description:

Based on any modifications due to the Plan-in-Hand field inspection (Activity 27), the design squad/project study group will refine the project quantities for the roadway design items developed during Activity 25. Using these quantities and those provided by other IDOT units (Activity 26), the design squad/project study group will prepare the Schedule of Quantities sheets according to the criteria presented in Chapter 64. These quantities will be incorporated onto the Summary of Quantities Sheet (Activity 29).

PROJECT ACTIVITY (Phase II)

Activity Title: Prepare Combined Summary of Quantities

Activity No.: 29

Responsible Unit: Design Squad/Project Study Group

Activity Description:

Using the quantities developed in Activity 25, refined in Activity 28, and those provided by other IDOT units (Activity 26), the design squad/project study group will prepare the Summary of Quantities sheets, which will summarize all pay items necessary to construct the improvement. It also should include the applicable construction and safety code items, pay item code numbers, units of measurement, total quantities, and quantity breakdown for each section. One or more summary sheets typically will be included in each set of plans. Do not show other data on the summary sheets (e.g., general notes). When preparing the Summary of Quantities sheets, it is important that all quantities be calculated and segregated accordingly prior to completing the Summary of Quantities.

The design squad should coordinate with the Project Support Section to ensure that the percentages and cost breakdown in the Summary of Quantities and the Local Agency agreements are identical.

For additional guidance on preparing the Summary of Quantities, see Section 63-4.

PROJECT ACTIVITY (Phase II)

Activity Title: Prepare Final Plans and Specifications

Activity No.: 30

Responsible Unit: Design Squad/Project Study Group/Others

Activity Description:

Based on the Plan-in-Hand Review and minutes (Activity 27), all bureaus and sections responsible for their respective project plans will make all necessary plan and specifications revisions. This will produce the final set of project plans ready for construction. Specifically for the design squad/project study group, the design squad/project study group will be responsible for revising the roadway plans and specifications. Once completed, the plans will be distributed for district review (Activity 32) and will allow the District Estimating Engineer to prepare the Final Plan Submittal Estimate.

Complete quality control/quality assurance (QC/QA) prior to the plans being circulated for district review.

PROJECT ACTIVITY (Phase II)

Activity Title:	Prepare Final Plan Submittal Estimate
Activity No.:	31
Responsible Unit:	District Estimating Engineer

Activity Description:

Based on the information from the final plans and specifications (Activity 30), the District Estimating Engineer will prepare the final district cost estimate. This may be a new estimate or an update of an earlier cost estimate prepared during Phase I or a revised cost estimate prepared during Phase II. This estimate will be submitted to the BDE Project Management Unit, which will use it to develop the Engineer's Estimate.

Chapter 65 provides guidance on the preparation of project cost estimates.

PROJECT ACTIVITY (Phase II)

Activity Title: Circulate Plans for District Review

Activity No.: 32

Responsible Unit: Design Squad/Project Study Group

Activity Description:

Once all revisions from the Plan-in-Hand Review and minutes have been made to the plans and specifications (Activity 30), the design squad/project study group will submit a completed set of construction plans to the district units involved with the project for final review and comment. Typically, this review will consist of:

- reviewing the plans to ensure the reviewer's comments from previous reviews have been incorporated;
- ensuring that the changes do not conflict with the bureau's commitments; and
- ensuring that the plans conform to the Department's design criteria.

If changes are requested at this point which are desirable, but not mandatory, the Studies and Plans Engineer will determine if they should be incorporated. This will depend on other factors which may preclude the changes from being added to the plans. If another bureau determines the changes still should be incorporated, an appeal can be made to the Program Development Engineer for their incorporation.

PROJECT ACTIVITY (Phase II)

Activity Title: Review all Project Commitments

Activity No.: 33

Responsible Unit: Design Squad/Project Study Group

Activity Description:

At this point in project development, the project design is essentially complete. The design squad/project study group must ensure that the following elements have been completed and/or have been incorporated into the plans:

- all environmental permits have been secured (Activity 23);
- all utility agreements and adjustments have been processed and signed (Activity 24);
- the final district cost estimate has been completed (Activity 31);
- all local agreements and letters of understanding have been processed and signed (Activity 15); and
- all commitments made during the project development, including those made during Phases I and II, have been incorporated.

The design squad/project study group must carefully review all minutes of meetings and the project study files to ensure that all commitments have been incorporated. If there are any questions, the design squad/project study group should contact the preparer of the Phase I report or the Unit making the commitment during Phase II.

If it is discovered during the plan development that a change is required to the approved Phase I report or a commitment cannot be met, the design squad/project study group must immediately notify BDE and all other applicable units so that the appropriate action can be taken. Failure to provide the appropriate notification and review may result in project delay.

PROJECT ACTIVITY (Phase II)

Activity Title: Submit PS&E to BDE

Activity No.: 34

Responsible Unit: Design Squad/Project Study Group

Activity Description:

Once the plans are complete and the design squad/project study group has ensured all commitments, agreements, permits, etc., are complete or have been incorporated, the design squad/project study group will submit the following items to the BDE Program Support Unit:

- the Certification Acceptance/Project Status Form, signed by the Regional Engineer;
- a cover sheet signed by the Regional Engineer indicating his/her approval of the plans;
- one complete set of plans on reproducible paper, mylar, or vellum (see Chapter 63 for the Department's guidelines on preparing plan sheets);
- one copy of each special provision required for the project, including a copy of the electronic file in Microsoft Word format (see Section 66-1.04 for the procedures on developing special provisions);
- a completed Recurring Special Provision check sheet (see Chapter 66);
- the project quantities on Form BD-213 or BDE approved equal (see Chapter 64 for the procedures on determining plan quantities);
- the expected construction time for the project (see Section 66-2.03 for the Department's guidelines on determining the expected construction time); and
- copies or originals of all permits and agreements.

To place an improvement on any specific letting, it is imperative that the plans and supporting documents be submitted according to the schedules established in Section 66-2 which indicate the minimum number of weeks prior to the letting date for the submittal or completion of a particular phase of work.

PROJECT ACTIVITY (Phase II)

Activity Title: Process Contract

Activity No.: 35

Responsible Unit: BDE

Activity Description:

Once BDE has received the plans and other information from the district (Activity 34), it will conduct the following:

- prepare the Engineer's Estimate;
- verify that the plans are on the list of recommended projects;
- check the Certification Acceptance/Project Status Form;
- verify the project is programmed and the scope of work is correct;
- determine the final funding source;
- check all agreements to ensure they are consistent with the project;
- submit the plans, special provisions, quantities, etc., for review and comment;
- prepare the Transportation Bulletin and advertise the project;
- if necessary, submit the PS&E to FHWA for approval;
- prepare the contract proposal;
- submit the proposal and plans to bidders;
- implement the letting process;
- review all bids; and
- execute the contract.

For additional guidance on the contract process, see Chapter 66.

Chapter Four
COORDINATION RESPONSIBILITIES

4-1 INTRODUCTION

Chapter 4 discusses the FHWA/IDOT Stewardship and Oversight Agreement as it relates to the project coordination and approval process (Section 4-2), and the various coordination activities that occur during project development (Section 4-3).

Specifically, Section 4-3 presents a generic discussion of the approximate sequence of events that lead to the preparation of a set of construction plans, specifications, and cost estimate (PS&E), and has been prepared from the perspective of the district. The section identifies which functional unit within the Department is responsible for various project activities. Where applicable, it provides references to other *BDE Manual* chapters:

For the coordination discussion for Phase I (Section 4-3.01), the "project study group" is responsible for project development. For Phase II, the term "designer" is generic and refers to any project manager from the district; i.e., the designer is assumed to have responsibility for the indicated actions.

Several other *Manual* chapters discuss project coordination within different contexts. Refer to the chapters below for more information:

- Chapter 1 lists the organizational bureaus within IDOT's Office of Program Development and the responsibilities of the functional units in the Bureau of Design and Environment.
- Chapters 2 and 3 present project development networks for several project types that describe, sequentially, the project activities.
- Chapters 5, 6, and 7 discuss coordination with local governments, utilities, and railroads.
- Chapters 11 – 15 discuss coordination for several studies that may be prepared during Phase I.
- Chapter 19 discusses coordination with the public on project input and district coordination meetings.
- Chapter 22 discusses coordination during implementation of the environmental process.
- Chapter 31 discusses the basic design criteria which control roadway design and the coordination process required when such criteria cannot be met (i.e., design exceptions).

4-2 FHWA OVERSIGHT AND INVOLVEMENT

4-2.01 Stewardship and Oversight Agreement

Section 106 of Title 23, U.S.C. (23 U.S.C. 106), requires that FHWA and the State enter into a Stewardship & Oversight (S&O) Agreement. The intent and purpose of the S&O Agreement is to document the roles and responsibilities of FHWA's Division Office and IDOT with respect to project approvals and related responsibilities, and to document the methods of oversight which will be used to efficiently and effectively deliver the Federal-aid Highway Program (FAHP).

The scope of FHWA responsibilities, and the legal authority for IDOT assumption of FHWA responsibilities, has developed over time. The most recent S&O Agreement between FHWA and IDOT was executed on May 27, 2015. The Agreement features a more targeted and "risk-based" approach rather than the traditional terminology of "full oversight." The notion of full oversight on Federal-aid projects by FHWA will no longer exist for all practical purposes, as Congress has recognized the need to give the States more authority to carry out project responsibilities traditionally handled by FHWA. The goal of the current risk based approach is to optimize the successful overall delivery of programs and projects and to help ensure compliance with federal requirements.

The current Stewardship and Oversight Agreement, including its Attachments A-D, is provided in *BDE Manual* Appendix A, "Regulations and Guidance", of Part III "Environmental Procedures."

Attachment A to the S&O Agreement contains a table entitled the "Project Action Responsibility Matrix", which outlines distinct typical project actions on or off the National Highway System (NHS), and whether those actions are to be carried out by FHWA or IDOT. Also Sections VI and VII of the S&O Agreement list specific permissible and non-permissible areas of IDOT assumption.

Attachment B to the S&O Agreement contains the "Program Responsibility Matrix" which specifies the program action responsibility, by activity, for FHWA and identifies both the FHWA and IDOT "responsible program office."

Attachment C to the S&O Agreement contains a list of all IDOT manuals and operating agreements through which the S&O Agreement is implemented.

Attachment D to the S&O Agreement and Section 4-2.02 below outline FHWA's selection and monitoring of Projects of Division Interest (PoDI's), a new FHWA oversight category which will be utilized along with project approval actions and the Compliance Assessment Program to ensure compliance with federal requirements.

4-2.02 Projects of Division Interest (PoDI's)

Approvals and related activities for which IDOT has assumed responsibilities as shown in Attachment A of the Stewardship and Oversight (S&O) Agreement will apply program wide, unless a specific project is listed by FHWA as a Project of Division Interest (PoDI). A PoDI is a project on which the responsibility for one or more of the actions indicated in Attachment A of the S&O Agreement as typically being assumed by IDOT will instead be retained by FHWA.

In coordination with IDOT, FHWA will annually select PoDI's and will finalize the list in June of each year. A PoDI plan will be developed by FHWA for each selected PoDI project. The PoDI plan will state the particular aspects of interest to FHWA and the specific actions for which FHWA will retain responsibility on the project.

Projects of Corporate Interest (PoCI's) are a subset of PoDI's. PoCI's are projects which have a national significance and may require FHWA resources beyond the Illinois Division. PoCI's will be included in the PoDI listing provided annually by FHWA, and will follow the guidelines for PoDI's.

The process by which PoDI's are coordinated between IDOT and FHWA is outlined in Attachment D of the S&O Agreement.

4-2.02(a) Projects Administered by Local Public Agencies

IDOT may permit Local Public Agencies (LPA's) to carry out IDOT's assumed responsibilities on locally administered projects. IDOT is responsible and accountable for LPA compliance with all applicable Federal laws and requirements.

4-2.03 <u>Oversight and Reporting Requirements</u>

FHWA and IDOT are responsible for ensuring financial integrity and compliance with applicable laws and regulations. The FHWA Division Office and IDOT may use techniques and processes such as program assessments, program reviews, certification reviews, periodic reviews such as the Compliance Assessment Program, or inspections of project elements or phases to ensure federal requirements are met. Oversight and reporting requirements will be in accordance with Sections X and XI of the S&O Agreement.

4-3 FUNCTIONAL RESPONSIBILITIES

Project development typically requires the completion of many functional work tasks. This Section briefly identifies which unit(s) is (are) responsible for the elements within each significant functional responsibility.

Section 4-3.01 summarizes the coordination responsibilities during the Phase I portion of project development. The remainder of Section 4-3 is primarily within the context of coordination responsibilities during the Phase II portion of project development.

4-3.01 Phase I Coordination

Reference: Chapters 2, 3, 11, 12, and 19, and Part III

4-3.01(a) General

The project study group or a consultant usually prepares Phase I reports. These reports are typically approved by the Regional Engineer. For large scale projects addressed by Corridor, Feasibility Study, and Combined Design Reports, the district requests design approval from the Project Development Unit in the Bureau of Design and Environment. Projects requiring a Phase I report that are proceeding to Phase II construction plans will be discussed at coordination meetings.

4-3.01(b) Environment

The project study group must coordinate closely with the district Environment Unit. For projects involving an EA or EIS, the district Environment Unit must coordinate closely with the Location and Environment Section within BDE throughout the development of the Phase I study to ensure that the project engineering analyses are consistent with the necessary project environmental analyses.

4-3.01(c) Public Involvement/Early Coordination

The project study group and district Environment Unit must coordinate during Phase I to fulfill the public involvement requirements and the early coordination requirements with other Department and governmental agencies. The Regional Engineer will determine if the project is to be developed using the principles of Context Sensitive Solutions (CSS), based on guidelines provided throughout the *BDE Manual*.

4-3.01(d) Governmental Coordination

The project study group must coordinate with the necessary Department, State, and Federal agencies to gather the necessary data for project evaluation (e.g., traffic, crashes, land-use plans, urban area transportation studies, bicycle plans).

4-3.01(e) Engineering Coordination

The project study group must coordinate with the applicable Department units to perform the engineering analyses necessary for a Phase I level of study, including:

- hydrology/hydraulics (district Hydraulics Unit and/or the Bureau of Bridges and Structures),
- intersection and interchange design studies (district Geometrics Unit)
- geotechnical and soils (district Geotechnical Unit),
- proposed structure sketches (Bureau of Bridges and Structures),
- utilities (district Project Support Section),
- detours (district Detour Committee),
- Highway Safety Improvement Program (HSIP) and crash trends (Bureau of Safety Programs and Engineering, district HSIP Coordinator and/or district Bureau of Operations),
- local agencies (district Project Support Section),
- aerial surveys (Surveys, Mapping and Modeling Section and district Surveys Unit), and
- bicycle/pedestrian impacts (district and BDE Bicycle and Pedestrian Coordinators).

4-3.02 <u>Agreements</u>

Reference: Chapters 5 through 7

1. The designer initiates action for the preparation of the following agreements:

    a. Utility—Agreements Unit or Project Support Section
    b. Railroads—Agreements Unit or Project Support Section
    c. Local—Agreements Unit or Project Support Section

2. Because agreements often require considerable time to be prepared and processed, especially railroad agreements, work should be initiated as early as possible.

4-3.03 Bridge Design

Reference: Chapter 39

1. The bridge design process is initiated during the Phase I study, and the Phase I report will incorporate information from the Bridge Condition Report prepared by the district Bridge Engineer or by a consultant designated by the district and approved by the Bureau of Bridges and Structures.

2. The designer must determine if bridge hydraulics are required for bridge design and initiate action.

3. The designer requests that TS&L drawings be prepared in Phase II by the Bureau of Bridges and Structures or by a consultant designated by the district for any structures located within the project limits. Base information should be collected and summarized as early as practical.

4. The roadway and bridge designers coordinate the approach work, including guardrail-to-bridge-rail transitions; the bridge designer performs any structural design based on the approved TS&L plan.

5. The Bureau of Bridges and Structures (BBS) prepares all necessary PS&E elements for in-house designed structural items, including special provisions, quantities, and cost estimates. BBS will incorporate final structure plans and special provisions into the final contract once the plans are submitted to the Central Office for all in-house designed structural items. For structural projects not designed in-house, structural engineering consultants will complete all necessary PS&E elements and will submit final structure plans and special provisions to the district for forwarding to BBS.

6. Minor work on existing bridges is incorporated into the plans by the roadway designer (e.g., minor deck repairs, patching); however, work shall be submitted and approved by the Bureau of Bridges and Structures, ideally prior to PS&E.

4-3.04 Bridge Deck Rehabilitation

Reference: Chapter 39

1. Other than minor repairs, bridge deck rehabilitation work is performed by the district or a consultant designated by the district and submitted to the Bureau of Bridges and Structures for approval.

2. The designer must coordinate with the District Bridge Maintenance Engineer.

4-3.05 Hydraulics

Reference: Chapters 39 and 40

1. The designer must coordinate work with the district Hydraulics Engineer and/or the Bureau of Bridges and Structures in the Central Office.
2. The designer will request maintenance and flood records for the location through the district Hydraulics Engineer.
3. The designer and Hydraulic Engineer will decide the necessary surveying along the channel.

4-3.06 CADD Usage

Reference: Chapters 11 and 63

Except for very simple project designs, most projects will use Computer Aiding Design and Drafting (CADD). Refer to the IDOT *Computer Aided Design, Drafting, Modeling and Deliverables Manual* for information on preparation of roadway plans using CADD.

4-3.07 Commitment File

Reference: Chapters 11 and 12

1. This file is usually initiated during Phase I by the project study group and should be transferred to the designer when the designer receives the approved Phase I report.
2. This file may contain commitments to/for:
   - right-of-way;
   - cities, towns, villages, counties, or townships;
   - other agencies (e.g., State, Federal);
   - traffic operations;
   - driveways and entrances;
   - shared costs;
   - environmental issues; and
   - other issues requiring special attention.
3. The designer adds commitments to the file that were made during the project development.
4. The designer must document the transfer of this file to the district Bureau of Project Implementation.

4-3.08 <u>Coordination with Bureau of Operations (Maintenance)</u>

Reference: None

1. The project study group should contact the district Bureau of Operations early in the project development.

2. Operations should be involved in the development of the Phase I report (e.g., snow-drifting, drainage problems, pavement deterioration).

3. Operations should be invited to all patching surveys.

4. The designer should continuously coordinate with Operations during project study and design, especially for drainage facilities.

5. The designer should invite Operations to the Plan-in-Hand Field Inspection.

4-3.09 <u>Field Surveys</u>

Reference: IDOT *Survey Manual*

1. Surveying is located in the Bureau of Programming in District 1 and in the Bureau of Program Development in all other districts.

2. The survey typically is requested by the designer during the development of the Phase I report, or topographic data may be obtained from available mapping.

3. The designer may need to request additional surveys for bridge hydraulics, roadway drainage, erosion potential, entrance information, location of utilities, etc.

4. The designer may need to schedule additional field checks to determine surveying needs.

4-3.10 <u>Roadway Drainage</u>

Reference: Chapter 40

1. Large and/or complex structures are designed by the Bureau of Bridges and Structures or consultants.

2. For hydraulic design or procedural questions, the district Hydraulics Engineer should be contacted.

3. The designer determines designs for open channels (ditches) and closed systems (storm sewers). The project study group must have identified a drainage outlet in a Phase I report for closed drainage systems.

4. The designer is required to determine drainage areas, rainfall intensities, and culvert design and must design all closed drainage systems.

5. Drainage areas greater than 625 acres (250 ha) should have been identified by the project study group in the Phase I report. On large projects, a preliminary drainage report is prepared by the district Hydraulics Unit or engineering consultant and transferred to the designer.

6. The type and design of a pipe or box culvert will be determined by the designer or district Hydraulics Engineer using the IDOT *Culvert Manual*. Any drainage structure requiring a waterway opening greater than 7.5 ft^2 (0.7 m^2) should be sized by the district Hydraulics Engineer. Multiple-box culverts, bridges, and three-sided structures will be designed by the Bureau of Bridges and Structures or structural engineering consultants.

7. Reference the Department's *Culvert Manual* and *Drainage Manual* for more information.

4-3.11 <u>Geotechnical Investigations and Reports</u>

Reference: None

1. The designer requests soil characteristics for pavement designs.

2. A Geotechnical Report should be completed in the planning stage; if not, the designer may need to request one from the district Geotechnical Unit.

3. Borings may be required for new pavements, bridges, box culverts, wingwalls, retaining walls, high-mast lighting, and deep storm sewers. Contact the district Geotechnical Unit to schedule borings.

4. The district Geotechnical Unit performs the following:

   - prepares the Soils Report (e.g., determines maximum fill and cut slopes, provides drainage recommendations for soils, determines the areas for removal of unsuitable materials);

   - performs simple pavement testing;

   - determines special materials to be used and provides assistance for special provisions;

   - determines when the Bureau of Bridges and Structures should be involved in the design of retaining walls and other types of walls; and

   - provides input on project schedules based on the expected availability of materials.

5. The Central Bureau of Materials (CBM):

- determines layer coefficients for special pavement designs,
- performs complex pavement and soil tests, and
- provides special assistance as needed.

6. See *Geotechnical Manual* for more information.

4-3.12 Patching Survey

Reference: Chapter 53

1. The designer will need to conduct a patching survey on pavement rehabilitation projects.

2. The designer should coordinate the survey with maintenance or off-peak construction personnel.

3. Usually, two patching surveys are conducted:

   - the first in Phase I to determine the preliminary scope of pavement work; and
   - the second near the end of the design phase to determine contract quantities.

4-3.13 Pavement Rehabilitation and Preservation

Reference: Chapters 52 and 53

1. These are established by IDOT policy.

2. The designer must adhere to policy. However, if the designer determines that policy is not applicable, the designer can request a variance from BDE. Design exceptions to policy shall be coordinated as applicable with the district Materials Section, BDE, CBM, and the Bureau of Research.

4-3.14 Pavement Design

Reference: Chapter 54

1. The designer submits the required pavement information to the district Pavement Design Engineer.

2. The district Pavement Design Engineer reviews and submits alternative designs to BDE.

3. The designer ensures that the approved pavement design is placed into the construction plans where appropriate (including on the typical sections, summary of quantities, schedules of quantities, and special provisions).

4-3.15 Utilities Coordination

Reference: Chapter 6

1. The designer coordinates work with the Project Support Section.
2. The designer contacts the Project Support Section to determine the potential involvement with utility companies.
3. The designer provides existing topography and/or preliminary plans, when available or necessary, to the Project Support Section, who then forwards these to the affected utility companies for markup and return to the designer.
4. The designer shows the location of all known utilities existing on the plans.
5. The designer identifies the possible locations of conflicts due to the proposed improvement.
6. The designer works with the Project Support Section to resolve any conflicts.

4-3.16 Railroad Involvement

Reference: Chapter 7

1. Any formal contact with railroad companies is accomplished through the Agreements Unit in BDE. Where a district Railroad Unit exists, informal contact can be made with a railroad to obtain preliminary information.
2. Railroad agreements usually require 18 to 24 months to process. Start this process early.
3. When work is performed by railroad forces, an Agreement is required. Some work included in the highway plans on railroad right-of-way and/or to railroad facilities may also require an agreement.
4. Where a contractor must work on or adjacent to the railroad right-of-way, railroad liability insurance is required. The designer must include a special provision and pay items with the plans that require this insurance.

4-3.17 Public Transportation Involvement

Reference: Chapters 55 and 58

1. A construction project may affect the location of public or school bus pickup/drop-off locations, bus turnouts or turnarounds or may involve commuter trains.

2. If a conflict appears unavoidable, the designer should coordinate with local public transportation agencies and school districts.

3. The designer must determine how the Traffic Control Plan will affect public transportation (e.g., detours), and convey this information to the appropriate public transportation agency so the agency can inform their ridership of revised routes.

4. Bicycle routes to public transportation facilities and bike storage facilities must be considered in project design.

4-3.18 Rest Areas

Reference: Chapter 16

1. Rest areas are usually included only on Interstate routes and other freeways.

2. The design of a rest area is developed by the district in coordination with BDE, the central Bureau of Operations, and the Rest Area Committee.

3. The design of the building, water supply, sanitary needs, and utilities is handled by the Capital Development Board (CDB), BDE, and district.

4. See Figure 16-1.A for details of which office is responsible for the various activities with rest areas.

4-3.19 Experimental Items

Reference: None

1. The designer coordinates their use with the Central Bureau of Materials (CBM).

2. The designer or CBM usually develops the specifications for experimental items.

3. Experimental items may also be initiated by BDE, which then prepares the specifications and work plan. The designer incorporates these into the final construction plans.

4. The designer coordinates work plans with CBM.

5. The CBM secures FHWA approval, if necessary.

6. The district may be requested to monitor the item in the field.

4-3.20 State and Federal Permits/Approvals

Reference: Chapter 28

1. The designer may need to coordinate with the US Army Corps of Engineers, US EPA, US Coast Guard, Illinois EPA, Illinois Division of Waterways, IDNR, the State Fire Marshall, etc.

2. The district Hydraulics Unit or district Environment Unit may become involved in any water-related permits.

3. Other permits or approvals on a project may include utility, driveway, and access permits.

4-3.21 <u>Traffic Engineering</u>

Reference: Chapters 56 and 57

1. The designer determines the placement of pavement markings. The district Bureau of Operations (District 1 Bureau of Traffic) reviews the plans.

2. The designer must consider the placement of signs in the design of a project.

3. Proposed traffic signing is typically part of the design plans, but may be prepared as a separate set of plans by the district Bureau of Operations (District 1 Bureau of Traffic). On Interstate or other freeway projects, signs are included in the roadway contract. Also, mast-arm mounted traffic signs are always included in the roadway contract.

4. For signal plans, the following applies:

   - Warrants for signals are usually requested by the project study group when an Intersection Design Study (IDS) is submitted.

   - Signals could also be added to a project at the request of the district Bureau of Operations (District 1 Bureau of Traffic). All locations require an IDS submittal, except standard designs for temporary traffic signals according to the *Highway Standards*.

   - Traffic signal plans are usually prepared by the district Bureau of Operations (District 1 Bureau of Traffic) and added to the plans by the designer.

5. For highway lighting, the following applies:

   - See Chapter 56 for warrants on highway lighting.

   - In all districts, except District 1, BDE prepares or reviews the plans and specifications for lighting.

   - In District 1, the lighting plans are prepared by the district Bureau of Electrical Operations.

- Where high-mast lighting is used, the designer must request soil borings.

6. For overhead signs, the following applies:

   - When standard designs do not apply, the Bureau of Bridges and Structures is involved in the structural design.

   - The district Bureau of Operations (District 1 Bureau of Traffic) usually prepares the message for each sign and selects its location.

   - Cantilever and truss-mounted signs require soil borings.

7. The designer must incorporate the proper highway standards for signing, signals, and lighting into the final construction plans.

4-3.22 Traffic Control Plans (TCP)

Reference: Chapters 13 and 55

1. A work zone traffic management plan should be prepared and included as a part of an approved Phase I report, designated as a Transportation Management Plan (TMP). A TMP that does not meet the goals for queueing and delay must be reviewed and approved by the Bureau of Safety Programs and Engineering. All other TMPs may be approved by the Regional Engineer.

2. The designer prepares the Traffic Control Plan (TCP) from the approved TMP.

3. The designer coordinates the TCP with the district Bureau of Operations and the Bureau of Safety Programs and Engineering.

4. The TCP should be on separate plan sheets.

5. The designer must also include the appropriate traffic control standards in the final construction plans.

4-3.23 Plan-in-Hand Field Inspection

Reference: Chapters 2, 3, and 66

1. The Plan-in-hand field inspection (PIH) is usually scheduled for all projects.

2. Appropriate individuals should be invited to the PIH (e.g., FHWA, BDE, district Project Implementation, district Operations, district Land Acquisition Section, local agency representatives).

3. Interstate projects require coordination between BDE and FHWA.

4-3.24 Special Waste

Reference: Chapters 26 and 27

1. Initial investigations are accomplished by the district Environment Unit during the development of a Phase I study. Where special waste is determined to be present in property to be acquired, the results of these investigations should be provided to the district Land Acquisition Section so they may determine the appropriate rights or property interests to be acquired and the appropriate value of the land.
2. The designer incorporates any mitigation plans from the Phase I report, Environmental Assessment, or FEIS into the final construction plans.
3. The designer includes any necessary special provisions in the plans.
4. Specialized consultants are used to do sampling and testing and to develop specifications for disposal.
5. The designer should inform the project study group of any changes in the scope of work concerning special waste.

4-3.25 Coordination with Local Officials

Reference: Chapter 5

1. The designer coordinates agreements, letters of understanding, letters of intent, and plan reviews with the Project Support Section.
2. Early coordination is accomplished during Phase I by the project study group.
3. The designer must ensure that commitments are incorporated into the final construction plans from the Phase I report, Environmental Assessment, or FEIS.
4. The designer will need to identify and coordinate any local sidewalk maintenance or additions, ADA ramp improvements, or bicycle facilities of interest to potentially be included in the project.
5. The designer may be requested to incorporate items of local interest into the plans.
6. The designer ensures that details for the installation and/or improvement of city-owned utilities or traffic signals are coordinated as early as possible in the design process.
7. In urban areas, the designer should coordinate the traffic control plans with local officials.
8. The designer will need to obtain final plan review from local officials (e.g., traffic signals, drainage, landscaping), working through the Project Support Section.

9. The designer will need to identify and coordinate, with a city or town, encroachments from sign overhangs onto State right-of-way.

10. The designer may need to attend local meetings with city councils, school boards, drainage districts, or neighborhood groups.

11. The designer will address how emergency services will be accommodated during construction.

12. The designer will coordinate the pavement type selection and pavement design on non-State highways with the local government.

13. The designer will coordinate the type and selection of noise abatement with adjacent residents and the local government.

4-3.26 Right-of-Way

Reference: None

1. The project study group determines preliminary right-of-way (ROW) needs and limits during Phase I. The group also identifies any specific ROW issues that could significantly affect the alignment, cost, or timeline of the project. Examples of such ROW issues would be billboards, cell towers, railroads, mobile home parks, cemeteries, low-income properties, and hazardous/special waste within property to be acquired.

2. Once final construction limits are decided, the designer develops ROW limits and forwards the limits to the district Land Acquisition Section. The designer must also notify the district Land Acquisition Section when Phase I design approval has been granted so that acquisition may begin.

3. The district Land Acquisition Section or a consultant prepares final ROW plats.

4. The district Land Acquisition Section informs the designer when all ROW is cleared.

4-3.27 NPDES/Erosion and Sediment Control

Reference: Chapter 41

1. The designer evaluates the project for proper implementation of Erosion and Sediment control Best Management Practices (BMPs).

2. The designer develops a fully completed Storm Water Pollution Prevention Plan (SWPPP)–BDE 2342.

3. The designer coordinates with the district Erosion and Sediment Control coordinator as needed.

4. The designer may attend project field reviews to determine how best to prevent future Incidences of Noncompliance (IONs).

4-3.28 Landscaping

Reference: Chapter 59

1. The district Bureau of Operations (District 1 Bureau of Maintenance) is responsible for landscaping on all projects.
2. The designer provides a set of preliminary plans to the Bureau of Operations for recommendations.
3. The Bureau of Operations marks up the set of plans, indicates the types of plants required, and notes which specifications or special provisions will be used.
4. The designer is responsible for including the information on the plan sheets and incorporating the remainder of the information into the project documents.

4-3.29 Coordination with BDE and FHWA

Reference: Chapter 31

1. When major changes are proposed to an approved Phase I report, the designer must coordinate these changes with the project study group. If a proposed change affects an approved FONSI or FEIS, FHWA should be briefed at a monthly Coordination Meeting on the extent of the change.
2. FHWA periodically checks the Department's compliance with approved reports through annual process reviews of completed construction projects. Therefore, the designer should not make any major changes to the final construction plans without discussing the proposals with the project study group.
3. Proposed design exceptions, if any exist on the project, must be coordinated at a bi-monthly Coordination Meeting with BDE and/or FHWA (depending on the affected criteria).
4. The designer should invite BDE and FHWA to Plan-In-Hand Field Inspections on Interstate projects.

4-3.30 Project Cost Estimate

Reference: Chapter 65

1. The designer calculates quantities and prepares the summary of quantity sheets.

2. The district Estimator will input these quantities into the BDE Electronic Contract Management (ECM) system.

3. The district Estimator estimates unit prices, prepares all forms, and submits these to the Estimating Unit in BDE.

4. Usually, the designer is not involved with determining unit prices.

4-3.31 Comparison to Estimated Program Costs

Reference: Chapter 65

1. Estimated program costs are initially prepared by the district Bureau of Programming for the annual program.

2. A revised program cost is tabulated in the Phase I report.

3. The designer must be aware of how changes and additions can affect the cost of a project.

4. The project study group must be notified when there are major changes in the scope of approved work in the Phase I report. The designer must request additional funds for a project through a programming change order.

5. The BDE Project Development Unit and the Office of Planning and Programming must concur in and approve all major cost changes to a project.

4-3.32 Specifications and Special Provisions

Reference: Chapter 66

1. The designer develops special provisions for the roadway items not covered by the *Standard Specifications*.

2. The designer assembles all District Recurring Special Provisions.

3. The designer reviews the Statewide Recurring Special Provisions, current BDE Special provisions, and recurring district Special Provisions, and indicates the applicable ones on the Checklist.

4. This portion of the PS&E package is sent to the BDE Project Coordination and Implementation Section.

4-3.33 Right-of-Way Purchased and All Permits Obtained

Reference: Chapters 2 and 3

1. The designer must check that all right-of-way (ROW) has been purchased or is in quick-take proceedings.

2. All permits must be approved before a project can be placed on a bid letting.

4-3.34 Construction Contract Items and Bid Letting

Reference: Chapter 66

1. The designer uses a Checklist to ensure that all project items have been cleared.

2. The PS&E is submitted to BDE for final checking and processing of documents.

3. The Project Coordination and Implementation Section authorizes the project to be placed in a bid letting.

4. The bid letting is held and the bids are tabulated. The district and low bidder are notified.

4-3.35 Pre-Construction Meeting

Reference: None

1. The designer typically attends the Pre-Construction Meeting.

2. The designer discusses commitments made and any unusual aspects of the project with the district Bureau of Project Implementation and the contractor.

Chapter Five

LOCAL AGENCY AGREEMENTS

BUREAU OF DESIGN AND ENVIRONMENT MANUAL

Chapter Five
LOCAL AGENCY AGREEMENTS

Table of Contents

Section **Page**

Table of Contents
(Continued)

Chapter Five
LOCAL AGENCY AGREEMENTS

Chapter 5 documents the Department's policies and procedures to use when processing local agency Agreements. The term "local agency," as used in this chapter, refers to municipalities, counties, townships, fire districts, and other public entities. The procedures in this chapter also apply to non-public entities.

5-1 GENERAL

5-1.01 Need For Agreements

The Department requires an Agreement with a local agency when the local agency participates in the improvement of a State route and/or when a transfer of jurisdictional responsibility is made. Participation may be a contribution of goods, services, or money (e.g., right-of-way, preliminary engineering, municipal funds). The Agreement also should resolve questions of maintenance, parking, storm sewer pollution, encroachments, approval of plans, and other similar items.

5-1.02 Signature Authority

The Regional Engineer, or assignee, may execute an Agreement with the local agency except under the following conditions:

- a Jurisdictional Transfer is involved;
- the Department is reimbursing or crediting the local agency;
- an Agreement with another State is involved; or

The Director of the Office of Highways Project Implementation will execute Agreements that cannot be executed by the Regional Engineer. The Secretary of Transportation will also execute Agreements when the Department is reimbursing the local agency or an Agreement with another State.

5-1.03 Processing Guidelines and Procedures

The district will prepare local agency Agreements in accordance with the applicable State laws and the Department's rules, regulations, and policies using the format discussed in Section 5-2. The following sections present the procedures and guidelines for processing local agency Agreements.

5-1.03(a) Executed by the Regional Engineer

The district is responsible for the Agreement from inception to execution. The project support engineer must submit a memorandum describing any element of an Agreement that deviates from IDOT policy to BDE for approval before the local agency signs the Agreement. Once fully executed, the district will send one original Agreement to the local agency and the other original Agreement, together with a copy of all waiver approvals, to BDE (to be retained, in perpetuity, as an official Department document). The district shall send copies of the Agreement to the affected central offices/bureaus and send one copy of the Agreement with the PS&E submittal.

5-1.03(b) Executed by the Secretary of Transportation and Director of the Office of Highways Project Implementation (< $250,000)

If the agreement obligates an expenditure of less than $250,000, the project support engineer will prepare the preliminary draft of the Agreement and send the preliminary draft to the appropriate district bureaus for review and approval of the Agreement prior to submitting drafts to each affected central office/bureau for review. To expedite the draft review process, note and explain in the transmittal memo to the bureaus any deviations from policy contained in the Agreement. If projects involve improvements to an unmarked State route and the Agreement does not provide for a transfer of jurisdictional responsibility, also note the following in the transmittal memorandum:

- whether the appropriate local agencies were contacted and their reasons for not accepting jurisdiction,
- whether the project could be deferred, or
- whether the project is the minimum required to prevent further deterioration of the existing pavement.

This information is necessary to obtain Executive Office approval to proceed with the project.

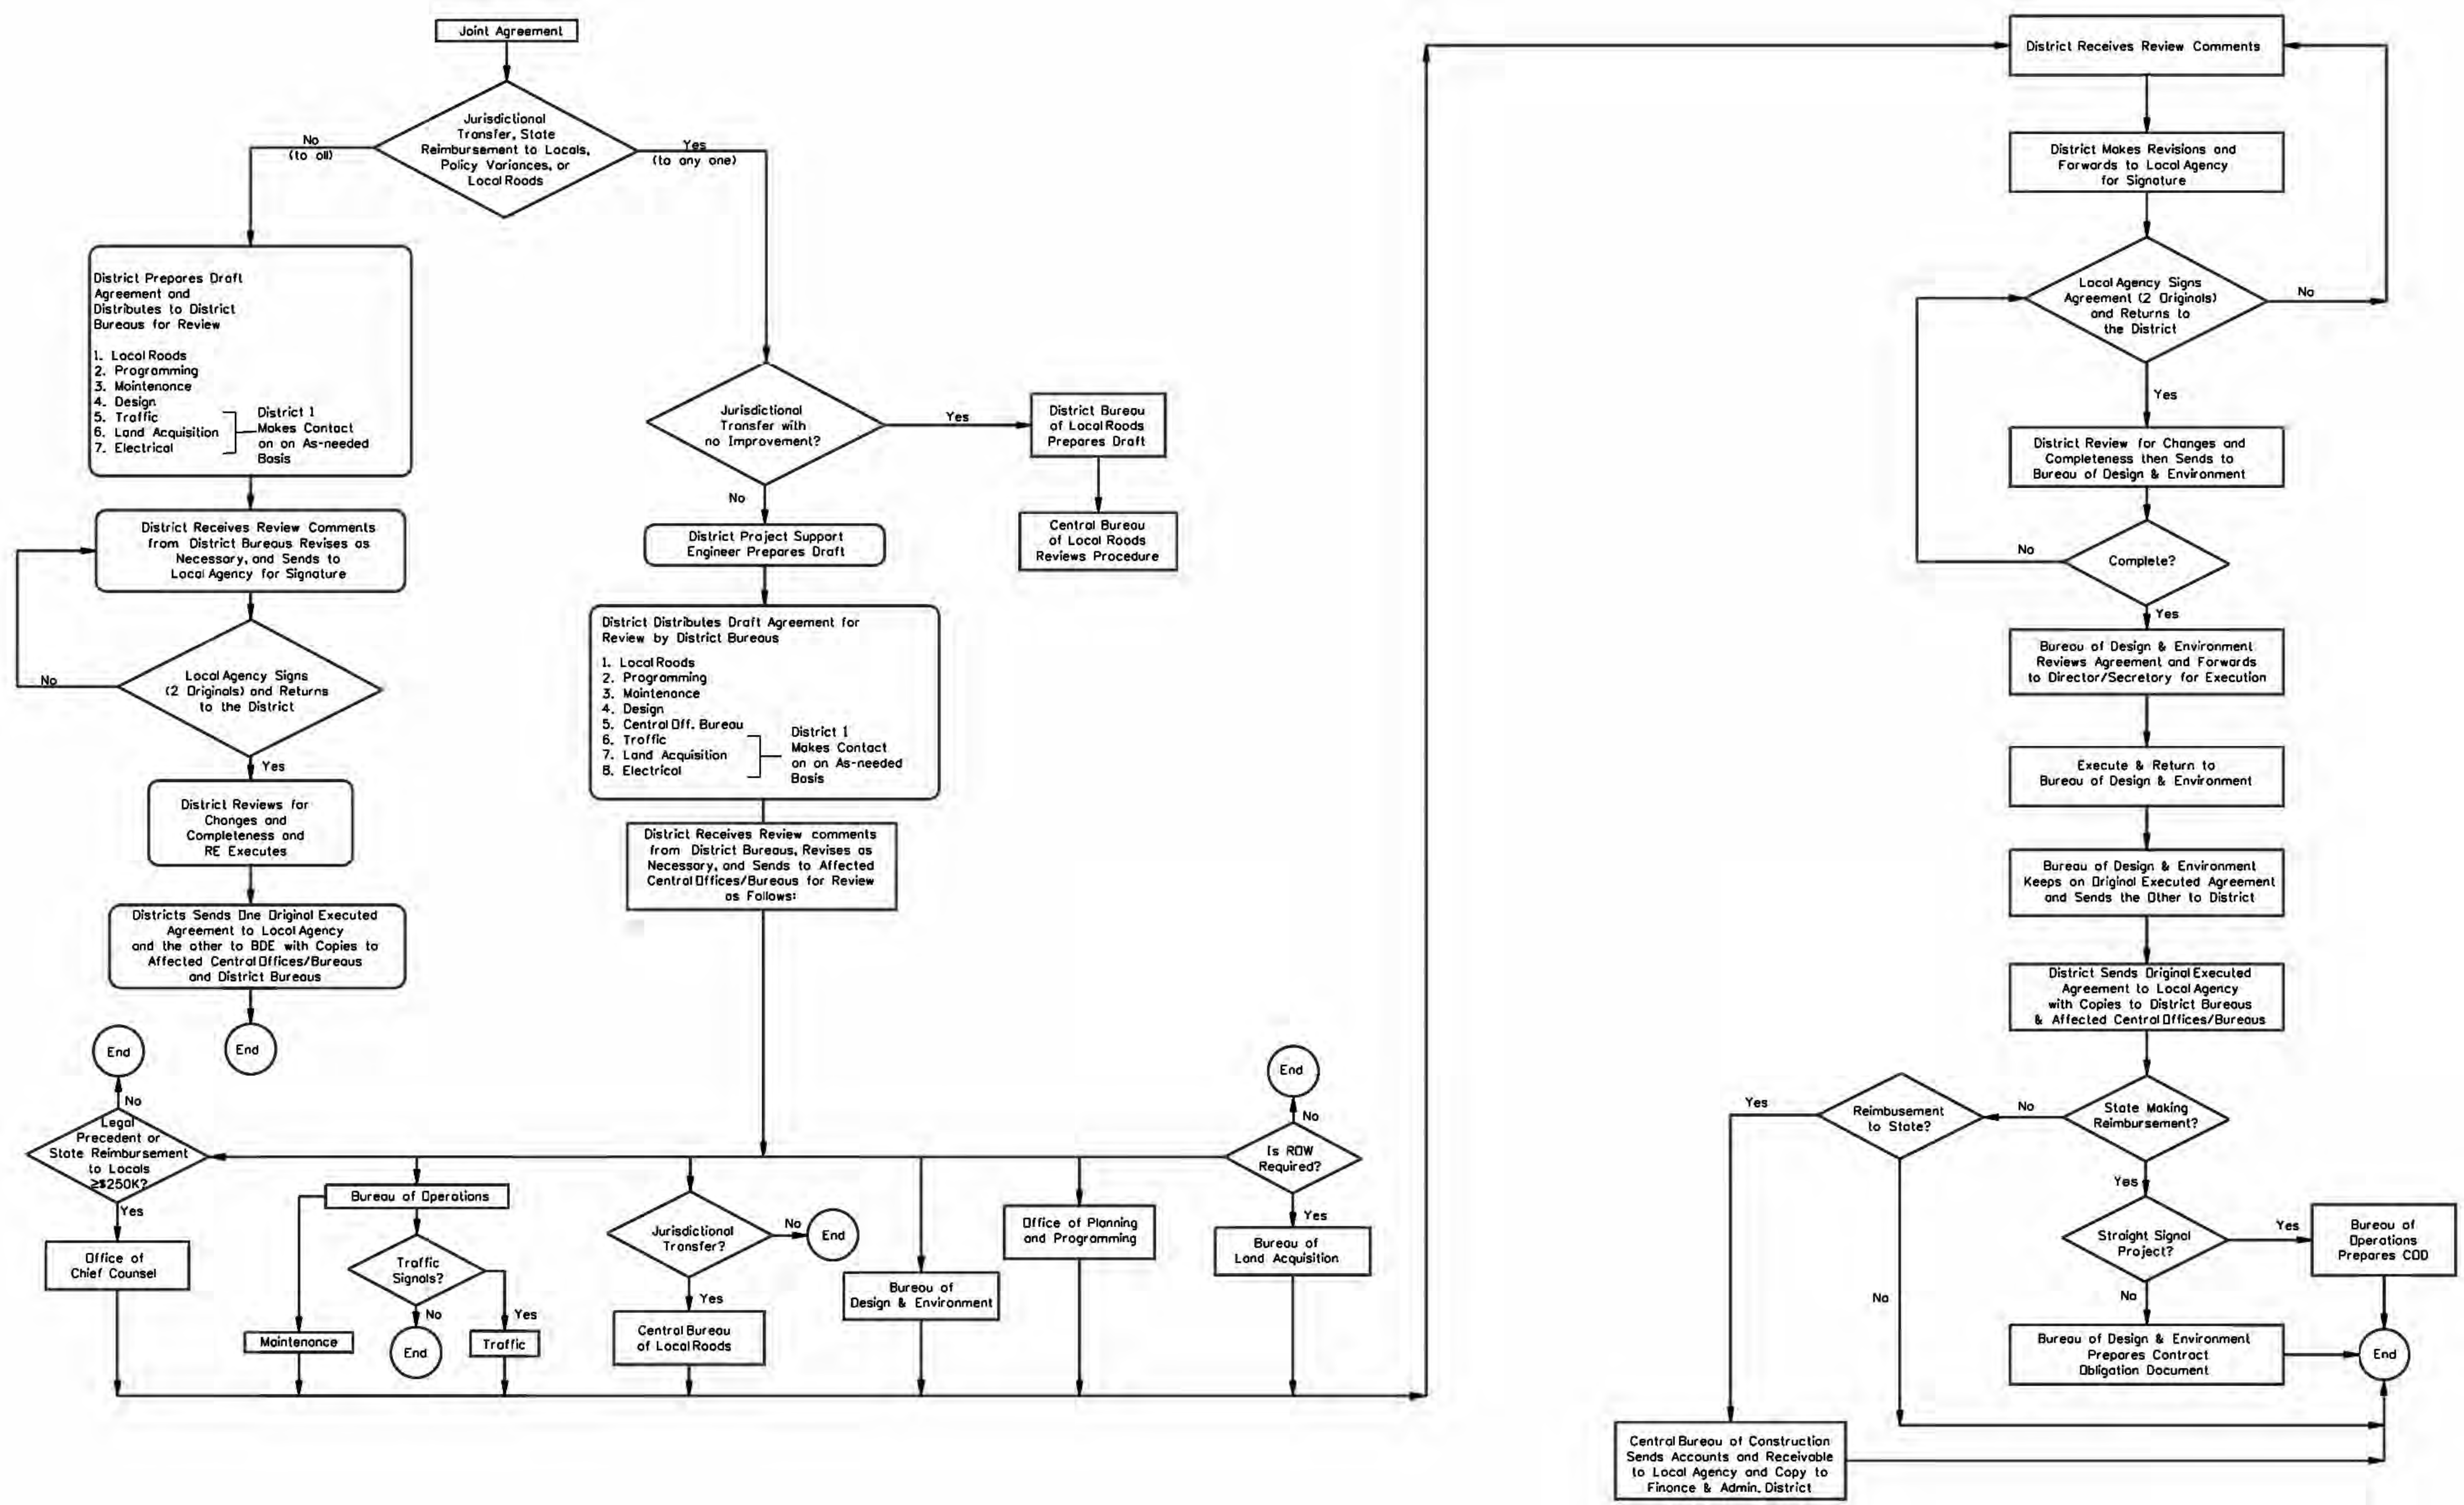
Following preliminary draft approval, the district will prepare the final draft in duplicate (i.e., presupposing a two-party Agreement) on letter-size paper and submit the two counterparts to the local agency for signature. The project support engineer will instruct the local agency to return the two signed counterparts. The project support engineer will then forward the signed counterparts to BDE for execution by the Director of the Office of the Highways Project Implementation and the Office of the Secretary. The BDE will file one original counterpart and send the remaining original counterpart to the district. The district will send the original counterpart to the local agency and forward one copy to each of the central offices/bureaus. For an improvement to be eligible for any particular letting, the Agreement, with attached ordinances, shall be fully executed and plan approval received prior to the PS&E dates indicated in the schedule for lettings that are published each year by BDE.

5-1.03(c) Executed by the Secretary of Transportation, Chief Counsel, Director of Finance and Administration and the Office of Highways Project Implementation (≥ $250,000)

If the Agreement obligates an expenditure of $250,000 or more payable to the local agency, the above signatures are required. The review process and all other aspects are the same as described in Section 5-1.03(b).

5-1.03(d) Processing Procedures

Figure 5-1.A illustrates the procedures to use when processing local agency Agreements. Adhering to these procedures will reduce confusion and provide consistency in implementing the process. For additional guidelines, contact BDE.



PROCESSING LOCAL AGENCY AGREEMENTS
Figure 5-1.A

5-2 AGREEMENT FORMAT

There is one format that is typically used for Agreements between the Department and a local agency. The following sections discuss the agreement format.

5-2.01 Developed Format

The district will use the Developed Format on all projects. See Section 5-8 for a sample of the Developed Format.

5-2.02 Description of Improvement

In the Agreement, include a brief description of the improvement to completely inform the local agency of the extent of the improvement. If the improvement extends beyond the limits of the local agency, also define the limits of local agency involvement. Provide the following in the description:

- the route designation and improvement limits, identified by official street names, as practical;
- the proposed number and width of traffic lanes;
- the width of any parking lanes;
- the width and type of median, if any;
- the type of curb and gutter construction;
- the type and limits of any pedestrian or bicycle accommodation being established;
- any storm sewer or incidental construction required; and
- any work requested by the local agency.

5-2.03 Termination

Include in the Agreement a mutually acceptable time of termination not to exceed three years if the contract is not awarded.

5-3 MAINTENANCE OBLIGATIONS

The Agreement should describe in detail the maintenance obligations of all parties to avoid potential misunderstandings upon completion of construction. Normally, on streets that are a part of the State highway system, the Department will maintain the following:

- the traffic lanes, including left- and right-turn lanes or bi-directional lanes, and the adjacent curb and gutter or ditch; and
- the median area, if provided.

The following sections provide additional information on maintenance obligations.

5-3.01 Traffic Lanes Under Municipal Jurisdiction

The municipality will maintain the traffic lanes and any adjacent curb and gutter under municipal jurisdiction.

5-3.02 Parking Under Municipal Jurisdiction

The Agreement should assign responsibility for parking maintenance according to the following criteria:

1. On-System Parking. If parking, including restricted parking, is included in the improvement, the municipality will maintain the parking lanes and the adjacent curb and gutter.
2. Off-System Parking Lanes. The municipality will accept complete jurisdiction of off-system parking facilities including, but not limited to, the following:
   - maintenance,
   - operation,
   - repair,
   - reconstruction,
   - striping, and
   - provision of electrical energy for lighting systems.

   The municipality will hold the State harmless from any legal suits arising from the construction, operation, and maintenance of off-system parking facilities.

5-3.03 Parking or Municipal Traffic Lanes Assumed by State

If an IDOT traffic capacity analysis demonstrates a justification for additional traffic lanes, the Department may assume the additional full-time traffic and/or parking lanes under municipal jurisdiction. Once assumed, the Department will maintain these facilities including any adjacent curb and gutter.

5-3.04 Storm Sewers and Appurtenances

The municipality normally will perform the routine maintenance of storm sewers and appurtenances constructed as part of the improvement, provided the storm sewer was designed to accommodate State highway drainage only. Routine maintenance is defined as those functions necessary to maintain the sewer in a serviceable condition including:

- cleaning sewer lines, inlets, manholes, and catch basins; and
- repairing and replacing inlet, manhole, and catch basin frames, grates, and lids.

The following provides additional guidance on the maintenance responsibilities of storm sewers and appurtenances:

1. Storm Sewers Constructed for State Highway Drainage Only. Beyond the level of routine maintenance, the Department will maintain, repair, and/or reconstruct storm sewers constructed for State highway drainage only.

2. Storm Sewers Constructed for Joint Municipal/State Use. If the storm sewer is oversized to accommodate a joint Municipal/State use, the Agreement shall proportion the cost for maintenance, repair, and/or reconstruction beyond the level of routine maintenance in the same manner as the initial construction cost was proportioned.

5-3.05 Traffic Signals

If traffic signals are included in the improvement and are within the municipality's corporate limits, the municipality and the Department normally will share maintenance responsibilities. The municipality is responsible for maintenance and energy costs as provided in Part 544 of the *Illinois Administrative Code* (92 Ill. Admin. Code 544) contact the Bureau of Operations for additional guidance).

5-3.06 Lighting

The following presents the maintenance obligations for lighting:

1. Separate Systems. The municipality is financially responsible for maintaining any separate lighting system installed by the Department at the request of the municipality. The municipality also will furnish and pay for the system's electrical energy.

2. Combined Systems. In addition to any obligations in Part 544 of the *Illinois Administrative Code* (92 Ill. Admin. Code) (contact the Bureau of Operations), the municipality is financially responsible for maintaining the luminaires, luminaire wiring, conduit, and control

devices and for providing the electrical energy for the combined systems the Department installs at the request of the municipality.

5-3.07 Sidewalks

The municipality will maintain any new or replacement sidewalks the Department provides in the improvement, excluding those constructed on structures.

5-3.08 Right-of-Way Under Municipal Jurisdiction

Use the following guidelines to determine maintenance responsibility for right-of-way under municipal jurisdiction:

1. Urban Cross Section. The municipality will maintain the entire right-of-way outside of that maintained by the Department. This includes, but is not limited to, municipal utilities, landscape plantings, parkways, guardrails, crosswalks, and stop line markings.

2. Rural Cross Section. The Department will maintain the entire right-of-way excluding the landscaping and utilities installed by others and the right-of-way under municipal responsibility as discussed in Sections 5-3.01 through 5-3.07.

5-3.09 Municipal Streets

If municipal streets are improved as part of the State highway project, the municipality is responsible for maintaining the municipal streets, except as provided in Section 3-500 “Construction/Reconstruction and Maintenance of Side Roads and Street Intersections with State Highways” of the Bureau of Operations “Maintenance Policy Manual.”

5-3.10 Shared Use Paths

The municipality will maintain any bicycle paths associated with the State highway project other than that portion of the bicycle path carried on State structures. Incorporate the following paragraph in the Agreement:

> *The _____________ agrees to assume responsibility for the administration, control, reconstruction, and maintenance of the shared use path not otherwise carried on State structures. The ___________ further agrees to indemnify and hold harmless the State, its officers, employees, and agents from any and all claims, lawsuits, actions, costs, and fees (including reasonable attorney fees and expenses) of every nature and description arising from, growing out of, or connected with the construction and/or operation of the shared use path.*

5-4 AGREEMENT ATTACHMENTS

5-4.01 Parking Restrictions

The district should ensure that any on-street parking included in the improvement is parallel and adjacent to the curb and, as practical, should eliminate any diagonal on-street parking from the project. Diagonal on-street parking shall be analyzed and approved by BDE before the Department will execute an Agreement for a joint municipal/State improvement; see Chapter 48. The municipality shall adopt and enforce an appropriate parking ordinance as part of the Agreement. If an appropriate parking ordinance is already in effect, obtain copies from the municipality. Attach the parking ordinance as an Exhibit to the Agreement prior to execution. Enforcement of the parking ordinance by the municipality is understood to include erection and maintenance of any necessary “NO PARKING” or “PARALLEL PARKING ONLY” signs. See Example 2 in Section 5-8 for a sample parking ordinance.

5-4.02 Sewer Restrictions

The municipality shall adopt and enforce an ordinance prohibiting the discharge of sanitary sewage or industrial waste into any storm sewer or drainage facility constructed by the Department as a part of the project. The district will attach the ordinance as an Exhibit to the Agreement prior to execution. See Example 3 in Section 5-8 for a sample storm sewer ordinance.

5-4.03 Encroachments

If a State highway improvement is within a municipality, the work generally is performed on right-of-way that is either acquired by or dedicated to the municipality. Occasionally, the Department performs work on new right-of-way, purchased either by the State or jointly with the municipality, under an Agreement with the municipality. As part of the Agreement, the municipality will provide for the disposition of any existing encroachments and adopt and enforce an ordinance prohibiting future encroachments on State highway right-of-way.

Encroachments on State highway right-of-way will not be permitted and shall be removed. Unless the encroachment is an existing violation, the State may compensate the owner during right-of-way negotiations. However, if the safe and free flow of vehicular and pedestrian traffic is maintained, the Department may allow the encroachment to remain. In such cases, the municipality will issue a revocable permit, approved by the Department, that provides for the future removal of the encroachment, if necessary.

The Department defines an encroachment as any building, fence, sign, billboard, or other structure or object (excluding certain items over sidewalks and most public and private utilities) that are placed, located, or maintained in, on, under, or over any portion of State highway right-of-way, except those structures and objects that:

- are informational signs,
- constitute a part of the highway,
- are a part of the highway facility's access control, or
- are in the public interest and do not impair highway operations or interfere with the safe and free flow of vehicular and pedestrian traffic.

Although not applicable to freeways, the last item includes awnings, marquees, signs advertising business activity, and similar building-supported structures that overhang a sidewalk on State highway right-of-way. If a building is set back from adjacent buildings that are flush with a sidewalk on State highway right-of-way, the Department may permit pole-mounted signs advertising the set-back enterprise to overhang the State highway right-of-way as it permits building-supported encroachments. In addition, if a public or private utility located in or near a sidewalk impedes the safe and free flow of pedestrian traffic, the Department considers the utility an encroachment. These utility encroachments are subject to a revocable permit. The Department should ensure that the placement of above-ground utilities does not restrict the clear width of the sidewalk to less than that allowed per Section 58-1. Clear width is the distance from the edge of the sidewalk to the near edge of the utility facility.

The Department and municipality jointly will establish a project right-of-way line within the limits of the platted street that will be encroachment free, except for revocable permits and the exempt structures and objects previously discussed. Representatives from both agencies will attend a field review to accomplish this task. As practical, establish the project right-of-way line to not less than 2 ft (600 mm) behind the face of the curb. After the field review, draw the project right-of-way line on the plans and designate the Municipal right-of-way area outside the project right-of-way line as a construction easement in which the Department will be permitted by Agreement to perform work. After construction, the municipality will control all areas outside the project right-of-way.

If an existing encroachment must remain on project right-of-way, the municipality will issue a revocable permit, approved by the Department, that provides for the future removal of the encroachment, if necessary. The district will coordinate a joint field review with the municipality to ensure that encroachments do not violate *Illinois Highway Code,* 605 ILCS 5/9-112.4. If during the field review it is determined that an encroachment impairs the safe and free flow of vehicular or pedestrian traffic, the municipality will revoke the permit. After the field review, the appropriate district personnel will certify that all encroachments have been properly disposed; see form BDE 488, Certification Acceptance/Project Status. Structures and objects over sidewalks on State highway right-of-way within the municipality that satisfy IDOT criteria may remain in place without a revocable permit. However, if alterations to a structure or object or to the highway itself subsequently cause the encroachment to impede the safe and free flow of traffic, the Department will require adjustment or removal of the encroachment.

In the Agreement, incorporate provisions for the disposition of existing encroachments and for the prohibition of future encroachments. Use the appropriate wording in the samples illustrated in Section 5-8. Regardless of the improvement's Federal-aid funding eligibility, the district will incorporate the encroachment verbiage in the Agreement and obtain the necessary municipal encroachment ordinance. See Example 4 in Section 5-8 for a sample encroachment ordinance. This will ensure uniform treatment of encroachments for all improvements. As practical, attach and directly reference the encroachment ordinance as an Agreement Exhibit prior to executing the Agreement. However, cases such as municipal participation in preliminary engineering may preclude this suggested practice. In these cases, the district will arrange to execute the Agreement with the understanding that the municipality will provide the Department with certified copies of the encroachment ordinance prior to bid advertisement.

5-4.04 Approval of Plans

Regardless of which agency prepares the plans for the improvement, submit prints of the detailed plans to the municipality and obtain formal approval to ensure that the municipality is fully aware of the extent of the improvement. During construction, this will better position the Department to refuse unwarranted requests for additional improvements and revisions by abutting property owners. The district will obtain one copy of a municipal resolution or a formal letter from a municipal official responsible for approving the plans and forward it to BDE prior to PS&E submittal.

5-4.05 Funding Resolution

If the local agency is to reimburse the Department for work described in the Agreement, a funding resolution providing payment for the work must be attached to the Agreement.

5-5 DIVISION OF COST

The extension of a State highway into and through a municipality provides a multipurpose facility that accommodates vehicular, bicycle, and pedestrian traffic for both the State and municipality (i.e., the State highway becomes an integral part of the local street system). As such, under an Agreement with the municipality, the Department performs State-initiated highway improvements within municipal jurisdictions that proportionately benefit both parties. This section delineates the financial responsibilities of each party for State-initiated projects under State jurisdiction.

5-5.01 State Responsibility

The State is financially responsible for preliminary engineering, right-of-way, construction, and construction engineering for the traffic lanes on the State highway and the appurtenances related to the traffic lanes for which the State has jurisdiction. The State's financial responsibility for other items along the State highway are described below.

5-5.02 Municipality Responsibility

The municipality is financially responsible for preliminary engineering, right-of-way, construction, and construction engineering for the items specified in the following sections.

5-5.02(a) Parking

The Agreement will base the division of cost between the State and the municipality on the following criteria:

1. New On-System Parking. New on-system parking is defined as the construction of parallel parking either to replace existing parking assumed by the State for additional traffic lanes or to provide parking where legal parking did not previously exist. If the municipality includes new on-system parking in the improvement, proportion the cost as follows:

    a. ADT > 5000. If the highway facility has an average daily traffic (ADT) greater than 5000, use the following criteria to proportion the cost:

        - If base and surface construction of new on-system parking is equivalent to the adjacent State-maintained traffic lane and the lane width for parking meets Department criteria, proportion the cost equally (i.e., 50%/50%) between the State and municipality.

        - The State is financially responsible for 100% of curb and gutter construction.

        - If the pavement composition of new on-system parking is less than the adjacent traffic lane's or if the lane width for parking does not meet Department criteria, the municipality is financially responsible for 100% of the cost.

b. ADT ≤ 5000. Construct the new on-system parking with a base and surface composition that is compatible with its anticipated usage to a width acceptable to the Department at 100% Municipal expense. The State is financially responsible for 100% of curb and gutter construction

For either ADT range above, the municipality is 100% financially responsible for right-of-way that is acquired solely for the construction of new on-system parking where legal parking did not previously exist. The State will pay 100% for right-of-way that is acquired to replace existing parking assumed by the State for additional traffic lanes; or when additional right-of-way is required to construct the IDOT-proposed cross section.

2. Existing On-System Parking (Resurfacing, Repair and Reconstruction). If existing on-system parking is retained in an urban street resurfacing project, the State is financially responsible for resurfacing only the pavement area maintained by the Department including a full-width taper on the parking lane from the edge of the travel lane to gutter flag or face of curb where no gutter flag exists. Limit the maximum width of taper to that of the adjacent travel lane. If the municipality elects to have existing on-system parking resurfaced to a full thickness, the municipality is financially responsible as follows:

- 50% of milling and resurfacing costs for existing on-system parking having a width less than or equal to that of the adjacent travel lane;
- 100% of milling and resurfacing costs for that portion of existing on-system parking greater than the width of the adjacent travel lane;
- 100% of base repair costs for the entire width of existing on-system parking;
- in municipalities with less than 3000 population, the maximum Municipal participation toward milling and resurfacing costs for existing on-system parking is a cost equivalent to three years' Motor Fuel Tax allotment. The District shall verify locations of existing on-system parking for all joint State/Municipal improvements; and
- 100% of reconstruction costs for existing on-system parking and any adjacent curb and gutter.

3. Restricted On-System Parking. If an IDOT traffic capacity study establishes the need to restrict parking during peak hours to ensure the safe and free flow of traffic and the municipality enacts an ordinance implementing such parking restrictions, the State will pay 100% of full-thickness resurfacing costs, up to a maximum 12 ft (3.6 m) width including any needed base and curb repairs, for the restricted on-system parking.

4. Off-System Replacement Parking. If, for the benefit of State highway safety and capacity, the Department and municipality jointly determine it necessary to replace existing and legal on-system parking (not accommodated under Item 1) with off-system parking, the State may financially participate as follows:

a. Alternative Off-System Replacement Facilities. The State will pay 100% of all engineering, right-of-way (except Municipal property), and construction costs to replace existing on-system parking with alternative off-system parking. The maximum ratio for replacing parking spaces is one to one. Alternative off-system replacement parking may include improving adjacent local streets to accommodate new parking, constructing new off-street parking facilities, or a combination of the two. Construction costs will include those items IDOT deems reasonable and practical for a safe and convenient parking environment (e.g., paved surface, drainage, lighting, pedestrian walkways, fencing). The municipality will pay 100% of the construction costs associated with installing guard and toll collection facilities, metering devices, and parking spaces beyond the maximum one-to-one replacement ratio.

b. Municipal Property. If the municipality owns the site selected for off-system replacement parking, the municipality will provide the property at no expense to the State.

c. Clearing Municipal Property. As part of the State's financial responsibilities to construct replacement parking, the State will pay 100% of the cost to clear Municipal property if included in the IDOT construction contract for the improvement. See Example 5 in Section 5-8.

5-5.02(b) Sidewalks

For sidewalks, the Agreement will be based on the following to determine the division of cost between the State and Local Agency:

1. New Sidewalks. If the sidewalk criteria contained in Chapter 17 are met and the local agency agrees to maintain the sidewalks, the State will pay 100% for construction of new sidewalks within the project termini or for short distances outside the project termini as may be required to extend sidewalks to logical termini. The State will also pay 100% for right-of-way, reimbursable utility adjustments, pedestrian barriers, retaining walls, and other collateral items that are required for sidewalk construction. The local agency will pay 100% of the cost difference between decorative sidewalks and standard sidewalks.

   If the local agency does not agree to maintain the sidewalk, the State will not construct it, even if it is warranted. However, the State will take reasonable actions to not preclude future additions of sidewalk at such locations.

2. Existing Deteriorated Sidewalks. If an existing deteriorated sidewalk is not affected by an IDOT project but is added at the request of the local agency, the local agency will pay 100% for its removal and the State will pay 100% for its replacement. The local agency will pay 100% of the cost difference between decorative sidewalks and standard sidewalks.

3. Adjustment or Removal and Replacement of Existing Sidewalks. If an existing sidewalk must be adjusted or removed and replaced due to an IDOT improvement, the State will pay 100% of the costs.

4. Curb Ramps. Cost sharing for curb ramps is treated the same as cost sharing of sidewalks.

All sidewalk construction can be considered for Federal-aid participation.

5-5.02(c) Highway Lighting Within a municipality

The Agreement will proportion the costs for highway lighting within a municipality according to the following:

1. New Lighting. If the municipality requests or includes street lighting in the improvement, the municipality is 100% financially responsible for lighting installation and energy costs.

2. Modernization of Existing Lighting. The municipality is 100% financially responsible for the modernization and betterment of any street lighting system the municipality installed or caused to be installed in the improvement.

3. Relocation of Existing Lighting. The Department considers the relocation of existing lighting as a utility adjustment which is subject to the cost proportioning discussed in Section 5-5.02(f).

4. Combination Traffic Signal and Lighting. If the poles will be replaced in new traffic signal installations or modernization projects, proportion the cost for combination lighting as follows:

   - Proportion the cost for poles and foundations (i.e., traffic signal appurtenances) in accordance with Section 5-5.02(e).

   - The municipality is 100% financially responsible for luminaires, luminaire wiring, conduit, and control devices.

5. Warrants for Highway Lighting. See Chapter 56 for criteria related to highway lighting.

5-5.02(d) Storm Sewers

For storm sewers, the division of cost between the State and municipality will be as follows:

1. Municipality Requests Extension or Use of IDOT Storm Sewer. If the municipality desires to extend or use the improvement's storm sewer facilities, the municipality is 100% financially responsible for any increase in system capacity over that required to drain the State highway improvement. An itemized division of cost between the State and municipality should be included in the preliminary draft Agreement.

   If the municipality's cost share is minor, use Equation 5-5.1 (i.e., percent of actual storm sewer cost) to determine the municipality's share:

   MC = (ASSC)(EF)[(ECC - ESOC) / ECC] Equation 5-5.1

   where:

   MC = municipality's Cost
   ECC = Estimated Combined Cost
   ESOC = Estimated State-Only Cost
   ASSC = Actual Storm Sewer Cost
   EF = 1.15 for Engineering

2. Municipal Storm or Combined Sewer System Rehabilitation or Adjustment. If the Department uses an existing Municipal storm or combined sewer system to drain the State highway, use the following guidelines to proportion any needed sewer adjustment or rehabilitation costs between the State and municipality:

   a. State Participation. If constructed for State highway drainage only, IDOT designs the highway storm sewer system to accommodate both the watershed runoff naturally reaching the highway site and the surface runoff across the highway right-of-way. If an improvement project uses an existing Municipal storm sewer system for State highway drainage, the State has no more or less financial responsibility for the storm sewer than any other property owner. The State will allocate straight State or Federal-aid funds for only the share of storm sewer costs that benefit the State. Unless a State highway improvement creates a need to increase the existing storm sewer system's capacity or the Department determines a need to improve the drainage of the State highway system, the State's financial participation will be limited to the cost of improving the storm sewer system within the limits of the State highway right-of-way. Use Equation 5-5.2 to determine the State's share of costs for rehabilitating and/or adjusting existing Municipal storm sewers:

      SSOC = 100[2(HROWA)(C1)] / [(TASBSS)(C2)] Equation 5-5.2

      where:

      SSOC = State Share of Cost, percent (%)
      HROWA = Highway Right-of-Way Area, acres (ha)

C1 = Hydraulic Runoff Factor for HROWA
TASBSS = Total Area Served by Storm Sewer, acres (ha)
C2 = Hydraulic Runoff Factor for TASBSS

Note: The factor 2(HROWA) in Equation 5-5.2 is an administrative determination accounting for the various factors affecting surface drainage in urban areas. The runoff factors (e.g., C1 and C2 in Equation 5-5.2) normally are used in accepted hydraulic practice and reflect factors such as slopes, percent of area with different permeability rates, etc.

b. Municipal Sewer System Adjustment. The State normally is 100% financially responsible for adjustments to Municipal sewer systems caused by State highway improvements unless it was originally installed on State right-of-way or within the limits of a highway under IDOT jurisdiction. However, if the Municipal sewer system will accommodate State highway drainage, the State may share the cost for adjusting the sewer on the basis of Equation 5-5.2. The State will not share in the cost of adjusting Municipal utilities that are not eligible for State participation. See Section 5-5.02(f) for additional information on utility adjustments.

c. Municipal Sewer System Rehabilitation. The Department may participate in the rehabilitation of structurally deficient or functionally inadequate Municipal sewer systems to the extent such action will benefit State highway drainage. Use Equation 5-5.2 to determine the State's share of rehabilitation costs. If the rehabilitation need is due to structural inadequacy, the municipality will be responsible for performing the structural condition evaluation. The Department will review and approve the municipality's findings before committing to State financial participation. The State will share the cost for the structural condition evaluation in the same proportion it does for construction costs. If the project includes Municipal sewer rehabilitation predicated on a need to increase drainage capacity for a State highway facility, use Equation 5-5.2 to determine the State's share of rehabilitation costs. If the need to increase Municipal sewer capacity is necessitated by a combination of State highway and other needs, the State's financial participation will be negotiated on a case-by-case basis and Equation 5-5.2 will not apply.

d. Combined Storm and Sanitary Sewer Systems. If the Municipal sewer carries both storm and sanitary flows, deduct the sanitary portion from the system's capacity before calculating the State's share of costs. In most areas, it is acceptable to assume 10% of system capacity is used for sanitary flow. However, in areas having significant sanitary flow (e.g., industrial parks, commercial business areas), evaluate the acceptability of using 10% and, if determined unacceptable, the Department will obtain mutual agreement with the municipality on a reasonable percentage to use in calculations.

e. Separation of Combined Sewer Systems. If the improvement involves separating a Municipal sewer into storm and sanitary systems, the State is financially responsible for its share of the storm sewer system only. The Department will review the municipality's local storm sewer separation plan before the municipality adopts the plan, which then becomes the basis for determining funding eligibility and the State's share of rehabilitation costs.

f. Participation Outside an Active IDOT Project. If in the State's best interest, the State may financially participate in rehabilitating an existing Municipal sewer system even though no State highway improvement project is underway. In these cases, consider the impact State highway improvements planned for the area will have on the sewer system and use the applicable guidelines in Item 2 to determine the State's financial responsibility. In determining the State's share of costs, do not consider the affects of any planned non-State facilities.

3. Additional Repair or Reconstruction of Joint-Use Storm Sewers. Joint-use storm sewers constructed under the provisions of Items 1 and 2 that require repair or reconstruction beyond that covered in Section 5-3 will be performed at the joint expense of the State and municipality. Proportion the costs as proportioned in the Agreement for the sewers' initial construction.

4. Shoulder and Open Ditch Construction. If shoulder and open ditch construction is less costly and compatible with existing development, the Department may provide such a facility. If, instead, the municipality desires curb and gutter and storm sewer drainage, the Department may provide such a facility; however, the State will not pay for the additional cost.

5-5.02(e) Traffic Signals

The installation, modernization, relocation, electrical energy, and maintenance costs for traffic signals differ according to their application. All are governed by Department rules, regulations, or policy as follows:

1. Dedicated Streets. See Part 544 of the *Illinois Administrative Code* (92 Ill. Admin. Code 544) (contact the Bureau of Operations) for information on traffic signals and dedicated streets. Eighty percent (90% on Safety Projects) of the signal cost first will be deducted under Section 544.60 of the *Illinois Administrative Code*. The State will pay 80% (90% on Safety Projects) plus its proration as determined from Section 544.60. This applies only to State-initiated projects.

2. School and Commercial/Industrial Areas. See TRA-5 (contact the Bureau of Operations) for guidelines on traffic signals serving school and commercial/industrial areas.

3. Combinations of the Above Applications. Traffic signals serving both a high-volume, dedicated street opposite a high-volume, private benefit facility may require a hybrid proration of costs. Consult BDE for specific guidance.

4. Emergency Vehicle Preemption Equipment Installation, Modernization, and/or Relocation. The municipality is 100% financially responsible for emergency vehicle preemption

equipment installation, modernization, and/or relocation costs. Cost limitations shown in Item 1 or in Section 5-5.02(g) are not applicable.

5-5.02(f) Utility Adjustments

The Agreement will be based on the following to proportion costs for utility adjustments:

1. State-Initiated Municipal Utility Adjustments. If the proposed improvement is a State-initiated project on a State highway within the Municipal street system, the State will assume the total cost of adjusting Municipal lights, signs, utilities, etc., except that the municipality is financially responsible, other than in certain cases of Interstate or Freeway construction, for adjusting its facilities located within the municipality if they were installed:

   - on right-of-way acquired by the Department; or
   - within the defined limits of a street, subsequent to the date the Department accepted maintenance responsibility for the street.

   If the utilities existed within the defined limits of the street prior to the Department's acceptance of maintenance responsibility for the street, the State will pay for the needed utility adjustments.

   The municipality is financially responsible for adjusting its utility facilities if previously installed on State highway right-of-way outside the Municipal limits and subsequently incorporated within the municipality.

   The Department will proportion the cost of adjusting any existing Municipal utility facility located outside Municipal limits the same as for any other utility facility (i.e., the State is financially responsible for the adjustment if the utility is located on private right-of-way and the municipality will pay for the adjustment if the utility is located on State highway right-of-way).

   If financially responsible for utility adjustments, the municipality may elect to have the Department include the adjustments in the highway improvement plans. However, this does not relieve the municipality of its funding obligation. Include in the Agreement with the municipality the conditions for reimbursing the Department for utility adjustment costs.

   For any improvement plans that include Municipal utility adjustments, the district will include a statement in the transmittal memorandum to the Central Office that describes the financial responsibilities of both the State and the municipality. If the municipality is obligated to pay for utility adjustments, also include in the memorandum the terms of reimbursement included in the Agreement.

   Any utility adjustment included in the State's contract at State expense, as provided above, will be limited to adjustments in kind as practical. If the municipality desires a betterment or extension of the utility being adjusted, then the municipality is financially responsible for any increase in adjustment cost.

2. <u>municipality-Requested Utility Adjustments</u>. The municipality is 100% financially responsible for the cost of any utility adjustment it requests.

3. <u>Other Utilities</u>. The municipality will exercise its franchise rights to cause private utilities to be adjusted at no expense to the State. The principles set forth in Section 5-5.02(f) regarding utility adjustments for Municipalities will also apply to other legally constructed governmental facilities encountered along the improvement.

4. <u>Permits and Assessment Fees</u>. See Part 530 of Title 92 of the *Illinois Administrative Code* (contact the Bureau of Operations) for information on permits and assessment fees.

5-5.02(g) Participation Cap

For non-private benefit traffic signal installations and/or modernization (see Section 5-5.02(e), Item 1) and mandated utility adjustments (see Section 5-5.02(f), Item 1, adjustments in-kind not betterments) caused by a State-initiated improvement, include in the Agreement a cap or ceiling equal to 125% of the estimated cost to the municipality for these two items. The estimator will exercise judgment to ensure that the estimate is properly adjusted to reflect expected inflation between the time the estimate is prepared and the anticipated contract award date.

5-5.02(h) Traffic Lanes Under Municipal Jurisdiction

The State is not necessarily responsible for the maintenance, repair, or reconstruction of all traffic lanes along a State highway. Before preparing an Agreement with a municipality for a State highway improvement, the district will check IDOT records to determine the width of pavement over which the Department has jurisdiction. The Department is responsible for the jurisdiction of only those portions of streets that it constructed or those portions of local streets, that it has subsequently assumed. For through traffic lanes under Municipal jurisdiction, the cost proration is as follows:

- The State will assume the financial responsibility for patching, milling, and resurfacing all traffic lanes along State highways constructed in conjunction with a State-initiated project.
- Repair and/or replacement of curb and gutter or reconstruction of local traffic lanes will continue to be the municipality’s financial responsibility in accordance with existing maintenance agreements.

5-5.02(i) Pedestrian Overpass Structures

The following presents the proration of construction costs and the warrants, liabilities, and maintenance responsibilities for pedestrian facilities:

1. State Highways Without Full Access Control. See Part 540 of *Illinois Administrative Code* (92 Ill. Admin. Code 540) (contact BDE).

2. State Highways with Full Access Control. For criteria on State highways with full access control (contact BDE).

5-5.02(j) Overpass Fencing

Part 510 of the *Illinois Administrative Code,* 92 Ill. Admin. Code 510 (contact BDE) presents the proration of construction costs and the warrants and maintenance responsibilities for overpass fencing.

5-5.02(k) RESERVED

5-5.02(l) Engineering

The municipality will share in the cost of engineering provided by the State in direct proportion to its construction costs. Preliminary and construction engineering will be computed as 5% and 10% respectively of the Municipal share of construction costs.

5-5.02(m) Right-of-Way

If the municipality is financially responsible for all or a portion of right-of-way costs, its share will include the purchase price thereof and the cost of negotiators, appraisals, title evidence, relocation assistance and payments, property management, and such legal services as necessary to acquire the right-of-way. The acquiring agency, if participating in the cost of the right-of-way, will receive a credit for a proportionate amount of the proceeds of any sale or rental of improvements acquired within the right-of-way or as a direct result of the right-of-way acquisition.

5-5.02(n) Municipal Streets

Many State-initiated projects require improvements to intersecting Municipal streets to meet the geometric requirements for the design level of service. Generally, the State is financially responsible for all improvements required to achieve this goal. Any work beyond that deemed necessary by the State will be included in the State's contract only if the municipality agrees to pay its cost.

5-5.02(o) Bicycle Accommodations

The Agreement will base the cost for bicycle accommodations on the following criteria:

1. On-Road Bicycle Lanes. The State will pay 100% for the construction of new on-road bicycle lanes, including right-of-way, reimbursable utility adjustments, barriers, retaining walls, and other collateral items that are required for bike lane construction. The State will assume the maintenance of traditional and buffered bicycle lanes. The local agency will assume the maintenance of separated bicycle lane pavement and vertical separation elements.

2. Wide Outside Lanes and Widened Shoulders. The State will pay 100% of all costs for wide outside lanes or widened shoulders constructed for bicycle accommodation. The State will also assume the maintenance of these facilities.

3. Shared Use Paths. A shared use path can be selected as an accommodation, in place of the on-road accommodation type(s) identified in Figure 17-2.A, whenever it is determined to fit the project context. When the local agency agrees to maintain the path, assign the costs associated with the path as follows:

   a. New Paths. The State will pay 100% of all costs for the construction of new paths within the project termini or for short distances outside the project termini as may be required to extend paths to logical termini. The State will also pay 100% for right-of-way, reimbursable utility adjustments, barriers, retaining walls, and other collateral items that are required for path construction.

      If the Local Agency does not agree to maintain the path, the State will not construct it, even if it is warranted. However, the State will take reasonable actions to not preclude future additions of paths at such locations.

   b. Existing Deteriorated Paths. If an existing deteriorated path is not affected by an IDOT project but is added at the request of the local agency, the local agency will pay 100% for its removal and the State will pay 100% for its replacement.

   c. Adjustment or Removal and Replacement of Existing Paths. If an existing path must be adjusted, or removed and replaced, due to an IDOT improvement, the State will pay 100% of the costs.

   All side path construction can be considered for Federal-aid participation.

5-5.02(p) Bicycle and Pedestrian Accommodations on Structures

If bicycle and/or pedestrian accommodations are warranted within the termini of a project, those accommodations should be carried over any structures within the project. See Chapter 17 for further guidance. If the project omits structure improvements, then bicycle and pedestrian improvements on those structures may also be omitted.

The State will pay 100% of all costs for bicycle and pedestrian accommodations on structures and approaches. The State will assume the maintenance of on-structure accommodations. The local agency will pay 100% of the cost difference of a requested separate bicycle and pedestrian structure if bicyclists and pedestrians could have been properly accommodated on the roadway structure, or a requested grade separation when at-grade crossings are considered adequate.

In determining cost shares, an approach is defined as the length of roadway necessary to transition the structure improvement into the existing highway system.

5-5.02(q) Other Work

Municipalities will bear all additional costs of improvements outside the traffic lanes including utility adjustments, curb or curb and gutter repair, drainage structure adjustments, traffic signal installation or modernization, and entrance reconstruction, except as otherwise noted in Section 5-5.02.

5-5.03 Basis of Payment

5-5.03(a) Municipality Reimbursement

For Agreements where the municipality is reimbursing the State, the Agreement or Funding Resolution must clearly delineate when and how the municipality will reimburse the State. The Central Office Bureau of Construction will bill the municipality directly after the award of the contract in accordance with the terms specified in the Agreement. Several alternative repayment methods are available as follows:

- Payment Upon Project Completion. Payment is made upon completion of the project provided the municipality's share does not exceed $10,000.
- Payment Upon Contract Award. An 80% payment is made upon contract award with any balance paid upon completion.
- Equal Monthly Payments. Equal monthly payments are made based upon Equation 5-5.3 as follows:

$$\text{Monthly Payment} = \frac{0.80\ (\text{Estimated Municipal Share})}{\text{Contract Duration in Months}} \qquad \text{Equation 5-5.3}$$

The municipality will send its final payment upon project completion.

- Progress Payments. Progress payments are made based upon Equation 5-5.4 as follows:

$$\text{Progress Payment} = \frac{\text{Total Municipal Share}}{\text{Total Construction Cost}}\ (\text{Actual Progress Payment}) \qquad \text{Equation 5-5.4}$$

- Dual Payment. A dual payment is based upon a 50% payment upon award with the remaining 50% paid upon completion. This payment alternative is limited to projects with a duration of 60 working days or less.

Example 6 in Section 5-8 illustrates a sample resolution.

5-5.03(b) State Reimbursement

It should be stated in the Agreement specifically when and how the State will reimburse the municipality. Once the Agreement is fully consummated, BDE will process the necessary Contract Obligation Documents (COD) for use in the processing of invoices. Any one of the five alternatives presented in Section 5-5.03(a) for municipality reimbursement can be applied similarly to State reimbursement. For an Agreement involving State reimbursement to be eligible for execution, the State's funding must be included in the current annual program or be approved as an exception by BDE and Statewide Program Planning. The Agreement must include specific language giving the State the right to approve the plans and specifications prior to advertisement for bids and to concur in the award of the contract.

5-5.04 Right-of-Way Acquisition

Under Section 605 ILCS 5/4-501 of the *Illinois Compiled Statutes*, the only governmental unit authorized to take title in its own name for a State highway improvement is the Department or any County, regardless of how the cost of the right-of-way is treated.

Accordingly, Agreements covering joint improvements with governmental units other than Counties shall provide that all right-of-way required for the improvement be acquired in the name of the State.

Although under the Statute a County can take title in its own name for land required for a State highway improvement, the Department will take this title in the name of the State for adequate control of the highway and more effective title approval.

5-6 OTHER AGREEMENTS

5-6.01 Jurisdictional Transfers

Improvement of an unmarked, State-maintained highway may involve a transfer of jurisdictional responsibility from the State to a local highway authority (i.e., a Jurisdictional Transfer). A marked route may also be transferred provided the marking is removed first. An Agreement using the developed format and executed by the Director of Highways Project Implementation is necessary for a Jurisdictional Transfer. See the Bureau of Local Roads and Streets publication *Jurisdictional Transfer Guidelines* for specific guidance. Example 7 in Section 5-8 illustrates a sample Jurisdictional Transfer Agreement.

5-6.02 Supplemental or Addendum Agreements

Use Supplemental Agreements to add provisions to the original Agreement. Use an Addendum Agreement to change rather than add to the original Agreement's provisions.

5-6.03 County and Township Agreements

County/township Agreements are most commonly required for improvements on unmarked routes involving a Jurisdictional Transfer or intersection improvement where one party is participating (as defined in Section 5-1.01) toward the second party's project.

The procedures for Agreements with municipalities generally apply to county/township Agreements, except as follows:

1. Agreement Format. Section 5-8 illustrates the Developed Format for county/township Agreements.

2. Maintenance Obligations. Use the following guidelines for maintenance obligations in County/Township Agreements:

   - The procedures presented in Sections 5-3.01, 5-3.02, 5-3.03, 5-3.08, and 5-3.09 are not applicable to county/township Agreements.

   - For storm sewers and appurtenances, the State will maintain all storm sewers it constructs outside a municipality except joint-use systems constructed at local request. Proportion the joint-use sewer's maintenance and/or reconstruction costs the same as the sewer's initial construction cost was proportioned.

   - For traffic signals and lighting, the State will maintain and pay the electrical energy for all traffic signals and lighting it deems necessary and constructs outside the corporate limits of a municipality.

3. Restrictions/Encroachments. The information presented in Sections 5-4.01, 5-4.02, and 5-4.03 are not applicable to county/township Agreements.

4. Division of Cost. The information in Sections 5-5.02(a), 5-5.02(c), and 5-5.02(h) are not applicable to county/township Agreements.

5-6.04 Private Benefit Agreements

Private Benefit Agreements generally are required where large traffic generators (e.g., shopping centers, factories) require special features (e.g., turn lanes, channelization, traffic signals) along a State highway to safely accommodate the increased traffic volume generated by the facility. Dedicated public roads which essentially provide access to developments (e.g., shopping centers, industrial, institutional, office sites) should be considered as private benefit roads in lieu of public roads. See Subchapter f, Part 550 of the *Illinois Administrative Code* (92 Ill. Admin. Code 550) and the Bureau of Operations publication TRA-5 for participation requirements.

The requisite Agreement should follow the procedures contained in Sections 5-1.01, 5-1.02, 5-1.03, 5-2.01, 5-2.02, 5-2.03, 5-4.04, 5-5.02(e) (Items 2 and 3), 5-5.02(j), and 5-5.02(k) and incorporate the following special considerations:

1. Letter of Credit. Except under extraordinary conditions approved by the Bureau Chief of BDE, all Private Benefit Agreements will include an irrevocable Letter of Credit. The Letter of Credit protects the State's interest by guaranteeing payment should the Private Benefit Organization (PBO) default.

2. Utility Adjustments. The PBO is financially responsible for all utility adjustments caused by highway improvements constructed for the PBO.

3. Right-of-Way. Any right-of-way required solely for PBO highway improvements will be provided at no expense to and as acceptable to the State. If the State must acquire the right-of-way, then the PBO will reimburse the State for its cost.

5-7 OTHER DOCUMENTS

5-7.01 Letters of Understanding

Improvements that do not involve local participation may at times be covered by Letters of Understanding. A Letter of Understanding may be used to delineate maintenance responsibilities (e.g., parking lanes, curbs and gutter flags, sidewalks, manholes, catch basins, storm sewers, traffic signals, utilities, appurtenances). Many of the provisions of an Agreement should be included in a Letter of Understanding (e.g., ordinances for sewer, parking, and encroachments; provisions for curb ramps and plan approval).

The district will prepare the Letter of Understanding. Include in the Letter of Understanding a brief description of the proposed project and describe the responsibilities of both parties. Also, include a description of any needed ordinances from the local agency. For convenience, the district will provide the local agency with sample ordinance forms.

The Letter of Understanding will be prepared by district in duplicate counterparts, signed by the Regional engineer, and transmitted to the local agency with the request that one of the counterparts with the Regional Engineer’s signature and the local official’s signature be returned to the district. As an option, where there is local agency reluctance to sign the document as presented, it may be advisable to request the local agency to sign the document first, thus avoiding the possibility of the local agency altering the fully executed Letter of Understanding in an unacceptable manner. The district shall file the counterpart with original signatures in the district and forward a copy to BDE. In addition, the report to BDE on projects available for letting should include a statement regarding the status of the Letters of Understanding. The district will secure copies of the required ordinances and plan approval from the local agency prior to advertising for letting and will notify BDE when all ordinances have been received for the improvement. The project support engineer or staff will file the ordinances in the district office.

5-7.02 Informational Letters

Informational Letters may be used on any project not requiring a formal Agreement where no changes in maintenance or other responsibilities from previously executed Agreements or Letters of Understanding will occur. The district will send the Informational Letter to the local official via certified or registered mail to verify receipt. For content, the document should advise the local agency of the improvement scope and anticipated letting and completion dates, and indicate that the covenants contained in previous Agreements or Letters of Understanding relating to jurisdiction, maintenance, electrical energy, enactment of ordinances, etc., will remain unchanged.

It will not be necessary to forward a copy of the document to BDE; however, the district should modify the Certification Acceptance sheet to designate that an Informational Letter rather than a Letter of Understanding will be used.

5-8 EXAMPLES

The following Examples present samples and guidelines for use when processing local agency Agreements:

Example 1 – Developed Agreement for Local Agencies

Example 2 – Parking Ordinance

Example 3 – Storm Sewer Ordinance

Example 4 – Encroachment Ordinance

Example 5 – Off-Street Replacement Parking Guidelines

Example 6 – Funding Resolution

Example 7 – Agreement for Jurisdictional Transfers

See IDOT Master Forms list for:

MFT Funding Resolution for Improvement by County (form BLR 09110)

MFT Funding Resolution for Improvement by municipality (form BLR 09111)

EXAMPLE 1 — Developed Agreement for Local Agencies

_________ Route __________

Section ____________

(VILLAGE, CITY, COUNTY, TOWNSHIP) Section _______

County ____________

Job No. ____________

Agreement No. ____________

Contract No. ______________

AGREEMENT

This agreement entered into this ____ day of _______, A.D., 20____, by and between the STATE OF ILLINOIS, acting by and through its DEPARTMENT OF TRANSPORTATION hereinafter called the STATE, and the _____________ of _____________, of the State of Illinois, hereinafter called the (VILLAGE, CITY, COUNTY, or TOWNSHIP).

WITNESSETH:

WHEREAS, the STATE in order to facilitate the free flow of traffic and insure safety to the motoring public, is desirous of improving approximately _____ foot (_____lineal meters) of _____ Street, (FA/SBI Route _____ US/Illinois/CH Route _____, State Section _____, (VILLAGE, CITY,COUNTY, TOWNSHIP) Section______ by (widening, milling, resurfacing. reconstructing) US/Illinois/CH Route _____ from _____ Street to ________Street, providing _______ foot (______meter) through traffic lanes in each direction, a _______ foot (_____meter) median with ______ foot (_____meter) and variable width left turn lanes at ______ and ______ Streets, (milling, resurfacing, constructing) ______ foot (_____meter) wide parking lanes on ______ side(s) of ______ Street between ______ Street and ______ Street, (modernizing, installing) traffic signals at the _______ Route ______ intersections with ______ and ______ Streets, installing a highway lighting system between ______ and ______ Streets, constructing new _____ foot (_____ meter) wide PCC sidewalks from ______ Street to ______ Street, constructing curb and gutter and a storm sewer system for highway drainage and by performing all other work necessary to complete the improvement in accordance with the approved plans and specifications; and

WHEREAS, the (VILLAGE, CITY, COUNTY, TOWNSHIP) is desirous of said improvement in that same will be of immediate benefit to the (VILLAGE, CITY, COUNTY, TOWNSHIP) residents and permanent in nature;

NOW, THEREFORE, in consideration of the mutual covenants contained herein, the parties hereto agree as follows:

1. The STATE agrees to make the surveys, obtain all necessary rights of way, prepare plans and specifications, receive bids and award the contract, furnish engineering inspection during construction and cause the improvement to be built in accordance with the plans, specifications and contract.

2. The STATE agrees to pay for all right-of-way, construction and engineering costs, including the cost of railroad adjustments, subject to reimbursement by the (VILLAGE, CITY, COUNTY, TOWNSHIP) as hereinafter stipulated. The STATE will negotiate and/or coordinate with the Railroad for the adjustment of their railroad facilities.

3. It is mutually agreed by and between the parties hereto that the estimated cost and cost proration for this improvement is as follows:

Type of Work	**State**		**Village, City, County, Township**		**Total**
	Cost	**%**	**Cost**	**%**	
All construction costs excluding the following:	$	100	NA	NA	$
Mill and resurface parking lanes	$	50	$	50	$
Patch parking lanes	NA	NA	$	100	$
Traffic signals at __________ Street	$	90	$	10	$
New highway lighting	NA	NA	$	100	$
Relocate water main at __________ Street	NA	NA	$	100	$
Sub Total	$		$		$
P&C Engineering 15%	$		$		$
Total	$		$		$

Participation and reimbursement shall be predicated by the percentages shown above for the specified work. Cost shall be determined by multiplying the final quantities times contract unit prices plus 15% for construction and preliminary engineering. Participation toward the traffic signals and watermain relocation shown above shall not exceed $__________ which represents 125% of their estimated construction and engineering cost.

(If the local agency is to acquire right of way, at its own cost and expense or at the cost and expense of the state, in whole or in part, use the following paragraphs and make appropriate changes in paragraphs 1, 2, and 3).

4. The (VILLAGE, CITY, COUNTY, TOWNSHIP) agrees to obtain and pay for the cost of acquiring the necessary right of way in accordance with the following requirements:

A. Right of way shall be acquired in the name of the STATE on standard State forms which will be provided for that purpose in accordance with Land Acquisition Policies and Procedures of the STATE.

B. No award of a contract shall be made to cover construction of the project or any part thereof without first having been made a title approval by the Attorney General of Illinois on each individual parcel of right of way, the consideration for which exceeds $10,000, including within such construction. A title approval shall be made by the STATE on each parcel of right of way acquired for the project where the consideration is $10,000 or less. In the event acquisition of the right of way is by condemnation, then such action must be brought in the name of the State by the Attorney General and an Assistant Attorney General appointed by him.

C. Cost of the right of way shall include the purchase price thereof as well as the cost of negotiators, appraisals, title evidence, relocation assistance and payments, property management and such legal service as may be necessary to acquire said right of way. The acquiring agency, if participating in the cost of the right of way shall receive a credit for a proportionate amount of the proceeds of any sale or rental of improvements acquired within the right of way or as a direct result of the right of way acquisition.

D. All parties engaged in the acquisition of the right of way shall be approved in advance by the STATE.

E. Appraisals (use Item (1) or (2) as appropriate):

(1) Appraisals shall be reviewed and a negotiating figure approved by the STATE in advance of negotiations for the purchase of said right of way.

(2) The (VILLAGE, CITY, COUNTY, TOWNSHIP) shall provide a sufficient number of qualified reviewing appraisers approved by the STATE. The STATE shall approve the appraisal process in advance of negotiations for the purchase of said right of way.

F. Any phase of the STATE's Relocation Assistance Procedures to be performed by any qualified agency other than the STATE shall be covered by separate contractual agreement or agreements with the agency and are subject to prior approval of the Division Administrator of the Federal Highway Administration.

G. The STATE shall provide such guidance, assistance and supervision and monitor and perform audits to the extent necessary to assure compliance with the STATE's Land Acquisition Policies and Procedures.

(If the local agency is to acquire right of way off the State highway system and there are Federal funds being used for any portion of the project, not just land acquisition, use the following paragraph. Please note, on those occasions when more than one land acquisition condition exists, all appropriate provisions that apply must be included.)

4a. The ______________________________agrees to acquire in its name and at its own expense, subject to reimbursement as hereinafter provided, all right of way necessary for this project in accordance with the requirements of Titles II and III of the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended. The requirements of Title II and Title III shall be carried out in accordance with established State Policies and Procedures, as now or hereafter revised or amended. Prior to the State's advertising for bids, the local agency shall certify to the STATE that all requirements of Titles II and III of said Uniform Act have been compiled with.

A. The STATE will advertise for bids for the construction of the proposed improvement after the local agency's certification as to compliance with Titles II and III requirements have been accepted by the STATE and subject to approval by the Division Administrator of the Federal Highway Administration.

B. The STATE shall provide such guidance, assistance and supervision and monitor and perform audits to the extent necessary to assure validity of the local agency's certification of compliance with Titles II and III requirements of the aforesaid Act.

5. The (VILLAGE, CITY, COUNTY, TOWNSHIP) has passed a resolution appropriating sufficient funds to pay its share of the cost for this improvement, a copy of which is attached hereto as "Exhibit____" and made a part hereof.

(For Local's use of non-MFT funds for reimbursement, include one of the following.)

The (VILLAGE, CITY, COUNTY, TOWNSHIP) further agrees

a. ***(Payment upon Completion)*** that upon completion of the contract for this improvement, the _________ will pay to the DEPARTMENT OF TRANSPORTATION of the STATE OF ILLINOIS in a lump sum for any funds allotted to the _________ an amount equal to 100% of its obligation incurred under this AGREEMENT.

b. ***(80% Payment upon Award)*** that upon award of the contract for this improvement, the _________ will pay to the DEPARTMENT OF TRANSPORTATION of the STATE OF ILLINOIS in a lump sum from any funds allotted to the ___________, an amount equal to 80% of its obligation incurred under this AGREEMENT, and will pay to the said DEPARTMENT the remainder of the obligation (including any non-participating costs on FA Projects) in a lump sum, upon completion of the project based upon final costs.

c. ***(Monthly Payments)*** that upon award of the contract for this improvement, the ______ will pay to the DEPARTMENT OF TRANSPORTATION of the STATE OF ILLINOIS from any funds allotted to the __________, the amount of $______ each month for a period of approximately _____ months or until 80% of the estimated obligation under the provisions of the AGREEMENT has been paid, and will pay to the said DEPARTMENT the remainder of its obligation (including any non-participating costs on FA projects) in a lump sum upon completion of the project based upon final costs.

d. *(**Progress Payments**)* that upon receipt of the first and subsequent progress payments made to the CONTRACTOR, the ________ will pay to the DEPARTMENT OF TRANSPORTATION of the STATE OF ILLINOIS from any funds allotted to the ______________ an amount equal to the ___________ share, $__________, divided by the estimated construction costs, $_______, multiplied by the actual progress payment (appropriately adjusted for non-participating costs on FA projects) made to the CONTRACTOR until the entire obligation incurred under this AGREEMENT has been paid.

e. *(**Dual Payment**)* that upon award of the contract for this improvement, the ______ will pay to the DEPARTMENT OF TRANSPORTATION of the STATE OF ILLINOIS from any funds allotted to the _______________, an amount equal to 50% of its obligation incurred under this AGREEMENT, and will pay to the said DEPARTMENT the remainder of the obligation (including any non-participating costs on FA projects) in a lump sum, upon completion of the project based upon final costs.

(Include in all Local reimbursement Agreements where non-MFT funds are used and traffic signals are not a sole reimbursable items):

The (VILLAGE, CITY, COUNTY, TOWNSHIP) further agrees to pass a supplemental resolution to provide necessary funds for its share of the cost of this improvement if the amount appropriated in "Exhibit____" proves to be insufficient, to cover said cost.

6. The (VILLAGE, CITY) has adopted and will put into effect an appropriate ordinance, prior to the STATE's advertising for the proposed work to be performed hereunder, or shall continue to enforce an existing ordinance, requiring that parking be (parallel to the curbs) (prohibited) within the limits of this improvement, a copy of which is attached hereto as "Exhibit_____ ", and will in the future prohibit parking at such locations on or immediately adjacent to this improvement as may be determined necessary by the STATE from traffic capacity studies.

7. The (VILLAGE, CITY) has adopted and will put into effect an appropriate ordinance, prior to the STATE's advertising for the proposed work to be performed hereunder, or shall continue to

enforce an existing ordinance, prohibiting the discharge of sanitary sewage and industrial waste water into any storm sewers constructed as a part of this improvement, a copy of which is attached hereto as “Exhibit_______ ”.

8. Prior to the STATE advertising for the work proposed hereunder, the disposition of encroachments will be cooperatively resolved with representatives from the (VILLAGE, CITY) and the STATE.

The (VILLAGE, CITY) has adopted and will put into effect an appropriate ordinance, prior to the STATE’s advertising for the proposed work to be performed hereunder, or shall continue to enforce an existing ordinance, relative to the disposition of encroachments and prohibiting, in the future, any new encroachments within the limits of the improvements, a copy of which is attached as “Exhibit______”.

(If the local agency is to perform any part of the work and/or engineering involved in the improvement, and the STATE is paying for or allowing credit for the work and/or engineering both of the following paragraphs (10 and 11) should be included):

9. The (VILLAGE, CITY, COUNTY, TOWNSHIP) shall maintain, for a minimum of (3,5) years after the completion of the Project, adequate books, records, and supporting documents to verify the amounts, recipients, and uses of all disbursements of funds passing in conjunction with this Agreement. All books, records, and supporting documents related to the Project shall be available for review and audit by the Auditor General and other State auditors and the (VILLAGE, CITY, COUNTY, TOWNSHIP) agrees to cooperate fully with an audit conducted by the Auditor General and other State Auditors and to provide full access to all relevant materials. Failure to maintain the books, records, and supporting documents required by this paragraph shall establish a presumption in favor of the STATE for the recovery of any funds paid by the STATE under this Agreement for which adequate books, records, and supporting documentation are not available to support their purported disbursement.

10. The (VILLAGE, CITY, COUNTY, TOWNSHIP) agrees to comply with all applicable Executive Orders and Federal Highway Acts pursuant to the Equal Employment Opportunity and non-discrimination regulations required by the U.S. Department of Transportation. (Non-Federal-aid projects use Illinois Department of Transportation in lieu of U.S.)

11. The (VILLAGE, CITY, COUNTY, TOWNSHIP) agrees not to permit driveway entrance openings to be made in the curb, as constructed, or the construction of additional entrances, private or commercial, along _____ Route _____ without the consent of the STATE.

12. The (VILLAGE, CITY, COUNTY, TOWNSHIP) shall exercise its franchise rights to cause private utilities to be relocated, if required, at no expense to the STATE.

13. The (VILLAGE, CITY, COUNTY, TOWNSHIP) agrees to cause its utilities installed on right of way after said right of way was acquired by the STATE or installed within the limits of a roadway after the said roadway's jurisdiction was assumed by the STATE, to be relocated and/or adjusted, if required, at no expense to the STATE.

(If the State contract includes the relocation or adjustment of a municipally owned utility, include the following paragraph):

14. All (VILLAGE, CITY) owned utilities, on STATE right of way within the limits of this improvement, which are to be relocated/adjusted under the terms of this Agreement, will be relocated/adjusted in accordance with the applicable portions of the "Accommodation of Utilities of Right of Way of the Illinois State Highway System." (92 Ill. Adm. Code 530).

15. The (VILLAGE/CITY) agrees to obtain from the STATE an approved permit for the facility, and to abide by all conditions set forth therein.

16. Upon final field inspection of the improvement and so long as (Street Name) ____is used as a State Highway, the STATE agrees to maintain or cause to be maintained the median, the _____ through traffic lanes lying _____ on either side of the (median), (centerline) and the left-turn and right-turn lanes, each lane being _____ feet (_____meters) and variable in width, and the curb and gutter or stabilized shoulders and ditches adjacent to those traffic lanes and turn lanes to be maintained by the STATE.

17. Upon final field inspection of the improvement, the (VILLAGE, CITY, COUNTY, TOWNSHIP) agrees to maintain or cause to be maintained those portions of the improvement which are not maintained by the STATE, including parking lanes and their adjacent curb and gutter, sidewalks,

parkways, guardrails, crosswalk and stopline markings, (VILLAGE, CITY, COUNTY, TOWNSHIP) owned utilities including appurtenances thereto, highway lighting including furnishing the electrical energy therefore and shall maintain the storm sewers and appurtenances by:

NOTE: INSERT A OR B AS APPROPRIATE.

(A) Applicable when storm sewer system constructed for State highway drainage only:

performing those functions necessary to keep the sewer in a serviceable condition including cleaning sewer lines, inlets, manholes, and catch basins along with the repair or replacement of inlet, manhole and catch basins' frames, grates or lids. The maintenance, repair and/or reconstruction of storm sewers constructed as part of this improvement beyond the aforedescribed responsibilities shall be that of the STATE.

(B) Applicable when storm sewer system constructed as a joint LA and State use facility:

performing those functions necessary to keep the sewer in a serviceable condition including cleaning sewer lines, inlets, manholes and catch basins along with the repair or replacement of inlet, manholes and catch basins' frames, grates or lids. The STATE shall share cost of the maintenance, except as aforedescribed, repair and/or reconstruction of the joint use sewer(s) to the same proportioning as the sewers initial construction costs.

The (VILLAGE, CITY, COUNTY, TOWNSHIP) further agrees to continue its existing maintenance responsibilities on all side road approaches under its jurisdiction, including all left and right turn lanes on said side road approaches, up to the through edge of pavement of US/Illinois/CH Route _____. Drainage facilities, if any, at the aforementioned side roads located within the STATE right-of-way shall be the joint maintenance responsibility of the STATE and the (VILLAGE, CITY, COUNTY, TOWNSHIP) unless there is an agreement specifying different responsibilities.

FOR TRAFFIC SIGNALS - USE 18a, 18b, 18c WHERE APPROPRIATE.

(Verbiage For Installation And/Or Modernization Projects Where No Master Agreement Exists.)

18a. Upon acceptance by the STATE of the traffic signal work included herein, the financial responsibility for the maintenance and electrical energy charges for the operation of the traffic signal(s) shall be proportioned as follows:

Intersection	Maintenance	Electrical Energy
______Route ______		
@ ___________ Street		
STATE Share	( )%	( )%
CITY or VILLAGE Share	( )%	( )%

(Share percentages are determined from Appendix C.)

It is mutually agreed that the actual traffic signal maintenance will be performed by the (STATE, CITY or VILLAGE), either with its own forces or through an ongoing contractual agreement. It is further mutually agreed that the traffic signals shall be maintained to the standard described in the 2000 Edition of the Illinois Manual of Uniform Traffic Control Devices, Part 4, Section 4D.02 a copy of which is attached hereto as "Exhibit______" and made a part hereof.

(The following paragraph is needed only when a City or Village maintains the signals.)

It is also understood that if, in the judgment of the STATE, the (CITY or VILLAGE) has not provided adequate maintenance for those traffic signals which it has been assigned to maintain, the STATE will, upon giving 30 days written notice, arrange for the appropriate maintenance efforts and bill the (VILLAGE or CITY) for its share of the costs.

The (STATE, VILLAGE or CITY) agrees to bill the (STATE, VILLAGE, or CITY) for its proportionate share of the traffic signal maintenance costs on a three-month basis. The amount billed shall be the actual costs incurred less any third party damage claims received during the billing period for repair of traffic signals that are the responsibility of the billed party.

Any proposed expenditure in excess of $5,000 for repair of damage to any single traffic signal installation must be approved by the billed party before the expenditure is made. The STATE reserves the right to examine the records of the (VILLAGE or CITY) to determine that costs billed are fully documented.
The STATE agrees to make arrangements with the local power company to furnish the electrical energy for the operation of the traffic signals. The (STATE, CITY or VILLAGE) agrees to pay their proportionate share of this cost as billed by the local power company.

The STATE retains the right to control the sequence and timing of the traffic signals.

Payment by the STATE of any or all of its share of maintenance and energy costs is contingent upon the STATE receiving adequate funds in its annual appropriation.

The parties hereto agree that the traffic signal maintenance and energy provisions of this Agreement shall remain in effect for a period of twenty (20) years from the date of its execution or so long as the traffic signals covered by the terms of this Agreement or any amendment hereto remain in place either in their current or some modified configuration, whichever, is the shorter period of time. Such an effective term shall apply unless otherwise agreed in writing by the parties hereto.

(Verbiage for Modernization Project Where Master Agreement Exists.)

18b. Upon acceptance by the STATE of the traffic signal work included herein the responsibility for maintenance and energy shall continue to be as outlined in the Master Agreement executed by the STATE and the (CITY/VILLAGE) on ______ 20 _____.

(Verbiage for Installation Project Where Master Agreement Exists.)

18c. Upon acceptance by the STATE of the new traffic signal installation(s), the financial responsibility for maintenance and electrical energy for the operation of the traffic signals shall be proportioned as follows:

Intersection	**Maintenance**	**Electrical Energy**
______Route ______		
@ __________ Street		
STATE Share	( )%	( )%
CITY or VILLAGE Share	( )%	( )%

(Share percentages are determined from Part 544 of Title 92, Illinois Administrative Code.)

It is mutually agreed that the actual traffic signal maintenance will be performed by the (STATE, CITY or VILLAGE), either with its own forces or through an ongoing contractual agreement.

It is further agreed that the traffic signal shall be maintained to at least the Levels of Maintenance shown in the Illinois Manual of Uniform Traffic Control Devices, Part 4, Section 4D.02, a copy of which is attached hereto as "Exhibit_____" and made a part hereof.

Upon acceptance by the STATE of the new traffic signal installation(s) included herein, the responsibility for maintenance and energy outlined above shall become a part of the Master Agreement executed by the State and the (CITY/VILLAGE) on _____ 20 _____.

(The following paragraph should be included when an agreement involves both new signal installations, as above, and the modernization or modifications of existing signals.)

19. Upon acceptance by the STATE of the work proposed herein on existing signals, the responsibility for maintenance and energy shall continue to be as outlined in the aforementioned Master Agreement.

20. The STATE agrees to make arrangements with the local power company to furnish the electrical energy for the operation of the traffic signals. The (STATE, CITY or VILLAGE) agrees to pay their proportionate share of this cost as billed by the local power company.

(If the local agency Is To Provide Engineering, Materials, And/Or Let The Contract On A Federal-aid Project, Then The Following Covenant Must Be Included.)

21. The (VILLAGE, CITY, COUNTY, TOWNSHIP), subrecipient or subcontractor shall not discriminate on the basis of race, color, national origin, or sex in the performance of this contract. The (VILLAGE, CITY, COUNTY, TOWNSHIP) shall carry out applicable requirements of 49 CFR part 26 in the award and administration of STATE-assisted contracts. Failure by the (VILLAGE, CITY, COUNTY, TOWNSHIP) to carry out these requirements is a material breach of this contract, which may result in the termination of this contract or such other remedy as the STATE deems appropriate.

22. The (VILLAGE, CITY, COUNTY, TOWNSHIP) agrees to provide written approval of that portion of the plans and specifications relative to the (VILLAGE, CITY, COUNTY, TOWNSHIP) financial and maintenance obligations described herein, prior to the STATE's advertising for the aforedescribed proposed improvement.

23. Obligations of the STATE and (VILLAGE, CITY, COUNTY, TOWNSHIP) will cease immediately without penalty or further payment being required if, in any fiscal year, the Illinois General Assembly or Federal funding source fails to appropriate or otherwise make available funds for this contract.

24. This AGREEMENT and the covenants contained herein shall be null and void in the event the contract covering the construction work contemplated herein is not awarded within the three years subsequent to execution of the agreement.

This agreement shall be binding upon and to the benefit of the parties hereto, their successors and assigns.

EXAMPLE 4 — Encroachment Ordinance

"Exhibit ______"

AN ORDINANCE REGULATING ENCROACHMENT
ON PUBLIC RIGHT OF WAY IN THE _______________ OF ________________
____________________________ COUNTY, ILLINOIS

WHEREAS, the ______________of _____________ hereinafter known as __________, and the State of Illinois, acting by and through its Department of Transportation, have entered into an agreement relative to the improvement of _____________ Street (______Route _________, State Section _______, ________ Section___________) From __________ to ________; and

WHEREAS, in order to facilitate said improvement, it is necessary for the _____________ to adopt an ordinance regulating encroachments on the right of way for said improvement in accordance with the following definitions:

1. Roadway Right of way is defined as those areas existing or acquired by dedication or by fee simple for highway purposes; also, the areas acquired by temporary easement during the time the easement is in effect:

2. Project Right of way is defined as those areas within the project right-of-way lines established jointly by the __________________ and the STATE which will be free of encroachments except as hereinafter defined;

3. Encroachment is defined as any building, fence, sign (excluding certain signs located over sidewalks) or any other public structure or object of any kind (with the exception of utilities and public road signs) which is placed, located, maintained, in, on, under or over any portion of the project right of way or the roadway right of way where no project right of way line has been established;

4. Permissible encroachment is defined as any existing awning, marquee or sign advertising activity on the property or similar overhanging structure supported from a building immediately adjacent to the limits of the platted street where there is sidewalk extending to the building line and which does not impair the free and safe flow of pedestrian traffic or traffic

on the highway. The permissive retention of overhanging signs is not to be construed as being applicable to those signs supported from poles constructed outside the project right of way line and not confined by adjacent buildings.

5. Construction easement Area is defined as the area lying between the project right of way limits and the platted street limits within which the ______________, by concurrence with the establishment of the project right of way lines, will permit the STATE to enter to perform all necessary construction activities; and

WHEREAS, representatives of the ________________ And the STATE have, by visual inspection, cooperatively established project right of way lines and have mutually determined the disposition of encroachments;

NOW, THEREFORE, BE IT ORDAINED, by the ____________ of ____________, County, Illinois:

Section 1: It shall be unlawful for any person, firm or corporation to erect, cause to be erected, to retain or cause to be retained any ENCROACHMENT (herein above defined), except as provided in Section 3, within the project right-of-way or roadway right of way where no project right-of-way lines have been established.

Section 2: Project right-of-way lines have been established at the following locations Along the ___________ side of __________ Street ___________ feet (________meter) ____________the centerline of the proposed improvement from ______________ to _______________.

(No project right-of-way lines have been established.)

Section 3: Revocable permits have been issued by the _____________________ for the temporary retention of the following PERMISSIBLE ENCROACHMENT (hereinabove defined):

(No temporary permits have been issued.)

Section 4: This ordinance is intended to and shall be in addition to all other ordinances, rules and regulations concerning encroachments and shall not be construed as repealing or rescinding any other ordinance or part of any ordinance unless in direct conflict therewith.

Section 5: Any person, firm or corporation violating the provisions of this Ordinance shall be fined not less than $ __________ nor more than $ _______________ for each offense, a separate offense shall be deemed committed for each and every day during which the violation continues or exists.

Section 6: This ordinance shall be published ___________ time(s) within ________ days after its passage in the newspaper having a general circulation in the __________ of ______________, Illinois, and shall be in full force and effect after its passage, publication and approval as provided by law.

Passed and approved this _____________ day of ________________, 20___.

EXAMPLE 5 — Off-Street Replacement Parking Guidelines

Illinois Department of Transportation

Memorandum

To: All District Engineers

From: Ralph C. Wehner

Subject: Replacement Parking Guidelines

Date: September 10, 1991

The following set of guidelines were developed to allow the Department to participate in the construction of replacement urban parking facilities as part of an improvement which requires removal of on-street parking.

I. PURPOSE

To enable the District Engineer, at his discretion, to cooperate with a municipality to replace existing legal on-State system parking in useable segments with off-site parking spaces for the benefit of State highway capacity and safety.

II. ASSUMPTIONS

These guidelines assume that existing on-street parking cannot be accommodated by widening the existing parking lanes or by constructing new replacement parking adjacent to through traffic lanes. These conditions are covered in Section 1-400 of the Design Manual and require municipal financial participation. This incentive/disincentive should work to discourage on-street parking thus reducing the hazard and capacity problems associated with on street parking.

III. IMPLEMENTATION

Early involvement coordination with the affected municipality shall be accomplished in order to determine any significant social, economic, and environmental effects from both parking removal and replacement. Discussion of existing parking patterns should be made to determine replacement requirements based on actual needs rather than the existing number of available spaces. This information should be included in the appropriate location and environmental studies and reports together with estimated costs for parking replacement. Replacement off-street parking may be let as part of the roadway improvement or as a separate municipal contract.

All District Engineers
Page 2
September 10, 1991

IV. PARTICIPATION

The State will provide 100% of all engineering, right of way (except where replacement parking is constructed on municipally-owned property), and construction costs required to construct alternate (off-State system) parking on a maximum ratio of 1 to 1. Alternate parking can consist of improving adjacent local streets to provide parallel parking, the construction of off-street parking facilities, or combinations thereof. Construction costs shall include those items the State deems reasonable to provide parking facilities having a safe and convenient environment as is practical, including a paved surface, drainage, lighting, pedestrian walkways, and fencing. The construction and installation of guard and toll collection facilities, metering devices, and parking capacity beyond the maximum replacement ratio shall be totally the local agency's responsibility.

V. MAINTENANCE

The municipality shall enter into an Agreement with the State accepting complete jurisdiction of the parking facility(ies) including but not limited to its maintenance, operation, repair, reconstruction, and provision of electrical energy for lighting systems and striping. The municipality shall hold the State harmless from any suits arising from construction, operation, and maintenance of these parking facilities.

VI. RIGHT OF WAY

The municipality shall acquire or have acquired all rights of way and easements in its own name and shall provide the State with certification that it holds good and sufficient title to such property(ies).

Prior to the municipality acquiring the right of way:

A. The State shall, at its own expense, conduct a survey for potential hazardous wastes and shall notify the municipality of its acceptance or rejection of said site.

B. The municipality shall follow the procedures contained in the State's Land Acquisition Manual and provide the State with an estimate of right-of-way costs, including its purchase price plus fees associated with negotiators, appraisals, title evidence, and legal services for each potential parcel. The State shall be given an opportunity to accept or reject the parcel(s).

All District Engineers
Page 3
September 10, 1991

C. If the municipality owns the site selected for replacement parking, it shall provide same at no expense to the State. Clearing of municipally-owned property included in the State's construction contract shall be considered as part of the replacement parking construction cost and thus shall be at the expense of the State.

VII. ENFORCEMENT

The municipality shall agree to enact and enforce ordinances prohibiting parking at all locations where on-street parking is removed.

The municipality shall, unless approved by the State in writing, retain in public trust for a period of 20 years, all parking facilities constructed at State expense. The State shall not unreasonably withhold such approval, but will require prorata compensation for its initial expense in constructing the parking facilities as a condition of its approval.

EXAMPLE 6 — Funding Resolution

“Exhibit ______”

FUNDING RESOLUTION

WHEREAS, the ________ of _________ has entered into an AGREEMENT with the STATE OF ILLINOIS for the improvement of ___________, known as State Section; _____________ and

WHEREAS in compliance with the aforementioned AGREEMENT, it is necessary for the _____________ to appropriate sufficient funds to pay its share of the cost of said improvement.

NOW, THEREFORE, BE IT RESOLVED, that there is hereby appropriated the sum of __________________________ dollars ($___________________) or so much thereof as may be necessary, from any money now or hereinafter allotted to the _______________ to pay its share of the cost of this improvement as provided in the AGREEMENT; and

BE IT FURTHER RESOLVED, that upon completion of the contract for this improvement, the _____________ will pay the DEPARTMENT OF TRANSPORTATION, in lump sum from any funds allotted to the _______________ an amount equal to 100% of its obligation incurred under this AGREEMENT.

BE IT FURTHER RESOLVED, that upon award of the contract for this improvement, the ________________ will pay to the DEPARTMENT OF TRANSPORTATION of the STATE OF ILLINOIS in a lump sum from any funds allotted to the_______________________, an amount equal to 80% of its obligation incurred under this AGREEMENT, and will pay to the said DEPARTMENT the remainder of the obligation in a lump sum, upon completion of the projected based on final costs.

BE IT FURTHER RESOLVED, that upon award of the contract for this improvement, the ________________ will pay to the DEPARTMENT OF TRANSPORTATION of the STATE OF ILLINOIS from any funds allotted to the_____________________, the amount of $________________ each month for a period of approximately __________ months or until 80% of its estimated obligation under the provisions of this AGREEMENT has been paid, and will pay to the said DEPARTMENT the remainder of the obligation in a lump sum, upon completion of the projected based on final costs.

BE IT FURTHER RESOLVED, that upon receipt of the first and subsequent progress payments made to the CONTRACTOR, the ___________________ will pay to the DEPARTMENT OF TRANSPORTATION of the STATE OF ILLINOIS from any funds allotted to the _____________, an amount equal to the ________________share $_____________ divided by the estimated construction costs, $_______________, multiplied by the actual progress payment made to the CONTRACTOR until the entire obligation incurred under this AGREEMENT has been paid.

BE IT FURTHER RESOLVED, that upon award of the contract for this improvement, the _______________ will pay to the DEPARTMENT OF TRANSPORTATION of the STATE OF ILLINOIS in a lump sum from any funds allotted to the___________________, an amount equal to 50% of its obligation incurred under this AGREEMENT, and will pay to the said DEPARTMENT the remainder of the obligation in a lump sum, upon completion of the projected based on final costs.

BE IT FURTHER RESOLVED, that the _________________ agrees to pass a supplemental resolution to provide any necessary funds for its share of the cost of this improvement if the amount appropriated herein proves to be insufficient, to cover said cost.

STATE OF ILLINOIS)
COUNTY OF ________________)

I,_________________________________, _________________ Clerk in and for the ________________________ of _____________________, hereby certify the foregoing to be a true perfect and complete copy of the resolution adopted by the __________________ at a meeting on ________________________, 20_____.

EXAMPLE 7 — Agreement for Jurisdictional Transfer

_________Route _______
Section ______________
(VILLAGE, CITY, COUNTY, TOWNSHIP) Section _______
County _______________
Job No. ______________
Agreement No. ________
Contract No. __________

AGREEMENT

This agreement entered into this ____ day of _______, A.D., 20____, by and between the STATE OF ILLINOIS, acting by and through its DEPARTMENT OF TRANSPORTATION hereinafter called the STATE, and the ____________ of ____________, of the State of Illinois, hereinafter called the (VILLAGE, CITY, COUNTY, or TOWNSHIP).

WITNESSETH:

WHEREAS, the STATE in order to facilitate the free flow of traffic and insure safety to the motoring public, is desirous of improving approximately ____ foot (____lineal meters) of _____ Street, (FA/SBI Route _____ US/Illinois/CH Route _____, State Section _____, (VILLAGE, CITY,COUNTY, TOWNSHIP) Section______ by (widening, milling, resurfacing. reconstructing) US/Illinois/CH Route _____ from _____ Street to _______Street, providing ______ foot (_____meter) through traffic lanes in each direction, a ______ foot (____meter) median with _____ foot (____meter) and variable width left turn lanes at _____ and _____ Streets, (milling, resurfacing, constructing) _____ foot (____meter) wide parking lanes on _____ side(s) of ______ Street between _____ Street and _____ Street, (modernizing, installing) traffic signals at the ______ Route _____ intersections with _____ and _____ Streets, installing a highway lighting system between _____ and _____ Streets, constructing new ____ foot (____ meter) wide PCC sidewalks from _____ Street to _____ Street, constructing curb and gutter and a storm sewer system for highway drainage and by performing all other work necessary to complete the improvement in accordance with the approved plans and specifications; and

WHEREAS, the (VILLAGE, CITY, COUNTY, TOWNSHIP) is desirous of said improvement in that same will be of immediate benefit to the (VILLAGE, CITY, COUNTY, TOWNSHIP) residents and permanent in nature;

NOW, THEREFORE, in consideration of the mutual covenants contained herein, the parties hereto agree as follows:

1. The STATE agrees to make the surveys, obtain all necessary rights of way, prepare plans and specifications, receive bids and award the contract, furnish engineering inspection during construction and cause the improvement to be built in accordance with the plans, specifications and contract.

2. The STATE agrees to pay for all right-of-way, construction and engineering costs, including the cost of railroad adjustments, subject to reimbursement by the (VILLAGE, CITY, COUNTY, TOWNSHIP) as hereinafter stipulated. The STATE will negotiate and/or coordinate with the Railroad for the adjustment of their railroad facilities.

3. It is mutually agreed by and between the parties hereto that the estimated cost and cost proration for this improvement is as follows:

Type of Work	State		Village, City, County, Township		Total
	Cost	%	Cost	%	
All construction costs excluding the following:	$	100	NA	NA	$
Mill and resurface parking lanes	$	50	$	50	$
Patch parking lanes	NA	NA	$	100	$
Traffic signals at __________ Street	$	90	$	10	$
New highway lighting	NA	NA	$	100	$
Relocate water main at _______ Street	NA	NA	$	100	$
Sub Total	$		$		$
P&C Engineering 15%	$		$		$
Total	$		$		$

Participation and reimbursement shall be predicated by the percentages shown above for the specified work. Cost shall be determined by multiplying the final quantities times contract unit prices plus 15% for construction and preliminary engineering. Participation toward the traffic signals and watermain relocation shown above shall not exceed $__________ which represents 125% of their estimated construction and engineering cost.

(If the agreement addresses a jurisdictional transfer, insert the following paragraph.)

4. The (VILLAGE, CITY, COUNTY, TOWNSHIP) and the State have agreed to the jurisdictional transfer of the portion of highway described in the local agency – State Agreement for Jurisdictional Transfer (BLR 05210), attached hereto as “Exhibit_____” and made a part hereof.

(If the local agency is to acquire right of way, at its own cost and expense or at the cost and expense of the state, in whole or in part, use the following paragraphs and make appropriate changes in paragraphs 1, 2, and 3.)

5. The (VILLAGE, CITY, COUNTY, TOWNSHIP) agrees to obtain and pay for the cost of acquiring the necessary right of way in accordance with the following requirements:

A. Right of way shall be acquired in the name of the STATE on standard State forms which will be provided for that purpose in accordance with Land Acquisition Policies and Procedures of the STATE.

B. No award of a contract shall be made to cover construction of the project or any part thereof without first having been made a title approval by the Attorney General of Illinois on each individual parcel of right of way, the consideration for which exceeds $10,000, including within such construction. A title approval shall be made by the STATE on each parcel of right of way acquired for the project where the consideration is $10,000 or less. In the event acquisition of the right of way is by condemnation, then such action must be brought in the name of the State by the Attorney General and an Assistant Attorney General appointed by him.

C. Cost of the right of way shall include the purchase price thereof as well as the cost of negotiators, appraisals, title evidence, relocation assistance and payments, property management and such legal service as may be necessary to acquire said right of way. The acquiring agency, if participating in the cost of the right of way shall receive a credit for a proportionate amount of the proceeds of any sale or rental of improvements acquired within the right of way or as a direct result of the right of way acquisition.

D. All parties engaged in the acquisition of the right of way shall be approved in advance by the STATE.

E. Appraisals (use Item (1) or (2) as appropriate):

(1) Appraisals shall be reviewed and a negotiating figure approved by the STATE in advance of negotiations for the purchase of said right of way.

(2) The (VILLAGE, CITY, COUNTY, TOWNSHIP) shall provide a sufficient number of qualified reviewing appraisers approved by the STATE. The STATE shall approve the appraisal process in advance of negotiations for the purchase of said right of way.

F. Any phase of the STATE's Relocation Assistance Procedures to be performed by any qualified agency other than the STATE shall be covered by separate contractual agreement or agreements with the agency and are subject to prior approval of the Division Administrator of the Federal Highway Administration.

G. The STATE shall provide such guidance, assistance and supervision and monitor and perform audits to the extent necessary to assure compliance with the STATE's Land Acquisition Policies and Procedures.

(If the local agency is to acquire right of way off the State highway system and there are Federal funds being used for any portion of the project, not just land acquisition, use the following paragraph. Please note, on those occasions when more than one land acquisition condition exists, all appropriate provisions that apply must be included.)

5a. The ______________________________ agrees to acquire in its name and at its own expense, subject to reimbursement as hereinafter provided, all right of way necessary for this project in accordance with the requirements of Titles II and III of the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended. The requirements of Title II and Title III shall be carried out in accordance with established State Policies and Procedures, as now or hereafter revised or amended. Prior to the State's advertising for bids, the local agency shall certify to the STATE that all requirements of Titles II and III of said Uniform Act have been compiled with.

A. The STATE will advertise for bids for the construction of the proposed improvement after the local agency's certification as to compliance with Titles II and III requirements have been accepted by the STATE and subject to approval by the Division Administrator of the Federal Highway Administration.

B. The STATE shall provide such guidance, assistance and supervision and monitor and perform audits to the extent necessary to assure validity of the local agency's certification of compliance with Titles II and III requirements of the aforesaid Act.

6. The (VILLAGE, CITY, COUNTY, TOWNSHIP) has passed a resolution appropriating sufficient funds to pay its share of the cost for this improvement, a copy of which is attached hereto as "Exhibit____" and made a part hereof.

(For Local's use of non-MFT funds for reimbursement, include one of the following.)

The (VILLAGE, CITY, COUNTY, TOWNSHIP) further agrees

a. *(**Payment upon Completion**)* that upon completion of the contract for this improvement, the _________ will pay to the DEPARTMENT OF TRANSPORTATION of the STATE OF ILLINOIS in a lump sum for any funds allotted to the _________ an amount equal to 100% of its obligation incurred under this AGREEMENT.

b. *(**80% Payment upon Award**)* that upon award of the contract for this improvement, the _________ will pay to the DEPARTMENT OF TRANSPORTATION of the STATE OF ILLINOIS in a lump sum from any funds allotted to the ___________, an amount equal to 80% of its obligation incurred under this AGREEMENT, and will pay to the said DEPARTMENT the remainder of the obligation (including any non-participating costs on FA Projects) in a lump sum, upon completion of the project based upon final costs.

c. *(**Monthly Payments**)* that upon award of the contract for this improvement, the ______ will pay to the DEPARTMENT OF TRANSPORTATION of the STATE OF ILLINOIS from any funds allotted to the __________, the amount of $______ each month for a period of approximately _____ months or until 80% of the estimated obligation under the provisions of the AGREEMENT has been paid, and will pay to the said DEPARTMENT the remainder of its obligation (including any non-participating costs on FA projects) in a lump sum upon completion of the project based upon final costs.

d. ***(Progress Payments)*** that upon receipt of the first and subsequent progress payments made to the CONTRACTOR, the ________ will pay to the DEPARTMENT OF TRANSPORTATION of the STATE OF ILLINOIS from any funds allotted to the ______________ an amount equal to the ___________ share, $__________, divided by the estimated construction costs, $_______, multiplied by the actual progress payment (appropriately adjusted for non-participating costs on FA projects) made to the CONTRACTOR until the entire obligation incurred under this AGREEMENT has been paid.

e. ***(Dual Payment)*** that upon award of the contract for this improvement, the ______ will pay to the DEPARTMENT OF TRANSPORTATION of the STATE OF ILLINOIS from any funds allotted to the _______________, an amount equal to 50% of its obligation incurred under this AGREEMENT, and will pay to the said DEPARTMENT the remainder of the obligation (including any non-participating costs on FA projects) in a lump sum, upon completion of the project based upon final costs.

(Include in all Local reimbursement Agreements where non-MFT funds are used and traffic signals are not a sole reimbursable items):

The (VILLAGE, CITY, COUNTY, TOWNSHIP) further agrees to pass a supplemental resolution to provide necessary funds for its share of the cost of this improvement if the amount appropriated in "Exhibit____" proves to be insufficient, to cover said cost.

7. The (VILLAGE, CITY) has adopted and will put into effect an appropriate ordinance, prior to the STATE's advertising for the proposed work to be performed hereunder, or shall continue to enforce an existing ordinance, requiring that parking be (parallel to the curbs) (prohibited) within the limits of this improvement, a copy of which is attached hereto as "Exhibit_____ ", and will in the future prohibit parking at such locations on or immediately adjacent to this improvement as may be determined necessary by the STATE from traffic capacity studies.

8. The (VILLAGE, CITY) has adopted and will put into effect an appropriate ordinance, prior to the STATE's advertising for the proposed work to be performed hereunder, or shall continue to

enforce an existing ordinance, prohibiting the discharge of sanitary sewage and industrial waste water into any storm sewers constructed as a part of this improvement, a copy of which is attached hereto as “Exhibit_______ ”.

9. Prior to the STATE advertising for the work proposed hereunder, the disposition of encroachments will be cooperatively resolved with representatives from the (VILLAGE, CITY) and the STATE.

The (VILLAGE, CITY) has adopted and will put into effect an appropriate ordinance, prior to the STATE’s advertising for the proposed work to be performed hereunder, or shall continue to enforce an existing ordinance, relative to the disposition of encroachments and prohibiting, in the future, any new encroachments within the limits of the improvements, a copy of which is attached as “Exhibit______”.

(If the Local Agency is to perform any part of the work and/or engineering involved in the improvement, and the STATE is paying for or allowing credit for the work and/or engineering both of the following paragraphs (10 and 11) should be included):

10. The (VILLAGE, CITY, COUNTY, TOWNSHIP) shall maintain, for a minimum of (3,5) years after the completion of the Project, adequate books, records, and supporting documents to verify the amounts, recipients, and uses of all disbursements of funds passing in conjunction with this Agreement. All books, records, and supporting documents related to the Project shall be available for review and audit by the Auditor General and other State auditors and the (VILLAGE, CITY, COUNTY, TOWNSHIP) agrees to cooperate fully with an audit conducted by the Auditor General and other State Auditors and to provide full access to all relevant materials. Failure to maintain the books, records, and supporting documents required by this paragraph shall establish a presumption in favor of the STATE for the recovery of any funds paid by the STATE under this Agreement for which adequate books, records, and supporting documentation are not available to support their purported disbursement.

11. The (VILLAGE, CITY, COUNTY, TOWNSHIP) agrees to comply with all applicable Executive Orders and Federal Highway Acts pursuant to the Equal Employment Opportunity and non-discrimination regulations required by the U.S. Department of Transportation. (Non-Federal-aid projects use Illinois Department of Transportation in lieu of U.S.)

12. The (VILLAGE, CITY, COUNTY, TOWNSHIP) agrees not to permit driveway entrance openings to be made in the curb, as constructed, or the construction of additional entrances, private or commercial, along _____ Route _____ without the consent of the STATE.

13. The (VILLAGE, CITY, COUNTY, TOWNSHIP) shall exercise its franchise rights to cause private utilities to be relocated, if required, at no expense to the STATE.

14. The (VILLAGE, CITY, COUNTY, TOWNSHIP) agrees to cause its utilities installed on right of way after said right of way was acquired by the STATE or installed within the limits of a roadway after the said roadway's jurisdiction was assumed by the STATE, to be relocated and/or adjusted, if required, at no expense to the STATE.

(If the State contract includes the relocation or adjustment of a municipally owned utility, include the following paragraph):

15. All (VILLAGE, CITY) owned utilities, on STATE right of way within the limits of this improvement, which are to be relocated/adjusted under the terms of this Agreement, will be relocated/adjusted in accordance with the applicable portions of the "Accommodation of Utilities of Right of Way of the Illinois State Highway System." (92 Ill. Adm. Code 530).

16. The (VILLAGE/CITY) agrees to obtain from the STATE an approved permit for the facility, and to abide by all conditions set forth therein.

17. Upon final field inspection of the improvement and so long as (Street Name) ____is used as a State Highway, the STATE agrees to maintain or cause to be maintained the median, the _____ through traffic lanes lying _____ on either side of the (median), (centerline) and the left-turn and right-turn lanes, each lane being _____ feet (_____meters) and variable in width, and the curb and gutter or stabilized shoulders and ditches adjacent to those traffic lanes and turn lanes to be maintained by the STATE.

18. Upon final field inspection of the improvement, the (VILLAGE, CITY, COUNTY, TOWNSHIP) agrees to maintain or cause to be maintained those portions of the improvement which are not maintained by the STATE, including parking lanes and their adjacent curb and gutter, sidewalks,

parkways, guardrails, crosswalk and stopline markings, (VILLAGE, CITY, COUNTY, TOWNSHIP) owned utilities including appurtenances thereto, highway lighting including furnishing the electrical energy therefore and shall maintain the storm sewers and appurtenances by:

NOTE: INSERT A OR B AS APPROPRIATE.

(A) Applicable when storm sewer system constructed for State highway drainage only:

performing those functions necessary to keep the sewer in a serviceable condition including cleaning sewer lines, inlets, manholes, and catch basins along with the repair or replacement of inlet, manhole and catch basins' frames, grates or lids. The maintenance, repair and/or reconstruction of storm sewers constructed as part of this improvement beyond the aforedescribed responsibilities shall be that of the STATE.

(B) Applicable when storm sewer system constructed as a joint LA and State use facility:

performing those functions necessary to keep the sewer in a serviceable condition including cleaning sewer lines, inlets, manholes and catch basins along with the repair or replacement of inlet, manholes and catch basins' frames, grates or lids. The STATE shall share cost of the maintenance, except as aforedescribed, repair and/or reconstruction of the joint use sewer(s) to the same proportioning as the sewers initial construction costs.

The (VILLAGE, CITY, COUNTY, TOWNSHIP) further agrees to continue its existing maintenance responsibilities on all side road approaches under its jurisdiction, including all left and right turn lanes on said side road approaches, up to the through edge of pavement of US/Illinois/CH Route _____. Drainage facilities, if any, at the aforementioned side roads located within the STATE right-of-way shall be the joint maintenance responsibility of the STATE and the (VILLAGE, CITY, COUNTY, TOWNSHIP) unless there is an agreement specifying different responsibilities.

FOR TRAFFIC SIGNALS – USE 19A, 19B, 19C WHERE APPROPRIATE.

(Verbiage For Installation And/Or Modernization Projects Where No Master Agreement Exists.)

19a. Upon acceptance by the STATE of the traffic signal work included herein, the financial responsibility for the maintenance and electrical energy charges for the operation of the traffic signal(s) shall be proportioned as follows:

Intersection	Maintenance	Electrical Energy
_______Route _______		
@ ___________ Street		
STATE Share	( )%	( )%
CITY or VILLAGE Share	( )%	( )%

(Share percentages are determined from Appendix C.)

It is mutually agreed that the actual traffic signal maintenance will be performed by the (STATE, CITY or VILLAGE), either with its own forces or through an ongoing contractual agreement. It is further mutually agreed that the traffic signals shall be maintained to the standard described in the 2000 Edition of the Illinois Manual of Uniform Traffic Control Devices, Part 4, Section 4D.02 a copy of which is attached hereto as "Exhibit______" and made a part hereof.

(The following paragraph is needed only when a City or Village maintains the signals.)

It is also understood that if, in the judgment of the STATE, the (CITY or VILLAGE) has not provided adequate maintenance for those traffic signals which it has been assigned to maintain, the STATE will, upon giving 30 days written notice, arrange for the appropriate maintenance efforts and bill the (VILLAGE or CITY) for its share of the costs.

The (STATE, VILLAGE or CITY) agrees to bill the (STATE, VILLAGE, or CITY) for its proportionate share of the traffic signal maintenance costs on a three-month basis. The amount billed shall be the actual costs incurred less any third party damage claims received during the billing period for repair of traffic signals that are the responsibility of the billed party. Any proposed expenditure in excess of $5,000 for repair of damage to any single traffic signal installation must be approved by the billed party before the expenditure is made. The STATE reserves the right to examine the records of the (VILLAGE or CITY) to determine that costs billed are fully documented.

The STATE agrees to make arrangements with the local power company to furnish the electrical energy for the operation of the traffic signals. The (STATE, CITY or VILLAGE) agrees to pay their proportionate share of this cost as billed by the local power company.

The STATE retains the right to control the sequence and timing of the traffic signals.
Payment by the STATE of any or all of its' share of maintenance and energy costs is contingent upon the STATE receiving adequate funds in its annual appropriation.

The parties hereto agree that the traffic signal maintenance and energy provisions of this Agreement shall remain in effect for a period of twenty (20) years from the date of its execution or so long as the traffic signals covered by the terms of this Agreement or any amendment hereto remain in place either in their current or some modified configuration, whichever, is the shorter period of time. Such an effective term shall apply unless otherwise agreed in writing by the parties hereto.

(Verbiage for Modernization Project Where Master Agreement Exists.)

19b. Upon acceptance by the STATE of the traffic signal work included herein the responsibility for maintenance and energy shall continue to be as outlined in the Master Agreement executed by the STATE and the (CITY/VILLAGE) on ______ 20 _____.

(Verbiage for Installation Project Where Master Agreement Exists.)

19c. Upon acceptance by the STATE of the new traffic signal installation(s), the financial responsibility for maintenance and electrical energy for the operation of the traffic signals shall be proportioned as follows:

Intersection	Maintenance	Electrical Energy
________Route _______		
@ _____________Street		
STATE Share	( )%	( )%
CITY or VILLAGE Share	( )%	( )%

(Share percentages are determined from Appendix C.)

It is mutually agreed that the actual traffic signal maintenance will be performed by the (STATE, CITY or VILLAGE), either with its own forces or through an ongoing contractual agreement.

It is further agreed that the traffic signal shall be maintained to at least the Levels of Maintenance shown in the Illinois Manual of Uniform Traffic Control Devices, Part 4, Section 4D.02, a copy of which is attached hereto as "Exhibit_____" and made a part hereof.

Upon acceptance by the STATE of the new traffic signal installation(s) included herein, the responsibility for maintenance and energy outlined above shall become a part of the Master Agreement executed by the State and the (CITY/VILLAGE) on _____ 20 _____.

(The following paragraph should be included when an agreement involves both new signal installations, as above, and the modernization or modifications of existing signals.)

20. Upon acceptance by the STATE of the work proposed herein on existing signals, the responsibility for maintenance and energy shall continue to be as outlined in the aforementioned Master Agreement.

21. The STATE agrees to make arrangements with the local power company to furnish the electrical energy for the operation of the traffic signals. The (STATE, CITY or VILLAGE) agrees to pay their proportionate share of this cost as billed by the local power company.

(If the Local Agency Is To Provide Engineering, Materials, And/Or Let The Contract On A Federal-aid Project, Then The Following Covenant Must Be Included.)

22. The (VILLAGE, CITY, COUNTY, TOWNSHIP), subrecipient or subcontractor shall not discriminate on the basis of race, color, national origin, or sex in the performance of this contract.

The (VILLAGE, CITY, COUNTY, TOWNSHIP) shall carry out applicable requirements of 49 CFR part 26 in the award and administration of STATE-assisted contracts. Failure by the (VILLAGE, CITY, COUNTY, TOWNSHIP) to carry out these requirements is a material breach of this contract, which may result in the termination of this contract or such other remedy as the STATE deems appropriate.

23. The (VILLAGE, CITY, COUNTY, TOWNSHIP) and the State have agreed to a jurisdictional transfer for a portion of Highway described in this Agreement. A copy of the jurisdictional transfer document is attached hereto as "Exhibit ________", and made a part hereof.

24. The (VILLAGE, CITY, COUNTY, TOWNSHIP) agrees to provide written approval of that portion of the plans and specifications relative to the (VILLAGE, CITY, COUNTY, TOWNSHIP) financial and maintenance obligations described herein, prior to the STATE's advertising for the aforedescribed proposed improvement.

25. Obligations of the STATE and (VILLAGE, CITY, COUNTY, TOWNSHIP) will cease immediately without penalty or further payment being required if, in any fiscal year, the Illinois General Assembly or Federal funding source fails to appropriate or otherwise make available funds for this contract.

26. This AGREEMENT and the covenants contained herein shall be null and void in the event the contract covering the construction work contemplated herein is not awarded within the three years subsequent to execution of the agreement.

This agreement shall be binding upon and to the benefit of the parties hereto, their successors and assigns.

Table of Contents
(Continued)

Section **Page**

Chapter Six
UTILITY COORDINATION

A utility adjustment is performed by a utility company (i.e., Utility), under a binding Agreement between the Utility and the State or under the terms of a utility permit, to relocate or remove a utility facility that cannot otherwise be avoided during highway construction. The procedures for processing these adjustments for IDOT's Federally funded projects are based primarily on the requirements of the Federal Highway Administration. For uniformity, IDOT also applies these requirements to its non-Federally funded projects. Chapter 6 documents the policies and procedures that should be employed when processing utility adjustments for the Department's highway improvement projects.

6-1 GENERAL GUIDELINES

6-1.01 Definitions

The following definitions apply to the accommodation of utilities on highway projects:

1. Utility. A privately, publicly, or cooperatively owned line, facility, or system for producing, transmitting, or distributing communications, cable television, power, electricity, light, heat, gas, oil, crude products, water, steam, waste, storm water not connected with highway drainage, or any other similar commodity, including any fire or police signal system or street lighting system, which directly or indirectly serves the public. The term Utility shall also mean the utility company inclusive of any wholly owned or controlled subsidiary. The term utility includes those facilities used solely by the Utility that are a part of its operating plant.

2. Utility Adjustment. A utility adjustment includes all activities necessary to relocate or remove an existing utility facility that interferes with a highway improvement project.

3. Utility Agreement. A utility Agreement is a legally binding document between the Utility and the State that defines the scope, reimbursement, and schedule parameters of the work to be performed by the Utility to complete the utility adjustment.

6-1.02 Applicable Publications

The policies, procedures, and guidelines that govern utility accommodation and adjustments are documented primarily in Items 1 through 4 in the following list of publications. Other references in the following list provide additional information on utility accommodation:

1. *Accommodation of Utilities on Right-of-Way,* 92 Ill. Admin. Code 530.

2. *A Guide for Accommodating Utilities within Highway Right-of-Way*, AASHTO.

3. *Federal-Aid Policy Guide*, 23 CFR 645 Subparts A and B.

4. *Buy America Requirements*, 23 CFR 635.410.

5. *The Illinois Underground Utility Facilities Damage Prevention Act*, 220 ILCS 50/1 *et seq*.

6. *49 CFR* 21 and 23.

7. Program Guide: Utility Relocation and Accommodation of Federal-aid Highway Projects, FHWA.

8. *Standard Specifications for Road and Bridge Construction*, IDOT.

9. *A Policy on the Accommodation of Utilities within Freeway Right-of-Way*, AASHTO.

10. *Transportation of Natural and Other Gas by Pipeline; Annual Report; Incident Reports, and Safety Related Condition Reports, 49 C.F.R. 191.*

11. *Transportation of Natural and Other Gas by Pipeline: Minimum Federal Safety Standards*, 49 CFR 192.

12. *National Bridge Inspection Standards*, 23 CFR 650, Subpart C.

13. *National Electrical Safety Code*, ANSI C2, IEEE.

14. Gas Transmission and Distribution Piping Systems, ASME B31.8, ASME.

15. Pipeline Transportation Systems for Liquid Hydrocarbons and Other Liquids, ASME B31.4, the American Society of Mechanical Engineers (ASME).

16. *Standard Specifications for Water and Sewer Main Construction in Illinois*, AGCE, ISPE, IML, UCA.

17. *Valuation of Landscape Trees, Shrubs and Other Plants: A Guide to the Methods and Procedures for Appraising Amenity Plants*, ISA.

6-1.03 <u>Reimbursement of Utility Adjustments</u>

6-1.03(a) General Policy for Reimbursable Utility Adjustments

When the State is obligated to reimburse a Utility for the removal or alteration of its facility, all parties should understand that the adjustment will be undertaken in the most economical manner consistent with good engineering practice and in compliance with applicable codes and permit regulations. It should also be understood that Buy America requirements (23 CFR 635.410) shall apply to all reimbursable costs.

The State only will reimburse the Utility for comparable facilities. If the Utility elects to improve its facility during the adjustment (i.e., a utility betterment), the State will only reimburse the company for the cost of a comparable facility. Non-reimbursable adjustments of utilities located on public right-of-way should be conducted in accordance with the requirements outlined in the *Accommodation of Utilities on Right-of-Way*. Additionally, pursuant to the same administrative regulations, a utility permit shall be obtained by the utility for all utilities to be located on State right-of-way.

6-1.03(b) Non-Freeway Facilities

Where utility adjustments are required for the construction of a non-freeway highway improvement project, the expense of these adjustments is generally borne as follows:

1. Public Right-of-Way. If a utility facility is located on publicly owned right-of-way, whether by permit or otherwise, the adjustment is at the expense of the Utility.

2. Private Right-of-Way or Easement Rights. If a Utility presents legal evidence that its facility is located on privately owned right-of-way or easement rights, the cost of the adjustment is eligible for reimbursement by the State.

3. Municipally Owned Utilities. When a Joint Agreement with a Municipality is required, the cost of adjusting a municipally owned facility is determined in accordance with the policies and procedures referenced in this section and in Section 5-5.

4. Prior Rights. If a utility was located on public right-of-way prior to the marking of a State-maintained route or if any utility is located on or adjacent to an easement previously subordinated to the State, the adjustments are eligible for reimbursement by the State. The burden of proof regarding prior rights falls upon the Utility. In absence of such proof, the Department considers the cost of the relocation to be non-reimbursable.

6-1.03(c) Freeway and Expressway Facilities

In accordance with 605 ILCS 5/3-107, the State may participate in the cost to reimburse the Utility for adjusting a facility on public right-of-way when such adjustment is necessitated by the construction or reconstruction of the freeway facility. The amount of reimbursement will be for a comparable facility; facility improvements (betterments) are not reimbursable. If the adjustment is in conjunction with highway reconstruction and the facility was adjusted during the highway's initial construction, the State will reimburse the Utility for the adjustment excluding any betterments or subsequent installations. Additional utility installations made after initial construction of an Interstate or other freeway facility are not eligible for reimbursement.

6-1.04 <u>Programming Utility Adjustments</u>

The district initiates, plans, and coordinates the programming and preliminary engineering activities of utility adjustments as documented in the *Federal-Aid Policy Guide* and Section 65-1. Consider the following guidelines when programming utility adjustments:

1. Programming. The adjustments may be programmed as:

- a separate project,
- a part of the right-of-way acquisition, or
- an item that is included in the construction phase.

2. Required Programming Information. Include the following programming information:

- list of all utility adjustments,
- a general description of the necessary adjustment activities, and
- the best available estimate for the total costs involved.

6-2 PROCEDURES

6-2.01 General

Locating and avoiding existing utility installations during the planning phase of any highway improvement is the first step for highways and utilities to co-exist in the same environment. If it is not practical to avoid an existing utility installation during construction, it will be necessary to adjust the utility. However, a considerable amount of time and money may be saved by modifying the design to avoid utility adjustments.

For Utility/State Agreements, City of Chicago Force Accounts, or Municipality/State Agreements, the cost estimates, design plan sheets, and Agreements should be reviewed, approved, and processed to meet scheduling of highway construction activities. The district must initiate, plan, and coordinate utility adjustment work so highway construction activities can proceed without unnecessary delay or expense. Completing the planning and negotiations for utility adjustments is as essential for clearing right-of-way as is acquiring property.

6-2.02 Utility Agreement/Adjustment Process (Utility/State Agreements)

Figures 6-2.A and 6-2.B illustrate, respectively, the process flowchart and timeline for utility adjustments on a typical highway improvement project.

6-2.03 Process for City of Chicago Force Account

If the State is obligated to reimburse the City of Chicago for adjusting utility facilities that interfere with highway construction, the following guidelines apply:

1. Plan and Estimate Review. The district reviews and approves the plan and estimate and forwards two copies of a Letter of Understanding to the City of Chicago for signature. Upon execution by the City, the district forwards the two copies of the Letter of Understanding to the Agreements Unit for final execution.

2. Authorization to Proceed. Upon final execution of the Letter of Understanding, the Agreements Unit returns one original to the district, which then authorizes the City to begin the relocation work.

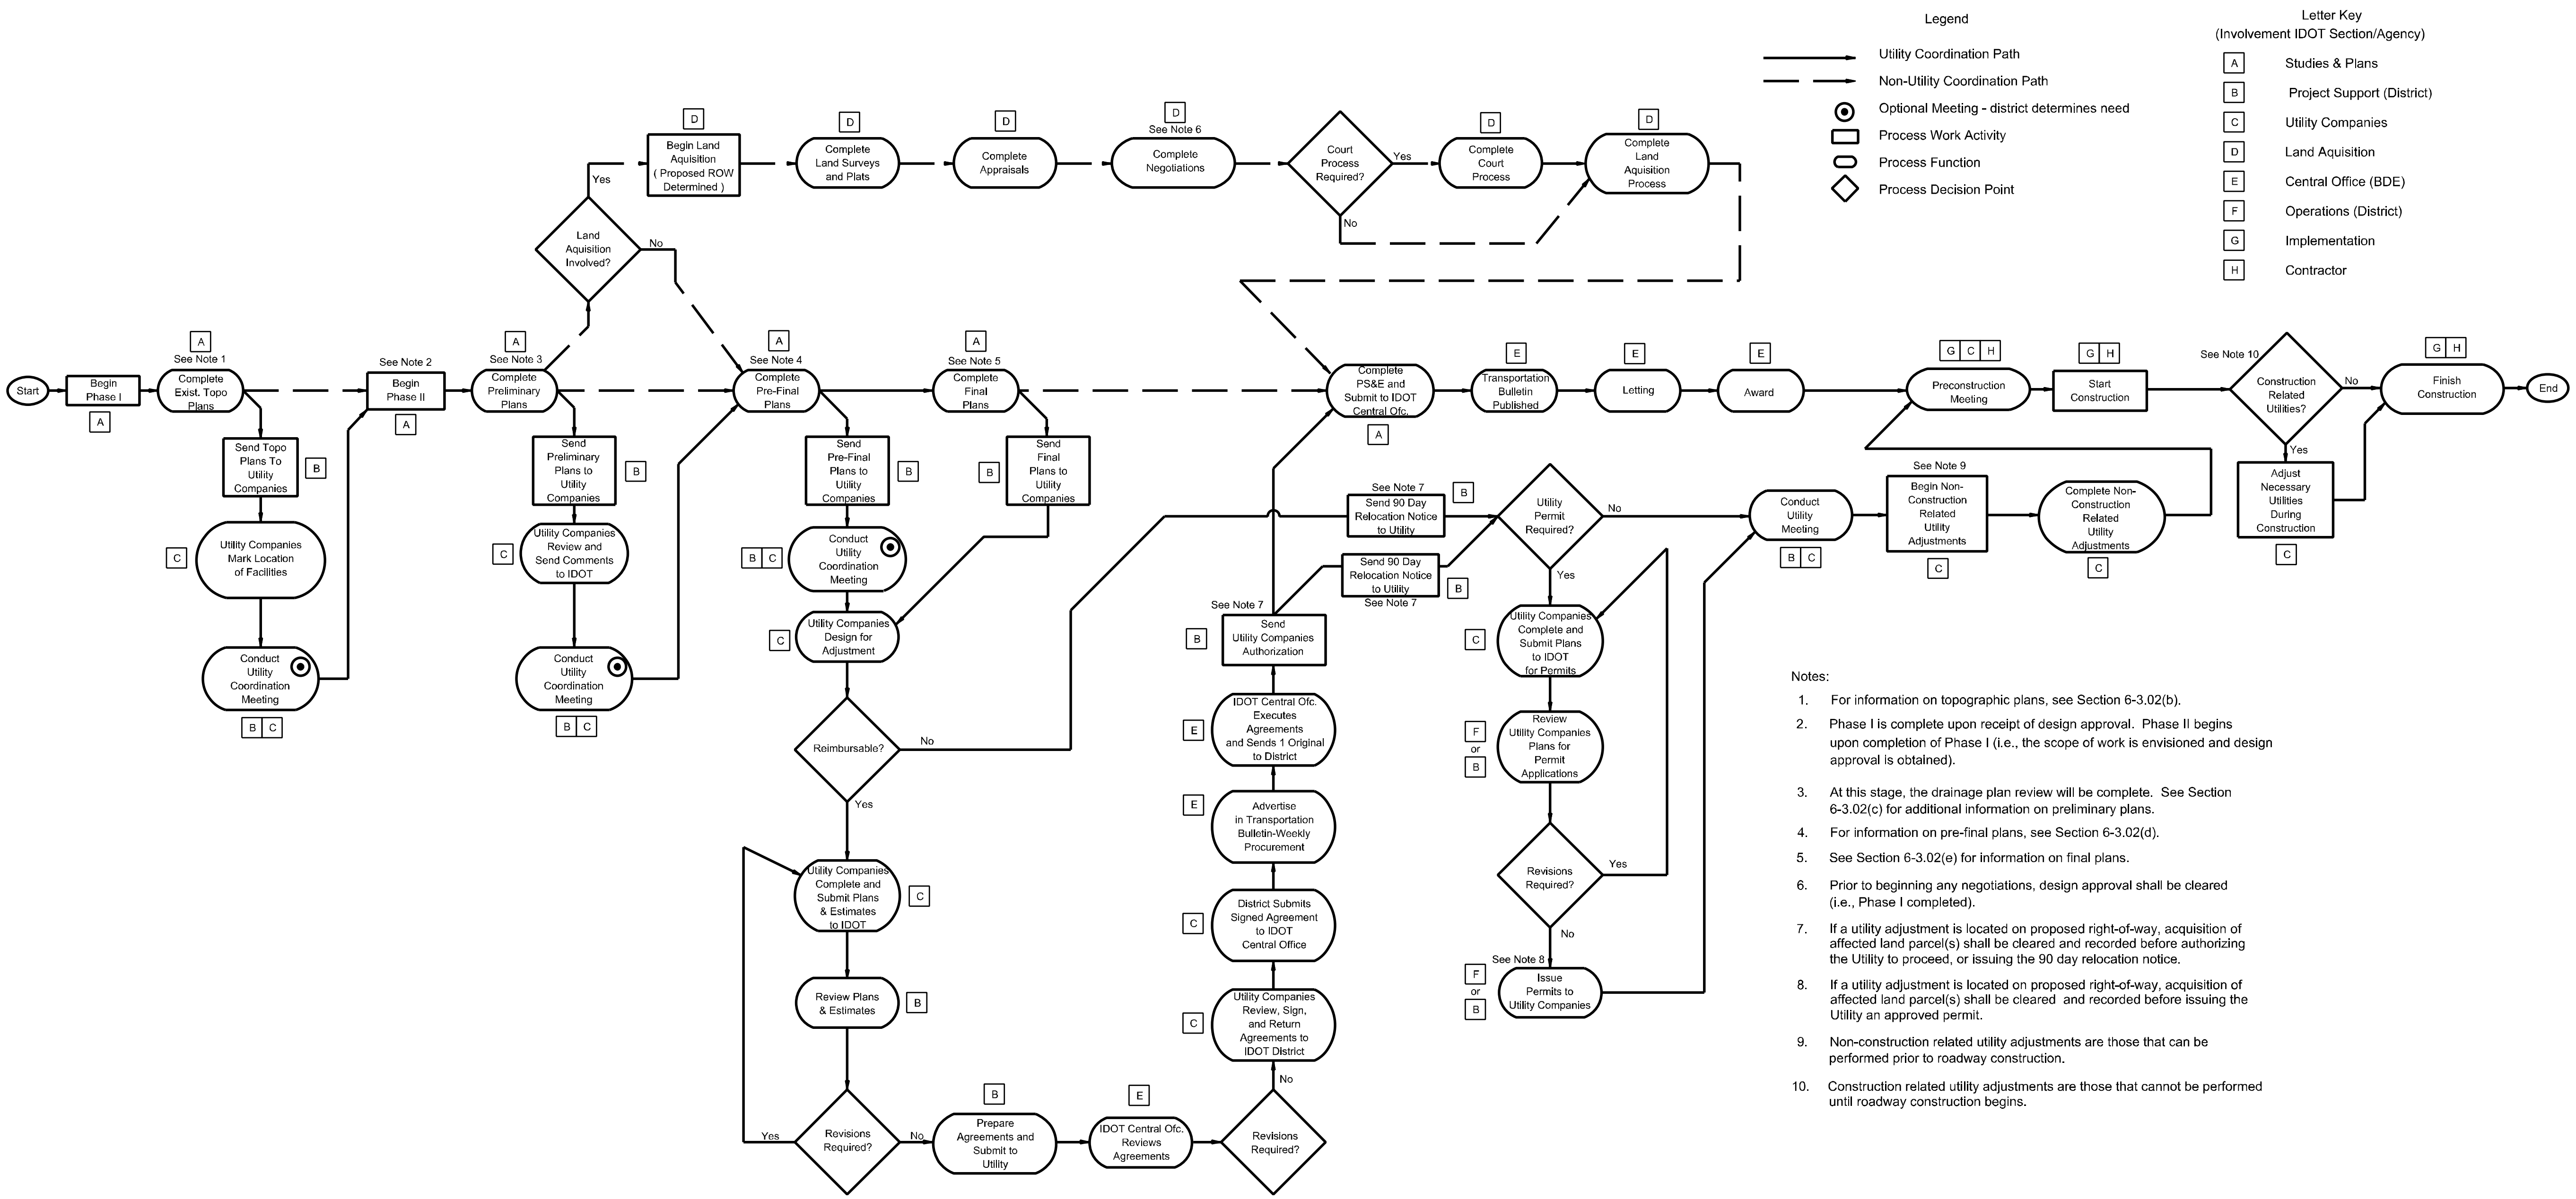
3. Contract Obligation Document (COD). The Agreements Unit uses the Letter of Understanding to prepare and submit COD.

6-2.04 Municipally Owned Utilities

If it is necessary to adjust a municipally owned utility, use one of the following two processing methods:

1. Joint Agreement Required. If a Joint Agreement is required between the State and local agency because of local participation in the project, the costs of any municipally owned utility adjustments may be included in the Joint Agreement. Follow the processing procedures for Joint Agreements outlined in Section 5-1.03.

2. Joint Agreement Not Required. If a Joint Agreement is not required or if the municipally owned utility operates as a separate entity, process the Agreement in the same manner as for Utility/State Agreements (see Section 6-2.02).



Notes:

1. For information on topographic plans, see Section 6-3.02(b).
2. Phase I is complete upon receipt of design approval. Phase II begins upon completion of Phase I (i.e., the scope of work is envisioned and design approval is obtained).
3. At this stage, the drainage plan review will be complete. See Section 6-3.02(c) for additional information on preliminary plans.
4. For information on pre-final plans, see Section 6-3.02(d).
5. See Section 6-3.02(e) for information on final plans.
6. Prior to beginning any negotiations, design approval shall be cleared (i.e., Phase I completed).
7. If a utility adjustment is located on proposed right-of-way, acquisition of affected land parcel(s) shall be cleared and recorded before authorizing the Utility to proceed, or issuing the 90 day relocation notice.
8. If a utility adjustment is located on proposed right-of-way, acquisition of affected land parcel(s) shall be cleared and recorded before issuing the Utility an approved permit.
9. Non-construction related utility adjustments are those that can be performed prior to roadway construction.
10. Construction related utility adjustments are those that cannot be performed until roadway construction begins.

UTILITY ADJUSTMENT PROCESS FLOWCHART
(Typical Highway Improvement Project)

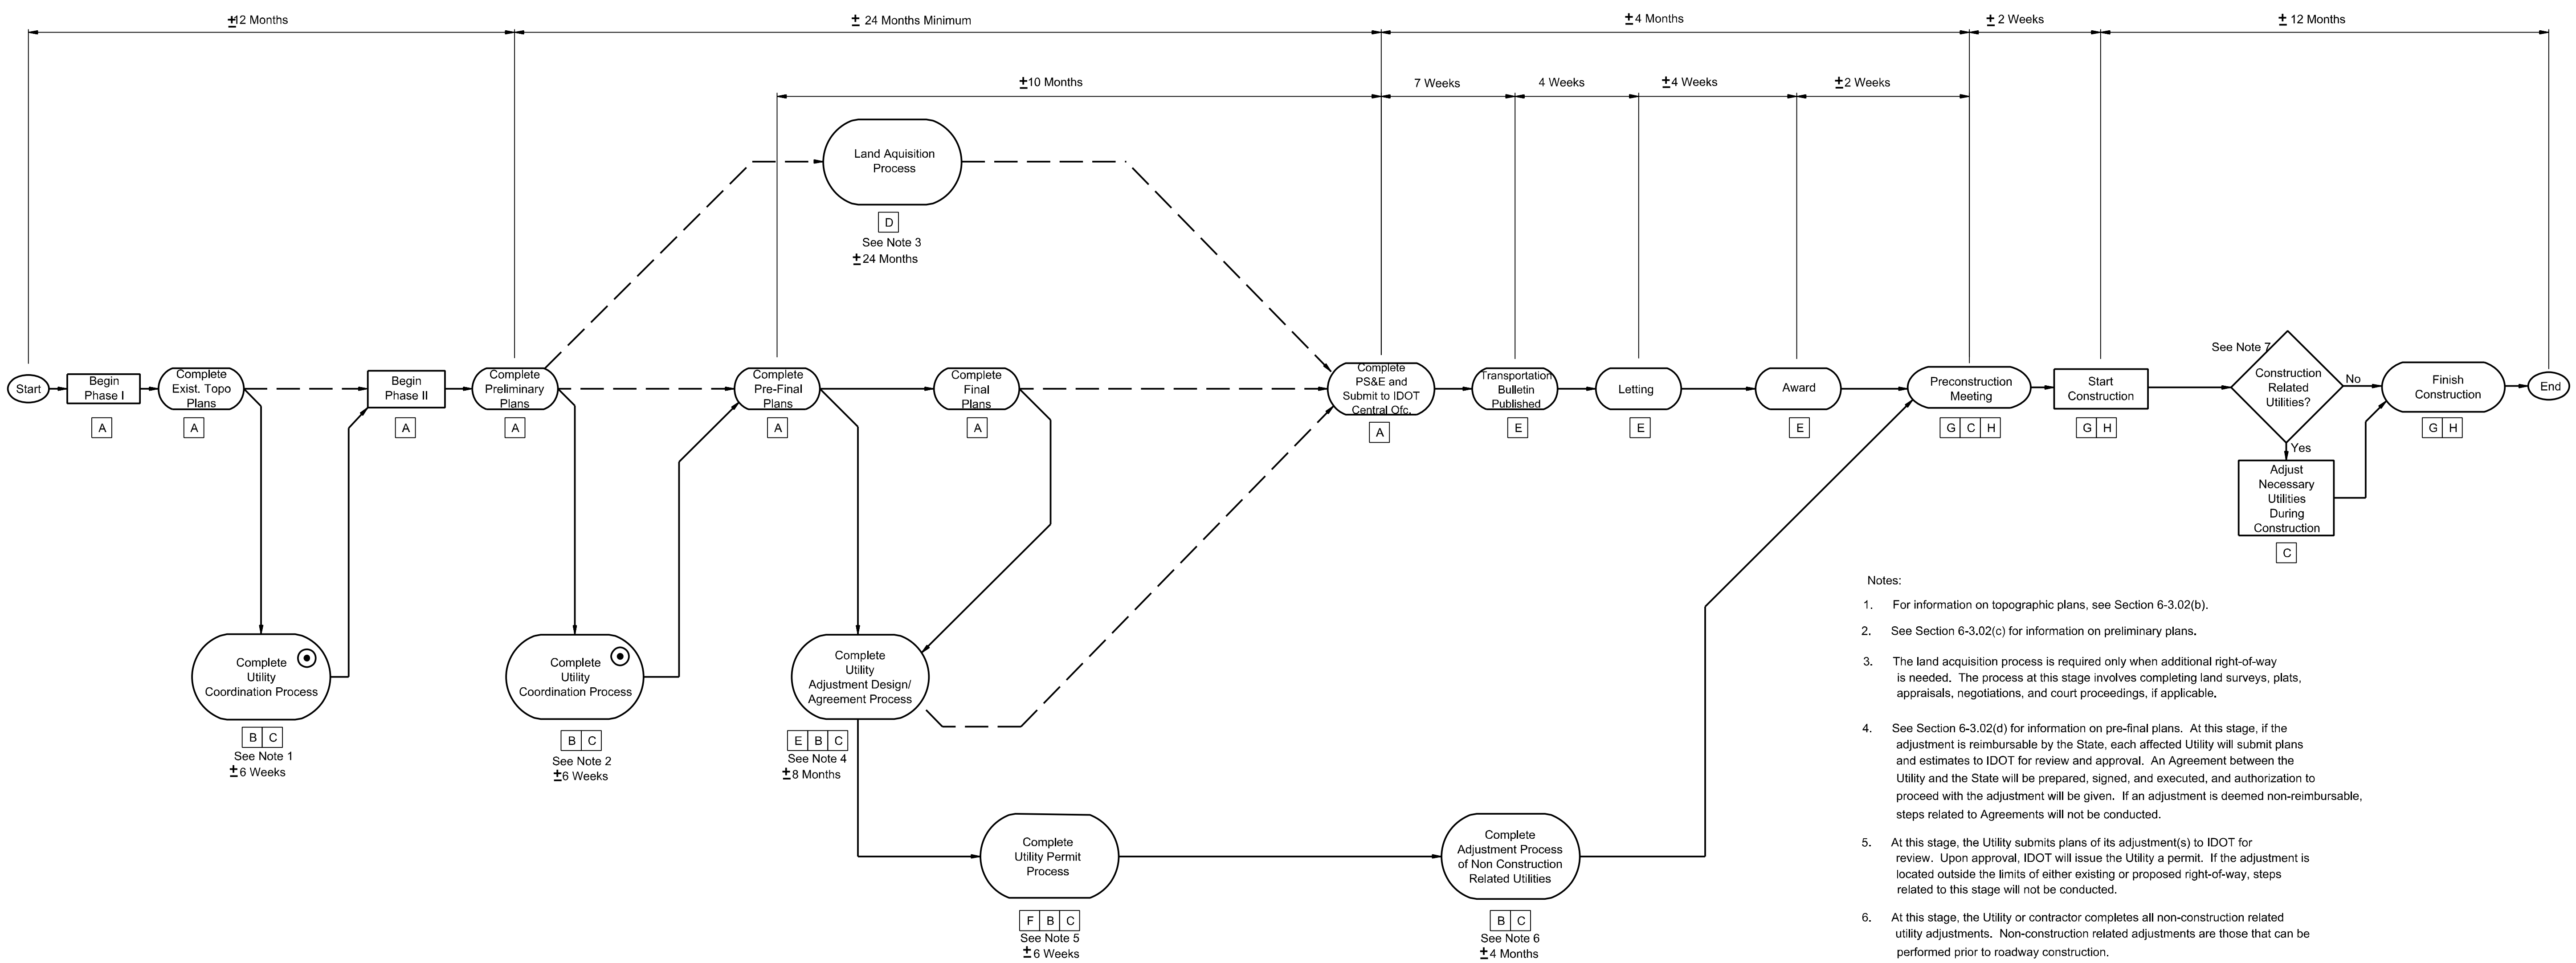
Figure 6-2.A

Legend

- Utility Coordination Path
- Non-Utility Coordination Path
- Optional Meeting - district determines need
- Process Work Activity
- Process Function
- Process Decision Point

Letter Key
(Involvement IDOT Section/Agency)

A	Studies & Plans
B	Project Support
C	Utility Companies
D	Land Aquisition
E	Central Office (BDE)
F	Operations
G	Implementation
H	Contractor



Notes:

1. For information on topographic plans, see Section 6-3.02(b).
2. See Section 6-3.02(c) for information on preliminary plans.
3. The land acquisition process is required only when additional right-of-way is needed. The process at this stage involves completing land surveys, plats, appraisals, negotiations, and court proceedings, if applicable.
4. See Section 6-3.02(d) for information on pre-final plans. At this stage, if the adjustment is reimbursable by the State, each affected Utility will submit plans and estimates to IDOT for review and approval. An Agreement between the Utility and the State will be prepared, signed, and executed, and authorization to proceed with the adjustment will be given. If an adjustment is deemed non-reimbursable, steps related to Agreements will not be conducted.
5. At this stage, the Utility submits plans of its adjustment(s) to IDOT for review. Upon approval, IDOT will issue the Utility a permit. If the adjustment is located outside the limits of either existing or proposed right-of-way, steps related to this stage will not be conducted.
6. At this stage, the Utility or contractor completes all non-construction related utility adjustments. Non-construction related adjustments are those that can be performed prior to roadway construction.
7. Construction related utility adjustments are those that cannot be performed until roadway construction begins.

UTILITY ADJUSTMENT PROCESS FLOWCHART
(Typical Highway Improvement Project)

Figure 6-2.B

6-3 PREPARATION OF UTILITY PLANS

6-3.01 General

Coordination with Utilities begins as early as practical during project development (e.g., planning, preliminary engineering). The Department typically sends plans at various stages of completion to each affected Utility for review and comment. It is the responsibility of each Utility to verify and/or provide the following information on its utility facilities:

- type,
- size,
- vertical and horizontal location, and
- information on retired facilities.

If a utility installation will be located or relocated on or across public right-of-way that is under the Department's jurisdiction, the Utility shall submit an application for a utility permit to the district for review and approval in accordance with the policies and procedures in the *Accommodation of Utilities on Right-of-Way.*

For any contract that requires work below the existing pavement structure or ground surface, including those where posts will be driven into existing ground, the designer will identify all known utility facilities within the limits of the right-of-way by appropriate symbol on the final construction plans. Show vertical and horizontal dimensions of both existing and proposed utility facilities to the precision provided by the Utility regardless of whether the facility will be adjusted or remain in place.

For each utility adjustment that will be reimbursed by the State, the district reviews the adjustment type, method, plans, and cost estimate and provides recommendations for final approval by BDE.

6-3.02 Plan Preparation for Department Projects

6-3.02(a) General

See Chapter 63 for criteria on plan preparation for Department projects (e.g., drafting guidelines, individual plan sheet content and format, construction codes). Plans typically are sent at various stages of completion to each affected Utility to assist in determining whether or not an adjustment is needed. IDOT may prepare separate plan sheets with utility information and insert these sheets into the final contract plan assembly at the proper location (see Section 63-3.04). The district is responsible for clearly showing the locations of all known utility facilities on the project plans and how they will be affected. Each Utility is responsible for identifying the location of their respective facilities (e.g., horizontal and vertical dimensions) on the plan sheets and documenting the work for any needed adjustments.

6-3.02(b) Topographic Plans

The district submits the following information to the Utilities so they can identify their respective facilities within the improvement area:

- a cover sheet that includes a location map showing the limits of the improvement, and
- a set of plan sheets that contain complete topography and existing right-of-way limits.

Prior to surveying a project, the Project Support Section will contact JULIE and schedule a Design Phase Locate Meeting with the Utilities to explain the limits and scope of the improvement and the approximate date and location that IDOT surveyors will begin work. So that IDOT surveyors can record the necessary utility information, the Utilities should be given sufficient time to locate and mark their facilities in the field prior to the IDOT survey. Incorporate the utility information gathered in the field on the topographic plans and submit the plans to each affected Utility for review and verification. If a Utility does not mark its facilities in the field prior to the IDOT survey, the Utility will need to manually plot its facilities on the topographic plans based on office records and previously filed location data and return the markups to the Department.

6-3.02(c) Preliminary Plans

Preliminary plans are considered to be 60% to 70% complete and ready for a district plan and field review. The district prepares preliminary plans in sufficient detail to conduct the preliminary plan and field review (see Section 63-1.02(b)) which will include the following:

1. Cover Sheet. Provide a cover sheet that includes a location map showing the limits of the improvement.
2. Plan Sheets. Include the following information on the plan sheets:
   - existing utility locations,
   - all proposed improvements,
   - existing and proposed right-of-way and easement lines, and
   - known environmental issues.
3. Cross Section Sheets. Include the following information on the cross section sheets:
   - proposed improvements,
   - limits of earthwork, and
   - drainage improvements.

During the development of the preliminary plans, it may be necessary for the Utilities to survey or probe the site to locate their facilities. Obtain and include this information on the preliminary plans.

The Project Support Section is responsible for determining the type and nature of all utility facilities located within the limits of both existing and proposed right-of-way and for identifying each facility owner and its address. Through field surveys, verify all utility facilities within the limits of the improvement and determine potential conflicts. Notify the Project Support Section of any additional utility facilities located but not previously identified. Use the following guidelines when preparing the preliminary plans:

1. Utility Facility Plan Symbols. Identify the utility facilities using the appropriate plan symbols as documented in the *Highway Standards* and the *Computer Aided Design, Drafting, Modeling and Deliverables Manual.*

2. Dimensional Precision in Locating Facilities. Show the vertical and horizontal locations of the utility facilities to the dimensional precision provided by the Utility.

3. Use of Dimensional Ranges. If the location of the utility facility provided by the Utility is expressed as a dimensional range (e.g., 6.0 ft to 6.5 ft (2.0 m to 2.5 m)), show the same range on the preliminary plans.

Submit the preliminary plans to the Utilities for review and verification and inform them of the schedule for placing the highway improvement under contract. Periodically contact all affected Utilities to maintain a mutual understanding of the project schedule and to facilitate a timely completion of the needed adjustments. For complex or utility-sensitive projects, hold coordination meetings with all affected Utilities to discuss and/or clarify the following:

- relevant details of the overall project scope,
- potential conflict areas,
- design alternatives,
- coordination of adjustments,
- timing and scheduling of work,
- deadlines for permit applications,
- deadlines for completing adjustments; and
- budgeting for future adjustments.

6-3.02(d) Pre-Final Plans

Pre-final plans are considered to be 90% to 95% complete, including all necessary details, pay items, quantities, and special provisions, and ready for district review and signatures. Send pre-final plans to the affected Utilities so they can identify conflicts, determine the extent of needed adjustments, complete adjustment designs, order materials, prepare contracts, and schedule work crews.

6-3.02(e) Final Plans

Final plans are 100% complete and ready for PS&E submittal and letting by the central office. Upon completing the final plans, the district immediately forwards the plan set to each Utility (this applies to both municipally owned and privately owned utilities). Include the following information in the transmittal letter:

1. Date of Transmittal. The date of transmittal is the date the transmittal letter is prepared.

2. Letting Date. The letting date is the anticipated date of letting by the central office.

3. Response Date. Request the Utility to respond with information by a specific date. The response date will be, at a maximum, 30 days from the Utility's receipt of the final plans.

4. Date(s) of Previous Plan Submittals. Include the date(s) that previous plans were forwarded, if applicable.

5. Verification of Accuracy. Include a short statement requesting the Utility to review the plans and verify the accuracy of its facility locations as shown on the plans.

6. Notification of Plan Changes. Inform the Utility of any revisions to its utility adjustment(s) that were made after the pre-final plan stage.

7. Other Information. Include other relevant information as appropriate.

Send the transmittal letter and final plan set to each Utility via certified mail and request that a delivery receipt be returned. Other methods of transmittal (e.g., e-mail, electronic transfer) are acceptable provided that a delivery receipt indicating the package was received by the Utility is returned.

6-3.02(f) Transmittal Letters

Examples of transmittal letters for topographic plans, preliminary plans, pre-final plans, and final plans are illustrated, respectively, in Figures 6-3.A, 6-3.B, 6-3.C, and 6-3.D.

6-3.02(g) Utility Plans

The Utility is responsible for preparing plans for adjustments to its facilities and for ensuring that the plans conform to the requirements of the following documents:

- *Federal-Aid Policy Guide*,
- *A Policy on the Accommodation of Utilities Within Freeway Right-of-Way*, and
- *Accommodation of Utilities on Right-of-Way*.

Clearly and accurately show the existing conditions, proposed utility adjustments, and any needed relocations relative to the final roadway construction. Include the following items on the utility plans:

Contract No. ____________________________

Dear ____________________________________:
Enclosed are preliminary plans for the above noted improvement, which is tentatively scheduled for the ________________________construction letting.

The improvement will consist of ____
____
____.

In order for us to complete our construction plans, it will be necessary for us to know the locations of all utilities on or along our right of way as well as possible utility conflicts.

We are enclosing two sets of plans, one of which you may keep for your files. On the second set of plans, please confirm the location of your facilities (if shown) and draw on the prints any facilities not shown. Accurate horizontal and vertical locations as well as sizes of facilities are needed. Also, please outline the areas of possible conflicts with your facilities.

Please return the marked set to this office by ______________________________.
We will include your utility locations on our detailed plans and provide you with such plans when they are available.

Since we are acquiring additional right of way, a portion of your adjustments may be reimbursable. If adjustments are required to that portion of your facilities located on easement and/or private property, then plans, estimates, and an agreement to cover reimbursement will be necessary. If a reimbursable agreement is required, please be aware that Buy America requirements, as specified in 23 CFR 635.410 shall apply to all reimbursable costs. (SEE NOTE)

In the above regard, you should advise us as soon as possible whether any portion of your adjustments is reimbursable and the approximate cost of such reimbursable adjustments. This letter is your authorization to proceed with the preliminary engineering for the adjustment of your facilities that are reimbursable. (SEE NOTE)

Contract No. ___________________________

Dear ___________________________:

Enclosed is one set of pre-final plans for subject improvement which is tentatively scheduled for the _______________________construction letting. These plans should permit you to determine the extent of adjustments to your facilities. Preliminary plans for this improvement were previously provided your office on ____.

Please review these plans as to the location of your utility facilities. Should you find any additions and/or corrections, you must notify the Project Support Section by ______________________________. Failure to comply with this notification could result in damage to your facilities and delays during the construction of this project.

We request you proceed with the preparation of plans for the necessary adjustment at the earliest possible time. If the cost of the adjustments is reimbursable, please submit four copies of the plans and estimates to this office along with documentation of easement rights.

Any adjustment work necessary in eliminating a conflict shall be done in accordance with the manual "Accommodation of Utilities on Rights of Way of the Illinois State Highway System" and an approved utility permit. Application for a permit shall be made through the Permit Section Chief. No adjustments may be performed until a permit has been issued by this office.

Should you have any questions regarding this improvement, contact ________ ____.

Sincerely,

Regional Engineer

Engineer of Program Development

SAMPLE TRANSMITTAL LETTER TO UTILITIES
(Final Plans)

Figure 6-3.D

- existing and proposed right-of-way lines;
- access control lines;
- existing utility facility;
- temporary work, if required;
- final utility facility;
- cross section and elevation drawings for all buried and overhead utilities;
- plan scale;
- roadway stationing; and
- notes for construction sequencing, as appropriate.

In addition to these requirements, consider the following additional guidelines when developing the utility plans:

1. Overhead Lines. Ensure that the vertical clearance of overhead power or communication lines crossing any highway meets or exceeds the vertical clearance criteria in the *National Electric Safety Code (NESC)*.

2. Underground Facilities. For underground facilities permitted to cross fully access-controlled or conventional highways, meet or exceed the minimum cover requirements of the applicable ANSI Standard.

3. Plan Detail. Provide a legend that clearly defines all plan symbols. Locate the plan scale in a discernible location and clearly show the roadway stationing. If the sequence of construction is not readily apparent from the plans, provide detailed notes for clarification.

4. Clear Width of Sidewalks. When placing above ground utilities in or near sidewalks, do not encroach the clear width of the sidewalk. See Section 58-1 for information on sidewalk clear width and other ADA design criteria.

5. Other Guidelines. See the publications in Section 6-1.02 for additional provisions, guidelines, and requirements.

If the utility adjustment is programmed and let by the State as a separate project, prepare a cover sheet in the same manner as for other highway projects. See Section 63-4.02 for information that should be included on the cover sheet. List each utility adjustment on the cover sheet and indicate the utility company name, type of adjustment, and its location with respect to roadway stationing. When adjustments are made under a State contract in conjunction with a roadway project, submit the plans and estimates according to the procedures in Section 66-3.

6-4 605 ILCS 5/9 – 113 AND UTILITY COORDINATION

For further statutory requirements on Utility coordination please refer to 605 ILCS 5/9-113 or contact BDE for additional guidance.

6-5 ESTIMATES

6-5.01 General

The affected Utilities are responsible for preparing and submitting to the district cost estimates for each of their respective reimbursable adjustments. Each cost estimate will be prepared in accordance with the requirements of the *Federal-Aid Policy Guide*, 23 CFR 645 Subpart A and shall meet Buy America requirements, 23 CFR 635.410.

6-5.02 Preparation of Estimates

Ensure that each cost estimate contains, at a minimum, the following details:

- labor type, hours, and hourly rate;
- equipment types and rates;
- material quantities and costs; and
- engineering costs.

Consider the following guidelines when requesting cost estimates for utility adjustments:

1. Multiple Locations of Adjustments. Request the Utility to submit a separate cost estimate for each reimbursable adjustment location within the limits of the project.

2. Multiple Sources of Funding. When a utility adjustment is necessary on a project financed with multiple funding sources, the district will indicate the limits for each participating source on the final utility plan sheets. The district will instruct the Utility on the division of the adjustment among the funding sources, and indicate the number of separate cost estimates required. For information on funding splits, see Chapter 65.

3. Utility Facility Improvements (Betterments). Improvements (betterments) to utility facilities are not reimbursable. If a Utility elects to improve, change, rearrange, or otherwise enhance its facilities beyond that which currently exists, obtain separate estimates to identify the cost difference between the preferred adjustment and the adjustment that is comparable to the existing facility.

4. Temporary Work. When temporary work (e.g., temporary pole, temporary line) is necessary to accomplish the final adjustment, separately estimate the costs attributable to the temporary portion. Document cost estimates for temporary work in the same detail as that required for permanent work.

5. Preliminary Engineering Estimates. Document preliminary engineering costs separately from construction costs.

6. Overheads and Additives. Include construction overheads and labor additives in the cost estimate as described in the *Federal-Aid Policy Guide*.

7. Credits. Credit for accrued depreciation and salvaged materials will be provided in the adjustment estimate.

8. Buy America. Buy America applies to any reimbursable utility relocation that is accomplished as a result of a federal-aid highway project. When a utility company is eligible for reimbursement for a utility adjustment they must comply with federal Buy America requirements to furnish and install only domestically manufactured iron and steel products from the United States. If the utility relocation is not eligible for reimbursement then Buy America does not apply to the utility relocation work.

6-5.03 Review of Estimates

The district will review each Utility's cost estimate for reasonableness and accuracy. Verify material costs through material suppliers or through a comparison to similar items on previous adjustments. Also verify material quantities. Compare engineering costs either to those previously approved or to those recommended by the Illinois Society of Professional Engineers. Document that all estimates have received the necessary level of technical evaluation.

6-6 AGREEMENT PROCESSING (Utility/State Agreements)

6-6.01 Review and Approval by District

The district has the primary responsibility for reviewing submittals prepared by Utilities. Thoroughly review each Agreement Package for the following:

- proper preparation and submission,
- discrepancies between the Utility's submittal and the project plans and schedule,
- reasonableness and accuracy of cost estimates,
- items that are not reimbursable by the State, and
- the identification and segregation of any proposed utility betterments.

If discrepancies are found, immediately return the plans and estimate, with appropriate comments, to the Utility. Resolve all discrepancies with the Utility prior to submitting the adjustment plans and estimate to BDE.

6-6.02 Utility Agreement Preparation

The district prepares the necessary Utility Agreements for any reimbursable relocations that have been determined. The Utility Agreement will contain the following:

- a district assigned Agreement Number (i.e., UTxxxxxx);
- all pertinent State project information;
- the full legal name of the Utility Company;
- a general description of the highway project including general location and the type of improvement, and also a detailed description of the utility relocation including type, size, number of poles, lengths, diameters, stationing, or any other special items that thoroughly describe the extent of the relocation;
- a detailed estimate of the cost and a reasoning for any cost divisions and/or betterments;
- an estimated number of working days;
- the correct signature blocks for over/under $ 250,000; and
- a general plan of the proposed utility relocation.

The following process will apply:

1. The district prepares the Utility Agreement containing the information above and forwards two originals to the Utility for review and execution.

2. After execution, the Utility returns both originals to the district where they are forwarded to BDE to be advertised in the Transportation Bulletin-Weekly Procurement and then executed by the Director of the Office of Highways Project Implementation along with the Secretary of Transportation. Agreements over $250,000 will also require signatures by the Director of Finance and Administration and the Chief Counsel.

3. When the Agreements are fully executed, one original Agreement is returned to the district and the remaining original Agreement is placed in the BDE file.

4. The district returns the original agreement to the Utility with a letter authorizing the Utility to proceed with the adjustment(s). The district also provides copies of the executed agreement to BDE (Project Coordination and Implementation Section) and the Project Control Section within the Office of Planning and Programming (OP&P).

5. The district prepares COD for the Utility Agreement using the Appropriation provided by BDE.

6-6.03 Emergency Agreements

If it is determined that a reimbursable utility adjustment is required after highway construction has begun, the district will immediately notify the BDE of the necessity and required adjustment and provide an Agreement to the Utility (see Section 6-6.02). The BDE will expedite Agreement upon receipt from the district.

In extreme cases when the adjustment has considerable impact on the progression of highway construction, the district, with concurrence from the BDE, may authorize the Utility to begin its adjustment(s) prior to completion of the Agreement. Inform the Utility that no reimbursement can be made until the Agreement is completed and executed. This type of emergency agreement will contain additional language stating the emergency authorization date and emergency authorization letter.

6-6.04 Approval of Bids

When a Utility is authorized to proceed with all or a portion of an adjustment via contract with an outside contractor rather than its own personnel, the Utility will furnish the district with a list of qualified contractors to whom invitations for bids will be sent prior to solicitation. The list of bidders is for informational purposes only and does not require approval by the State; however, the State is to be notified of the selected bidder.

6-7 ADJUSTMENT PROCEDURES

6-7.01 Change Orders

If the scope, nature, and/or cost of the adjustment has changed significantly, an amendment to the Agreement may be necessary. If it is deemed that an amendment is required, the district will submit the amendment to the Utility for signature and then to BDE for processing. See Section 6-6.02.

For minor modifications in scope, nature, and/or cost, the district should complete BDE 804A or BDE 804B and set forth the following information:

- the extent of the change,
- an estimate of the additional costs,
- the justification for the change, and
- a request for authorization of the change.

6-7.02 Final Billing

The following applies to processing the final bill for utility adjustments:

1. Preparation of Final Billing. Ensure that the final bill complies with all requirements of the *Federal-Aid Policy Guide*, Part 645 A and B.

2. Review of Final Billing. The district will review the final bill to determine whether or not the final bill reflects the labor, equipment, and materials used in the adjustment. A Buy America certificate of compliance shall be submitted with the final invoice.

3. Billing Discrepancies. If the final bill exceeds the estimated amount of the adjustment and BDE 804A or BDE 804B were not submitted in the interim, explain the increase and submit appropriate recommendations on BDE 804A or BDE 804B.

Submission of Final Billing. Submit final bills and recommendations to the Bureau of Business Services within the Office of Finance and Administration.

RAILROAD COORDINATION

7-1 ADMINISTRATIVE FUNCTIONS

7-1.01 Selection of Projects

The *Federal Highway Safety Act* authorizes funds for the improvement of highway-railroad safety by installing or upgrading warning devices.

The available program funds are allocated as a specific dollar amount between the Bureaus of Design and Environment and Local Roads and Streets with recommendations for distribution among the various types of projects (e.g., warning devices, abandoned crossings) for each bureau's program.

The BDE allocates funds to each district according to a weighted average of a district's share of the total track-lanes of crossings in the State, modified by demonstrated need. Each district prepares a list of candidate projects and proposed types of improvement for inclusion in the upcoming year's program, based on the following criteria:

- the expected crashes (see Section 7-3.02 to determine if existing warning devices are sufficient for the expected crashes);
- crash history;
- public complaints;
- individual observations made during the annual grade crossing inspection (the credibility of the existing warning devices should be carefully checked); and
- Railroad Company's request for improvements.

For additional guidance on the selection of projects, review the FHWA *Railroad-Highway Grade Crossing Handbook*. Consider the following when determining project selection:

- removal of non-complying guardrail around warning device bases; and
- removal of abandoned at-grade crossings.

Make every attempt to coordinate any proposed warning device projects on crossings of State-maintained highways where track circuitry overlaps those of adjacent local crossings. Exchange this information with the Bureau of Local Roads and Streets to coordinate the work and programming.

The BDE, working with the Bureau of Safety Programs and Engineering, Office of Planning and Programming, and Illinois Commerce Commission, may identify a list of high-crash locations not included in the district's lists. The BDE will convene a "Diagnostic Team" to investigate each crossing on the list. BDE will document any deficiencies discovered and solutions proposed.

The priority lists are finalized and published as the "FY 20__ Highway Safety Improvement Program." This publication becomes the official program of the Department. The selected projects are then sent to FHWA by BDE with a request for authorization as soon as the Federal funds become available. The projects are then administered as Federal-aid projects under the FHWA/IDOT Stewardship and Oversight Agreement.

7-1.02 Financial Participation

7-1.02(a) Grade-Separation Improvements

The following financial arrangements will apply:

1. New Structure — Department Project. Where a new grade-separation structure will be constructed as a result of a project initiated by the Department, 100% of the cost will be borne by the Department except for the following:

    a. Active Warning Devices. Where the principal grade crossing or crossings, at which active warning devices are in place or ordered to be installed by the Illinois Commerce Commission, will be closed after completion of the project, the Railroad will be required to bear 5% of the cost of the structure and approaches.

       Where the number of traffic lanes will increase, the Railroad's share will be based on the estimated cost of the theoretical structure and approaches required to separate the grade for the existing number of traffic lanes.

    b. Additional Track(s). Where the Railroad has no definite plan for the installation of additional future tracks within a reasonable time, the Railroad will be responsible for 100% of the increased costs due to providing space for the additional future track(s).

2. New Structure — Railroad Project. Where a new grade-separation structure will be constructed as a result of a Railroad-initiated project, the Railroad will be responsible for 100% of the cost.

3. Existing Structure — Department Project. Where an existing grade-separation structure on a State highway will be reconstructed as a result of a project initiated by the Department, 100% of the cost will be borne by the Department; however, this policy will not abrogate the covenants of any existing agreement that remains in effect containing provisions for maintenance or reconstruction of the structure.

4. Existing Structure — Railroad Project. Where an existing grade-separation structure (maintained by the Railroad) on a State highway is determined by the Department to be unsafe due to physical damage or deterioration and must be reconstructed, the Railroad

will be responsible for 100% of the estimated cost of the theoretical structure required to reconstruct the existing structure to its original design loading or 100% of the estimated cost to repair the existing structure to its original design loading.

7-1.02(b) Grade-Separation Maintenance

The Department will maintain new grade-separation structures on Department initiated construction. Any structures constructed as a Railroad initiated project will be maintained by the Railroad. In all cases, the Railroad will maintain the track, track bed, and railroad appurtenances.

When the Department is responsible for the maintenance of an existing structure, either by the terms of an agreement or by an Illinois Commerce Commission Order, maintenance of the Department initiated reconstructed structure will remain the responsibility of the Department.

When the Railroad is responsible for the maintenance of an existing structure, either by the terms of an agreement or by an Illinois Commerce Commission Order, maintenance of the reconstructed structure will remain the responsibility of the Railroad unless an exception is granted.

When it is in the best public interest, the Department may relieve a railroad of its maintenance obligations for a structure in return for a lump-sum payment based on the capitalized cost for perpetuation of the structure. This capitalized cost will be determined according to the following:

1. Service Life. For calculations, assume that no routine maintenance is performed and that each of the structural components will be replaced at the end of its service life in perpetuity. For most structures, the service life of the substructure will be assumed to be 100 years and, for the superstructure, 50 years. Calculate the costs for replacing the existing structural components at current prices.

2. Interest Rate. Determine the interest rate by calculating the average annual rate of return to the nearest 0.25% increment using the current fiscal year and the two preceding fiscal years. The annual rate of return for each fiscal year can be obtained from the State Treasurer's Office.

3. Capital Cost. The capitalized cost should be derived using the equation shown in Figure 7-1.A.

$$C = y\left[\frac{1}{(1+i)^n}\right] + x\left[\frac{1}{(1+i)^m}\right] + \left[\frac{\left(y\left[\frac{i}{(1+i)^{50}-1}\right]\right)}{i}\right]\left[\frac{1}{(1+i)^n}\right] + \left[\frac{\left(x\left[\frac{i}{(1+i)^{100}-1}\right]\right)}{i}\right]\left[\frac{1}{(1+i)^m}\right]$$

Where:

C	=	capitalized cost
x	=	cost of replacing substructure, in kind, at current prices
y	=	cost of replacing superstructure, in kind, at current prices
m	=	remaining life of substructure, years
n	=	remaining life of superstructure, years
100	=	service life of substructure, years

50 = service life of superstructure, years
i = interest rate, decimal

$\left[\frac{1}{(1+i)^m}\right]$ = single payment present worth factor for *m* years

$\left[\frac{1}{(1+i)^n}\right]$ = single payment present worth factor for *n* years

$\left[\frac{i}{(1+i)^{100}-1}\right]$ = sinking fund factor for 100 years

$\left[\frac{i}{(1+i)^{50}-1}\right]$ = sinking fund factor for 50 years

$x\left[\frac{1}{(1+i)^m}\right]$ = present cost which expresses the cost of replacing the substructure *m* years from the present

$y\left[\frac{1}{(1+i)^n}\right]$ = present cost which expresses the cost of replacing the superstructure *n* years from the present

$\left[\frac{\left(x\left[\frac{i}{(1+i)^{100}-1}\right]\right)}{i}\right]\left[\frac{1}{(1+i)^m}\right]$ = present cost which expresses the cost of replacing the substructure at 100-year intervals in perpetuity beginning at a point in time *m* years from the present

$\left[\frac{\left(y\left[\frac{i}{(1+i)^{50}-1}\right]\right)}{i}\right]\left[\frac{1}{(1+i)^n}\right]$ = present cost which expresses the cost of replacing the superstructure at 50-year intervals in perpetuity beginning at a point in time *n* years from the present

CAPITAL COST DETERMINATIONS

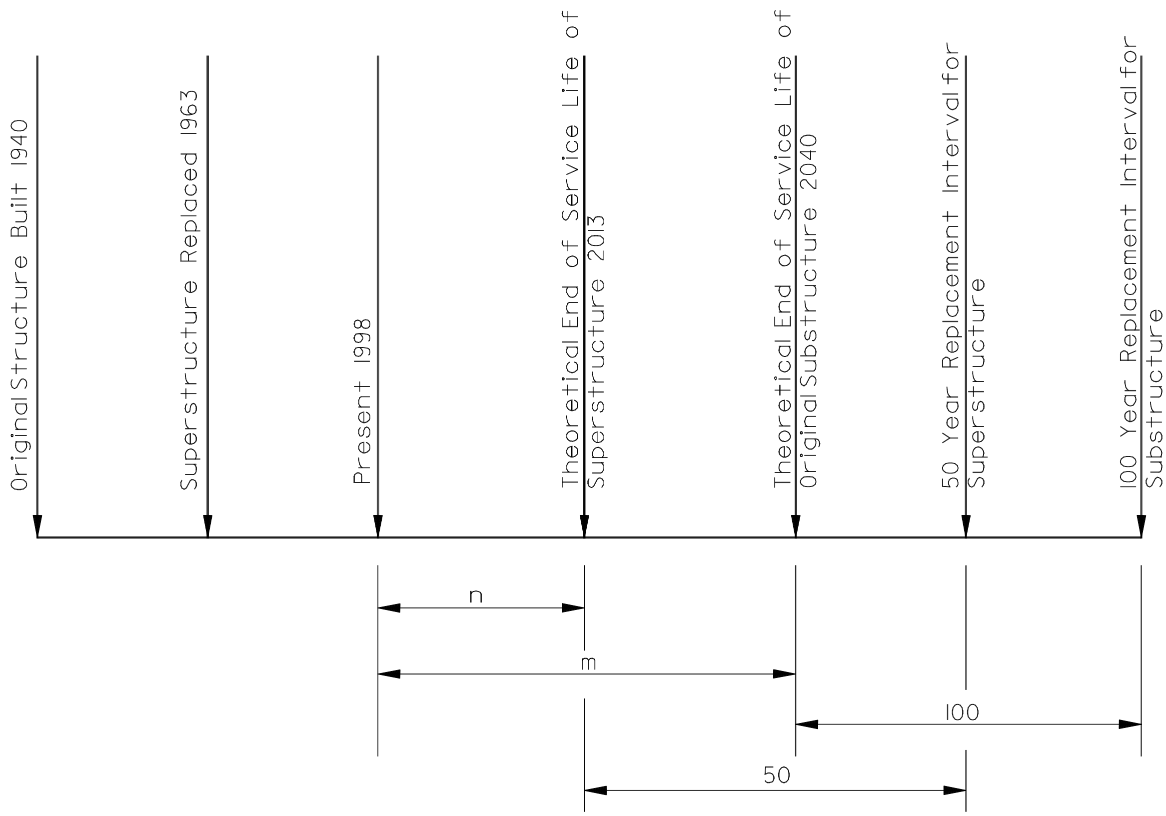
Figure 7-1.A

* * * * * * * * * *

Example 7-1.1

Given: An original highway-railroad grade structure was built in 1940. In 1963, the original superstructure was removed and replaced. Maintenance of the structure has been borne equally by the Railroad and the Department by Illinois Commerce Commission Order.

x = \$52,003 – Cost to replace the substructure
y = \$56,956 – Cost to replace superstructure
m = 42 years – Remaining life of substructure
n = 15 years – Remaining life of superstructure
i = 6% – Interest rate



Problem: A Railroad has indicated its interest in being relieved of its maintenance obligation for a highway-railroad grade-separation structure in return for a lump-sum payment to the Department in a sum equivalent to the capitalized cost for perpetuation of the structure.

<u>Solution</u>:

$$x\left[\frac{1}{(1+i)^m}\right] = 52{,}003(0.0865) = \$4498.26$$

$$y\left[\frac{1}{(1+i)^n}\right] = 56{,}956(0.4173) = \$23{,}767.74$$

$$\left[\frac{\left(x\left[\frac{i}{(1+i)^{100} \quad 1}\right]\right)}{i}\right]\left[\frac{1}{(1+i)^m}\right] = \left[\frac{(52{,}003[0.00018])}{0.06}\right][0.0865] = \$13.49$$

$$\left[\frac{\left(y\left[\frac{i}{(1+i)^{50} \quad 1}\right]\right)}{i}\right]\left[\frac{1}{(1+i)^n}\right] = \left[\frac{(56{,}956[0.00344])}{0.06}\right][0.4173] = \$1362.69$$

Capitalized Cost = $29,642.18

Railroad share (50%) = 0.5 (29,642.18) = $14,821.09

* * * * * * * * * *

7-1.02(c) Grade Crossing Participation

The Department opposes any new at-grade crossing when such crossing involves a railroad line used for passenger train operations, regardless of the operator or frequency of the trains or the location of the crossing.

Where a new grade crossing of a freight rail line is established or an existing grade crossing will be reconstructed on a State highway as a result of a highway improvement project initiated by the Department, the Department will be responsible for 100% of the cost for constructing the crossing.

Where a new grade crossing is established or an existing grade crossing will be reconstructed on a State highway as a result of a railroad reconstruction, rehabilitation, or maintenance program initiated by the Railroad, the Railroad will be responsible for 100% of the cost of constructing or reconstructing the crossing.

When the Department determines that an existing grade crossing on a State highway is at the end of its service life and in need of reconstruction or when the Department determines that conditions warrant reconstruction, the Department may participate toward the cost of the new construction or reconstructing the crossing.

If an existing grade crossing on a State highway will be reconstructed or rehabilitated as a result of a project initiated by other than the Department or the Railroad and the Department has determined that the installation is necessary and in the best public interest, the Department may participate in the cost in proportion to the benefits to the motoring public.

Where all or any portion of the cost of new construction, reconstruction, or rehabilitation of a crossing will be provided by the Department, participation by the Department will be limited to the materials, labor, and equipment required to construct, reconstruct, or rehabilitate the crossing.

7-1.02(d) Grade Crossing and Warning Device Maintenance

The Railroad, or the track owner, is responsible for maintenance of the grade crossing and the warning devices, actuating devices, and circuitry.

7-1.02(e) Grade Crossing Warning Device Improvements

The Department requires the installation of appropriate warning signs and devices at all highway-railroad grade crossings. The Department's participation in the cost of these devices is contingent upon Department concurrence in the type of device required, the degree of sophistication necessary in the activating equipment, and the degree of contribution to highway capacity and safety.

Funding for all Department-initiated projects will be determined on a priority basis based on vehicular traffic, railroad traffic, highway classification, and the availability of funds.

The Department, the Railroad, or agencies other than the Department may propose changes in either the type of warning devices or in the method of actuation at existing crossings. Where the Department has determined that these changes will result in mutual benefits to all parties involved, the Department may participate in the costs in proportion to the benefits to the motoring public.

The Department will generally bear 100% of the cost of the improvements for the following conditions:

- Where the project includes the installation of warning devices at new grade crossings, the relocation of existing warning devices, or the installation of additional devices at existing crossings that are required as the result of highway improvement projects initiated by the Department.

- Where the Department has determined that the warning devices in place at an existing grade crossing are no longer adequate to provide for the safety of the motoring public and that additional or supplemental warning devices are deemed necessary.

- Where the Department has determined that a change is necessary in the method of actuation of automatic warning devices at existing crossings for the improvement of vehicular operations.

The Railroad will be responsible for 100% of the cost of the improvements where changes to an existing grade crossing or the construction of a new grade crossing are necessitated as the result of improvement or maintenance programs initiated by the Railroad or changes in rail operations (e.g., number of movements, speeds).

7-1.02(f) Grade Crossing Modification on a Permit Crossing

Where a railroad grade crossing has been created as the result of a permit issued by the Department, the Railroad or track owner shall take prompt action to adjust, reconstruct, or otherwise modify the crossing and/or warning devices as required by any highway improvements upon receiving a request from the Department. The Railroad or track owner will be responsible for 100% of the costs of such improvements. See *Accommodation of Utilities on Right-of-Way, 92 Ill. Admin. Code 530.*

7-1.03 <u>Preliminary Engineering</u>

7-1.03(a) General

In most instances, the Department prepares the plans for new construction, modernization, or reconstruction of highway structures, drainage facilities, and the approaches. Occasionally, the Railroad will prepare plans for a structure carrying the railroad over a highway.

All plans, specifications, and special provisions prepared by either the Department or the Railroad are subject to approval by the other party, and no changes will be allowed by either party without the consent in writing of the other party.

7-1.03(b) Reimbursement

Preliminary engineering performed by Railroad forces or by consultants employed either by the Railroad or by IDOT on highway-railroad grade separations is reimbursable with Federal or State funds.

7-1.03(c) Railroad Structures Designed By or For the Railroad

This section applies to a railroad structure over a State highway. When the Railroad elects not to perform the structure design with its own forces and the Department does not have the forces available to perform the design within the required schedule, a consultant may be employed to perform the design. Ordinarily, the Department will select a suitable consultant from a list of consultants approved by the Railroad. The design work is then performed by agreement between the Department and the consultant with the Railroad’s approval.

In certain cases, where justified, the Railroad will select a consultant to design the structure and enter into an agreement with the consultant for the design. The selection of the consultant and the terms, including the fee, is subject to IDOT approval.

In those projects where Federal-aid funds are anticipated for reimbursing the Railroad's consultant for the cost of preparing the plans for a structure, the preliminary engineering cost must be programmed before IDOT can authorize the preparation of such plans.

7-1.03(d) Preliminary Engineering Portion of Railroad Force Account Work

The Railroad will generally perform the preliminary engineering with its own forces for the railroad force account work covered by construction agreements between the Department and the Railroad.

In special instances (particularly warning device system design), the Railroad may use the services of a consultant retained by the Railroad to perform the preliminary engineering.

7-1.03(e) Programming

When the method of treating a railroad crossing has been determined, it is essential that the district plan, initiate, and coordinate the programming and preliminary engineering portion of the proposed construction.

7-1.04 <u>Commerce Commission Hearings</u>

7-1.04(a) Commerce Commission Jurisdiction

Rail carriers (Railroads) are corporations engaged in the transportation of passengers and/or goods for hire in the State of Illinois, as defined in the *Illinois Commercial Transportation Law, 625 ILCS 5/18c-1101 et seq.,* and come under the jurisdiction of the Illinois Commerce Commission. The *Code* states, in part:

> *No public road, highway, or street shall hereafter be constructed across the track of any rail carrier at grade, nor shall the track of any rail carrier be constructed across a public road, highway, or street at grade, without having first secured the permission of the Commission;*

The Commission's rules, regulations, and requirements cover the construction, maintenance, division of cost, marking, and signalizing of highway and railroad crossings in the State.

7-1.04(b) Procedure Before the Commission

The Preliminary Engineering Section will work with the Office of Chief Counsel to prepare petitions to the Commission requesting issuance of an Order relative to the crossing of a railroad by a proposed highway improvement when the improvement requiring the crossing was initiated by the Department.

If a hearing is required, the Department must be represented at the hearing to present the evidence through an expert witness who is familiar with the project.

After the case is heard by a duly authorized examiner of the Commission, an Order will be entered either denying or granting the request of the petitioner.

When a Railroad desires to establish a new crossing with a highway, it will file a petition with the Commission and present its case at a hearing which will be attended by representatives from the Office of Chief Counsel, the Preliminary Engineering Section, and the district involved when the Department is a respondent. This action is followed by the decision of the Commission as outlined in its Order. The Railroad must also acquire a permit from the district according to the Department's *Accommodation of Utilities on Right-of-Way.*

7-1.05 <u>Procedure for Removing Abandoned Railroad Structures and Grade Crossings</u>

Many highway-railroad grade-separation structures, at-grade crossings, and related track materials of rail lines that have been abandoned remain in place on intersecting public highways. These structures constitute obstructions and encroachments on these highways and should be removed.

Before a Railroad company's right to operate on a particular line has been terminated (i.e., the rail line is abandoned), the Railroad company had authority from the Illinois Commerce Commission to obstruct the highway with the structure in question. After the right to operate is terminated, there remains no authority to obstruct the highway. Therefore, the Railroad company may be treated as any other person obstructing the highway.

The *Illinois Highway Code, 605 ILCS 5/9-117* establishes the procedure for identifying and removing obstructions from public highways. This procedure may be used if it is clear that the highway authority has absolutely no responsibility. Because sole responsibility by a Railroad is uncommon, it is unlikely that this procedure for removing obstructions will be used often. The Office of Chief Counsel may be consulted to help determine whether this procedure is appropriate in a particular situation.

The *Illinois Commercial Transportation Law, 625 ILCS 5/18c-7401* provides an additional statutory means for removing railroad structures from public highways. Under this law, the Illinois Commerce Commission, after notice and hearing, has the authority to order the removal of abandoned tracks and overhead railroad structures crossing highways, waterways, or other railroads. The Commission may equitably apportion the costs between the parties. This may be based on the assignment of original construction costs and/or the present maintenance responsibility.

Therefore, after determining that the abandonment is final, as per notice from the Bureau of Rail in the Office of Intermodal Project Implementation, and that the facility can be removed and after the district determines that the Railroad refuses or delays the removal, a request should be made to BDE for the removal. BDE will ensure the abandonment is final and request the Office of Chief

Counsel to file a Petition for an Order requiring the removal of the facility. The district should be aware that the Commission may order the Department to bear part or all of the cost of removal.

If the Department determines that it should pay the entire cost of structure removal or that the structure presents an immediate danger to the traveling public, the Department may remove the structure without the permission of the Railroad, its successor in interest, or the Illinois Commerce Commission.

Remember that only the Railroad's right to operate is being abandoned. The Railroad may wish to sell its structures or may wish to use the structure at another location. If the Department agrees that the Railroad owns the structure on the highway right-of-way, the Railroad should be allowed to remove it. If the Department removes a structure owned by the Railroad or its assignee, the removed materials should be made available to the rightful owner.

7-1.06 Acquisition of Railroad Property

When the Department requires property interest from a Railroad to complete a highway improvement, sufficient lead time to acquire these interests is essential. It is critical that once it is determined that a project will require the acquisition of property owned or under the control of a Railroad that the Department's Land Acquisition personnel be informed.

7-1.06(a) Acquisition of Railroad Non-operating Property

The acquisition of non-operating Railroad property is accomplished according to the criteria outlined in the *Land Acquisition Policies and Procedures Manual*, and the *Federal-Aid Policy Guide*.

7-1.06(b) Acquisition of Railroad Operating Property

Where a proposed highway improvement will cross or longitudinally use a Railroad's operating property, the Department generally will acquire a permanent easement to construct and maintain the improvement. There will be instances when a highway project will require only the temporary use of Railroad property. When this situation occurs, permission to do work of a temporary nature on Railroad right-of-way will be included in the construction and maintenance agreements between the Department and the Railroad. When there is no agreement, permission to do work of a temporary nature will be obtained by the district Land Acquisition staff.

Occasions where payment for such acquisition may be established and paid are as follows:

1. Land Owned in Fee. When a value is indicated and the Railroad company owning the fee title to its operating right-of-way can continue to operate its facilities either in, above, below, or adjacent to the highway, the Department of Transportation will compensate the Railroad for the right-of-way needed according to the Department's *Land Acquisition Policies and Procedures Manual*. No compensation of any kind will be provided for the acquisition of right-of-way to construct a grade-separation facility where an existing highway grade crossing is eliminated.

2. Land Owned as an Easement. If a Railroad has only an easement for its operating right-of-way and can continue to operate its facilities either in, above, below, or adjacent to the highway, there will be no compensation paid to cross or longitudinally use any part of the right-of-way.

The Railroad shall execute the necessary documents to cover the rights or interests required for the highway project according to the criteria in the *Land Acquisition Policies and Procedures Manual*, regardless of whether or not it owns the fee title or easement. The *Land Acquisition Policies and Procedures Manual* provides the procedure to be used if condemnation is necessary. However, note that permission of the Illinois Commerce Commission is a prerequisite to the filing of the complaint for condemnation and motion for the right of immediate possession and the time required must be considered when scheduling the project.

7-2 AGREEMENTS

7-2.01 General

The Preliminary Engineering Section within BDE is responsible for the preparation and negotiation of formal Agreements between the Department and the Railroad. This includes railroad grade separation projects, grade crossing projects, or projects involving the installation of State facilities (e.g., pipe culverts, storm sewers, underground electrical wiring on Railroad property) or any other work on Railroad property for improvements to the State highway system. The district should submit the necessary crossing data with sufficient lead time allowed for these negotiations. Typically, a year or more is required.

The Agreement will cover:

- division of work and expense involved between IDOT and the Railroad in connection with the crossing improvement;
- responsibilities for the future maintenance of the improvement;
- establishment of the Railroad's share of the cost as determined under the provisions of any one of the several classifications provided in the *Federal-Aid Policy Guide* and Section 7-1.02;
- reference to the acquisition of property rights, (see Section 7-1.06);
- reimbursement of the costs incurred by the Railroad according to the requirements of the *Federal-Aid Policy Guide*;
- coverage of liability during construction operations; and
- reference to or identification of plans and plan approval.
- Buy America requirements, as specified in 23 CFR 635.410

7-2.02 District Data

When Federal-aid funds are proposed, the district will be required to submit the necessary data for programming the project together with the necessary data for negotiations with the Railroad.

The district should submit a report to BDE containing reproducible drawings of the crossing plan prepared in sufficient detail showing the following:

1. Grade Separations. Include the following in the report:
    - existing conditions in the crossing area;

- a plan and profile of the track or tracks and of the proposed highway improvement for 500 ft (150 m) in each direction from the intersection of the highway and railroad centerlines;
- typical highway and track cross sections;
- railroad and highway right-of-way limits;
- distance to a railroad reference marker (i.e., mile post);
- railroad communication lines including the location of poles and height of wires;
- existing and proposed drainage ditches, structures, and the direction of flow affecting the railroad;
- construction details of existing and/or proposed grade crossings in the vicinity; note the type and location of warning devices;
- details of any track adjustments or runaround tracks proposed, including staging;
- details for detour road crossings and proposed temporary warning devices, including a plat and description of temporary easement if required;
- number and speeds of passenger and freight trains using the track or tracks daily;
- plat and description of the temporary easement as required by Section 7-3.03 for the possible location of the contractor's temporary grade crossing; and
- all other data pertinent to the project.

2. Grade Crossings. For this report, full-size plan sheets will not be required. Include the following in the report:

    a. Existing Grade Crossing. At existing grade crossings, provide the following:

        - number of mainline and subsidiary tracks;
        - type, width, and condition of the existing crossing(s);
        - type and locations of the existing warning devices at the crossing;
        - number and speeds of passenger and freight trains using the crossing daily; and
        - current and ten-year ADT of the highway.

    b. Proposed Grade Crossing. For new grade crossings, provide the following:

- number of tracks;
- type and width of crossing(s);
- types and locations of the proposed warning devices;
- anticipated date of construction; and
- any unusual conditions bearing on the proposed work.

c. Alternative Methods of Accommodating Traffic. For most projects, include a recommended method for accommodating traffic in the report. Methods are discussed in Chapter 13 and Departmental Policy TRA-3, Handling Traffic During the Reconstruction and Repair of Railroad Grade Crossings.

7-2.03 Negotiation Procedure

The Railroad Agreement is normally prepared by the Preliminary Engineering Section, Agreements Unit, and sent to the Railroad for review. A copy is also furnished to the district for its review.

When the Railroad receives the Agreement, the Railroad will begin preparation of the plans and cost estimates for the railroad force account work involved. Upon completion, the Railroad will submit the plans and cost estimates to the Department for review.

After the plans and cost estimates have been approved by the Department and the Agreement has been executed by the Railroad, the Agreement is returned to BDE for execution by the Department.

Upon full execution of the Agreement by the Railroad and the Department, one original copy is retained for the BDE file and the Agreement Unit distributes copies of the Agreement to the following:

- Railroad (1 original copy);
- Illinois Commerce Commission (1 copy);
- district (1 copy);
- Bureau of Accounting and Auditing (1 copy at the time the contract obligation document is established); and
- Project Control (1 copy).

7-2.04 Authorization Procedure

When a contract is awarded for a highway improvement which includes work in the area of a highway-railroad grade crossing, and when the affected Railroad is required to adjust its facilities as a part of the improvement, construction delays may be encountered. Generally, the Railroad is authorized to assemble its materials and perform its construction work at the time the contract has been scheduled for letting or at the time the contract is awarded. Because time is required by the Railroad to order materials and schedule work crews, it is not uncommon for the highway contractor to be unable to proceed with its work in the area of the crossing. Although the delay may not create problems for the highway contractor or for the Department, it does represent a hardship to the motoring public.

To avoid delays and to facilitate construction, the district is allowed to review each project individually to determine if the contractor's operations will be facilitated by authorizing the Railroad to proceed prior to the letting advertisement or award of the highway contract. The district will authorize the Railroad to proceed with the force account work according to the executed railroad Agreement. The authorization should be issued to the same Railroad official to whom BDE sent the executed Agreement.

Before an early authorization is given, a most probable highway letting date should have been established so that any necessary coordination between the Railroad and the contractor can be undertaken. Proper timing can also reduce any interim roadway maintenance.

If Federal-aid funds are used, the crossing work also must be programmed and authorized before the advance Railroad work is authorized. The district must request and obtain approval for early authorization from BDE's Project Coordination and Implementation Section, Program Support Unit and send a copy of the district authorization letter to the Railroad to BDE.

BDE will authorize the railroad work for individual safety crossings not related to highway contracts.

7-2.05 <u>Adjustment Procedures</u>

7-2.05(a) Change Orders

If a plan or estimate change becomes necessary after the Agreement has been executed, the district initiates the change. Extensively review all change orders or amendments to Agreements. Fully explain any deviations between the actual cost or the revised estimate and the original estimate. Submit supporting documentation (e.g., reason for change, copies of revised estimate, statements of actual cost) with the request for the change order or amendment to the Agreement. Changes will not be deemed accepted until approved by BDE.

If the scope, nature, and/or cost of the adjustment has changed significantly, an amendment to the Agreement may be necessary. If it is deemed that such an amendment is needed, submit an Agreement report for the amendment to BDE for processing. See Section 7-2.02.

For minor modifications in scope, nature, and/or cost, the district should complete BDE 804A or BDE 804B and set forth the following information:

- the extent of the change,

- an estimate of the additional costs,
- the justification for the change, and
- a request for authorization of the change.

BDE 804A, Request for Authorization for Costs Involving Utility, Railroad or Local Agency Agreement under $250,000 and BDE 804B, Request for Authorization for Costs Involving Utility, Railroad or Local Agency Agreement $250,000 and above may be located on the IDOT official website.

7-2.05(b) Final Billing

The following applies to processing the final bill for railroad adjustments:

1. Preparation of Final Billing. Ensure that the final bill complies with all requirements of the *Federal-Aid Policy Guide*, Part 140, Subpart I.

2. Review of Final Billing. The district will review the final bill to determine whether or not the final bill reflects the labor, equipment, and materials used in the adjustment. Buy America certificate of Compliance shall be submitted with the Final Invoice.

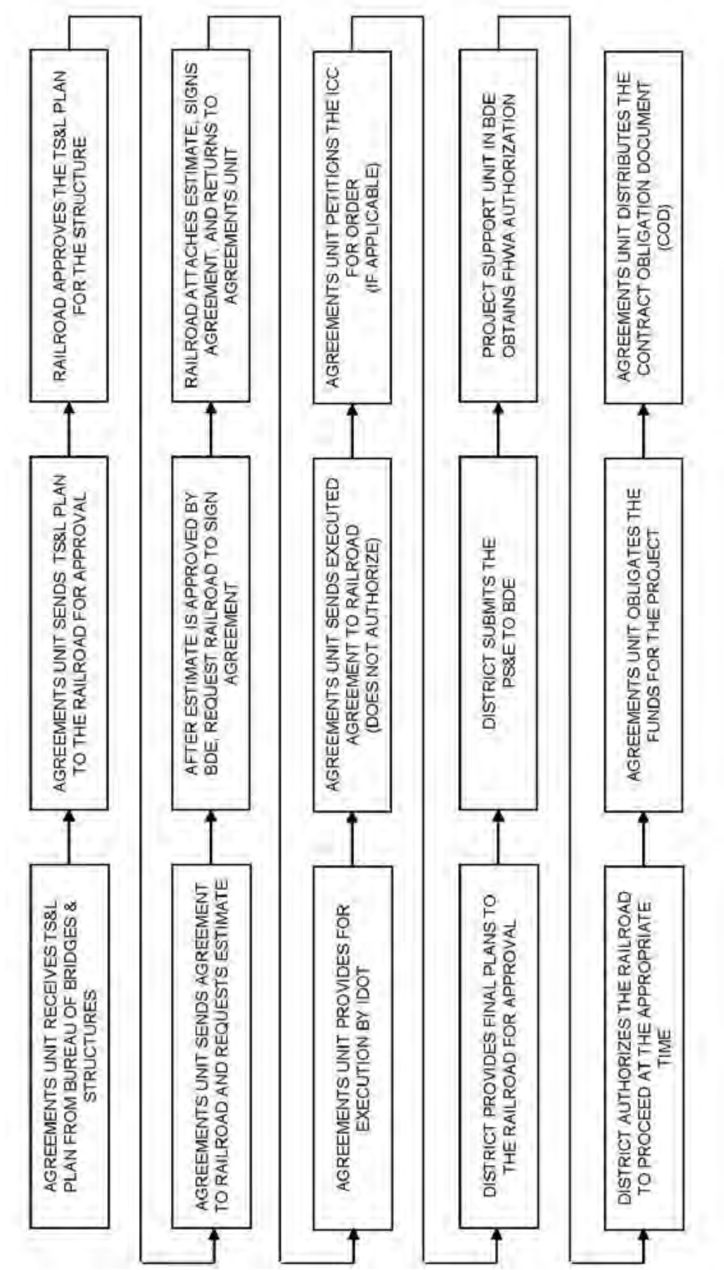
3. Submission of Final Billing. Submit final bills and recommendations to the Bureau of Accounting and Auditing for audit.

4. Billing Discrepancies. If the final cost as approved by audit exceeds the estimated amount of the adjustment and BDE 804A or BDE 804B were not submitted in the interim, explain the increase and submit appropriate recommendations on BDE 804A and BDE 804B.

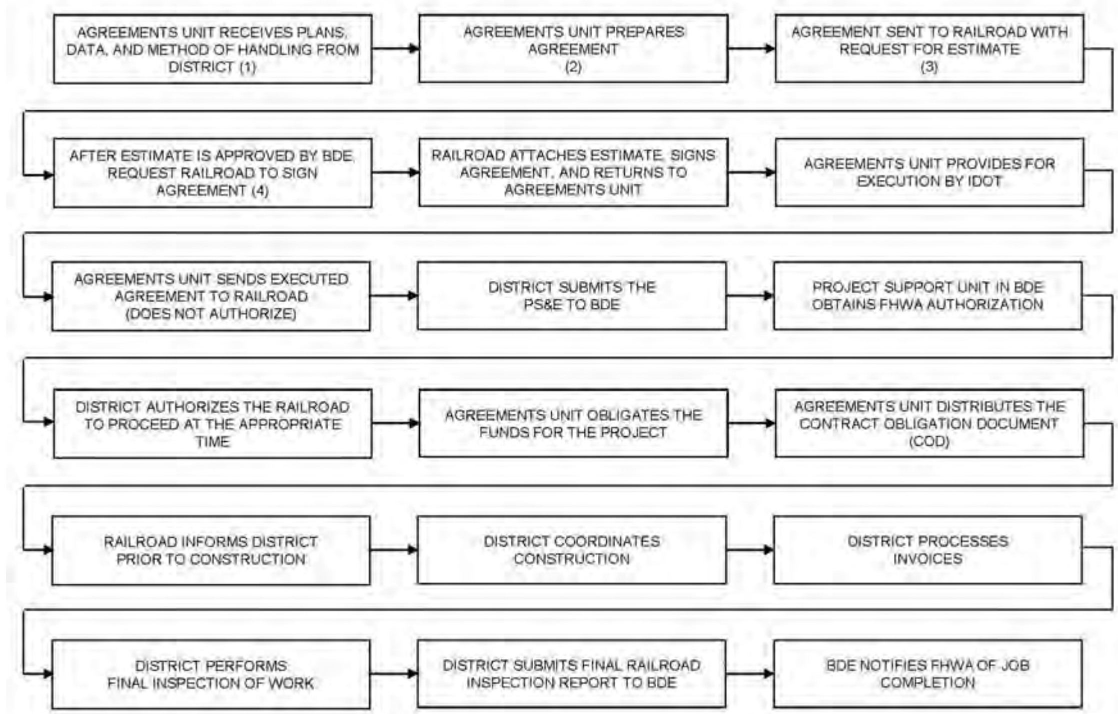
7-2.06 Railroad Agreement Process

Figures 7-2.A, 7-2.B, and 7-2.C illustrate flowcharts for the agreement negotiation processes for the following projects:

- Figure 7-2.A — grade separation structure projects,
- Figure 7-2.B — grade crossings/non-safety projects, and
- Figure 7-2.C — grade crossings/safety projects.



RAILROAD AGREEMENT PROCESS
(Grade Separation Structure Projects)
Figure 7-2.A



(1) District submittal should indicate whether an interconnection is needed, including any timing requirements for the railroad control circuitry. Interconnection plans and requirements will be approved by the Central Bureau of Operations prior to submittal to the Railroad.

(2) When signal improvements are involved, the typical agreement states the following:

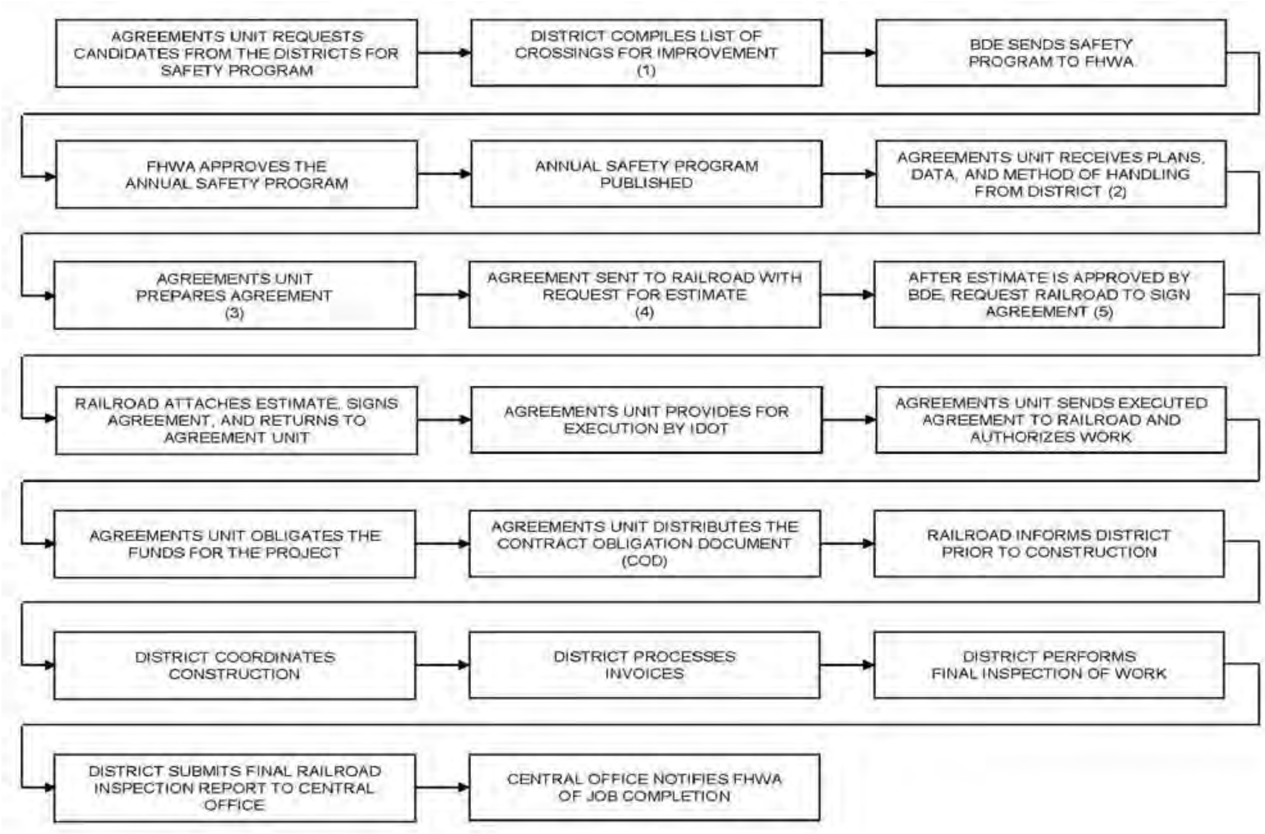
The COMPANY will petition the Illinois Commerce Commission in accordance with 92 Illinois Administrative Code 1535 to take jurisdiction in this matter and to enter such orders as may be necessary.

(3) The transmittal to the Railroad should indicate any interconnection requirements.

(4) The Railroad’ s interconnection plans will be approved by the Central Bureau of Operations prior to the approval of the estimate.

RAILROAD AGREEMENT PROCESS
(Grade Crossing/Non-Safety Projects)

Figure 7-2.B



(1) List based on annual inspections, expected crashes, and complaints.

(2) District submittal should indicate whether an interconnection is needed, including any timing requirements for the railroad control circuitry. Interconnection plans and requirements will be approved by the Central Bureau of Operations prior to submittal to the Railroad.

(3) When signal improvements are involved, the typical agreement states the following:

> *The COMPANY will petition the Illinois Commerce Commission in accordance with* 92 Illinois Administrative Code 1535 *to take jurisdiction in this matter and to enter such orders as may be necessary.*

(4) The transmittal to the Railroad should indicate any interconnection and requirements.

(5) The Railroad' s interconnection plans will be approved by the Central Bureau of Operations prior to the approval of the estimate.

(Grade Crossing/Safety Projects)

Figure 7-2.C

7-3 DESIGN FUNCTIONS

7-3.01 General

As State highways and railroads are expanded or modernized, it is inevitable that new highway-railroad crossings will need to be established and that existing crossings will need to be modernized, reconstructed, or eliminated. Basically, there are two methods of accomplishing these crossings:

1. At-Grade Crossing. This method is where the highway and railroad intersect at the same elevation requiring proper warning to reduce the inherent hazard of collisions between trains and highway vehicles.

2. Grade Separation Crossing. This method is where the inherent collision hazard is eliminated by the construction of a structure that carries the highway over or under the railroad.

7-3.02 At-Grade Crossings

7-3.02(a) Selection Guidelines for Warning Devices

Warning devices will be warranted at all highway-railroad crossings where grades are not separated. Select the type of warning device according to the following:

1. General. At a minimum, provide reflectorized crossbucks, pavement markings, and advance warning signs as indicated in the *Illinois Manual on Uniform Traffic Control Devices* at all crossings.

2. Flashing Signals. Install flashing signals at crossings where the warrants for gates are not met and where the expected crash frequency equals or exceeds 0.02. Use Equation 7-3.1 and the factors in Figure 7-3.A to determine the expected crash frequency.

   $$ECF = A \times B \times T \qquad \text{Equation 7-3.1}$$

   Where:

ECF	=	Expected Crash Frequency
A	=	Traffic factor, see Figure 7-3.A
B	=	Component factor, see Figure 7-3.A
T	=	Current number of trains per day

3. Cantilevered Flashing Signals. Use cantilevered flashing signals, in addition to other warning devices, on multilane highways that qualify for active warning devices and where there is the possibility of a truck blocking the view of the roadside signals. Also, consider providing cantilever signals at high-frequency crash locations that possibly could be improved by more visible signals.

A Factors

VEHICLES PER DAY (10-YR. ADT)	FACTOR
250	0.000347
500	0.000694
1000	0.001377
2000	0.002627
3000	0.003981
4000	0.005208
5000	0.006516
6000	0.007720
7000	0.009005
8000	0.010278
9000	0.011435
10000	0.012674
12000	0.015012
14000	0.017315
16000	0.019549
18000	0.021736
20000	0.023877
25000	0.029051
30000	0.034757

B Factors — Basic Values for Existing Devices

Components	Basic Value Adjustments
Crossbucks, traffic volume less than 500 vehicles per day	3.89
Crossbucks, urban	3.06
Crossbucks, rural	3.08
Stop signs, traffic volume less than 500 vehicles per day	4.51
Stop signs	1.15
Wigwags	0.61
Flashing lights, urban	0.23
Flashing lights, rural	0.93
Gates, urban	0.08
Gates, rural	0.19

CRASH FREQUENCY FACTORS
(Highway-Railroad Grade Crossings)

Figure 7-3.A

4. Gates and Flashing Signals. Provide flashing signals and gates where one or more of the following conditions are met:

- multiple mainline railroad tracks;
- multiple tracks at or in the vicinity of the crossing which may be occupied by a train or locomotive, so as to obscure from view the movement of another train approaching the crossing;
- high-speed train operation combined with limited sight distance at either single or multiple track crossings;
- a combination of high speeds and moderately high volumes of highway and railroad traffic;
- either a high volume of vehicular traffic, high number of train movements, substantial numbers of school buses or trucks carrying hazardous materials, unusually restricted sight distance, continuing crash occurrences, or any combination of these conditions;
- the expected crash frequency for flashing lights exceeds 0.02 and the benefit-cost ratio equals or exceeds 1.0 (the method for determining the benefit-cost ratio is shown in Figure 7-3.B); and/or
- a diagnostic team recommends them.

In individual cases where a diagnostic team justifies that gates are not appropriate, gates will not be required.

5. High-Type Device. Provide a higher type of warning device which may not be justified under any of the preceding warrants based on continuing or potential crash occurrence due to:

- unusual track or roadway geometrics;
- restricted sight distance; and/or
- other unusual conditions, such as where there exist exceptional crash consequences to a large number of people as rail or highway passengers or as the result of a crash involving hazardous materials.

In other instances, a lower level device may be justified if concurred with by a diagnostic team.

Definitions: ECF = Expected Crash Frequency = A x B x T Equation 7-3.1

Z = Cost of crash = ratio of deaths and injuries per crash (average for latest 3 years in Illinois) x cost per crash (National Safety Council crash cost data which is documented and periodically updated by BDE)

U = Cost of flashing lights divided by expected life = ______________

V = Yearly maintenance cost of flashing lights = ______________

Y = Cost of gates divided by expected life = ______________

W = Additional annual cost to maintain gates instead of flashing lights = ______________

L = Cost of grade separation divided by expected life = ______________

M = Additional annual cost to maintain grade separation instead of gates = ______________

(Expected life can be assumed as 20 to 30 years.)

<u>Step 1</u>: ECF for present installation = A x B x T = ______________

<u>Step 2</u>: ECF for proposed installation = A x B x T = ______________

<u>Step 3</u>: Savings in ECF per year = Step 1 - Step 2 = ______________

<u>Step 4</u>: Benefit = Z x Step 3 = $______________

<u>Step 5</u>: Cost of proposed installation = Y + W, or U + V, or L + M = $______________

<u>Step 6</u>: Benefit-Cost Ratio = Step 4 divided by Step 5 = ______________

BENEFIT-COST RATIO ANALYSIS
(Highway-Railroad Crossings)

Figure 7-3.B

Where the distance measured along the centerline of the highway between two regularly used adjacent tracks is less than 100 ft (30 m), consider the crossing as a multiple track crossing and install warning devices accordingly. Where the distance is 100 ft (30 m) or more, consider each crossing as individual crossings and signalize each according to the preceding warrants.

7-3.02(b) Example for Warning Device Selection

* * * * * * * * * *

Example 7-3.1

Given: Urban Area
Crossbuck Protection
10-year ADT = 5000 Vehicles Per Day
Current Train Traffic = 5 Trains Per Day

Problem: Determine the appropriate warning devices that should be used at this crossing.

Solution: First determine the expected crash frequency of the existing crossbuck protection.

Expected Crash Frequency:
ECF = 0.006516 x 3.06 x 5
ECF = 0.10
ECF = 1 crash every ten years

Crash frequency is greater than 0.02 indicating the need for higher type device.

Try flashing lights:
“B” = 0.23

ECF = 0.006516 x 0.23 x 5
ECF = 0.01

Therefore, flashing lights are warranted.

* * * * * * * * * *

7-3.02(c) Circuitry Devices

Refinements to activation circuitry should be recommended where the credibility of the warning devices could be beneficially increased. This includes shortening the signal “starts” to reflect reduced train speeds, or installing motion detectors or constant warning time devices (predictors). Consider the following:

1. Grade Crossing Predictors. Install grade crossing predictors (GCP/constant warning time) circuitry at crossings with ADT of at least 1000 vehicles and an average daily train traffic of at least 5 trains per day, or where there are concentrations of train or vehicular traffic during “rush hours” and where:

   - there are switching moves on the approach circuits,
   - at least 25% of the average daily trains operate at 25 mph (40 km/h) slower than the fastest train on the line, or
   - there is an unusual track and crossing geometry.

2. Motion Detectors.

   a. Gates. Where gates are present, provide motion detectors where there:

      - is stopping or other lengthy occupancy of the approach circuits,
      - are new gate installations,
      - is upgrading of crossings with flashing signals to gate installations, or
      - are major control circuitry changes required at existing installations.

   b. Flashing Signals. For flashing signals, provide motion detectors where there:

      - is stopping or other lengthy occupancy of the approach circuits,
      - are new flashing signal installations with ADT of 1000 vehicles or more and 5 or more trains per day, or
      - are major control circuit changes required by changes in or additions to flashing signals at crossings with ADT of 1000 vehicles or more and 5 or more trains per day.

   Note that the cost differential between grade crossing predictors (GCP/constant warning time) and motion detector circuitry is minor in comparison to the total installation cost. In addition, grade crossing predictor (GCP/constant warning time) circuitry can be adjusted to a wider, more variable set of train traffic conditions. When contemplating circuitry improvements, it is best to contact the railroad to make an accurate assessment of train traffic and a more informed decision on circuitry improvements.

7-3.02(d) Barrier Systems

The following will apply to barrier systems around warning devices:

1. General. Do not provide barrier systems (e.g., guardrail, impact attenuators) at railroad grade crossings except in extraordinary circumstances. In most cases, the roadside barrier presents more of a hazard than the railroad warning device it shields. Also, it may

block a lateral escape route in advance of the signal. Extraordinary circumstances which may justify the use of a roadside barrier in the vicinity of a railroad crossing warning device include:

- locations where the approach roadway is on a fill with side slopes steeper than 1V:3H and greater than 10 ft (3.0 m) in height,
- locations with a high-crash history involving warning device where a cost-effective analysis demonstrates a roadside barrier is warranted, and
- locations where there will be a temporary delay in moving warning devices for widening of a highway.

2. Installation. See Chapter 38 and the *Highway Standards* for the installation of guardrail at crossings.

3. Special Conditions. In industrial or other areas involving low-speed highway traffic and where warning devices are vulnerable to damage by turning truck traffic, ring-type guardrail may be installed to provide protection for warning devices. Ring-type guardrail should conform to Figures 7-3.C and 7-3.D. Substitute shielding devices (e.g., concrete, railroad ties, railroad rails) are not permitted.

4. Signals. Do not use breakaway or frangible bases for cantilever signal supports.

5. Maintenance of Barriers. The Department will maintain all longitudinal guardrail and impact attenuators. The Railroad will be responsible for maintaining the ring-type guardrail.

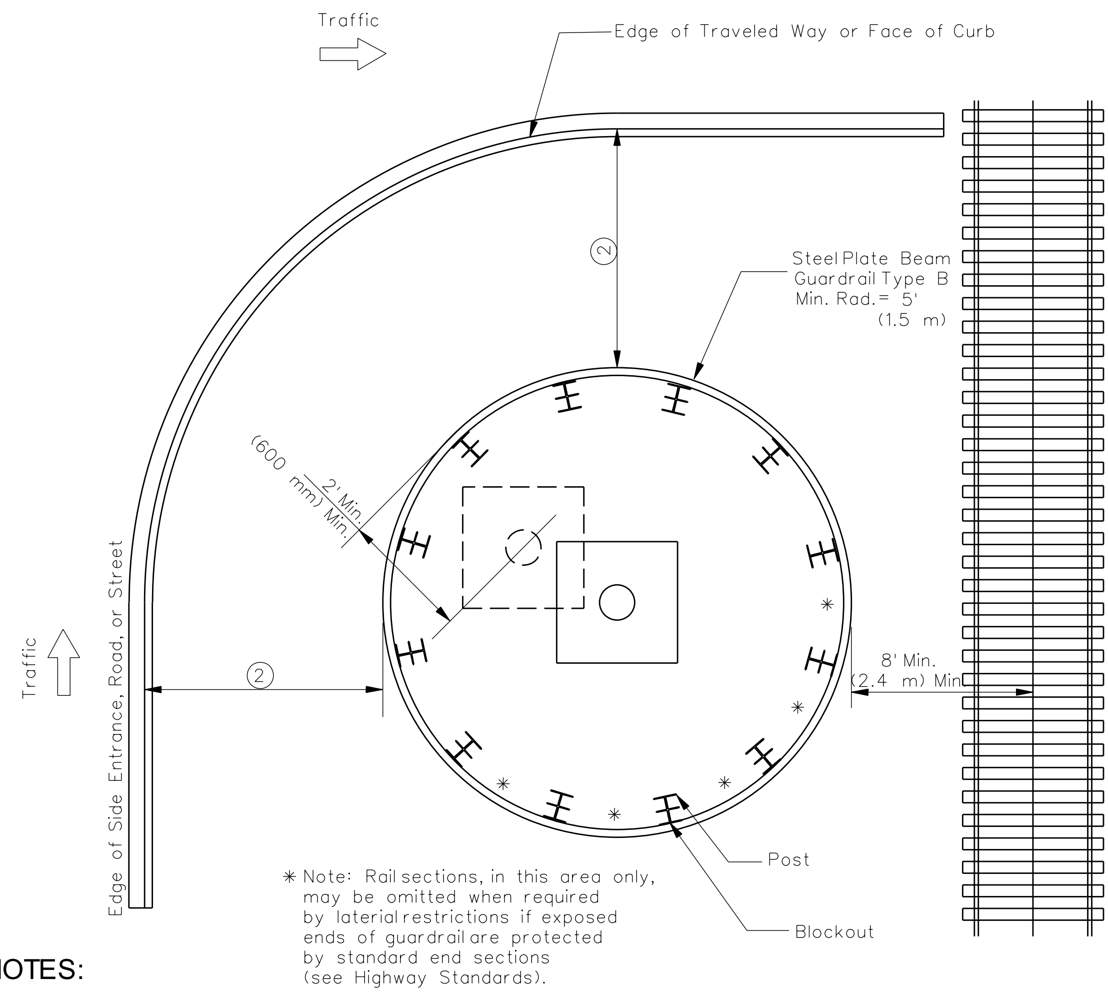
6. Approval. Approval for the erection of any roadside barrier by the Railroad must be obtained in writing from BDE.

7-3.02(e) Approaches

When a grade crossing improvement is undertaken, that portion of the roadway lying within or adjacent to the crossing should, if necessary, be improved to provide a smooth approach to the crossing so that the driver's attention will not be diverted from warning devices or oncoming trains by rough approaches. Also, consider removing or relocating any obstructions to a motorist's view of warning devices within the roadway. This includes utility poles, shrubs, trees, signs, etc.

7-3.02(f) Design Considerations

When it has been determined that an at-grade crossing is appropriate at a highway-railroad intersection, the district will prepare a plan and profile sheet for the highway showing complete



NOTES:

1. All construction and material should conform to the latest editions of the IDOT *Highway Standards* and IDOT *Standard Specifications*.

2. Minimum offset determined by general conditions with 6 ft (1.8 m) and 2 ft (600 mm) desirable for rural and urban sections respectively. Offset the guardrail a minimum of 6 ft (1.8 m) where the roadway cross sections include flush shoulders. In no case shall guardrail encroach upon the shoulder.

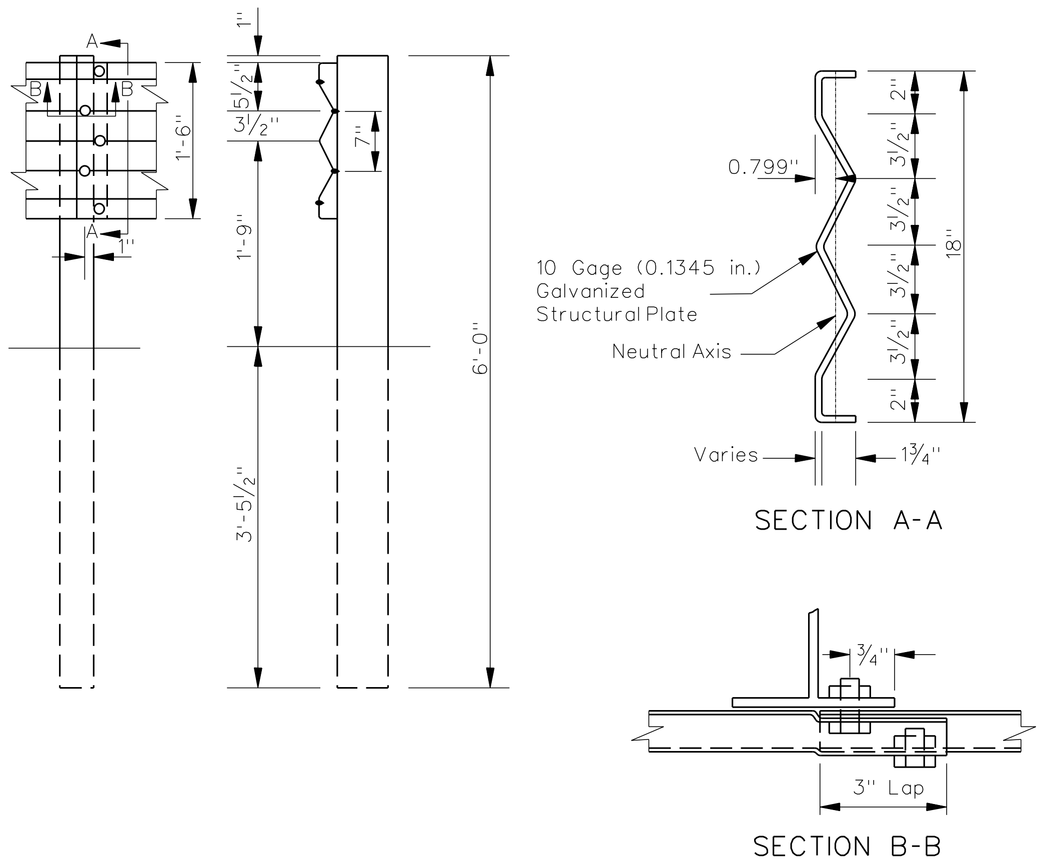
3. Guard ring may be off center of warning device when required by lateral restrictions.

4. If either the size or the number of warning device foundations will preclude the use of a circular ring as shown, an appropriate amount of tangent guardrail may be included.

5. If, due to geometrics of the warning device location, it is not practical to provide a 5-ft (1.5-m) minimum radius guard ring, with minimum clearance, the alternative structural plate ring should be considered; see Figure 7-3.D.

RAILROAD WARNING DEVICE GUARDRAIL
(For Roadways Up to 45 mph (70 km/h))

Figure 7-3.C



General Notes:

1. *All bolts have a 5/8″ diameter and length as required.*
2. *Galvanize all bolts and nuts according to the requirements of AASHTO M232.*
3. *All holes in posts are 3/4″ diameter.*
4. *The rail elements should conform to the material requirements and be galvanized according to AASHTO M180.*
5. *Structural Plate Guard Ring and posts will conform to the applicable portions of the* IDOT Standard Specifications *and* Highway Standards*.*
6. *The inch-pound units have been retained for use by Railroads.*

(For Radius, 5 ft (1.5 m))
Figure 7-3.D

information for existing and proposed railroad facilities; see Section 7-2.02. These plans will be used by BDE for negotiating with the Railroad involved. When designing grade crossings, consider the following:

1. Grade Crossing Proper.

   a. Surface Material. Where the roadway traffic equals or exceeds 1000 ADT, use prefabricated rubber or concrete surface materials. For ADT less than 1000, timber and/or asphalt crossings may be used.

   b. Medians. Where median-mounted warning devices will be installed and other than an earth median is adjacent to a grade crossing, the median should have a minimum median width of 8.5 ft (2.6 m) (10 ft (3.0 m) desirable) back-to-back of curb. Depress all medians and curbs on approaches to the crossing to the level of the pavement edge or gutter flag within the track clearance line which is parallel to and 8 ft (2.4 m) from the centerline of the nearest track; see Figure 7-3.E.

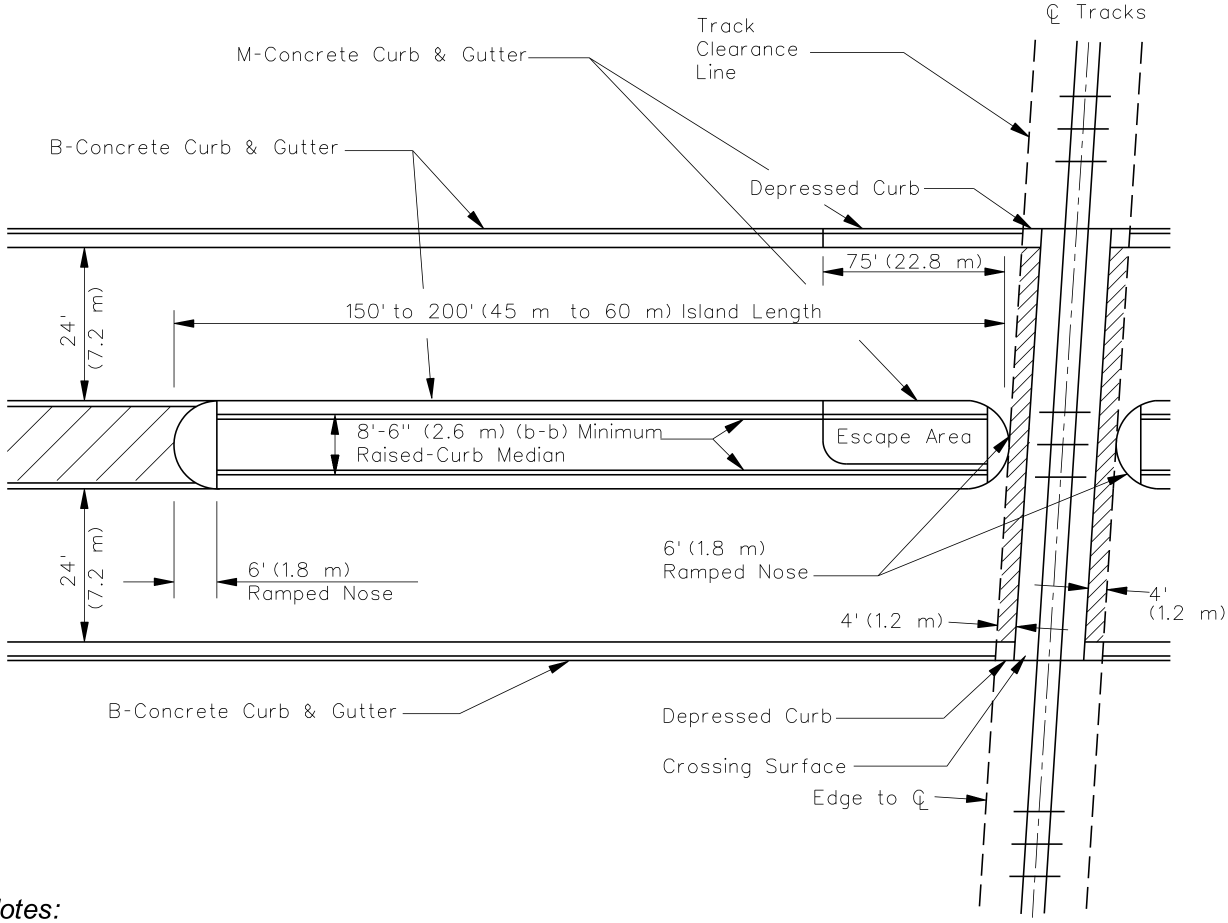
   c. Location. Where no barrier curbs extend along the pavement, the crossing proper and islands between tracks should extend to parallel lines which are 8 ft (2.4 m) outside of the pavement edges or to edge of stabilized shoulder, whichever is greater. Where barrier curbs along the pavement are present, the crossing proper and islands should extend to the back of the curb except where the opening along the curb exceeds 55 ft (16.8 m), in which case the crossing should extend 3 ft (900 mm) outside the curb face.

   d. Sidewalks. Where sidewalks are present, also include a sidewalk crossing. Where sidewalks abut or are in close proximity to the back of curb, the district may elect to extend the prefabricated crossing materials to the outer limits of the sidewalk.

   e. Pavement. Construct the approaches to grade crossings and the islands between the tracks according to the *IDOT Highway Standards*. This also applies where a Railroad constructs a crossing through an existing pavement.

   f. Grades. Design the grades on approaches to grade crossings, as a minimum, according to the criteria in the *92 Ill. Admin. Code*, 1535.204.

2. Grade Crossing Warning Devices. Ensure the design, installation, and operation of grade crossing warning devices conforms to the *Illinois Manual on Uniform Traffic Control Devices (ILMUTCD)* and *92 Ill. Admin. Code*, 1535 as applicable.



Notes:

1. *Where a raised-curb, flush, or traversable type median is used on the roadway, provide B-6 or B-9 (B-15 or B-22) raised-curb median on crossing approaches and provide M-2 or M-4 (M-5 or M-10) raised-curb median on crossing departures adjacent to each side of the railroad track(s); see Section 34-2.04.*

2. *In addition to deterring vehicular movements over the track(s) in the median area, the raised-curb median provides a space for mounting railroad warning device units, if required. Also, see Section 36-8.*

3. *If the railroad tracks are located close to a cross street and lie within the left-turn lane of the intersection, this situation will require a special design and the use of barrier type curb along the median adjacent to the turn lane.*

4. *The median should have a minimum width of 8.5 ft (2.6 m) (10 ft (3.0 m) desirable) back-to-back of curb.*

TYPICAL MID-BLOCK MEDIAN TREATMENT ADJACENT TO RAILROAD CROSSINGS (Multilane Urban and Suburban Highways)

Figure 7-3.E

Locate warning device units a minimum of 12 ft (3.6 m) from the centerline of near track and 4 ft-3 in. (1.3 m) back of the face of curb or outside the edge of paved shoulder or 8 ft-3 in. (2.5 m) outside the edge of traveled way. The 4 ft-3 in. (1.3 m) and 8 ft.3 in. (2.5 m) dimensions allow the clearances noted in the *ILMUTCD* in the event the railroad installs lamp units equipped with large backgrounds.

3. Sight Distance. The AASHTO *A Policy on Geometric Design of Highways and Streets* presents criteria to determine the applicable sight triangle at a highway-railroad crossing.

7-3.02(g) Signalized Intersections

Where a signalized highway intersection is located near a railroad grade crossing, ensure that there is sufficient storage distance between the highway intersection and railroad grade crossing to allow for the storage of stopped vehicles at the intersection. Where this is not practical, coordinate the traffic signal system with the railroad's approach circuitry to allow stopped traffic on or near the grade crossing to clear the crossing upon the approach of a train. Where the railroad crossing is signalized, interconnect the two signal systems. For guidance on the design and coordination of traffic signals near grade crossings, review the *ILMUTCD*, the ITE publication *Preemption of Traffic Signals At or Near Railroad Grade Crossings with Active Warning Devices*, Section 36-8, and Chapter 57.

All grade crossings requiring an interconnection must be coordinated with the Bureau of Operations. See the flowcharts in Figures 7-2.A, 7-2.B, and 7-2.C for a general outline of the coordination process.

7-3.03 Grade-Separated Structures

7-3.03(a) Warrants

A grade separation should be provided where a highway is constructed or reconstructed across a railroad when the crash frequency for gates exceeds 0.02 and the benefit-cost ratio equals or exceeds 1.0.

A grade separation should be provided where an expressway in a rural area is constructed or reconstructed across the railroad.

7-3.03(b) Design Considerations

Where grade separation is warranted as determined by the criteria contained in Section 7-3.03(a), BDE will be responsible for the negotiations with the railroad involved to determine who will design the structure; see Section 7-2. Plans prepared by or for the Department must be approved by the Railroad and should show:

- the structural design features;
- the vertical clearance from top of rail to under clearance of superstructure;

- the distance between track centers for multiple-track crossing;
- the lateral clearance from track center to face of adjacent pier (or abutment);
- the distance to a designated railroad reference marker (i.e., mile post) from centerline of bridge;
- the flow line and cross section of existing and proposed drainage features, including drainage structures;
- the location and stationing of railroad right-of-way lines;
- the wire lines and utility facilities located on railroad right-of-way; and
- other pertinent features affecting the Railroad’s interests.

For details of the geometric design, see the *Bureau of Bridges and Structures Manual*.

Section 7-1.06 addresses acquisition of the necessary railroad property for the structure. The contractor shall be responsible for temporary railroad crossings for use by the Contractor in accordance with Article 107.10 of the *Standard Specifications*.

7-3.04 Other Agency References

For uniformity, use the applicable Federal regulations on both Federally and non-Federally funded projects. Clearance and public safety aspects of all projects shall conform to the regulations of the Illinois Commerce Commission. Applicable publications of these agencies are provided in Figure 7-3.F.

Chapter Eight

CONSULTANT DEVELOPED AND/OR DESIGNED PROJECTS

Chapter 8 documents the Department's policies and procedures to use when processing consultant developed and/or designed projects.

8-1 DEFINITIONS AND PROCEDURES

8-1.01 Definitions

The following definitions apply to Chapter 8:

1. Additional Services. Any service or action required of the consultant not identified in the Agreement or any Supplemental Agreement.

2. Agreement/Contract. The legal instrument or negotiated contract defining the obligations and considerations of the signatory parties. The term "Agreement" or "Contract" includes all Supplemental Agreements.

3. Bureau Chief. The Department's officer named in the Agreement who shall approve any change or additional work authorization.

4. Consultant. The firm providing professional services as a party to the Agreement.

5. Department or IDOT. The Department of Transportation of the State of Illinois.

6. Department or IDOT Internet Site. http://www.dot.il.gov.

7. Director. The director of the office of the Department who is in charge of the services under the Agreement.

8. EPAS: Engineering Prequalification and Agreement System.

9. Fixed Fee. A specified dollar amount to cover profit and certain business expenses based on the assigned complexity factor of the project.

10. Liaison Managers. The duly authorized representatives of the Department and the Consultant charged with day-to-day administration of the terms of the Agreement.

11. Prequalification. A condition that shall be met before consideration is given.

12. Project Schedule. A comprehensive description of all significant services required of the Consultant and of all actions required of the Department and approving parties by the obligations of the Agreement, together with the durations and/or dates for performing these services and actions.

13. Regional Engineer. The engineer in charge of the region that has jurisdiction over the services.

14. Scope of Services (Advertised). All services and actions required of the Consultant as advertised in the Professional Transportation Bulletin (PTB).

15. Scope of Services (Negotiated). All services and actions required of the Consultant by the obligations of the Agreement.

16. Subconsultant. Any independent professional firm, person, or organization who, with the approval of the Department, performs a part of the services for the Consultant.

17. Supplemental Agreement. An additional agreement modifying the original signed Agreement.

18. Service. All engineering and related services and the furnishing of all equipment, supplies, and materials required to achieve the broad purpose and general objectives of the Agreement.

8-1.02 Acronyms

The following are common terms used with consultant developed and/or designed projects:

1. AA Affirmative Action.
2. A/E Architectural-Engineering.
3. AFC Annual Fee Capacity.
4. AU Agreements Unit.
5. BBFM IDOT Bureau of Budget and Fiscal Management.
6. BIC IDOT Bureau of Investigations and Compliance.
7. BoBS IDOT Bureau of Business Services.
8. BDE IDOT Bureau of Design and Environment.
9. CA Certification Acceptance.
10. CAAS Consultant Agreement Approval Sheet.
11. CECS Cost Estimate of Consultant Services.

12. CEUF Consultant's Employee Utilization Form.

13. CFR Code of Federal Regulations.

14. COD Contract Obligation Document.

15. CPO Chief Procurement Officer.

16. CPFF Cost Plus Fixed Fee.

17. CSC Consultant Selection Committee.

18. CU Consultant Unit.

19. DBE Disadvantaged Business Enterprise.

20. DLM Direct Labor Multiple.

21. EEO Equal Employment Opportunity.

22. EPAS Engineering Prequalification and Agreement System.

23. FHWA Federal Highway Administration.

24. OMB The White House Office of Management and Budget.

25. OP&P IDOT Office of Planning and Programming.

26. PPB Procurement Policy Board.

27. PSU Project Support Unit.

28. PTB Professional Transportation Bulletin.

29. QA/QC Quality Assurance/Quality Control.

30. SAPCS Standard Agreement Provisions for Consultant Services.

31. SEFC Statement of Experience and Financial Condition.

32. SOI Statement of Interest.

33. TS&L Type, Size, and Location Plan.

8-2 PREQUALIFICATION AND SELECTION

8-2.01 Use of Consulting Engineering Firms

Extensive engineering activity is required to complete the Transportation Improvement Program (e.g., performing necessary studies, preparing construction plans and specifications for advertising construction projects, inspecting construction activities). To accomplish the Program without appreciably increasing the number of IDOT personnel or performing services for which the Department does not have specialized expertise, the Department uses outside consulting engineering firms. Engineering and Land Surveying consulting firms' services are procured under the Architectural, Engineering, and Land Surveying Qualifications Based Selection Act; 30 ILCS 535-1 et seq., the Selection of Architectural, Engineering and Land Surveying Services, 44 Ill. Admin. Code 625, and Departmental Order 6-2.

8-2.02 Prequalification of Consultants

All Architectural-Engineering (A/E) Consultants desiring to provide services to the Department, whether as Prime or Subconsultant, are prequalified before any consideration is given to their respective Statements of Interest; see Section 8-2.04(a). Prequalification must be obtained no later than the final date established for the receipt of Statements of Interest for any particular work. However, a Consultant that is prequalified for one or more types of work on the final date established for the receipt of Statements of Interest may submit supplemental information as necessary to establish prequalification for additional types of work. This supplemental information must be approved no later than three working days prior to the Consultant Selection Committee meeting; see Section 8-2.05(a). The following items discuss the prequalification procedures:

1. SEFC Filing. A properly completed Statement of Experience and Financial Condition (SEFC) with required attachments are filed through an on-line application called EPAS; see IDOT's website. Because of varying workloads, the Department cannot guarantee a SEFC will be processed by a particular date. Therefore, any Consultant desiring prequalification for a particular project should complete this process as early as possible.

2. Prequalification Notification. The BDE analyzes SEFC and attachments and notifies the Consultant of the size and types of services it is qualified to perform. When this notice is given, the Consultant is prequalified. The size of service that a Consultant is qualified to perform is based on its annual fee capacity.

3. Annual Fee Capacity. A Consultant's annual fee capacity is an evaluation of its technical and professional staff's ability to generate an annual volume of work. To estimate the maximum annual fee capacity of a Consultant to perform transportation or architectural work, the larger of the fees computed by the following two methods is used:

   - the fee produced by multiplying the total number of technical staff by $200,000, or,
   - the fee produced by multiplying the total number of professional staff by $800,000.

To determine the annual fee capacity of Consultants performing aerial mapping services only, the figure of $700,000 per plotter/operator is considered appropriate or the fee produced by multiplying the total number of technical staff by $200,000. The following presents general application guidelines:

a. Determining Performance Ability. To determine a Consultant's ability to perform a project, the total uncompleted volume of transportation-related work is subtracted from the annual fee capacity, as determined above, to arrive at an unobligated fee capacity. Appropriate consideration is given to instances where a Consultant's uncompleted work is expected to extend over a period of more than one year. To be eligible for consideration, such unobligated fee capacity shall equal or exceed the estimated annual fee of the project for which the Consultant is seeking to perform.

b. Determining Staff Sufficiency. To determine whether a Consultant is sufficiently staffed to do a construction supervision project, the estimated overall fee for the project is reduced by one-half for the comparison to account for the seasonal hiring by the Consultant for this type of work.

4. Period of Effectiveness. The prequalification notice provided in Item 2 above is effective, unless otherwise changed by the Department, from the time notice is given until six months after the end of the Consultant's current fiscal year. At that time, the prequalification automatically expires and the Consultant's Statement of Interest cannot be considered until prequalification is re-established. To avoid expiration of prequalification, a Consultant renews and submits the Corporate and Financial Information section of SEFC as early as practical after the end of each fiscal year. In addition, Consultants submit a new SEFC (i.e., the Experience and Staffing) every three years. The due date for the new SEFC is noted in the firm's last prequalification letter. The schedule for new SEFC's is also located in the EPAS manual.

5. Changes within the Consulting Firm. Each Consultant notifies the Department within 15 working days of key personnel changes.

6. Evaluation and Prequalification Status. A Consultant is removed from the list of prequalified firms for a category when a final evaluation of Poor or Substandard is given by the Department. For specific information on consultant evaluations, see Section 8-4.05.

7. Prequalification Inquiries. All inquiries regarding the procedures or information required for prequalification are referred to in the EPAS instructional manual on the Department's website.

8. Confidentiality of Information. The Department maintains and treats all information required under this section as confidential for use only by the Department or other governmental agencies entitled by law or agreement.

9. Categories of Service. The Department prequalifies A/E Consultants in the categories of service. A description of the work involved in each category and the minimum requirements are available on Department's website.

10. Professional Licensing and Registration. A Full-time employee who has acted in a leadership role on relevant projects is required when the prequalification category requires Illinois licensing or registration. Consultants, committing or pledging individuals, or persons on retainer are not considered to meet the minimum requirements for prequalification, except as noted for Environmental Reports. See "Description and Minimum Requirements for Prequalification" on the Department's website. The experience of the licensee or registered must be relevant to the category of transportation work and performed within the time frames specified in "Description and Minimum Requirements for Prequalification" available on the Department's website.

11. Support Staff Experience and Training. Prequalification also requires a support staff of engineers and/or technicians with relevant experience or training. The lack of relevant experience or training of the support staff may result in denial of prequalification.

12. Required Documentation. Consultants requesting prequalification, upload documentation through EPAS of their previous work outlining:

    - firm and key employee pertinent experience, and
    - capabilities of current staff.

The Department may, at its discretion, make on-site visits to the Consultant's office to verify the information set forth in SEFC is submitted.

8-2.03 Request for Consultant Services

Use the following general guidelines when requesting consultant services:

1. Project Selection Proceedings. The Consultant Unit (CU) requests offices, districts, and bureaus submit candidate projects approximately 6-8 weeks prior to publishing a Professional Transportation Bulletin (PTB). Actual dates are shown on the Schedule for Professional Transportation Bulletins available on BDE's internal SharePoint site.

2. Preparation of Form A/A-1. Information is entered into A/A-1 section in EPAS; see District EPAS manual available on BDE's internal SharePoint site.

   To request engineering services use the following guidelines:

   a. Cost Estimate. A detailed cost estimate (not required for work order projects) is prepared by the submitting IPM ensuring adequate funds are programmed for the advertised project. Where insufficient funds are programmed, IPM works with OP&P to secure the necessary funds. The detailed cost estimate is retained in the originating office's file for use during negotiations. The total required dollars are entered into EPAS; see district EPAS manual available on BDE's internal SharePoint site.

b. Proposed Project Advertisements. In conjunction the information contained on the A/A-1 page, the requesting IPM submits a proposed advertisement for PTB. The project is advertised after approval by the originating area's division or office director. The advertisement is prepared in EPAS for review, coordination, final preparation, and issuance. Use the PTB guidelines (see BDE's internal SharePoint site) and previous advertisements when preparing project advertisements.

c. Urgent Consultant Need. When the selection of a Consultant is urgent and special advertisement is required, submit the request with justification to BDE. BDE requests concurrence from the Secretary of Transportation through the Director of Program Development to either hold a special bulletin/selection or to use a Secretary Selection according to the appropriate laws and rules.

3. Dissemination of Materials. After all divisions and IPMs have completed the information on A/A-1 and advertisement in EPAS, the information is distributed to the following individuals for comment:

- Director of the Office of Program Development, and
- Director of the Office of Planning and Programming.

4. Presentations for Advertisements. Presentations may be required as part of a Consultants SOI and the request for presentations is included in the advertisement. Presentations may be required if:

- Estimated engineering fee is greater than $10,000,000,
- Extremely complex project,
- High visibility, and
- Specialized Services.

Review and final determination of the need for presentations is determined by the requesting bureau/office and the Director of Highways Project Implementation or Director of Program Development on a project by project basis. The presentation process is overseen by CU.

Short Listing: The requesting Bureau/Office is responsible for determining criteria for the review of submitting firm's Statements of Interest. Criteria are required before Statements of Interest are submitted. The Bureau submits documents with the criteria for the specific job for CU file. This is specific for the projects but in general criteria consists of:

- Firm's capability and project team experience,
- Understanding the scope and goals of the project,
- Demonstrated successful past performance on Project Management Team oversight, and

- Independence and innovation.

5. The SOI's are reviewed by the requesting office and the top scoring firms are requested by letter and e-mail to do presentations. Typically, the top four firms are chosen. Firms are also notified if they are not being requested to do a presentation.

6. PTB Advertisement. After incorporation of any comments from the Director of Program Development the advertisements are completed for publication in the next PTB. When projects are dropped from the list to be advertised, appropriate Directors, Regional Engineers, or Bureau Chiefs are informed of the reason(s) for not advertising the projects.

8-2.04 Advertisement of Need

Official notice of the need for architectural or engineering services by the Department is published in an IDOT Professional Transportation Bulletin (PTB). The PTB schedule is available on the Department's website and the Notice of the PTB publication is sent through the IDOT's subscription service. Each advertisement describes the requirements of the project as they apply to:

- the project's scope of work,
- the time for completion,
- the necessary professional and technical expertise, and
- the required proximity of the Consultant to IPM in charge of the work, if applicable.

8-2.04(a) Statements of Interest (SOI)

Consultants desiring consideration as a Prime Consultant for a project submit, through EPAS, a Statement of Interest by the date and time specified in PTB. The PTB also specifies the types of information required in the Statement of Interest. See SOI Entry in the EPAS Instruction Manual located on the Department's website. This information includes:

- a staffing plan that designates key personnel and shows the number and classification of personnel assigned to the project, along with their current office location, and any work that the Consultant proposes to subcontract;
- estimated time requirements for completion using the proposed staff,
- the known work load of the Consultant's transportation staff,
- the existing office where the majority of the work will be performed,
- a completed disclosure form,

- a completed Delinquent Debt Certification, and
- a completed Disclosure of Business Operation in Iran.

8-2.04(b) Confirmation of Eligibility

The Department determines the eligibility of each Consultant responding to a project advertisement. A Consultant is considered ineligible from the selection process for any of the following reasons:

- the Statement of Interest was not completed and/or not received by the deadline,
- the firm is not prequalified for the type(s) or volume of services required,
- the firm does not have sufficient expertise or work force for the particular job,
- the firm does not have a sufficient financial rating or accounting system for the type of contract contemplated, or
- the owning Railroad determines that the particular Consultant is unacceptable on projects when the Consultant is retained to prepare construction plans for a facility, which will carry railroad traffic.

Any Consultant determined to be ineligible under this section is notified of such determination and the reason(s) therefore.

8-2.04(c) Preliminary Review and Ranking

Following the confirmation of each Consultant’s eligibility, each Statement of Interest is reviewed for: firm’s experience data, staffing, and any evaluations of previous work for the Department. Based upon this review, each candidate firm is ranked in order of apparent ability to perform the work. This review and ranking takes into consideration at least the following factors:

- previous experience in the type(s) of service required,
- the staffing plan and specific expertise of key employees,
- the plan for accomplishing the objectives, if applicable, as stated in the requirements of the PTB,
- the Department’s evaluations of prior contractual services with IDOT, if any; and
- comments furnished by the requesting division or office.

Depending upon the type of project, the following factors also may be important in selecting a Consultant:

- the location of the Consultant's office in which the majority of the work on the project will be performed, and

- the Consultant's proposed utilization of Disadvantaged Business Enterprise subconsultants.

The Consultant Selection Committee (CSC) reviews information including the ranking of each Consultant and the additional information described above. The information also indicates those Consultants determined to be disadvantaged business enterprises in accordance with the Department's eligibility criteria.

The CSC determines which projects, by their nature and the corresponding qualifications of the proposing minority-owned firms are suitable for implementing in an applicable affirmative action program. Any unresolved differences between the reviewers will be brought to the attention of CSC.

All information developed or provided under this section is advisory only and has no binding effect upon CSC. The Department maintains and treats all such information as confidential for use only by the Department or other governmental agency entitled by law or agreement.

8-2.05 Consultant Selection

8-2.05(a) Consultant Selection Committee

The Consultant Selection Committee (CSC) consists of the following members:

1. Chairperson. The Deputy Secretary of Transportation for Project Implementation, or his/her designee, serves as member and chairperson of up to nine-member CSC.

2. Department Members. Three of the remaining seven members of CSC are from the Department. Specifically, they are:

   - The Director of the requesting office, or that Director's designee (currently the Director of Finance and Administration is the designee),

   - the Regional Engineer, or designee, or the central office Bureau Chief, or designee, from the same division or office, as designated by the Director, and

   - the Director of the Office of Planning and Programming, or designee.

   In the event that the office requesting the services is the Office of Planning and Programming, CSC meets and operates as normal except the Director of Planning and Programming has only one vote and CSC has only seven members and seven votes.

3. Public Members. The other four members of CSC are from the public and have professional experience in either transportation or engineering. Two are appointed by the Secretary of Transportation and the other two by the Illinois Society of Professional

Engineers (ISPE). Each public member is appointed for a term of two years. If a public member does not complete the term, another member is appointed by the Secretary or ISPE, in accordance with the original appointment, to serve the remainder of the uncompleted term.

4. Diversity. It is the goal of the Department that membership of CSC reflects the ethnic and cultural diversity of the population of Illinois. In furtherance of such, the Department has a goal that two or more of the members of CSC are females or minorities. Additionally, the Department has a goal for CSC membership to reflect the geographic diversity of the population of Illinois.

5. Pursuant to the Illinois Procurement Code, 30 ILCS 500 *et seq*., Public Officer Prohibited Activities Act, 50 ILCS 105 *et seq*., Selection of Architectural, Engineering and Land Surveying Services, 44 Ill. Admin. Code 625, and Department Personnel Policies Manual (PPM) all CSC members are required to sign a Compliance, Conflict of Interest, and Confidentiality statements before selection. The CSC members sign the statement attesting to an understanding of the confidentiality, compliance, and conflict of interest policies established by the State of Illinois. This document is updated on a two year cycle or as needed by the Office of Chief Counsel and signed/re-signed by the CSC members. The CU retains these documents.

The CSC meets when called by its Chairperson. This meeting is usually scheduled approximately 7 to 8 weeks after the Consultant Statement of Interests are due. The selection date is stipulated in the Professional Transportation Bulletin and on the Schedule for Professional Transportation Bulletins located on the Department’s website.

To conduct business, CSC shall have a quorum. A quorum consists of at least four members; at least one of who is a public member.

Where another governmental body, or bodies, is contributing to the funding of a particular contract, CSC may, at its discretion, take either of the following two actions:

- Permit such governmental body, or bodies, to provide one or more representatives to serve as member(s) of CSC with a total of one vote, or such fractional vote as may be prescribed by the Department. In some instances, this option may result in a total CSC membership of more than eight and a total number of votes in excess of eight, with respect to the affected services.

- Select a number of Consultants, typically three, in the typical manner, in no order of preference; the Department then may permit the governmental body, or bodies, to select one Consultant from that group selected by CSC.

8-2.05(b) Selection Procedures

The following procedures are used when selecting the Consultant. Political affiliation of the Consultant shall not be considered during the selection process.

1. Preliminary Vote. The CSC members review the rankings for the Consultants, as well as any of the additional information described in Section 8-2.04(c) and, by voice/electronic vote, reduce the number of Consultants under consideration to three, or fewer where fewer than three have submitted acceptable Statements of Interest.

2. Written/Electronic Ballot. First, second, and third choices are determined by a plurality vote of those CSC members in attendance. This second round of voting is by written/electronic ballot.

3. Policy Against Multiple Awards. Selection of a single Consultant as first choice for more than one project is not made in a single session unless such selection is determined necessary. The reasons therefore are recorded in the CSC's records, and a majority of the committee members approve, by written ballot, such reasons. For purposes of this part, "single session" means and includes one or more meetings necessary for CSC to make all selections from a single Professional Transportation Bulletin.

4. Identity of Firms. The identity of the second and third ranked firms is maintained and treated by the Department as confidential for use only by the Department or other governmental agencies entitled by law or agreement. However, if negotiations fail with the first ranked firm, the identity of the second ranked firm then is considered public information. Similarly, if negotiations fail with the second ranked firm, the identity of the third ranked firm is considered public information.

5. Notification of Selection. The first ranked firms are notified of the following information:

   - PTB and item number of selection,
   - date and time of the negotiation meeting, and
   - request for current payroll by employee, classification, hourly rate, and raise schedule for their firm and any proposed Subconsultants.

A list of the top ranked consultants and corresponding projects is available on the Department's website. All prequalified firms on the subscription server are e-mailed when the list is available.

8-3 AGREEMENT NEGOTIATION AND PROCESSING

8-3.01 General

The Department’s project manager initiates negotiations with the top ranked firm. If a successful conclusion cannot be obtained, negotiations are formally terminated. Negotiations with the second ranked firm are then initiated. Similarly, if negotiations fail with the second ranked firm, negotiations with the third firm are initiated. Prior to the second and/or third ranked firms being contacted, the director’s concurrence is required.

The term “negotiation” includes all of the steps necessary, following the selection of a Consultant, to arrive at a signed Agreement and to authorize the work. This includes negotiation meetings to reach agreement on:

- scope of work,
- man-hours,
- schedule of completion,
- subconsulted work, and
- non-salary direct costs.

Negotiations also include:

- reaching agreement on the acceptable average payroll rates for the project;
- approving the detailed fee estimate and proposal from the Consultant firm and obtaining authorization from the Federal Highway Administration (when Federal participation is anticipated),
- obtaining signatures to the Agreement, and
- authorizing the work.

8-3.02 Scope

8-3.02(a) Scope of Services Meeting

The scope of services meeting is the first step in the process leading to the execution of an Agreement and authorization to proceed with the work. For simple and typical projects, the scope of services can be determined in one meeting whereas more complex jobs may require multiple meetings to delineate the scope of work. The initial scope of services meeting date is specified in the project advertisement in the Professional Transportation Bulletin.

The Department’s project manager chairs the meeting, records attendance, distributes data, and informs the Consultant to keep minutes of the meeting and to furnish the minutes to those in attendance. The chairperson discusses with the Consultant and Subconsultants the following items:

- Standard Agreement Provisions for Consultant Services (SAPCS), (see Department's Website),
- Architectural and Engineering Report and Negotiation Guidelines for Engineering Agreements and Supplements, see BDE Procedure Memorandum 17-09 (see the Forms Master List for the latest BDE 17-09 form), and
- Quality Assurance/Quality Control Guidelines; see Section 8-6.

The Department personnel answer questions about SAPCS and discuss Equal Employment Opportunity and Affirmative Action Plan requirements. The Consultant is asked to review the Architectural and Engineering Report and Negotiation Guidelines for Engineering Agreements and Supplements and to be prepared to answer the questions in the report.

Final scope details may be completed in subsequent negotiation meetings.

The method of reimbursement is explained and the firm informed when a Start-Up Agreement is anticipated. The Consultant reviews all the material furnished and prepares man-hours, average hourly rates, and direct non-salary costs for the project. Subsequently, the Consultant submits, on the applicable forms, the Cost Estimate of Consultant Services (CECS), Average Hourly Payroll Rates, and Direct Cost all on IDOT forms found on the Department's website. The Consultant and Subconsultant(s) are reminded to submit electronically their payroll rates and direct costs, to facilitate the Agreement process. The Consultant also includes in its submittal CECS and Direct Costs for all Subconsultants working on the project.

8-3.02(b) Scope of Work

A well-defined scope of services facilitates the negotiation process. The better the understanding of the scope of services between the Consultant and the Department, the easier it is to develop a fee that is acceptable and reasonable to both parties. It is vital that all parties become familiar with the project. To this end, the Department's project manager sends a preliminary engineering information package containing all the pertinent project information to the selected Consultant immediately after selection notification, allowing the Consultant and the Subconsultants to be active participants during the first meeting. The final negotiated scope, by law, must fall within the advertised scope for the project. However, the negotiated scope does not need to be as all-inclusive as the advertised scope.

The overall scope of work is described and the schedule of completion is discussed, on which general agreement is reached. The Consultant is reminded of the Department's policy concerning Quality Assurance/Quality Control (QA/QC), and is asked to submit a project specific QA/QC plan for review and approval, including specific hours for QA/QC in his/her proposal.

On Phase II projects, the Consultant includes specified hours for consultation during Phase III of the project. The Consultant is furnished preliminary information pertinent to the work, such as:

- Phase I study reports,
- environmental documents,
- aerial photography,
- mapping studies,
- traffic data,
- survey data,
- old plans, and
- samples of final product format.

8-3.03 Methods of Compensation

The following are the methods of compensation used by the Department:

- cost plus fixed fee (CPFF),
- unit of work; and
- specific hourly rates.

The Contract specifies a maximum amount payable for direct labor, for direct costs, and a total contract amount, none of which is exceeded unless adjusted by a Supplemental Agreement. The method of compensation for work by a Subconsultant is the same as the Prime Consultant's method of compensation.

8-3.03(a) Cost Plus Fixed Fee (CPFF)

This method of payment compensates the Consultant for actual payroll, overhead & fringe benefits, and direct costs plus a fixed fee. Use this method of compensation for work involving aerial mapping, geotechnical engineering, special waste, or asbestos abatement; Federally funded projects; and on all project specific Agreements.

R = Complexity Factor: 0.00, 0.035 or 0.07

Compensation = DL + DC + OH + FF

DL = Direct Labor

DC = Direct Cost

OH = Overhead & Fringe Benefits Rate

SubDL = Subconsultant Direct Labor

Prime Consultant Fixed Fee formula: (0.37 + R) DL + %SubDL

%SubDL is: 1 to 2 Subconsultants = 10% of direct labor of Subconsultants

%SubDL is: 2 to 4 Subconsultants = 12% of direct labor of Subconsultant

%SubDL is: 5 or more Subconsultants = 15% of direct labor of Subconsultants

Subconsultant Fixed Fee formula: (0.37 + R)SubDL

When firms combine forces to create a Team, neither firm shall be considered a Subconsultant for the purposes of calculating the subconsultant direct labor.

8-3.03(b) Unit of Work

Unit of work involves compensating the Consultant in units such as “each” or “feet.” Rates are established in the Agreement and include all costs including profit. The unit of work method of payment often is used for geotechnical, thermographic, ground penetrating radar, subsurface utility and special waste contracts.

8-3.04 Negotiations

The negotiation meeting is one of the most important steps to the success of the project. It is vital that all parties become familiar with the project and come prepared to participate in the meeting. The project team for both the Department and the Consultant, including Subconsultants, should be active participants in this process.

The end result of the negotiations is a well thought out and clearly documented understanding of the anticipated project scope and level of effort. The Department and the Consultant’s representatives (i.e., individuals with the authority to modify original man-hour estimates) negotiate to clarify the extent of the effort involved in completing various work tasks.

For a successful negotiation immediately after selection, provide the consultant the following:

- any pertinent project information, (i.e. schedules, reports, survey data, etc.),
- the “Consultant Scoping and Negotiation Check Sheets” for the project, and
- a detailed list of tasks for which hours will be negotiated. The list of tasks is taken from the independent man-hour estimate completed prior to advertising the project. Also you this estimate in evaluating the number of hours the Consultant proposes for each task to establish the final project upper limit.

The negotiations should culminate with agreement on the following items:

- scope of work,
- project schedule,
- man-hours required,
- direct costs,
- QA/QC plan,
- QA/QC hours specified,
- Phase III hours in Phase II projects, and
- All of the above items for each Subconsultant.

The Department’s project manager and the Consultant also reach agreement on the procedure for the work progression and the line items of work to be shown on the monthly progress report. It is imperative that the Department’s project manager ensures that the appropriate Department personnel and the Consultant are thoroughly familiar with the Agreement and the SAPCS, particularly with Sections 2.24, 2.32, 2.37, and 2.4, because improper procedures under these sections of the SAPCS may preclude payment to the Consultant.

8-3.05 Cost Proposal Packages

After negotiations have been completed, the Consultant submits a proposal package to the IPM. Instructions and forms for preparing the proposal are available on the Department’s Consultant Services SharePoint site. The IPM verifies the proposal is consistent with negotiations and all the proper forms are completed and submitted with the required IDOT approvals through the BDE SharePoint site for further processing. The proposal package contains the following items for the appropriate type of project:

1. Prime Agreement Proposal Package.* Consists of the following:

    - draft Scope of Work* with schedule,
    - BDE Procedure Memorandum 17-9,
    - Negotiation Meeting Minutes,
    - Cost Estimate Of Consulting Services (CECS), including QA/QC and Phase III hours/costs broken out,
    - Consultant Employee Utilization form (BDE 2350),
    - EEO/AA/Title VI Section form (EEO 1981),
    - Direct Costs (BDE 436), and
    - CAAS*- – for costs that exceed 10% of the estimate given to CSC.

* Uploaded to the BDE SharePoint site.

2. Subconsultant Agreement Package.** Consists of the following:

- Cost Estimate Of Consulting Services (CECS),
- Consultant Employee Utilization form (BDE 2350),
- EEO/AA/Title VI Section form (EEO 1981), and
- Direct Costs (BDE 436).

** The Prime Consultant posts all Subconsultant Agreements on the Vendor Documents site with the Subconsultant disclosure forms prior to the Prime Consultants' authorization to proceed.

3. Various/Various Prime Agreement Package. Consists of the following:

- draft Scope of Work,*
- Architectural & Engineering Report & Negotiation Guidelines for Engineering Agreements & Supplements (BDE 17-09),
- Negotiation Meeting Minutes,
- Consultant Employee Utilization form (BDE 2350),
- EEO/AA/Title VI Section form (EEO 1981), and
- Direct Costs (BDE 436).

4. The IPM's approvals included in the proposal package. The IDOT's project manager (IPM) includes in the proposal package affirmation of the following:

- IPM's review and approval of all consultant prepared forms,
- an independent check of the man-hour estimate is on file in the IPM,
- the negotiated scope is within the scope of the advertisement,
- IPM's approval of all the submitted direct cost and labor costs,
- IPM's approval of the QC/QA plan included in the IPM project file,
- IPM approval of the minutes of the scoping and negotiation meetings, and
- the negotiated DBE percent participation meets or exceeds the advertised goal.

For Prime Agreements that exceed the estimated fee by more than 10%, a Consultant Agreement Approval Sheet (CAAS) stating reasons for the cost overrun with costs and man-hours for each reason is uploaded to the BDE SharePoint site.

8-3.06 Agreement Processing

Upon receipt of the proposal package from the IPM, BDE conducts the following steps:

- verifies the program numbers and dollar amounts through the Office of Planning and Programming (OP&P),
- requests Federal authorization from the BDE Program Support Unit for projects Federally funded,
- prepares independent check of extensions and escalations and all costs can be supported,
- ensures the negotiated scope is within the advertised scope,
- ensures QA/QC hours of all projects and Phase III hours in a Phase II Contract are included,
- ensures the Consultant disclosure information are current, complete, and approved,
- checks on the status of the Consultant insurance, and
- secures the procurement waiver or ensures project information is posted for at least 30 days.

The Agreements Unit resolves any findings. This may involve discussions with IPM and Consultant. After all issues have been mutually resolved, the Agreement is sent to the Consultant for signature. The Consultant reviews the Agreement, signs it, dates the signature but does not date the Agreement, and returns all copies to BDE. BDE obtains the appropriate signature(s) (including the date each signature is written) on behalf of the Department. Once the Agreement is fully executed, the Consultant and IPM are notified to proceed with the work. A fully executed copy is sent to the Consultant and uploaded into EPAS. An original copy is placed on file in BDE. The IPM will receive a copy of the approved Contract Obligation Document (COD). Work done prior to Department authorization date is not eligible for reimbursement.

8-3.07 Funding Approvals and Federal Authorizations

Upon receipt of a proposal package from the IPM, the Agreements Unit requests verification of the program code number and the type & amount of funds (State or Federal) from OP&P. Once the information is received from OP&P, the agreement manager initials and includes the funding sheet in the project file.

When Federal funds are to be used, the Agreement Manager requests Federal authorization through the BDE Program Support Unit (PSU). The PSU requests FHWA’s authority to proceed with the work. Once authorization is received, a copy of this request and the FHWA authorization furnished by PSU is included in the project file. Work done prior to FHWA authorization date is not eligible for Federal participation.

Compliance with all aspects of 23 CFR 172 and OMB Circular No. A-102 is required and shall be documented. Lead-time of three weeks is estimated for obtaining FHWA authority to proceed, provided IPM has submitted prerequisite programming material (OMB Standard Form 424).

8-3.08 Cost Approvals

When the first ranked firm is notified after selection, current payroll by employee and classification, hourly rates, and raise schedule are also requested emailed to BDE in the correct form.

The BDE completes an independent CECS for each firm on the project once a complete proposal package is received. The Agreement Manager reviews the independent CECS and discusses any differences with Consultant, and IPM, until consensus is reached. The disposition of the differences is kept in the project file.

Delays in sending wage rates and direct costs (with appropriate back-up information) to BDE results in a delay in processing the Agreement.

After the Agreement is executed, a COD form is prepared by the Agreements Unit and along with a copy of the executed agreement is submitted to the BoBS for approval. Funds, by law, are obligated and the Agreement filed with the State Comptroller within 30 days of the date of the Agreement.

If the 30-day deadline is not met, a late filing affidavit is required.

On projects using bond funds, the funds are released by BBFM. A request memorandum is prepared by PSU listing such projects. The PSU then notifies the Agreements Unit when the bond funds are released.

The Bureau of Investigations and Compliance is also responsible for performing a final audit on completed projects. The administering IPM should request that the appropriate audit be made at the time the Consultant's final invoice is submitted for payment.

8-3.09 Signature Authority

Every Contract must contain the Secretary's signature. A card must be on file with the Comptroller for the IDOT personnel with the Secretary's signature authority. The Secretary of Transportation has delegated signatures for Consultant Agreements; see Departmental Order 2-2. Each Agreement contains a line for the Secretary of Transportation's signature (signed by the delegated authority) followed by a line for the delegated authority's own signature.

8-3.10 Authority to Proceed

8-3.10(a) Letter of Authorization

A Letter of Authorization is sent to the Consultant with a “blue-backed” original of the fully executed Agreement. Copies of the Letter of Authorization are electronically transmitted to the administering IPM. The following items are distributed as indicated:

- the Agreement-original in BDE’s project file and electronic copy in EPAS,
- an approved COD form- emailed to IPM and copy in BDE’s project file, and
- the FHWA authorization, if Federal funds are utilized- copy in BDE project file.

The Department’s project manager verifies in EPAS the firm’s insurance is up to date before approving payments made to the Consultant.

Prior to issuance of the Letter of Authorization, the Agreements Unit reviews the entire file and ensures all required clearances/approvals for authorization (e.g., by the FHWA, BBFM (bond funds), procurement waiver/advertisement, design approval or risk management approval) have been obtained.

8-3.10(b) Risk Management

Authorization to proceed for Phase II projects is possible without design approval if risk management is approved. Only projects with completed public involvement, a draft Phase I report reviewed by BDE, and funded with STATE only funds are considered for risk management. The Department’s project manager requests risk management from BDE. Authorization request for a Start-Up Agreement does not include risk management approval.

8-3.11 Early Authorization To Proceed

8-3.11(a) Start-Up Agreement

At the option of the Regional Engineer/Bureau Chief or agency head, the Regional Engineer/Bureau Chief/ Agency Head may authorize the Consultant to begin work by obtaining approval through BDE and signing a Start-Up Agreement.

Immediately after the final negotiation meeting, the IDOT project manager (IPM) completes and uploads to BDE’s SharePoint site, a Start-Up Agreement request memorandum. The IPM is sent approval or denial of the Start-Up Agreement. The IPM works with the Office of Planning and Programming to resolve any funding issues with the Start-Up Agreement.

The Start-Up Agreement request is granted when the disclosures for the Prime Consultant are clear and a procurement waiver granted. Approval of the request for a Start-Up Agreement does not include approval of risk management. A separate risk management request is submitted to BDE.

The IPM, upon receiving a complete proposal package from the Consultant, and approval for the Start-Up Agreement, enters into a Start-Up Agreement with the Consultant using the Start-Up Agreement template. The Agreement amount may be for no more than 40% of the Prime Agreement negotiated amount. Non-Federally funded Start-up Agreements for $249,999 or less can be executed by the Regional Engineer or corresponding Office Director for Central Bureaus. Federally funded Start-up Agreements and Start-up Agreements of $250,000 or more shall be executed by the Central Office and the necessary signatures shall be coordinated by BDE. The District or Central Bureau may authorize the consultant to begin work after the Start-Up Agreement is authorized. The Consultant may then work up to the Start-Up Agreement dollar amount. The Start-Up Agreement should not exceed the contract term length or two years, whichever is less.

The IPM e-mails copy of the fully executed Start-Up Agreement to the Preliminary Engineering Section within 1 week of signing the Start-Up Agreement authorization. Failure to do so might result in a late filing affidavit by IPM and delay processing the proposal package. The Preliminary Engineering Section develops COD for the Start-Up Agreement.

Once the Prime Agreement is executed, it supersedes and includes costs stated in the Start-Up Agreement. The Consultant may start, complete, and invoice for the work as specified in the Start-Up Agreement prior to the authorization of the Prime Agreement. No other work may be started until the Prime Agreement has been executed, and the Consultant authorized.

No supplements are written on the Start-Up Agreement. The Consultant may not invoice for work until COD is approved. The Preliminary Engineering Section tracks the Start-Up Agreement through EPAS. Once approved and executed, a PDF version of the executed Agreement and the approved request are found in EPAS Copies of the Start-Up Agreement template and request memorandum template for the Start-Up Agreement are on BDE's SharePoint site.

8-3.12 Contract Administration

Administration of the project agreement is the responsibility of the agency (IPM) requesting use of a Consultant. The IPM is responsible for monitoring the execution and progress of the work.

The Department's project manager is the Department's contact with the Consultant. A Department's project manager is assigned and all work, and all project correspondence are channeled through the Department's project manager. Invoices and progress reports are received and reviewed by the Department's project manager.

The Department's project manager ensures any changes are negotiated in accordance with the terms of the Agreement and the files are properly documented for all verbal instructions. The Department's project manager is also responsible for documenting the Consultant's performance throughout the project and provides the Consultant Performance Evaluation.

8-3.13 Subcontracts by Consulting Engineering Firms

The SAPCS provides that the Department can utilize prequalified Subconsultants upon approval. The SOI submitted by the successful consultant, lists all the Subconsultants the Prime proposes to utilize on the project. After the scoping and negotiation meetings and the proposal package is sent uploaded to BDE, a copy of the fully executed subcontract is uploaded to the Vendor Doc site by the Prime Consultant before any Subconsultant work is authorized. The Subconsultant Agreement and Supplemental Subconsultant Agreement templates located on the Department's Website contain the clauses required by law and the clearly defined scope of work, the schedule of completion, and the payment basis are included by the Prime. Any Subconsultant Agreement not using the Department's template requires review and approval by the Office of the Chief Council (through BDE) prior to authorizing the Subconsultant's work. The following items provide additional guidance on subcontracts by Consultants:

1. Individual Professionals and Nonprofessional Work. All subcontracted work by professional Consultants requires negotiation of a subcontract. This does not apply to individual professionals that are on a retainer basis to the Prime Consultant; nor does it apply to nonprofessional work, obtained by competitive bidding.

2. Supplemental Agreements and Profit. If the scope of work in the Prime Agreement does not include the proposed subcontract work deemed necessary by the Department, the Prime compensation and scope of the Prime Agreement is modified by a Supplemental Agreement to include the subcontract work. If the Prime Agreement has a fixed fee for profit that includes profit on items later proposed to be subcontracted, the Prime Agreement shall be modified to exclude profit to the Prime Consultant on subcontracted items (i.e., no double profit).

3. Fee Estimates. The Subconsultant's proposal for work shall contain direct payroll, direct costs, man-hours or units of work, and supported by back-up data as required for a Prime Agreement. The proposed man-hours and direct costs are approved by the administering IPM based upon its estimate of cost and submitted to BDE. Payroll additive percentages used in the fee estimate are approved by Bureau of Investigations and Compliance.

4. Payment. The Consultant may bill the Department for the Subconsultant's work as the work progresses. If the method of reimbursement is lump sum or unit of work, payment is based upon the percentage of work completed as indicated on the Progress Schedule. If the method of reimbursement is CPFF, payment is based upon the number of man-hours completed. The Subconsultant contract provides that the final payment is not made to the Subconsultant by the Prime Consultant until an Affidavit of Completion is submitted.

8-3.14 Supplemental Agreements

8-3.14(a) General

During the course of a Consultant's work on a project, occasions arise where changes in the negotiated work items are identified. All changes in the schedule, negotiated scope of work, or fee require the Department’s written authorization to the Consultant prior to implementation. The Consultant, per the Agreement, forfeits its right to claim additional compensation for added work done prior to receiving written authorization from the Department. It is the Department’s project manager’s responsibility to ensure that any changes are negotiated, agreed to, and authorized in full accordance with SAPCS and the terms of the Agreement. When the Consultant is notified of changes the Department finds necessary, the notice should clearly state that it is not an authorization to proceed with the changes and advise of the steps necessary to negotiate the change. When in doubt, the Department’s project manager contacts BDE for procedural advice.

Increases in the negotiated work are accomplished through Supplemental Agreements that include the additional scope of work to be accomplished, any necessary changes to the project schedule, and the manner of payment with a stated Upper Limit of Compensation.

Most Supplemental Agreements are applicable in the following situations:

- extension of time,
- corrections in Contract language,
- deletion of work,
- addition of direct costs not previously in agreement,
- transfer of work between Prime and Subconsultant,
- transfer of funds between labor and direct costs,
- work advertised but not previously negotiated nor included in contract scope, and
- additional level of effort of previously negotiated items.

All Supplemental Agreements must have a Consultant Agreement Approval Sheet (CAAS) approved prior to execution. The CAAS states reasons for the additional cost and the associated man-hours. The CAAS also includes the work items involved, why it is being added, the cost for each, and why the Consultant is entitled to additional compensation. When the supplemental cost has been negotiated, the Consultant Agreement Approval Sheet (CAAS) is prepared by Department’s project manager and approved by the Bureau Chief of Design and Environment.

All Supplemental Agreements are authorized and paid for in accordance with the terms of the Agreement. The appropriate Departmental signatures, in accordance with Departmental Order 2-2, are required to authorize Supplemental Agreements. Note, if a Supplemental Agreement increases the value of the Contract equal to or greater than $250,000 in a fiscal year (total of all supplements in a fiscal year), the Agreement requires the signatures necessary to authorize an Agreement of $250,000 or greater. All procedures for estimates, review, and approval that apply to Prime Agreements also apply to Supplemental Agreements. The Department’s project manager negotiates the scope of work, man-hours and direct costs for the Supplemental Agreement. The following information is then uploaded to the SharePoint site:

- cover memo/transmittal memo,
- draft Scope of Work with schedule (bar chart),
- BDE 17-09 (if applicable),
- negotiation meeting minutes,
- Cost Estimate Of Consulting Services (CECS(if applicable)),

- revised QC/QA Plan, if applicable,
- direct costs if applicable, and
- CAAS.

The BDE obtains fee approval, finalizes the Supplemental Agreement, and obtains FHWA approval, if required, executes the agreement, and notifies IPM, that the consultant may be authorized to begin work.

8-3.14(b) Early Authorization to Proceed-Prior Approval

The Consultant may be authorized to work on items outside of the negotiated scope once that work is identified and agreed to by all parties through a Prior Approval. A written Prior Approval allows the Consultant to begin the additional work; however, the Consultant may not invoice for the increased work until the Supplemental Agreement has been authorized.

Once the need and extent of the additional work is identified and within the advertised scope of the project by the Department, and negotiations with the Consultant begin, the appropriate Department personnel authorizes, by Prior Approval Authorization Letter, and the Consultant to proceed with the work up to a specific dollar amount. This Prior Approval Letter outlines the additional work being authorized and the amount being authorized. A signed copy of the letter is sent to BDE. Prior Approval is intended to keep the work going to meet the project’s schedule. Supplemental Agreement negotiations should be finalized quickly.

The Prior Approval authorization process only establishes limits for continued work while the Supplemental Agreement is negotiated and processed. Any additional funding required for the supplemental work must be secured by IPM through OP&P. Once the negotiations for the supplemental agreement are complete and CAAS is approved, a second letter called, ***CAAS Approved Letter***, may raise the authorized amount. (Send a copy to BDE.) See the following chart for authorization limits. At all times, the amount authorized prior to the execution of a supplemental agreement may not exceed 40% of the anticipated supplemental agreement amount.

Only a single set of Prior Approval authorizations (initial letter and CAAS approved letter) may be issued per Supplemental Agreement. A subsequent set of Prior Approval authorizations cannot be issued until the previous Supplemental Agreement has been authorized. Prior Approval authorizations cannot be issued adding a Subconsultant.

Signature Required	Prior Approval Amount
Prior Approval Authorization Letter signed by Regional Engineer (maximum of 40% of the estimated supplement amount)	Up to $50,000
CAAS Approved Letter (2nd Letter) signed by Regional Engineer (maximum of 40% of the estimated supplement amount)	$50,000 to $249,999
CAAS Approved Letter after CAAS is approved, Secretary (maximum of 40% of the estimated supplement amount)	Over $249,999

PRIOR APPROVAL AUTHORIZATION SIGNATURE AUTHORITY

Figure 8-3.A

8-3.15 Monitoring Consultant's Work

8-3.15(a) Agreement Schedule

After the work under the Agreement has been authorized, IPM meets with the Consultant. They agree on detailed procedures and progress report percentages for elements of work. They also indicate on the appropriate progress report the calendar days to complete each of the various work elements, which should agree with the calendar days indicated in the Agreement Project Schedule. The date due is indicated on the Progress Report for each work element after authority to proceed with that work element is given. All report forms and invoice forms are available to the Consultant on IDOT's website.

As work progresses and work elements are approved, the date due for other work elements should be indicated on the Progress Report. These dates should be revised, as needed, if the Consultant's work is stopped or placed on hold by the Department. The "Remarks" column may be used to indicate the date on which the work element was submitted.

The IPM, or other appropriate official, indicates on the Progress Report if the project is on schedule or behind schedule. If behind schedule, the reason for the delay is stated on the Progress Report; the reverse side of the form may be used if needed.

If it is determined that the work is behind schedule due to factors under the Consultant's control, this is reflected on the Consultant's Performance Evaluation Form.

If work is lagging due to no fault of the Consultant, IPM should make every effort to expedite the work because the Agreement provides for fee renegotiations if completion is delayed beyond the time limits set in the Agreement. If the completion schedule is to be revised, IPM has the Consultant request approval of the revised schedule. A copy of the approved schedule change is then furnished to BDE. If the work is behind schedule due to factors under the Consultant's control, IPM issues written remedial instructions to a principal of the firm. If this fails to correct the problem, it may be necessary for the using agency to recommend termination of the Agreement to BDE. The IPM may recommend that the Agreement be terminated for other reasons in the best interest of the Department such as unsatisfactory work or change in Department priorities shifting construction time too far into the future.

8-3.15(b) Completion Dates

The IPM should be aware of the completion dates in the Agreement. There is a work schedule completion date and a completion date for billing purposes. If the Contract extends past the billing completion date any submitted invoices will be rejected by the Comptroller’s office. The IPM should request a time extension from BDE prior to the schedule and/or billing dates in the Agreement. If the completion dates are passed, IPM obtains a general affidavit signed by the Consultant and completes one, signed by the Regional Engineer, and submits these to BDE with the extension request.

8-3.15(c) Documentation

The project manager maintains a complete log in the files of what was decided during all phone calls, meetings, visits, and inspections. Copies are furnished to the Consultant for purposes of FHWA audit and/or of documenting performance.

8-3.15(d) Consultant Invoices

Process consultant invoices for payment only when the reported percentage of completion is approved. The IPM promptly notifies the Consultant if the percent of work complete does not correspond to the percent of work accomplished. Total costs in excess of the approved percentage of completion are not approved for partial or final payments. When such higher costs are billed, IPM determines if this is due to Consultant inefficiency and, if so, takes appropriate steps to correct the problem. If overruns are due to underestimation of the negotiated scope by the Department, IPM takes steps to have the limits adjusted; see Section 8-4.03. The IPM promptly requests BBFM make payment on invoices found reasonable, or corrected to reasonable, and in accordance with the terms of the Agreement.

The “Invoicing Procedure Guide for Project Managers” is available for IDOT employees on the Engineering Consultant information SharePoint site.

8-3.15(e) Federal Funding

When Federal funds are involved in the Agreement, IPM keeps the FHWA representative apprised of the Consultant’s work and, if FHWA requests, arrange to conduct joint reviews of the work.

8-3.16 Evaluation of Consultant's Performance

8-3.16(a) General

The Department formally evaluates all work performed by Consultants. During the life of a project, IPM informally evaluates a Consultant by keeping lines of communication open, and keeping the Consultant aware of any problems or concerns the Department has with its performance. Among the areas evaluated are:

- timeliness,
- completeness,
- quality & assurance,
- public / agency / coordination,
- cooperation management,
- budget / supplement / invoicing,
- additional comments.

There are some Consultant errors that the Department views as significant and substantial causing the project to be in jeopardy. These are "Fatal Flaws" and where these Consultant errors occur, the highest final rating the project may receive is a "Satisfactory," providing the Consultant makes corrections and improves their quality control. These errors result in an interim rating of "Substandard" or "Poor." If a Consultant demonstrates any of the fatal flaws below, their evaluation should reflect these errors and justification must be documented in the comments section:

Fatal Flaws are defined as:

- errors involving significant structural deficiencies or safety on bridges/structures,
- errors resulting in the Consultant failing to identify significant environmental impacts,
- errors involving substandard geometrics for the specified design criteria,
- inaccurate survey information impacting the project's constructability,
- inappropriate behavior by the Consultant when working with the public,
- false information used by the Consultant in the report documentation, and
- adjustment of letting date or design approval due to late Consultant submittals.

The evaluation process, by nature, is a subjective process. Although an "Excellent" project is a goal, in practice, very few projects are truly "Excellent." An Excellent project has the following characteristics:

- the submittals contained no major errors and very few minor errors.
- the Consultant during the life of the project was self-managed (e.g., responsive to requests, minimal calls/requests on standard procedures, took lead of project).

- the Consultant was innovative (e.g., focused special resources on issues, perceived and managed problems early and effectively, innovatively used resources/technology, and/or posed solutions which saved the Department significant funds).

- submissions were not only early, but allowed the Department to advance a letting or advertisement to an earlier date. Consideration will be given for an accelerated Department dictated timetable.

- the project was cost effective, safe, and considered a context-sensitive design.

- quality presentation of products was acceptable (e.g. spelling, grammar, labeling, links).

- the Consultant maintained a consistent high-quality level of personnel throughout the life of the project.

- complied with all Department manuals, policies, procedures, or explained exceptions with minimal prompting by the Department.

- consistently promoted a positive Department image and minimized controversy during public involvement.

The evaluations are available through the Engineering Prequalification and Agreement System (EPAS) database. The following are areas generally evaluated under each prequalification category. Consider the following guidelines when evaluating Consultants:

1. Timeliness.

    - Exceeds – Consultant submits key items of work consistently early affording the Department the opportunity to advertise the next phase of work on an earlier bulletin.

    - Meets – Consultant submits key items of work consistently on or about the time agreed to by both parties.

    - Substandard – Consultant submits key items of work consistently past the time agreed to by both parties.

2. Completeness.

    - Meets – Consultant includes, consistently on key items of work, all items in a submittal as specified in Department manuals, policies, procedures, and the Contract documents.

    - Substandard – On key items of work, the Consultant consistently fails to include all items in a submittal as specified in Department manuals, policies, procedures, and the Contract documents.

    -

3. Quality & Assurance.

- Exceeds – The Consultant submittals contain no major errors and very few minor errors. Minimal hours are expended by Department staff in review of submittals. Presentation of material is clear, concise, and of high quality (e.g., spelling, grammar, labeling, links). The next phase of work experienced little or no major problems/questions attributable to the Consultant. The project thoroughly analyzed the major elements of the project. Maintained a high quality of work with a Department-accelerated schedule.

- Meets – The Consultant submissions contain no major errors and some minor errors. Presentation of material is clear, concise, and adequate (e.g., spelling, grammar, labeling, links). The next phase of work experienced the expected problems/questions attributable to the Consultant.

- Substandard – The Consultant submissions contain major and minor errors. The Consultant demonstrated low quality presentation of products (e.g., spelling, grammar, labeling, links, etc.). The next phase of work experienced problems/questions attributable to the Consultant. The Consultant showed poor understanding of the work type.

4. Public / Agency / Coordination.

- Exceeds – The Consultant independently developed proactive and creative public/agency involvement techniques that both identified and effectively responded in a timely manner to minimize highly controversial issues. The Consultant managed and implemented the public relations program and presented accurate and pertinent project information to the public, news media, and coordinating agencies, which resulted in project acceptance and a positive Department image.

- Meets – The Consultant followed Departmental guidelines in performing project coordination with the public, news media, and agencies in such a manner that fulfilled all requirements and resulted in project acceptance and design approval.

- Substandard – The Consultant responses were misleading, incorrect, or inflammatory at public/agency involvement meetings. Presentation material (e.g., aerial exhibits, details, tables, data, etc.) contained incorrect or conflicting information which reflected negatively on the Department or the public’s acceptance of the project design features. The Consultants public/agency involvement program required an over-reliance on Department staff to correct, revise, and present project improvement/mitigation.

5. Cooperation Management.

- Exceeds – Consultant was consistently available and responsive to and ahead of problems and concerns. The Consultant initiated open and timely communications with the Department. Consultant was consistently self-managed.

- Meets – Consultant was available and generally responsive to problems and concerns. The Consultant initiated open and timely communications with the Department. Consultant was self-managed at times.

- Substandard – Consultant was generally neither available nor responsive to problems and concerns. The Consultant communications with the Department were rarely timely. Consultant continually asked the Department for clarification on standard procedures.

6. Budget / Supplement / Invoicing

- Exceeds – Submittals are accurate with little to no send backs, invoices and work orders are submitted in a timely fashion.

- Meets – Consultant were able to stay within the projected budget, invoices were submitted in a timely and complete accurate manner.

- Substandard – Consultant has numerous errors in invoice/work order submittals resulting in a multiple send backs, late invoice submittals, submit charges that are above/outside the agreement, lack of backup documentation or missing information on forms.

8-3.16(b) Interim Evaluations

Evaluations are made for both Prime Consultants and Subconsultants at interim and final stages. Interim evaluations may be completed at any time. Scheduled interim evaluations are determined by each IPM. Interim evaluations are typically done on an annual basis or at deliverables dates determined at negotiations. The structural work, however, requires two interims, one at TS&L and one at prints of the final plan stage, and then final overall evaluation. An interim evaluation accompanies a submittal when returned to the Consultant due to excessive errors/corrections.

All interim evaluations are sent to Consultants at the same time they are transmitted to BDE. The evaluations are a very important tool for both the Consultant and Department. They provide timely feedback to the Consultant concerning its performance on an active project. The interim evaluation allows the Consultant to correct any deficiencies during the life of the project, in some cases turning what would otherwise have been a bad experience for all involved, into a good one. The responsibilities for completing Consultant evaluations are documented in the following sections.

It is important to conduct interim evaluations so as not to delay processing any possible Supplemental Agreements.

8-3.16(c) Final Evaluations

After the Consultant completes the work covered in an Agreement, final evaluations are prepared by IPM for the Consultant and Subconsultant in the appropriate categories. The Department's project manager and his/her supervisor concur and sign the final evaluation. The final evaluation is sent to the Regional Engineer or Bureau Chief for concurrence and signature. The final evaluation is then sent to the Consultant and transmitted electronically to the BDE Consultant Unit using the EPAS database.

8-3.16(d) Structure Plan Evaluations

The performance evaluations of Consultants or Subconsultants preparing structure plans are completed by the Bureau of Bridges and Structures. An interim evaluation is completed if the overall work is "poor" or "needs improvement", if work is "satisfactory" or greater no interim evaluation is performed. The final overall evaluation is made after the completed drawings are submitted for letting and takes into account the two interim ratings.

In the case where the completed final plans are not placed on an immediate letting, IPM forwards a reduced set of bridge plans (prints) to the Bureau of Bridges and Structures (BB&S). This procedure allows BB&S to complete its final overall evaluation of the Consultant in a timely manner.

8-3.16(e) Other Evaluations to be Completed by the IDOT Project Managers

The interim and final performance evaluations of Consultants preparing construction plans, performing specialized studies, surveys, geotechnical engineering, construction engineering, preparing photogrammetric mapping, and other services are completed by the appropriate IDOT personnel. These evaluators may access the EPAS database.

8-3.16(f) Final Project Evaluations

Upon completion of all the final evaluations by IPM and/or bureau, a final project evaluation is prepared. The final project evaluation is prepared after PE II for PE I work and after construction is complete for PE II and PE III. If the next phase is delayed more than one year, the final project evaluation is prepared immediately after completion of the contract work.

Where the project is evaluated by more than one department evaluating entity (e.g., BB&S, Environment), the final evaluations are transmitted to BDE by the Regional Engineer and/or Bureau Chief with the ratings incorporated from the applicable entity.

8-3.16(g) Consultant Selection Committee

Performance evaluations are provided to the Consultant Selection Committee as part of the preliminary review and rating information. A five-year average of performance evaluations on similar types of projects is used for this purpose. The Selection Committee is also apprised of all appeals.

A listing of all evaluations, other than Satisfactory, is forwarded to the Consultant Selection Committee. In addition, a listing of all evaluations of Good or Excellent (final) are forwarded to the Consultant Selection Committee. The Consultant Selection Committee considers this information when deliberating at the selection meetings.

8-3.16(h) Below Satisfactory Interim Evaluations

Where a below satisfactory rating is received on an interim evaluation: A Substandard or Poor rating can be removed based on any of the following conditions:

- Five years has elapsed since the interim evaluation of Substandard in a particular category.
- A subsequent interim evaluation on the same project in the same category is satisfactory or better.
- The Consultant meets with IPM that made the Substandard or Poor evaluation and the evaluation for the project is upgraded to satisfactory. This condition involves situations where there has been a misunderstanding between the Department’s evaluator and the Consultant.
- The Consultant demonstrates to IPM the corrective measures have been taken to correct the less than satisfactory performance. Under this condition, the evaluations will not be removed but marked with an asterisk to indicate that corrective measures have been implemented by the Consultant to the satisfaction of IPM.

8-3.16(i) Below Satisfactory Final Evaluations

A final evaluation of Poor results in suspension from submitting a Statement of Interest in the evaluated category and any higher level category in the same work type for a period of the next eight PTB’s or two years, whichever is greater, as a Prime or Subconsultant. At the end of this period, the Consultant must request reinstatement to the suspended category. This will require documentation of the efforts and success in correcting the issues which led to the Poor evaluation.

If a second final evaluation of Poor occurs in the same category within five years, it will result in loss of prequalification in that category for five years. At the end of this period, the Consultant must request reinstatement of prequalification in that category. This will require documentation that the issues which led to the subject evaluations have been rectified.

A final evaluation of Substandard results in suspension from submitting a Statement of Interest in the evaluated category and any higher level category in the same work type for a period of the next two PTB’s or six months, whichever is greater, as a Prime or Subconsultant. At the end of this period, the Consultant must request reinstatement to the suspended category. This will require documentation of the efforts and success in correcting the issues which led to the Substandard evaluation.

If a second final evaluation of Substandard occurs in the same category within five years, it will result in loss of prequalification in that category for one year. At the end of this period, the Consultant must request reinstatement of prequalification in that category. This will require documentation that the issues which led to the subject evaluations have been rectified.

8-3.16(j) Consultant Appeal Process of Final Evaluation

After receipt of the final evaluation, the Consultant has 30 days in which to appeal a Substandard or Poor evaluation. The appeal is submitted in writing to the Department entity that prepared the final evaluation (e.g., Regional Engineer, Bureau of Design and Environment, Bureaus of Bridges and Structures). The appeal will clearly state the basis for the appeal and any supporting documentation shall be attached.

If the Consultant is not satisfied with the results of the appeal, the Consultant may request in writing, within 14 days, a review by either the Director of Highways Project Implementation or Director of Program Development. Either Director will review the documentation file, the evaluation, and meet with the Consultant and the departmental entities involved.

If the Consultant is not satisfied with the results, after meeting with the either Director of Highways Project Implementation or Director of Program Development, the Consultant may file a written appeal with the Deputy Secretary for Project Implementation or Deputy Secretary for Program Development within 14 days of final action by the either Director. The appeal shall state specifically the basis of the appeal and the reason(s) the Consultant disagrees with Director’s decision. No new issues may be raised. The appropriate Deputy Secretary will review the information submitted in the appeal. The appropriate Deputy Secretary may request a meeting with the Consultant. The Consultant will be notified in writing of the Deputy Secretary’s decision which will be final.

8-3.17 <u>Completion and Termination Procedures</u>

8-3.17(a) Completion

When any Consultant Agreement is ended, whether by completion of the work or by termination procedures stipulated in the Agreement, copies of the final voucher request, request for audit, Affidavit of Completion, and the final invoice with all its attached documentation is submitted by the administering agency to BDE.

Upon receipt of a final audit, IPM prepares a Contract Obligation Document (COD) deobligating excess funds for jobs that have reduced costs. The COD is submitted to the Bureau of Investigations and Compliance with a copy to the Agreements Unit. This completes the closeout procedures for projects, which are not programmed for Federal fund participation. If the final audit recommends increasing the Agreement amount, a COD is prepared by BDE.

The IPM must submit the following additional documentation to BBFM for all programmed Federal-aid projects when completed (after final costs are confirmed by the BBFM audit):

- the date all work was completed or the Agreement was terminated;
- a list of all authorization dates from FHWA, for work authorized on the project, to verify that it is participating;
- a list of all construction sections under the specific preliminary engineering Agreement. In the event the Agreement is for work other than construction plans, the type of work should be listed and its acceptance verified (e.g., "the report was approved by *(name)* on ((*date*))," or "the Soils Committee approved the soils report on ((*date*) "); and
- method of payment stipulated in the Agreement. Note all the methods and areas of application if several methods of payment are used.

8-3.17(b) Termination

If an administering IPM desires to terminate an Agreement, a memorandum recommending termination will be submitted to BDE. The memorandum will include:

- the reasons for recommending termination,
- the percentage of work completed,
- the percentage of fee expended, and
- an estimate of the cost and time required to complete the work, if applicable.

The BDE will send the termination request to the Secretary. Upon notification by BDE that the Secretary has concurred with termination, the administering IPM will notify the Consultant in writing.

8-3.18 Reassignment of Vested Interest in an Agreement to Another Consultant

Occasionally, it is necessary to assign an existing Agreement to another Consultant because of an ownership or organizational change (e.g., dissolution of the firm, death of a principal, absorption of the firm by corporate expansion, a partnership change). The existing Agreement is kept in force by an Assignment to the new legal entity.

The Assignment Agreement is a legal document that transfers all rights, obligations, and interests in the Agreement from the original Consultant (the assignor) to the new Consultant (the assignee). It must be properly executed in triplicate by the assignor and the assignee and then submitted to IDOT for acceptance and signature. A copy of the Assignment is returned to the assignor and assignee when fully executed. Form BDE 2364 may be used as a guide in determining whether the Assignment contains the essential elements.

If there is no ownership or management change and the change is only related to name, address, absorbing another firm, or adding personnel to the firm which is party to the Agreement, a notice of the Assignment, authorization to make payment to the new Consultant, and release of obligation executed by the assignor is sufficient to continue the Agreement work and payments.

The Agreements Unit makes distribution of information on the reassignment of a Consultant to the affected areas within the Department.

8-4 CLAIMS

8-4.01 Damage Due to Consultant Errors and/or Omissions

By Contract, a Consultant is responsible for damages incurred by the Department as a result of the Consultant's errors and/or omissions. However, when the Department believes a fair and equitable price for an omission is obtained from the Contractor and the cost would have normally been incurred by the nature of the contract; the Consultant typically is not charged damages for their omissions.

8-4.01(a) Errors by Phase I Consultant Discovered During Phase II

The IPM will notify the Agreements Unit if errors in the Phase I work have occurred that will result in additional cost in subsequent phases of the project. The notification should describe the situation, the corrective measures that result, and the amount of the Consultant's liability. If IPM deems it practical, the Consultant responsible for the error may be given the opportunity to assist in making the corrections to reduce his/her financial liability.

8-4.01(b) Errors by Phase II or Phase III Consultant Discovered During Construction

When an error or omission is found resulting in damages to the Department and is believed to be caused by the Consultant, the district's Bureau of Project Implementation or the Bureau Chief responsible for the phase of work where the error was discovered first determines if time is critical and then:

1. Where Time is Not Critical. Notify the Program Development Engineer or the appropriate Department office immediately. The Department's Consultant Manager notifies the Consultant of the error or omission either by e-mail, fax, or mail. The Consultant is given an opportunity to be involved in the resolution of the error or omission along with the timetable involved. After the investigation, if the error or omission is determined not to be the Consultant's responsibility, the firm may submit an invoice for the hours used during the investigation. The fact that the Consultant provided assistance in the resolution of the error or omission will not be construed as either absolving the Consultant of the firm's portion of the damages or implying the Consultant's responsibility for the damages.

2. Where Time is Critical. Notify the Program Development Engineer or the appropriate Department office of the error and also identify the steps that were taken to remedy the error. If the Department determines the error is the Consultant firm's responsibility, the Department's Consultant Manager notifies the Consultant firm of the error and the remedy by e-mail, fax, or mail.

The initial notification to the Consultant firm includes: (1) the nature of the error or omission, (2) the action sought from the Consultant, if any, and (3) the time constraints required for the response or the solution recommended for implementation. The extent of liability for the error may be determined at a later time and is not included in the initial notification. A copy of the notification is sent to BDE.

The district’s Bureau of Project Implementation submits an Authorization of Contract Changes (form BC-22), necessitated by the plan error or omission, to the Central Bureau of Construction and resolves the error accordingly. The BC 22 should provide detailed information on the cost to correct the error or omission. The BC 22 should also include a copy of the district’s Bureau of Project Implementation notification to the Program Development Engineer (or appropriate Department office) specified above.

Upon approval of BC 22, the district’s Bureau of Project Implementation forwards a copy of the approved BC 22 to the Program Development Engineer or the appropriate Department office. If the Consultant is found responsible for damages, the Program Development Engineer or the appropriate Department office will forward a copy of the approved BC 22, all applicable documentation, and the extent of the consultant’s liability to BDE.

8-4.01(c) Notifying Consultant of the Cost of the Errors or Omissions

The Agreements Unit in BDE notifies the Consultant of the amount and extent of liability of the Consultant resulting from the errors and/or omissions. The Consultant has 30 days to respond to the notification indicating either agreement that they are responsible for the claim or intent to appeal the claim. A Consultant may request an extension of those 30 days for more complex situations to allow sufficient time to investigate the matter. If the Consultant agrees they are responsible for the claim, an invoice is sent to the firm as set forth in Section 8-4.01(f). If the Consultant does not agree they are responsible either totally or partially, the dispute resolution process in Section 8-5.01(e) is followed.

8-4.01(d) Errors and Omissions Threshold (EOT)

In recognition that the Department is not seeking a level of effort required to produce a perfect product and in order to reduce the time and expense for the Department and the Consultant in processing claims for minor dollar amounts, an Errors and Omissions Threshold (EOT) is used. Claims for damages involving errors and/or omissions are not billed to the Consultant unless the damages exceed the EOT Amounts shown in Figure 8-5. Errors and omissions are defined in the Standard Agreement Provisions for Consultant Services along with the EOT amounts.

Construction Contract Award Amount	EOT Amount
$2,000,000 or less	$20,000
Over $2,000,000 to $10,000,000	1% of Contract
Over $10,000,000	$100,000

Error and Omissions Threshold (EOT)

Figure 8-4.A

Where a Consultant designed multiple projects under one Contract, use a separate EOT for each project (e.g., one Phase I report for multiple Phase II projects, one Phase II Contract for multiple construction contracts).

8-4.01(e) Dispute Resolution

The Department and the Consultant agree to work together on a basis of good faith and fair dealings. When a dispute arises concerning damages caused by errors or omissions, the Consultant may choose to appeal according to the following requirements. The Consultant providing assistance in the resolution of the problem is not construed as absolving the Consultant of his/her portion of the damages.

If the appeal, after consideration by the Department, is found to have merit, an equitable adjustment is made. If the Department finds the appeal to be without merit, no adjustment to the damages due by the Consultant is made.

All appeals are submitted in writing no later than six months after notification of the damages by the Department.

All appeals are first submitted to the Regional Engineer. The Consultant may request an opportunity to present the appeal verbally at each of the following levels if the appeal is not satisfactorily resolved at the previous level:

(1) Regional Engineer

(2) Director of Highways Project Implementation/Chief Engineer

(3) Deputy Secretary for Project Implementation

The Department has the option of considering other methods to resolve the dispute (e.g. Alternative Dispute Resolution).

If the Consultant and the Department cannot agree on the extent of the liability, the matter will be referred to the Bureau of Claims in the Office of Chief Council for further proceedings. Damage claims arising subsequent to construction will be referred to the Office of Chief Council for proper resolution.

The written response of the Deputy Secretary for Project Implementation shall be deemed a final action of the Department.

Once the appeal process has been exhausted, IPM notifies BDE, clearing the way for an invoice to be sent to the Consultant. The Department notifies the firm when the Consultant is considered delinquent if the invoice is not paid within 30 days.

8-4.01(f) Obtaining Reimbursement for Consultant Errors or Omissions

When the Consultant takes responsibility for the errors or omissions or the dispute resolution process has been completed with a finding of Consultant responsibility, BDE sends an invoice to the Consultant. Procedures for processing invoices and accounts receivables are contained in the *Revenue Accounting Manual*. The “Payment Due Date” on the invoice is 30-45 days from the date of the invoice. If payment is not received by the due date, use the collection procedures described in Chapter 4 of the *Revenue Accounting Manual*. If those procedures fail, refer the matter in writing to the Bureau of Claims in the Office of the Chief Counsel. The referral to the Bureau of Claims should include all correspondence from the appeal and collection processes.

8-5 QUALITY ASSURANCE QUALITY/CONTROL (QA/QC) GUIDELINES FOR WORK BY CONSULTING ENGINEERS

8-5.01 Definitions

1. Calculations. Written documentation of assumptions, analysis, and conclusions for design of an element of a project.

2. Checklist. A list of things, names, etc., to be checked off or referred to for verifying, comparing, ordering, etc.

3. Communication. Giving or exchanging of information, signals, or message as by talk, gestures, or writing. Communication is required throughout the process, is the responsibility of everyone, and must be open.

4. Compliance. The act of following the stated quality assurance plan. An act of complying with a requirement, directive, etc.

5. Computations. Written documentation of the figuring of quantities for a project.

6. Computer Program Verification. Assurance that a computer program correctly performs the operations specified in a numerical model. Usually accomplished by comparing program results to:

   - a hand calculation,
   - an analytical solution or approximation,
   - a verified program designed to perform the same type of analysis, or
   - a comparison with a test case provided by the vendor of the program.

7. Consultant. The firm providing professional services as a party to a Standard Agreement. An expert who is called on for professional or technical advice or opinions.

8. Corrective Action. Measures taken to rectify conditions adverse to quality and, where necessary, to preclude repetition.

9. Department. The Department of Transportation of the State of Illinois.

10. Design Control. Requirement providing assurance that a design is defined, controlled, and verified.

11. Documentation. Any written or pictorial information describing, defining, specifying, reporting, or certifying activities, requirements, procedures, or results.

12. Final Documents. Approved documents and approved changes thereto.

13. Performance. The act of carrying out the stated objectives on a project.

14. Planning. Those activities needed to ensure that the correct people are performing the correct tasks using the correct tools in the correct sequence. The end product should be

identified and kept in mind when performing planning activities to ensure that the end product contains the required quality.

15. Project Budget. A comprehensive description of the costs associated with all the services required of the consultant, including labor costs, direct expenses, overhead costs, and profit.

16. Project Team. The Department's and the Consultant's staff assigned to the project with specified duties and responsibilities, participating together in a cooperative manner.

17. Project Resources. All things available to the project team to complete the project, including people, tools, information, equipment, etc.

18. Project Manager. The individual assigned by the Consultant to act as the liaison between the consultant and the Department in matters relating to the achievement of project requirements, including budget control, schedules, milestones, and quality objectives.

19. Project Schedule. A comprehensive description of all significant services required of the Consultant and of all actions required of the Department and approving parties by the obligations of the Agreement, together with the durations and/or dates for performing these services and actions.

20. Quality. Meeting valid requirements so that the product produced is suitable for its intended use (quality in fact). Providing what is expected (quality in perception).

21. Quality Assurance. All those planned and systematic actions necessary to provide adequate confidence that a structure, system, or component will perform satisfactorily in service.

22. Quality Assurance Manager. The individual assigned by the Consultant to have full authority and responsibility for generating, updating, monitoring, and maintaining the quality assurance program, and responsibility for verifying conformance to the QA requirements as set forth by the Department and applicable codes and standards.

23. Quality Assurance Plan. A document describing the implementation of the Quality Assurance Program on a specific project, including organizational responsibilities, applicable procedures, and other information required to address client (contractual) quality requirements. The plan may also address any unique contractual requirements or modifications.

24. Quality Assurance Procedures. A quality assurance document that outlines a planned and systematic action for various quality affecting activities requiring quality control.

25. Quality Control. A system for maintaining desired standards in a product or process, especially by inspecting samples of the product.

26. QA Records. A completed document that furnishes evidence of the quality of items or activities affecting quality. A record is an authentic, official copy (or original) of a document retained to attest to past decisions, actions, or events.

27. Scope of Services. All the actions required of the Consultant to complete the obligations for the project.

28. Training. In-depth instruction provided to personnel to develop and demonstrate initial proficiency in the application of selected requirements, methods, and procedures, and to adapt to changes in technology, methods, or job responsibilities.

29. Valid Requirements. Requirements established resulting in the product satisfying the customer's expectations on schedule and within planned resources.

30. Verification. The act of reviewing, inspecting, testing, checking, auditing, or otherwise determining (and documenting) whether items, processes, services, or documents conform to specified requirements. Ensuring that the project team is doing the right thing and that the work being performed, or that has been performed, is performed correctly.

8-5.02 Elements of a QA/QC

The following sections identify the key elements addressed in the QA/QC plan.

8-5.02(a) Project Team

This section should include a list of key personnel from in-house staff, outside consultants, and client liaison and includes a brief description of the key members' responsibilities. A typical project team should include:

- Project Manager,
- Client Liaison,
- Technical Support Staff,
- Subconsultants and other Consultants, and
- QA/QC reviewer.

8-5.02(b) Written Project Plan

A. PROJECT SCOPE

This section includes a brief description and the purpose and need for the project. Consider and address the matter of possible future expansion of the facilities. Identify if the project is to be done in U.S. customary or metric units. Note if the project includes more than one contract (i.e., two or more sections). Also note in this section anything significantly different for this project.

B. SUBCONSULTANT’S ROLE

List and identify all Subconsultants. Delineate the scope of work and responsibilities for each Subconsultant. Provide the Subconsultant’s key project personnel and telephone numbers. Identify all deliverables with expected time frames. These deliverables can be from the Subconsultant to the consultant and, in certain instances, vice versa.

C. STANDARDS AND GUIDELINES

List all appropriate manuals and memorandums applicable to the project.

D. TIME SCHEDULE

The schedule includes the estimated Agreement date, any meeting dates, and periodic milestones. The number of milestones varies considerably depending on the size and type of project.

Establish deliverables with dates for submittals to various parties to the Agreement. Provide reasonable float and review times in the overall schedule.

Ensure in-house quality assurance reviews are scheduled in accordance with the various milestones and deliverables. Schedule the reviews several times during the project rather than as a final, comprehensive check.

Identify and schedule report phase milestones and the preliminary submittal date. Provide the beginning date for preliminary design along with milestones and submittal date to IDOT. Identify the starting date for final design along with any overlap with the preliminary design. Provide a list of periodic milestones during this stage.

Periodic meetings with IDOT are required, up-front, and coordinated with the various deliverables and their review.

The success of the project can often hinge on the time schedule. The entire time schedule is a dynamic schedule and may be reviewed and adjusted periodically.

E. PERSON-HOUR BUDGET

Prepare a person-hour budget by classification and by work tasks. Estimate the percent of total budget expected to be expended at various milestones. This assists in monitoring progress and assists in providing early alerts to a problem with the budget.

F. RESOURCE MATERIAL

This section consists of a listing of pertinent information available for the project including:

- existing drawings,
- previous reports,
- soil borings,

- TS&L,
- boundary surveys, and
- easements.

G. ESTIMATED CONSTRUCTION BUDGET

This section notes the anticipated total construction cost. Keep in mind, cost and budget during the course of design. When the consultant believes the costs will be exceeded, the Consultant notifies IDOT. The goal is to avoid unpleasant surprises further down the road.

Identify and list cost limitations by segment, where applicable.

H. SPECIAL CONDITIONS

If the project has any special requirements and/or special construction materials requirements for a project, note them in this section.

8-5.02(c) Project Control

A. PROCEDURES

Procedures for quality control are often in the form of check lists. The procedures are intended to assure completeness of the function and conformance of the project.

1. **Engineering and Environmental Studies/Plan Preparation**.

   a. **Scoping/Field Checks**. This procedure itemizes basic elements to be reviewed and evaluated during the initial field inspection of a project. The basic elements include, but are not limited to:

      - inspection of pavement condition,
      - logical termini,
      - drainage problems,
      - hazards,
      - existing guardrail condition,
      - accessibility,
      - evidence of wells,
      - gas pumps or storage tanks, and
      - other environmental considerations.

   b. **Contents of Submittals**. This procedure provides a consistent definition of the content of the following key submittals:

      - preliminary reports,
      - prefinal reports,
      - final reports,
      - preliminary plans,

- prefinal plans, and
- final plans.

c. **Special Provision Preparation**. This procedure defines the proper preparation of a contract special provision and provides a procedural method to ensure a clearinghouse for unnecessary special provisions.

2. **Design Calculations**. Identify the procedures to be used to develop quantity calculations and proposed methods for checking the calculations.

3. **Computer Inputs/Outputs**. This procedure defines the software applications and the process for verifying results.

4. **Documentation of Directives**. This procedure provides guidelines for consistent documentation of project decisions and directives (e.g., meeting minutes, telephone communications).

5. **Dissemination of Correspondence and Documents**. This procedure provides guidelines for consistent dissemination of project decisions and directives.

B. PROJECT RECORDS

This section specifies the requirements for the preparation and maintenance of project records generated by the Project Team. The following are key features of these requirements:

- legible, identifiable, and retrievable records;
- records protected from damage or loss; and
- defined responsibilities for routing, maintaining, accessing, transferring, and long-term storage.

Project records generated during project work activities may include, but are not limited to:

- informational records,
- field records,
- data compilation and testing records,
- data interpretation records,
- calculation and computer records,
- telephone messages,
- e-mails, and
- draft and final reports.

The Department requires quality records be maintained to demonstrate achievement of the required quality and the QA/QC plan is followed. Pertinent Subconsultant quality records are an element of these records.

Where agreed contractually, ensure quality records are available for review by the Department for an agreed period.

8-5.03 Compliance Statements

All Agreements contain language requiring "statements of compliance" with the QA/QC plan prepared by the Consultant and approved by the Department. Statements of compliance are required on an interim basis and at the conclusion of the work. The interim statements of compliance are required throughout the project at each major milestone. For example, a statement of compliance is made for a typical contract plans project at the preliminary plans, pre-final plans, and final documents stages. The interim statements of compliance satisfies with a sentence added to the Consultant's letter of transmittal stating the plans were prepared in compliance with the approved QA/QC plan.

The final statement of compliance is on the Department's form.

8-5.04 Verification Process

The Department reviews selected projects to verify the Consultant's plan, approved by the Department, was followed. Selection of jobs to be reviewed considers type of work, size of project, IPM, and level of performance ensuring the results of the review are meaningful.

The review is conducted at the Consultant's office. Participants include, but are not limited to, the Consultant's project manager, Consultant's QA/QC manager, IPM, and representatives from the Department's central bureaus. Generally, the review is one-half day and occurs prior to completing the work. The firm is furnished questions and/or statements to assist in preparation for the review meeting. The review meeting begins with a brief overview of the QA/QC plan by the Consultant. The Department's review team proceeds through the questions/statements previously furnished to the Consultant. A copy of the report prepared by the review team is furnished to the consultant.

The purpose of the verification process is to determine if the QA/QC plan is being followed, identify innovative ideas that can be shared with others, and to identify areas needing improvement.

The IPMs may conduct their own verifications in addition to the formalized process described above.

In the event of non-compliance with the QA/QC plan, certain actions by the Department may occur. It is essential the Consultant demonstrate to the Department corrective action was taken to ensure future compliance. The Agreements state non-compliance could result in termination of the Contract and/or have an effect on the firm's prequalification status. Non-compliance leading to less than satisfactory performance is considered in the selection of firms for future work.

PHASE I STUDIES

Chapter 11 discusses the goals and objectives of Phase I studies for projects administered by the Department. Phase I studies include both engineering and environmental studies, each requiring a separate decision-making process. Chapter 12 discusses the applicability of the various Phase I engineering report types, as well as their content, format, processing, and approval.

For the engineering and environmental analyses and any public involvement conducted in a Phase I study, Chapter 11 references the applicable chapters in the *BDE Manual* and other applicable documents (e.g., other Department manuals, FHWA publications).

11-1 GENERAL

11-1.01 <u>Phase I Studies</u>

11-1.01(a) Scope

Phase I work can vary from a very minor type study to an in-depth investigation of corridors, alternative alignments and cross sections, different highway types, and other design features with consideration of social, economic, environmental, and engineering factors. In addition, safety, serviceability, and economy must be considered during project development. The Phase I study should clearly describe the need for the improvement and how to implement the improvement in a logical and organized manner.

To effectively analyze a proposed improvement, coordinate and develop Phase I studies concurrently with public involvement activities and any required environmental analyses. The Phase I study will culminate in the completion of a Phase I report that documents the findings of the study. Chapter 12 describes the recommended content and format of, in addition to the submittal and approval processes for, the different types of Phase I engineering reports.

Job limits shall be extended to include intersections within 500 ft of paving and other improvement project termini for the inclusion of pedestrian and bicycle features. Pedestrian and bicycle features included in this work are detailed in Section 17-1.02. Normal project termini for pavement work should remain in place.

11-1.01(b) Purpose

Phase I studies are developed to ensure that, as practical, highway locations and proposed designs are consistent with Federal, State, and local goals and objectives. Consider the following when performing a Phase I study:

1. Design Uniformity. When conducting Phase I studies, ensure that proposed improvements will satisfy a need, are designed and constructed according to IDOT policies and criteria, and that uniform designs are used statewide. Designers must seek, however, to use all of the flexibility inherent in the policies included herein to craft the best possible solutions to identified transportation problems.

2. Public Involvement. Develop the final design in conformance with the public involvement requirements of Chapter 19.

3. Public Interest Considerations. Make final project decisions in the best overall public interest. A Phase I study should fully consider the need for safe and efficient transportation, public services, and the costs of eliminating or minimizing adverse impacts to the social and natural environment.

4. Adverse Effects of Project. Ensure that the potential adverse economic, social, and environmental effects of any proposed action have been fully considered. See Part III, Environmental Procedures.

11-1.01(c) Types of Phase I Studies

For complex projects, a separate corridor and design study may be required to determine the location and design of a proposed improvement. However, for minor type improvements only a separate Phase I engineering study is required. Depending upon the complexity and potential impact of a proposed improvement, the following types of Phase I studies are prepared:

1. Corridor Study. A corridor study is required for a complex highway project on new location of significant length and where alternative corridors are available. A corridor study will determine, in part, the selection of a specific corridor for the proposed highway. Alternative alignments should be developed within a general corridor location during the corridor study to determine the suitability of that corridor. These improvements typically will have a substantial social, economic, and environmental effect, or they will essentially change the layout or function of connecting roads and streets. The impacts of a complex highway project, such as a freeway on new location, will also require the preparation of a separate environmental document (normally an environmental impact statement (EIS)) to address the environmental issues of both the corridor and subsequent Phase I design studies.

2. Major Design Study. For complex highway projects requiring a separate corridor study, a Phase I design study is prepared after the corridor location has been selected and approved. The design study determines, in part, the specific alignments, profiles, and the major design features (e.g., typical sections, location and type of interchanges, road closures) of the proposed highway improvement. Because a separate environmental report is required with this category of work, environmental investigations are initiated during the corridor phase and are completed concurrently along with the design study.

3. Combined Design Study (Combined Corridor and Design Study). A combined design study is conducted for a proposed highway project within a predetermined highway

corridor or location. The acceptability of the corridor or location usually results from a decision to use the existing highway alignment due to constraints imposed by land use and development, or due to the results of prior engineering studies (e.g., a transportation systems plan). For example, the reconstruction of an urban arterial highway requiring additional right-of-way and some business or residential relocations will normally be a suitable project for a combined design study. Other examples include upgrading an existing two-lane rural highway to a four-lane expressway, the addition of an interchange, or a change in type for an existing interchange. For these types of projects, an environmental assessment (Chapter 24) is usually required. However, if significant impacts are known in advance, an EIS (Chapter 25) will be required.

4. Minor Design Study. For categorical exclusion type projects, conduct and document any necessary engineering and environmental analyses to substantiate the categorical exclusion determination; see Chapter 23. As discussed in Chapter 12, a Project Report, Abbreviated Project Report, 3P Report, or SMART Report will be prepared for this type of project. Examples of highway improvement types normally addressed include:

   - bridge rehabilitation or replacement projects,
   - intersection improvements,
   - most 3R projects, and
   - resurfacing of the existing traveled way with no other improvements.

5. Feasibility Study. A feasibility study is typically initiated to assess whether or not a proposed highway improvement warrants further study or whether additional Phase I engineering studies are needed. Feasibility studies typically are conducted to address the following types of questions:

   - Will a new four-lane highway or major river bridge promote economic development in a certain region of the State and create more benefits than costs, or would upgrading existing two-lane highways be a better solution for promoting economic development?
   - Is a missing link of a four-lane highway causing traffic operational problems, which, in turn, are creating a high number of crashes? Would a new four-lane highway or bypass alleviate the problem, or would some other type of improvements be more cost effective?
   - Would it be possible and cost effective to build a new four-lane highway on new alignment through rugged terrain in comparison to upgrading the existing alignment? Also, what would be the projected benefits?
   - Will a new four-lane highway (typically an expressway) promote economic development in a certain region of the State and create more benefits than costs? With this scenario, there may be two closely spaced corridors (10 to 12 miles (15 to 20 km) apart) that tie into the same termini at each end. Both corridors are worthy of consideration for upgrading to a new four-lane highway and a determination is needed as to which corridor would provide more benefits. The feasibility study provides this answer and the need as to whether to proceed with

location/design study type work in one corridor. However, to proceed with only one corridor, sufficient corridor environmental investigations must be completed, documented, and then carried forth into the location/design study phase.

- Other similar situations where additional information is needed before making a decision to proceed with more detailed engineering studies (e.g., major drainage alternatives, alternate locations for a proposed interchange).

A feasibility study can be similar to a corridor study.

11-1.02 Social, Economic, and Environmental Considerations

Part III, Environmental Procedures, discusses in detail the procedures for evaluating the social, economic, and environmental impacts of proposed actions. Consider the following items when developing a highway improvement:

- effects on regional and community growth;
- conservation and preservation of natural resources;
- public facilities, services, and recreational areas;
- community cohesion;
- displacement of people, businesses, and farms;
- air, noise, and water pollution; and
- aesthetic values.

The depth of environmental analysis will vary depending upon the scope and nature of the project, the location, the stage of project development, and the magnitude of any adverse impacts. For complex projects, the district will prepare a separate environmental document (i.e., an environmental impact statement or an environmental assessment). For categorical exclusion projects, the project report will document the environmental analysis.

11-1.03 Project File

Each Phase I study requires establishment and maintenance of a project file. This file shall be the responsibility of the associated district office under the terms of the pertinent document retention policy. The Phase I file shall be considered the collection of record for any legal or other inquiries pertaining to the Phase I portion of the project.

To assist in successful compilation of the file, the district shall utilize BDE 1101 Phase I Project File Checklist. Upon final file completion, district staff will sign and date the form – including supervisory review - and append the form to the file.

Annual reviews will be performed on a sample of project files by BDE in each district to provide central management oversight and assure compliance with requirements.

11-2 DESIGN AND ENGINEERING CONSIDERATIONS

11-2.01 General

11-2.01(a) Scope

Phase I studies are used to identify the following:

- need for highway improvement,
- capacity deficiencies,
- need to improve safety,
- level of service,
- project termini,
- specific locations,
- design criteria,
- cross section elements,
- horizontal and vertical alignments,
- need for right-of-way,
- hydraulic design (drainage),
- need for intersection design/interchange designs,
- access control features or access management guidelines,
- location of bridge and traffic structures, and
- project costs.

The scope and depth of engineering analyses for Phase I studies will vary depending on the project scope of work. These studies may be less than that required for final plans, but they should be sufficiently accurate to preclude significant design or major cost estimate revisions during final construction plan preparation. When determining the scope, extent, and accuracy needed for a specific engineering study, the effects on adjacent property owners are often a good indicator.

11-2.01(b) Design Policies and Guidelines

One objective of a Phase I engineering study is to compare existing highway features (or topography and land use for possible new highway locations) to current design policies and criteria and then to determine the needed improvements that are cost and safety effective. This requires resourcefulness and engineering judgment in the development of alternatives and the preparation of project designs.

Location/design study personnel must ensure that major design decisions are finalized during the Phase I engineering studies. This minimizes the time and effort needed to prepare design details during final plan preparation in Phase II. Examine and document any design exceptions from current policies and explain the reasons for the variance; see Chapter 31. A few of the most frequently referenced policies and guidelines are as follows:

1. New Construction/Reconstruction. Part IV, Roadway Design Elements and Part V, Design of Highway Types provide cross section and alignment criteria for new construction projects on new location and for reconstruction projects.

2. Rehabilitation, Restoration, and Resurfacing (3R). Chapter 49 presents the Department 3R criteria for non-freeways, and Chapter 50 presents the Department 3R criteria for freeways.

3. Intersections/Interchanges. Chapters 36 and 37 provide design guidance for intersections and interchanges.

4. Access Control/Access Management. Chapter 35 presents Department policies and guidelines for the control of access on freeways and expressways and access management principles.

5. Bikeways/Pedestrians. Chapters 17, 48, and 58 present Department policies for the accommodation of bicyclists and pedestrians within the highway right-of-way.

6. Roadside Safety. Chapter 38 discusses the selection and layout of roadside safety appurtenances. The design policies for protective barriers (e.g., median barriers, longitudinal barriers, impact attenuators) included in Chapter 38 are for new construction/reconstruction projects. For 3R improvements, Chapters 49 and 50 present roadside safety design policies.

7. Structures. For the structural design and rehabilitation of existing bridges, the Bureau of Bridges and Structures maintains several manuals for design. For structure geometrics, Chapter 39 documents bridge width and vertical clearance criteria for new construction/reconstruction improvements. Chapters 49 and 50 present geometric design criteria for bridges within the limits of 3R projects.

8. Pavements. Chapters 53, and 54 present information for determining pavement preservation, pavement rehabilitation, and pavement design, respectively.

9. Other Department Manuals/Publications. The Illinois Department of Transportation publishes and maintains a wide variety of engineering documents in addition to the *BDE Manual*. These address other aspects of roadway projects, including standards and specifications, policies for local roads and streets projects, land acquisition, surveying, CADD, traffic engineering, structural design, hydraulics, materials, and construction. Chapter 60 of the *BDE Manual* briefly describes these publications. As needed, the Phase I designer should review other Department manuals/publications for use in project evaluation.

To properly conduct engineering analyses and to develop a functional design, diverse sources of information must be used. This includes contact with Central Office and district bureaus. The designer must be familiar with data available from outside sources and needs to understand how to use the data. In addition, the designer must ensure that the scope, extent, and accuracy of the data requested from other sources are commensurate with the intended use of the engineering analysis being performed.

11-2.01(c) Phase I Study Procedures

The successful implementation of a Phase I study will depend upon timely coordination among all parties involved in the process. Chapters 2 and 3 present Phase I Project Development Networks that illustrate the proper interrelationships among the IDOT central office bureaus, the district, resource agencies, and the public for different types of projects. Depending on the scope of the project and design policies used, the Phase I designer should, as practical, use one of these networks.

11-2.02 Need for Highway Improvements

Engineering investigations in a Phase I study must determine if the proposed highway improvement satisfies the need for safe, economical, and efficient transportation and provides other relevant benefits (e.g., traffic benefits, public services, reduction of crashes, pedestrian facilities, and transit considerations). Having a clear and provable need will help the project avoid pitfalls later on. The following informational sources are important in establishing the need for the highway improvement.

11-2.02(a) Functional Classification

The Office of Planning and Programming has departmental responsibilities for functionally classifying all State highways. For information on functional classification, see the FHWA's document entitled, *Highway Functional Classification Concepts, Criteria and Procedures,* 2013 Edition, available on the FHWA website *and IDOT's Five Year Classification Maps*, available on the IDOT website. Section 43-1 discusses the application of the functional classification system in Illinois for geometric design applications. All highway improvements must be compatible with the functional classification of the highway under design. A highway's functional classification and highway type are important factors in determining which design policies and criteria to use and for establishing programming priorities for new construction, reconstruction, or 3R type improvements.

11-2.02(b) Multi-Year Program

The Office of Planning and Programming annually issues the IDOT publication "Statewide Program Planning – Programming Guidelines." This usually occurs in the autumn of each year. This publication includes programming criteria for:

- improvement categories,
- pavement surface conditions,
- deficient bridges,

- safety improvements,
- Interstate rehabilitation,
- widening narrow and rough pavements,
- improving intersections and reducing traffic bottlenecks,
- new construction/reconstruction of major facilities,
- enhancement projects,
- Congestion Mitigation Air Quality (CMAQ) projects, and
- bicycle accommodation.

The publication also contains criteria for district selection of projects for inclusion in the annual and multi-year programs, such as bridge deficiencies for improvement eligibility when based upon highway classification and average daily traffic.

11-2.02(c) Highway Data Bank

The Office of Planning and Programming, Planning Systems Section, is responsible for maintaining and updating the Illinois Roadway Information System (IRIS,) and corresponding *Illinois Highway Information System Roadway Information and Procedure Manual*, in addition to the Illinois Structure Inventory System (ISIS) and corresponding *Illinois Highway Information System Structure Information and Procedure Manual*. Maintaining IRIS and ISIS is accomplished through the district data collection and highway field inventory operations. The Planning Systems Section can provide computer-generated route log listings for State routes, local roads, and municipal streets. The available data is dependent on the highway system. A key route number designates each roadway. IRIS contains information on roadway administrative classification, physical dimensions, characteristics, traffic data, pavement cross sections, pavement surface type, shoulder and median type, and historical construction information. ISIS contains detailed inspection and appraisal data, in addition to existing physical characteristics and historical construction information, on bridges and large culverts.

11-2.02(d) Urban Transportation Planning

The urban transportation planning process produces information on local governmental functions in urbanized areas of over 50,000 inhabitants. The Metropolitan Planning Organizations (MPOs) administer a continuing, cooperative, comprehensive transportation planning process that results in transportation improvement plans and programs consistent with the planned development of the urbanized areas. This process determines the transportation modal choice. In urbanized areas, Phase I reports should discuss the consistency of proposed improvements with local transportation planning agencies. Major urban freeway improvements shall meet joint FHWA/FTA regulations for major highway improvements in urban areas. The urban transportation planning process also can provide other social-economic-environmental-engineering information for Phase I studies.

11-2.02(e) Traffic-Carrying Capacity

A facility's current and future traffic-carrying capacity is one of the most critical elements for establishing the need for a highway improvement. Two elements impact this analysis:

1. <u>Current and Projected Traffic Volumes</u>. Under the general guidance of the Office of Planning and Programming (OP&P), the districts count and classify existing traffic volumes on the State highway system. OP&P also maintains data used to project future traffic volumes (i.e., annual traffic growth factors). The following data are available from the districts:

    - current hourly and daily traffic volumes,
    - current turning movement volumes,
    - traffic projections and assignments for new facilities, and
    - traffic projections for future design years on existing facilities.

    Similar data, developed in conjunction with the Urban Transportation Planning Process, also may be obtained from a local MPO. OP&P maintains a list of MPOs on the Department's webpage. Phase I reports should document current year average daily traffic (ADT), design year ADT, and design year 30th highest hourly traffic volumes (DHV). Also, provide the directional distribution factor and the percent of trucks for the proposed highway and for other affected facilities. Because the design of a project is so greatly dependent upon the projected design hourly volumes, these figures must be carefully examined and questioned before using for design purposes. Improper traffic projections can result in the assumption of unnecessary highway improvements.

2. <u>Highway Capacity Studies</u>. The desired level of service (LOS) (i.e., mobility and freedom from delay and congestion) for a State highway is determined by its functional classification and urban/rural location. The tables of geometric design criteria in Part V, Design of Highway Types present the Department's LOS criteria for each functional class. The *Highway Capacity Manual* provides the analytical techniques to determine the level of service for all highway elements (e.g., for basic segments, intersections, interchanges) for a given set of traffic and roadway conditions. For a major highway segment, for example, the capacity analysis will determine if an existing roadway will accommodate future traffic demands at the desired LOS or if roadway improvements are necessary (e.g., the addition of travel lanes). Section 31-4 discusses highway capacity analyses for Department projects in more detail.

11-2.02(f) Crash and Skid Reduction Analyses

The districts are able to access crash data through the use of GIS applications and the Safety DataMart, which are linked to the Bureau of Safety Programs and Engineering Crash Information System (CIS). The Bureau of Safety Programs and Engineering may also furnish the district with traffic crash information upon request. The following is a partial listing of available crash information for Phase I studies:

- State highway Five-Percent Report and computer-generated listings that report supplemental data for high-crash spots and roadway sections;
- county crash summaries;
- municipal crash summaries;
- reports which can be generated for individual locations, selected geometric feature, or type of crash:

  + Five-Percent Report,
  + Intersection Profile,
  + Segment Profile,
  + Location Summary,
  + Crash—One-Line Listing,
  + Intersection Summary,
  + Cross Tab—Time of Day by Severity,
  + Cross Tab—Crash Type by Severity,
  + Cross Tab—Conditions by Severity,
  + Cross Tab—Time of Day by Day of Week,
  + Roadway Description,
  + Roadway Summary, and
  + Deer/Vehicle Collisions.

- Statewide average crash rates (distributed annually for comparison with existing project crash rates for proposed improvement justification);
- collision diagram printouts for requested project locations, including intersections. Coding sheets are available for interpreting collision diagram printouts of vehicle maneuvers and involvements. Collision diagram summary sheets document percentages of collision types (on or off the roadway), weather conditions, and light conditions. Crash rates also may be requested for specific locations. Sufficient information is included to assist in manually drawing a collision diagram. Collision diagram computer plots also may be requested for intersections;
- individual crash reports at specific locations (upon request from a microfilm or imaging retrieval system);
- summaries of Motor Vehicle Traffic Crashes and Class of Trafficway (statewide average percentages) by type of collision, light condition, and road surface (these percentages may be compared with project percentages from collision diagram summary sheets to help identify over-represented crash patterns).

The Phase I study should include, as appropriate, the following crash analyses to assist in demonstrating the need for a highway improvement:

1. Spot Map. Provide a crash spot map as basic crash information in the Phase I report. As applicable, also include a comparison of the calculated project crash rates with the statewide average crash rates for the same class of highway. Collision diagram summary sheet percentages also may be compared with statewide averages.

2. High-Crash/Crash Pattern Analyses. In the Phase I study, identify Five-Percent Report locations, rates, and all crash patterns (e.g., fixed objects, sideswipes, rear-ends, overturns, wet-weather, night-time, etc.) at various sites throughout the project. Also, include schematic collision diagrams, results of field checks, crash analyses, and recommended countermeasures for these items, or provide a statement that no high-crash locations or other crash patterns exist along the proposed improvement.

   For projects with a high percentage of wet-weather crashes, include friction numbers, if available, in the analysis of critical wet-pavement crash locations. Also include existing and projected traffic volumes, existing geometric features, and countermeasure alternative(s) such as grooving, reprofiling, and/or high-friction resurfacing. Specify a high-friction resurfacing type and mix design during Phase II.

3. Time Period. Analyze the traffic crash data available for the most recent five years and update the data accordingly. Notify BDE of any resultant changes to project design elements, if appropriate.

4. IDOT Procedures. See Chapter 12 for a discussion on processing Phase I reports for the "Highway Safety Improvement Program" at isolated Five-Percent Report locations identified and selected for the Illinois Safety Improvement Program. Include project/program sheets in the Phase I report, with benefit/cost ratio calculations and district safety committee signatures.

5. Other Publications. For additional information on analyzing crash patterns, see the Institute of Transportation Engineers (ITE) publications *Manual of Transportation Engineering Studies* and *Traffic Engineering Handbook,* the FHWA publication *Highway Safety Engineering Studies Procedural Guide, or the Highway Safety Manual (HSM)*.

11-2.02(g) Pavement Condition

The Condition Rating Survey (CRS) is performed biennially by the districts in cooperation with the Office of Planning and Programming. This information is most often used to determine the extent of pavement rehabilitation for a 3R project, or eligibility for potential SMART or 3P resurfacing projects. All State highway pavements are rated on a scale from 1.0 (poorest) to 9.0 (best) that measures pavement serviceability based upon cracking, patching, potholes, rutting, deterioration, maintenance, and visual physical condition. Resurfacing and rehabilitation needs may be determined from the surface condition rating in combination with the functional classification criteria and the traffic volume/crash criteria presented in the multi-year program. Include the most recent CRS values for pavement improvement eligibility in the Phase I report. See Chapter 53 for more information on pavement condition surveys and pavement rehabilitation strategies.

11-2.02(h) Bridge Condition Information

For existing bridges within the limits of a proposed project, coordinate with bridge maintenance engineer to obtain information on the bridge condition and to prepare a Bridge Condition Report;

see Section 39-3. Identify any deficiencies in a bridge's physical condition and load-carrying capacity. Also, contact the Bureau of Bridges and Structures for inventory and operating load ratings and the results of physical inspection ratings for the substructure and superstructure. Determine any bridge improvement needs from this information and the multi-year program.

11-2.03 Access Control/Access Management

Access control features are dependent upon a variety of factors (e.g., type of highway, either freeway or expressway, urban/rural location) and will affect traffic benefits, access to adjacent properties, and right-of-way costs. Proposed access control features for freeways or expressways must be determined for public presentation and discussion because of their effects on adjacent properties. The *BDE Manual* discusses access control elements and access management concepts in several locations. These are summarized as follows:

11-2.03(a) Overall Policy

Chapter 35 presents the overall Departmental policies and guidelines for access control and access management on the State highway system. This includes:

- definitions of access control terms,
- access control at interchange crossroads,
- access control along expressways and at sideroads,
- the development of access control plans, and
- access management concepts and techniques.

11-2.03(b) Highway Type

The tables of geometric design criteria in Chapters 44 through 48 interrelate access control or access management with highway functional classification (i.e., principal and minor arterials, and collectors). Section 43-1 discusses, in general, the relationship between access, mobility, and functional classification.

11-2.03(c) Median Crossovers and Openings

These are discussed in various locations in the *BDE Manual* as follows:

- Section 44-2.04 discusses median crossovers on freeways.
- Chapter 45 discusses median crossovers on expressways.
- Chapter 46 discusses median openings on Strategic Regional Arterials.
- Chapters 34 and 36 discuss median openings on all other facilities.

11-2.03(d) Frontage Roads/Service Drives

Frontage roads and service drives and how they relate to access control are discussed in Sections 44-2.05 (freeways) and 45-2 (expressways).

11-2.03(e) Driveways

Locate driveways to provide good service to users while simultaneously minimizing interference to highway traffic. The *Policy on Permits for Access Driveways to State Highways* (92 Ill. Admin. Code 550) provides guidance for driveway design in conjunction with the permit process and may be used as a starting point for developing access management studies.

11-2.03(f) Changes in Access

For new or revised points of access to an existing freeway, see Section 37-1. For changes in access control along an expressway, see Section 45-2.04.

11-2.03(g) Signing Policies

For the current IDOT policies on signing of access controlled highways, see the Bureau of Operations *Traffic Policies and Procedures Manual*.

11-2.04 Geometric Design Criteria

Part IV, Roadway Design Elements and Part V, Design of Highway Types of the *BDE Manual* present the Department's geometric design criteria for the different types of highways. This is an important element for all Phase I studies. The following sections briefly summarize the information in Parts IV and V.

11-2.04(a) Basic Design Controls

Chapter 31 discusses the design controls that have an overall impact on the geometric design of a highway facility; therefore, this is an important chapter for Phase I studies. As discussed in Chapter 31 and as appropriate, the designer should evaluate the following:

1. Project Scope of Work. Section 31-6 defines the following project scopes of work:

    - new construction,
    - reconstruction,
    - 3R (non-freeways), and
    - 3R (freeways).

The project scope of work will be determined before the initiation of a Phase I study. The definitions in Section 31-6 indicate the conceptual objective of the project under study.

2. Design Speed. This is a critical highway design element and is selected before initiating any studies. Section 31-2 discusses the overall philosophy in design speed selection. Chapters 44 through 50 present specific numerical criteria for project design speed based on functional classification, highway type, urban/rural location, and project scope of work.

3. Traffic Volume Analysis. Section 31-4 provides definitions of highway capacity terms and selection of the design year and design hourly volume for highway capacity analyses. It references the *Highway Capacity Manual* for detailed highway capacity techniques.

4. Sight Distances. Stopping sight distance (SSD) is a determining factor in an acceptable highway design, especially for vertical alignment. Section 31-3 presents Department criteria for SSD based on design speed. Other sight distances which may be applicable are:

    - decision sight distance,
    - intersection sight distance, and
    - passing sight distance.

5. Design Exceptions. Section 31-7 describes the Department's process for justifying and approving design exceptions to geometric design criteria on its roadway projects. There are two categories of design exceptions:

    a. Level One. Level One design exceptions involve the controlling design criteria established by FHWA, but only on the interstate system, pursuant to the FHWA/IDOT Stewardship and Oversight Agreement. When not met, Level One design exceptions require documentation and justification by the district, concurrence by BDE, and formal approval by FHWA.

    b. Level Two. Level Two design exceptions involve two distinct sub-sets. In addition to the 13 FHWA controlling design criteria for projects off the interstate system, Level Two design criteria are also design criteria identified by IDOT, on both interstate and non-interstate projects. When not met, Level Two design exceptions require documentation and justification by the district and formal approval by BDE only.

11-2.04(b) Horizontal Alignment

Chapter 32 discusses horizontal alignment for new construction/reconstruction projects in general. A significant portion of this chapter applies to the Phase II detailed design (e.g., superelevation development, mathematical details for horizontal curves). However, during Phase I studies, the designer should review and evaluate the following based on Chapter 32 and Section 48-5:

1. General Design Controls. The overall horizontal alignment of a highway facility impacts the safe and efficient flow of traffic and the aesthetic appeal of the facility. Section 32-5 presents several general design controls for horizontal alignment that will enhance the performance of the highway (e.g., avoidance of alignment reversals and broken-back curvature). The designer should ensure that alignment development is consistent with these goals.

2. Minimum Radii. Section 32-2 presents minimum radii for horizontal curves assuming open-roadway conditions, which applies to high-speed urban facilities and all rural facilities. When developing and evaluating alternative alignments in Phase I, the designer should, as practical, avoid the use of minimum radii. Section 48-5.03 discusses design criteria for horizontal curves for low-speed conditions ($V \leq 45$ mph (70 km/h)).

3. Coordination with Vertical Alignment. See Section 11-2.04(c) and Chapter 33.

11-2.04(c) Vertical Alignment

Chapter 33 discusses vertical alignment for new construction/reconstruction projects. A portion of this chapter applies to the Phase II detailed design (e.g., mathematical details for vertical curves). However, the majority of Chapter 33 applies to the decision-making during Phase I studies. This reflects the significant impact that vertical alignment has on a highway's safety, aesthetics, operations, and costs. Therefore, the Phase I designer must carefully review the following from Chapter 33 before proceeding with alignment development:

1. General Design Controls/Coordination with Horizontal Alignment. Sections 33-6.01 and 33-6.02 present several general design controls for vertical alignment (e.g., avoidance of roller-coaster profile) and in coordination with horizontal alignment (e.g., balance between horizontal and vertical curvature). Using these controls will enhance the overall design of the highway. The designer should ensure that profile development is consistent with these goals.

2. Aesthetics. The combined effect of horizontal and vertical alignment on highway aesthetics is considered to be very important. A highway alignment should fit gracefully into its surroundings and become an integrated component of the natural landscape. The guidance in Section 33-6.03 describes how to accomplish this objective.

3. Maximum/Minimum Grades. Section 33-2 discusses, in general, the use of maximum and minimum grades. These values determine the limits of vertical profiles studied in Phase I. Avoid the use of maximum grades, as practical. Chapters 44 through 48 present specific criteria for maximum and minimum grades based on highway types, design speed, and urban/rural location.

4. Minimum Vertical Curvature. Section 33-4 presents K-values for minimum curvature at crest and sag vertical curves, which are based on minimum stopping sight distances. When developing and evaluating alternative profiles for new construction and

reconstruction projects, the designer should, as practical, avoid the use of minimum vertical curvature.

5. Truck-Climbing Lanes. Section 33-3 presents the warrants and design of truck-climbing lanes. If truck-climbing lanes are warranted, the designer should determine the critical design elements (e.g., starting and ending points, width).

6. Vertical Clearances. Section 33-5 discusses vertical clearances in general, and Chapters 39 and 44 through 50 present specific clearance criteria based on highway type, urban/rural location, highway feature crossed (e.g., highway bridges, railroads, traffic signals), and the type of proposed improvement. Profiles must meet the vertical clearance criteria listed in these chapters.

7. Gradelines. In addition to previously discussed elements, the proper selection of the gradeline in Phase I will depend on many other factors (e.g., geotechnical, right-of-way impacts, snow drifting, drainage, earthwork balance). Section 33-6.04 discusses the evaluation of these factors in selecting a profile gradeline.

11-2.04(d) Cross Section Elements

Chapter 34 presents the Department's general criteria for cross section elements, and Chapters 44 through 48 present specific numerical criteria for cross sections based on highway type, design speed, traffic volumes, and urban/rural location. The designer must review the cross section criteria in these chapters and determine the most appropriate design for the given conditions. The selected roadway cross section will determine the type of operations, maximum allowable design speed, safety, costs, and right-of-way needs of a highway facility. The proposed typical section must identify:

- the number and width of travel lanes;
- the selection of an urban (curbed) or rural section;
- the shoulder width, if applicable;
- cross slopes;
- the type and width of median;
- parking lanes, if applicable;
- sidewalks and bike lanes/paths, if applicable;
- side slope configuration (i.e., fill slopes, cut slopes, roadside ditches);
- right-of-way width; and
- type and thickness of pavement.

11-2.04(e) Intersections

Chapter 36 presents the Department's criteria for the design of intersections. Chapter 14 specifically discusses the warrants and the criteria for the preparation of an Intersection Design Study (IDS). If IDSs are required with a project, the IDSs shall reflect the latest design alternative if displayed at a public hearing. The IDSs must be labeled as a draft version if it is not approved.

An IDS is not required when the scope of work for a project is limited to only installing pedestrian and/or bicycle accommodations unless their installations is done in conjunction with a change in the vehicular lane configuration of an intersection.

11-2.04(f) Interchanges

Chapter 37 presents the Department’s criteria for the design and layout of interchanges. In some cases, type approval may be required before proceeding with detailed design. Chapter 15 discusses the warrants for an interchange and the criteria for the preparation of an Interchange Design Study (IDS). If IDSs are required with a project report, the IDSs shall reflect the latest design alternative if displayed at a public hearing. The IDSs must be labeled as a draft if it is not approved.

11-2.04(g) Roadside Safety

Chapter 38 presents the Department’s criteria for roadside safety, including clear zones, barrier warrants, barrier design and layout, impact attenuators, and glare screens. Most of the information in Chapter 38 is applicable to the detailed design completed in Phase II. During a Phase I study, however, the designer should evaluate and establish the following:

1. Clear Zones. Section 38-3 presents the Department’s clear zone criteria for new construction/ reconstruction projects. The applicable clear zone should be identified in Phase I. This will determine, in part, right-of-way needs and utility impacts.

2. Median Barrier Warrants. Section 38-7 discusses the Department’s warrants for median barriers based on the median width and traffic volumes. The Phase I study should identify whether or not a median barrier is warranted.

3. Roadside Barrier Warrants. Section 38-4 discusses roadside barrier warrants. In general, the preferred design is to provide a roadside configuration and clearance that eliminates the need for roadside barriers. The typical section and alignment decisions made during Phase I must include the determination of the need for roadside barriers. Also, during Phase I a determination of the roadside barrier length may be included. Therefore, the Phase I study should, as practical, seek to find the balance between providing a safe roadside (which tends to increase project costs) and limiting construction, right-of-way, and environmental impacts (which tends to decrease roadside safety). Review Section 38-4.03, which discusses the Department’s policies on roadside barrier warrants and cost-effective analyses.

11-2.04(h) Design of New Construction/Reconstruction Projects

In the Phase I study, use the appropriate chapter in Part V that corresponds to the type of facility under design.

Part V Highway Systems presents the following chapters based on functional classification and highway type for new construction or reconstruction type projects:

- Chapter 44, Rural and Urban Freeways,
- Chapter 45, Expressways,
- Chapter 46, Strategic Regional Arterials,
- Chapter 47, Rural Two-Lane/Multilane State Highways, and
- Chapter 48, Urban Highways and Streets.

These chapters are structured to present specific numerical criteria for each highway type and reference the chapters in Part IV, Roadway Design Elements for detailed information on specific geometric design elements (e.g., horizontal alignment). Chapters 44 through 48 also discuss geometric design features that are unique to a certain type of facility. For example, Chapter 44 discusses frontage roads adjacent to freeways, and Chapter 48 discusses urban design features (e.g., parking lanes, sidewalks, horizontal alignment on low-speed urban streets).

11-2.04(i) Design of 3R Projects

The applicable chapters in Part IV, “Roadway Design Elements” and Part V, “Highway Systems” present the Department’s design criteria that apply to new construction/reconstruction projects. For these projects, the designer often has the liberty of designing the highway to meet the most desirable criteria. However, available finances do not always permit the reconstruction of existing highways to this level.

Therefore, the geometric design of projects on existing highways must be viewed from a different perspective. These projects are often initiated for reasons other than geometric design deficiencies (e.g., pavement deterioration, crashes), and they often must be designed within existing right-of-way, with financial limitations, and environmental constraints. As a result, the design criteria for new construction and reconstruction are often not attainable without major cost and, frequently, adverse impacts. At the same time, however, the Department must make cost-effective and practical improvements to existing highways and streets.

For these reasons, the Department has adopted separate geometric design guidelines for 3R projects on existing highways. Chapter 49 presents guidelines for 3R projects on rural and urban highways, and Chapter 50 presents guidelines for 3R freeway projects. These guidelines are intended to find a balance among many competing and conflicting objectives. These include the objective of improving the riding surface; minimizing adverse impacts of highway construction on adjacent lands; targeting improvements where ADT is higher or safety performance is lacking, and improving the greatest number of miles (kilometers) with available funding.

Phase I studies for 3R projects will be based on the guidelines discussed in Chapters 49 and 50.

11-2.04(j) Design of 3P and SMART Projects

Chapter 53 presents the guidelines for SMART projects, as well as other pavement preservation strategies, which are intended to extend the service life of the pavement without significantly increasing its structural capacity. Chapter 53 presents the guidelines for 3P projects, as well as other methods of pavement rehabilitation, which are intended to address specific pavement deficiencies. The scope of SMART and 3P Projects do not normally include geometric improvements. Job limits shall be extended to include intersections within 500 ft of project termini for the inclusion of bicycle and pedestrian features. Pedestrian and bicycle features included in this work are detailed in Section 17-1.02. Normal project termini should remain in place.

11-2.05 Hydraulics (Drainage)

For the hydraulic evaluations in conjunction with a Phase I study, use the following references:

1. *IDOT Drainage Manual*. The Bureau of Bridges and Structures is responsible for the *Drainage Manual*. The Manual is a compilation of Department policies and criteria on drainage and hydraulics for road and bridge projects. The *Drainage Manual* discusses:

   - division of responsibility for drainage;
   - legal requirements;
   - drainage policies;
   - permits;
   - preparation of drainage studies and hydraulic reports;
   - floodplain encroachments (hydraulic analysis);
   - hydrology;
   - open channel flow;
   - culvert hydraulics;
   - bridge hydraulics;
   - storm sewers;
   - encroachment onto traveled way adjacent to curb and gutter;
   - inlet spacing;
   - roadside ditches;
   - erosion and sediment control;
   - scour;
   - detention storage;
   - pumping stations; and
   - rules for construction in rivers, lakes, and streams.

2. Drainage Procedures. Chapter 40 of the *BDE Manual* discusses those procedures related to the evaluation of drainage design in a Phase I study. This includes the division of responsibility between the districts and Central Office, scope of the Drainage Study, and general drainage considerations in the design of highway projects.

3. Floodplain Finding. The *IDOT Drainage Manual* provides the hydrological requirements for a floodplain study. Section 26-7 of the *BDE Manual* provides guidance for the environmental documentation required for projects that will involve a significant floodplain encroachment.

4. Hydraulic-Related Permits. These include permits for Section 404, Section 9, Section 401, Section 402 (NPDES) and IDNR Construction in Floodways. Chapter 28 of the *BDE Manual* briefly discusses each of these permits.

11-2.06 Traffic Engineering

The Bureau of Operations has the primary responsibility for traffic engineering analyses on State highway projects. These responsibilities include:

- warrants and phasing for traffic signals;
- warrants, design, and placement for highway signs and pavement markings; and
- traffic engineering investigations (e.g., speed studies, school zone studies).

Many traffic engineering elements are addressed during detailed design in Phase II (e.g., selection and location of traffic signs and pavement markings). However, as appropriate for the project scope of work and a Phase I study, the designer will evaluate those traffic engineering factors which will impact the decision-making in Phase I (e.g., traffic signal warrants, preliminary signing plans for freeways and expressways). Chapter 57 of the *BDE Manual* provides guidance on traffic engineering issues important to highway design, and it references documents published by the Bureau of Operations for more detailed information.

11-2.07 Structures

The Bureau of Bridges and Structures is responsible for the design of highway structures (e.g., bridges, culverts, retaining walls). As appropriate for the project scope of work and a Phase I study, the designer will evaluate those structural factors that are appropriate for these studies. Section 39-3 of the *BDE Manual* discusses the bridge planning process, which documents:

- the necessary coordination between parties to identify needed bridge improvements,
- the preparation of a Bridge Condition Report and proposed Bridge Drawing,
- preliminary bridge investigations, and
- the preparation of Type, Size, and Location Plans for Phase II work.

The proper implementation of the bridge planning process will ensure that appropriate structural considerations are reflected in a Phase I study. This includes geotechnical, hydraulic, environmental, right-of-way, costs, and aesthetic factors. In addition, Section 39-4 presents the Department’s criteria for bridge geometrics (e.g., widths, clearance).

11-2.08 Miscellaneous Highway Features

The Phase I study should reflect, as appropriate, other highway features as follows:

11-2.08(a) Utilities

The Illinois Administrative Code (92 Ill. Admin. Code 530) sets forth the requirements for the accommodation of utilities on the right-of-way of the Illinois highway system. The Bureau of Operations should be contacted for policies on the location of utilities (e.g., with respect to the roadside clear zone). Consider provisions for utilities when determining approximate project right-of-way requirements during the Phase I study. See Chapter 6 for utility adjustments required for highway improvements. Describe all utility locations and any proposed modifications, changes, or multiple uses of right-of-way, including a division of the estimated adjustment costs.

11-2.08(b) Railroads

The Phase I study must identify all railroad crossings within the proposed project limits, and it must determine if each crossing will be at-grade or grade separated. This will be a collaborative effort between the Department, the affected railroad, and the Illinois Commerce Commission. For existing crossings, the Phase I report should document the number of trains/day, the existing warning devices, the crash history, and the geometrics at the crossing. In most cases for at-grade crossings, it will be appropriate in Phase I to specifically determine the type of warning devices at the crossing (e.g., automatic gates, flashing signals). Section 7-3 provides additional information on the design of highway/railroad crossings.

11-2.08(c) Weigh Stations and Rest Areas

See Chapter 16 for guidance when a proposed project involves a weigh station or rest area. Analyze access and other design considerations (including effects on highway alignment and grade) where weigh stations, rest areas, or rest stops are proposed.

11-2.08(d) Lighting

Consult Chapter 56 for warrants for highway lighting and illumination. Describe existing and proposed illumination levels including uniformity ratios and glare levels. Provide descriptions of crash rates, night/day crash ratios, and illumination of adjacent highway sections, as necessary, to demonstrate the need for proposed lighting improvements.

11-2.08(e) Sidewalks and Pedestrians

See Chapter 17 for information on pedestrian accommodations and Chapter 48 for warrants and the design of sidewalks within the roadway cross section. Also, see Chapter 39 for sidewalks or bikeways on bridges. Describe the reasons for providing, or not providing, sidewalks and the coordination needed with local governmental units. See Chapter 58 for additional discussion on sidewalks and ADA compliance. The Phase I report must discuss any requests and the justification for deviations from the participation policies for sidewalks as discussed in Chapter 5 on Local Agency Agreements.

11-2.08(f) ADA

Chapter 58 discusses the Department's implementation of the Americans with Disabilities Act (ADA). The Phase I report must contain a discussion on satisfying ADA requirements including, if applicable, coordination with local officials. Any Intersection Design Study (see Chapter 14) prepared in Phase I must indicate the location of the curb cuts/ramps or other accommodations to be provided. The Phase I report also must discuss any request for a design exception from Department policies on accommodating individuals with disabilities and the justification for the request; see Section 31-7.04(c).

11-2.08(g) Landscaping/Stormwater Pollution Control

Consult the District Landscape Architect for tree removal/replacement, revegetation/erosion control, and other landscaping features and document the recommendations in the Phase I report. To avoid duplication, information contained in environmental documents that has been developed according to Section 26-17 and Sections 24-3.02(e) and 25-3.08(r) (e.g., environmental commitments and mitigation) should be referenced. Also, review Chapter 59 for guidance on landscaping and Chapter 41 for stormwater pollution control.

11-2.08(h) Existing Public Educational Facility Entrances

1. Background. Public Act 95-0271 amended the Department of Transportation Law of the Civil Administrative Code of Illinois by adding Section 2705-580 (20 ILCS 2705/2705-580) as follows:

> "As part of State highway construction projects, the Department shall evaluate, fund, and repair, within the right-of-way, the entrances to public educational facilities that border State highways."

2. Procedures. The following procedures apply to all State highway projects with a public educational facility entrance onto a state highway. For the purpose of this policy the word "evaluate" shall mean to examine the existing public educational facility entrance and to determine any deficiencies and repairs needed as part of the roadway project. The intent is to improve the condition of such existing entrances, if unsatisfactory, as part of an improvement of the roadway onto which the entrances abut, consistent with the scope of the mainline improvement. For instance, it would not be appropriate to improve the unsatisfactory roadway surface condition of an entrance if the mainline project scope is only installation or modification of traffic signals.

a. Phase I Studies and Reports. The Phase I study and engineering report shall evaluate and document any entrance for a public educational facility that enters onto the project roadway.

b. New Construction/Reconstruction Projects. For these types of projects, the procedures for designing entrances and side roads as outlined in the *BDE Manual* and the *Handbook for the Policy on Permits for Access Driveways to State Highways* would apply. The entrance should be evaluated and a design provided based on operational needs, turning radii, left and right turn movements, safety, drop-off/pick-up zones, and accessibility for pedestrians, bicyclists, and persons with disabilities.

   Reconstruction types of projects are not limited to the existing right-of-way, but the entrance construction should not be the main reason for the right-of-way acquisition. If the reconstruction project could be done without any reconstruction or other upgrade to an existing public education facility entrance, such entrances should still be evaluated and repaired as necessary within the existing right-of-way, as described above.

c. 3R Projects. Use the same procedures as that for New Construction/Reconstruction Projects.

d. Pavement Rehabilitation and Preservation Projects. For pavement rehabilitation and preservation projects that are generally considered to be resurfacing only, such as 3P or SMART, the entrance to the public educational facility should be evaluated and any repairs/resurfacing should be extended to the right-of-way limits. The work shall be consistent with the work allowed by this type of project and in most cases match the existing grade and surface of the entrance.

11-2.09 Maintenance Considerations

See the FHWA publication *Integration of Maintenance Needs into Preconstruction Procedures*, Report No. FHWA-TS-78-216, for information on highway maintenance as it pertains to highway design. The section of this publication entitled “Maintainability Considerations in Highway Planning” provides guidelines for highway maintenance considerations related to highway location, right-of-way, and geometrics. Also, see NCHRP Report 349*, Incorporation of Maintenance Considerations in Highway Design*. In addition, develop Phase I studies in cooperation with bridge and highway maintenance personnel who are responsible for the highway section under design.

11-2.10 Geotechnical Considerations

See the IDOT *Geotechnical Manual* for information on geotechnical considerations. The Central Bureau of Materials (CBM) maintains the *Geotechnical Manual*. The following applies:

1. Chapter 1, Geotechnical Investigations and Chapter 3, Geotechnical Analysis. These chapters provide guidelines to adequately assess the subsurface conditions on highway projects and to identify the soil and foundation concerns that need to be evaluated for structural support. This information facilitates preliminary highway location or design and can assist in determining the economies of various alignments considering soils and geology. Upon determining the general alignment, the data also assists in selecting the proposed gradeline.

2. Chapter 4, “Design Recommendations”. This chapter describes design recommendations and reflects the conclusion of field and laboratory investigations and any office work. The conclusions are documented in a Geotechnical Report. The Soils Committee reviews district- or consultant-prepared Geotechnical Reports for proposed highway improvements. The district initiates the requests for reviews.

Conduct Phase I studies in cooperation with soils specialists and geologists when these disciplines influence the location and/or design of a proposed improvement. Also, the location of foundations for structures or high embankments may be an important item in the highway location.

11-2.11 Agreements

Consult with the Agreements Unit in BDE during the preparation of Phase I studies to determine if any agreements will be necessary. Depending upon the nature of the project, one or more of the following agreements may be necessary:

11-2.11(a) Local Agency Agreements

In general, agreements will be required with a local agency whenever it will participate in the improvement of a State route within its boundaries. Local agency participation may be a contribution of materials, services, or money (e.g., right-of-way, preliminary engineering, local funds). Although the Agreements Unit has the primary responsibility for processing local agency agreements after design approval, some agreements may depend in part upon decisions reached during the Phase I study. See Chapter 5 for information on local agency agreements. The agreement, or Letter of Understanding, will also define the division of costs between the State and local agency and the respective responsibilities for a variety of project elements and any maintenance or jurisdictional transfers.

11-2.11(b) Utility Agreements

A Utility Agreement will be necessary on all State highway projects that require an adjustment of a public or private utility. Chapter 6 documents the policies and procedures that apply to utility adjustments on Department projects. This chapter discusses Department reimbursement policies, procedures for agreement processing, the preparation of utility plans, and the preparation of cost estimates for utility adjustments.

11-2.11(c) Railroad Agreements

A Railroad Agreement will be necessary on all State highway projects that impact railroad right-of-way, either at a highway-railroad grade crossing or a grade-separation between a highway and railroad. Chapter 7 documents the policies and procedures for work that impacts railroad right-of-way. This chapter also discusses division of costs between the Department and Railroad, procedures for processing the agreement, and other activities related to railroads (e.g., removing abandoned highway-railroad crossings, preliminary engineering for design, and acquisition of railroad property).

The Phase I report should document the reasons for any deviations from current Department policies for these agreements, and it should describe the necessary coordination with the district and other affected entities. In addition, discuss the coordination with local officials, utility companies, and railroads that might affect the preparation of any agreements. Develop cost estimates for the Phase I study consistent with the division of costs between the State and other entities involved in the work. Also, describe any commitments made with the local agency, utility companies, or railroad.

11-2.12 Right-of-Way Issues

The district Land Acquisition Section develops preliminary right-of-way cost estimates and relocation assistance plans as necessary and in accordance with the *Land Acquisition Policies and Procedures Manual*.

Right-of-way costs are determined on a per acre (hectare) basis or on a parcel-by-parcel basis and include costs for displaced persons as a result of a proposed highway improvement. For projects where relocations are anticipated, it is a good practice to estimate the cost of each relocation when finalizing the overall right-of-way project cost estimate. The steps in the land acquisition process are shown in the *Land Acquisition Policies and Procedures Manual*.

When publicly owned facilities will be acquired, a decision should be made at the completion of the Phase I study to either pay the market value for the property or to functionally replace it. The guidance on this issue is in the *Land Acquisition Policies and Procedures Manual*.

See Section 34-5 when laying out highway alignments. This section provides guidance on right-of-way issues that could avoid adverse property severance, undesirable access features, unnecessary damages, and odd-shaped takings. Also, consider existing property lines and the value of property to avoid excessive right-of-way costs. Often, alternative locations and designs can be selected with lower right-of-way costs.

11-2.13 Coordination with Airports

Highway and bridge improvements within 2 miles (3.2 km) of publicly owned airports, within 1 mile (1.6 km) of privately owned airports open to the public, and within 0.5 miles (0.8 km) of restricted-landing areas will require coordination with Aeronautics. These coordination requirements concerning distance to an airport are in conjunction with height obstructions of 15 ft (4.6 m) or more above the roadway. In addition, the district must coordinate with Aeronautics for all realignments and construction improvements on new location regardless of the height of obstruction.

Airport clearance requirements could affect the controlling elevations and locations of pavements and structures. Discuss the necessary construction equipment (e.g., cranes, pile drivers), highway appurtenances (e.g., signs, lighting, traffic signals, utility poles), and environmental mitigation that might affect airspace clearances. During preparation of the Phase I study, also contact the local airport authorities to ascertain that any proposed airport expansion plans will not cause the highway improvement to conflict with future airspace clearances.

For those airports that are publicly owned, coordination with the Federal Aviation Administration (FAA) is required. Contact Aeronautics prior to communicating with FAA.

The Phase I report must include a discussion as to whether or not any airports exist within the distance requirements set forth above and if any obstructions will exist due to highway improvements. Any required vertical clearance permits must be obtained prior to PS&E approval. Airspace clearances are defined in the Illinois Administrative Code (Aviation Safety, 92 Ill. Admin. Code 14).

11-2.14 Traffic Control During Construction

The Phase I study must include a discussion on or development of a conceptual plan to accommodate traffic during construction. The following references are applicable:

1. Work Zone Traffic Management Studies. Chapter 13 documents the goals and objectives for developing a Transportation Management Plan (TMP) report. Each Phase I report should contain TMP indicating an overall strategy for accommodating traffic during construction. The TMP usually will be approved as part of a Phase I report and the decisions made in TMP will be used to prepare the detailed Traffic Control Plan (TCP) during Phase II work.

2. Work Zone Traffic Control. Chapter 55 presents detailed design criteria for accommodating traffic in a work zone (e.g., geometric design, roadside safety). During the Phase I study, the designer will need to review Chapters 13 and 55 to determine the appropriate design features for different methods of accommodating traffic during construction.

11-2.15 Estimate of Costs

At the completion of a Phase I study, prepare a cost estimate for the project. This cost estimate is used during the programming process at both the district and central office levels to determine a realistic annual construction budget. To accomplish this for complex projects requiring more than one construction season, provide cost estimates for individual usable segments. The multi-year highway improvement program can then be developed using the individual segment costs rather than an estimated proportional cost of the total project.

Sections 12-4 and 65-1.02 discuss the information needed to document project costs. Typical cost estimate sheets for minor complexity and major complexity Phase I projects are shown in Section 12-4. To provide statewide uniformity of items used in estimating costs, the designer should use these typical cost estimate sheets in Phase I reports.

11-3 ROUTE PLANNING

11-3.01 Scope

Route planning is the general term used for locating and selecting a design for a major highway facility on new alignment or, in some cases, along an existing highway. Route planning is typically accomplished by the Office of Planning and Programming and is conducted 10 to 15 years prior to a corridor study analysis. Typical examples where route planning would apply are with freeways, expressways, and bypasses. It involves the consideration of engineering, sociological, environmental, and economic elements. Proper planning will determine the traffic needs and the type of facility required to satisfy those needs. After this determination has been made, a study area and area of influence can be selected, and corridors within the study area can be proposed and investigated.

After selection and approval of a corridor, a Phase I study may be initiated and alternative alignments within the corridor may be developed to determine the optimum project design. During detailed project development, consider the requirements in Chapter 19 (public involvement) and Part III, Environmental Procedures.

11-3.02 Logical Termini

Phase I studies for route planning projects as listed above should span a route length that extends to logical termini. Also, ensure that the study addresses the social, economic, and environmental impacts of the ultimate improvement and provides for a uniform set of design criteria between logical termini.

Logical termini generally consist of population centers, major traffic generators, major crossroads, and other features that serve as a destination, either intermediate or final, for a significant portion of the traffic likely to use the route being considered for improvement. Consider the following when determining logical termini:

1. Population Centers. Population centers, typically considered as logical termini, will vary considerably in size. They may be defined, however, as those cities, towns, or villages that serve as trade or business centers in the geographical area where the improvement is located.

2. Major Traffic Generators. Major traffic generators are those shopping districts, factories, employment centers, recreational facilities, and other developments that serve as a destination for a significant portion of the traffic likely to use the facility being considered for improvement.

3. Major Crossroads. Major crossroads are those crossroads that have a functional classification equal to or higher than the route being proposed for improvement.

Section 22-6 discusses logical termini in more detail with respect to the selection of project alternatives.

11-3.03 General Considerations

Prior to developing a Phase I study in detail, reaffirm the location of logical termini for consistency with the project goals, objectives, and NEPA requirements. Logical termini usually have been predetermined by other methods (e.g., need studies, comprehensive transportation studies). Also, reaffirm the recommendations of any previous studies.

Upon reaffirming the recommendations of previous studies and selecting the major logical termini, consider the following factors in route planning for freeways, expressways, or bypasses:

- functional classification;
- directness;
- preliminary intersection or interchange locations;
- provision of good access to communities;
- effect on developed areas;
- route markings;
- plans of adjacent States for routes at State lines;
- location of major structures;
- flood hazards and longitudinal floodplain encroachments;
- displacement of businesses, families, and farms;
- property values and prime farmlands;
- public utilities;
- fire protection;
- traffic operations;
- operation and use of existing highway facilities and other transportation facilities during construction and after completion of project; and
- general environmental impacts including those on archaeological sites, historic sites, wetlands, special waste sites, and public lands (see Part III).

In the route planning process, it is necessary to use the knowledge and expertise from various disciplines and to obtain information from various sources. The following is a partial list of sources, information, and disciplines that are available in the route planning processes:

- photography;
- bridge condition reports, crash reports, and pavement condition ratings;
- natural resource and conservation agencies;
- local agencies;
- economists;
- geotechnical engineers;
- airport agencies;
- railroad agencies;
- sociologists;
- road designers;
- urban and regional transportation planning agencies;
- other resource, recreational, planning, and public agencies;
- utility companies; and
- special flood hazard area maps.

11-3.04 <u>Overall Procedures</u>

Once the route planning process is completed and a general route location is selected, the next step in the highway development process is to investigate and select a corridor location. Once the corridor location is selected, Phase I studies are initiated and the final alignment and design features are chosen.

For an overview of the Study Development Process for these types of projects, see Chapter 2, Figures 2-2.A and 2-3.A. Each of these stages is discussed elsewhere in this chapter, Chapter 19, and Part III, Environmental Procedures.

11-4 CORRIDOR STUDIES

As applicable, a corridor study must reflect general engineering evaluations as discussed in Section 11-2 and the environmental analyses in Part III, Environmental Procedures. Section 11-4 presents additional information that applies specifically to a corridor study. Section 12-3.01 discusses the content and format of a Corridor Report.

11-4.01 Purpose

The purpose of a corridor study is to investigate all feasible corridors within a regional area as determined by the route planning process. In some cases, such a study could be considered a Feasibility Study. The feasibility of a corridor depends on the social, economic, environmental, and engineering effects of the proposed highway improvement within each corridor. Corridor studies usually are prepared only for new freeways, for new expressways where two or more existing routes are being considered for upgrading, or for a new two-lane highway proposed on new location.

A separate corridor study usually is necessary for lengthy projects on new location where alternative corridors are available for a proposed action. This analysis will indicate that alternative corridors can cause substantially different social, economic, or environmental effects or will essentially change the layout or function of connecting streets or roads. Because alternative corridors may be able to provide similar functions, a corridor study provides the means to select the most appropriate corridor for detailed studies of a highway facility. Coordinate and fulfill the appropriate requirements of Chapter 19 and Part III concurrently with the corridor study. Chapter 2, Figure 2-2.A illustrates corridor study coordination on a highway with environmental studies and public involvement activities.

11-4.02 Reconnaissance During Corridor Study

11-4.02(a) Objectives

The objectives of the reconnaissance stage of the corridor study are to:

- reaffirm the need for the proposed improvement,
- establish goals and objectives,
- establish the study area and logical termini,
- identify preliminary corridors,
- analyze each of the preliminary corridors, and
- eliminate corridors not feasible for further study.

11-4.02(b) Sources of Information

Use the following sources of information during the reconnaissance stage:

- State, county, and city maps;
- ASCS photography or IDOT photography;
- USGS quadrangle topographic maps;
- National Wetland Inventory maps;
- Advanced Identification of Wetland maps (District 1 only);
- traffic maps and data;
- functional classification maps;
- Federal agency plans (e.g., U.S. Army Corps of Engineers, Coast Guard, Department of Interior, Department of Housing and Urban Development);
- special development plans (e.g., conservation, industrial, recreational, resource);
- population growth trends;
- utility maps;
- urban area transportation studies;
- other regional planning studies;
- road inventory data from the Illinois Road and Inventory System (IRIS);
- Illinois Department of Natural Resources (IDNR), including:
  + Office of Water Resources for regulatory floodway maps;
  + Office of Mines and Minerals for mined-out area maps; and
  + Office of Realty & Environmental Assessment for consultation, coordination, and Impact Assessment;
  + Office of Resource Conservation for endangered species, nature preserves, wildlife action plan, fishery data, and biological stream ratings;
- USDA, Natural Resources Conservation Services for county soils surveys and wetland maps;
- Federal Emergency Management Agency (FEMA) for flood hazard boundary maps and flood insurance rate maps;
- IEPA Illinois Integrated Water Quality Report and Section 303(d) List;
- USEPA/IEPA for a listing of special waste sites (e.g., LUST, USTS, CERCLIS sites); and
- IHPA for historic site location information.

This list is not all-inclusive, and the designer should consult all available sources prior to proceeding with the development of the corridor study.

11-4.02(c) Coordination

In accordance with Chapter 19 and Part III, Environmental Procedures, contact the following agencies during the reconnaissance phase:

- planning agencies;
- airport authorities;
- local agencies (e.g., counties, municipalities, townships);
- conservation, drainage districts, historical, recreational, and archaeological agencies; and
- other appropriate individuals or agencies.

Contacting these agencies will avoid conflicting improvements. See Section 22-5 for more information on coordination.

11-4.02(d) Study Area

Determining the need for a highway facility is a function of the Office of Planning and Programming and/or local urbanized area transportation agencies. Because the type of highway is selected during route planning, this identifies the geometric design requirements of the facility and the area of influence. Once the area of influence is determined, this allows an estimate of potential land development and, in turn, traffic growth within the corridor.

County or other area maps and USGS quadrangle topographic maps, combined with aerial photography, will furnish the locations of towns, streams, railroads, and other topographic features that will assist in defining the limits of the study area. Plot special flood-hazard areas, wetlands, and public lands on those maps for reference and analysis. Review these maps and locate feasible corridors upon the area maps with respect to local terrain, topographic features, and other controlling items. Use the area maps showing all feasible corridors as the basis to study and investigate different corridor locations.

The study area is determined through a general overview of area maps in the office and field trips. Field trips may be facilitated by prudent use of helicopter flights. The study area is that part of the area of influence within which the facility will be investigated. The limits of the study area may not be the same as the area of influence. Lateral limits are dependent on the distance between the major termini, the function of the highway, and the character of the area traversed.

11-4.02(e) Corridor Location

In general, locate new highway facilities as close as practical to major municipalities to maximize road-user and local-interest benefits and to contribute to the orderly growth of communities. Traffic volumes, combined with origin-destination studies and major transportation plans, reflect the need and extent of intersection or interchange connections to other highway facilities within the corridor. Determine whether these connections can be adequately developed (e.g., size of interchanges, length of access control on crossroads, profiles). It may be necessary to revise tentative corridors to accomplish this goal.

During this stage, determine the approximate location of major intersections and/or interchanges, major drainage structures, and the approximate number of proposed grade separations, if applicable. This information will be used for cost estimating. At this time, determine the need for frontage roads, service drives, and other related features, and their practicality. This will aid in the determination of corridor widths. Also, consider establishing an approximate gradeline for certain segments if:

- an abnormal amount of earthwork is anticipated,
- there is a major difference in the grading requirements of alternative corridors, or
- major drainage structures require that a gradeline be established.

In planning the location of a highway, avoid corridors that create longitudinal encroachments into floodplains. Transverse encroachments of a floodplain are unavoidable and, fortunately, create much less of an impact on floodways compared to longitudinal encroachments. However, transverse encroachments must still be investigated to establish the significance of floodway impacts.

Also, at this stage, a general geologic survey should be made to determine whether the study area contains any adverse soil conditions that could have a major impact on the suitability of a potential corridor. The district initiates the request for a Corridor Geotechnical Report by contacting the Soils and Foundations Unit in the Bureau of Bridges and Structures. If they are unable to conduct the study, the Soils and Foundations Unit will recommend hiring a consultant to complete the work.

Analyze the reconnaissance information and eliminate the unacceptable corridors. In the Corridor Report, note the reason(s) for the elimination of any corridors (e.g., environmental consequences, route planning considerations).

11-4.03 Analysis of Acceptable Corridors

11-4.03(a) Objectives

After completing the reconnaissance stage and eliminating unacceptable corridors, analyze the remaining corridor alternatives. The objective of this stage of analysis is to perform a detailed study of acceptable corridors. The following additional information will be useful during this stage:

- land use;
- habitat (e.g., forested, prairie, wetlands);
- drainage impacts and construction in floodplains;
- projected ADT's;
- fire districts, mail routes, school districts, drainage districts, and taxing districts shown on maps;
- recommendations from Geotechnical Reports;
- locations of major utility installations;
- other transportation facilities (e.g., commuter and freight railroads, airports, bus and trucking terminals);
- urban area transportation study reports and other data;
- regional planning agency reports;
- interagency coordination in accordance with Chapter 19 (public involvement) and Part III (environment);
- route planning considerations (see Section 11-3);
- private and commercial property owner reports; and
- location of cemeteries, public lands, wetlands, threatened and endangered species/habitat, nature preserves, natural areas, biological stream ratings, TMDLs, historic structures, archaeological sites, and special waste sites.

11-4.03(b) Final Corridor Exhibits

For rural areas, sketch corridors on aerial photography (screened half-tone positives) at a scale of 1 in = 600 ft (1:7500 metric). If recent aerial photography for rural areas is not available, county maps may be used initially until new photography is obtained. In highly urbanized areas, use aerial mosaics at a scale of 1 in = 100 ft (1:1000 metric). Sketch sensitive areas (e.g., parks, wetlands, nature preserves, historic sites) and other controlling features on the base maps of aerial photography. As practical, avoid any of these controlling features and sensitive areas.

In addition to the use of aerial photography, sketch the final corridors on USGS quadrangle maps. Using the quad maps, consider the characteristics of the land including flood-prone areas and the need for major drainage structures. Evaluate soils maps in conjunction with aerial photography and locate any areas of unstable or unsuitable materials that must be avoided or replaced. These areas may cause stability problems for embankments or may not be suitable for excavated material to be used in embankments.

See Section 11-5.02 for the services and products available from the Surveys, Mapping and Modeling Section in BDE.

11-4.03(c) Final Field Inspections

During the final analysis of acceptable corridors, conduct a field inspection of each corridor. This inspection should consider any features previously noted and observations should be made of any new local developments. Also, investigate other major features in the corridors and make decisions on the suitability of each corridor.

11-4.03(d) Estimate of Costs

Prepare a generalized cost estimate for all acceptable corridors; see Sections 12-4 and 65-1.02. This estimate, by necessity, will be an approximation because only major design features will have been determined. Therefore, a road user benefit analysis comparing alternative corridors will not be required.

11-4.03(e) Public Involvement

Public involvement for corridor studies entails a series of meetings with different agencies, interest groups, municipalities, and general public; see Chapter 19. The results of these meetings help determine the most suitable corridor or corridors for detailed design studies.

11-4.03(f) Selection of Final Corridor

When selecting the final corridor, consider the public involvement comments (see Chapter 19), environmental effects (see Part III), and engineering factors (see Section 11-2). The final selection of a corridor is documented in a Corridor Report; see Section 12-3.

11-5 DESIGN STUDIES

As applicable, a design study reflects the engineering evaluations discussed in Section 11-2 and the environmental analyses in Part III, Environmental Procedures. Section 11-5 presents information that applies specifically to a design study for a complex project (e.g., freeway, expressway, bypass) as defined in Section 11-1. Section 12-3.03 discusses the content and format of a Design Report for a complex project.

11-5.01 Objective

Develop the purpose and need for the study of a complex project and then investigate all plausible alignments within an approved corridor by using topographic mapping and aerial photography. In developing the design study, address the following features or items:

- design criteria;
- typical sections;
- intersection/interchange designs;
- access control features;
- horizontal alignment and vertical profile;
- right-of-way limits;
- number of traffic lanes; and
- the rationale for the location of bridges, interchanges, intersections, and other structures.

In addition, public involvement activities (see Chapter 19) and environmental studies (see Part III) shall be conducted concurrently with the design study. The Project Development Network for complex projects shown in Chapter 2 illustrates the coordination needed in conjunction with public involvement activities and environmental studies.

11-5.02 Products and Services from Surveys, Mapping and Modeling

Extensive products or services are available from the Surveys, Mapping and Modeling Section for use in performing design studies and other types of work. Some of the more common products or services are:

- uncontrolled aerial photography (black and white or color);
- high-altitude statewide photography;
- aerial photographic mosaics (i.e., aerial photographs that are pieced together to eliminate most of the distortion and then re-photographed);
- contact prints;
- CADD-generated mapping at a scale of either 1 in = 50 ft (1:500 metric) or 1 in = 200 ft (1:2500 metric);
- digital terrain models;
- screened positives of aerial photographs (paper prints can be produced from this product);
- oblique photography for use at informational and/or public hearings;
- enlargements or reductions of exhibits and mapping;

- a complete USGS quadrangle file for use by the Department;
- plotting of centerline on mylar sheets;
- photo plan and profile sheets;
- orthophoto maps (controlled aerial photography with contour lines superimposed on photography); and
- reading of cross sections from mapping.

To determine more details on the use of the above products and services, contact the Surveys, Mapping and Modeling Section.

11-5.03 Alignment Investigations

11-5.03(a) Review of Corridor Selection

Review the Corridor Report in detail before proceeding with the design study and ensure that the corridor decisions are still valid. Throughout the design study process, reaffirm the approved corridor as contacts are made with planning agencies. Also, assess any changes in land use or development plans to determine if corridor modifications should be considered. This is especially important if several years have elapsed between the corridor and design studies or if new information is discovered during a more in-depth design analysis.

11-5.03(b) Preliminary Alignments

The objectives of the first phase of a design study for a complex project are to:

- Identify the preliminary alignments for study, including an analysis of the no-action alternative, and if applicable, analyze the alternative for improving existing highways. The no-action alternative is used as a base condition to determine the consequences of not proceeding with the project.
- Analyze the preliminary alignments identified in the previous step.
- Determine preliminary social, economic, environmental, and engineering factors that will affect the suitability of each preliminary alignment.
- Eliminate the preliminary alignments deemed unacceptable for detailed study.

Use county maps and USGS quad maps in the preparation of base maps for the remaining preliminary alignments. Indicate the following on these base maps:

- existing and projected land use;
- school districts;
- school bus routes;
- fire districts;
- neighborhood boundaries;
- parks and historic sites and districts;
- nature preserves; and

- other elements listed in Part III, Environmental Procedures that may affect the location of the alignments studied (e.g., flood-plain encroachments, natural areas, wetlands, special waste sites, cultural resources, public lands identified as 4(f) by FHWA).

Once the base maps have been prepared, determine and layout preliminary alignments from the following other known influences within the area:

- locations of municipalities,
- recreational areas,
- other highways,
- topography,
- property lines,
- acceptable locations of intersections or interchanges,
- industries, and
- the feasible locations of bridges (over railroads and waterways) and grade separations.

Once the preliminary alignments are identified on these base maps, eliminate the unacceptable alternatives. For the next step of alternative development, transfer plausible alignments to aerial photography. This is accomplished by requesting current aerial photography, scaled at either 1 in = 600 ft (1:7500 metric) or 1 in = 400 ft (1:5000 metric) for rural areas, and aerial photographic mosaics, scaled at either 1 in = 100 ft (1:1000 metric) or 1 in = 200 ft (1:2500 metric) for urban areas. The photographic exhibits are prepared as screened positives. This medium allows paper prints to be produced from the aerial photography. Depict the main influences and any other secondary influences on aerial photography. To proceed further with this phase of the design study, contact all affected agencies and planning commissions within the corridor again to obtain their comments and opinions. These agencies may be affected either directly or indirectly by the proposed improvement. This is part of the scoping process.

Analyze the results of these contacts. Revise or eliminate any of the alignments that are undesirable because of adverse engineering, environmental, economic, or social effects. Document the reason(s) any alignments have been discarded. Also, determine and discuss the impacts of the “no-action” alternative.

11-5.03(c) Mapping Requests

Long lead times are usually required to obtain mapping (one to two years) and, therefore, mapping requests must be made early so that delays do not occur in proceeding with a study. However, it must be noted that many times insufficient information may be available at the time mapping is requested and, therefore, some judgment must be used in deciding on the width limits of the mapping. Additional mapping always can be requested during the design study if needed for further alignment investigations.

In rural areas, the Department typically uses a 1 in = 200 ft (1:2500 metric) scale for topographic mapping where a freeway or expressway is proposed on new alignment. This mapping is commonly referred to as location mapping. However, if a freeway or expressway alternative is being considered along and adjacent to an existing rural highway, use a larger topographic map scale [i.e., 1 in = 50 ft (1:500 metric)]. This larger scale enables the location study staff to make informed, accurate decisions on the feasibility and impacts of using the existing alignment and it also can be used for the preparation of construction plans at a later time.

In urban areas, where a new freeway is being proposed or where an existing expressway is proposed for upgrading, or where the extension of an arterial route into an urban area is being proposed for reconstruction, use a 1 in = 50 ft (1:500 metric) scale topographic mapping for the design study. This larger scale mapping in urban areas provides the necessary detail to determine impacts, displacements, and right-of-way limits.

Submit all mapping requests to the Surveys, Mapping and Modeling Section. This Section will make the determination on whether the in-house staff can provide mapping or if there is a need to hire a mapping consultant. Also, requests for photography for the preparation of aerial photographic mosaics or digital imagery should be made at the same time as mapping requests. This procedure helps to ensure that the minimum number of flights is made to the project area.

11-5.04 Study of Design Alternatives

11-5.04(a) Objectives

After the set of plausible alternatives has been reduced to a set of feasible alignments, perform a detailed analysis to compare the remaining alternatives. Topographic mapping and aerial photography are the primary media used for this phase of the design study. The objectives of this phase are:

- to study and analyze the feasible alignments for a freeway, expressway, bypass, etc.;
- to identify acceptable design alternatives; and
- to choose and recommend a final preferred alternative for construction.

11-5.04(b) Sources of Information

The following are sources of information available, items to use, and items to consider for this phase of the design study:

- crash rate maps and collision diagrams (see Section 11-2.02);
- pavement and bridge condition reports (see Section 11-2.02);
- ADT traffic maps and DHVs for current and design year traffic (all affected routes) (see Section 11-2.02);
- detailed transportation maps and plans with all modes of travel included;
- utility installations and detailed maps from utility companies;
- fire, school, mail, and school bus routes; location of churches, drainage districts, and historic sites; and field-tile maps;
- commercial, agricultural, industrial, recreational, historic, and residential land use (see Part III);

- parks and conservation areas, archaeological sites, floodplains, wetlands, endangered and threatened species, nature preserves, special waste sites, biological stream ratings, etc. (see Part III);
- local, State, and Federal agency coordination (see Section 22-5);
- maintenance information on existing routes (see Section 11-2.09);
- current topographic mapping at a scale of 1 in = 50 ft (1:500 metric) in urban areas and 1 in = 200 ft (1:2500 metric) in rural areas on new alignment or 1 in = 50 ft (1:500 metric) in rural areas where existing alignment is studied;
- current aerial photographic mosaics at a scale of either 1 in = 100 ft (1:1000 metric) or 1 in = 200 ft (1:2500 metric) in urban areas and aerial photography at 1 in = 400 ft (1:5000 metric) or 1 in = 600 ft (1:7500 metric) in rural areas;
- geotechnical investigations (see Section 11-2.10);
- highway geometrics (see Section 11-2.04), development of access control plans (see Section 11-2.03), and right-of-way issues (see Section 11-2.12);
- joint development uses, scenic easements, and aesthetics of highway design (see Chapter 33); and
- cost estimate (see Section 11-2.15) and road-user benefits (see Section 11-7.01).

11-5.04(c) Locating Alignments

Upon receipt of the topographic mapping, plot property lines, property names, names of roads, and all other important cultural features on the original mylar sheets. Make paper copies of the mapping sheets and tape together. This procedure allows the designer to review long lengths of the alignment in one view and to see how lines may best fit together. Begin laying out feasible alignments. With freeways and expressways, the major controlling items in locating the highway alignment are as follows:

- the proper location of interchanges and major intersections;
- topography;
- waterway crossings;
- property lines;
- avoidance of cultural features, if practical; and
- avoidance of regulatory environmental constraints (e.g., wetlands, Section 4(f) lands, longitudinal floodplain encroachments).

In some cases, the placement of grade separations or major bridges may dictate the location of the highway and may require a revision to an initial proposed alignment.

After an alignment is laid out, determine the state plane coordinates of all control points (POTs and PIs) from the project mapping. This information, along with radii of horizontal curves, is then input into a computer file to mathematically describe each alternative. Once an alignment is mathematized and tied into digitizing mapping files, the alignment can then be stationed from west to east or south to north and the information stored as a computer file for further design work.

11-5.04(d) Establishing Gradelines (Procedures)

Once an alignment is judged to be a probable final alternative, the design of the profile may then be investigated in detail. This may require designing two to three trial vertical profiles and performing several complete earthwork calculations. However, before profile work can be completed, preliminary drainage investigations (see Section 11-2.05), using stream gauging data, USGS quadrangle maps, or topographic mapping, must be completed to set design high waters. Use computer programs to determine high waters and other drainage information. IDOT uses GEOPAK software for alignment, profile, and cross section designs. Once the overall design is finalized, compute earthwork using the GEOPAK software. This software allows the designer to quickly investigate trial profile designs, to determine quantities, and to determine construction limits. GEOPAK can also be used to generate perspective plots for any portion of the roadway. Use 3-D plots in the design process to assess potential safety problems and the aesthetic value of each final alternative.

The following procedures apply to the development of gradelines for construction and reconstruction projects:

1. Control Factors. Develop each feasible highway alignment on mapping sheets based on the following factors:

   - location of intersections or interchanges,
   - property lines,
   - topography, and
   - waterway crossings.

   These factors will be the main alignment design controls if environmental issues are not a significant factor.

2. Centerline Elevations. For each feasible alignment, develop a tabulation of groundline elevations along the centerline of the alignments at the selected station intervals. This may be done manually and plotted on a continuous roll of cross section paper or elevations may be read from digitized mapping and plotted using computer programs. The method of obtaining centerline elevations will be dependent on the length and complexity of the proposed project.

3. Controlling Features. Locate controlling features by station and elevation along the centerline profile, including:

   - railroad crossings or separations,
   - streams,
   - highway crossings or separations,
   - location and elevation of transverse utility crossings,
   - rock outcrops, and
   - known locations of unsuitable soils.

4. Trial Profile Gradelines. Once the groundline at the centerline of an alignment has been plotted, either manually or by using computer plots, and other controlling features such as PCs and PTs noted, the designer may then proceed to lay out the first trial profile gradeline. This procedure allows the designer to begin selecting VPI locations and elevations and to visualize how a profile might fit together over long distances. The selected VPIs are connected together by using a long, straight edge and drawing in the profile lines.

5. Vertical Profile. Examine the preliminary profile design considering the controls for vertical alignment discussed in Chapter 33. Make adjustments to ensure safety and to promote aesthetics. A good vertical alignment design should not be sacrificed only to achieve a balance in earthwork or solely to create a less expensive design.

6. Computations. Compile VPI elevations and stations and compute the gradient between VPIs. Determine the minimum length of vertical curves to be used at each VPI. Crest vertical curve lengths are set by using desirable K-values for the selected design speed or longer to emphasize aesthetic values. Sag vertical curve lengths have a more pronounced effect on the view of the road than crest vertical curves. Therefore, use longer lengths than the minimums wherever practical to provide a more pleasing profile.

Upon completing the first trial profile gradeline, use either of the following two methods to obtain cross sections from topographic mapping and to compute earthwork:

1. Method #1. Manually scale distances and groundline elevations from CADD-generated mapping sheets and compile data. Enter the data into a suitable earthwork program (available with either GEOPAK or equivalent software). Run the program using typical sections, special cross sections, superelevation runoff lengths, and the proposed profile.

2. Method #2. Provide state plan coordinate data for all POTs, PIs, horizontal curves, and beginning stationing. District staff then can submit this information to the Surveys, Mapping and Modeling Section for direct reading of cross sections from CADD-generated mapping. Enter the cross section data into a suitable earthwork program (available with either GEOPAK or equivalent software). Run the program using typical sections, special cross sections, superelevation runoff lengths, and the proposed profile.

Using either method, obtain a computer-generated mass-haul diagram and graphically investigate the earthwork balances. To assess the aesthetics of key roadway segments, use computer-generated perspective plots to critique the facility from a driver's-eye view. Examine the results of the first trial profile and develop additional profiles as needed. Usually, two to three trial profiles are developed before a final profile gradeline is selected.

Upon selecting the final profile, request a computer-generated slope-stake table to determine right-of-way limits. Also, see Section 34-5 for guidance on setting right-of-way limits. Then save the final preliminary earthwork file and use this file to develop final cross sections during the Phase II design.

11-5.04(e) Evaluation of Alternatives

Analyze each of the proposed final alignments considering the social, economic, and environmental factors discussed in Part III “Environmental Procedures.” To properly analyze these effects, it may be necessary to meet again with affected agencies that had been previously contacted. See Chapter 19 for public involvement activities on complex projects and Section 22-5 for guidance on coordination.

After the results of further investigations have been analyzed, there may be legitimate reasons to eliminate one or more final alignments. Discuss the reasons these alignments were not given further consideration in the Design Report. For instance, traffic estimates for the no-action alternative may overload existing routes creating unacceptable congestion and, thereby, eliminating this alternative.

11-5.04(f) Access Control Plans

Once the design study has eliminated all but two or three major alternatives for the proposed project, prepare an access control plan for each freeway, expressway, or bypass alternative; see Chapter 35. Prepare the plan on aerial photographic exhibits (i.e., screened positives) at a scale defined in Section 11-5.03(b). The access control plan will consist of all interchange, intersection, frontage road, service drive, and entrance locations. Also, show all grade separations, major drainage structures, and any cattle underpasses or machinery underpasses that may be required. See Chapter 35 for the access control symbols.

Before an access control plan can be finalized, all intersection or interchange designs shall be developed and approved in sufficient detail to indicate all entrances and access control limits. Show all current property owners, property lines, and developments. In addition, indicate the approximate right-of-way limits for each alternative. If alternatives overlap or are closely spaced, it may be desirable to prepare separate sets of access control plans.

11-5.04(g) Exhibits

After completing all public involvement and environmental requirements, the original scaled mapping is reduced for insertion into an appendix to the Design Report. Prepare the reduced mapping sheets and other engineering exhibits on 11 in x 17 in sheets and place them in an appendix. In addition, place the aerial photography (access control plans) showing the alternatives advanced for environmental analysis and any other environmental exhibits on 11 in x 17 in sheets and place them in an appendix. The appendix can then be used in conjunction with a draft and final EIS or with an environmental assessment. Use the 11 in x 17 in format in all cases. This size format provides for ease of use of all final exhibits by planning, design, and land acquisition personnel.

11-5.04(h) Technical Reports

In completing a design study for an expressway, freeway, or bypass, it is usually necessary to prepare a number of technical reports. The following is a list of technical reports that may be required:

- Preliminary Drainage Report,
- Frontage Road/Service Drive and Access Road Justifications,
- Grade Separation/Road Closure Analysis,
- Crash Analysis Report Along Existing Route,
- Transportation Management Plan (TMP) Report,
- Preliminary Pavement Design Report,
- Agricultural Report,
- Noise and Air Quality Report,
- Water Quality Technical Report,
- Wetlands Technical Report,
- Tree Assessment Report,
- Biological Assessment or Detailed Action Report, and
- Geotechnical (Soils) Report.

Reference these technical reports in the Design Report and EIS, as appropriate. It is also recommended that each report be assigned a letter description (e.g., Technical Report A, Technical Report B).

11-5.04(i) Selection of Preferred Alternative

Resolve all public involvement comments (see Chapter 19) and consider all environmental impacts (see Part III) and engineering factors (Section 11-2) before recommending a preferred alternative. See Chapter 12 for processing and approval of reports, Corridor Protection, Route Location Decisions, and for the Order Establishing a Freeway.

11-6 COMBINED DESIGN STUDIES

Sections 11-4 and 11-5 address projects that require a separate corridor study and design study, respectively.

Many proposed projects (e.g., reconstruction of an existing urban arterial, adding a new interchange to a freeway, creating a one-way urban street couple, upgrading an existing two-lane highway to an expressway design) using predominantly the existing alignment are categories of improvements where the corridor or location is predetermined due to the design of the project and, therefore, a separate corridor study is not needed nor required.

For these types of projects, the investigation of how to design the project is designated as a "combined corridor and design study." To shorten the title of the engineering investigations, the Department has designated these studies as "combined design studies." Projects in this category of improvement are major in nature, use most or all of the existing alignment and right-of-way, and usually involve the purchase of additional right-of-way adjacent and contiguous to existing right-of-way.

The items covered in Section 11-2 apply to studies in this category of improvement types and, in some instances, the information in Section 11-5 "Design Studies" applies to the engineering investigations. Review both of these sections before proceeding with the scope of a combined design study.

Projects designated as combined design studies are set up to follow Federal environmental and public involvement procedures to be eligible for Federal-aid construction funding and may or may not involve separate environmental documentation. If the proposed project qualifies as a categorical exclusion type project, environmental documentation will be included in the Combined Design Report as a separate section. If not, a separate environmental report (EA or EIS) is prepared.

11-7 OTHER PHASE I STUDY CONSIDERATIONS

Section 11-7 discusses other analyses and procedures that might apply to Phase I studies.

11-7.01 Road User Benefit Analysis

11-7.01(a) Scope

To optimize the use of available highway funds, the Department's objective is to provide motorists with the safest and most economically efficient highway practical. Highway economy is not limited to the initial cost of construction. It also includes the cost of maintenance and operating costs to motorists. Any proposed improvement should be cost effective. It may be necessary to determine the comparative worth of likely alternative improvements where other considerations (e.g., highway location) do not clearly indicate a preferred alternative.

An aid in making these determinations is a road user benefit analysis. This analysis compares road user operating costs to highway construction and maintenance costs. Note, however, that the road user benefit analysis is not a complete economic analysis. It does not consider the solvency of the highway system or the economic impacts on adjacent land and communities. The road user benefit analysis, therefore, aids in making a selection between alternatives. It should not be used as the sole indication of engineering practicality.

Road user benefit analyses may be used, in conjunction with other considerations, for the following:

- comparing alternative alignments,
- determining the location of interchanges and grade separations, and
- determining the cost-effectiveness of providing freeway frontage or access roads.

Use the guidelines contained in the AASHTO publication *User and Non-User Benefit Analysis of Highways in* conjunction with this section when performing road user benefit analyses. Also, consult NCHRP Report 133 *Procedures for Estimating Highway User Costs, Air Pollution, and Noise Effects.*

11-7.01(b) Procedures

When it is determined that other social-economic-environmental-engineering considerations do not control a specific location or design element, a road user benefit analysis may be conducted. For each proposed alternative, determine the annual road user costs and the annual cost of improving, maintaining, and operating that section of highway over a selected period of time. Then, arithmetically compare the alternatives to express a benefit ratio or quotient of a cost difference.

In the simplest form of the analysis, one alternative will be the proposed improvement and the other will be the base condition, normally the no-action alternative. For two or more alternatives, calculate a benefit ratio for each alternative and compare the results to that of the base condition. The ratio indicates the relative merit of each alternative considering road user benefits.

The annual road user cost is the total of the computed vehicular operating costs, travel time costs, and traffic crash costs. The highway improvement is divided into as many sections as there are significant variations among the major elements of analysis. Summation of the sectional road user costs provides the annual road user cost for that specific alternative. Road user costs include the costs of all traffic directly involved or indirectly affected by the improvement. For example, an analysis may include the road user costs both for vehicles operating on the new or improved route and for those vehicles continuing to operate on parallel or connecting routes on which traffic flow is affected by the improvement.

The road user analysis should cover the entire design period, normally 20 years. Figure 11-7.A provides the average life expectancy, or period of amortization, for individual items comprising the highway cost.

Ensure that the alternative improvements are equivalent for those items not included in the road user benefit analysis. These items are primarily the degree of access control and the design features affecting operational safety. First, determine and analyze the provision of access control and the retention of substandard features only for similar alternatives, or consider qualitative factors for these differences in the final analysis.

11-7.02 Road Closures

11-7.02(a) General

During the project development process, it may be necessary to assess the practicality of eliminating at-grade crossings that are within the limits of the proposed improvement. The primary reasons for eliminating crossings are to promote the safety and convenience of highway traffic and to best serve the public interest. If at-grade crossings will be eliminated, perform a study of the existing road system and traffic patterns to determine the most effective method of elimination (e.g., relocation, grade separation, closure).

With the design of freeways, it is necessary to eliminate at-grade crossings for traffic safety. The Department has the legal authority to either close, relocate, or to grade separate at-grade crossings with proposed freeways. This includes any highway, road, street, alley, or other public way. When cost effective, the Department may choose to eliminate at-grade crossings by proposing grade separations and, thereby, continuing the public way over or under the freeway. Because relocations and grade separations provide for the continuation of through traffic, road closure proceedings are not required.

ITEM		PERIOD OF SERVICE LIFE
Right-of-Way		100 Years
Major Structures:	Substructures	100 Years
	Superstructures	50 Years
Concrete Pipe & Box Culverts & Heavy Grading		40 Years
Portland Cement Concrete Pavement		40 Years
High-Type Flexible Pavement		40 Years
Continuously Reinforced PCC Overlay		20 Years
Metal Culvert Pipe		20 Years
Bituminous Concrete Resurfacing of PCC Base (Depending upon thickness, base, and traffic)		5 to 15 Years
Low-Type Flexible Pavement		12 Years
Gravel or Crushed Stone Surface		10 Years
Bituminous Surface Treatment of Gravel or Crushed Stone		5 Years

Notes: *1. The cost of light grading shall have the same service life period as the proposed surfacing or resurfacing.*

2. For service lives to be used for Highway Safety Improvement Program projects, see the benefit/cost methodology presented in the IDOT publications, Systemic Safety Improvements: Analysis, Guidelines and Procedures and *Users Manual Benefit-Cost Tool,* located on the IDOT website..

PERIOD OF SERVICE LIFE FOR HIGHWAY COSTS

Figure 11-7.A

Expressways (partial access control) are more likely to require relocations of at-grade crossings or to remain in place than either grade separations or road closures. Complete closures of at-grade crossings primarily occur on freeways (full access control) where it is neither practical nor cost effective to provide a grade separation at each local road or street and where relocation may not involve such extensive adverse travel as to cause a serious disruption to local travel patterns.

During the design study, determine which at-grade crossings should be eliminated and document this information in a technical report to the Design Report or Combined Design Report. See Chapter 44 for a detailed analysis of whether or not to close a road. For appropriate signing guidelines on road closures, review the Bureau of Operations *Traffic Policies and Procedures Manual.*

Applicable sections of the Illinois Compiled Statutes discuss the authority to relocate or close roads and the means of implementation. Because closure procedures vary according to the type of improvement and jurisdiction, this subject will be treated in three sections:

- road closures for freeways (full access control),
- road closures for expressways (partial access control), or
- road closures for highways other than freeways or expressways.

The procedures described in the following sections are applicable to improvements on new location and improvements to existing facilities.

11-7.02(b) Road Closures for Freeways (Full Access Control)

The Department may close any intersecting road, street, alley, or other public way at its intersection with a freeway but only after holding a public hearing in the county in which the crossing is located. The hearing will consider the needs of local traffic and the effect of the closing on other highways in the locality. The authority for such closures is granted to the Department under 605 ILCS 5/8-106(b)(2).

Road closure hearings are discussed in Chapter 19. Specific requirements for road closure hearings are included where appropriate. If no specific requirements are mentioned, the general public involvement procedures will apply. When road closure hearings are advertised and integrated with design or combined design hearings, the project record submitted for design approval normally will contain the required information as described in Chapter 19 and shall include hearing transcripts, road closure comments, copies of notices, and handouts.

If the road closure hearing for each county is held as a separate hearing before design approval is requested, the road closure transcript, copies of notices, and handouts shall be included with the project record that is submitted for design approval.

When the requirements of a road closure public hearing are satisfied prior to receiving design approval or when a road closure public hearing is held subsequent to receiving design approval but before construction plans are completed, an “Order Closing a Public Way” shall be prepared.

11-7.02(c) Road Closures for Expressways (Partial Access Control)

Road closures on expressways usually are accomplished through agreements with appropriate local officials according to the *Illinois Highway Code*, 605 ILCS 5/8-106(b)(1). When using this procedure, the district shall secure an agreement with each local agency having jurisdiction over roads to be closed.

The district will prepare and present the agreement to the local officials together with a written request for their cooperation. In addition, the district will make available a written or verbal explanation of the need to close the roads in question to those entities expected to act on the agreements. Agreements need not be executed prior to design approval; however, the Design Report or Combined Design Report should include evidence of coordination with local officials.

In addition to the use of Section 605 ILCS 5/8-106(b)(1), Section 605 ILCS 5/8-106(b)(2) may also be used to propose the closing of any existing public road at its intersection with the expressway. In this case, the district will advertise and hold a road closure hearing.

Provide a statement in the Design Report or Combined Design Report that construction of the recommended expressway design will not be initiated until critical road closures, applicable to the operations and safety of the expressway, have been completed.

11-7.02(d) Road Closures for Highways Other Than Freeways or Expressways

In the rehabilitation, relocation, or construction of State routes that are not freeways or expressways, it may be necessary to relocate or eliminate intersections with local roads, city streets, alleys, or other thoroughfares, usually for the safety and convenience of the traveling public. The following describes two options available to the Department for this procedure:

1. <u>Traffic Control</u>. IDOT has the authority to eliminate an intersection using a traffic control measure or device as authorized under the *Illinois Vehicle Code*, 625 ILCS 5/11-302(c). This can occur if IDOT determines that a local road intersection may be a hazard to State highway traffic.

   See the *Illinois Manual of Uniform Traffic Control Devices* for the full range of traffic control devices available to protect and give preference to State highway traffic. The Prohibition of Left Turns, Right Turn Only, and No Outlet are traffic control measures that may be considered at an intersection. However, note that the restriction or prohibition of access to a State route from an intersecting highway is not the same as a road closure or, to be more definitive, as vacating the local highway.

   In addressing the isolated elimination of crossings for non-freeways, IDOT also considers the interest of all affected highway authorities based on the intent of the *Illinois Highway Code*. Section 605 ILCS 5/1-102 of the *Illinois Highway Code* declares legislative intent and indicates the need for an integrated system of highways based on cooperation between various highway agencies. Therefore, when applying the *Illinois Vehicle Code*, 625 ILCS 5/11-302(c), consult with the local highway authority as a means of addressing any local concerns.

2. Road Closure and Relocation. The Department has the option to eliminate traffic at an intersection with a State route through a relocation or closing of the local highway. In this case, the local agency having jurisdiction over the intersecting roads or streets must authorize the relocation or closing. Municipalities, townships, and counties must meet different statutory requirements when asked to close roads under their jurisdiction. Counties and municipalities require action by their governing bodies, and township highway commissioners follow a specified procedure that allows for public input.

   Perform the following tasks when it is determined that a county or municipal road, street, or alley should be closed:

   - contact the appropriate local official;
   - explain the need to close the road, street, or alley;
   - provide adequate descriptions and information for the preparation of required legal documents; and
   - request that the local agency take the necessary action to accomplish the closing.

   Then, secure a reproducible copy of the passed resolution or ordinance on vacating the road and forward it to BDE for proper distribution. See the *Illinois Highway Code*, 605 ILCS 5/5-109 for counties and the *Illinois Municipal Code*, 65 ILCS 5/11-91-1 for municipalities.

If a township or district road closure is proposed, prepare and sign a certificate describing the roads affected and the need for altering or vacating such roads. Ensure that the certificate and its processing conform to the requirements of the *Illinois Highway Code*, 605 ILCS 5/6-303 and 605 ILCS 5/6-305.

Although it is not necessary to close local roads prior to design approval, include evidence of the coordination with the local agency having jurisdiction over such roads in the Phase I report. Also, state in the report that construction of the recommended design will not be initiated until critical road closures, applicable to the operation and safety of the improvement, have been completed.

11-7.03 Value Engineering

Value Engineering is the systematic application of recognized techniques by a multi-disciplinary team not directly involved with the planning and development phase of a project to identify the function of a product or service, establish a worth for that function, generate alternatives through the use of creative thinking, and provide the needed functions to accomplish the original purpose of the project, reliably and at the lowest life-cycle cost, without sacrificing safety, necessary quality, and environmental attributes of the project.

23 U.S.C. 106 and 23 C.F.R. 627 establishes value engineering (VE) requirements for Federal-aid projects developed and administered by the Department. These requirements include establishing a VE Program, conducting a VE analysis, providing VE program oversight, and reporting performance results annually. The preferred timing to conduct a VE study is during Phase I for complex projects.

A VE analysis is required for the following types of projects:

1. Each project located on the National Highway System (NHS) (as specified in 23 U.S.C. 103) with an estimated total project cost of $50 million or more that utilizes Federal-aid highway program (FAHP) funding (see Section 11-7.03(a), item 2, for definition of total project cost);
2. Each bridge project located on the NHS with an estimated total project cost of $40 million or more that utilizes FAHP funding;
3. Any Major Project (as defined in Chapter 20) located on or off of the NHS that utilizes FAHP funding in any contract or phase of the project;
4. Any project where a VE analysis has not been conducted and a change is made to the project's scope or design between the final design and the construction letting which results in an increase in the project's total cost exceeding the thresholds as identified in 23 USC 106 and 23 CFR 627; and
5. Any other project FHWA determines to be appropriate that utilizes FAHP funding.

The following links provide more information regarding Value Engineering:

FHWA VE Policy (https://www.fhwa.dot.gov/ve/)

Society of American Value Engineers (http://value-eng.org)

11-7.03(a) Procedures

1. Project Selection. Each district identifies applicable projects during the preparation of the multi-year program. However, other projects not meeting the definition may be selected for this program. Due to the complexity and scope of large projects, more than one VE study may be desirable.

2. Total Project Cost. Costs associated with environmental studies, preliminary engineering, final design, land acquisition, and construction should be used in determining the selected project cost. The project cost includes State, local agency, and Federal-aid highway funds.

3. VE Analysis.

a. Initiation of VE Analysis. Schedule the VE analysis in a manner so as not to cause delay of the project. For a Phase I report with multiple construction contracts, develop a plan for conducting the VE analysis based on the Phase I considerations and the nature and complexity of the work type, (e.g., one VE study may cover alike construction projects). A single VE analysis should cover as many construction contracts under the single Phase I report as practicable and beneficial. Initiate the VE analysis no later than the time the construction plans are 30% complete and to allow for the implementation of the recommendations without delaying the project.

b. Team Makeup. The VE team, selected by the district, consists of individuals not personally involved in the design of the project. The team leader should have attended the NHI course on Value Engineering or have equivalent experience in the preparation of VE studies. When making up the team, take into account the following:

- draw team members from either the district or central office;
- consider individuals from specialty areas depending on the project scope;
- assign personnel from construction, maintenance, and studies and plans (as applicable);
- include representatives from environment, operations, and land acquisition as necessary; and
- include individuals from the public and other agencies when in the public interest.

Qualified consultants may be retained to conduct VE studies provided the consultant has not worked on the subject project.

c. Conducting VE analysis. To accomplish the goals of VE, the district should follow the following seven phases when completing the VE Analysis. Figure 11-7.B shows the flow diagram of the Value Engineering Process.

1. Information Phase: Gather specific project information, including purpose and needs of all the owners/users/stakeholders, project commitments and constraints. The following list of information is usually assembled:

   - All project reports (Location Drainage Studies, Hydraulic Report, Bridge Condition Report, etc.)
   - Design Criteria
   - Plans and Specifications
   - Programmed Cost and Detailed Cost Estimate
   - Project Schedule (design approval and target letting)

2. Function Analysis Phase: Analyze the project to understand the required functions. The purpose of function analysis is to thoroughly familiarize all

members of the VE Team with the functional aspects of the project, to ensure that all relevant issues are addressed, and to highlight any imbalances between cost and worth of functions.

3. Creative Phase: Generate ideas on ways to accomplish the required functions that improve project performance, enhance quality, and lower project costs.

4. Evaluation Phase: The VE Team evaluates and selects feasible ideas for development.

5. Development Phase: The VE Team develops the selected alternatives into fully supported recommendations (long-term as well as interim solutions).

6. Presentation Phase: The VE Team presents the recommendations to the project stakeholders. The team leader develops a report that documents the VE study.

7. Resolution Phase: District Office evaluates, resolves, and implements all approved recommendations.

d. Final VE Analysis Report. Each Study concludes with a formal VE analysis report, which outlines the decisions and recommendations and is presented to the Deputy Director/Regional Engineer or representative. The FHWA shall be invited to all VE closeout meetings. The district establishes a procedure for prompt review and implementation of the approved recommendations. When any recommendation is a major change to an approved Design Report or is a design exception to policy, the recommended change is coordinated through the appropriate central bureau.

Furthermore, district VE coordinators should ensure that the following eight required items are included in the VE report:

1. Project information;

2. Identification of the VE analysis team;

3. Background and supporting documentation, such as information obtained from other analyses conducted on the project (e.g., environmental, safety, traffic operation, constructability);

4. Documentation of the stages of the VE Job Plan, which would include documentation of the life-cycle costs that were analyzed;

5. Summarization of the analysis conducted;

6. Documentation of the proposed recommendations and approval received at the time the report is finalized;

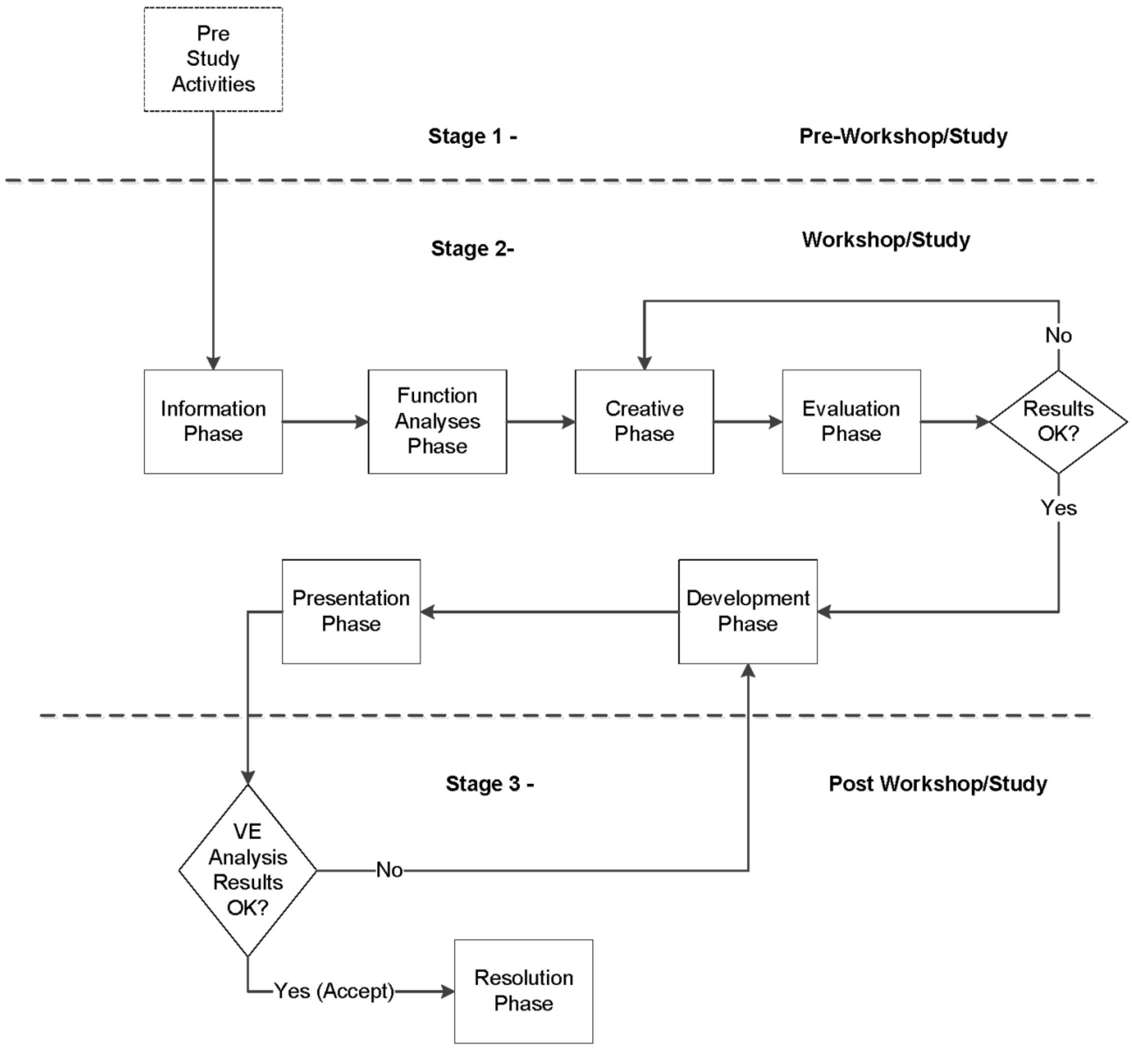
7. Documentation of the proposed and approved recommendations, and related information to support the Department's and FHWA's VE program monitoring and reporting;

8. The formal written report shall be retained for at least 3 years after the completion of the project (as specified in 49 CFR 18.42).

e. Monitoring. Each district appoints a VE coordinator who is knowledgeable in VE studies and trained in VE procedures. Coordinator's responsibilities include monitoring each VE study from initiation through the final report, reviewing the report, and assisting in the implementation of the findings. During the month of October, each year, the district VE coordinator sends the BDE VE coordinator a list, which itemizes the total number of VE studies conducted over the past year and the estimated cost savings for each study. BDE will summarize the information and forward it to the FHWA.

11-7.03(b) Constructability Reviews

Constructability reviews are useful tools for complex or unusual projects and are encouraged as a cost or time saving measure. These reviews may include the use of IDOT personnel unassociated with the project or consultant/contractor teams that would not be bidding on the project. These reviews would not typically be making complex design change recommendations as would be expected in a full VE study. The constructability review would focus upon staging issues, work staging areas, field expedient procedures or methods, and similar activities focused upon accelerating or enhancing the proposed design.



Value Engineering Flow Diagram

Figure 11-7.B

11-7.04 Planning and Environmental Linkage

Per the *Integration of Planning and NEPA Processes Memorandum*, dated February 22, 2005, and Federal Acts authorizing funds for Federal-Aid highway projects (i.e., SAFETEA-LU, MAP- 21, and FAST ACT), the planning process and NEPA can be designed to work in conjunction so that the results of the planning process can directly flow into NEPA. However, planning studies such as Corridor Studies and Feasibility Studies, as discussed in Section 11-1, are not traditionally written to produce a NEPA product such as Purpose and Need and Alternatives to be Carried Forward.

The purpose of this section is to provide guidance on when Planning and Environmental Linkage (PEL) is appropriate and what elements to include when drafting a PEL document with the goal of producing a document that seamlessly flows into the CE, EA or EIS Phase I process. A major component of meeting this goal is drafting a NEPA-ready Purpose and Need and Alternatives to Be Carried Forward so that an outcome of this process will be a shorter time frame from project initiation to the FONSI or ROD.

11-7.04(a) PEL Considerations

There are three considerations for why PEL is appropriate for CE (usually of the more complex nature), EA or EIS project. It can:

- assist a subsequent Phase I project in meeting FHWA time constraints for EAs and EISs;
- advance a project that does not have Phase II funding; and
- assist in gauging public support for a project.

Note: Planning products generated from PEL (i.e., Purpose and Need and Alternatives to be Carried Forward) must meet the conditions specified in 23 U.S.C. 168 in order to be incorporated into NEPA. If more than five years have passed between the PEL study and incorporated by reference into a NEPA product, the project sponsor shall determine that, “there is no new significant information or new circumstances that have a reasonable likelihood of affecting the continued validity or appropriateness of the planning product.”

11-7.04(b) PEL Process

The steps below describe the PEL process: The project sponsor shall:

1. Notify FHWA and BDE that a project will be processed as PEL.

2. Introduce the PEL study and coordinate the need for the study and logical termini with BDE and FHWA at regularly scheduled district coordination meeting.

3. Determine the level of public involvement. For projects using the principles of Context Sensitive Solutions, see Section 19-5 for applicable procedures (i.e., Section 19-5.01(a) to Section 19-5.01(c)).

4. Develop a timeframe agreement for the PEL study (see Section 24-2.01(d)).

5. Submit an Environmental Survey Request (see Section 24-2.03) to BDE for database information and evaluation. This is to help ensure an informed decision is made for potential environmental impacts.

6. Develop a NEPA-ready Purpose and Need in accordance with Section 24-2.07 and Part 1 of Chapter 1 in Appendix D, to be coordinated with Federal and state resource agencies through the NEPA/404 Merger Process, as applicable for EAs and EISs. In addition, coordination with the tribes shall be initiated by the district, in consultation with the cultural resource unit, via letter (See Figure 11-7.C for letter example).

7. Develop NEPA-ready Alternatives to be Carried Forward in accordance with Section 24-2.08 and Part 1 of Chapter 2 in Appendix D, to be coordinated with Federal and state resource agencies through the NEPA/404 Merger Process, as applicable for EAs and EISs. In addition, coordination with the tribes shall be done by the district, in consultation with the cultural unit, via letter (See Figure 11-7.D for letter example).

   Note: The Purpose and Need plus Alternatives to be Carried Forward will be called “coordination points” during the PEL process. For projects that will be processed as an EA or EIS under NEPA, and when the project moves from PEL to NEPA, then FHWA will request the resource agencies to concur on the Purpose and Need and Alternatives to be Carried Forward that were considered “coordination points” during PEL. The request for concurrence may occur via email from FHWA to the resource agencies.

8. A PEL document, after coordination with FHWA and BDE, may include:

   a. the Purpose and Need for the project,

   b. discussion of Alternatives to Be Carried Forward, and

   c. summary of public involvement.

11-7.04(c) PEL to Class of Action Determination or NEPA Scoping

A project initiated through the use of a PEL can advance to:

- a CE and incorporate the PEL study by reference into the Phase I document;
- NEPA scoping (if the project may be processed as an EA or EIS) by sending out the cooperating agency and Section 106 consulting party letters (see Section 24-2.02). The PEL study should be incorporated by reference in the EA or EIS. NEPA Scoping is discussed in Chapter 24; or,
- a stand-alone PEL planning document.

[Date]
[Address Title] [First Name] [Initial] [Last Name]
[Agency]
[Address]
[City], [State] [Zip Code]
Subject: [name of study] invitation for Section 106 consulting party status
Dear [Address Title] [Last Name]:

The Illinois Department of Transportation (IDOT) is notifying your Tribe that a Planning and Environment Linkage (PEL) study is being developed for [name of study].. Your Tribe is being notified based on your interest in the county(ies) where the project is located.

<u>What is a PEL?</u>

PEL studies are a collaborative and integrated approach to transportation decision-making that 1) considers environmental, community, and economic goals early in the transportation planning process, and 2) uses the information, analysis, and products developed during planning to inform the environmental review process. The PEL study will include an evaluation of transportation system needs across the entire study area. [list primary technical tools used to identify transportation system needs and potential environmental impacts during the PEL, e.g. GIS, transportation demand models, field studies.]

Upon conclusion of the study, IDOT intends to carry forward the decisions made into the National Environmental Policy Act (NEPA) decision-making process and additional coordination with your Tribe will occur during the NEPA process.

<u>THE PROJECT</u>

The study area is located in [project location including local agencies and counties]. See enclosed map. The study area covers approximately [area in square miles] and is located [description of study area]. It contains environmentally sensitive resources, including [list primary resources/locations potentially affected].

Please notify us if there are any resources of concern in the project area that should be avoided. **No field archaeological investigations will occur during the PEL study.**

We are submitting for your review and comment on the attached Purpose and Need for the project. The next step in the PEL process will be the determination of Alternatives to be Carried Forward at which time a separate notification letter will be sent to you. The selection of a preferred alternative will not occur until after initiation of the NEPA process.

If you have any questions, would like to discuss the study in more detail or have questions regarding our agencies' respective roles and responsibilities during the preparation of this study, please contact [IDOT POC].

Thank you for your cooperation and interest in this project.

Sincerely,

[IDOT Signature]

[City], [State] [Zip Code]
Subject: [name of study] invitation for Section 106 consulting party status
Dear [Address Title] [Last Name]:

The Illinois Department of Transportation (IDOT) is notifying your Tribe that a Planning and Environment Linkages (PEL) study is ongoing for [name of study]. As discussed in the previous letter sent to you regarding this project on [date], your Tribe is being notified based on your interest in the county(ies) where the project is located. IDOT will continue to coordinate with your Tribe throughout the study.

THE PROJECT

The study area is located in [project location including local agencies and counties]. See enclosed map. The study area covers approximately [area in square miles] and is located [description of study area]. It contains environmentally sensitive resources, including [list primary resources/locations potentially affected].

Please notify us if there are any resources of concern in the project area that should be avoided. **No field archaeological investigations will occur during the PEL study.**

We are submitting for your review and comment the attached Alternatives to be Carried Forward under consideration. As stated previously, the selection of a preferred alternative will not occur until after initiation of the NEPA process.

If you have any questions, would like to discuss the study in more detail, or have questions regarding our agencies' respective roles and responsibilities during the preparation of this study, please contact [IDOT POC].

Thank you for your cooperation and interest in this project.

Sincerely,
[IDOT Signature]

11-8 ENGINEERING COMPUTER PROGRAMS

11-8.01 General

IDOT uses various engineering programs for Phase I and Phase II work (e.g., hydraulic programs, traffic operations, highway capacity programs). These programs greatly increase the efficiency of providing solutions to the Department's engineering needs and should be used whenever possible. Discuss with the appropriate district bureau, section, or unit the use of computer software for project development.

The remainder of this section focuses on the use of MicroStation and GEOPAK Computer Aided Drafting and Design (CADD) software used in project development.

11-8.02 Roadway Design Software

The GEOPAK Engineering Suite is a comprehensive, proprietary design software package from Bentley Systems, Inc. that works as an interactive program within MicroStation. The Department presently uses this engineering program for its roadway design work. GEOPAK is used to provide engineering solutions in Phase I work and to develop detailed plans in Phase II. All final roadway plans are produced using MicroStation.

Detailed workflows and required deliverables for all aspects of roadway design using MicroStation and the GEOPAK suite of tools are included in the IDOT *Survey Manual* and the *Computer Aided Design, Drafting, Modeling and Deliverables Manual.*

11-8.03 Bridge Design Software

The Bureau of Bridges and Structures uses a variety of software packages for analytical design. The software provides a full suite of structural design capabilities for concrete and steel structures and bridges. While a variety of different software can be used for analytical design on bridge and structures projects, all final plans are produced using MicroStation.

Detailed workflows and required deliverables for all aspects of bridge and structures design are included in the *Computer Aided Design, Drafting, Modeling and Deliverables Manual*.

11-8.04 3D Models

For many projects during and at completion of Phase II design, a three-dimensional (3D) model of roadways, bridges, or structures is the desired end product. The workflows defined in the *Computer Aided Design, Drafting, Modeling and Deliverables Manual* have been developed in order to produce these 3D models in a standard and consistent format when the nature of the project makes 3D models desirable.

Many projects, such as SMART and PPP projects, do not greatly benefit from 3D models. For these projects the workflows for a traditional two-dimensional (2D) design are also accommodated in the *Computer Aided Design, Drafting, Modeling and Deliverables Manual*.

11-8.05 CADD Support

Detailed information on the uses of MicroStation and GEOPAK is available in the *Computer Aided Design, Drafting, Modeling and Deliverables Manual, as well as* MicroStation and GEOPAK user reference materials provided to each district, and tutorial information available on-line through the Bentley Systems Learn website.

The Bureau of Information Processing (BIP) is responsible for the following:

- Computer hardware configuration and support,
- Software installation, maintenance and support,
- Inter-agency coordination, and.
- Management of software licensing.

Please see Section 1-2.01(c) for a list of support duties provided by the BDE Modeling and Support Unit.

Also in each district, the CADD Manager or an Engineering Support Specialist may be available to provide assistance on the use of MicroStation and GEOPAK software.

11-9 DISTRICT GEOMETRIC APPROVAL QUALIFICATION REQUIREMENTS

Geometric designs such as Intersection Design Studies and Interchange Design Studies represent some of the most critical parts of Phase I Engineering Reports with respect to the safety and operational quality of the highway facilities. These designs are some of the most complex and technically rigorous portions of the preliminary engineering process. Proficiency in geometric design takes years of experience, training, and hands-on work to achieve. Great care must be taken in choosing those individuals responsible for the development and approval of such designs, and the end products must be closely monitored for quality compliance. As such, only qualified individuals shall approve geometric designs for phase I of the project, or for any geometric modifications proposed in phase II or phase III of the project after initial phase I design approval. This section details the requirements and process necessary for the District Geometrics Engineer to approve geometric designs on federally funded roadway projects.

11-9.01(a) General

Districts are eligible to become qualified to approve all geometric designs they produce. The process involves the Regional Engineer of the appropriate district seeking district approval authority from the Central Office Bureau of Design and Environment (BDE). The prerequisite requirements for the District Geometrics Engineer, and hence the district, to be qualified for approval of geometric designs, are listed below in Section 11-9.01(d). Once qualified, districts can approve all geometric designs they produce. However, design exceptions included in any geometric design must be approved through the central office as outlined in Chapter 31.

As an ultimate goal, districts would fill the Geometrics Engineer position with able and experienced personnel. With budget constraints and staff turnover, it is understood that this process will be an evolving one, where responsibilities will shift periodically between the district offices and the central office. District coordination meetings and annual quality reviews will ensure proper and consistent application of policy and quality compliance.

The geometric designs of districts not qualified for geometric approval will be reviewed and approved by BDE. This would occur for districts where the Regional Engineer has not requested anyone to be qualified, where staffing changes have left the Geometric Engineer position vacant, as well as for those districts for which qualification has been rescinded. Although BDE review and approval are not required for qualified districts, these districts may request BDE assistance in the processing of any geometric design. The Regional Engineer is also responsible for requesting assistance from BDE should the district staff experience be insufficient for the required work.

The BDE is not precluded from reviewing any portion of the Phase I process at any time, especially when unique features or unusual circumstances are involved. If an annual quality review determines that a qualified district’s geometric designs are unsatisfactory, the Regional Engineer and the Director of the Office of Program Development will be notified immediately of the deficiencies, and corrective action up to and including rescission of the qualification may be pursued.

11-9.01(b) Items Exempt from Qualification

Design exceptions included in any geometric design must still be approved through the central office as outlined in Chapter 31. Access Justification Reports (AJR) and access control changes on interstates will continue to be coordinated with BDE. This is due to the complex nature of the designs and issues involved, and the need for statewide consistency. BDE will review and approve the AJR and access control changes for transmittal to the Federal Highway Administration (FHWA) for federal approval.

11-9.01(c) Removal of Qualification

Once approved, the District Geometrics Engineer is qualified to approve all geometric designs. The District Geometrics Engineer is the only position in the districts eligible to have geometric design approval authority.

Approval authority of the Geometrics Engineer can be withdrawn by the Bureau Chief of BDE in the event of failure to exhibit the requisite professional ability. Removal of approval authority would be based on unsatisfactory results of process reviews or other similar evidence.

Staffing changes within the Geometrics Unit may also nullify the district's approval authority. To continue to maintain approval authority, the Regional Engineer shall submit a list of staffing changes within the Geometrics Unit, including revised qualifications, to the Bureau Chief of BDE for approval. See Section 11-9.01(e).

11-9.01(d) Qualification Requirements

1. The candidate must have a degree in Civil Engineering, possess a Civil Engineer V technical classification or higher within the department (State of Illinois Professional Engineer License implied), and be the District Geometrics Engineer.
2. The candidate must have demonstrated the professional ability to produce designs which reflect genuine expertise in the field of geometrics as recognized by the Regional Engineer.
3. The candidate must have attended the following IDOT approved capacity and geometrics training classes:
   a. Basic Highway Capacity
   b. Advanced Highway Capacity
   c. Fundamentals of Geometric Design
   d. Advanced Geometric Design

11-9.01(e) Qualification Process

1. Upon fulfillment of the above requirements, the Regional Engineer will assess the capabilities of the Geometrics Engineer and, if deemed qualified, submit the candidate to the Bureau Chief of the Bureau of Design and Environment for district approval

authority. The submittal to BDE should include a cover memo requesting district qualification and a resume which details the professional experience of the candidate and lists the significant projects the candidate has previously worked on.

2. The Bureau Chief of the Bureau of Design and Environment will verify the qualifications of the candidate and determine whether the candidate Geometrics Engineer is qualified for approval authority.

3. The Bureau Chief of BDE is responsible for approving or denying the Geometrics Engineer as qualified for approval authority. The Bureau Chief of the Bureau of Design and Environment will notify the Regional Engineer via memo of the approval or denial of the request for geometric qualification.

Chapter Twelve
PHASE I ENGINEERING REPORTS

Chapter 11 discusses the goals and objectives of Phase I studies for projects administered by the Department. Chapter 12 discusses the applicability of the various Phase I engineering report types, as well as their content, format, processing, and approval.

12-1 GENERAL

12-1.01 Purpose of Phase I Engineering Reports

The purpose of preparing reports for the projects in the annual and multi-year programs is to document the coordinated efforts of each district on why the Department is proposing an improvement, and how the improvement will be designed to satisfy a need. Depending on the complexity and type of improvement proposed, the size of a Phase I engineering report and appropriate exhibits can vary from a two-page form for a pavement preservation project, to 25-50 pages for a pavement rehabilitation/replacement project on an existing road, or to a few hundred pages for a complex new construction or reconstruction project.

These reports are more than just a paperwork requirement and have been created to ensure that a proposed improvement has been carefully evaluated, that appropriate policies and criteria are being used, that the design reflects an assessment of environmental concerns, and, if required, that public involvement has occurred. These reports should be able to stand on their own and document all major design decisions and exceptions to the policy.

12-1.02 Applicability of Report Types

Each type of Phase I study requires a corresponding report to document the findings of the investigation. The type of Phase I engineering report used depends upon the scope of the study and sometimes the funding source as described below:

1. Corridor Report. The funding and scope of engineering (e.g., a large scale Federally funded project on new alignment) will determine when to prepare a Corridor Report. The following will apply to a Corridor Report:

   a. Funding. These projects involve Federal funding for construction or the desire to obtain future Federal reimbursement of construction costs.

   b. Engineering. Typically, these projects involve significant lengths of highway on new location with alternative corridors available for the proposed improvement.

c. Typical Projects. Typical projects include new freeways, alternative bypasses around an urban area, or expressway designs with a considerable length of proposed highway on new locations.

d. Environment. Because these projects are complex and Federally funded, environmental aspects are addressed in a separate section of the Corridor Report or in a separate EA or EIS type document.

e. Review. The BDE Location and Environment Section reviews and provides concurrence on engineering information contained in the Corridor Report, as well as environmental information either contained in the Corridor Report or provided separately through the EIS or EA.

2. Feasibility Study Report. A Feasibility Study, which is similar in scope and purpose to a Corridor Study, is typically prepared to assess whether or not a proposed highway improvement warrants further study or additional funding for Phase I engineering costs. The following other types of investigations are applicable:

- study of major drainage alternatives,
- comparison of proposed interchange types at different locations, and
- HOV studies versus other transportation alternatives.

The Feasibility Study Report documents the findings and recommendations of the study and, in many cases, may be used as a substitute for a Corridor Report. Reviews are essentially the same as for a Corridor Report and concurrence in the recommendations is by the Bureau Chief of Design and Environment.

3. Design Report. The funding and scope of engineering (e.g., a large scale Federally funded project on new alignment) will determine when to prepare a Design Report. The following will apply to a Design Report:

a. Funding. These projects involve Federal funding for construction or the desire to obtain future Federal reimbursement of construction costs.

b. Engineering. Typically, these projects involve significant lengths of highway on new location and include an analysis of potential alternative locations and a detailed design of each alternative.

c. Typical Projects. Typical projects include new freeways, new bypasses around an urban area within a selected corridor, or expressway designs with considerable length of proposed highway on new locations.

d. Environment. Because these projects are complex and Federally funded, environmental aspects are addressed in a separate document (i.e., EA or EIS).

e. Review. The BDE Location and Environment Section reviews and provides concurrence on engineering information contained in the Design Report, as well as environmental information provided separately through the EIS or EA.

4. Combined Design Report. The funding and scope of engineering (e.g., a large scale Federally funded project on existing alignment) will determine when to prepare a Combined Design Report. The following will apply to a Combined Design Report:

   a. Funding. These projects involve Federal funding for construction or the desire to obtain future Federal reimbursement of construction costs.

   b. Engineering. Typically, these projects are complex projects using most or all of an existing highway alignment and right-of-way.

   c. Typical Projects. The corridor or location is predetermined due to the design of the proposed project. Typical projects include:

      - proposed expressway designs using much of the existing highway alignment;
      - the upgrading of existing urban arterial or collector highways to add through lanes and/or the addition of a median or a change in median type;
      - the creation of a one-way couple;
      - the addition of an interchange;
      - a change in type for an existing interchange;
      - the reconstruction of an existing rural highway with a considerable number of changes to the alignment, profile, and front slopes and back slopes; or
      - the reconstruction of an existing freeway or expressway to increase capacity by adding lanes and/or to increase safety.

   d. Environment. Depending upon the anticipated environmental issues involved, the project could be a CE, EA, or EIS. If the proposed improvement qualifies as a Federally Approved CE project, the environmental documentation will be included in the Combined Design Report as a separate section. If not, a separate environmental report (EA or EIS) is prepared.

   e. Review. Environmental information (EA or special analyses and studies that may be necessary to address environmental compliance requirements for specific types of resources or potential for unusual circumstances) and comments are passed on to the BDE Regional Field Engineer and forwarded to the district for inclusion in the Combined Design Report. The district is responsible for compliance with engineering policies. However, if design exceptions are proposed, the project should be presented at a district coordination meeting.

5. Project Report. Only the scope of engineering (e.g., pavement or bridge replacement, pavement rehabilitation with geometric, roadside, or drainage improvements, etc.) will determine when to prepare a Project Report. The following will apply to the Project Report:

a. Funding. These projects involve Federal or State funding for construction. The design of the project would allow it to be programmed for Federal funding.

b. Engineering. Typically, these projects use the existing highway alignment but some may involve curve corrections or minor relocations.

c. Typical Projects. Typical projects may include:

- widening and resurfacing or resurfacing only of existing lanes,
- bridge rehabilitation or total bridge replacements,
- pavement replacement,
- reconstruction of an intersection with minor right-of-way impacts, or
- other projects on existing roads which may involve an occasional curve relocation or profile changes.

d. Environment. These projects typically qualify as a CE and, therefore, the environmental documentation is included in the Project Report.

e. Review. Environmental information (EA or special analyses and studies that may be necessary to address environmental compliance requirements for specific types of resources or "potential for unusual circumstances") and comments are passed on to the BDE Regional Field Engineer and forwarded to the district for inclusion in the Project Report. The district is responsible for compliance with engineering policies. However, if design exceptions are proposed, the project should be presented at a district coordination meeting.

6. State Improvement Report. The funding and scope of engineering (e.g., a large scale State-funded project) will determine when to prepare a State Improvement Report (SIR). The following will apply to a State Improvement Report:

a. Funding. A decision has been made that no Federal funds will be used for planning, right-of-way, or construction of the project.

b. Engineering. Typically, these projects involve a major construction project that may or may not use an existing highway alignment or street.

c. Typical Projects. Typical projects will include:

- upgrading of existing urban arterial or collector highways to add through lanes and/or the addition of a median or change in median type;
- creation of a one-way couple;
- addition of an interchange;
- change in type for an existing interchange; or

- reconstruction of an existing intersection with significant right-of-way impacts.

d. Environment. Because Federal funding is not being used, these projects typically only require environmental documentation to comply with State regulations and Federal permits as identified in Chapters 26 and 28. Include any documentation of public involvement coordination in the State Improvement Report (SIR).

e. Review. Environmental information (EIS, EA, or special analyses and studies that may be necessary to address environmental compliance requirements for specific types of resources or "potential for unusual circumstances") and comments are passed on to the BDE Regional Field Engineer and forwarded to the district for inclusion in the State Improvement Report. The district is responsible for compliance with engineering policies. However, if design exceptions are proposed, the project should be presented at a district coordination meeting.

7. Pavement Preservation Policy (3P) Report. The scope of engineering will determine when to prepare a 3P Report and the following will apply:

a. Funding. These projects may or may not involve Federal funding for construction.

b. Engineering. These projects rehabilitate existing paved roadways to prevent further pavement deterioration by repairing and resurfacing existing pavements. Avoid projects with significant safety needs where an improvement with a larger scope would be more appropriate.

c. Typical Projects. The emphasis of this program is to improve State highway pavements with few or no non-pavement items. Focus is on rural marked routes, but urban marked routes and high-volume unmarked routes may be acceptable on a priority basis. Rural projects should be at least 1 mile (1.6 km) in length. No geometric revisions or pavement widening are permitted, and acquisition of right-of-way is not allowed except when required to implement a countermeasure to mitigate Five Percent Report locations. However, 1 ft (300 mm) wide shoulder strips are required for rural cross-sections if no paved shoulders exist. Structurally deficient or functionally obsolete bridges should be gapped and addressed through other programs.

d. Environment. These projects will usually qualify as a categorical exclusion.

e. Review. Engineering information will be developed by the district using the standard 3P Report, form BDE 1202 (fill in the blanks, check off items, and attachments). Occasionally, a special analysis may be required to address environmental compliance requirements. The district is responsible for compliance with engineering policies. However, if design exceptions are proposed, the project should be presented at a district coordination meeting.

8. Pavement Preservation (High/Low) Report. This simple report is required for projects categorized as High Pavement Preservation or Low Pavement Preservation. No report is required for preservation projects categorized as Proactive Maintenance. The following applies to High/Low Pavement Preservation Reports:

   a. Funding. These projects may or may not involve Federal funding for construction.

   b. Engineering. These projects are primarily intended to preserve pavements in good condition using "low cost" treatments. However, if safety improvements are identified as part of the project's needs and can be accomplished for 15% or less of the total project cost, said safety improvements shall be made part of the project.

      When the identified safety need is beyond the scope of high/low preservation, or would represent more than 15% of the total project cost, the roadway is not eligible for preservation and a higher project scope must be selected to address the need.

   c. Typical Projects. The emphasis of this program is to improve State highway pavements with few or no non-pavement items. Structurally deficient or functionally obsolete bridges should be gapped and addressed through other programs. Avoid projects with significant safety needs where a project on an existing road with a larger scope would be more appropriate.

   d. Environment. These projects almost always qualify as a categorical exclusion.

   e. Review. The district will develop engineering information using BDE 1203 Pavement Preservation (High/Low) Report form (fill in the blanks, check off items, and attachments). Occasionally, a special analysis may be required to address environmental compliance requirements. The district is responsible for compliance with engineering policies. However, if design exceptions are proposed, or there are issues related to the project's scope that would benefit from discussion, the project should be presented at a district coordination meeting.

12-1.03 Functions

Phase I reports provide a systematic methodology for identifying and evaluating location, design, and environmental issues. The report provides a medium for documenting the decision-making process and communicating the reasoning for the proposed improvement need. In this capacity, the report fulfills many functions, including:

1. Project Summary. Phase I reports summarize the coordinated efforts of both the district and Central Offices in determining the need for a project and how it will be designed.
2. Public Involvement. Phase I reports provide an organized document that can be used by the district to discuss improvements with the public and to ensure that the proposed project has been planned consistent with safety and cost-effective objectives.
3. Plan Preparation Guide. A Phase I report provides a reference guide for preparing construction plans and ensures that certain prerequisite design and environmental

requirements have been met. This aids and expedites plan preparation, scheduling, environmental coordination, and construction.

12-1.04 Objectives

All Phase I engineering reports should meet the following general objectives:

- Present the study findings in clear, unambiguous language. As practical, the writing should be understandable to the general public.
- Do not duplicate information documented in other reports (e.g., environmental documents, Transportation Management Plan, Geotechnical Report, Preliminary Drainage Report, Bridge Condition Report). The Phase I Engineering Report should reference or summarize these other documents.
- Ensure all relevant information is included or referenced in the report so that the reader can understand the reasons for the design decisions.
- Ensure the level of detail in the report is commensurate with the conceptual objective of a Phase I study; i.e., limit the information to that needed to make major decisions.

12-1.05 Content

A Phase I engineering report should document the following, as applicable:

1. Prior Studies. List and analyze any prior studies relevant to the undertaking.
2. Project Need. Include all the necessary information, technical reports, and other materials to clearly demonstrate the study has adequately demonstrated the need for safe, fast, and efficient transportation. In addition, document the construction cost, traffic benefits, and public services provided by the highway improvement.
3. Local Conditions and Improvements. Briefly describe the highway/pavement conditions adjacent to the proposed action and any plans for future improvements. Coordinate these items between districts for route continuity when district boundary lines fall between logical termini.
4. Improvement Alternatives. Describe the alternatives considered and discuss the anticipated social, economic, and environmental effects of the alternatives, emphasizing the significant differences and the supporting reasons for the proposed location or design. In addition, analyze the relative consistency of each alternative with the goals and objectives of any adopted local or regional urban plan. Depending on the type of study, also include the following information:
    a. Corridor Studies. For Corridor Studies (see Section 11-4), describe the termini, the general type of facility, the nature of the service that the highway is intended to provide, and other major features of the alternatives.

b. Design Studies. For Design Studies (see Section 11-5), describe the critical elements such as safety and crash patterns on the existing route, applicable design criteria (e.g., new construction, reconstruction, projects on existing roads), traffic volumes, number of traffic lanes, other cross-section elements, access control/access management features, method of locating horizontal alignment, vertical profile considerations, right-of-way requirements, bicycle/pedestrian considerations, intersection designs, interchange designs, hydraulic information, bridges, and other structures.

5. Environmental Issues. Summarize or reference the discussion in the environmental document on the anticipated social, economic, and environmental effects as discussed in Part III "Environmental Procedures." Identify the adverse effects, develop appropriate measures to avoid, minimize, or mitigate these effects, and estimate the associated costs.

6. Policy and Design Exceptions. List any major design exceptions from IDOT policies and design criteria (e.g., engineering, environmental) together with supporting reasons, pertinent minutes of district coordination meetings, and relevant documentation of BDE coordination with FHWA, if appropriate. For geometric design exceptions, see Chapter 31.

7. Maps and Drawings. Include the appropriate maps or drawings of the location or design for which approval is requested.

8. Summary of Public Involvement. Provide a summary and analysis of the comments received from the public involvement process (see Chapter 19) and from the environmental analyses (see Part III, Environmental Procedures) based on:

- coordination with the State's resource, recreational, planning, and historic agencies; and
- those Federal and local public agencies, public officials, and public advisory groups that IDOT knows or believes are interested in and/or affected by the proposed action.

9. Costs and Schedules. Estimate costs and tentative schedules for right-of-way acquisition and construction. For complex projects requiring more than one construction season, provide cost estimates for individual usable segments for construction staging. The multi-year highway improvement program can then be developed using the individual segment costs rather than an estimated proportional cost of the total project.

   If cost breakdowns for individual segments or improvement alternatives are necessary, use multiple columns on the cost-estimate sheet or provide multiple cost estimate sheets. For all cost estimates, indicate the base year and separate all construction, right-of-way, utility adjustment, and consultant PE costs to facilitate the programming of these items.

   See Section 12-4 for more information on cost estimates.

12-2 REPORT FORMAT FOR MAJOR STUDIES

Section 12-2 presents the detailed outline format that can be used for a Corridor Report, Design Report, Combined Design Report, or State Improvement Report. Section 12-3 discusses specific requirements for report content of major and minor studies. Use the following format, as applicable, when developing reports for major studies:

I. INTRODUCTION

- A. Description and Location of Project
- B. History of Project
- C. Discussion of Design Criteria Used (e.g., new construction, reconstruction) and Highway Types Considered

II. PURPOSE AND NEED FOR THE IMPROVEMENT

- A. Conditions on Existing Highway Network
  1. Typical sections
  2. Extent of access control/access management
- B. Existing Traffic and Capacity Deficiencies
- C. Existing Safety Performance/Crash Analysis
- D. Alignment and Profile Deficiencies
- E. Corridor Studies

III. EXISTING SETTINGS OR CONDITIONS

- A. Description of Project Area
- B. Project Limits (logical termini)
- C. Land Use (fire districts, school bus, and mail routes)
- D. Existing Bicycle/Pedestrian Generators
- E. Environmental Resources
- F. Sensitive Environmental Areas
  1. Parks and recreational areas (Section 4(f) properties)
  2. Floodplains and waterways
  3. Wetlands
  4. Historical sites
  5. Special waste sites
  6. Endangered species locations
  7. Natural areas
  8. Biologically significant streams

IV. ALTERNATIVES CONSIDERED

A. Transportation Demand Strategies

B. Mass Transit (if applicable)

C. Proposed Highway Design Guidelines

1. Typical sections
2. Design speed
   a. Horizontal alignment
   b. Vertical profile
3. To remain in place criteria
4. Proposed access control or access management

D. No Action (continued maintenance)

E. Widen Existing Roadway or Major Reconstruction of Existing Roadway

1. Urban arterial improvement
2. Expressway design

F. Construction on New or Existing Locations

1. Freeway design
2. Expressway design
3. Bypass around towns
4. New rural two-lane highway

G. Description of Intersections or Interchanges

1. Locations and types
2. Design features
3. Level of service achieved
4. Signal progression (if applicable)
5. Uniformity of types

H. Description of Bicycle and Pedestrian Facilities

V. DESCRIPTION AND ANALYSIS OF ALTERNATIVES STUDIED IN DETAIL

A. Attainment of Purpose and Need

B. Traffic Service to Region

C. Engineering Considerations Including Aesthetics (e.g., combining horizontal and vertical alignments)

D. Important Social, Economic, and Environmental (SEE) Effects (mainly reference)

E. Utility Involvements/Drainage Considerations

F. Possible Mitigation Measures

G. Discussion of Costs and Benefits

H. Priority of Implementation

VI. COORDINATION ACTIVITIES

A. Local Governments/Metropolitan Planning Organizations

B. State and Federal Agencies

C. Property Owner Considerations

VII. PUBLIC INVOLVEMENT ACTIVITIES

A. Advisory Committee and Working Groups (if desirable)

1. Public interest groups
2. Agricultural groups
3. Growth and development groups
4. Public officials' groups

B. Informational Meetings/Property Owner Contacts

C. Design Public Hearing (open house meeting)

D. Analysis of Correspondence

E. Commitments

VIII. CONCLUSIONS/RECOMMENDATIONS

A. Recommended Design Alternative

B. Supporting Reasons for Alignment Recommendation and/or Design Features (be specific)

C. Discussion of Design Exceptions

D. Identification of Criteria for Implementing Next Step/Phase of Study

E. Proposed Interim Improvements or Stage Construction (if applicable)

IX. APPENDICES (Usually produced in an 11 in. x 17 in. format)

A. Quad Maps and County Maps

B. Proposed Typical Sections

C. Schematic Drawings Showing Traffic Data

D. Aerial Mosaics Showing Alternatives and Important Cultural Features

E. Environmental Survey Data Shown on Aerial Mosaics, As Needed

F. Topographic Mapping, As Needed, Showing Alternatives

G. Oblique Photographs and Photomontages (perspective view of a proposed highway)

H. Schematics of Interchange Designs and Approved Interchange/Intersection Design Studies (IDSs)

For more complex projects, prepare the appendix as a separate document using 11 in. x 17 in. sheets. In this case, a separate appendix improves the readability of the Report, allows design information to be examined more easily, and simplifies the conveyance of information to the design and land acquisition personnel.

12-3 SPECIFIC PHASE I REPORTS

Major studies should follow the detailed outline format described in Section 12-2. Section 12-3 presents information specific to the content of individual Phase I engineering reports.

12-3.01 Corridor Reports

A corridor study is developed according to the guidance in Section 11-4. In addition to the information listed in Section 12-2, also include the following in the Corridor Report:

1. Structure of Report. Lay out the Corridor Report in the format as shown in Section 12-2. In addition, consider the following:

   a. Table of Contents. Provide a table of contents for the report that should list each separate report section, the figures and tables, and appendices.

   b. Page Numbers. Consecutively number the pages in the report including all exhibits and figures (i.e., do not renumber each major section).

   c. Exhibits. Show all exhibits as figures with figure numbering for easy referencing. Place figures, small maps, and tables at the back of the report and reference them in the text. Place large figures (11 in. x 17 in. format) in an appendix to the report. Removing the figures and tables from the text allows for easier reading and review of the report, quicker access to a desired page number, and more effective positioning and access of materials that are used to support the text.

   d. Cross References. Provide cross-references to information provided elsewhere in the report (e.g., other sections, figures, appendices).

2. County Maps. Use 11 in. x 17 in. sheets and a scale of either 1 in. = 1 mile (1:60,000 metric) or 1 in. = 2 miles (1:120,000 metric). Indicate the following on these maps:

   - all corridors studied;
   - all acceptable corridors; and
   - existing and proposed land use including:
     + flood plains/floodways,
     + school districts,
     + fire protection districts,
     + recreational areas and lakes (existing and proposed),
     + airports,
     + historic sites,
     + cemeteries,
     + archaeological sites (only show on internal use maps),
     + Special Waste Sites (CERCLIS, RCRA and Brownfield sites, etc.),
     + wetland sites/natural resources, and
     + other pertinent information.

3. <u>USGS Quadrangle Maps</u>. Use 11 in. x 17 in. sheets and a scale of 1 in. = 2000 ft (1:24,000 metric). This larger scale is used to provide more detail on the project and to show topography.

4. <u>Traffic Data</u>. Determine design year ADT volumes for all acceptable corridors. This data is used during the corridor selection stage. Prepare ADT volume data for other highways within the area of influence and determine the impacts the improvement will have on the entire system of highways in the area.

5. <u>Corridor Report Discussion</u>. Discuss the following items:

   a. <u>General Description</u>. Describe the following for each alternative:

      - purpose and need of the project,
      - logical termini,
      - general type of facility,
      - nature of service which the highway is intended to provide, and
      - other major features.

   b. <u>Prior Studies</u>. Discuss any prior studies relevant to the undertaking (e.g., feasibility studies) and a reaffirmation of the need for the improvement.

   c. <u>Eliminated Alternatives</u>. Discuss the alternative corridors considered but not studied further and describe the reason(s) the alternatives were discounted. Identify and discuss the environmental factors, as discussed in Part III, Environmental Procedures, that were considered in the preliminary investigation but were not considered significant determinants among the alternatives.

   d. <u>Compatibility with Highway System</u>. Discuss the compatibility of the alternatives studied with the existing street and highway plans or related comprehensive plans. Where these plans do not exist, discuss the extent of coordination with local officials concerning highway needs.

   e. <u>Compatibility with Other Plans</u>. Discuss the compatibility of the alternatives studied with the plans and objectives of all agencies affected by the improvement.

   f. <u>Advantages and Disadvantages of Final Alternatives</u>. Discuss the advantages and disadvantages of the final acceptable corridors, including the no-action alternative. Discuss the issues of primary concern to the Department such as construction costs, right-of-way acquisition, highway maintenance, traffic operations, type of access control, and any other pertinent engineering aspects (see Section 11-4) of the improvement. Also, when applicable, discuss other transportation facilities in the corridor.

   g. <u>Environmental Considerations</u>. Discuss the socio-economic and environmental advantages and disadvantages of the final acceptable corridors, including the no-action improvement alternative. Discuss the environmental considerations as they relate to each alternative; see Part III, Environmental Procedures. Identify the adverse effects, appropriate measures to avoid, minimize or mitigate the adverse effects, and the costs to do so.

h. Impacts on Existing Communities. In addition to the general factors mentioned above, discuss the impacts on existing communities where a corridor passes near or through an urban area. Include the following in the discussion:

- change in travel patterns;
- the estimated number of people, dwelling units, and business establishments being displaced and the economic effects on the communities;
- the potential for land use change and the likelihood of joint development; and
- the relative consistency of the alternatives with the goals and objectives of any urban plan adopted by the community concerned.

These factors will often significantly impact the selection of the corridor location in densely populated areas. Ensure that the proposed corridor adequately reflects the urban transportation planning process.

i. Public Involvement and Environmental Coordination. Include a summary and analysis of the views received as a result of public involvement activities and environmental coordination.

j. Recommended Corridor. Identify the recommended corridor and provide a synopsis of the determinants used in making the final selection.

6. Estimate of Cost. Include a general estimate of right-of-way and construction costs for those corridors that have not been eliminated. The estimate should reflect the effects the proposed improvement will have on the existing transportation system in conjunction with other needed proposed improvements in the corridor.

7. Map Exhibits. In the discussion, reference all exhibits used in the study. As needed, develop map exhibits and other exhibits on 11 in. x 17 in. sheets. If many exhibits are planned for the report, prepare a separate Appendix for the report. A separate Appendix provides a more useful format.

12-3.02 Feasibility Study Reports

A feasibility study is very similar to the details described for a corridor study and, in many cases, the feasibility study is documented in a similar format as a Corridor Report. See Sections 11-1.01(c) and 12-1.02 for typical situations where a feasibility study is initiated.

12-3.03 Design Reports

A design study is developed according to the guidance in Section 11-5. In addition to the information listed in Section 12-2, consider the following items in the preparation of the Design Report:

1. Structure of Report. Lay out the Design Report in the format as shown in Section 12-2. In addition, consider the following:

    a. Table of Contents. Provide a table of contents for the report that should list each separate report section, the figures and tables, appendices, and other reports included with the Design Report.

    b. Page Numbers. Consecutively number the pages in the report including all exhibits and figures (i.e., do not renumber each major section).

    c. Exhibits. Show all exhibits as figures with figure numbering for easy referencing. Place figures, small maps, and tables at the back of the report and reference them in the text. Place large figures (11 in. x 17 in. format) in either Appendix A or B. Removing the figures and tables from the text allows for easier reading and review of the report, quicker access to a desired page number, and more effective positioning and access of materials that are used to support the text.

    d. Technical Reports. Provide a summary or reference the information provided in the technical reports.

    e. Cross References. Provide cross-references to information provided elsewhere in the report (e.g., other sections, figures, appendices).

    f. Checklist. Section 12-3.09 provides a checklist that may be used to ensure all applicable project information, certifications, coordination, and other requirements are covered in the Design Report.

2. Design Report Discussions. Include the following discussions in the Design Report:

    a. Summary of Need and Location. Provide a summary of the need for the improvement and reasons supporting the general location of the highway as described in the Corridor Report.

    b. Prior Studies. Include an analysis and listing of prior studies relevant to the improvement.

    c. Plausible Alternatives. Discuss the plausible alternatives considered but not studied in depth; and provide a detailed explanation of why these alternatives were eliminated. Also, address the “no-action” alternative.

    d. Major Design Features. Provide a detailed explanation of how major control points (e.g., interchange locations, river crossings, topography) were selected for the location of alignments on mapping; how the alignment best satisfies the geometric needs of an intersection or interchange; selected median types; and how the profile relates to the intersections and interchanges so that driver decision points are not hidden or cause visual obstructions. Also, provide a detailed explanation of aesthetic considerations for combining alignment and profiles; see Chapter 33.

e. Compatibility with Highway System. Discuss the compatibility of the alternatives studied with existing street and highway plans including any necessary detours. Also, discuss the compatibility of alternatives with comprehensive urbanized plans or, where these plans do not exist, the extent of coordination with local officials concerning their highway needs.

f. Environmental Considerations. Present the social, economic, and environmental advantages and disadvantages of the final alternatives studied, including the "no-action" alternative. Part III "Environmental Procedures" discusses environmental considerations.

g. Final Alternatives. Discuss the advantages and disadvantages of the final alternatives studied with respect to:

- purpose and need;
- traffic service, safety and operations;
- construction and maintenance considerations and costs; and
- other pertinent aspects (e.g., those revealed by engineering analyses); see Section 11-2.

h. Public Involvement and Environmental Coordination. Provide a summary and an analysis of comments and concerns received as a result of public involvement activities and environmental coordination.

i. Temporary Traffic Control. If applicable, discuss the management of existing traffic during construction; see Chapter 13.

j. Commitments. Provide a list of commitments made during the public involvement process and interagency coordination. This list should eventually be discussed with the Phase II design squad and then transmitted to construction personnel.

k. Recommended Alternative. Identify the recommended design alternative and present a synopsis of the determinants for its selection. Demonstrate that the recommended alternative best meets the purpose and need of the project with consideration of its social and environmental impacts.

3. Estimate of Costs. Prepare a cost estimate for all final alternatives developed by usable segments. A usable segment is suitable for traffic operations and construction phasing. The estimate format should follow that shown in Section 12-4 and Chapter 65.

4. Typical Sections. Provide typical sections for all proposed and affected roadways. Include pavement cross sections from approved pavement designs.

5. Base Maps. Use county maps or USGS Quadrangle Maps as a base map to show all alternatives considered initially, the final alternatives advanced for detailed study, and the termini of the design study.

6. Aerial Photography. Use uncontrolled photography in rural areas and controlled aerial photography in urban areas. Indicate the access control limits and sensitive environmental features for the alternatives advanced for detailed study. Prepare these exhibits on 11 in. x 17 in. sheets and place them in a separate Appendix A. This Appendix is used in conjunction with an EIS or EA and for the overall design study. Section 11-2.03 and Chapter 35 discuss access control features. Include in the Design Report a discussion on the specific access control features of the project. The Report should analyze and justify road closures and access features on expressways and freeways; see Sections 11-7.02 and Chapter 44.

7. Mapping Exhibits. Reduce original mylar sheets of mapping at 1 in. = 50 ft (1:500 metric) or 1 in. = 200 ft (1:2500 metric) scales by 50% to 1 in. = 100 ft (1:1000 metric) and 1 in. = 400 ft (1:5000 metric), respectively. Prepare mapping exhibits as plan and profile sheets for reduction on 11 in. x 17 in. sheets. Show the following on the mapping sheets:

   - State plane coordinates for all control points,
   - right-of-way limits,
   - preliminary design data,
   - structure locations,
   - horizontal alignment,
   - proposed frontage roads and service drives, and
   - current ADTs for all intersected or affected roadways.

   Use a vertical scale of 1 in. = 20 ft (1:250 metric) with 1 in. = 200 ft (1:2500 metric) mapping and a vertical scale of 1 in. = 5 ft (1:50 metric) with 1 in. = 50 ft (1:500 metric) mapping. Combine the complete design of the highway as shown on the mapping sheets with the profile to make the final plan and profile sheets. Place these final reduced sheets into a separate Appendix B.

8. Intersection/Interchange Design Studies. Include approved IDSs for all interchanges and major intersections for each studied alignment carried to a public hearing. Prepare Intersection Design Studies in accordance with Chapter 14 and Interchange Type and Design Studies in accordance with Chapter 15. Include reduced-size copies of approved IDSs in Appendix B.

9. Public Involvement Document. On large complex projects, a considerable volume of letters is received from the public and different agencies concerning the need for the project and the possible impacts. For guidance on responses, refer to Section 19-4.08(c), Section 24-2, and Section 25-2. To organize this information and to make it more useful for future reference in case of litigation or questions concerning environmental issues, the letters and their responses are included together in a separate volume. When a large number of similar

comments are received, it may be advantageous to prepare a newsletter and mail to public meeting participants.

12-3.04 Combined Design Reports

The Combined Design Report is prepared where the corridor or location is predetermined due to the design of the proposed project. See Section 12-1.02 for a listing of typical projects in this category. At a minimum, the Combined Design Report should include the items listed in Section 12-2 and the following:

1. Structure of Report. Lay out the Combined Design Report in the format as shown in Section 12-2. In addition, consider the following:
   a. Table of Contents. Provide a table of contents for the report that should list each separate report section, the figures and tables, appendices, and other reports included with the Combined Design Report.
   b. Page Numbers. Consecutively number the pages in the report including all exhibits and figures (i.e., do not renumber each major section).
   c. Exhibits. Show all exhibits as figures with figure numbering for easy referencing. Place figures, small maps, and tables at the back of the report and reference them in the text. Place large figures (11 in. x 17 in. format) in either Appendix A or B. Removing the figures and tables from the text allows for easier reading and review of the report, quicker access to a desired page number, and more effective positioning and access of materials that are used to support the text.
   d. Technical Reports. Provide a summary or reference the information provided in the technical reports.
   e. Cross References. Provide cross references to information provided elsewhere in the report (e.g., other sections, figures, appendices).
   f. Checklist. Section 12-3.09 provides a checklist that may be used to ensure all applicable project information, certifications, coordination, and other requirements are covered in the Combined Design Report.
2. Functional Classification. Identify the functional classification of the highway proposed for improvement and for all affected roadways.
3. Typical Sections. Provide typical sections for the proposed improvement and all side roads. Include pavement cross sections from the approved pavement design.
4. Traffic Volumes. Include the current and design year traffic volumes for the proposed facility and for all crossroads; see Section 11-2.02.
5. Area Map. Provide an area map that indicates the general location of the improvement.

6. Existing Conditions and Alternative Features. Present the existing conditions and features along the proposed improvement. This information may be shown on a county map, city map, or photographic aerial mosaic, as needed, to adequately illustrate differences and termini. Prepare these exhibits on 11 in. x 17 in. sheets.

7. Major Design Features. Indicate the criteria used (e.g., new construction, reconstruction) and present, on appropriate exhibits such as topographic mapping, the proposed design for the project. Include horizontal and vertical alignment revisions, intersections, entrances, any grade separations, drainage structures, and other major design features. The original mylar sheets of mapping with proposed design features are reduced 50% and prepared on 11 in. x 17 in. sheets for the report. If an extensive number of exhibits are necessary, place them in an Appendix to the report. Also, include the appropriate information from any engineering analyses; see Section 11-2.

8. Right-of-Way Requirements. Provide an indication of the right-of-way to be acquired in sufficient detail to inform an individual of the effect on his or her property. This is usually shown on topographic mapping for the project. Also, discuss the resolution of any encroachment or utility adjustment problems.

9. Intersection/Interchange Design Studies. Include approved Intersection Design Studies (Chapter 14) or Interchange Type and Design Studies (Chapter 15) for all major intersections. Use an 11 in. x 17 in. reduced size sheet format.

10. Estimate of Costs. Provide cost estimates by usable segments, if applicable, or for an isolated project in accordance with the format in Section 12-4 and Chapter 65.

11. Combined Design Report Discussion. Discuss the following items:

    a. General Description. Describe the need for the improvement, the general type of facility, the nature of service which the highway is intended to provide, and the adjacent highway sections including any plans for improvements on adjacent sections.

    b. Corridor Feasibility. Discuss the reasons that no other corridor or location is feasible.

    c. Alternatives and Environmental Considerations. Discuss any plausible alternatives considered and the reasons why these alternatives were eliminated. Use the EA checklist to identify the social, economic, and environmental considerations. For large complex projects, an EA or EIS may be required; see Part III, Environmental Procedures.

    d. Compatibility with Highway System. Discuss the compatibility of the alternatives studied with existing street and highway plans including related comprehensive urban plans and pedestrian facilities. Where these plans do not exist, discuss the extent of coordination with local officials on highway needs.

    e. Final Alternatives. Discuss the advantages and disadvantages of the alignment or cross section alternatives studied with respect to the following:

- purpose and need;
- traffic service, safety, and operations;
- maintenance and protection of traffic during construction;
- the need for bridge improvements;
- the need for traffic signals and progression;
- access control or access management considerations;
- construction costs and right-of-way impacts; and
- other pertinent aspects (e.g., those revealed by an engineering analysis); see Section 11-2.

f. Recommended Improvement. Provide a summary of facts leading to the recommended improvement, including the consideration of the "no-action" alternative and an analysis of all comments received as a result of public involvement (see Chapter 19) and environmental coordination (see Part III, Environmental Procedures).

g. Commitments. Provide a list of commitments made during the public involvement process and interagency coordination. This list should eventually be discussed with the Phase II design squad and then transmitted to construction personnel.

12. Public Involvement Document. On large complex projects, a considerable volume of letters is received from the public and different agencies concerning the need for the project and the possible impacts. For guidance on responses, refer to Section 19-4.08(c), Section 24- 2, and Section 25-2. To organize this information and to make it more useful for future reference in case of litigation or questions concerning environmental issues, the letters and their responses are included together in a separate volume. When a large number of similar comments are received, it may be advantageous to prepare a newsletter and mail to public meeting participants.

12-3.05 State Improvement Reports

A State Improvement Report is a combined engineering/environmental document prepared for a State-only or State and locally funded project. This report is used when the scope of the project is major in nature and a programming decision is made that no Federal funds will be used for planning, right-of-way, or construction of the project. See Section 12-1.02 for a description of typical projects. Environmental information, agency coordination, and public involvement coordination are included in the report. Consider the following when preparing State Improvement Reports:

1. Format. The format of a State Improvement Report generally will be similar to that of a Combined Design Report; see Section 12-3.04.

2. Structure of Report. Lay out the State Improvement Report in the format as shown in Section 12-2. In addition, consider the following:

a. Table of Contents. Provide a table of contents for the report that should list each separate report section, the figures and tables, appendices, and other reports included with the State Improvement Report.

b. Page Numbers. Consecutively number the pages in the report including all exhibits and figures (i.e., do not renumber each major section).

c. Exhibits. Show all exhibits as figures with figure numbering for easy referencing. Place figures, small maps, and tables at the back of the report and reference them in the text. Place large figures (11 in. x 17 in. format) in either Appendix A or B. Removing the figures and tables from the text allows for easier reading and review of the report, quicker access to a desired page number, and more effective positioning and access of materials that are used to support the text.

d. Technical Reports. Provide a summary or reference the information provided in the technical reports.

e. Cross References. Provide cross-references to information provided elsewhere in the report (e.g., other sections, figures, appendices).

f. Checklist. Section 12-3.09 provides a checklist that may be used to ensure all applicable project information, certifications, coordination, and other requirements are covered in the State Improvement Report.

3. Functional Classification. Identify the functional classification of the highway proposed for improvement and for all affected roadways.

4. Typical Sections. Provide typical sections for the proposed improvement and all side roads. Include pavement cross sections from the approved pavement design.

5. Traffic Volumes. Include the current and design year traffic volumes for the proposed facility and for all crossroads; see Section 11-2.02.

6. Area Map. Provide an area map that indicates the general location of the improvement.

7. Existing Conditions and Alternative Features. Present the existing conditions and features along the proposed improvement. This information may be shown on a county map, city map, or photographic aerial mosaic, as needed, to adequately illustrate differences and termini. Prepare these exhibits on 11 in. x 17 in. sheets.

8. Right-of-Way Requirements. Provide an indication of the right-of-way to be acquired in sufficient detail to inform an individual of the effect on his or her property. This is usually shown on topographic mapping for the project. Also, discuss the resolution of any encroachment or utility adjustment problems.

9. Intersection/Interchange Design Studies. Include approved Intersection Design Studies (Chapter 14) or Interchange Type and Design Studies (Chapter 15) for all major intersections. Use an 11 in. x 17 in. reduced size sheet format.

10. Content. The content of a State Improvement Report will be based on project complexity:

    a. Design Features. These projects are major reconstruction or new construction type of improvements that may or may not involve an existing highway alignment or street. List and discuss the design guidelines used for the proposed improvement.

    b. Environmental Information. Use the Abbreviated Environmental Assessment, BDE Template 2401 to determine the potential project impacts. Most projects will be the Categorical Exclusion type or occasionally will require an Environmental Assessment type analysis. Include a summary and analysis of the environmental impacts.

    c. Public Involvement. Include a summary and analysis of the comments and concerns received as a result of public involvement. One or two informational meetings should be held and an offer to hold a public hearing should be made.

    d. Estimate of Costs. Provide cost estimates by usable segments, if applicable, or for an isolated project in accordance with the format in Section 12-4 and Chapter 65.

12-3.06 Project Reports

A Project Report typically documents a construction project which uses an existing alignment but curve corrections or minor relocations may also be involved. It could be prepared for a Federal or State-only funded project. These types of projects typically qualify as Categorical Exclusions and, therefore, the environmental documentation is included in the Project Report. Also, see Section 12-1.02. When preparing a Project Report, consider the following:

1. Format. The Project Report should have the following generalized format:

    - table of contents;
    - BDE 1201 Phase I Report Approval;
    - text of report; and
    - exhibits (e.g., plan and profile sheets, aerial photograph, maps) located in the back of the report on 11 in. x 17 in. sheets. Designate each different exhibit as a "Figure" and, if figures are depicting the same information but at different locations, label each exhibit as Sheet ____(No.)___ of ___(No.)___.

2. Page Numbering. Provide consecutively numbered pages for the report. Also, provide page numbers for all figures in the exhibit sections.

3. Cross References. Make cross-references between related areas and to figures contained in the exhibit section of the report.

4. Content. Information placed in a Project Report should reflect appropriate engineering and environmental investigations and should indicate compatibility with current Department criteria. The project study should meet the requirements for public involvement (Chapter 19), environmental analyses (Part III, Environmental Procedures), and engineering analyses (Section 11-2). Figure 12-3.A provides an outline of the information, as applicable, that should be included in a Project Report. Also, review the items listed on the Fact Sheets for an Abbreviated Project Report as shown in Section 12-3.07.

5. Checklist. Form BDE 1210 provides a checklist that may be used to ensure all applicable project information, certifications, coordination, and other requirements are covered in the Project Report.

TABLE OF CONTENTS
FOR PROJECT REPORT

Note: Table of Contents may be modified as necessary depending on the proposed improvement.

3. Proposed improvement — In addition to roadway work, include the results of the coordination with the Railroad Unit to determine proposed improvements (e.g., rail replacement, rehabilitation, changes in gate/flasher (preemption) timing).
4. Train interruptions/detour routes.
5. Proximity of traffic signals and preemption. Include results of discussions with the district Bureau of Operations to identify signal sequence and preemption at the crossing. Describe existing (or the need for) near side traffic signals that stop traffic in advance of the crossing; see Section 36-8.
6. Coordination with Illinois Commerce Commission.

V. Surveillance
1. Existing surveillance within or in the proximity of the proposed improvement (e.g., changeable message signs, detector loops, volume/speed loops, video detection/monitors).
2. Proposed surveillance for the improvement.
3. Results of coordination with the district Bureau of Operations (Bureau of Traffic, District 1), where necessary.

W. Pump Stations

The electrical requirements associated with pump stations are determined and designed by the Bureau of Electrical Operations (District 1) and Bureau of Operations in other districts. The roadway collection system, pump capacity, pump discharge, storm water storage, and outlet evaluation are detailed in the Hydraulics Report prepared by the Hydraulics Unit in the district. For this section of the Project Report, provide the following general information, while referencing the Hydraulics Report for the more detailed, technical information:

- pump station number and location,
- roadway limits that are drained by the pump station,
- outfall location, and
- proposed improvements as directed by Hydraulics Unit.

X. Retaining Walls
a. Existing retaining walls within and/or affected by the improvement.
b. Proposed retaining walls that are required as a result of improvement (e.g., profile adjustments, regrading near bridge abutments, sidewalk separations). Walls over 10 ft (3 m) high are either designed by Bureau of Bridges and Structures or the design is reviewed by Bureau of Bridges and Structures.

12-3.07 Abbreviated Project Reports

For some pavement rehabilitation or pavement replacement projects, an Abbreviated Project Report format may be used to document the results of a Phase I engineering study. This format eliminates considerable writing and provides an easy-to-follow checklist, fill-in-the-blanks, and attachments type report.

Only use an Abbreviated Project Report when the environmental and engineering impacts of a project can be adequately described by completing the Fact Sheet and by use of attachments. However, if the project information as described in Part III, Environmental Procedures requires the preparation of a narrative type report for adequate coverage, then use the Project Report format described in Section 12-3.06.

The recommended format of an Abbreviated Project Report can be found in the following figures as applicable:

- Figure 12-3.B, Fact Sheet (Roadway Improvement); and
- Figure 12-3.C, Fact Sheet (Total Structure or Superstructure Replacement).

As an exhibit, include a copy of the applicable district coordination meeting minutes. This documentation describes the proposed improvement and lists the decisions made at those meetings. A typical example of these meeting minutes is shown in Figure 12-3.D.

ABBREVIATED PROJECT REPORT

ILLINOIS DEPARTMENT OF TRANSPORTATION

1. PPS (Project Planning System) No.: ________________________

2. Contract No.: __________________

3. State Job No.: _________________

4. Highway Functional Classification: ____

5. Truck Route Classification: ____

6. Type of Improvement: _________________ W & RS or __________________ RS

   If other type of improvements, attach description: _______________________________

7. Proposed Project Funding (Must be compatible with selected design guidelines.): ______

8. Current ADT: ________________________ % Trucks in ADT: ___________________

9. Surrounding Land Use: ____

10. Existing Right-of-Way Width: _________________ Proposed: ______________

11. Existing No. of Lanes: _______________________ Proposed: ______________

12. Existing Roadway Width: _____________________ Proposed: ______________

13. Existing Traveled Way Width: ________________ Proposed: ______________

14. Pavement Surface Condition (CRS): ___________ (Year): _________________

15. Existing Shoulder or Curb Type: ______________ Proposed: ______________

16. Existing Clear Zone Width: __________________ Proposed: ______________

17. Describe existing conditions or proposed highway improvements adjacent to project limits:
    ____
    ____

18. Are there any bridges in this construction section? ____ Yes _____ No. Can they all remain in place? ______ Yes ______ No. Give description of what must be done to each bridge in this segment and when work will be accomplished; see Figure 12-3.C: ___
    ____

19. What has the field check indicated for culvert extensions, side road culvert improvements, and other safety work: ____

FACT SHEET
(Roadway Improvement)

Figure 12-3.B
(1 of 4)

____

____

Use a straight-line diagram or schematic plan to indicate proposed work including culvert extensions, guardrail, etc.

20. Will ditch cleaning be necessary with this improvement? _______ Yes _______ No

21. What has a review of crash data shown? ____

____

____

22. Existing Rural Posted Speed: _______________ Urban Posted Speed:_______________

23. Proposed Rural Design Speed: ____

Proposed Urban Design Speed: ____

24. Check design policy used:

______ Projects on Existing Roads, pavement replacement; see Chapter 49
______ Projects on Existing Roads, pavement rehabilitation; see Chapter 49
______ Projects on Existing Roads, unmarked routes; see Chapter 49
______ Other (list): ____

25. List and indicate reasons for any design exceptions: ______________________________

____

____

Does existing highway geometry meet IDOT criteria?

Horizontal: ______ Yes ______ No

Vertical: ______ Yes ______ No

If "No" is checked, discuss what will be done:______________________________

____

____

Is resurfacing thickness in accordance with policy; see Chapter 53?

______ Yes ______ No; Reason(s) ____

FACT SHEET
(Roadway Improvement)

Figure 12-3.B
(2 of 4)

26. How will traffic be maintained during construction? ______________________________

27. RR Data: Trains/Day _________ # Tracks ________ Speed of Trains ________

28. RR Crossing Protection: Existing: _____ Changes Proposed: ____ Yes ____ No

29. Type of proposed improvements at RR crossing: ________________________________

30. Sidewalks: Existing: _________________ Proposed: _____________________

31. Parking: Existing: _________________ Proposed: _____________________

32. Will signals be installed or modernized? ____

33. Lighting: ____

34. Utilities/Encroachments: ____

35. Drainage (flood plain, detention, flooding over the roads, etc.): _____________________

36. Any Section 4(f) sites on Federal-aid projects? _____ Yes _____ No

37. Is an environmental survey request required by Department policy? _____ Yes _____ No

38. If applicable, Metropolitan Planning Organization approval date: ____________________

39. Permit Status (Sections 404, 402, and 10 Permits, 401 Certification, etc.): ___________

40. Have any special erosion control or tree retention commitments been made?

    ___ Yes ___ No

    If yes, has the district Landscape Architect/Specialist reviewed the commitments?

    ___ Yes ___ No

41. If soil is exposed to displacement, include construction site stormwater pollution control documentation; see Chapter 41.

42. Are there any existing public educational facility entrances onto the route? See Section 11: 2.08(h)

    ___ Yes ___ No

ILLINOIS DEPARTMENT OF TRANSPORTATION

COORDINATION MEETING MINUTES DISTRICT 3 CONFERENCE ROOM			TOPIC NO. 9
DATE OF MEETING:	January 29, 2019	FUNDING SOURCE:	STBG
ROUTE:	FAP 41		
MARKED ROUTE:	Illinois 17	DESIGN GUIDELINES USED: Existing Roads (Chapter 49)	
LOCAL NAME:	N/A	FUNCTIONAL CLASSIFICATION: East of CH 6 - Urban Other Principal Arterial West of CH 6 - Rural Minor Arterial	
SECTION:	(11, 12) RS-3	DESIGN SPEED:	60 mph
COUNTY:	Kankakee	POSTED SPEED:	55 mph
ADT:	Herscher Rd. to Warner Bridge Road - 3,850/2018/10.4 Warner Bridge Road to Kankakee City Limits - 9,400/2018/5.4		

1. **LIMITS OF PROJECT:** The project begins approximately 0.75 miles east of Herscher Road and extends east approximately 9.13 miles to the west Kankakee city limits.

2. **PREVIOUS DATES OF DISCUSSION**: None

3. **PROJECT DESCRIPTION:** The length of roadway to be improved is approximately 9.13 miles. It was originally constructed in 1924 to a width of 18 ft with a pavement design of 9 in.-6 in.-9 in. portland cement concrete and earth shoulders.

   In 1961, the roadway was widened to 24 ft with 9 in. portland cement concrete and overlaid with 3.25 in. of HMA. In 1975, HMA shoulders 9 in. at a width of 1.5 ft were added to each side and the entire roadway given an HMA overlay of 3 in. and aggregate shoulders. In 1986, the shoulders were widened an additional 1.5 ft with 6 in. of HMA to allow for a bituminous shoulder of 3 ft. Turn lanes of 12 ft were also constructed at Lehigh and Limestone Roads with 9 in. of HMA base course. The existing roadway was cold milled 0.625 in. and the entire roadway was given an HMA overlay of 2 in. Aggregate shoulders 5 ft were also added.

   Pavement rehabilitation is the only need established for this project so the proposed improvement includes a 2.25 in. HMA overlay consisting of 0.75 in. IL-4.75 binder and 1.5 in. IL-9.5FG surface course. A 5 ft aggregate wedge will also be placed. Mr. John Doe of the Bureau of Design and Environment concurred with the scope of work and with the project being processed as a State Approved Categorical Exclusion.

4. **TRAFFIC CONTROL:** This project will be constructed using applicable traffic control standards with one lane open to traffic at all times during construction.

5. **REVIEW OF CRASH DATA:** A total of 102 crashes have occurred on this segment of Illinois Route 17 from January 1993 to December 1995. The highest crash pattern was in clear and dry conditions (69 percent). The most common type was animal related (28 percent). No Five Percent Report locations were noted in the project limits.

6. **EXPLANATION OF DESIGN EXCEPTIONS:** No exceptions required.

7. **ENVIRONMENTAL ACTIONS DESIRED:**

   - **NATIONWIDE 404 PERMITS:** N/A
   - **ENVIRONMENTAL SURVEY REQUEST:** N/A
   - **CATEGORICAL EXCLUSION**: State Approved CE Concurred 1-29-2019

8. **ADDITIONAL RIGHT-OF-WAY NEEDED**: N/A

9. **ATTACHMENTS**: Location Map(s) attached.

EXAMPLE OF DISTRICT MINUTES
(Coordination Meeting Minutes)

Figure 12-3.D

12-3.08 3P and PAVEMENT PRESERVATION (High/Low) Projects

12-3.08(a) Report Format and Content

The report format for documenting 3P projects and pavement preservation projects in the "high" or "low" categories (see Chapter 53) are contained in forms BDE 1202 and BDE 1203, respectively. At the discretion of the district, 3P and pavement preservation projects may be presented at coordination meetings. These meetings provide the means to discuss design exceptions and how other project needs, especially safety and ADA compliance, will be addressed. However, 3P or pavement preservation projects are only required to be presented at coordination meetings when any of the following conditions apply:

- design exceptions are being requested by the district; see Section 31-7,
- the proposed project will have a location(s) not fully compliant with current ADA standards, requiring completion of form BDE 3101 ADA Statement of Maximum Extent Practicable; see Section 31-7.03(c),
- the project is (or will be presented to be) classified as a Federally Approved Categorical Exclusion, or
- there are issues related to the project's scope that would benefit from discussion.

See Section 12-1.02 for further information on these reports and Chapter 53 for further design details on pavement rehabilitation and preservation strategies.

12-3.08(b) Safety Needs Analysis

The need to address safety must be determined during scoping. This is done by analyzing the existing crash data to determine: 1) the relative safety performance of the roadway as compared to similar roadways in the district; and 2) if specific crash types, severities, locations, or conditions are over-represented in the data.

When safety improvements are identified as part of the project's needs and can be accomplished for 15% or less of the total project cost, said safety improvements shall be made part of the project. When the needed improvements are beyond the scope of 3P or high/low preservation or would represent more than 15% of the total project cost, a higher project scope must be selected to address the safety need.

12-3.09 Phase I Checklist

A checklist for Phase I Reports, BDE 1210 Phase I Checklist, is available on the Forms Master List. This form is optional for inclusion in Phase I Engineering Reports.

12-3.10 Phase I Report Exemptions

There are certain projects that are not complex from an engineering standpoint. Additionally, they do not cause sufficient impacts to require the preparation of a Phase I report. In this case, the district prepares a set of documents designated as the Plans, Specifications, and Estimates (PS&E).

However, even though Phase I documentation is not needed, projects that are federally funded still require NEPA documentation. This documentation may be achieved by either using BDE 488 Certification Acceptance/Project Status or BDE 2301 Categorical Exclusion Determination and Approval, whichever is most convenient for the district.

The following project types (and combinations thereof) are intended to have the above-mentioned expedited processing and design approval prior to implementation:

1. traffic signal modifications and installations of new signals;
2. signing;
3. pavement markings not affecting the number of through traffic lanes;
4. anti-skid treatments and pavement reprofiling;
5. pavement preservation projects in the “proactive maintenance” subcategory;
6. curb and/or gutter repairs and construction of curb ramps for persons with disabilities;
7. bridge repairs, which do not require traffic detours or runarounds, including:*
    a. bridge rail replacement;
    b. bridge deck overlay and waterproofing;
    c. expansion joint replacement;
    d. bearing replacement;
    e. repairs to deck, partial or full depth;
    f. repairs to damaged rails, corroded or damaged structural steel members, and deteriorated areas of concrete elements including sidewalks, curbs, water tables, girders, and portions of the substructure above ground or water;
    g. painting of structural steel;
    h. bridge washing, and
    i. individual stringer replacement for a portion of a superstructure;

**Note: All items under Number 7 require coordination with the Bureau of Bridges and Structures prior to preparation of final plans. Additionally, Item 6a requires TSL plan approval and Item 6e requires approval of a “Bridge Deck Condition Report.”*

8. the following lighting and electrical work:
    a. continuous and tower lighting,
    b. tunnel lighting,
    c. temporary lighting,
    d. bridge lighting,
    e. pedestrian lighting,
    f. pumping station,
    g. highway advisory radio,
    h. control systems for changeable lanes,
    i. traffic monitoring systems, and
    j. changeable message signing;
9. landscaping;
10. the following stormwater control within existing right-of-way:
    a. slope repair,
    b. ditch and/or culvert cleaning, and
    c. miscellaneous storm sewer work to eliminate ditch (which does not reduce necessary urban runoff storage/retention);
11. impact attenuator and glare screen installations;
12. the following isolated highway-railroad grade crossing improvements:
    a. repair/rehabilitation of crossing proper,
    b. rehabilitation of immediate roadway approaches to crossing, and
    c. upgrading of crossing protection;
13. the following restoration projects:
    a. retaining wall repair (coordinate with Bureau of Bridges and Structures),
    b. fencing,
    c. guardrail repair,
    d. pavement and shoulder patching/sealing,
    e. intermittent resurfacing, and
    f. repairs to drainage structures not requiring traffic detours or runarounds;
14. installation of turning lanes within an existing median;
15. junkyard screenings;
16. upgrading safety features (e.g., signing, striping, guardrail end terminals);
17. approval of utility installations along or across a transportation facility, excluding longitudinal installations within the access control lines of Interstate and freeway rights-of-way;
18. activities included in the highway safety plan developed pursuant to *23 U.S.C. 402*;
19. alterations to existing buildings to provide for noise reduction and/or the installation of noise abatement barriers;

20. emergency repairs under *23 U.S.C. 125* that do not substantially change the design of the facility and are commenced during or immediately after the occurrence of a declared national disaster;

21. acquisition of scenic easements;

22. minor improvements to existing rest areas and truck weigh stations that do not require changes to the geometrics or to the number of parking stalls;

23. installation of noise barriers;

24. approval of air space agreements; and

25. disposal of excess right-of-way.

12-4 ESTIMATE OF COST FORMATS

12-4.01 Corridor or Feasibility Studies

These studies are general in nature and are usually comparing alternative corridors or locations. Therefore, the cost estimate is generalized and is made on a per-mile (per-kilometer) basis or by assigning lump-sum dollar amounts to major items.

The format of the cost estimate sheet should only cover major items plus a contingency figure. As a guide in preparing generalized estimates, see Chapter 65 or the latest instructional manual for preparing an Interstate Cost Estimate.

12-4.02 Design Reports, Combined Design Reports, and State Improvement Reports

Figure 12-4.A presents the cost items normally used for complex projects. See Section 12-1.02 for a description of typical projects in this category. Items may be added or further divided as necessary to properly identify costs on specific projects. Individual cost estimate sheets are usually necessary for each construction segment, which then make up the total cost of each alternative. This segment type format allows the project to be easily programmed for multi-year construction and to provide for usable highway segments. Individual major elements such as interchanges or bridges are listed separately to identify their location and costs. For additional guidance, see Chapter 65.

12-4.03 Project Reports and Other Reports

Figure 12-4.B presents a sample cost estimate form with work classification elements considered appropriate for a Project Report or Abbreviated Project Report. This form may be copied and inserted directly into reports or may be modified to fit a specific improvement.

For other reports (e.g., 3P Reports, Pavement Preservation (High/Low) Reports), the cost estimate is completed on work sheets and the total cost for the project is listed in the report; see forms BDE 1202 and BDE 1203. For improvements not requiring a report (i.e., Phase I Report Exemptions, see Section 12-3.10), the cost estimate is prepared at the same time as the PS&E package and itemized by pay items.

12-5 PROCESSING AND APPROVAL OF PHASE I REPORTS

12-5.01 Corridor and Feasibility Study Reports

For Corridor and Feasibility Study Reports, the following will apply:

1. Submittal of Reports. Before the report is submitted for approval, the Secretary of IDOT and the Director of the Office of Planning and Programming should be contacted on their desire for a briefing meeting. The designer will submit the Corridor and Feasibility Study Reports to BDE for approval. BDE will approve a highway corridor only after the following has occurred:

   - The requirements of Chapter 11 and other applicable laws and regulations (e.g., Part III, Environmental Procedures) have been met.
   - The public involvement activities as required by Chapter 19 have been fulfilled.
   - Coordination and involvement with BDE and FHWA have been completed. This is usually accomplished at district coordination meetings or at special district meetings. Include the minutes of these meetings in the report.
   - The district has submitted three copies of a Corridor Study Report or Feasibility Study Report and any separate appendices to the Report to BDE.
   - The district has written a detailed memorandum to BDE describing the reasons for selecting the recommended corridor, the items submitted, and requesting corridor approval.

2. Corridor Study and Feasibility Study Approval. The Bureau Chief of Design and Environment will grant corridor approval and feasibility approval (for feasibility studies which involve a corridor) with concurrence of the Director of Highways Project Implementation.

3. Feasibility Study Approval not Involving a Corridor. For feasibility studies which do not involve a corridor, concurrence of the recommendations will be by the Bureau Chief of Design and Environment.

12-5.02 Design Reports

For Design Reports, the following will apply:

1. Submittal of Reports. Before the report is submitted for approval, the Secretary of IDOT and the Director of the Office of Planning and Programming should be contacted on their desire for a briefing meeting. The designer will submit the Design Report to the Regional Engineer for approval, except those involving major new alignment, which should be submitted to the BDE Location and Environment Section for approval.

The Regional Engineer (or BDE) will approve a Design Report only after the following has occurred:

- The corridor has been approved.
- The applicable requirements of Chapter 11 and other applicable laws and regulations (e.g., Part III, Environmental Procedures) have been met.
- The Record of Decision (ROD) for projects requiring an Environmental Impact Study (EIS) has been signed; the Finding of no Significant Impacts (FONSI) for projects requiring an Environmental Assessment (EA) has been approved; or the Categorical Exclusion (CE) has been approved for projects qualifying as being exempt from the requirement to prepare and EIS or an EA.
- The district has submitted two copies of the Design Report and appendices including copies of any technical reports (see the partial list in Section 11-5.04(h)), if applicable, to BDE when the project involves a major new alignment.
- The Bureau of Design and Environment's Bicycle and Pedestrian Policy Engineer has been notified. See Chapter 17 for Bicycle and Pedestrian Accommodation.
- The public involvement activities as required by Chapter 19 have been fulfilled.
- Coordination and involvement with BDE and the FHWA have been completed. Projects requiring Federal Actions such as EIS/ROD approval, EA/FONSI approval, and Federal Approved CE are required to be discussed at district coordination meetings. Actions qualifying as a State Approved CE are not required to be discussed at district coordination meetings (see Section 22-5.03), unless there are issues related to the project's scope, design exceptions, or meeting ADA standards to the maximum extent practicable. The district may choose, however, to present at the coordination meeting additional projects qualifying as a State Approved CE at their discretion. Include the minutes of these meetings in the report.
- BDE and/or FHWA has concurred with and approved any design exceptions to the project as discussed in Chapter 31.
- The district has written a memorandum to the Regional Engineer (or BDE if applicable) describing the reasons for selecting the recommended alignment and design features, the items submitted, and requesting design approval.

2. Design Approval. The Regional Engineer or the Bureau Chief of Design and Environment, (for large-scale projects on new alignment) with concurrence of the Director of Highways Project Implementation, will grant design approval for Design Reports. The district will retain the final approved report. When the Regional Engineer approves the report, a copy of form BDE 1201 is submitted to the BDE Location and Environment Section upon report approval. A sample design approval sign-off sheet is shown in Figure 12-5.A.

12-5.03 Combined Design Reports

For Combined Design Reports, the following will apply:

1. Submittal of Reports. Before controversial projects are submitted for approval, the Bureau Chief of Design and Environment and the Director of Highways Project Implementation should be contacted on their desire for a briefing meeting before design approval is granted. The designer will submit the Combined Design Report to the Regional Engineer for approval. The Regional Engineer may approve a proposed improvement in a Combined Design Report only after the following has occurred:

    - The applicable requirements of Chapter 11 and other applicable laws and regulations (e.g., Part III, Environmental Procedures) have been met.
    - The Record of Decision (ROD) for projects requiring an Environmental Impact Study (EIS) has been signed; the Finding of no Significant Impacts (FONSI) for projects requiring an Environmental Assessment (EA) has been approved; or the Categorical Exclusion (CE) has been approved for projects qualifying as being exempt from the requirement to prepare an EIS or an EA.
    - The public involvement activities as required by Chapter 19 have been fulfilled.
    - Coordination and involvement with BDE and the FHWA have been completed. Projects requiring Federal Actions such as EIS/ROD approval, EA/FONSI approval, and Federal Approved CE are required to be discussed at district coordination meetings. Actions qualifying as a State Approved CE are not required to be discussed at district coordination meetings (see Section 22-5.03), unless there are issues related to the project's scope, design exceptions, or meeting ADA standards to the maximum extent practicable. The district may choose, however, to present at the coordination meeting additional projects qualifying as a State Approved CE at their discretion. Include the minutes of these meetings in the report.
    - BDE and/or FHWA has concurred with and approved any design exceptions to the project as discussed in Chapter 31.
    - The district has written a memorandum to the Regional Engineer describing the reasons for selecting the recommended alignment and design features, the items submitted, and requesting design approval.

2. Design Approval. On most projects involving a Combined Design Report, design approval will be granted by the Regional Engineer. The district may request concurrence from BDE if project complexities warrant BDE involvement. The district will retain the final approved report. Submit form BDE 1201 to the BDE Location and Environment Section upon report approval.

12-5.04 State Improvement Reports

For State Improvement Reports, the following will apply:

1. Submittal of Reports. Projects in this category are similar to those covered in a Combined Design Report (major improvements) except that a decision was made during the programming process not to use Federal funds on the project. For controversial projects, the Bureau Chief of Design and Environment and the Director of Highways Project Implementation should be contacted on their desire for a briefing meeting before design approval is sought.

2. The Regional Engineer approves projects in this category after the following has occurred:

   - The applicable requirements of Chapter 11 and other applicable laws and regulations (e.g., Part III "Environmental Procedures") have been met.
   - The public involvement activities as required by Chapter 19 have been fulfilled.
   - Environmental information and documentation have been completed. Use the EA record form as a checklist to determine potential project impacts. Include a summary and analysis of impacts as a separate section in the report.
   - BDE has concurred with and approved any design exceptions to the project. However, regardless of the funding, if the project involves the Interstate, FHWA must approve any Level One design exceptions.
   - The district has written a memorandum to the Regional Engineer describing the reasons for selecting the recommended design alternative, the items submitted, and requesting design approval.

3. Design Approval. Design approval for State Improvement Reports will be granted by the Regional Engineer. The district will retain the final approved report. Submit form BDE 1201 to the BDE Location and Environment Section upon report approval.

12-5.05 Other Types of Reports

The Regional Engineer gives design approval for Project Reports, Abbreviated Project Reports, 3P Reports, and Pavement Preservation (High/Low) Reports. For all of these report types, submit form BDE 1201 to the BDE Location and Environment Section upon report approval.

Before any reports can be finalized, the district and the BDE Regional Field Engineers must determine if any design exceptions on the project are required and, if so, concurrence of the exception must be approved by the BDE Regional Field Engineer, or, if necessary, FHWA, through discussions at a district coordination meeting. See Chapter 31 for guidelines on design exceptions.

FEDERAL AID PRIMARY ROUTE 413
FROM INTERSTATE ROUTE 270 AND INTERSTATE
ROUTE 255 INTERCHANGE IN MADISON COUNTY
TO ILLINOIS ROUTE 267 NORTH OF ALTON, ILLINOIS
IN MADISON COUNTY

FINAL DESIGN REPORT

Prepared by
the Illinois Department of Transportation

August 1998

The proposed action is the construction of approximately 21 miles (34 km) of four-lane, fully access-controlled, divided highway. The proposed highway extends from the directional interchange of I-270 and I-255 west of Glen Carbon to Illinois Route 267 north of Alton.

This Design Report addresses the no-action alternative and the option of improving existing highways in the study area. Detailed studies for five build alternatives are also presented in this document.

An Environmental Impact Statement has been prepared and the Record of Decision signed in conjunction with this Design Report and assesses the potential social, economic, and environmental effects of the various alternatives. The recommended alternative for construction is Alternative C.

Design Approval __________________________________ ____________

EXAMPLE OF DESIGN APPROVAL SHEET
(Major Type Project)

Figure 12-5.A

12-5.06 Regional Engineer Delegation of Approval Authority

The Regional Engineer may only delegate project approval authority to the district Program Development Engineer.

12-5.07 Reports for Local Public Agency Projects

When a local public agency has a project on the State highway system, or on a local highway system that affects a state highway, the following sections, as well as the *Bureau of Local Roads and Streets Manual*, will apply. Note: Projects that qualify as a State Approved CE would be approved by the district BLRS.

12-5.07(a) Local Public Agency Lead Projects on the State Highway System

For Federal-aid projects, generally use the procedures outlined in Section 12-5-05 and Section 12-3.10. In addition, consider the following:

1. Projects Not Involving a Jurisdictional Transfer (JT). The following applies to all State routes, marked or unmarked:

   a. District Coordination Meetings. Discuss all projects at district coordination meetings before finalizing and submitting any reports.

   b. Geometric Review. If a local public agency or their consultant is preparing the report for any marked or unmarked State highway, the district Geometric Engineer will review the highway geometrics and cross-section design during the development of preliminary alternatives stage. Once the geometrics and cross-section designs are approved, the district BLRS will forward the report to central office Bureau of Local Roads and Street (CBLRS).

   c. Submittal of Reports. Reports prepared by the district (or their consultant) or the local public agency (or their consultant) should be submitted to CBLRS for information, review, and/or approval, in conformance with the CBLRS policies. When the need for design exceptions is determined on routes under State jurisdiction, CBLRS will coordinate and discuss the design exceptions with BDE prior to approval action.

2. Projects Resulting in a Jurisdictional Transfer (JT) to a Local Public Agency (not including Present Worth Value (PWV) JT's. The following will apply:

   a. Federal Funds. Regardless of which agency initiates a project, submit the project report to CBLRS for review and approval. When the State is providing matching funds, CBLRS will coordinate the design requirements with BDE prior to approval.

   b. State-Only Funds. The preparation of a project report will usually be required. Submit the report to CBLRS for review and approval. The local public agency should coordinate the proposed design with the district BLRS before submitting the report to CBLRS.

c. <u>District Coordination Meetings</u>. For jurisdictional transfers using either Federal funds or State-only funds, it is imperative that these projects be discussed at the district coordination meetings. This will allow BDE and CBLRS to become aware of proposed design features and costs and to determine if the project scope is appropriate.

d. <u>Agreements</u>. Ensure all joint projects conform with the Department's participation policies for joint agreements; see Chapter 5.

e. <u>Review of Agreements</u>. After joint agreements are finalized by the district and submitted to CBLRS, CBLRS will forward agreements to BDE for their review and concurrence. In addition to the normal review by the BDE Preliminary Engineering Section, the BDE Regional Field Engineers will also review the agreement for proper design content.

12-5.07(b) Local Public Agency Projects on Combined Systems

For local public agency projects that have substantial work on both highway systems or for systems under joint jurisdiction with the State, process the project report through the district to CBLRS. CBLRS will coordinate design requirements with BDE.

12-5.07(c) Local Public Agency Projects on the Local Highway System

See the *Bureau of Local Roads and Streets Manual* for procedural requirements.

12-5.07(d) Modified Procedures

Where special or unusual situations arise during project development, modified review and processing procedures may be necessary. In these cases, the district, CBLRS, and BDE should agree on the modified procedures to use.

12-5.08 <u>Project Reports for the Highway Safety Improvement Program</u>

The Highway Safety Improvement Program (HSIP) is intended to make moderate cost improvements, addressing specific site-related crashes, and eliminating over-represented crash patterns. These projects will typically require an Abbreviated Project Report or may be exempt from the preparation of a report; see Section 12-3.10.

In many cases, the improvements may be short-term until major reconstruction can be undertaken. Any additional work not directly related to the specific crash problem is not eligible for HSIP funding, unless it can be justified as being appropriate or necessary due to its relationship with the basic crash history.

In addition to the guidelines in Section 12-3.07, Project Reports for safety improvements will include the Regional Engineer's concurrence of the project in the Highway Safety Improvement Program. Project Reports should include the following information:

- project priority numbers for the annual district HSIP;
- project locations showing county, route, and limits of construction;
- descriptions of work as determined by the district Highway Safety Committee;
- estimated costs and benefit/cost ratios; and
- district Highway Safety Committee member titles, their bureaus, and signatures together with the Regional Engineer's concurrence.

When any significant revisions to the scope of work, estimated cost, or benefit/cost ratio are proposed for the annual district HSIP, the district Safety Coordinator must coordinate the revision through the Bureau of Safety Programs and Engineering.

Design approval procedures and the preparation of a project report for safety projects will continue to be in accordance with Section 12-5.05 or Section 12-3.10.

12-6 CORRIDOR PROTECTION

12-6.01 Authority and Purpose

The *Illinois Highway Code,* 605 ILCS 5/4-510 provides the Department the authority to “establish presently the approximate locations and widths of rights of way for future additions to the State highway system to inform the public and prevent costly and conflicting development of the land involved”. The law then provides once corridor protection is established by the Department, “no one shall incur development costs or place improvements in, upon, or under the land involved nor rebuild, alter or add to any existing structure” without first giving notice to the Department.

Corridor protection can be applied to either new construction projects or to additions/widening of the existing highway system under the reconstruction category (legal opinion, Chief Counsel, November 19, 1991).

12-6.02 Need

Prior to establishing corridor protection, the proposed improvement must be analyzed to determine the potential for costly development within the future rights of way. For example, a proposed highway located in or near a rapidly developing urban area might benefit from corridor protection provided the Department is willing to acquire properties upon notification from the owners of their intent to make costly improvements; whereas a proposed highway in a rural area might not benefit from corridor protection if there is little likelihood of immediate or costly development.

12-6.03 Timing and Procedures

Since corridor protection is related to the approximate locations and widths of future rights of way, it is usually established during the Phase I process based upon the specific details and schedule of the project at hand. However, there are a few important milestones that are typically achieved before the decision is made:

1. The preferred corridor has been identified,
2. The NEPA process has progressed far enough to assure the corridor contains no fatal flaws, and
3. The public involvement process has progressed far enough to satisfy the legal requirements contained in 605 ILCS 5/4-510.

Note: Corridor protection is separate from, and does not have to be tied to, either a route location decision or an order establishing freeway; see Sections 12-7 and 12-8 respectively.

Chapter 19 of the BDE Manual describes the public involvement process. The *Land Acquisition Policies and Procedures Manual* describes the detailed procedures and exhibits needed to establish corridor protection.

Once corridor protection is established, the Department must be cognizant of the length of time the protection is maintained. Pursuant to 605 ILCS 5/4-510: Not more than ten years after a protected corridor is established, and not later than the expiration of each succeeding ten-year period, the Department shall hold public hearings to discuss the viability and feasibility of the protected corridor. The Department shall retain the discretion to maintain any protected corridor but shall give due consideration to the information obtained at the public hearing. If the Department in its discretion determines that the construction of the roadway is no longer feasible, the Department shall abolish the protected corridor. The *Land Acquisition Policies and Procedures Manual* describes the detailed procedures and exhibits needed to abolish corridor protection.

12-7 ROUTE LOCATION DECISIONS

12-7.01 Purpose

A Route Location Decision is a legal declaration made by the Illinois Department of Transportation, establishing the location of a proposed State highway or revising the location of an existing State route, as required by the *Illinois Highway Code*, 605 ILCS 5/4-204.

12-7.02 Applicability

Prepare a Route Location Decision where the following occurs on a State highway:

- a route will be developed on a new location;
- there is a change in the termini of an existing route;
- a portion of an existing route will be relocated for a length of 1 mile (1.6 km) or more;
- a portion of an existing route will be relocated a lateral distance of 0.5 miles (0.80 km) or more from the former location;
- a loop or spur will be added to an existing route;
- an existing route will be relocated due to the expansion of airport facilities; and/or
- in conjunction with an Order Establishing a Freeway, the freeway or expressway will be developed on a new location. Where a portion of an existing route will be declared a freeway, a Route Location Decision is not required.

12-7.03 Content

The Route Location Decision consists of a detailed legal description referenced to section corners, townships, ranges, and a map upon which the selected route location is shown.

Approximate scale values may be used in the description where field survey data is not available. A county map having a scale 1 in. = 1 mile (1:60,000 metric) typically is used to show the route location.

A sample Route Location Decision is shown in Figure 12-7.A.

12-7.04 Preparation and Processing

After the review of comments received at a public hearing or informational meeting and the disposition of comments, and after design approval of the location is given by BDE, prepare a Route Location Decision and forward it, in duplicate, to BDE. The Preliminary Engineering Section will review the location decision for form and content and will process it for execution.

STATE OF ILLINOIS
DEPARTMENT OF TRANSPORTATION

ROUTE LOCATION DECISION

Along Federal-aid Route 155 from Henry Street in Alton, one block east of the Clark Bridge, in a generally southeasterly direction to a point near the intersection with FA Route 4 near Wood River in Madison County.

WHEREAS, the Department of Transportation of the State of Illinois has proceeded to select, lay out, and survey a part of Federal-aid Route 155 along a line as shown on the map attached hereto and made a part hereof, and on a location more particularly described as follows:

Commencing from a stone set at the northwest corner of Front Street and Henry Street, as said streets are now laid out on the plats of the City of Alton, thence South 84 degrees 19 minutes East along an easterly prolongation of the north line of Front Street for a distance of 99.00 feet (30.175 meters) to a point in the east line of Henry Street; thence South 6 degrees 12 minutes West along the east line of Henry Street for a distance of 864.60 feet (263.530 meters) to a point, said point being the POINT OF BEGINNING; thence South 80 degrees 48 minutes East along the centerline of FA Route 155 for a distance of 585.73 feet (178.531 meters) to a point of curve,

(*continuation of detailed legal description referenced to section corners, townships, and ranges*)

…for a distance of 266.82 feet (81.327 meters) to an intersection with the centerline of FA Route 4 (Business US 67); said point of intersection being the END OF ROUTE LOCATION DECISION; and being approximately 1000 feet (305 meters) South 68 degrees 17 minutes West from the east Line of NW 1/4 of Section 28, T5N, R9W of Third Principal Meridian, Madison County.

WHEREAS, the location of Federal-aid Route 155 within the above limits having been fully examined and observed and the width of right-of-way needed for developing and improving said route having been considered and determined; and

WHEREAS, it is required that a detailed description of the location of that part of Federal-aid Route 155 described above, and the width of right-of-way needed for development and improvement be entered of record in the Department of Transportation of the State of Illinois;

IT IS THEREFORE ORDERED, that that part of Federal-aid Route 155 extending from a point on Henry Street in Alton, one block east of the Clark Bridge, in a generally southeasterly direction to a point near the intersection with FA Route 4 near Wood River in Madison County be and is hereby located as described herein, and that the said location as described be and is hereby selected as the location of part of Federal-aid Route 155 and also, that there shall be acquired for this part of Federal-aid Route 155 a general right-of-way width of 200 feet (60.960 meters), except that such additional widths may be acquired as may be required for backslopes in cuts, downslopes in fills, frontage roads to serve built-up areas, and additional areas as may be required at intersecting streets or highways for providing traffic flow, safe-sight distances, and control of access to Federal-aid Route 155.

SAMPLE ROUTE LOCATION DECISION

Figure 12-7.A
(1 of 2)

IT IS FURTHER ORDERED that this map and order be filed as a part of the records of the Department of Transportation of the State of Illinois.

ENTERED THIS ____________________ day of ____________________ 20____.

____
Secretary of Transportation

SAMPLE ROUTE LOCATION DECISION

Figure 12-.7A
(2 of 2)

12-7.05 Execution

Upon execution of the Route Location Decision by the appropriate Department officials, an original copy of the document is returned to the district for recording in the Office of the County Clerk of each county in which the highway is located. Once the recording is complete, the Route Location Decision is returned to BDE for filing.

12-8 ORDER ESTABLISHING A FREEWAY

12-8.01 Freeways and Expressways

1. New Locations. According to the *Illinois Highway Code*, 605 ILCS 5/8-101, once it has been decided to control access on a State route, it is necessary to designate and establish the facility as an access-controlled highway. This action is initiated after design approval is obtained for the freeway/expressway. The Order Establishing a Freeway (Freeway Order) is a legal declaration made by the Department designating a highway as an access-controlled facility and delineating the extent of the freeway/expressway.

2. Revisions to Existing Orders. This situation is identical to "new locations" except that an existing Freeway Order is revised to describe a change in the originally approved access control limits; see Section 37-1.03 and Chapter 35.

12-8.02 Procedures

The Freeway Order must include the access limits along the mainline and the specific limits on all crossroads kept open to traffic. The Freeway Order contains a legal description of the freeway/expressway referenced to section corners, townships, and ranges. The Freeway Order is approved and signed by the Illinois Secretary of Transportation. An original copy of the fully executed Freeway Order is returned to the district for recording in the Office of the County Clerk of each county in which the freeway/expressway is located. Once the recording is completed, the Freeway Order is returned to BDE for filing. Figure 12-8.A illustrates a sample Freeway Order.

STATE OF ILLINOIS
DEPARTMENT OF TRANSPORTATION

ORDER ESTABLISHING A FREEWAY

Along Federal-aid Route 155 from Henry Street in Alton, one block east of the Clark Bridge, in a generally southeasterly direction to a point near the intersection with FA Route 4 near Wood River in Madison County.

The Department of Transportation of the State of Illinois acting under authority conferred on it by "An Act authorizing the Department of Transportation, the County Board of any County, or the corporate authorities of any City, Village, or Incorporated Town to designate and establish existing and proposed highways under their respective jurisdiction and control as freeways, and to limit access thereto" designated as Chapter 605 ILCS 5/8-101, as amended, and the Department being of the opinion that the safety and convenience of highway traffic will be promoted and the public interest subserved thereby, does hereby designate and establish a FREEWAY along the general location of those portions of Federal-aid Route 155 described below, and does declare its intention of proceeding to improvement and develop said portions of Federal-aid Route 155 in a manner which will permit access between said FREEWAY and abutting lands only at entrances provided for that purpose, in accordance with the provisions of said Act:

Commencing from a stone set at the northwest corner of Front Street and Henry Street, as said streets are now laid out on the plats of the City of Alton, thence South 84 degrees 19 minutes East along an easterly prolongation of the north line of Front Street for a distance of 99.00 feet (30.175 meters) to a point in the east line of Henry Street; thence South 6 degrees 12 minutes West along the east line of Henry Street for a distance of 864.60 feet (263.530 meters) to a point, said point being the POINT OF BEGINNING; thence South 80 degrees 48 minutes East along the centerline of FA Route 155 for a distance of 585.73 feet (178.531 meters) to a point of curve, thence along a curve to the right, having a radius of 2864.79 feet (873.188 meters), for a distance of 1879.17 feet (572.771 meters) to a point of tangency; thence South 43 degrees 13 minutes East for a distance of 589.97 feet (179.823 meters) to a point of curve; thence along a curve to the left, having a radius of 3819.72 feet (1164.251 meters), for a distance of 1433.33 feet (436.879 meters) to a point of tangency; thence South 64 degrees 43 minutes East for a distance of 259.62 feet (79.132 meters) to a point of curve; thence along a curve to the right, having a radius of 5729.58 feet (1746.376 meters), for a distance of 2206.67 feet (672.593 meters) to a point of tangency; thence South 42 degrees 39 minutes East for a distance of 1241.69 feet (378.467 meters) to a point of curve; thence along a curve to the left, having a radius of 2864.79 feet (873.188 meters), for a distance of 970.00 feet (295.656 meters) to a point of tangency; thence South 62 degrees 3 minutes East for a distance of 2529.42 feet (770.967 meters) to a point on the westerly edge of east-half of Fractional Section 19, T5N, R9W, 3rd PM; said point being South 0 degrees 51 minutes East a distance of 498.40 feet (151.912 meters) from the center of said Section 19, thence South 62 degrees 3 minutes East for a distance of 791.51 feet (241.252 meters) to a point of curve; thence along a curve to the right, having a radius of 3819.72 feet (1164.251 meters), for a distance of 1631.11 feet (497.162 meters) to a point of tangency; thence South 37 degrees 35 minutes East for a distance of 319.90 feet (97.506 meters) to a point of curve; thence along a curve to the left, having a radius of 2864.79 feet (873.188

SAMPLE ORDER ESTABLISHING A FREEWAY/EXPRESSWAY

Figure 12-8.A
(1 of 2)

meters), for a distance of 1718.34 feet (523.750 meters), to a point of tangency; thence South 71 degrees 57 minutes East for a distance of 1111.06 feet (338.651 meters) to a point of curve; thence along a curve to the right, having a radius of 7473.04 feet (2277.783 meters), (for a distance of 1021.69 feet (311.411 meters) to a point of tangency; thence South 64 degrees 7 minutes East for a distance of 1256.64 feet (383.024 meters) to a point of curve; thence along a curve to the left, having a radius of 3819.72 feet (1164.251 meters), for a distance of 3173.33 feet (967.231 meters) to a point of tangency, thence North 68 degrees 17 minutes East for a distance of 266.82 feet (81.327 meters) to an intersection with the centerline of FA Route 4 (Business US 67); thence continuing North 68 degrees 17 minutes East along the centerline of SBI Route 3, being also the centerline of Ferguson Avenue, for a distance of 598.70 feet (182.483 meters) to a point, said point being approximately 40 feet (122 meters) South 68 degrees 17 minutes West from the east line of the NW 1/4 of Section 28, T5N, R9W of the Third Principal Meridan, Madison County, and the END OF THIS FREEWAY ORDER.

Notice is hereby given that, in accordance with the provisions of the Act referred to above, no owner of or persons having an interest in land abutting those portions of Federal-aid Route 155 hereby designated and established as a FREEWAY shall lay out, provide, or construct any new means or enlarge or extend any existing means of ingress to or egress from said abutting land from or to such FREEWAY except upon written consent of the Department of Transportation.

Notice is further given that, in accordance with the provisions of the Act referred to above, no new highway, road, street, alley, or other public way shall be opened into or connected with or be carried over or under those portions of Federal-aid Route 155 hereby designated and established as a FREEWAY except upon written consent of the Department of Transportation.

(Continued)

Chapter Thirteen

WORK ZONE TRANSPORTATION MANAGEMENT PLANS

Chapter 13 discusses the goals and objectives of a Transportation Management Plan (TMP). The Bureau of Safety Programs and Engineering policies, Chapter 13, Chapter 55, the *Standard Specifications for Road and Bridge Construction*, and the *Highway Standards* provide the criteria to be used when developing TMP.

13-1 GENERAL

13-1.01 Goals

The goal of TMP is to address the following safety and mobility issues early in project development:

1. Safety.

    - Zero worker fatalities for traffic-related work zone crashes.
    - Reduce the number of motorist fatalities in traffic-related work zone crashes by 10% each year with the eventual goal of eliminating all of these fatalities.
    - Eliminate crashes and resulting fatalities and serious injuries caused by queuing.
    - Reduce the number of work zone crashes by 5% from each prior year.

2. Mobility.

    - Delays caused by work zones should not exceed more than 5 minutes per mile (3 minutes per km) of project length with a maximum of 30 minutes above the normal recurring traffic delay.
    - Queues caused by work zones should be no more than 1.5 miles (2.4 km) beyond pre-existing queues.

13-1.02 Definitions

1. Impact Analysis. An analysis of the safety and mobility impacts of a road construction or maintenance project.

2. Mobility. Moving road users efficiently through or around a work zone area (site specific or regionally) with a minimum of delay compared to baseline travel when no work zone is present, while not compromising safety.

3. Non-Significant Route. Work on a roadway that is not considered a significant route and that impacts the traveling public to a small degree due to low traffic volume, low public interest, and short to moderate duration.

4. PIP (Public Information Plan). A plan that consists of strategies to inform those affected road users, including the surrounding community, of the expected impact of a project, of changing conditions, and available travel options.

5. PLCM (Permitted Lane Closure Map) List. Developed by the district, PLCM defines the allowable times a lane(s) may be closed on Significant Routes within each district. The PLCM is based upon district knowledge and should be updated as traffic conditions warrant. The intent of PLCM is to allow minor short-term work to be completed with as little impact to the motorist as possible and to aid the district in complying with mobility requirements.

6. Safety. For work zones, safety refers to minimizing potential hazards to travelers and highway workers in the vicinity of a work zone.

7. Significant Project – Long Term. Roadway segments identified on the Significant Route Location Maps involving work greater than three days duration are considered as Significant Projects – Long Term. A Significant Project – Long Term requires an Impact Analysis be performed and requires TMP.

8. Significant Project – Short Term. (Operations, Permit, Utility, and other short-term work.) Roadway segments identified on the Significant Route Location Maps involving work of three days or less.

9. Significant Route. Roadway segments where a lane closure on the roadway is expected to cause sustained work zone impacts that are not considered tolerable based on work zone mobility goals or public opinion.

10. TCP (Traffic Control Plan). A plan to safely guide traffic through a construction project through the use of traffic control devices and project coordination. The TCP focuses on the mobility and protection of traffic within the construction zone.

11. TMP (Transportation Management Plan). An integrated strategy to manage work zone impacts of a project. The possible components of TMP are TCP, TOP, and PIP.

12. TOP (Transportation Operations Plan). A plan that consists of strategies which mitigate work zone impacts through the use of improved transportation operations and management of the transportation system.

13. Work Zone Impacts. Deviation from normal mobility and safety of the roadway due to the presence of a work zone.

13-1.03 Guideline for Work Zone Mobility Strategies

A well-planned method for maintaining traffic flow is critical for meeting the Department's mobility goals, minimizing complaints from the traveling public, residents, and businesses, and reducing unnecessary capital costs. Each Phase I report should contain a Transportation Management Plan indicating an overall strategy for work zone safety and mobility during construction.

For projects not requiring a Phase I report (e.g., 3P, traffic signals) and for projects where the application of the *Highway Standards* and *Standard Specifications* will provide the TCP, TMP is not required except for projects on significant routes. The goals of the Work Zone Safety and Mobility Rule for queuing and delay should be addressed. If the goals can be met, the district may approve TMP. If the goals cannot be met, then submit a Request for Exception to Compliance with the Work Zone Safety and Mobility Rule" form to the Bureau of Safety Programs and Engineering; see Section 13-1.05.

Figure 13.1-A presents the Work Zone Safety and Mobility Process Flow Chart to determine the level of significance of a project. Significant Route Location Maps (see Bureau of Safety Engineering's Programs and Policies website for maps) are statewide and district maps that show those State routes where a lane closure on the roadway is expected to cause sustained work zone impacts that are not considered tolerable based on the goals and objectives of this policy or public opinion. Roadways marked in red are considered as Significant Routes. Roadways marked in yellow are approaching Significant Route designation and should be evaluated for potential impacts. These maps will be revised as additional information becomes available through process reviews and district feedback.

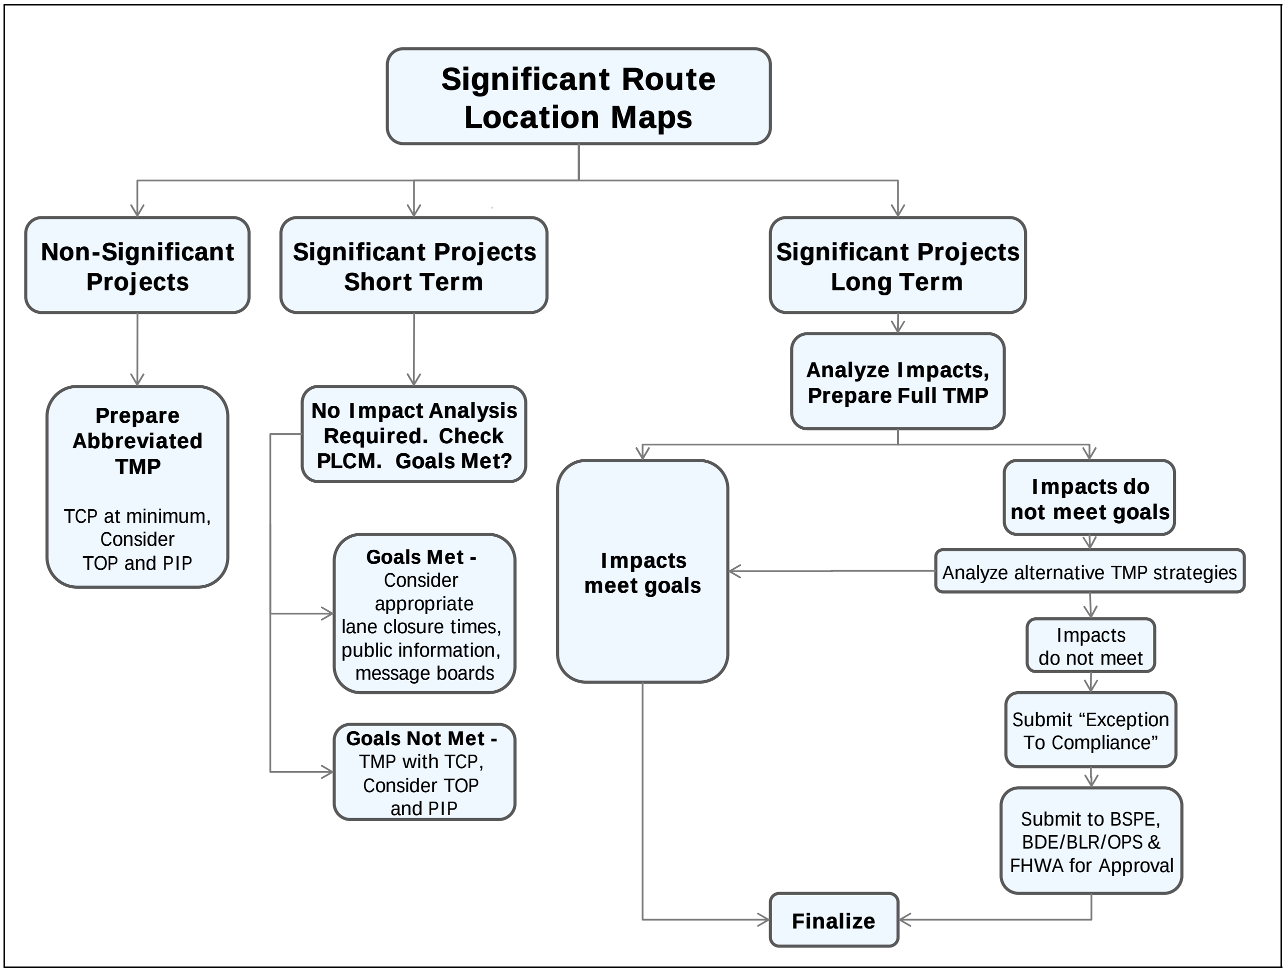
Use the Significant Route Location Maps and the Work Zone Safety and Mobility Process Flow Chart to determine if a project is considered Non-Significant, Significant–Short Term (Less Than Three Days), or Significant–Long Term.

13-1.03(a) Non-Significant Projects

If the proposed project is on a roadway that is not considered a Significant Route, then it is a Non-Significant Project. Work is considered to impact the traveling public to a small degree. Traffic volumes are low, public interest is low, and duration is short to moderate. For Non-Significant Projects, an Impact Analysis is not required. The final design may proceed with TMP that consists of only TCP. However, appropriate TOP and PIP strategies are encouraged to be considered as well.

13-1.03(b) Significant Projects – Short Term

Roadway segments identified on the Significant Route Location Maps involving work of three days or less are considered Significant Projects–Short Term. A Permitted Lane Closure Map/List (PLCM) is to be developed by the district, based on the Significant Route Location Maps and district knowledge. The PLCM should be updated as traffic conditions warrant.



WORK ZONE SAFETY AND MOBILITY PROCESS FLOW CHART

Figure 13-1.A

The PLCM map defines the allowable times a lane (or lanes) may be closed on Significant Routes within each district to assist in meeting mobility goals. It allows minor short time work to be accomplished with as little impact to the motorist as possible. If mobility goals cannot be met, plan the work in advance to minimize impacts. However, emergency repairs/work is allowed. The project may proceed with TMP that consists of only TCP. However, consider appropriate TOP and PIP strategies to ensure the project achieves the Department’s stated safety and mobility goals.

13-1.03(c) Significant Projects – Long Term

Routes identified on the Significant Route Location Maps involving work greater than three days are considered Significant Projects–Long Term. Because of their duration, work zones for these projects have a much greater impact on motorists. Consider every reasonable effort to mitigate these impacts. Identify Significant Projects as early as possible in the development process to help allocate resources more effectively to projects that are likely to have greater impacts. A Significant Project–Long Term requires an Impact Analysis. The Impact Analysis is the process of understanding the safety and mobility impacts of a road construction/ maintenance project.

During the planning and design phase of a Significant Project–Long Term, consider various TMP strategies and the resulting impacts to delays and queuing should be analyzed to determine which are acceptable or unacceptable based upon safety and mobility goals.

Developing TMP is a process that involves identifying applicable strategies to manage the impacts of the work zone, and budgeting costs to ensure that funding is available. A full TMP is required for Significant Projects–Long Term. The TMP should lay out a set of coordinated transportation management strategies and describe how they will be used to manage the work zone impacts of a road project. As the project evolves, it is important to reassess TMP, including the transportation management strategies, to ensure the work zone impacts are mitigated and the necessary budget for the project is available. Incident management and emergency services should also be considered.

A full TMP includes TCP, TOP, and PIP. A relatively small project on a significant route may follow the outline in Section 13-8 for a simple full TMP. Larger projects will require a more extensive examination. See Figure 13-1.B for the components of large project TMP.

13-1.04 <u>Impact Meet Goals – TMP Approval</u>

If the prepared TMP meets the mobility and/or queueing goals, present the project as follows:

1. <u>Federal Funds</u>. Present at the periodic joint FHWA/IDOT coordination meeting.

2. <u>No Federal Funds</u>. Present at the district project coordination meeting.

The TMP may be approved by the appropriate bureau (Bureau of Design and Environment, Bureau of Local Roads, or Bureau of Operations). Once TMP is approved, include TMP in the Phase I report and incorporate it into plan development.

Note that delays or time lapse from Phase I to Phase II in project development or changes made during the preparation of TCP may affect the overall TMP. For example, a lane closure that precipitates unavoidable large queues on a freeway may cause traffic to divert to a nearby urban arterial. This may require signal coordination, lane widening, turn restrictions, etc., on the arterial to improve its capacity. Review TMP from Phase I to Phase II to ensure that it is still applicable.

TRANSPORTATION MANAGEMENT PLAN COMPONENTS CHECKLIST
(For Large Projects)

Figure 13-1.B

13-1.05 Impacts Do Not Meet Goals – Exception to Compliance

Once all reasonable and cost-effective TMP strategies have been evaluated and incorporated into the project and mobility and/or queue goals still cannot be met, the district prepares an exception to compliance form BSPE WZ 2. All strategies, including those in the full TMP, an explanation of why it is not feasible to meet the goals of this policy, and the proposed strategies to mitigate work zone impacts are submitted with the exception to compliance.

Submit the request to the Bureau of Safety Programs and Engineering for review, and routing for additional reviews to the appropriate bureau (i.e., Bureau of Design and Environment, Bureau of Local Roads, or Bureau of Operations) and FHWA for approval. Upon approval, final development of TMP may proceed. Include the final TMP in the Phase I report and incorporate it into plan development.

13-1.06 Implementation

During Phase II, it will be the designer's responsibility to implement the recommendations from the approved TMP into a detailed Traffic Control Plan, which is included in the construction plans and special provisions. Design standards, special provisions, traffic volume or movement, etc., may have changed if there is a significant time lapse between Phase I and Phase II. The designer may be required to collect additional data and conduct additional analyses. Coordination with the Phase I author is recommended when possible.

Any significant changes to TMP proposed by Construction or the contractor should be reviewed with the TMP author or team prior to implementation. For larger projects, a public relations campaign as documented in PIP may be required prior to construction. If an approved marked detour route must be altered, it must be coordinated with the District Detour Committee for approval of the new detour route. During construction, TMP performance will be assessed as per Safety Engineering Policy 3-07.

13-1.07 TMP Corridor Considerations

The TMP should not only address traffic mobility alternatives confined to the project site, but it should also evaluate the impact traffic will have on the entire corridor. Conduct an evaluation of the entire corridor on projects that have one or more of the following characteristics:

- where the project scope of work consists of major reconstruction or new construction;
- where there are high traffic volumes;
- where there may be significant detrimental impacts on mobility for either through or local trips in the corridor;
- where the facility's capacity will be significantly reduced (e.g., lane, ramp, or interchange closures);

- where alternative routing will be necessary (e.g., detour routing for hazardous materials, wide loads);
- where there will be significant impacts on local communities and businesses (e.g., emergency vehicles, school buses, postal service);
- where timing (e.g., special events) and seasonal impacts may be significant;
- where there will be significant grade changes; and/or
- where no alternative routes are available.

Where a series of proposed projects are along the same corridor or along corridors of close proximity, consider coordinating individual TMPs into a Unified TMP for the corridor. The Unified TMP is authored by a TMP Team, a group organized during Phase I to study the traffic control alternatives and their effect on the corridor. The TMP Team and selection is discussed in Section 13-1.08.

13-1.08 TMP Team

A TMP Team may be created for a project that is large in scope or impact. It may be beneficial to write a Unified TMP for a series of TMPs created for several projects along the same corridor, or along corridors of close proximity. A TMP Team allows the designer to bring in stakeholders to aid in “buy-in” of the project and may avoid changes to plans in Phase II and Phase III.

For projects that the Regional Engineer has determined will use the principles of Context Sensitive Solutions (CSS), the public should be involved with the TMP Team. See Section 19-5 for more information on CSS.

If it has been determined that a TMP team is required for the project, the district will initially recommend the TMP Team representatives. This determination will be based on the purpose, goals, and constraints of the TMP. A well-balanced TMP Team is an important ingredient for a successful project. The variety of disciplines represented presents an effective liaison group to meet the various needs of TMP. Depending on the project logistics, the team composition will vary from project to project. The TMP Team may include representatives from:

- Design;
- Operations;
- Construction;
- Local Roads and Streets;
- Safety Engineering;
- Maintenance Operations;
- Traffic Operations;
- Planning and Programming;
- Public Transportation;
- FHWA;

- local government (county and/or city);
- State or local enforcement;
- major employers (e.g., factories, shopping malls); and/or
- others as deemed necessary (e.g., emergency responders, hospitals).

The anticipated work zone impacts will dictate the extent and nature of the TMP team's responsibilities. This is especially true for those projects on significant routes. These may include all or part of the following functions:

- collecting data (e.g., traffic counts, crash history, roadway geometrics, proposed developments, operating speeds);
- conducting analyses (e.g., capacity analyses, traffic impact studies, safety studies, queuing analysis, geometric adequacy);
- addressing safety (see the most current Bureau of Safety Programs and Engineering's Policy Memorandum BSE-04):
  + Positive Protection Devices,
  + Design Policy to Minimize Drop-off Exposure, and
  + Law Enforcement in Work Zones;
- reviewing design alternatives;
- reviewing traffic control alternatives;
- reviewing the adequacy of alternative routes (e.g., geometrics, capacity, safety, structural, roadway widths);
- reviewing on-site and off-site traffic operational improvements (e.g., signal improvements, parking restrictions, radius improvements);
- reviewing construction phasing and scheduling alternatives;
- determining the cost of various options and improvements;
- determining which options are the most cost effective;
- coordinating with local officials and businesses;
- researching local traffic demand for effects of seasonal and special events;
- coordinating funding and timing with other projects within the corridor;
- coordinating the design with other TMP plans in the region that may be under construction before, during, and after the project(s);
- planning for emergency responses (incident management);

- planning rideshare and transit strategies;
- providing recommendations for the Phase I report;
- reviewing design and TMP changes made by the designer to ensure they meet the TMP objectives;
- reviewing proposed changes made by the contractor or resident engineer during construction; and
- where necessary, developing a final report on the successes and problems of TMP.

13-2 TRAFFIC CONTROL MANAGEMENT

13-2.01 Terminology

The following definitions are used to define the time length for work zones:

1. Long-Term Stationary Work Zone. A construction, maintenance, or utility work site that requires traffic control in the same location and where the activity requires longer than three days.

2. Intermediate-Term Stationary Work Zone. A construction, maintenance, or utility work site that requires traffic control in the same location and occupies a location from overnight to three days.

3. Short-Term Stationary Work Zone. A construction, maintenance, or utility work site that requires traffic control in the same location and where the activity takes from one to twelve hours.

4. Short-Duration Work Zone. A construction, maintenance, or utility work site that occupies a location up to one hour.

5. Mobile Work Zone. A construction, maintenance, or utility work site that is continuously moving during the period when work is actively in progress.

13-2.02 Work Zone Type

There are several basic work zone types that may be considered in TMP. The main function of these work types is to “relocate traffic flow” so that the construction work can proceed with minimum interruption and hazard to the workers and to the motorists. The most common projects where relocating traffic flow may be a factor include:

- bridge reconstruction, rehabilitation, or replacement;
- major pavement rehabilitation of existing highways;
- pavement removal and replacement;
- horizontal alignment change; and
- vertical alignment change.

The following presents a description for several work zone applications:

1. Lane Constriction. This work zone type is configured by reducing the width of one or more lanes to retain the number of lanes normally available to traffic. An example of lane constriction is shown in Figure 13-2.A. This application is the least disruptive of all work zone types, but it is generally only appropriate if the work area is mostly outside the normal traffic lanes. Note that narrow lane widths may reduce the facility’s capacity, especially where there is significant truck traffic. The use of shoulders as part of the lane width helps reduce the amount of lane width reduction that may be required; however, check the structural adequacy of the shoulders. Where this application is

applied to long-term work zones, it will require the removal of the current lane markings to avoid motorist confusion. Chapter 55 discusses the minimum lane widths that must be provided.

2. Lane Closure. This work zone type closes off one or more normal traffic lanes. A lane closure example is shown in Figure 13-2.B. Capacity and delay analyses may be required to determine whether serious congestion will result from lane closures. In some cases, use of the shoulder or median area as a temporary lane will help mitigate the problems arising from the loss in capacity. Upgrading or replacement of existing pavement or shoulder, or placement of temporary pavement may be necessary.

3. One-Lane, Two-Way Operation. This work zone type involves utilizing one lane for both directions of traffic. Figure 13-2.C illustrates a one-lane, two-way operation work zone. This work zone type is typically only used on bridges or small, short-term projects. Flaggers or traffic signals are normally used to coordinate the two directions of traffic.

4. Runaround. This work zone involves the total closure of the roadway (one or both directions) where work is being performed and the traffic is rerouted to a temporary roadway constructed within the highway right-of-way. A runaround example is shown in Figure 13-2.D. This application may require the acquisition of a temporary easement and usually requires extensive preparation of the temporary roadway. Generally, temporary runarounds are designed for a posted speed reduction of no more than 5 mph to 15 mph below the existing posted speed of the route. Chapter 55 discusses the minimum geometric design criteria for runarounds.

5. Intermittent Closure. This work zone type involves stopping all traffic in one or both directions for a relatively short period to allow the work to proceed. This application is illustrated in Figure 13-2.E. After a specific time, depending on traffic volumes, the roadway is re-opened and all vehicles can travel through the area. This application is normally only appropriate on low-volume roadways or during periods where there are very low volumes (e.g., Sunday morning, nighttime).

6. Use of Shoulder or Median. This work zone type involves using the shoulder or the median as a temporary traffic lane. Figure 13-2.F illustrates an example of using the shoulder and median. To use this technique for more than a short period, it will be necessary to evaluate the shoulder and subgrade to see if it is adequate to support the anticipated traffic loads. This technique may be used in combination with other work zone types or as a separate technique.

7. Two-Way Traffic on Median Divided Facility with Crossover. This work zone type involves routing one direction of the traffic stream across the median to the opposite traffic lanes. This application might also incorporate the use of shoulders and/or lane constrictions to maintain the same number of lanes. Figure 13-2.G illustrates examples of crossovers. Due to the inherent high traffic volumes and, in most cases, higher speeds, it will be necessary to consider higher geometric criteria due to the higher motorist expectations.

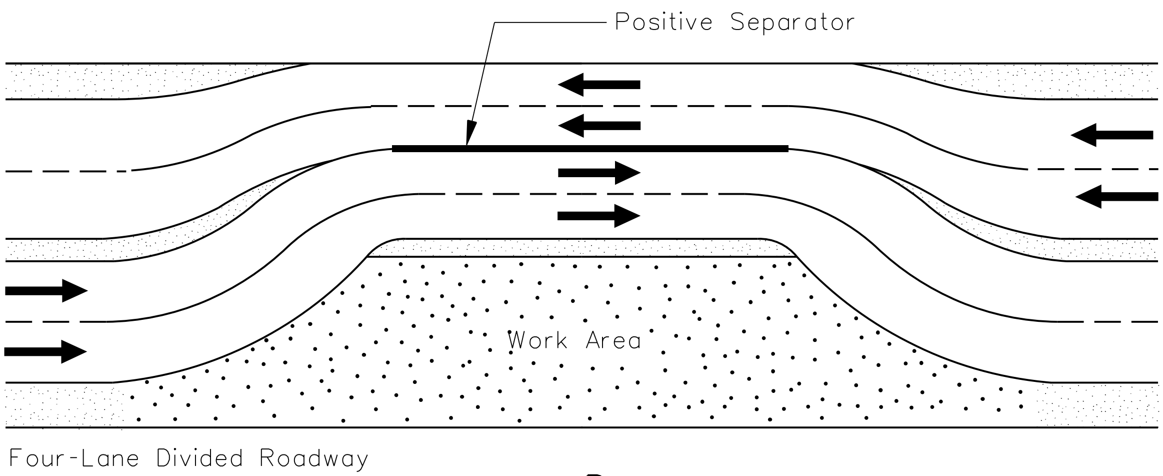
A



B

CROSSOVER WORK ZONES

Figure 13-2.G

The use of this application is encouraged under the following conditions:

- all safety issues can reasonably be addressed,
- construction time can be reduced,
- pavement and shoulder structures can be reasonably upgraded, and
- roadway geometrics allow crossover construction.

Chapter 55 and the *Highway Standards* discuss the design issues relative to designing two-way applications and crossovers (e.g., maximum length, pavement widths, pavement design, speed reductions). If this application is used, separate opposing traffic on high-speed facilities (i.e., posted speeds of 45 mph or greater) with positive barriers throughout the length of the two-way operation. Drums, cones, or vertical panels may be substituted for positive barriers in low-speed urban situations. The *Highway Standards* also depict the channelization devices that may be used with this layout. Consider also the option of reconstructing the shoulder to allow it to be used as a travel lane.

8. Detour. This work zone type involves total closure of the roadway, one or both directions, when work is being performed and rerouting the traffic to existing alternative facilities. This application is particularly desirable when there is unused capacity on roads running parallel to the closed roadway. When considering detours, evaluate the following:

   a. Local Route Detours. Local route detours are generally used in conjunction with the rehabilitation or reconstruction of two-lane, two-way State-maintained highways having ADT less than 5000 vpd. However, a local route (e.g., county highway, township road, municipal street) may require upgrading (structurally and/or geometrically) or extraordinary maintenance to carry the anticipated temporary increase in traffic and to restore it subsequent to the detour. When investigating the practical use of a local road as a detour route, note that the detour route only will be temporarily serving the through traffic. If the local route detour will be an economically reasonable alternative, make every effort to use the existing roadway width, the existing right-of-way, and to minimize any contemplated utility adjustments. Also, investigate the local route to determine the safe detour speed. Where the posted speed of the detour route is less than that of the detoured route, additional speed signs and warning devices may be required. Contact officials having jurisdiction over the local route and obtain their concurrence prior to using the route for a temporary detour.

   b. Marked State Routes. For marked State routes with ADTs greater than 5000 vpd, locate the detour along other marked State routes. Note that the adverse effects listed below and those for local detour routes also may apply to these detour routes.

c. Location. The beginning and end of all detours should coincide as near as possible with the beginning and end of the construction project. Where practical, avoid long detours that will bypass entire communities.

d. Pedestrians. Evaluate pedestrian traffic concerns and methods of eliminating or minimizing any other adverse effects when closing a road. Adverse effects could include inadequate access to buildings, private property, or businesses along the closed road.

e. Railroad Crossings. Examine railroad crossings to see if existing protective devices, sight distances, geometrics, and crossing surfaces are adequate for the proposed traffic.

f. Wide Load Restrictions. Determine if there will be a need to post advance signs to prohibit wide loads from using the detour.

g. Split Detours. In some cases, it may be advantageous to provide two detours routes — a marked State route detour and a local route detour. Through traffic and heavy-truck traffic is detoured onto State-marked, high-type surface highways. The local route detour is for local traffic and vehicles weighing less than 25,000 pounds (11,000 kg). This limit will allow school buses to use the local route detour.

h. Benefits. Note that improvements to local routes provide a permanent benefit for the public, whereas runarounds provide only temporary benefits that cease when the construction project is completed.

9. Roadway Shifts. This work zone type shifts the proposed roadway alignment laterally, (e.g., 50 ft (15 m), 100 ft (30 m)) so that the existing roadway or bridge can be used as the means to maintain traffic flow at the work site. This is an option that is usually only appropriate at horizontal curve locations, or bridge sites where the roadway profile gradeline must be raised for hydraulic purposes. Note that additional right-of-way or easements will often be necessary for this work zone type.

10. Work During Non-Peak Hours. When high-volume projects do not have good alternatives for 3R type work, consider requiring work during non-peak hours and/or night work.

13-2.03 Work Zone Strategies

13-2.03(a) Relocating Traffic Flow

The desired objectives to consider in relocating traffic flow are:

- Meet safety and mobility goals (see Section 13-1.01) to reduce fatal and serious injury crashes, and to avoid unreasonable adverse travel and public inconvenience.

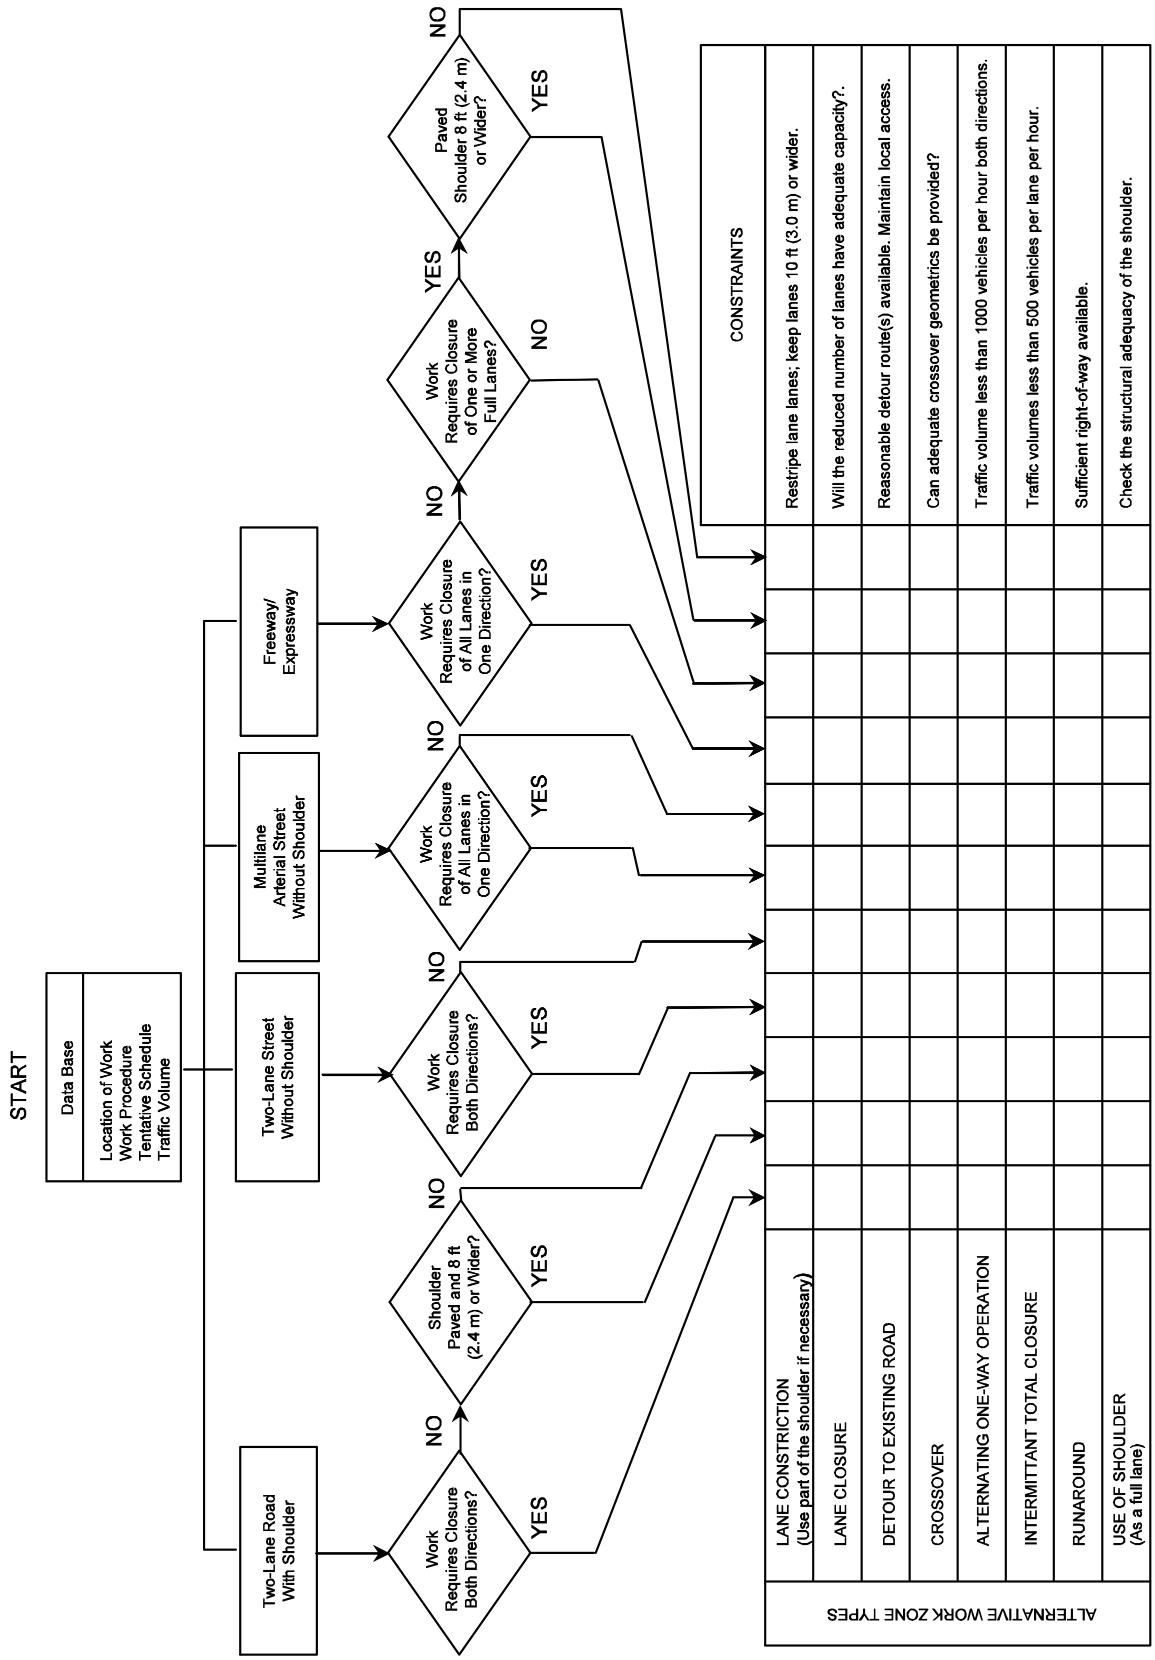
- Plan for incidents and emergency vehicle access. Ensure that emergency vehicles can move through the work zone with minimal delay.
- Maintain reasonable access for local interests (residents, businesses, agriculture, etc.).
- Maintain marked route continuity to avoid motorist confusion and to enhance safe travel.

13-2.03(b) Selection of Traffic Control Strategy

Selection of the appropriate work zone type represents one of the most significant elements of a control strategy. Other elements of a control strategy that should be considered include length of the work zone, time of work, number of lanes, width of lanes, traffic speeds, and right-of-way. Considering these and other factors, reasonable alternatives can be narrowed to a selected few for further review. Typically, only a small number of reasonable work zone alternatives will emerge for a particular project. Identification of these alternatives at an early stage in the planning process can reduce significantly the necessary analysis effort.

Figure 13-2.H provides guidelines for identifying practical work zone alternatives based on roadway type, lane closure requirements, shoulder width, traffic volume, and the availability of right-of-way and detour routes. However, every work zone location will have a wide variation of conditions and an all-inclusive selection matrix is not practical. Other issues to consider include the following:

1. Local Regulations. Many jurisdictions have adopted safety regulations and public convenience policies as safeguards against the unacceptable impacts of work zones. These regulations and policies may impose additional constraints regarding the types of control strategies that can be implemented. Knowing these constraints can help eliminate impractical alternatives from consideration. The public convenience policies or local regulations may specify peak-hour restrictions, access requirements, noise level limitations, material storage and handling, excavation procedures, work zone lengths, and number of traffic lanes that must remain open.
2. Multilane Facilities. Traffic on multilane facilities is usually maintained through the use of lane constrictions, lane closures, or median crossovers. Maintaining traffic flow on multilane facilities generally will require higher criteria than those used on the rural two-lane highway system because of the higher speeds and traffic volumes. See the *Highway Standards* and Chapter 55 for recommended design guidelines.



Practical Altern

IDENTIFICATION OF FEASIBLE WORK ZONE TYPES

Figure 13-2.H

3. Bridges. Traffic maintenance for bridges may consist of crossovers, stage construction (partial closure), detours, runarounds, or split detours. Coordinate all proposed designs with the Bureau of Bridges and Structures early in Phase I to determine possible structural solutions and related costs before writing TMP. In addition, consider the following:

   a. Crossovers (Full Closure). Consider using crossovers with bridge and superstructure replacements and deck replacements on multilane median divided facilities.

   b. Stage Construction (Partial Closure). Stage construction for bridges will generally consist of lane constrictions, lane closures, or one-lane, one-way operations. However, stage construction may increase unit costs, increase the difficulty of reconstructing the bridge, have inherent hazards due to close proximity of traffic to the construction operations, and generally involves a restricted lateral clearance for vehicles, wide loads, and farm equipment. With lateral restrictions, it is important that these restrictions be adequately marked in advance of the work site. Consider the following factors when determining the feasibility of stage construction for bridges:

      - type, length, and width of present and new structure;
      - beam spacing and location in relation to the desirable staging limits;
      - lane and shoulder widths required during stage operations; this may require using the shoulder as part of the lane;
      - the use of temporary traffic signals; and
      - cost attributable to staging.

      Deck repairs can usually be staged for all structure types. Superstructure and deck replacement, however, is sensitive to the type of structure involved. Existing multi-beam superstructures (e.g., steel I-beams, concrete I-beams) and culverts can usually be adapted to construction staging techniques. Other types of structures (e.g., pony trusses, relatively short-span structures utilizing low trusses without cross bracing) may be staged, but with greater difficulty and expense. Some structures (e.g., through trusses, through girders) cannot practically be staged.

   c. Runarounds. At locations where a through truss, pony truss, or steel through girder is being replaced, consider moving the truss or girder laterally to temporary abutments and using the structure as a part of the runaround.

   d. Split Detours. If significant through traffic is using the road, it may be advantageous to provide a marked detour route around the work site and build a low-water runaround across a stream for local access. This option is usually applicable only on low-volume unmarked rural highways with less than 400 vehicles per day. See the *Bureau of Local Roads and Streets Manual* for design considerations and Section 404 permit requirements.

4. Additional Guidance. For additional guidance in analyzing and preparing a scheme to maintain traffic flow at work sites, see the *Highway Standards*, *Illinois Manual on Uniform Traffic Control Devices*, and *Standard Specifications*.

13-3 TRAFFIC CONTROL PLAN STRATEGIES

The following sections provide brief summaries of the various Traffic Control Plan (TCP) strategies that may be considered during the development of TCP. These strategies must be reviewed and adjusted to meet each project location and situation. Note that the strategies discussed in these sections are not all inclusive and that other options may be applicable for the location under consideration. Specific work zone traffic control recommendations are discussed in Chapter 55.

13-3.01 Construction Phases

How a project is constructed can greatly impact the traffic flow through the work area. The following sections discuss some of the basic construction phases for freeways.

13-3.01(a) Reconstruction by Halves (Sides)

This approach involves the reconstruction of all lanes in one direction while the opposing lanes share the same roadway with traffic in the other direction. This basic concept is the two-way traffic on a divided facility discussed in Section 13-2.02. For high-volume, four-lane facilities, both shoulders may be rebuilt to provide four reduced-width lanes. For six-lane facilities, traffic is generally restricted to two lanes in each direction. This may require using the shoulders, reducing the lane widths, and/or providing minor widening. Under certain circumstances, depending on the median width and shoulder configuration, the inner lane of the two-way operation may not be readily accessible in the event of emergencies. Providing for emergency turnouts and/or emergency vehicle access at appropriate intervals on the segment under construction may be considered. Some advantages and disadvantages of this strategy include:

<u>Advantages</u>

- It provides an effective work area.
- Generally, workers are well separated from the traffic stream.
- Work site access can be arranged with minimal interference from the general traffic flow.

<u>Disadvantages</u>

- Crossovers are typically required.
- Positive separation of the traffic streams is required.
- There are potential emergency access problems throughout the project.
- There may be special problems at interchanges with traffic crossing the work zone.
- Reduced capacity.

13-3.01(b) Parallel/Adjacent Reconstruction

This approach usually involves a variety of lane constriction and lane closure sequences discussed in Section 13-2.02. A typical sequence of this approach is as follows:

1. <u>Phase A</u>. First, the existing shoulders are widened and strengthened if necessary.

2. Phase B. Traffic is shifted to the shoulders to allow construction of the inner lanes and any median reconstruction.

3. Phase C. Traffic is then shifted to the newly constructed inner lanes to allow reconstruction of the outer lanes.

4. Completion. After construction is completed, traffic is returned to the original travel lanes.

A key advantage of this strategy is that traffic is not required to cross over the median and does not operate in a two-way operation. Some of the disadvantages include:

- Typically, it provides a more constrained work area for the contractor.
- Work crews are generally closer to moving traffic.
- Access to the construction zone typically involves entry and exit from the travel lanes.

For six-lane facilities, the facility is generally reduced to two-lanes in each direction and the above sequence is used. When closing the middle lane, it is preferable to keep the two through lanes on the same side of the construction zone (e.g., by using the shoulder) versus splitting the two lanes on either side of the construction zone.

13-3.01(c) Serial/Segmental Reconstruction

This strategy consists of permitting only short segments of the facility to be under construction at one time. This also requires one or more of the other concepts for traffic accommodation. An example of this application may include a shallow culvert replacement where each half can be constructed, backfilled, and opened to traffic within a 12-hour time period.

The advantages of this approach include relatively short work zones and few, if any, interchanges are impacted at any one time. One of the more serious disadvantages of this strategy is that the overall time period that the facility is under construction may be lengthened considerably because the construction for each segment will proceed independently. Therefore, the exposure to the potentially hazardous conditions of a work zone for both the traveling public and the work force may be substantially greater than could be the case with one of the other strategies.

13-3.01(d) Complete Closure (Detour)

In some circumstances, complete closure of the facility or closure of one direction of travel and detouring the traffic onto an alternative route may be an effective strategy. This strategy may also be effective for only certain hours of the day (e.g., 8 p.m. to 6 a.m. on weekdays and from 8 p.m. to 8 a.m. on weekends). Section 13-2.02 discusses other issues relative to detours. Some of the advantages and disadvantages of this strategy include:

Advantages

- Increases the safety for construction workers.
- May provide cost and time savings.

- Reduces the overall travel impacts to the public due to reduced construction time.

Disadvantages

- Potentially significant short-term travel impacts to the public.
- Potential increase in traffic congestion on other routes.
- May need to construct a detour/runaround.
- Potential adverse impact on businesses due to trip suppression (not enough traffic).
- Potential adverse impact to businesses on alternative routes (too much traffic).

13-3.01(e) Combinations

Often, a combination of construction sequences is the best strategy. For example, reconstructing existing shoulders prior to initiating parallel construction activities. The following sequence of construction could be used:

1. Phase A. Reconstruct shoulders as appropriate to allow one side of the roadway to accommodate four lanes.

2. Phase B. Shift traffic to the four available lanes on one side of the roadway.

3. Phase C. Shift traffic to the newly constructed side of the roadway using the additional reconstructed shoulder lane.

Other combination-type construction sequences involve the reconstruction of interchanges where both sequential and parallel activities may occur simultaneously.

13-3.02 On-Site Strategies

13-3.02(a) Traffic Control Devices

Consider the application of the following traffic control devices when developing TCP:

1. Portable Changeable Message Signs (PCMS). These devices may be used where static sign messages are not sufficient to accommodate the changing conditions of a work zone (e.g., lane closures, ramp closures, to advise motorists of conditions for which they will need to possibly react). These devices are also used to inform the traveling public of road construction activities on site prior to construction. Where numerous PCMS are used on a project, there should be a plan for their use to ensure a consistent and cohesive message. See Section 55-5.01(d) and *MUTCD* for further guidance.

2. Additional Informational Panel Signs. These signs may be used to give the motorists additional information about a work zone. Ensure the message on these signs is pertinent to the likely conditions the motorist will encounter.

3. Signal Interconnect. Interconnect traffic signals where the benefit of moving traffic through a work zone more efficiently will be enhanced by adding interconnection between the traffic signals on the system.

4. Signal Timing. Revise the timing of traffic signals within a work zone to increase the capacity. Adding or deleting of signal phases may be required for changes in travel patterns.

5. Highway Advisory Radio. Use highway advisory radio where changing work zone conditions make it important to give the motorist a longer, more accurate message than could be obtained through the use of signs or other means. This option requires additional information and signing to alert motorists.

6. Temporary Work Zone Speed Limits. A reduced regulatory speed limit may be warranted where work activity may constitute a hazard to traffic or workers. Direction on alteration of work zone speed limits may be found in the Bureau of Operations Policy on Establishing and Posting Speed Limits on the State Highway System.

7. Arrow Boards. In construction areas, arrow boards are used to supplement conventional traffic control devices. They typically are warranted where additional warning and directional information is required to assist in merging and controlling traffic through and around the work activity. The *Highway Standards* provide additional guidance on the placement and use of arrow boards in construction zones.

8. Intelligent Information Systems. Investigate new and emerging technology to provide better travel information to the public. Current systems provide real time travel information to the public through PCMS. Other systems that have been used include: variable speed limit signs, early merge and late merge strategies for lane closures, and electronic speed monitoring devices.

13-3.02(b) Capacity

Each construction site will affect the capacity of the existing facility. The extent the roadway is occupied for work and safety purposes will determine the number of strategies required to compensate for the loss of capacity. As well as, a reduction in capacity affects mobility (see Section 13-3.02(c)). Consider the following capacity strategies when developing TCP:

1. Temporary Parking Restrictions. One option to increase capacity is to restrict on-street parking that can then be used to add an additional lane or to reduce traffic conflicts. These restrictions can be during peak periods or for 24 hours/day. However, ensure that the concerns of on-street parking for local businesses have been addressed. Use of parking lanes for traffic lanes also may require geometric revisions at intersections.

2. Restriction of Trucks. Restriction of trucks may increase the facility's capacity. However, consider local and/or State ordinances and the availability and suitability of alternative routes that the restricted trucks will be required to take.

3. Turn Restrictions. Eliminate or restrict turns at intersections and/or driveways may increase capacity and reduce crashes. Turn restrictions can be during peak periods or for 24 hours/day.

4. Reversible or Contra-Flow Lanes. Reversible or contra-flow lanes may be considered where a large percentage of the traffic moves in one direction during peak periods, and the existing facilities are adaptable. Candidates for reversible flow lanes lack center medians and have continuity in the route and the width of the street. The optimum distribution may be found by dividing the number of lanes operated in the primary direction by the total number of lanes (e.g., 4 lanes primary direction divided by 6 lanes total yields a 67% optimum percent traffic in the primary direction).

   The advantage of reversible lanes is the ability to increase the capacity of the existing facility. However, there are many disadvantages:

   - High cost of reversing direction twice a day.
   - Consider need for positive separation between lanes, which requires movable barrier and the associated equipment.
   - Public information campaign required to educate the traveling public.
   - Resistance from business owners, schools, traffic generators, and emergency service providers.
   - Where applicable:
     + Parking must be time restricted or eliminated.
     + Left turns must be restricted or eliminated.
     + Bus service may cause mobility problems in secondary direction.
   - Incident management may be needed, as a stalled vehicle or crash will severely restrict or stop flow for the secondary direction.

5. Ramp Metering. Consider using or revising ramp metering where it is necessary to control the volume of traffic entering a freeway for capacity and safety reasons. Ramp metering may be used during peak periods or for 24 hours/day. Also, consider the impact ramp metering will have on the intersecting street (e.g., traffic backup).

13-3.02(c) Queue Analysis

Queue analysis is critical not only to meeting mobility goals, but to improving safety for the motorist. The largest category of crashes in work zones is rear end collisions. At highway speeds, the number of rear end collisions increases to nearly 30% of all work zone crashes. These crashes are largely due to the highway not meeting the motorist’s expectations – the motorist does not expect a queue, even in a work zone.

Analysis of the peak queue allows the designer to place warning signs (e.g., road construction ahead, static PCMS, dynamic message boards) in advance of possible queues. This practice not only improves the safety of the work zone, but it aids the designer in the placement of signage for suggested alternative routes well ahead of the queue.

Queue analysis methodology should be appropriate to the type of work zone and may include one or more of the following:

- Permitted Lane Closure Maps;
- hourly volume maps;
- district knowledge and experience;
- site reviews;
- highway capacity analysis converted into a predicted queue; and
- computer simulation programs (e.g., QUEWZ, TSIS – CORSIM, Quickzone).

Experience with similar construction projects and the effectiveness of the traffic control strategies employed is critical to provide a reality check to any analysis.

Where queues are normally present without lane closures, compare existing queues to expected queues. Discuss how the main and alternative strategies may reduce the impact lane closures, construction, or other work have on the project.

13-3.02(d) Miscellaneous Strategies

In addition to the above sections, consider the following miscellaneous on-site strategies when developing TCP:

1. Ramp Closures. The following will apply to ramp closures:

    a. Short/Intermediate Term. Short- or intermediate-term ramp closures may be necessary for construction purposes. If closures are required, additional signage will be necessary to forewarn the motorist. It is recommended to post signs on the affected ramp two weeks in advance to advise motorists of the closure date(s) and/or periods of the day the ramp will be closed.

    b. Long Term. Long-term ramp closures may be necessary to construct or to improve traffic flow on the mainline road. Consider the effect the ramp closure will have on emergency services, local access, and businesses before deciding on a long-term ramp closure. Also evaluate the user costs for a detour route and the capacity and safety impact of the detour route. Do not close two adjacent ramps at the same time unless necessary for safety reasons.

2. Incident Management. Consider the use of on-site tow trucks for freeway work zones with limited or no shoulders available. They should also be considered where a crash or break-down will seriously impact the roadway and cause significant backups and delays. Consider providing turnarounds for access through temporary concrete barrier and for tow trucks and State Police to park.

3. Special Materials. Examine the use of high early strength concrete, precast items or other special materials where traffic restrictions must be minimized (e.g., ramps, intersections, high-volume roadways). Time and overall cost savings may offset the potentially higher material costs.

4. Police Enforcement. For projects that include complex work zones with high speeds, high traffic volumes, or that would benefit from the presence of enforcement over an extended period of time, consider using planned enforcement. Designers should indicate this need as part of the Phase I and Phase II process in developing the project Transportation Management Plan. Designers should coordinate with Construction, Operations, and Programming Engineers to include this cost as an additional project expense in the highway program, as opposed to using annual allocation of hire-back hours, if it is warranted in order to ensure that dedicated law enforcement is provided in the work zone.

5. Photo Speed Enforcement. Photo Speed Enforcement is another work zone enforcement option allowed by Illinois law. This program is funded by the Transportation Safety Highway Hire-back Fund. The locations of these patrols are coordinated through IDOT and Illinois State Police districts with the guidance of the Bureau of Safety Programs and Engineering.

6. Pedestrians. In urban or suburban areas where pedestrian activity is likely, pedestrian access must also be provided during construction. This may require positive guidance, providing temporary sidewalks, protection from drop offs, adjustment to traffic signals, etc. ADA accessibility requirements shall be applicable to construction zones in urban areas where accessibility is provided by the existing facility. Consult *MUTCD* and *ADA Standards for Accessible Design* to ensure devices meet accessibility requirements.

13-3.03 Off-Site Strategies

Where construction will significantly impact the traffic flow away from the work zone, consider the following off-site strategies in TCP:

1. Advance Informational Signs. These signs may be used to give the motorists additional information about a work zone that is ahead or on a different route. Provide these signs where it is advantageous to give this information to a large number of motorists or where it is necessary to inform motorists of an alternative route to avoid a congested work zone.

2. Portable Changeable Message Signs (PCMS). These devices can be used to give the motorists information required to prepare them for upcoming changing conditions or information about how to avoid a condition. These devices may be used to provide more information than feasible on an informational panel sign. See Section 55-5.01(d) for more information.

3. Signal Interconnect. Evaluate interconnecting traffic signals where moving traffic through an alternative route corridor more efficiently is enhanced by adding interconnection between traffic signals on the alternative route system.

4. Signal Timing. Evaluate traffic signal timing changes and/or additional phases for traffic signals on an alternative route because of the added traffic expected to use the route.

5. Capacity Improvements. Additional improvements on the alternative route may be necessary for capacity reasons to accommodate the expected diversion of traffic. Examples of capacity improvements include additional pavement width, adding turn lanes, removal of parking, turn restrictions, and truck restrictions.

6. Trailblazing to Attractions and Points of Interest. Trailblazing may be necessary to guide motorists to attractions and points of interest in those circumstances where the normal route is closed or seriously restricted, or where an alternative route to the attraction or points of interest will assist traffic through the work zone.

13-3.04 Scheduling

Construction time has a direct effect on the cost of the project. A short schedule to minimize construction activities and disruption to traffic may be required if motorist user costs are expected to be high. A schedule that minimizes construction time also limits the exposure for workers and the traveling public to the hazards of the work zone. However, short schedules may increase the cost of the project. A longer schedule of construction activities may be cost effective if it does not significantly increase the adverse impact to motorists. The contractor may bid a lower price for a longer schedule. When determining a construction schedule, consider the following:

1. Strategies for Reducing Construction Time. Incentives/Disincentives and A+B contracts may be used to minimize the time a facility is affected by construction. Contact BDE for information. See Section 66-2.03 for guidance on estimating the expected construction time for the project.

2. Lane Rental. Lane rental is a contracting technique whereby either the contractor bids the number of days of work requiring lane closures as part of the contract, or the Department sets the number of days for which such closures are allowed. If the contractor finishes early, an incentive is paid. If the contractor exceeds the number of days allowed, a disincentive payment is deducted from the contract for each day the limit is exceeded. This type of contract forces the contractor to schedule resources and perform work in a more timely manner.

   Consider contracts using a lane rental specification on all high-volume, multi-lane projects (e.g., Interstates, expressways). Complete a traffic capacity analysis for these projects to determine the level-of-service to be anticipated during construction. In addition, conduct a queuing analysis to determine the anticipated traffic backups at different times during the day and week. Once a traffic capacity analysis and queuing analysis are complete, a decision may be made on whether or not to use a lane rental specification. If a lane rental specification is used, this information will aid in determining the average road user benefit cost.

For all Interstate and expressway projects that involve patching, include the lane rental specifications. The lane rental specification must apply to the patching operation and may be applied to the whole project. Prepare a traffic capacity analysis and queuing analysis to determine the anticipated back-ups at different times during the day and week. This information is then used in determining the average road user benefit cost for purposes of developing the lane rental specification.

3. Letting Dates. Projects that can be completed in one construction season should be let and scheduled to be completed prior to winter shutdown. For those projects requiring more than one season, the major phases of construction need to be planned to recommend an appropriate letting date and provide a schedule for winter shutdown. Delays and impacts to the traveling public and adjacent property owners should be minimized. A schedule that minimizes construction time also limits the exposure for workers and the traveling public to the hazards of the work zone. See Chapter 66 for further information for selecting contract letting dates.

4. Time of Day/Day of Week Restrictions. These types of restrictions may be necessary if the work zone capacity will not accommodate the expected demand during the peak periods and other measures are not as cost effective. For example, night work may be required to allow longer work hours than can be provided between morning and afternoon peaks. Night work may also be used to decrease the excessive traffic delays or congestion associated with lane closures during the daytime.

5. Project Phasing. Project phasing or completing smaller portions of a construction project one portion at a time may be necessary to limit disruption to traffic. However, construction activity in the same area over several seasons should be discouraged.

6. Combining with Other Work. Projects within a corridor may be combined or scheduled at the same time where practical, pending available funding, to minimize impacts to the motoring public.

7. Timing. Control the timing of road closures for a certain time of the year by either setting the letting date or by placing restrictions in the special provisions. Also, when closing or restricting widths on rural highways, time the closure to occur after spring planting operations have been completed and ensure that the highway is open to traffic by harvest time.

8. Sequence of Construction. Consider the sequence of construction to reduce any stages of construction when possible. For example, requiring a shoulder and pavement lane to be milled and resurfaced in the same operation would eliminate a second traffic control setup for resurfacing the shoulder. The reduction in traffic control cost, overall reduction in time, the bituminous plant change over from one mix to another, and cost reduction due to increased volume of one mix may offset the additional cost for the increased

material cost on the shoulder material, especially in the binder stage. Examine the overall effects of staging and sequence of construction to reduce the exposure time of workers and the traveling public to the hazards of the construction zone.

9. Prohibit Weekend Lane Closures. On roadways with ADT of 25,000 or more, keep all lanes open to traffic from 3:00 P.M. Friday to 12:00 midnight Sunday except where structure construction or major rehabilitation makes it impractical. Where patching and resurfacing are performed on these routes, lane closures are often in place and cause extensive backups. By restricting the work on weekends, all traffic lanes are available to accommodate the higher weekend volumes of traffic.

   Where ADT exceeds 25,000, provide ADT on the cover sheet of the construction plans. A traffic capacity analysis and a queuing analysis should still be completed. On some routes ADTs may be lower on weekends and it would be beneficial to allow or require work on weekends. In these cases, contracts should contain specifications to allow this work.

   For projects with less than 25,000 ADT on which traffic volumes are still relatively high, especially Interstates, conduct a traffic capacity analysis and a queuing analysis to evaluate the possible benefit of prohibiting weekend lane closures.

10. Night/Non-Peak Hour Construction. On high-volume roadways, the Traffic Management Analysis (TMA) should consider limiting construction to non-peak or nighttime hours. For all TMAs prepared for roadways with greater than 25,000 ADT, include a traffic capacity analysis and a queuing analysis. Where the one-way VPH exceeds 1700 or the level of service drops to E or F, excessive back-ups will occur. Under these situations, restrict work to other times of the day.

    Once the traffic peaks and expected queues have been reviewed, TCP can be developed. Under the above situations, construction should not be permitted during certain time periods for each direction of travel. This provides the contractor with some flexibility in scheduling work.

    Under certain conditions it may be beneficial to require work be done only at night. This decision should be made after close examination of the traffic capacity analysis and queuing analysis. In cases where the traffic volumes remain high throughout the day but drop significantly during the night, where traffic delays would be continuous throughout the day, or to provide longer continuous work periods, consider using night construction.

    Before requiring night construction, consider the following factors:

    - noise level ordinances that may prohibit certain construction activities at certain times,
    - noise and light impacts on the surrounding community,
    - neighborhood traffic impacts due to detours or alternative routes,
    - impacts to businesses, and

- community resistance.

When night construction is required by the contract, include the following:

- a lighting specification detailing the minimum lighting requirements,
- additional signing and increased use of PCMS to alert traffic,
- increased public relations efforts to notify the surrounding community, and
- restrictions to limit work hours to 7:00 P.M. to 6:00 A.M. Hours may be adjusted according to the traffic analysis.

13-4 PUBLIC INFORMATION PLAN (PIP)

Work zones, particularly those deemed to have a sustained impact on safety and mobility should include a Public Information Plan (PIP) in the Transportation Management Plan. Significant projects are required to have PIP.

Successful work zone public information and outreach campaigns incorporate three essential messages:

- Safety First,
- Plan ahead to minimize delay, and
- We care.

It is important that the public be informed initially and remains informed in a timely manner. Consider the following steps to create PIP:

1. Scope. The PIP should consist of a plan to inform and reach out to the public. For smaller projects, PIP may be limited to contacting local EMS and schools, press releases of project scope and duration, and the IDOT website. Larger, more disruptive projects may warrant a more extensive campaign.

2. Identify Resources.

   - Use free media coverage through press releases to local news media (newspapers, radio, television) and the IDOT website.

   - Examine use of existing resources (e.g., highway advisory radio, dynamic message signs).

   - Use town meetings and project hearings to describe the project and gather public support.

   - Coordinate with public officials and law enforcement to help with gaining favorable public opinion.

   - Consider low cost options (e.g., creating brochures to be given to motorists at key locations and for posting at rest areas and welcome centers).

   - Coordinate with other transportation agencies (e.g., local agencies) to identify their construction and maintenance activities and to minimize motorist delays near the project.

   - Major employers and service providers may assist in informing the public. For example, these entities may be willing to incorporate messages in newsletters, web sites, or flyers to employees and customers at no cost to the Department.

- Business and neighborhood associations have a vested interest in the road network. Buy-in from these groups may result in strategies to offset traveling hours or delivery times and increase the use of local routes by local drivers.

Larger projects may require public information and outreach spending as a part of the project budget.

3. Identify Partners. Identify other affected State and local agencies, major employers, schools, businesses, and neighborhood associations.

4. Identify Target Audience. Examine the project and identify which motorists are most affected by the project. Focus efforts on this audience.

5. Develop the Message.

    - Inform the motoring public that the Department cares about safety and delay in the work zone. For example:

        + Emphasize that safe passage through the work zone is critical.
        + Show that minimizing delay is important to the Department.

    - Indicate which alternate routes are available. Do not simply say "use alternative routes," be specific as to which route should be taken.

    - Clearly communicate the project start date and plan to update the public throughout the project.

    - Where applicable, communicate hours of work (e.g., 7:00 pm to 5:00 am Monday through Saturday). Encourage travel during off-peak times.

    - Advertise alternative modes of transportation (e.g., carpool, share-a-ride, mass transit).

    For larger projects, consider a unified message that revolves around a slogan or mascot (e.g., Jack Hammer (mascot) for the upgrade 74 (slogan) project in Peoria, Illinois, 2002). A unified approach may aid in gathering positive public support for extensive projects.

6. Determine Communication Strategies and Timing. Develop a plan for how and when to get the word out. For large projects, consider including a thank-you campaign to publicize completion and enhance the Department's image as focused on the motorist.

7. Evaluate. The TCP author or team should evaluate the effectiveness of PIP as part of the Department's long-term efforts to improve safety and mobility in and around work zones.

See the FHWA publication *Work Zone Public Information and Outreach Strategies*, November 2005, for more information.

13-5 TRANSPORTATION OPERATIONS PLAN (TOP)

Work zones, particularly those deemed to have a sustained impact on safety and mobility should include a Transportation Operations Plan (TOP) in the Transportation Management Plan. Significant projects are required to have TOP.

A TOP is a plan that consists of strategies that mitigate work zone impacts through the use of improved transportation operations and management of the transportation system. The TOP may consist of strategies for:

- demand management,
- corridor/network management,
- work zone safety management,
- traffic and Incident management, and
- enforcement.

13-5.01 Demand Management

Demand management strategies include techniques intended to reduce the volume of traffic traveling through the work zone. These techniques include, but are not limited to:

- mass transit service improvements and incentives,
- shuttle services,
- carpooling incentives,
- park and ride promotion,
- ramp metering, and
- working with local business to promote variable work hours and/or telecommuting.

13-5.02 Corridor/Network Management

Corridor or network management strategies optimize traffic flow through the work zone corridor and adjacent roadways. Strategies include, but are not limited to:

- signal timing and coordination improvements,
- street and intersection improvements on mainline and adjacent roadways,
- bus turnouts,
- truck lanes or truck restrictions,
- turn restrictions,
- parking restrictions, and
- coordination with adjacent construction projects.

13-5.03 Work Zone Safety Management

Work zone safety management strategies address worker and traffic safety. Strategies include, but are not limited to:

- variable work zone speed limits based on traffic volume and/or type of work,
- temporary traffic signals,
- temporary longitudinal traffic barrier and movable barrier systems,
- trailer or truck mounted attenuator systems,
- temporary rumble strips,
- safety awards/incentives,
- construction safety supervisor/inspectors,
- TMP monitoring/inspection team, and
- work zone safety assessments.

13-5.04 Traffic and Incident Management

Traffic and incident management strategies monitor traffic conditions and make adjustments based on these changing conditions. Strategies include, but are not limited to:

- Intelligent Transportation Systems (ITS) may be used to:
  + detect traffic flow, and automatically relay “real time” travel time to motorists via PCMS, websites, or other outlets; and
  + detect queues, and automatically actuate warning systems.
- gawk screens to reduce driver distraction;
- milepost markers to aid the motorist in locating themselves in an incident;
- tow/service patrol; and
- incident/emergency management plans.

13-5.05 Enforcement

Enforcement is a critical and unique portion of work zone transportation operations planning. The presence of law enforcement, appropriately deployed, has proven effective in gaining compliance with work zone speed limits to enhance work zone safety. See Section 55-6 for more information.

13-6 COST-EFFECTIVE ANALYSES

13-6.01 General

Along with not obtaining mobility goals, failure to maintain traffic flow during construction can cause driver aggravation, add substantial operating cost to motorists or businesses, and cause unfavorable public relations for the Department. However, these considerations must be balanced against the capital costs to the Department, because limited funds are available.

Capital costs include the building and removal of a temporary runaround, using a local route detour and structurally upgrading its roadway, paying for accelerated construction progress, night work, or providing stage construction that may result in increased unit costs. These options can add considerable costs to the overall project.

For many projects, there may be more than one option that will address the problem of traffic during construction. To determine the most appropriate option, the designer or TMP team must compare the benefits and costs of each to determine the most appropriate option.

13-6.02 Cost Evaluations

13-6.02(a) On-Site

When determining the cost for on-site options (e.g., runarounds, lane closures, crossovers, shoulder use), the designer should consider the following:

- right-of-way costs (temporary and permanent);
- additional construction costs;
- environmental effects;
- vehicular delay;
- user costs (including detour user costs; see Section 13-6.02(c)); and
- crash potential.

When determining the effect of each on-site option, the designer may also consider the effect the selected option will have on unofficial detours (i.e., detours which drivers select on their own to avoid the construction area).

13-6.02(b) Detours

For detours, the designer must determine the total cost of the detour. This includes:

- detour user costs; see Section 13-6.02(c);
- the cost for any improvements needed to the detour route (e.g., repaving, pavement widening, signal improvements);
- the effect the detour will have on the community and local businesses; and

- the effect on the local street network.

13-6.02(c) Detour User Costs

Adverse travel is the additional distance that motorists must travel to complete their trips around the work site while a detour is in use. To reduce project construction costs to the Department and to enable these savings to be used for other needed improvements, it is considered in the best interests of the public for road users to directly share in the costs of road and bridge improvements. Road users will bear some of the costs of reasonable adverse travel. Accordingly, this should be reflected during preparation of TMP. Multiply the computed adverse travel costs by 0.5 before making any comparisons to the costs of other alternative methods of maintaining traffic flow.

Breakout the cost according to the following:

1. <u>Cars, Pickups, and Vans</u>. When computing operating costs for cars, pickups, and vans, *Your Driving Costs* published by the American Automobile Association and available on their website, may be used as a guide to determine the per mile (km) costs.

   Only the operating costs need to be considered in computing per mile (km) costs that include:

   - gasoline and oil (note the gasoline price used for calculation by the publication);
   - maintenance, accessories, parts, and tires; and
   - State and Federal taxes on the above.

   Fixed costs (e.g., insurance, depreciation, license fees, finance charges) need not be considered because they are incurred whether or not a vehicle is driven extra miles (km).

2. <u>Trucks</u>. For truck operation costs, only the operating costs need to be considered in computing per mile (km) costs for trucks. These costs include:

   - diesel fuel for tractor-trailer units and gasoline or diesel fuel for single-unit trucks (note the fuel cost used for calculations by the publication);
   - tires;
   - maintenance (oil, grease, repairs);
   - driver's wages and fringes; and
   - operating depreciation.

   Fixed costs (e.g., tractor or trailer replacement costs, Federal highway use tax, license fees, insurance, finance charges) need not be considered because they are incurred whether or not the vehicle is driven extra miles (km).

These costs may be estimated by multiplying the average car, truck, and van operating costs by 4.5 for SU and 5.5 for MU.

For any additional information on adverse travel costs or on the above listed publications, contact BDE.

13-6.02(d) Example Cost Evaluation

Project – Three Span Bridge, Full Structure Replacement

Option 1 – Detour			
Project Costs	1	Widening and Intersection Improvements	$
	2	Signal Improvements	$
	3	Repairs/Improvements of Local Routes	$
	4	Motorist delay/cost in detour	$
Total Project Cost			$
User Costs	1	Effect on Local Businesses	$
	2	Adverse Travel, Cars	$
	3	Adverse Travel, Trucks, 8% SU, 5% MU	$
Total User Costs			$
Option 2 – Temporary Runaround			
Project Costs	1	Right-of-Way	$
	2	Construction and Removal of Runaround	$
	3	Temporary Bridge	$
Total Project Cost			$
User Costs	1	Motorist delay in work zone	$
Total User Cost			$
Option 3 – Stage Construction			
Project Costs	1	Temporary Longitudinal Traffic Barrier	$
	2	Temporary Traffic Signals	$
	3	Increased Structure Cost due to Staging	$
Total Project Cost			$
User Costs	1	Motorist delay in work zone	$
	2	Longer construction time	$
Total User Cost			$

13-7 EXAMPLE TMP FOR SMALL PROJECTS ON SIGNIFICANT ROUTES

A small project on a significant route may follow this full TMP template:

District X Transportation Management Plan

1. Project Description:

   This project consists of …
   This project is located …
   This project is on (or approaching) a significant route.

2. Work Zone Impacts:

   The impacts to the work zone were evaluated by …

   Based on this evaluation and previous experience with similar work in this area, the project is expected to meet safety and mobility goals of less than X mile queue and less than X minute delay.

3. Selected Work Zone Impact Management Strategies:

   A. Traffic Control Plan: A traffic control plan was developed using Standard Specifications, Special Provisions, and Highway Standards. A copy of the Traffic Control Plan is attached.

   B. Public Information Plan: Project information will be communicated to the public at the beginning of work by use of portable changeable message boards (PCMS) two weeks in advance of construction activities. Media outlets will be informed with a press release two weeks in advance. Both static message boards and PCMS will be used to convey real time information to the public.

   C. Transportation Operations Plan: The scope of this project does not warrant extensive transportation operations strategies. Strategies to be utilized include: Limited work hours, etc.

4. TMP Monitoring:

   The TMP will be monitored during the project for queue length and user delay. Monitoring of TMP will be completed by district personnel as required throughout the duration of the project. Evaluations will be completed daily during work zone activity. Evaluations will be discussed during 50% design reviews with design personnel.

   The Resident Engineer overseeing the project will be responsible for evaluating the need to revise traffic control strategies, and will coordinate these revisions with the Supervising Field Engineer. Contingency plans may be developed with the input of the contractor, Bureau of Construction, and the Bureau of Operations.

Section **Page**

Chapter Fourteen
INTERSECTION DESIGN STUDIES

An Intersection Design Study (IDS) is a graphic representation of a proposed treatment for the development or improvement of an intersection facility. It is based on an analysis of traffic needs and an evaluation of physical and economic elements at the intersection site. Chapter 14 presents the Department's criteria for the preparation of an IDS. Chapter 36 presents the detailed design criteria for intersections.

The primary purpose of an IDS is to provide a review medium for use by the district, BDE, and the general public. The IDS also provides a file reference that documents all pertinent data and information controlling the design of the intersection improvement.

14-1 WARRANTS FOR THE PREPARATION OF INTERSECTION DESIGN STUDIES

Prepare an IDS for intersections if any of the following conditions apply:

- The study location is an intersection of two marked routes.
- The improvement is intersected by either:
  - + a rural highway that has an existing 30th maximum hourly volume greater than 300 vehicles or additional lanes and/or channelization is proposed on one or both routes; or
  - + an urban highway that has an existing 30th maximum hourly volume greater than 400 vehicles or additional lanes and/or channelization is proposed on one or both routes.
- Where complex conditions exist at the intersection (e.g., high crash rate, adverse terrain features, geometric features that will be difficult to correct due to the extent of cultural development).
- Where a roundabout is proposed.
- When requested by the district or BDE in accordance with the engineering study and advance engineering data requirements in the ILMUTCD.

14-2 PREPARATION OF INTERSECTION DESIGN STUDIES

14-2.01 Signalized, Two-way Stop controlled, and All-way Stop-controlled Intersections

Prepare IDS plan sheets on CADD. For guidance on the preparation of plan or profile sheets, see Section 63-4.01. A sample intersection design study for a signalized intersection is illustrated in Figure 14-2.A. To facilitate uniformity, use the following sheet formats:

1. Cover Sheet. The cover sheet layout for two-way stop-controlled and all-way stop-controlled intersections is generally similar, with different Capacity Design Analysis, Elements Controlling Design, and General Notes blocks. In urban areas, the intersection layout is usually drawn at a scale ratio of 1 in = 50 ft (1:500 metric) and in rural areas 1 in = 100 ft (1:1000 metric) or 1 in = 50 ft (1:500 metric). The cover sheet contains the following items:

   - scaled plan view layout of the intersection (including traffic signal locations, if proposed, and striping plan),
   - Capacity Design Analysis table,
   - DHV turning movement diagram,
   - graphic bar scale,
   - Traffic Data table,
   - north arrow,
   - phasing diagram,
   - location map box,
   - existing and proposed right-of-way,
   - Elements Controlling Design data block,
   - General Notes data block,
   - property lines, natural features, and manmade cultural developments, and
   - signature and title block in the lower right-hand corner.

2. Intersection Detail Sheet(s). These sheets are supplemental sheets for intersection details. They may not be necessary (for simple intersections), be a single page or be multiple pages. The need to show special details or cross sections depends on the complexity and size of the intersection. These sheets contain improvements to the approach legs, beyond the intersection proper, when they cannot fit on the cover sheet. In urban areas, the scale ratio is usually 1 in = 20 ft (1:250 metric) and in rural areas 1 in = 50 ft (1:500 metric). Also include the following items on each sheet:

   - graphic bar scale,
   - title block in the lower right-hand corner, and
   - sheet index block in the upper right-hand corner indicating the route, section, county, and sheet numbers.

3. Profile Sheets. Typical grid sheets are used for showing profiles, if profiles are necessary. Use the format illustrated in Figure 14-2.B. Also include the following items on the sheet:

- title block in the lower right-hand corner; and
- sheet index block in the upper right-hand corner indicating the route, section, county, and sheet numbers.

4. Design Vehicle Turning Path Sheets. Include the design vehicle turning paths if generated by computer software.

14-2.02 Roundabout Intersections

1. Cover and Intersection Detail Sheets. Information on these sheets of a roundabout IDS is similar as that described above for signalized intersections

2. Other Sheets.

- Include the baselines of the approach roadways and the central island. The baselines of the approach roadways should follow the median edges of the approaches and be defined by tangents and curve data. Both edges of the median should have a baseline as the alignment of the approaches and departures are independent. Once the baselines reach the outside edge of the circulatory roadway, it should break directly toward the center of the central island. Include a station equation at the center of the central island where the other baselines intersect. The baseline of the central island should be along the outside of the truck apron.

- Include the profiles of the approach roadways along the baselines up to the intersection of the baseline of the central island. Include the profile of the central island along the baseline of the central island. Include the stations equations and elevations at the intersection of the profile of the approach baselines and the profile of the central island.

- Include the design vehicle turning paths for all movements from all approaches.

- Include the fastest paths. Include the radii of the curves and the design speed.

- Include the sight lines for the approaches to show there is adequate intersection sight distance for drivers to perceive and react to the presence of conflicting vehicles, pedestrians, and bicyclists. Evidence suggests that it is advantageous to provide no more than the minimum required sight distance on each approach. Excessive intersection sight distance can lead to higher vehicle speeds that reduce the safety of the intersection for all users.

- Include the phi (Φ) angle. Defined in Section 36-9.04(h), the phi angle should range between 20° and 40°.

- Show the existing and proposed right-of-way, if not shown on Sheet No. 1.

All of the above sheets should have the title block in the lower right-hand corner and sheet index block in the upper right-hand corner indicating the route, section, county, and sheet numbers.

14-3 DATA REQUIRED FOR INTERSECTION DESIGN STUDIES

Document the following data in the IDS:

1. Elements Controlling Design. Chapter 36 presents the design criteria for intersections. On the cover sheet, list all pertinent elements affecting the design of the intersection including:

    - the route designation including highway functional classification for both intersecting routes, where applicable,
    - SRA Route designation, if appropriate,
    - existing and design traffic (ADT) for both intersecting routes;
    - the preferential route;
    - design year and the number of years for which the project is designed,
    - the anticipated year of construction;
    - the type of existing and proposed traffic control including:
        + a statement indicating whether signals will be installed or adjusted;
        + the signal warrant (only one is necessary) from the *ILMUTCD* justifying the use of signal control, or whether new signal installations are a special request; and
        + use of a roundabout;
    - design criteria;
    - Improvement Type. List the type of improvement (e.g., new construction, reconstruction, 3R, safety).
    - design vehicle;
    - truck route designation and whether the routes are to be designed for oversize/overweight vehicles (OSOW), and
    - existing and proposed posted and design speeds on all intersection approaches.

2. General Notes. Include the following information in the general notes on the cover sheet:

    a. Grades. Where all existing grades to remain are greater than 1% or in all cases with any new or altered grades, include a statement that profiles are shown for both intersecting roads and show them on a subsequent sheet. If existing grades are to remain and are all less than 1%, including profiles is optional. Indicate this fact if profiles are not included for these reasons.

b. Curb and Gutter. Indicate the type of curb and gutter to be used on the outer edges of the traveled way, shoulders, channelizing islands, and corner islands.

c. Dimensions. Indicate the type of dimensioning used (e.g., edge-to-edge of pavement, edge-to-edge of traveled way).

d. Design Exceptions. List design exceptions that affect the intersection from design criteria and typical traffic control practice (e.g., large truck turning encroachments, lane widths less than Department criteria, less than desirable level of service, less than desirable storage length for queued vehicles). Include the justification for the design exceptions in the Phase I report.

e. Verification. Note the software or method used to verify sufficiency of the intersection to accommodate turning movements of the design vehicle.

f. Right-of-Way. Indicate if proposed right-of-way limits for the intersection are preliminary.

g. Other. A cell is available for additional information not listed elsewhere that will add information relevant to the operation of the intersection, address unique policies or regulations, and/or aid in the review of the IDS.

3. Capacity Analysis. Perform and document the capacity analysis of the IDS according to the following guidelines:

   a. Source Document. Use the *Highway Capacity Manual* and the *Highway Capacity Software* (distributed by the McTrans Center for Microcomputers in Transportation) for the capacity analyses. The use of any other capacity techniques and software must be first approved by BDE; see Section 36-1.07.

   b. Signal Phasing. For signalized intersection, illustrate the proposed signal phasing for the level of service determined from the capacity analysis in diagrammatic form. Orient the signal phasing diagram to be consistent with the plan view of the intersection and any other pertinent diagrams.

   c. Results. Document the data and results of the capacity analysis for each leg of the intersection. Use Figure 14-3.A for a signalized intersection, Figure 14-3.B for a roundabout intersection, Figure 14-3.C for an all-way stop-controlled intersection, and Figure 14-3.D for a two-way stop-controlled intersection.

4. Traffic Data. Provide the following traffic data on using the format illustrated in Figure 14-3.E:

   a. Traffic Movements. Provide a tabular listing of all movements to and from each leg of the intersection during the a.m. and p.m. 30th maximum hour for the existing and design years. . Also, prepare a traffic diagram for the design year showing all 30th maximum hour movements within the intersection. Orient the traffic diagram to be consistent with the plan view of the intersection and any other pertinent diagrams.

b. Percent Truck Traffic in 30th Maximum Hour. Provide the percentage of vehicles with more than 4 wheels touching the pavement..

c. Estimated Percent Increase. Include the percent of traffic increase between the existing year's traffic and the design year's traffic.

5. Intersection Layout and Design. Provide the following intersection layout and design information on the cover sheet and, if necessary on subsequent sheets:

a. Centerline. Show the centerline information for all proposed and existing curves within the immediate area of the intersection. Include superelevation rates and transition stations. Label the station equation for all intersecting side roads.

b. Angle. Note the angle of intersection between the two intersecting roadways and between the roadways and side roads.

c. Location Map. Provide a small scale location map, covering a sufficient area to properly identify the location of the improvement. It should portray the existing street or local road network and any municipalities adjacent to the improvement. Layout the map with North in the same direction as shown on the intersection layout.

d. Auxiliary Lane Lengths. Indicate lengths for all auxiliary lanes.

e. Widths and Dimensions. Include lane, median, driveway, and sidewalk widths. Include the radii for all curb returns and offsets for two and three center curb returns.

f. Tapers. Indicate all taper lengths and rates.

g. Scales. Provide a bar scale on each sheet.

h. Topographic Features. Indicate all limiting topographic features or cultural developments including:

- existing and proposed access driveways;
- existing and proposed right-of-way lines and any access control limits;
- property lines;
- property identification numbers, business names, land uses, and buildings;
- sidewalks, curb ramps, and other accessibility requirements, see Chapter 58; and

- other factors controlling the intersection design (e.g., retaining walls, utilities, gasoline pumps, other appurtenances).

i. Signals. Show the proposed signal and controller locations and signal phasing diagram. Prepare these according to the criteria and guidelines presented in Chapter 57. This information will ensure compatibility with other design elements, right-of-way, and traffic flow (progression).

j. Signs. For complex intersections, show the proper placement of signs and traffic control devices. Because signing distance and legend requirements could influence the design of complex facilities, include a preliminary signing plan with the IDS for all complex intersection designs.

k. Striping. Include the proposed striping details on the IDS as well as on Phase I plan sheets.

l. Control Points. Provide the station and offset of all control points, including all island noses, radius return points of curvature and tangency, and centerline or baseline control points.

6. Title Block. Only the individual personally responsible for the intersection design will occupy the “Designed By” line in the title block.

14-4 INTERSECTION DESIGN STUDY PROCESSING

Intersection design studies (IDS) are normally prepared under the direction of and approved by the District Geometrics Engineer. Upon completion of the IDS, it is approved by the district as illustrated in the signature block in Figure 14-2.A and included in the Phase I report. BDE will review and approve IDS's if requested by the district or if the district does not have a qualified Geometrics Engineer. The procedure to qualify a District Geometrics Engineer is discussed in Section 11-9.

When projects require an IDS, the district should not conduct public involvement activities without a completed IDS which reflects the most recent design alternatives. When an IDS is prepared by a qualified Geometrics Engineer, reviewed according to current geometric design policies, and approved by the District Geometrics Engineer, it may be included as part of the Phase I report. Upon approval of the IDS, the district will submit a completed BDE 2602 template to BDE for status information of the IDS.

Final approval of an IDS is given with the design approval of the final Phase I report. This ensures the consideration of social, economic, and environmental factors and public comments that could affect the design elements of an intersection. In addition, a crash analysis and relevant collision diagrams may be reviewed concurrently with the IDS.

If intersection conditions are complex, the district, at its option, may forward the IDS to BDE for early review. In this case, the IDS is reviewed with particular emphasis on compliance with accepted design practices, methods of managing or controlling access, intersection capacity, signal phasing, operational safety, efficiency, and any needed design exceptions. BDE may recommend changes to the IDS. If changes are recommended, the comments are forwarded to the district for revision. After the revised IDS is reviewed and considered satisfactory, it is then approved by the District Geometrics Engineer or BDE for inclusion in the Phase I report.

Chapter Fifteen

INTERCHANGE TYPE AND DESIGN STUDIES

Chapter 37 presents criteria for determining the warrants, application, and selection of various interchange types.

15-1 INTERCHANGE TYPE STUDIES AND ADDITIONS

The functional classification of the crossroad has a significant impact on whether an interchange is warranted and the type of interchange selected. In addition, traffic operations (e.g., freeway ramp terminal spacing, mainline weaving, level of service, signing) may affect the interchange type and spacing, especially in urban areas. The following sections present guidelines on the preparation and processing of Interchange Type Studies.

15-1.01 Purpose of Interchange Type Studies (ITS)

Interchange Type Studies (ITS) are prepared to determine the preferred type, to aid in developing the design of the selected type, and to minimize the number of man-hours used before detailed design studies are initiated. When a corridor/design study is initiated for a new freeway or expressway, the Phase I project study group prepares a brief report that includes proposed interchange locations and describes the proposed interchange type at each location.

An existing freeway may require an additional interchange due to urban development or due to lack of proper access to an area, or an expressway may require the upgrading of an existing intersection to an interchange. In all cases, the proposal to provide an interchange must be justified and documented and may require an Interchange Type Study. Section 37-1 provides the guidelines for justification of need, and the results of the entire Study are documented in a report entitled *Request for Additional (Modified) Interstate (Freeway or Expressway) Access*.

As part of the access report, include the necessary information as discussed in Chapter 19 and in Part III, Environmental Procedures, that demonstrates the public benefits and need for an interchange (i.e., the “Purpose and Need”). See Chapter 35 for details on access control along the crossroad.

If the district determines that a conventional diamond or parclo Type C interchange is the most appropriate type of interchange at a particular location, an Interchange Type Study is not required. However, the district may prepare and submit an Interchange Type Study to BDE for review if assistance would be beneficial.

For complex interchanges, BDE involvement in type studies is recommended because of the larger number of alternatives requiring analysis and the typically higher costs. Complex interchange designs usually require more supporting information, such as:

- crossroad, ramp, and mainline profiles;
- access restrictions;
- weaving analyses;
- capacity analyses of entrance and exit terminals;
- lane balance;
- route continuity coordination;
- preliminary signing plans;
- topography;
- existing cultural developments; and
- cost estimates.

15-1.02 Guidelines for Preparing Interchange Type Studies

Use the following guidelines to prepare the Interchange Type Study:

1. Base Exhibits. Prepare a schematic drawing of the interchange layout on a print of an aerial mosaic or aerial mapping using a scale of 1 in = 400 ft (1:5000 metric) or 1 in = 600 ft (1:7500 metric). For complex interchanges, use a scale of 1 in = 200 ft (1:2500 metric) for rural areas and either a 1 in = 100 ft (1:1000 metric) or 1 in = 50 ft (1:500 metric) scale for urban areas. Figure 15-1.A illustrates a typical schematic drawing of an interchange layout. In addition, it is desirable to include a county map and a 0°7′30″ quadrangle map as exhibits with the ITS. In urban areas, also include a city map showing the proposed interchange location(s).

2. Alternatives. When interchange type selection is controversial, prepare alternative schematics on separate aerial mosaics. Indicate which alternative is preferred and the rationale used in the selection.

3. Content. Schematic drawings may be prepared in the form of a single-line diagram. Show the layout of the mainline, crossroad, and ramps. Include the following information:

    - traffic flow diagram for projected DHV (e.g., typically based on 20 years);
    - functional classification, design speed, and design traffic volumes of both routes;
    - angle of intersection between mainline and crossroad;
    - angle of intersection between ramps and crossroad;
    - typical cross sections, including shoulder widths;
    - all existing and proposed radii of ramps and roadways;
    - lengths of left-turn lanes and taper rates;
    - limits of access control along the crossroad;
    - limits of ramps on the mainline and crossroad;

- any proposed structures;
- any proposed local road relocation and frontage roads or service drives;
- property lines and names of land owners; and
- any relevant photographs of the area.

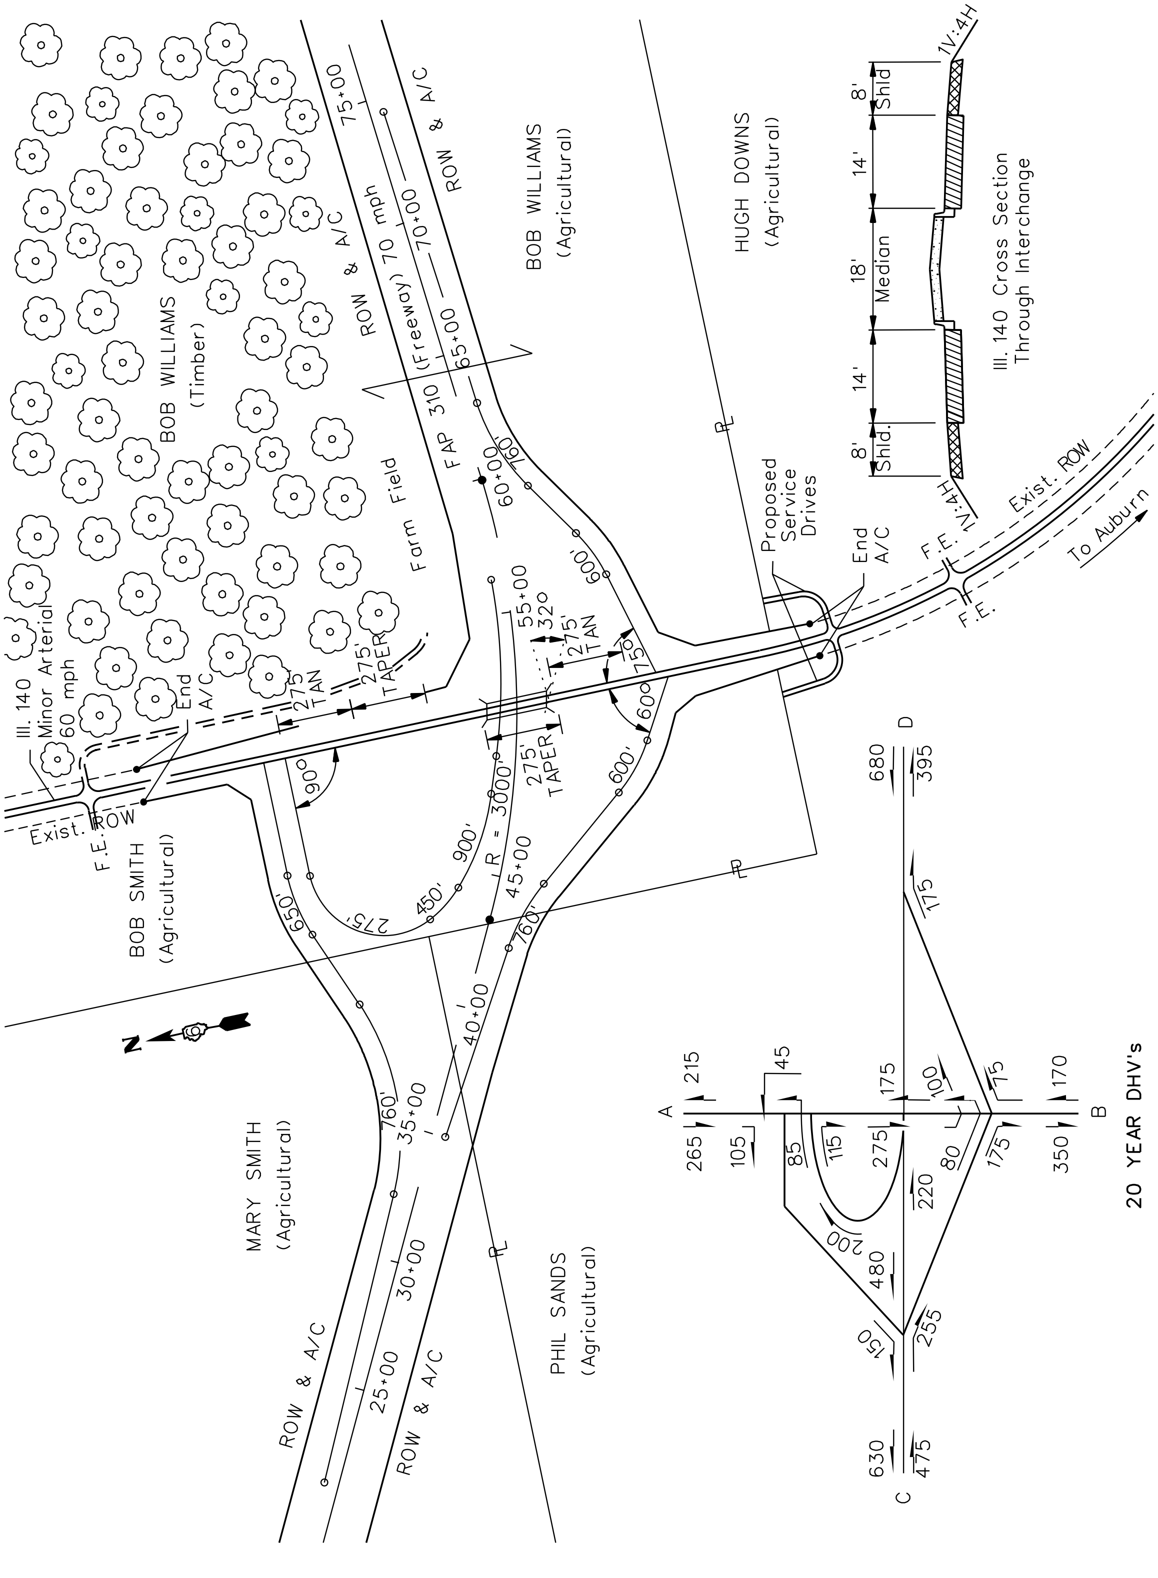
4. Special Conditions. List any special conditions (e.g., wetlands, historic site, archeological site) that support the development of an unusual interchange type, and include all necessary elements that control the design. Provide a statement regarding satisfactory alignments and profiles in conjunction with the design. If the development of preliminary profiles are necessary, include them with ITS.

15-1.03 Processing Interchange Type Studies

The district is responsible for preparing the Interchange Type Study (ITS). Districts with a qualified Geometrics Engineer can approve the ITS.

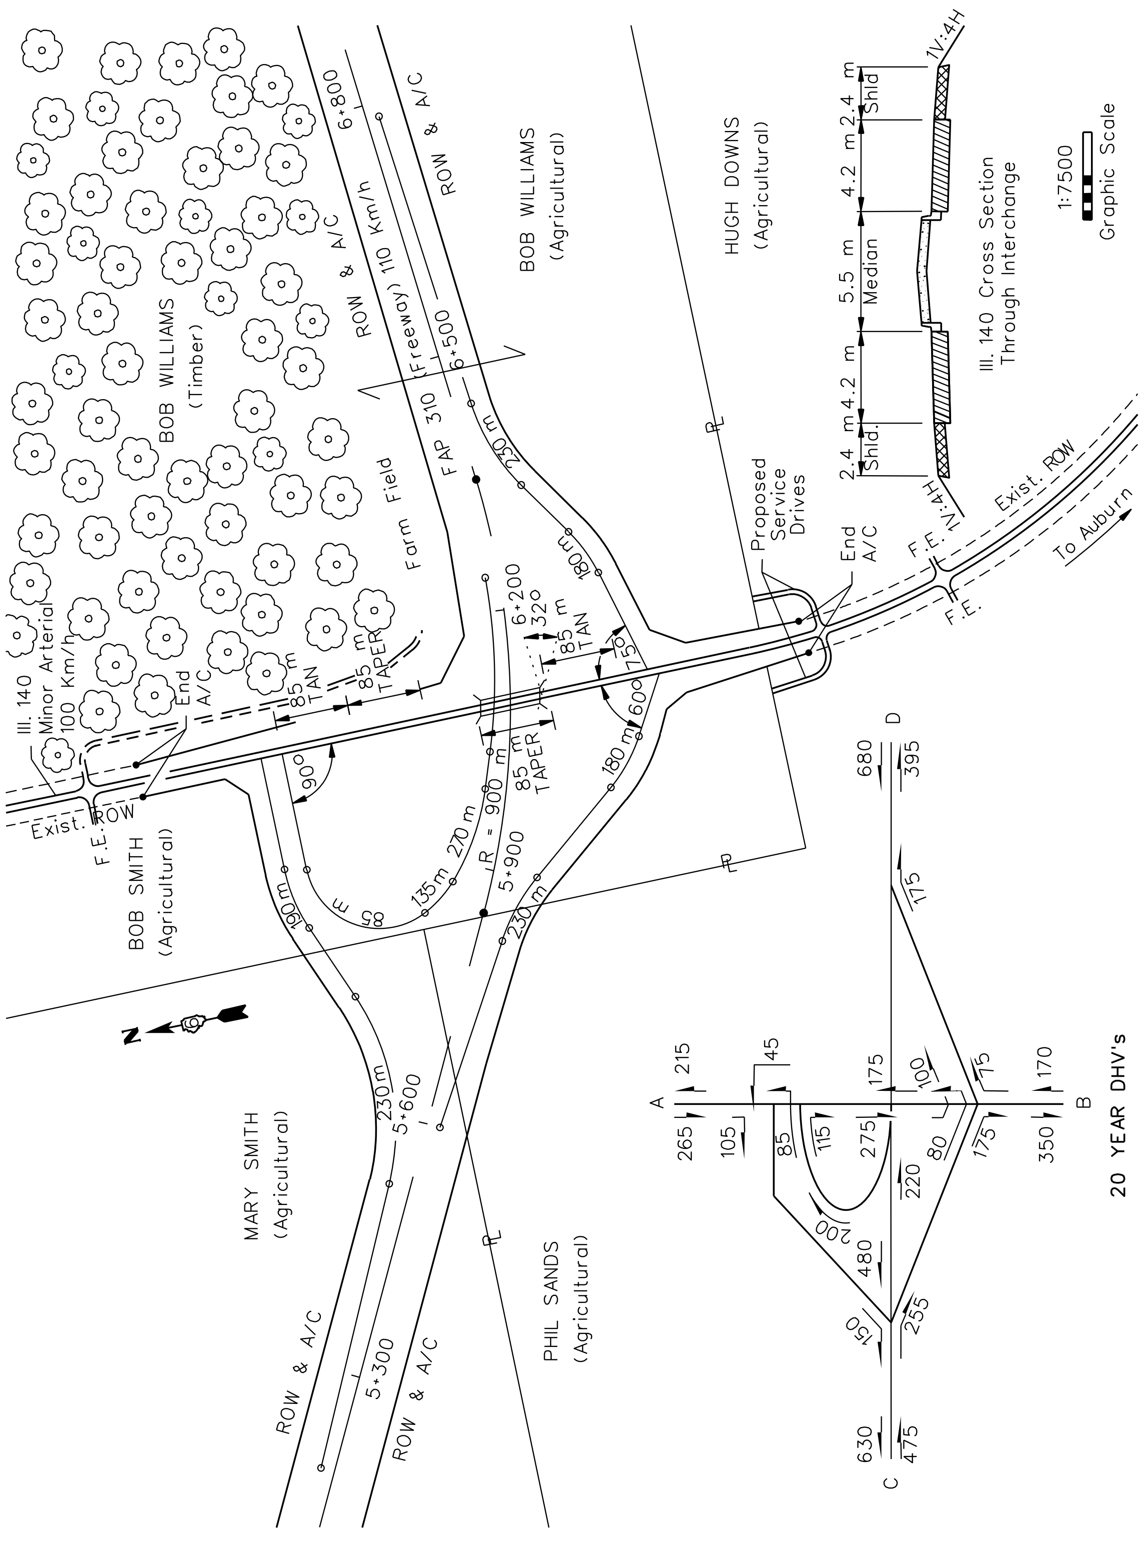
Access Justification Reports (AJRs) and access control changes on Interstates require coordination with headquarters. This is due to the complex nature of the designs and issues involved, and the need for statewide consistency. BDE will review and approve the documents for transmittal to FHWA for final Federal approval. If ITS is a part of access control modification and/or access justification report, the district should submit the report to BDE for review and approval.

Once the type study, interchange addition, or proposed change in access has been approved and, where necessary approved by FHWA, the district may initiate the preparation of the Interchange Design Study, as discussed in Section 15-2.



TYPICAL SCHEMATIC OF AN INTERCHANGE TYPE STUDY
(US Customary)

Figure 15-1.A



TYPICAL SCHEMATIC OF AN INTERCHANGE TYPE STUDY (Metric)

Figure 15-1.B

15-2 INTERCHANGE DESIGN STUDIES

Interchange Design Studies (IDS) are required for all interchange facilities. After the interchange type has been approved, preparation of IDS can be initiated. However, before design work is started, a field review should be made to each interchange location. The following sections discuss the guidelines and procedures for preparing IDS.

15-2.01 Guidelines for Preparing Interchange Design Studies

The IDS base sheets are standardized and available in the IDOT CADD cell library. These standardized sheet sizes along with formatting details are used in developing IDS. In general, prepare IDS in the same manner as an intersection design study; see Chapter 14 for format details. Figures 15-2.A, 15-2.B, 15-2.C, 15-2.D, and 15-2.E illustrate the typical format that should be used for uniformity on IDS plans. In addition, consider the following guidelines:

1. General.

   a. Drafting. The entire IDS is prepared on CADD. A controlled-scale aerial mosaic or aerial mapping usually is the base for development of IDS. This base is the visual description of the existing topography. Photographic inserts may be added for additional clarification.

   b. Scales. For interchange designs on new alignment, use topographic mapping at 1 in. = 200 ft (1:2500 metric) for the interchange layout. This scale allows the entire interchange to be shown on one sheet without match lines and also allows all property lines and roads to be shown around the interchange. If the interchange is being developed as a result of a planned upgrade of an existing route, usually an expressway design, use a scale ratio of either 1 in. = 100 ft (1:1000 metric) or 1 in. = 50 ft (1:500 metric). Also, for interchange designs in urban areas, the same scale ratios of either 1 in. = 100 ft (1:1000 metric) or 1 in. = 50 ft (1:500 metric) may be used. Larger scales aid in the decision-making process, especially where cultural land development or elevation restrictions are an issue.

2. First Sheet. Include the following information on the first sheet:

   a. Topography/Cultural Features. Include all houses, businesses, major utilities, roads and streets, right-of-way, access control lines, and structures on the topographic mapping. If contour lines are desired, plot them as light lines so they do not detract from the line work of the proposed interchange.

   b. General Notes. Include references to design exceptions, crash data, cultural development, terrain, improvement type, etc. See Section 14-3 for additional information.

c. Elements Controlling Design. Chapter 37 presents the design criteria for interchanges. On Sheet No. 1, list all pertinent elements affecting the design of the interchange.

d. Interchange Layout. Include horizontal alignment details, stationing, and proposed structures.

e. Capacity Analysis Table. For ramp/crossroad intersections, include the capacity analysis table in the upper left-hand corner. This table summarizes the results of the capacity analysis. See Chapter 14 for an example of the format.

3. Second Sheet. Show the details for each ramp/crossroad intersection, any specially designed free-flow terminals, and how the crossroad turn lanes are designed. If more space is needed, use an additional sheet for details. See Figure 15-2.B. Select a scale that will allow the details to be clearly shown. Include the capacity table for free-flow ramp terminals; see Figure 15-2.F. If weaving areas are proposed, also include a weaving analysis table as illustrated in Figure 15-2.G. This table should include a summary of the ramp capacity analysis and the number of lanes required.

4. Profiles. After the crossroad details, show the profiles for the mainline and crossroad through the interchange; see Figure 15-2.C. Next, include the profiles for each ramp; see Figure 15-2.D. Where necessary, include detailed profiles for each turning roadway at the ramp crossroad intersections.

5. Cross Sections. After the profile sheets, show all the necessary controlling cross sections adjacent to the mainline, a cross section for the mainline, if applicable, and a typical section of the ramp proper; see Figure 15-2.E. Figures in Chapter 37 indicate the locations where controlling ramp cross sections should be taken.

6. Interchange Models. For very complex interchanges, it may be desirable or necessary to prepare a model for evaluating alternative interchange design features. This can be accomplished using a computer software package (i.e., GEOPAK) or by preparing a simple, three-dimensional model. The model may be developed by mounting the plan layout onto thin cardboard and then pasting the mainline, crossroad, and ramp profiles onto the plan sheet of the roadway alignment.

15-2.02 Processing Interchange Design Studies

The Interchange Design Study (IDS) is prepared under the direction of and approved by the District Geometrics Engineer or BDE. Upon approval of IDS, the district will submit a completed BDE 2602 template to BDE for status information of IDS. The BDE will review and approve IDS if requested by the district or if the district does not have a qualified geometrics engineer. The procedure to qualify a District Geometrics Engineer is discussed in Section 11-9.

IDS on the Interstate system will require FHWA approval. IDS's used at public involvement activities should reflect the most recent design alternatives. Final approval of IDS is given with design approval of the Phase I report. This final approval ensures that the social, economic, and environmental factors have been properly considered. Once the Phase I report has been approved, the IDS can then be used in the preparation of the detailed construction plans.

Table of Contents

Section **Page**

Table of Contents
(Continued)

Section **Page**

Chapter Sixteen
REST AREAS/WEIGH STATIONS

16-1 REST AREAS

16-1.01 General

Rest areas are an essential element of the complete highway system. They are provided for the safety and convenience of the traveling public. A rest area provides an oasis for weary travelers to relax and refresh from the rigors of highway travel. A comfort station is provided to accommodate the basic needs of the traveling public. Multi-use land is also provided for picnic tables and limited recreational activities. Rest stops for two-lane highways are discussed in Section 16-1.06.

Welcome centers are rest areas located at port-of-entry routes that also provide a full range of amenities. Welcome centers are staffed to provide assistance to travelers regarding directions, lodging arrangements, automotive services, food services, and many other activities. Welcome centers also promote local tourist attractions. Tourist information centers are rest areas that provide amenities similar to welcome centers but are located on interior routes and generally serve a specific tourist area.

16-1.02 Rest Area Committee

The Rest Area Committee (RAC) is comprised of members of the Office of Program Development and the Office of Highways Project Implementation and directs the rest area program to ensure that the Department's objectives are met. The Committee is co-chaired by the Directors of the Offices of Program Development and Highways Project Implementation. The responsibilities and Committee objectives are as follows:

1. Central Bureau of Operations. This Bureau is responsible for maintaining the rest areas, comfort stations, signing, and traffic operations.
2. Bureau of Design and Environment. The BDE will have one representative on the Committee.
3. District. One representative from the district will serve on the Committee, and the district is responsible for providing the environmental survey of the site and the geometric design of the rest area.

4. Committee. The Committee's responsibilities include:

   - reviewing and evaluating all applicable guidelines, policies, and procedures for the location and design of a rest area facility;
   - establishing priority projects and coordinating the construction program; and
   - recommending corrective rehabilitation treatments as appropriate.

16-1.03 Departmental Responsibilities

The recommended actions of the RAC are carried out by the districts, BDE, and Bureau of Operations. Their responsibilities are noted in Figure 16-1.A.

16-1.04 Interstate Rest Area Design Components

16-1.04(a) Spacing

Select and acquire the site for the rest area concurrently with the acquisition of the freeway right-of-way. Use a one-hour driving time to determine the average spacing between rest areas. However, many factors influence the final location of the site.

16-1.04(b) Site Selection

Rest areas should be developed as part of a comprehensive program that considers:

- the attractiveness of the location,
- the site's topography,
- the distance from other rest areas,
- the distance between interchanges, and
- the availability of water and utilities.

Consider the following additional information during the site selection process:

1. Needs Assessment. The RAC, in cooperation with the district, will make the determination that a rest area is to be constructed within certain limits of a freeway corridor.

2. Site Investigation and Prioritization. Representatives of the Committee and the district will investigate potential sites and prioritize the sites using the form illustrated in Figure 16-1.B. Site selection basically considers the scenic quality of the area, access to the area, and the site's adaptability to development including available utilities.

3. Residential and Industrial Areas. Desirably, do not locate rest areas near residential or industrial areas due to noise and fumes. New rest areas or improvements to an existing rest area may be considered a Type I project for noise and consequently require a noise

analysis. Traffic noise analyses shall be conducted in accordance with Section 26-6 "Noise Analyses" of this BDE Manual. The *IDOT Highway Traffic Noise Assessment Manual* has been prepared to provide guidance on how to implement the policy for IDOT projects o*r projects being reviewed by IDOT. The guid*ance manual provides information to be included in the environmental documentation.

4. Airports and Lighting Zones Desirably, do not locate rest areas near airports, air fields or heliports, which have airspace restrictions prohibiting highmast light towers. Also avoid observatories and areas having lighting ordinances which discourage the type of site lighting necessary for rest areas.

5. Water and Sewer Needs. As practical, use a municipal service for the facility's water and sewer system. Recommend using municipal services to reduce operating costs. If access to a municipal system is unavailable, provide well water and an on-site waste disposal system. Contact the Illinois State Geological Survey for assistance in evaluating the water conditions of a proposed site. Also, contact local well driller/ contractors for local history of water depths.

6. Right-of-Way Needs. Approximately 25 acres (10 ha) of right-of-way are necessary to accommodate each site.

7. Locations Near Interchanges. Where a rest area is located near a freeway interchange, provide a minimum distance of 3000 ft (1000 m) between the ramp gores of the rest area and the interchange. Provide a greater distance where a rest area ramp is near a major convergence or divergence.

8. Juxtaposition of Rest Areas. Locate rest areas on a freeway so that the rest area approaching on the right precedes the rest area on the opposite side of the freeway and separate them by at least 0.25 miles (400 m). Where rest areas are located closer than the desired distance, consider providing a fence or other physical barrier in the median to restrict crossover pedestrian traffic. Locate rest areas near median crossovers to allow maintenance operations to easily access both locations.

9. Entrance and Exit Ramps. Design rest area entrance and exit ramp terminals according to the typical design criteria used for interchange ramps. See Section 16-1.04(e).

Once a site has been selected, presented to the RAC, and inspected by representatives of the FHWA for preliminary approval, prepare a Phase I report and submit it to the BDE for obtaining FHWA approval.

EVALUATION CRITERIA FOR SITE SELECTION, LAYOUT, AND DESIGN OF INTERSTATE REST AREAS

Figure 16-1.B

16-1.04(c) Vehicle Capture Rates/Parking and Usage Requirements

National studies indicate that approximately 10% of the total Average Daily Traffic (ADT) will enter a rest area. A study conducted by the Department concluded that 9% of passenger cars and 15% of trucks in the approaching traffic stream will enter a rest area. Based on ADT, the criteria for estimating the number of vehicle parking stalls (per type), picnic tables, and litter receptacles required at a rest area are illustrated in Figure 16-1.C.

The annual growth of traffic on the Interstate highway system has created the demand to increase vehicle parking requirements for new and rehabilitated rest areas. The RAC has established that a facility should be maximized at 50 passenger car stalls and 40 truck stalls. Where site conditions restrict full compliance of the maximum requirements, apply the values obtained from Figure 16-1.C.

The criteria for determining the number of persons projected to use the rest area, the anticipated demand for water, and the type of rest room facilities that should be provided are illustrated in Figure 16-1.D.

Route ____________________________ Rest Area ________________________ NSEW-Bound

County _________________________ Analyst ______________________________ Date ______________________________

Two-Way ADT ___________________________________ (Current/Projected) Year ______________________________

x 0.60 Directional Distribution (1 Way ADT) ______________________________

x 0.11 Design Hourly Volume (30th Max. Hr.) DHV $\boxed{}$

Parking Requirements	
Trucks	**Passenger Cars**
% Trucks _____ x DHV = ___________________ x 0.15 Entering Veh. = _____________________ x 0.50 Dwell Time/Turnover $\boxed{}$ Min. Required Truck Stalls (One Side Only)	% P. Cars _____ x DHV = ___________________ x 0.09 Entering Veh. = ______________________ x 0.34 Dwell Time/Turnover $\boxed{}$ Min. Required P. Car Stalls (One Side Only)*

Notes:

*1. *Passenger car stall requirements should be increased 25% for welcome centers.*
2. *Provide one (1) accessible stall per 25 passenger cars in the passenger car parking area.*
3. *Provide one (1) accessible stall per 25 trucks in the truck parking area.*
4. *See Section 16-1.05(d) for maximum number of vehicle parking stalls.*

Picnic Tables	Litter Receptacles
DHV x 0.008 = $\boxed{}$ (Generally, 33% are sheltered.)	DHV x 0.0008 = $\boxed{}$

Determination of Design Guidelines
for Rest Area Parking Requirements

- Enter with two-way **ADT** for current or projected year.
- **Directional Distribution** — A 60/40 distribution is a typical split on the Interstate highway system.
- **Design Hourly Volume** — The DHV represents the 30th maximum hourly volume of the year (30 HV). In this case, it represents the vehicles on the mainline that approach a rest area in one hour. Typical conversion of ADT to DHV on the Illinois Interstate system is 11% as indicated in *Traffic Characteristics on Illinois Highways — Bi-Annual Report OPP*.
- **Trucks/Cars as % of Traffic** — Enter actual truck and passenger car percentages of the appropriate highway section and multiply by the DHV.
- **Percent of Entering Vehicles** — Typically, 15% of the trucks and 9% of the passenger cars enter the rest area.
- **Dwell Time** — Assume a dwell time of 15 minutes for trucks and 10 minutes for passenger cars. A factor of 2 is used to convert to 30 minutes (0.50 hour) for trucks and 20 minutes (0.34 hour) for passenger cars.

DESIGN GUIDELINES FOR INTERSTATE REST AREA PARKING REQUIREMENTS

Figure 16-1.C

Route ____________________ Rest Area __________________________ Date ______________

County Analyst ____

Two-Way ADT (Current/Projected) Year __________________

	x	0.60	Directional Distribution (One-Way ADT)		______________
	x	0.11	Design Hour Volume (30th Max. Hr.)		______________
	x	0.10	Vehicles Entering Rest Area Per Hr.		______________
	x	2.0	Average Vehicle Occupancy		______________
	x	0.85	Persons/Rest Room Usage =	**P/RU**	______________
	÷	60	Persons Per Minute		______________
*	x	2.5	Gallons (9.5L) Per Person **=**	**GPM (LPM)**	[ ]
	x	60	Gallons (Liters) Per Hour **=**	**GPH (LPH)**	[ ]
	x	12	Gallons (Liters) Per Day **=**	**GPH (LPD)**	[ ] (One Side Only)

Notes:

**1. Ensure that the momentary peak flow rate (GPM (LPM)) is twice the design flow rate or the total toilets and urinals times 5 GPM (19 LPM), whichever is less for a period of two hours.*

2. Check water supply systems to determine the impact of momentary peaks.

3. Provide design usage at a pressure of 40 psi (275 kPa).

DESIGN GUIDELINES FOR INTERSTATE REST AREA USAGE AND WATER NEEDS

Figure 16-1.D
(1 of 2)

- Enter with **Two-Way ADT** for current or projected year.

- **Directional Distribution** — Use a 60/40 distribution, which is a typical split on the Interstate highway system.

- **Design Hourly Volume** — The DHV represents the 30th highest hourly volume of the year (30 HV). In this case, it represents the vehicles on the mainline that approach a rest area in one hour. Typical conversion of ADT to DHV on the Illinois Interstate system is 11% as indicated in *Traffic Characteristics on Illinois Highways — Bi-Annual Report OPP*.

- **Vehicles Entering Rest Area** — Typically, 15% of the trucks and 9% of the passenger cars will enter the rest area. Using a typical Interstate truck percentage of 28% and 72% for passenger cars, the capture rate of passing vehicles is a weighted average of 10%. On Interstate routes where the truck percentage is 45%, the weighted average is 16%. Various truck percentages can be interpolated to determine the weighted average.

- **Vehicle Occupancy** — Vehicle occupancy is determined to be 1.83 persons per vehicle; however, the weekend rate is 2.3. Use a weighted average of 2.0 for these calculations.

- **Persons/Rest Room Usage** — Of the people entering a rest area, 85% will utilize the rest rooms. A slightly higher percentage of men use the rest rooms than women, but the difference is not significant to warrant any difference in rest room conveniences.

- **Water Usage** — Use a value of 2.5 gallons (9.5 L) per person to determine the peak gallons (L) per minute rate (based on low-volume flush toilets and urinals). Provide for enough on-site water storage to handle peak traffic volumes.

- **Water Usage Per Day** — The multiplier of 12 is based on GPH (gallon per hour) (LPH, liters per hour) rate for two hours per day, 80% of GPH occurring for eight hours and 25% of GPH occurring for 14 hours. Hence, GPD = (GPH) (2) + (0.8 GPH) (8) + (0.25 GPH) (14) = 11.9 round to 12.

- Use the **P/RU** value in the table to determine the desirable rest room amenities.

DESIGN GUIDELINES FOR INTERSTATE REST AREA USAGE AND WATER NEEDS

Figure 16-1.D
(2 of 2)

16-1.04(d) Other Design Elements

Consider the following guidelines during the design of rest areas:

1. Buffer Zone. To enhance patron safety, locate the facility a minimum distance of 100 ft (30 m) away from the freeway to create a buffer zone to the nearest use area.

2. Parking. See Section 16-1.05(d) for information on vehicle parking requirements.

3. Internal Roadways. Design internal rest area roadways for a minimum speed of 20 mph (30 km/hr) and a desirable speed of 25 mph (40 km/hr).

4. Curbing. Curbing may be used on internal roadways to restrict illegal parking on the shoulder and to minimize vehicular encroachment.

5. Fencing. Fence the rest area right-of-way to prevent access to or from adjacent properties.

16-1.04(e) Entrance and Exit Ramp Terminals

Provide access to and from rest areas according to the typical ramp terminal designs presented in Chapter 37 and the *Highway Standards*. Also consider the following additional information on entrance and exit ramp terminals:

1. Exit Ramps. Design initial ramp curves for 50 mph (80 km/hr) and limit superelevation to 6% maximum. Provide decision sight distance for the exit maneuver. Provide a deceleration distance of 600 ft (180 m) from the gore of the exit ramp to the car/truck divergence gore. See Section 37-6.01 for additional guidance.

2. Entrance Ramps. Provide a minimum distance of 1200 ft (350 m) from the truck parking area to the gore nose on the entrance ramp. This distance typically will allow a truck to accelerate to an acceptable speed before entering the freeway. Adjust the acceleration distance where the ramp terminal is on a grade greater than 3% or where the freeway level of service is adversely affected by the truck's merging speed. See Section 37-6.02 for additional guidance.

16-1.04(f) Parking Area and Internal Roadway Requirements

Typically, truck parking areas are located to the rear of a site. An exception to this would be if the terrain or a scenic vista would be better served if passenger cars were located at the rear of a site. The truck parking area should typically provide a center aisle 30 ft (9.2 m) wide with 45-degree diagonal parking on both sides; however, 35-degree may be used in confined areas.

Design exit aisles to be 28 ft (8.6 m) in width, minimum, with an adjacent B-9.18 (B-22.45) curb and gutter. Desirably, place an island in the truck parking area near the center walkway to the comfort station. This island may contain a telephone kiosk and picnic tables. Design ramp widths and roadway geometry to accommodate a WB-67 (WB-20) design vehicle assuming the Case I condition. Ramp widths are normally 16 ft (4.9 m) wide; however, increase this width to accommodate truck off-tracking when providing a curved alignment. See Section 36-2.03 for turning roadway widths that are also applicable to rest areas. Chapter 37 provides additional criteria regarding entrance/exit ramp design.

Within the car parking area, the through roadway width of 20 ft (6.0 m) is desired with diagonal parking generally on both sides of the roadway. Provide B-6.18 (B-15.45) curb and gutter within the vehicle parking area.

For typical details for rest area parking, including typical accessible parking stall locations, typical accessible parking striping layout, the required number of accessible parking spaces, and a typical ramp cross-section, see Figures 16-1.E through 16-1.H. Note that accessible parking spaces and accessible passenger loading zones shall be the spaces or zones closest to the nearest accessible entrance of the comfort station. Further, an accessible route must be provided from the accessible spaces or zones to the comfort station entrance. See Chapter 58 for additional guidance.

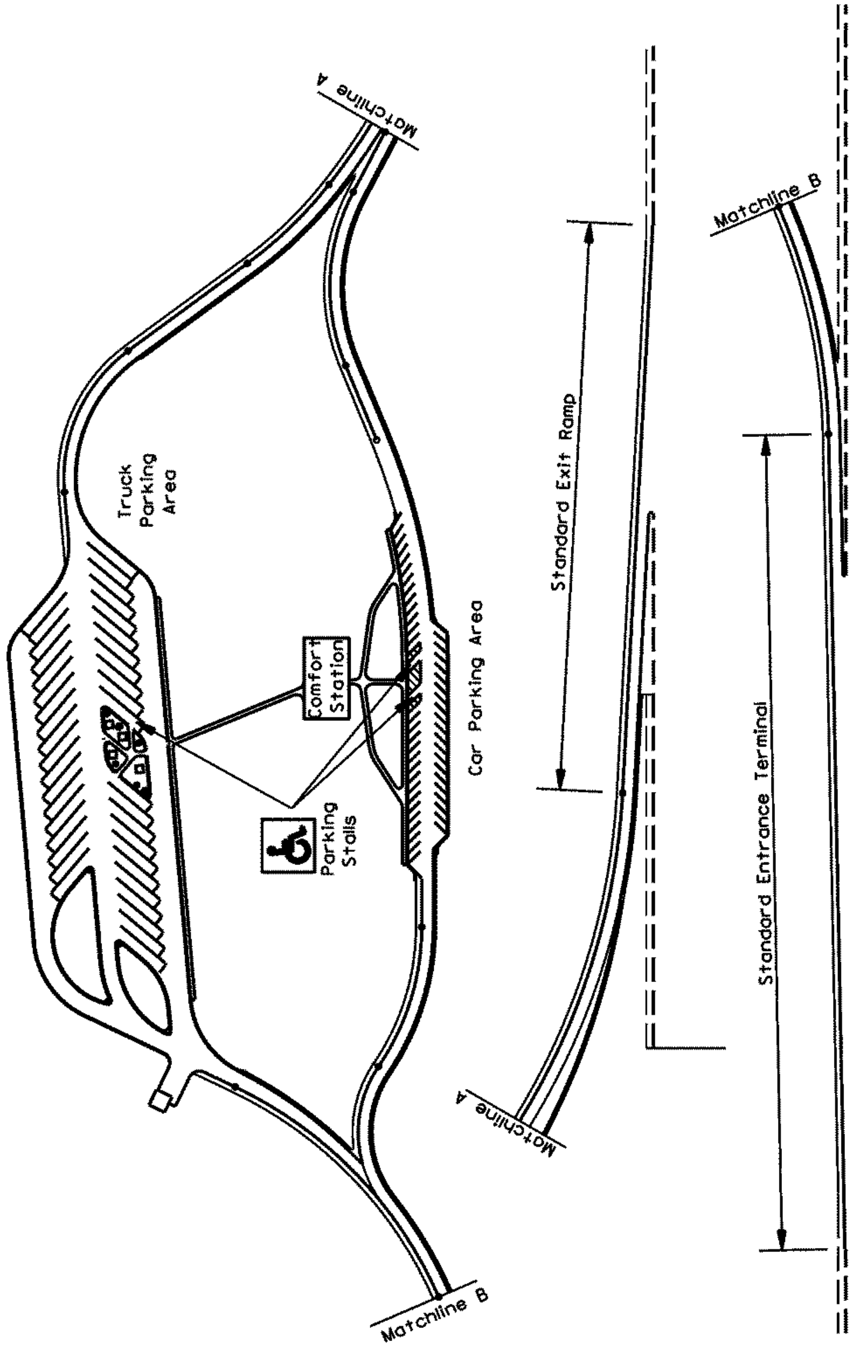
16-1.04(g) Pavement/Shoulder Design

Design the rest area exit and entrance ramps, roadways, shoulders, and parking areas according to Section 54-1.07. The concentration of heavy trucks braking on the ramps and inner roadways and the sharp turning maneuvers to enter parking stalls requires these facilities to be considered “high stress” locations. See Chapter 54 for guidelines on “high stress” pavement designs. Design ramps to handle overflow truck parking on shoulders (40,000 lbs (16,000 kg) plus for each truck).

Figure 16-1.H illustrates a typical ramp cross section with 1V:4H side slopes and pipe underdrains. In areas where curbing is desired to restrict trucks from parking on the shoulder, use a B-9.24 (B-22.60) curb and gutter. For truck parking areas, use a B-6.18 (B-22.45) curb and gutter with a 1 ft (300 mm) wide curb top. For car parking areas, use a B-6.18 (B-15.45) curb and gutter. Ramp all island noses for safety and ease of maintenance.

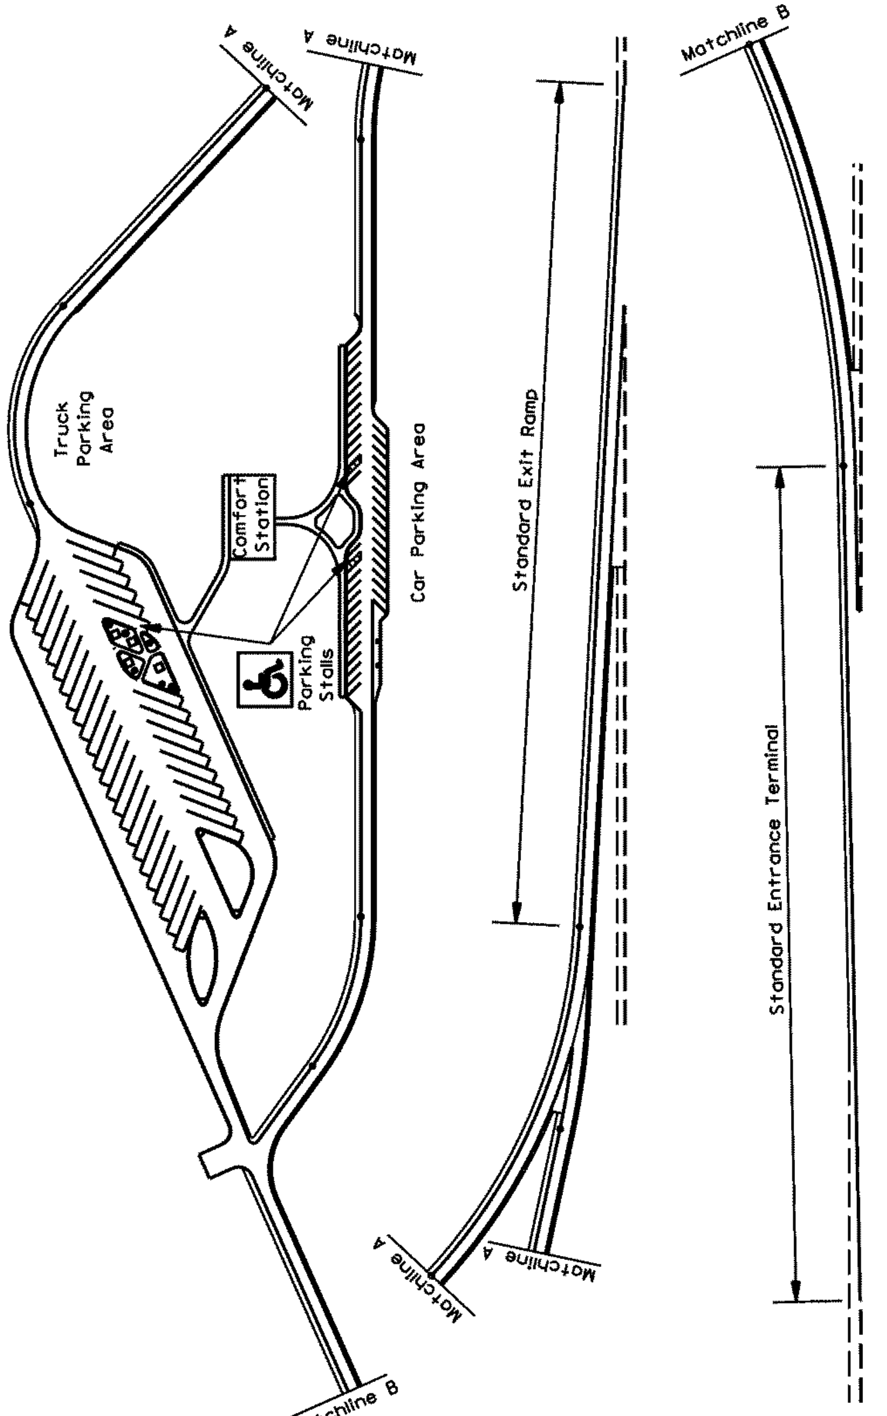
Because of the likelihood of vehicle off-tracking onto ramp shoulders, provide fully paved 8 ft (2.4 m) wide shoulders on the right and fully paved 4 ft (1.2 m) wide shoulders on the left. The transition (i.e., intersection of paved shoulders) between the rest area shoulder design and the freeway shoulder design will occur near the 1 ft (300 mm) stub of the ramp tapers.

Design ramp elements (e.g., superelevation, superelevation transitions, crossover crown) as indicated in Chapter 37.



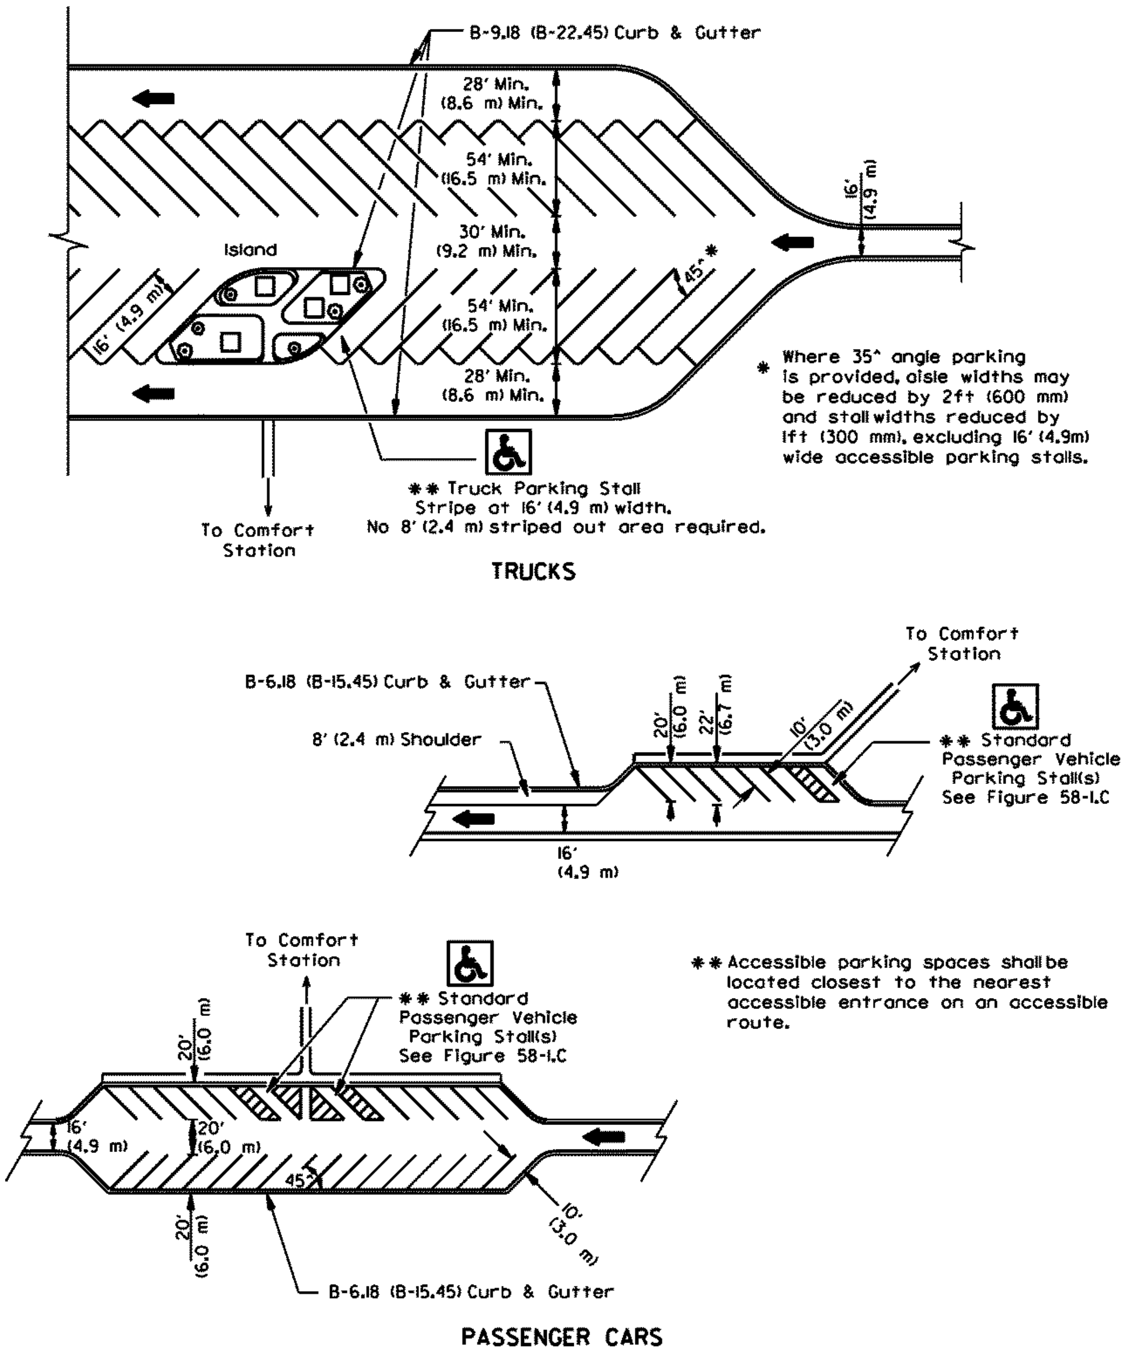
TYPICAL REST AREA DESIGN LAYOUT

Figure 16-1.E



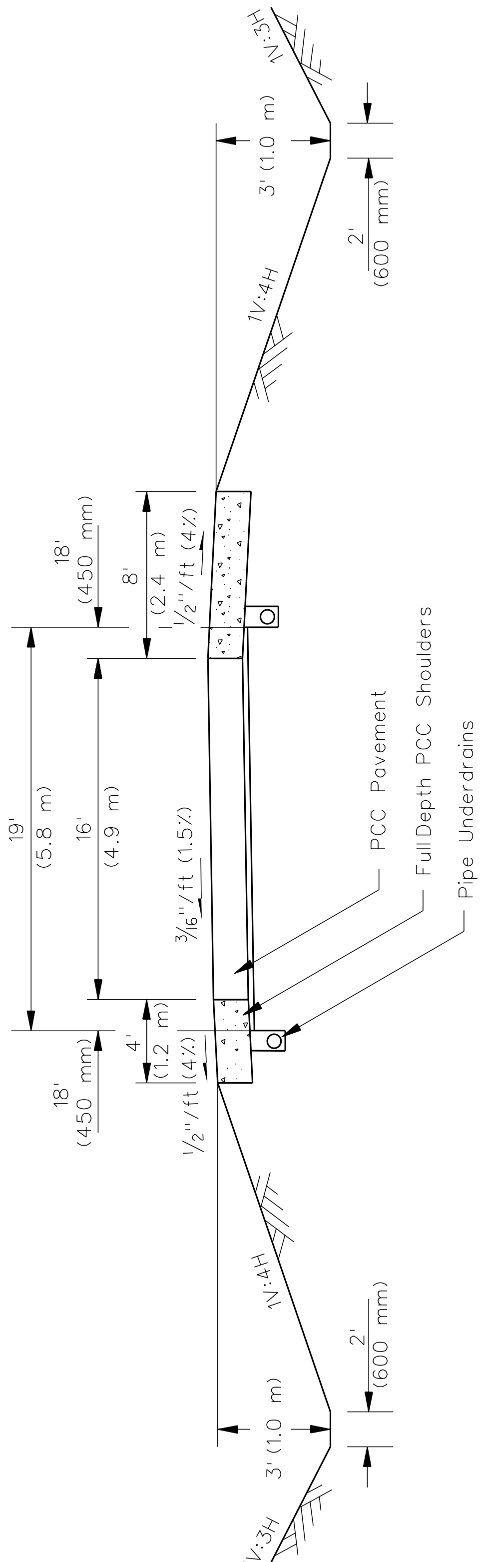
TYPICAL REST AREA DESIGN LAYOUT

Figure 16-1.F



TYPICAL PARKING CONFIGURATION

Figure 16-1.G



RAMP CROSS SECTION (Rest Areas)

Figure 16-1.H

16-1.04(h) Comfort Station

Entranceways to comfort stations should provide an unobstructed, ADA compliant, walkway to the facility per criteria presented in Chapter 58, as well as a clear view into the lobby area. Elevated planters, walls, shrubs, and bushes should not obscure the view of the approaching patron. The open view also allows the State Police to scan the lobby in drive-by and recording video surveillance. In general, a comfort station requires approximately 3000 ft^2 (280 m^2) of floor space to accommodate the necessary conveniences to meet the needs of the traveling public. The following provides additional information on the design of comfort stations:

1. Vestibule. The entryway should be a glass enclosure that provides an unobstructed view into the lobby. Use double air-lock doors with high-quality latches and closure hardware to withstand high use.

2. Lobby. The lobby area should provide 800 ft^2 to 1000 ft^2 (75 m^2 to 93 m^2) of floor space with a generous amount of windows to maximize natural light. Windows will be provided with safety glass and sectioned in 4 ft (1.2 m) increments or less for ease of repair and maintenance. Protect full-length windows on the inside by placement of handrails and/or bench seating. Locate water fountains away from the windows to prevent splashing. Recessed lighting with vandal-proof flush lenses is desirable. Design emergency lighting to be flush with the ceiling.

3. Vending Area. Locate the vending area to the side of the lobby and provide space for a minimum of six machines. Bench seating is desirable in this area. A security camera should be installed to monitor the vending area. Also, provide a cold-water (softened water) hose bib for the vending machines.

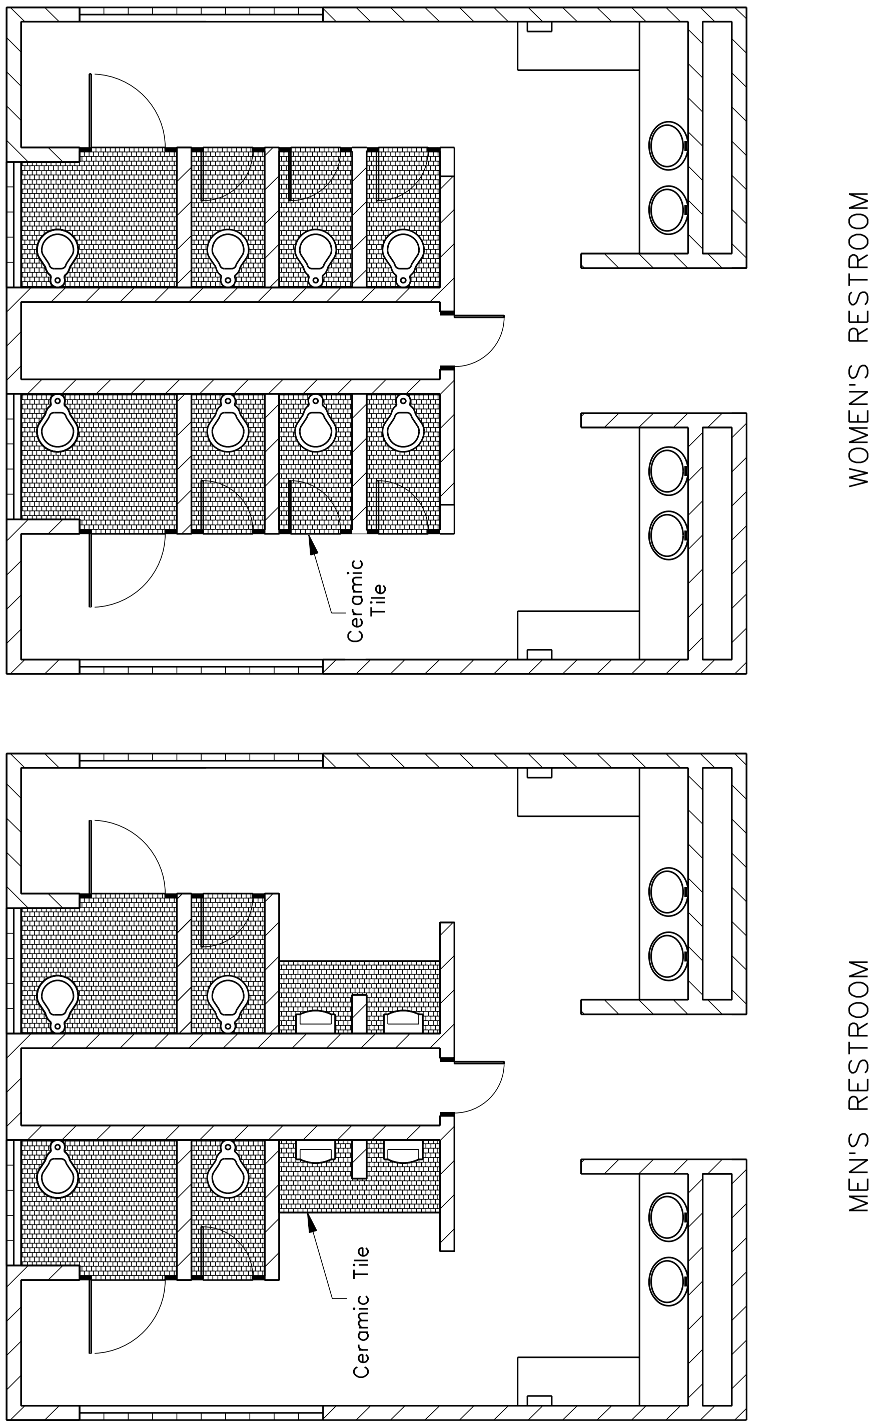
4. Wall Space for Information Boards. All rest area facilities will display a large 4 ft x 6 ft (1.2 m x 1.8 m) State map in a prominent location on either a wall or a center kiosk. Additional wall space of approximately 30 ft^2 (3 m^2) is necessary for information services and notices. Welcome/tourist information centers require additional space for brochures to promote Statewide and local attractions.

5. Telephones. Provide a minimum of one telephone in the comfort station lobby for public use, one of which meets accessibility requirements. TTY telephones (i.e., teletypewriters for persons with hearing and speech impairments) may be provided in selected facilities in coordination with Central Management Services (CMS). Additionally, one phone is required in the mechanical room and, where a welcome center is provided. One phone is required for the Department of Commerce and Community Affairs (DCCA) attendants. Provide remote ringers in the lobby and outdoors for the mechanical room phone.

6. Vending Storage Room. The vending storage room should be located near the vending area with internal and external access doors. The room should be approximately 225 ft^2 (21 m^2). Provide a 5 lb (2.26 kg) ABC fire extinguisher in the storage room. Also, provide double duplex receptacles and telephone outlet at the proposed location of a desk. Provide hose bibs in the storage area.

7. Rest Rooms. Rest rooms should be a "split" design with open doorways (see Figure 16-1.I). Rest rooms with eight fixtures should be approximately 700 ft^2 (65 m^2). Determine the number of urinals and toilets using Figure 16-1.D. Design the rest room entry to prohibit direct sight lines into rest rooms from the lobby. The split design allows one-half of the rest room to be closed for cleaning, repairs, and off-season low usage. Also, install a diaper changing station in both the men's and women's rest rooms. Plumbing and electrical systems should be valved and switched, respectively, to allow repair work in one-half of each rest room. The following provides additional information on rest rooms:

- Standardization of components such as faucets, valves, fixtures, washers, lighting, and locks are essential for ease of replacement. High-quality, heavy-duty vandal proof components are required.
- Rest room walls should be tiled with a neutral color for ease of maintenance.
- Construct toilet stall partitions with minimum 4-in (100-mm), glazed-tile concrete blocks.
- Recessed toilet paper holders are desirable. Consider large volume type multi-roll dispensers (vandal proof).
- Provide three-quarter length stainless steel stall doors with heavy-duty hinges and latches.
- Toilet stools will be of high-quality, "institutional type," floor-mounted, rear-discharge fixtures. Consider using stainless steel or cast iron.
- Specify use of water-saving, automatic-flushing devices with an override.
- Install wash basins (i.e., lavatories), other than accessible wash basins, with heavy-duty, twist-type, self-closing faucets with cam ball-bearing pressure plates or automatic controls (ADA compliance).
- Specify access doors below basins to be manufactured of stainless steel material made to prison standards.
- Provide an infrared sensory device at accessible wash basins.
- Include a small plate glass mirror over wash basins. Include a lower facing mirror for ADA compliance.
- Specify and locate heavy-duty hand dryers near the lavatories to minimize a slippery floor condition.
- Provide heavy-duty soap dispensers that will not drip onto floor.



TYPICAL REST ROOM LAYOUT
(Rest Rooms with Stalls for the Persons with Disabilities)

Figure 16-1.I

8. Lighting. The lighting of a rest area is accomplished by a combination of high-mast lighting and pole lights. Lighting shall be provided to illuminate entrance and exit ramps, parking areas, internal roads, sidewalks, and pedestrian areas. The high-mast lighting is normally applicable to parking and multi-use areas with poles approximately 100 ft (30 m) in height. Flagpole lighting shall be mounted above ground in inconspicuous locations. Lighting on the sides of buildings shall be recessed with screen covers to prevent bird nesting. Lighting plans shall be prepared by BDE according to the criteria in Section 56-4. Design all light poles to be of a non-breakaway design; see Section 38-4.11.

9. Flooring. Provide terrazzo flooring in the lobby and rest rooms except for the tile flooring under urinals and stalls. Terrazzo flooring will be curved upward at the edges (i.e., where it meets the wall) to enhance the cleaning process. Consider using uric acid resistant material under urinals.

10. Sidewalks. Place sidewalks adjacent to all curb parking areas and design them to comply with accessibility requirements (ADA). Entrance walks to the comfort station should provide direct access from the parking area and should not be obstructed by signing, bench seating, or planting areas. Accessories (e.g., drinking fountains, signing, newspaper containers, recycling receptacles) should be positioned adjacent to the sidewalk and anchored to concrete pads. Provide a specific location for newspaper dispensers.

    Other than the main entrance to the comfort station, sidewalks should be 5 ft (1.5 m) wide and constructed of concrete with a slip-resistant surface. Do not include wood slats at expansion construction joints. Other recreational walkways may be constructed with loose gravel, shredded bark, or similar loose material, to allow extended walks to other natural areas of the facility. Consider ADA compliance requirements. Provide nature trails where site conditions warrant such amenities.

11. Unisex Rest Room. This room serves a person with disabilities who needs assistance. It should be located off the lobby and is generally 60 ft^2 (6 m^2) in which one toilet and one lavatory are provided with inside locking door.

12. Mechanical/Storage Room. This room will house all of the mechanical equipment necessary to serve the facility. Approximately 350 ft^2 (32 m^2) is required with access doors to both the interior lobby and the exterior. Provide a 5 lb (2.26 kg) ABC fire extinguisher in this room. Also include a desk, telephone, and an area for security system computer and monitors in the room. Storage space is required with shelving for toiletry items, cleaning liquids, appliances, and electronic equipment for the security system.

13. Code Blue Emergency Phones. If these are provided, install a minimum of one wall-mounted phone in the interior of the lobby area, and one post-mounted in the exterior of the building located in the car parking area and truck parking area. Install additional units as deemed necessary. Code Blue Emergency Phones must be located along an accessible route and within allowable reach ranges from an ADA clear space.

14. Welcome Centers/Visitors Center. A welcome/visitors center generally requires an additional 300 ft^2 (28 m^2) of flooring for a service counter and storage room. Provide a minimum 8 ft (2.4 m) counter for the distribution of brochures and/or information services. Also provide a gate to secure the counter area and a storage room of approximately 250 ft^2 (23 m^2).

16-1.04(i) Other Amenities

The multi-use area provides a restful environment for the traveler and allows some limited recreational activities. Many facilities offer a scenic vista to the adjacent landscape as well as access to lakes, creeks, and wooded areas. Use the following guidelines to provide the most desirable elements of a rest area facility:

1. Picnic Tables. Use Figure 16-1.C to determine the desired number of picnic tables. Generally, ensure that 33% of the tables are sheltered with an appropriate number being wheelchair accessible. Sheltered tables are not required where an adequate number of trees would provide some shade for picnic tables. Sidewalks should interconnect approximately 50% of the picnic tables, particularly those tables that are wheelchair accessible.

   The design of the shelters should be compatible with the design of the comfort station. Ensure the shelter design takes in consideration to exclude birds and insects from gathering in the rafters. Generally, lighting in the shelters is not required, but certain locations may warrant some illumination. Anchor picnic tables to concrete pads to prevent vandalism. Where appropriate, place tables on parking lot islands or on the backside of truck parking areas.

2. Playground. Provide a children's playground in a convenient location that attracts its use, but does not impede access to the comfort station. Locate the playground area as near to the car parking area as practical, but a sufficient distance away to enhance the safety of playing children. A general size of 30 ft x 40 ft (9 m x 12 m) provides an acceptable area to install a variety of playground equipment.

   The area should have a fixed border to retain the surface material. Consider using rubberized surface on top of concrete base for ease of maintenance and longevity of surface. Ensure that the playground meets accessibility requirements (ADA) and includes a sufficient number of play equipment to accommodate the needs of children with disabilities. The following ASTM Standards can be used as guides for the construction of playgrounds:

   - ASTM F1487 – 07ae1 "Standard Consumer Safety Performance Specifications for Playground Equipment for Public Use," and

   - ASTM F1292 – 04 "Standard Specification for Impact Attenuation of Surfacing Materials within the Use Zone of Playground Equipment."

3. Pet Walk. Provide a mowed pet walk area at all rest area facilities. The location should be a designated area that is well signed and well-lit at night. Also, the area should be away from the parking lot, picnic tables, and playground.

16-1.04(j) Accessibility Requirements

Design all elements of the rest area facility to properly accommodate persons with disabilities according to the criteria presented in Chapter 58, *ADA Accessibility Guidelines for Buildings and Facilities*, and the *Illinois Accessibility Code.*

16-1.04(k) Utilities

Generally, rest areas are located in rural areas where utility services are not readily available. Water, electric, gas, and sewer services are necessary for a rest area facility. The following provides information on these rest area utilities:

1. Water. It is highly desirable to obtain water service from an adjacent municipal system. If this option is not available, then use a well-water system. If a well system is used, provide for a secure storage area for water treatment chemicals and softener salt. Also, use a back-up well and water storage (3000 gallon (11,350 L) plus) to maintain adequate supply and pressure during peak periods. Determine water demand from Figure 16-1.D. Evaluate all water systems, well or municipal, for quality and, if deemed necessary, treat to remove objectionable minerals and/or gases. Hard water also should be treated to avoid early deterioration of fixtures.

2. Electricity. Obtain electrical service from the local utility company. Provide a high-efficiency, commercial-grade cooling unit in the facility to cool all areas of the building. Where a feasible, include an emergency generator to operate enough lighting and machinery to function.

3. Gas. Consider natural gas where readily available to provide for the heat source. The use of propane gas is not desirable because of the potential for vandalism. Perform life-cycle cost analyses of energy sources, for heat and cooling requirements. Provide a high-efficiency, commercial-grade heating unit in the facility to heat all areas of the building and locate controlled access thermostats inside the mechanical room.

   Consider using geothermal, solar, and/or wind power to augment traditional heating/cooling systems. However, alternative energy systems should be carefully investigated and considered and, where practical and financially feasible, incorporated into the design of the comfort station.

4. Sewer. It is highly desirable to connect sewer systems to a local municipal system. Where this is not practical, consider the construction of sewage lagoons with aeration capability. Consider installation of an inline mechanical grinder to reduce the need to sewer rod a clogged line. Other sewage systems that may be considered include:

- purification mounds (Wisconsin mound),
- recirculating sand-filter systems, and
- self-contained systems of reusable chemicals.

Perform life-cycle cost analyses to determine the appropriate system for the facility. Size sanitary sewer lines and lift stations in accordance with the *Illinois Plumbing Code*. Design lift-station pressure switches for specific requirements and pumping demands. Provide a malfunction or power-outage warning signal in the building for wells and lift stations. Provide for sewer gas escapement. Built-up sewer gases combining with moisture will create sulfuric acid that will greatly reduce the life of untreated metal and concrete components.

16-1.04(l) Outdoor Electrical and Mechanical Equipment

Where practical, locate heating and air conditioning equipment indoors or on the building rooftop. If the only reasonable outdoor location is at ground level, then provide a security fence around the equipment that is architecturally compatible with the building design.

Locate electrical transformers and exterior electrical cabinets on an inconspicuous side of the building away from the view of entering patrons. If necessary, screen these items from view with plantings or architecturally compatible fencing. Coordinate with the utility company for required equipment access clearances.

16-1.04(m) Landscaping

When cost effective, preserve existing shade trees and other natural features to increase the aesthetic value of the site. Develop the facility with minimal disturbance to natural terrain and existing plant growth. Supplement existing vegetation with landscape treatments to achieve an environment conducive to rest and relaxation. Where applicable, give consideration to the acquisition of adjacent right-of-way or easement where a scenic view or natural attraction can be correlated with shorelines, ridgetops, woods, and/or other natural features.

Promote the use of low-maintenance features in a facility's landscape plans. Consider providing earth mounding to screen features such as sewage lagoons and to enhance the visual effect of plantings. See Chapter 59 for additional information on landscaping and plant material.

16-2 REST STOPS

16-2.01 General

Rest stops are facilities constructed on State highways other than freeways or expressways. These facilities are generally located on one side of the highway and serve both directions of travel. The need for a rest stop is initiated by the district and submitted to the Rest Area Committee for concurrence. Also included are scenic overlooks and roadside tables. Scenic overlooks also may provide rest room facilities, enlarged parking facilities, and picnic tables. New rest stops or improvements to an existing rest stop may be considered a Type I project for noise and consequently require a noise analysis. Traffic noise analyses shall be conducted in accordance with Section 26-6 “Noise Analyses” of this BDE Manual. The *IDOT Highway Traffic Noise Assessment Manual* has been prepared to provide guidance on how to implement the policy for IDOT projects or projects being reviewed by IDOT. The guidance manual provides information to be included in the environmental documentation.

16-2.01(a) Site Selection

When it is determined that a State highway should be considered for rest stops, representatives of the RAC and the district will investigate and prioritize potential sites. Most of the site selection guidelines presented in 16-1.04(b) are also applicable to rest stops. Locate rest stops at sites with natural settings and shade. To avoid its misuse as a local park, do not locate rest stops close to urban areas.

Rest stops usually have rest rooms, limited parking spaces, and several picnic tables. Generally, running water and flush toilets are provided unless the availability of water is not practical for a particular site, in which case a vault type is used. A minimum designed facility requires approximately 4 acres (1.6 ha).

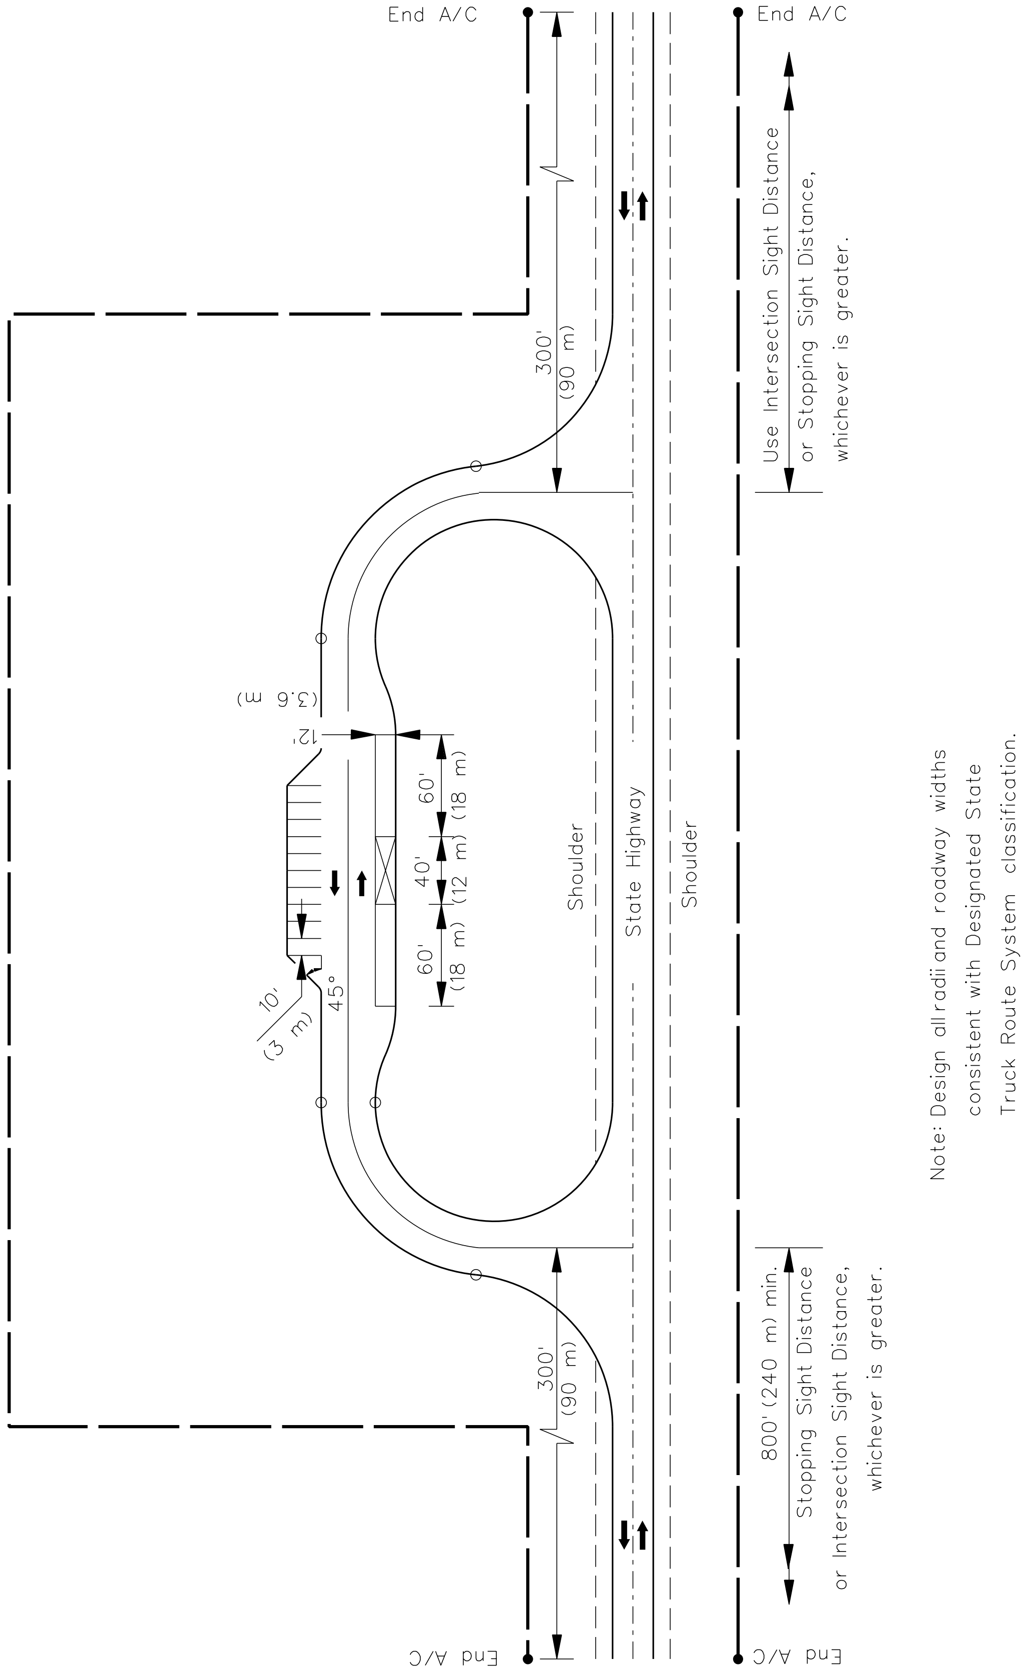
16-2.01(b) Design Guides

A typical rest stop configuration is illustrated in Figure 16-1.J. Entrances to the facility and the inner roadway should accommodate the movement of two-way traffic. Provide minimum intersection sight distance as discussed in Section 36-6. Entrance radii are typically simple curves, and the roadway surface beyond the limits of the shoulder should be an aggregate material.

Base the estimated vehicle parking spaces on 20-year, two-way ADT. Provide for one passenger car stall for every 500 vehicles passing the facility and one truck stall for every four passenger car stalls. A minimum number of four car stalls and one truck stall is necessary to warrant the consideration of such a facility. Parking stalls, although not striped, should be provided for passenger cars at 10 ft x 20 ft (3 m x 6 m) and for trucks at 12 ft x 60 ft (3.6 m x 18 m). Use a WB-55 (WB-17) design vehicle for turning roadway criteria, see Chapter 36.

16-2.01(c) Access Control/Right-of-Way

A rest stop facility shall be provided with access control to enhance the site and to preclude the future development of adjacent commercial properties. This will prevent the rest stop from being used as customer parking. Figure 16-1.J also illustrates the extent of access control that should be acquired to ensure the intended functions of the facility. Exercise engineering judgment in acquiring access rights because more or less distance may be required depending upon the exact locations of property lines.



TYPICAL REST STOP

Figure 16-2.A

16-3 WEIGH STATIONS

16-3.01 General

Truck weighing facilities are necessary to:

- collect data for pavement research,
- monitor single axle loads (ESAL's),
- inspect trucks for safety violations, and
- remove illegal trucks from the Illinois highway system.

Other agencies (e.g., State Police, Department of Agriculture, Interstate Commerce Commission) also use weigh stations for inspection purposes. A weigh station provides a means to monitor vehicles for compliance with Federal Regulations and State statutes. Interstate weigh stations are discussed in Section 16-2.03. Arterial weigh station facilities are discussed in Section 16-2.05.

16-3.02 Weigh Station Committee

To ensure a level of consistency in all matters concerning weigh stations, the Department has established a Weigh Station Committee. The Committee directs and monitors the truck weight program. It also provides coordination with the districts, the Illinois State Police, and the Department of Agriculture. In addition to serving as a technical liaison with these agencies, the Committee is responsible for providing long-range planning and developing policies for design, construction, operation, and maintenance. The Weight Enforcement Engineer of the Bureau of Operations chairs the Committee. The Committee is comprised of representatives from IDOT and other agencies as follows:

1. IDOT Office of Program Development:

    a. Bureau of Design and Environment. This bureau is responsible for providing the environmental survey of the site, designing all outdoor site lighting, and letting all construction contracts except those concerning the scale house. New weigh stations or improvements to an existing weigh station may be considered a Type I project for noise and consequently require a noise analysis. Traffic noise analyses shall be conducted in accordance with Section 26-6 "Noise Analyses" of this BDE Manual. The *IDOT Highway Traffic Noise Assessment Manual* has been prepared to provide guidance on how to implement the policy for IDOT projects or projects being reviewed by IDOT. The guidance manual provides information to be included in the environmental documentation.

    b. Bureau of Bridges and Structures. This bureau prepares the scale pit and inspection pit designs.

2. IDOT Office of Highways Project Implementation:

   a. Central Bureau of Operations. This bureau is charged with maintaining the weigh station facilities, maintenance of the electronic scales, signing, and traffic operations.

   b. District. The district is responsible for the geometric design of the weigh station layout and for preparing the detailed plans for roadway construction of the weigh station. The district will also provide survey data, as needed by the Capital Development Board, for the design of the scale house.

3. IDOT Office of Planning and Programming. This office is responsible for collecting and analyzing data concerning truck weights and dimensions.

4. Capital Development Board (CDB). This agency is responsible for the preparation of construction drawings and contract specifications for the scale house and appurtenances. It will also let the contract for the construction of the scale house and provide construction supervision.

5. Illinois State Police (ISP). This agency is responsible for the enforcement of State statutes regarding weight and dimension limitations.

16-3.03 Interstate Weigh Stations

16-3.03(a) Site Selection Criteria

Weigh stations on the Interstate system generally should be located near State lines to serve inbound traffic. Other sites within the State should be considered on high truck volume routes. Site selection for weigh station facilities should attempt to restrict by-pass opportunities via convenient alternate routes. The Weigh Station Committee will determine the need to construct a facility within a specific corridor. Representatives of the Weigh Station Committee and the district will select the site and submit the proposal to the Committee for concurrence. Consider the following criteria when selecting a site for a weigh station:

1. Utilities. Ensure that utilities are available to adequately serve the scale house.

2. Spacing. Provide a distance of approximately 4000 ft (1200 m) between the weigh station entrance or exit ramp gore and any adjacent interchange ramp gore.

3. Sight Distance. Provide decision sight distance to the weigh station exit ramp gore.

4. Airports and Lighting Zones Desirably, do not locate weigh stations near airports, air fields or heliports, which have airspace restrictions prohibiting highmast light towers. Also avoid observatories and areas having lighting ordinances which discourage the type of site lighting necessary for weigh stations.

16-3.03(b) Planning

The following procedures are established to provide the proper coordination of various agencies involved in the planning of weigh stations:

1. Determine Location. Representatives of the district and the Weigh Station Committee will determine a suitable location.

2. Preliminary Layout. Prepare and submit a preliminary layout in the form of an aerial mosaic or scale drawing showing the following information:

   - the scale house location and limits of entrance and exit terminals;
   - the distance from the exit or entrance ramp gore to the ramp gore of the nearest interchange or to the nearest intersection, and
   - the availability of telephone, electrical power, heating fuel, water, and sewer services.

3. Field Inspection. Conduct a field inspection of the site and ensure that all agencies involved are invited to attend.

4. Road Plan Preparation. Upon approval of the site by the Weigh Station Committee, prepare the road plans and submit them to the BDE. Appropriate low-maintenance landscaping should be included in the roadway plans or as a separate contract.

5. Preparation of Lighting Plans. All weigh stations should be illuminated. See Sections 56-2.05 and 56-4 for the data to be submitted for preparing lighting plans.

6. Scale Pit Design. The district shall submit the following data for the scale pit design:

   - soil borings and blow counts at each end and in the center of the proposed scale pit to determine the size and type of footings and whether pilings are necessary,
   - location and details of the pit drainage, and
   - estimated quantities for the pavement and the median section adjacent to the scale and for the approach pavement.

   Upon receipt of the above information and a set of roadway plans, the Bureau of Bridges and Structures will prepare the scale pit plans.

Figure 16-3.A provides the required information for the design of weigh stations.

16-3.04 Interstate Design Criteria

16-3.04(a) General

A typical Interstate weigh station facility with weigh-in-motion (WIM) capabilities is illustrated in Figure 16-3.B. A WIM facility virtually eliminates the delay legal trucks experience from stopping at weigh stations. When a truck enters a facility, the dynamic scale in the ramp pavement will sort the vehicle into one of two lanes. The by-pass lane allows a legal weight vehicle to return to the freeway without any further delay. The static scale lane directs the vehicle to the static scales for a more precise weighing. The static lane vehicles then are either returned to the freeway or directed to the detention parking area.

There are five basic operational elements of a WIM facility as follows:

- the deceleration distance,
- the signal zone,
- the storage requirements,
- the acceleration distance, and
- the detention parking area.

Design the weigh station to accommodate the operational characteristics of a WB-67 (WB-20) design vehicle. Provide advanced signing in accordance with the *ILMUTCD*. Coordinate signing with the Bureau of Operations.

16-3.04(b) Weigh-in-Motion

The dynamic scale is placed in the exit ramp at the end of the required deceleration length. The WIM electronic processor can determine:

- vehicular speed,
- length of wheelbase,
- gross weight,
- axle weight,
- axle spacing,
- vehicle length, and
- classification of 13 different vehicle types.

A vehicle that is within 3% of its maximum legal weight limit or exceeds its legal limit will be directed to the static scale for a precise weighing. Vehicles that are determined to be within the legal weight limit are directed to a bypass lane and returned to the freeway. As a vehicle passes over the dynamic scale, the vehicle will be directed to the static scale if the driver:

- exceeds the posted speed limit,
- does not maintain a 100 ft (30 m) distance from the rear of the forward vehicle, or
- fails to properly align the vehicle on the dynamic scale.

Pneumatic tubes or electronic sensors are placed on the outer edges of the dynamic scale to detect off-scale occurrences and to override the system to direct the vehicle into the static scale lane.

The “signal zone” is illustrated in Figure 16-2.C which describes critical lengths of the WIM system. Trucks exit the freeway and decelerate to the posted speed of 30 mph (50 km/hr) before passing over the dynamic scale. A WIM facility may be designed for a higher speed; however, extend the signal zone accordingly to provide approximately six seconds of signal viewing time.

16-3.04(c) Storage Requirements

At a facility where only a static scale is provided, all trucks will stop and be weighed. Delays at such facilities are frequent and queuing often occurs on the deceleration ramp. Research has determined that approximately 12% of the trucks that enter a weigh facility are near their legal limit and require a more precise weighing on a static scale. Storage length requirements for static scale and WIM facilities are illustrated in Figure 16-3.D. It is imperative that the signal zone of a WIM facility is free of stored vehicles. Consequently, use a safety factor of two in the storage equation that increases the 12% trucks-entering value to 25%. Provide the calculated storage length between the secondary signal and the static scale. Generally, a concrete barrier wall is desired in the median adjacent to the storage lane with a length equal in distance to the storage length requirements.

1.	Property: (a) Location and orientation of the site and legal description (b) Property lines and dimensions (c) Elevations and/or contours, including at least one bench mark (d) Layout of proposed approach, weighing platform and scale house and exit. (e) Proximity to airports, airfields, and heliports. (f) Location of nearby observatories.
2.	Test Soil Borings (a) To be made in area of proposed new buildings when required (b) Type of soil and bearing capacity in pounds per square foot (kN/m^2)
3.	Availability of water supply: (a) City water supply available Location Distance from site Size of main Water pressure Easements required (b) Well to be provided Information on wells in vicinity Depth Size Yield in cubic feet per second (m^3/s) Location Water characteristics Test holes drilled
4.	Availability of sewers (a) Sanitary district or city sewers Location Distance from site Size at proposed connection Invert elevation Easements required (b) Septic tank required Absorption tests
5.	Availability of natural gas for heating (Input 55 ft^3 (1.6 m^3) per hour per building}: (a) Natural gas available Name of utility company Location of service connection Distance from site Specific gravity pressure Size of main at connection Easement required
6.	Availability of electrical service (17 kW per building, ramp lighting additional) Name of utility company Service available Volts Phase Location of service Distance from site Telephone Service: Name of company Location of service Distance from site

TYPICAL INTERSTATE WEIGH STATION WITH WEIGH-IN-MOTION

Figure 16-3.B
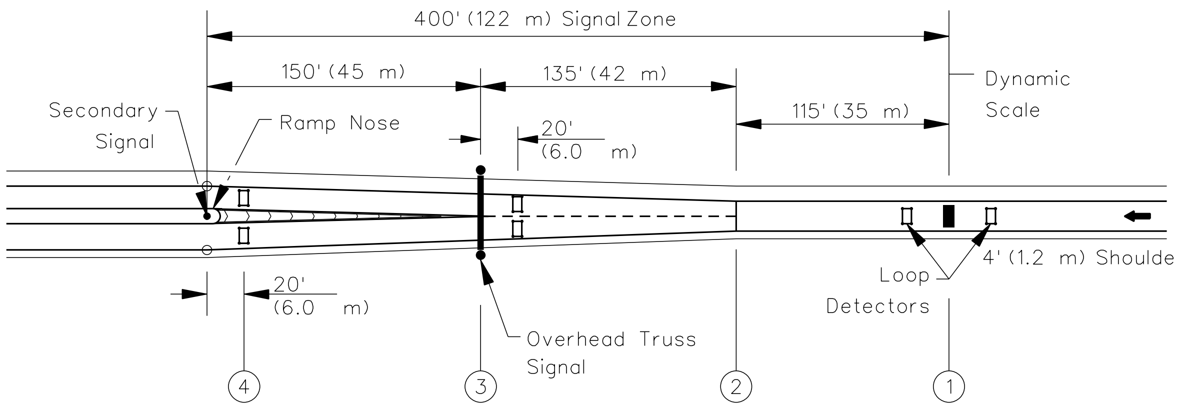
(Continued)



① *Vehicle approaches the dynamic scale at a posted speed of 30 mph (50 km/hr). Loop detectors adjacent to the dynamic scale will determine vehicular speed.*

② *The distance of 115 ft (35 m) past the dynamic scale is based on the length of a large truck (i.e., 75 ft (22.5 m)) plus one second travel time at 30 mph (50 km/hr) (i.e., 40 ft (13 m)). At this position, an overhead signal arrow will direct the driver to the proper lane. The remaining distance to the overhead signal is 135 ft (42 m) which allows nearly three seconds of viewing time. Loop detectors located in front of the overhead signal truss will deactivate the overhead signal and simultaneously activate the secondary signal allowing a continued lane arrow assignment.*

③ *The overhead signal truss displays a lane arrow for proper lane assignment. The truss signal is deactivated when the vehicle passes over the loop detector preceding the truss. The secondary signal is simultaneously activated as a vehicle passes over the loop detector. This provides a continuation of the lane arrow assignment for an additional three seconds.*

④ *When a vehicle passes over the loop detector preceding the secondary signal, it deactivates the secondary signal and detects a vehicle that violates the proper lane assignment. When a violation occurs, a warning alarm is activated in the scale house and the violator is intercepted and directed to the detection parking area.*

Figure 16-3.D

16-3.04(d) Entrance and Exit Terminals

The exit and entrance terminal designs are modified versions of the typical designs. The exit ramp terminal design provides a 4°30′ divergence angle from the freeway which normally will allow the design of a single horizontal curve to be used in advance of the dynamic scale. Provide a minimum distance of 800 ft (240 m) from the ramp gore to the dynamic scale to accommodate vehicular deceleration, allows drivers to maintain a steady speed, and achieve proper vehicular spacing. The approach tangent preceding the dynamic scale should desirably be level and smooth for 200 ft (60 m) to enhance scale performance. The ramp downstream from the dynamic scale also should be level for 100 ft (30 m).

For trucks to achieve an acceptable speed before entering the freeway, provide an acceleration distance of approximately 2000 ft (600 m) from the static scale to a point coinciding with the 12 foot (3.6 m) width of ramp. Adjust the acceleration distance where the ramp terminal is on a grade greater than 3% or where the freeway level of service is adversely affected by the truck’s merging speed. See Section 37-6.02 for additional guidance.

16-3.04(e) Detention Parking Requirements

Design the detention parking area to accommodate a minimum of 10 trucks that may be held for overweight violations or vehicle inspections. The turning roadways to and from the parking area should have a 50 ft (15 m) inside radius and are generally 30 ft (9 m) wide. Adjust the parking angle for specific site conditions. Provide a 4 ft (1.2 m) concrete shoulder on the turning roadways and parking area. See Figure 16-3.B. Provide an accessible route from the detention parking area to the scale house. See Section 58-1.05 for more information.

16-3.04(f) Scale House Parking Requirements

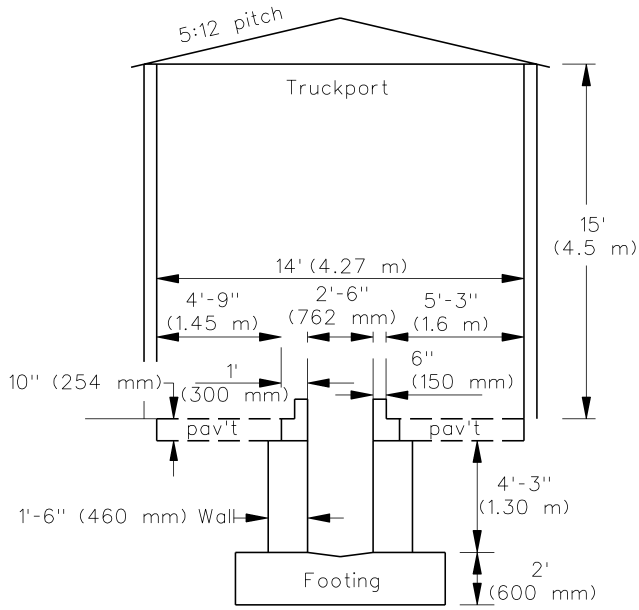
Provide sufficient parking for scale house staffing and maintenance needs, including the appropriate number of accessible parking spaces as shown in Figure 58-1.B.

16-3.04(g) Pavement Design

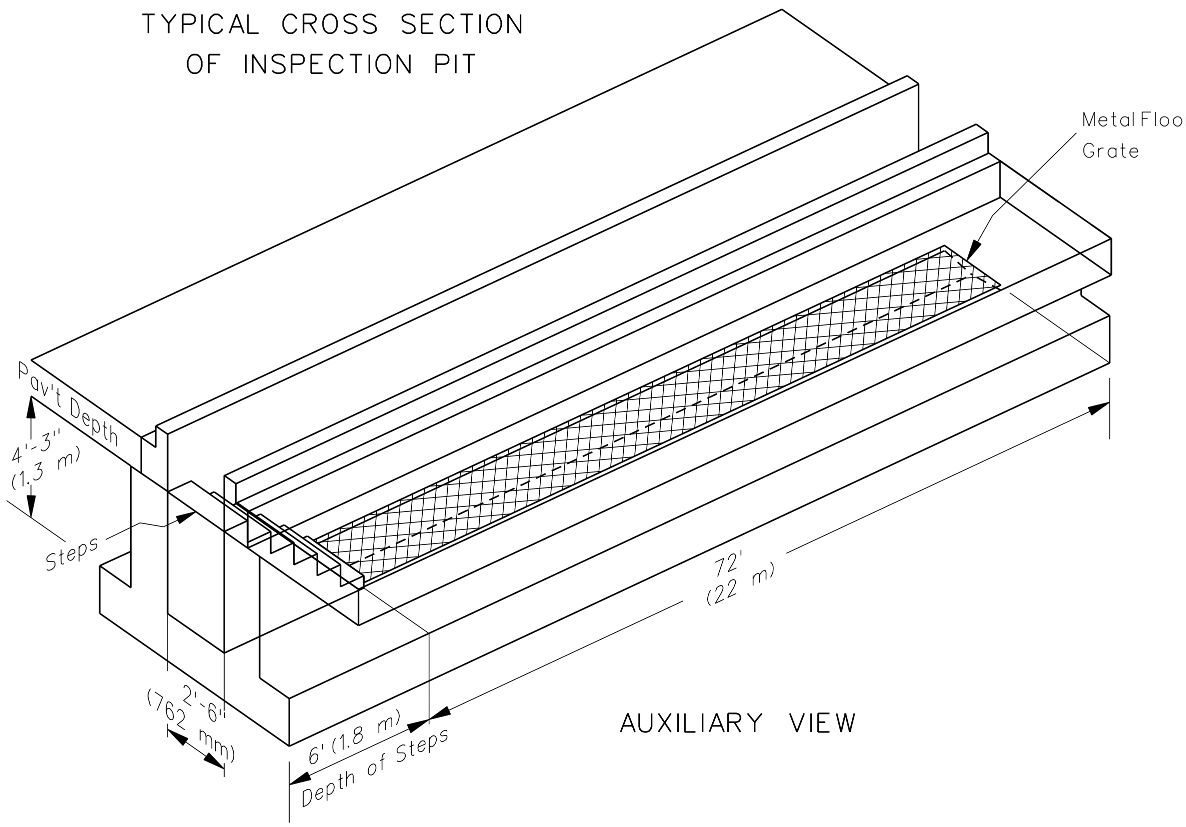
Design the weigh station ramps and detention parking area according to Section 54-1.08. Truck weighing stations are considered “high stress” locations. See Chapter 54 for pavement and shoulder design guides.

16-3.04(h) Vehicle Inspection Pit

A vehicle inspection pit may be provided to enhance the safety inspection of trucks or other special vehicles. Locate the pit adjacent to the detention parking area to provide joint parking opportunities. A schematic design is shown in Figure 16-3.E.



TYPICAL CROSS SECTION
OF INSPECTION PIT



AUXILIARY VIEW

TYPICAL INSPECTION PIT DESIGN

Figure 16-3.E

16-3.04(i) Conversion of Static Scale Facility to Weigh-in-Motion

Most existing static scale weigh stations can be converted to weigh-in-motion facilities within the existing right-of-way limits. Reconstruction will be required of the exit ramp terminal, ramp proper, and detention parking area. The remaining elements of the weigh station (i.e., scale house, static scale, by-pass lane, storage lane, and acceleration ramp) only will need replacement if in deteriorated condition.

Design the exit ramp terminal as illustrated in Figure 16-3.B. With the conversion of existing facilities, the ramp should be aligned with the existing by-pass lane. Extend the existing 6 ft (1.8 m) median upstream a distance equivalent to the required storage length. Typically, a concrete barrier wall should be constructed between the by-pass and static lanes.

Widen the turning roadways to and from the detention parking area to accommodate the WB-67 (WB-20) design vehicle criteria. Design the detention parking area in a diagonal pattern according to Figure 16-3.B. The existing scale house should adequately accommodate the new WIM equipment without expansion.

16-3.04(j) Intelligent Transportation Systems (ITS)

Weigh station facilities may be provided with electronic systems that can monitor passing trucks equipped with transponders. A dynamic scale is located in the mainline pavement preceding the exit ramp to the weigh station. A roadside reader connected to the scale house computer system emits a signal to an approaching truck that is equipped with a transponder. The roadside reader relays the signal to the scale house computer, identifying the particular vehicle, while the dynamic scale computer analyzes the vehicle's weight. A record is created by merging the weight of the vehicle with the transponder information. Using the merged record, a signal is transmitted back to the transponder. A green light indicates approval to by-pass the weigh station and a red light indicates that the vehicle must exit into the weigh station for the normal weighing process.

These electronic systems can be expanded to include additional features (e.g., tracking hazardous materials, identifying mechanical malfunctions) and may be interconnected to other State systems.

16-3.05 <u>Arterial Weigh Stations</u>

16-3.05(a) General

Arterial weigh stations are constructed on State highways other than freeways. This facility is typically located on one side of the highway and serves both directions of travel. The Weigh Station Committee determines the need for an arterial weigh station. A 12 ft (3.6 m) wide static scale is provided for single and dual-axle weighing.

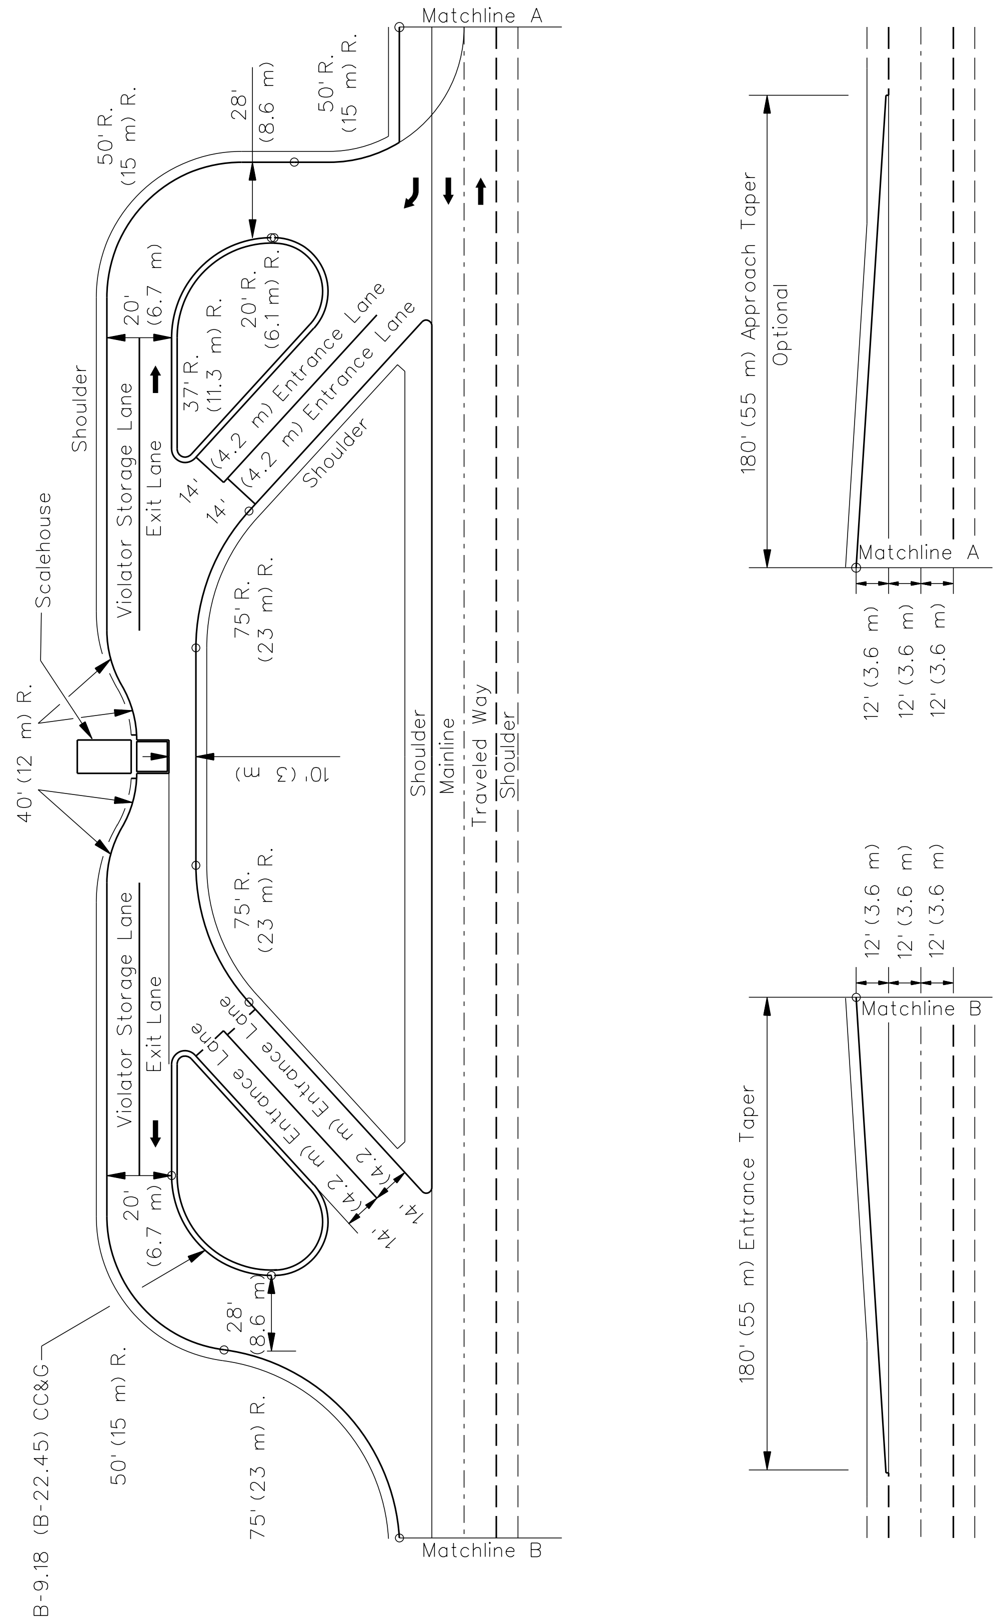
16-3.05(b) Site Selection

Arterial weigh stations are generally located at ports-of-entry on high-volume arterial State routes. Other intra-State facilities may be located at high-volume truck routes as deemed necessary.

Where it is determined that a specific corridor of a State highway should be considered for an arterial scale facility, representatives of the district and the Weigh Station Committee will investigate feasible locations and determine a suitable site. Criteria for site selection primarily are based on availability of right-of-way, minimizing by-pass opportunities, and availability of utilities to support the scale house.

16-3.05(c) Design Guides

The geometric design of an arterial weigh station is illustrated in Figure 16-3.F and should accommodate the appropriate design vehicle for the highway classification. A facility is designed to store two or four vehicles from both directions of travel. If additional storage is required, construct auxiliary lanes on the mainline. For example, if opposing volumes restricts left-turn entry, consider providing a flush left-turn lane on the State highway.



TYPICAL ARTERIAL WEIGH STATION

Figure 16-3.F

16-4 CONTRACT PLANNING AND COORDINATION

16-4.01 General

All rest area type facilities and weigh stations are inherently complex to build because they can involve as many as seven separate construction contracts to complete each project. Therefore, it is important to clearly define the scope of each contract relative to the others. Doing this can prevent overlapping scopes of work or omitting necessary work tasks. Both situations ultimately lead to expensive contractual problems in the field.

16-4.02 Scope

All rest area type facilities and weigh stations generally will be built through a combination of contracts. The following presents the recommended sequence of contract award:

1. Grading and Paving. Grading and paving, a unit-price contract, will be awarded first.

2. Outdoor Lighting. The second award will be for outdoor lighting, a unit-price contract.

3. General. The general work typically is awarded as four lump-sum contracts as follows:

    - general,
    - plumbing,
    - HVAC, and
    - electrical.

    The general contractor is named as the prime contractor who coordinates the work of the other three assigned contractors.

4. Landscaping. The landscaping award, a unit-price contract, typically is the last contract to be awarded.

16-4.02(a) Division of Work

It is relatively simple to determine the scope of work for each contract. However, certain aspects of the work in each contract clearly affect subsequent contracts. Consider the following design elements to better avoid conflicts and omissions of scope:

1. Grading and Paving Contracts. Grading and paving contracts include the following items:

    - earthwork,
    - pavement and shoulders,
    - curbs,
    - storm sewers,
    - right-of-way fencing,

- roadway signing,
- pavement striping, and
- seeding.

2. Outdoor Lighting Contracts. Lighting contracts generally include the following items:

- light poles,
- light towers,
- sign lighting,
- unit duct and wiring, and
- controller.

3. General and Assigned Contracts. General and assigned contracts include the following items:

- complete buildings,
- utility connections,
- water system,
- sanitary sewer system,
- site furnishings, and
- sidewalks.

4. Landscaping Contracts. Include the following items for landscaping contracts:

- sodding and final seeding,
- trees and bushes, and
- flower plantings.

5. Security/Surveillance/Code Blue. For security and surveillance concerns, consider the following:

- site placement and installation of equipment,
- maintenance, and
- training.

16-4.02(b) Coordination of Scope

Experience has shown that the following suggestions simplify the construction process and ultimately reduce costs:

1. Grading and Paving Contracts. Consider the following for grading and paving contracts:

   a. Topsoil. Rather than placing topsoil where buildings and sidewalks will be located, stockpile the topsoil for placement after all other general contract work is complete. This will promote better turf growth.

b. Temporary Seeding. Specify temporary seeding for areas that will be disturbed under future contracts.

c. Curb Slipforming. Prohibit slipforming of portland cement concrete (PCC) curbs where they will abut PCC sidewalks. Formed PCC curbs will provide a better appearance adjacent to sidewalks.

d. Earthwork. Design earthwork grades in sidewalk areas to ensure compliance with accessibility requirements. Design earthwork carefully to minimize excavation during the general contract.

2. Lighting Contracts. Consider the following when preparing lighting contracts:

a. Unit Ducts. Coordinate unit duct routing with building utilities to avoid conflicts.

b. Lighting Controller. Allow space in the mechanical room for the lighting controller.

3. General and Assigned Contracts. Consider the following for general and assigned contracts:

a. Plan Limits. Establish plan limits of areas to be seeded under the landscaping contract. Beyond these limits, require restoration by the general contractor.

b. Topsoil Spreading. After sidewalk and building work is complete, specify the spreading of topsoil that was stockpiled during the grading and paving contract.

c. Topsoil Grading. Specify that topsoil remain in a rough-graded condition for the landscaping contract.

4. Landscaping Contracts. The following should be considered when preparing landscape contracts:

a. Grading and Seeding. Specify fine grading and seeding of all areas that remained in a rough-graded condition under the general contract.

b. Number of Contractors. Experience has shown that only one contractor should be responsible for all landscaping work within a clearly defined area. Otherwise, unneeded conflicts will arise.

Chapter Seventeen
BICYCLE AND PEDESTRIAN ACCOMMODATIONS

When planning transportation improvements, the Department considers the travel needs of all users of a transportation corridor including bicyclists and pedestrians. Bicycle and pedestrian travel demand in the vicinity of a project is to be determined in the scoping and early project planning phases. When sufficient demand is indicated the Department will provide the appropriate accommodations by applying guidelines presented in Chapter 17.

Chapter 1 of the *AASHTO Green Book* identifies five context classifications that integrally affect the design of a transportation facility. These contexts – rural, rural town, suburban, urban, and urban core – were originally presented in NCHRP Report 855, A*n Expanded Functional Classification System for Highways and Streets*. Primary factors that lead to the designation of a context classification include development density, land uses, building setbacks, and population density. The character of development along a corridor may vary such that a single project may include more than one context classification. Simply applying geometric criteria without regard to context and roadway user needs will not adequately meet the expectations of the traveling public and local community. This chapter acknowledges the *AASHTO Green Book* context classifications in making pedestrian and bicyclist accommodation decisions, and references context throughout.

Policies relating to accessibility, including curb ramps, crossing controls, and overpasses and underpasses are addressed in Chapter 58. Financial and maintenance responsibilities for bicycle and pedestrian accommodations are addressed in Chapter 5.

17-1 BICYCLE ACCOMMODATIONS: POLICIES AND PROCEDURES

17-1.01 Definitions

The following terms and definitions apply to Chapter 17:

1. Bicycle and Pedestrian Policy Engineer (BPPE). The engineer within the Bureau of Design and Environment, who is accountable for the development and interpretation of the engineering policies that govern the design of bicycle and pedestrian facilities.

2. Bicycle Box or Bike Box. A designated area on an approach to a signalized intersection, typically between an advance motorist stop line and the crosswalk, intended to provide bicyclists with a visible place to wait in front of stopped vehicles during the red signal phase.

3. Bicycle Facilities. A broad term which includes bikeways, shared roadways, shoulders (which may be used by bicyclists), shared-use paths, traffic control devices, shelters, and parking facilities for bicycles.

4. Bicycle Lane or Bike Lane. That portion of the traveled way that is designated for bicyclist use by pavement marking/symbols and optional signing. The bicycle lane width includes any buffer areas. Without buffers these lanes may be called conventional bike lanes.

5. Bicycle Level-of-Service (BLOS). A measure of on-road bicycle service quality along road segments that is based on studies of bicyclist perception of safety and comfort. The BLOS model considers a variety of factors influencing bicycle service quality and computes a numerical base score that is translated into a level of service ranging from A (best) to F (worst). Intersections are not considered. The *Highway Capacity Manual* describes BLOS computations in detail.

6. Bicycle Travel Assessment (BTA). The standard evaluation performed to determine whether bikeway warrants are met and bicycle accommodations should be included as part of a project. A BTA form BDE 1702 is used to document the results of the evaluation and describe the accommodations to be provided.

7. Bikeway. A generic term for any road, street, path, or way which is specifically designated for bicycle travel and provides space reserved for bicyclists distinct from motor vehicle traffic.

8. Buffered Bicycle Lane. A bicycle lane that includes a primary riding area and additional width to increase separation of bicyclists from vehicular traffic. The buffer area comprises a pattern of standard longitudinal markings and added chevron or diagonal markings for larger buffer widths.

9. Excessive Cost. In documenting whether pedestrian and bicycle facilities must be included in projects according to the *Illinois Highway Code*, excessive cost typically involves adding at least 20% to the total cost of a project not providing accommodation.

10. Leading Pedestrian Interval (LPI) The practice of displaying the walk symbol to pedestrians several seconds ahead of parallel vehicular traffic receiving a green signal allowing pedestrians a 'head start' to occupy the crosswalk and increase their visibility to both right-turning and left-turning drivers.

11. Municipality. A city, village, or incorporated town in the State of Illinois (65 ILCS 5/1-1-2).

12. Rural Roadway. To guide the process of bicycle facility selection and design, rural roadways are discussed in this chapter as those generally in undeveloped and low-density development areas, with shoulders along the edges of the traveled way. These roadways are most generally present in the AASHTO rural *town* and *rural* contexts and may have posted speeds of 30 mph (in town) to 55 mph.

13. Separated Bicycle Lane (SBL). A portion of the roadway that is designated for use by bicyclists and is physically separated from the vehicle traveled way by horizontal distance

and vertical elements such as flexible delineators, longitudinal raised curb islands, or parking lanes. SBLs are usually designed for one-way bicycle travel in the same direction as the adjacent lane, but may be designed for two-way bicycle travel when operationally justified. SBLs are also sometimes called protected bicycle lanes.

14. Shared Lane. A travel lane where motor vehicles and bicyclists share operating space. For projects on state routes shared lanes will typically be widened to a minimum of 14 ft (4.2 m) to provide adequate space for drivers to pass bicyclists while staying in the lane and providing the "three feet clear" distance required by state law.

15. Shared Roadway. Any roadway upon which a bicycle lane is not designated and which may be legally used by bicyclists, regardless of whether such facility is specifically identified as a bikeway.

16. Shared-Use Path/Side Path. A facility within public right-of-way but physically separated from the roadway, intended for bicycle and other non-motorized transportation (e.g., pedestrians, in-line skaters). A "side path" is typically located parallel within the road right-of-way. The terms "shared-use path" and "path" are used interchangeably throughout this chapter in discussing these facilities. "Trails" are considered recreational facilities, are often unpaved, and are not covered by this policy.

17. Suburban Roadway. To guide the process of bicycle facility selection and design, suburban roadways are discussed in this chapter as those in outlying portions of urban areas, with low-to moderate development densities, off-street parking, and posted speeds of 40 to 45 mph. Suburban roadways may incorporate either curb and gutter or shoulders along the edges of the traveled way and are generally found within the AASHTO *suburban* context.

18. Two-Stage Bicycle Turn Box. An area set aside for bicyclists, outside of the travel paths of motor vehicles and pedestrians, to queue to turn at a signalized intersection, and avoid having to merge across traffic ahead of the turn.

19. Urban Roadway. To guide the process of bicycle facility selection and design, urban roadways are discussed in this chapter as those generally in high-density development areas and generally incorporating curb and gutter along the edges of the traveled way, and quite often parking. With posted speeds of 40 mph and lower, these roadways are most generally found in the AASHTO *urban core* and *urban* contexts but occasionally also in the *rural town* context.

17-1.02 Policies

The *Illinois Highway Code,* 605 ILCS 5/4-220, states (*in part*):

1. Bicycle and pedestrian ways shall be given full consideration in the planning and development of transportation facilities, including the incorporation of such ways into State plans and programs.

2. In or within one mile of a municipality with a population of over 1,000 people, (*…redacted…*), the Department shall establish and solely fund bicycle and pedestrian ways in conjunction with the construction, reconstruction, or other change of any State transportation facility except:

    a. in pavement resurfacing projects that do not widen the existing traveled way or do not provide stabilized shoulders.

    b. where approved by the Secretary of Transportation based upon documented safety issues, excessive cost, or absence of need; or

    c. where the municipality passes a resolution stating that a bicycle or pedestrian way does not fit within its development plan.

3. Bicycle and pedestrian ways may be included in pavement resurfacing projects when local support is evident or the bicycling and walking accommodations can be added within the overall scope of the original roadwork.

4. The Department shall establish design and construction standards for bicycle and pedestrian ways.

Providing for the needs of pedestrians and bicyclists is a key goal of this policy. Therefore, an assessment of non-motorized transportation needs and appropriate accommodation is central to the fulfillment of the policy. The location of a project in either areas covered in the *Illinois Highway Code* above or other areas is in and of itself insufficient to make accommodation decisions. On each project it is necessary to:

- Where bicyclists and pedestrians are legally allowed to use the roadway, evaluate and document safety issues and warrants specific to the project.

- If warrants are not met, document the absence of need in the Phase I engineering report.

- If warrants are met, assess the appropriate type(s) of accommodation and coordinate with the local agency.

- Where warrants are met and the local agency is supportive, the Secretary must specifically approve omission of accommodations in areas covered in the law on the basis of documented safety issues, excessive cost, or absence of need. BDE 1701 shall be used to request such an omission. The BPPE concurrence should be sought for any omissions in other areas of the State. As safety issues and costs will vary greatly depending on the characteristics of the project, there will not be simple and absolute guidelines. A cost analysis would include all costs specifically attributable to the accommodation, including construction costs, environmental mitigation, and right-of-way, as applicable. However, needs will be based on whether warrants have been met as defined in Section 17-1.03.

Exceptions to the provision of bicycle accommodations cannot be considered simply because a roadway is identified in the Illinois Official Bicycle Maps as unsuitable for bicycling. Current usability or comfort to cyclists does not preclude a roadway project from bicycle consideration or this policy.

Furthermore, the Illinois Highway Code, 20 ILCS 2705/2705-625 states (in part):

Every state route project within municipal boundaries, regardless of scope, shall make improvements to bicycle and pedestrian safety within 500 ft beyond the limits of the scoped project. The intent of the 500 ft intersection rule is to provide continuity for bicycle improvements and accelerate the implementation of bicycle and pedestrian safety features. These features shall be in alignment and complement the scope of the project.

Improvements are limited to those that follow the design guidance within Chapters 17 and 58 and current Operations policies. Examples include but are not limited to signs, pavement markings including crosswalks and bicycle pavement markings, beacons, signal improvements such as APS and ADA pushbuttons, countdown heads or leading pedestrian interval timing, bus stop accommodations, and lighting improvements.

17-1.02(a) Exceptions to Consideration of Accommodations – Access Controlled Facilities

Projects on interstate highways, or other roadways where bicycles and pedestrians are prohibited, can be excluded from consideration of accommodations. As such, no warrant analyses or needs assessments are required. In rare circumstances, incorporation of separated accommodations along access-controlled facility right-of-way may be possible in coordination with the Secretary and FHWA.

However, consideration for bicycle and pedestrian accommodations on roads/bridges crossing such roadways are typically appropriate. Especially in urban and suburban contexts, strive to reserve sufficient space along crossing roadway approaches and bridges for pedestrian and bicycle facilities which may be added in the future.

17-1.02(b) Consideration of Accommodations on Resurfacing Projects

On pavement resurfacing projects that do not widen the existing traveled way nor provide stabilized shoulders bicycle accommodation is not mandated by 605 ILCS 5/4-220. However, the need for and feasibility of providing an accommodation should still be assessed in the scoping phase based on the statutory provisions on local support and accommodation within the overall scope of each project. Chapter 1 of the *AASHTO Green Book* encourages designers to consider all potential road users and apply flexibility for “projects on existing roads”. The potential for reallocation of available roadway space is a fundamental decision that must be made on all resurfacing projects except those in rural contexts. On some state routes there may be excess capacity that encourages faster speeds and discourages use by pedestrians and bicyclists. Such locations are particularly well-suited for reallocation of space on resurfacing projects since slower travel speeds and improved safety may result in conjunction with appropriately reduced motor vehicle capacity.

On rural route resurfacing projects, the presence of a bicycle warrant may affect paved shoulder rumble strip considerations; these issues are discussed in Chapter 34. Adding paved shoulder width will typically be constrained by scope considerations.

If sufficient width is available, bike lanes or shared lanes can be created in a resurfacing project by adjusting the pavement markings at very little cost. In other cases, reducing the number of through travel lanes through a Road Diet or eliminating parking may provide sufficient space for adding an accommodation. Evaluate trade-offs in terms of vehicle capacity, vehicle travel times, bicycle and pedestrian facility widths, potential levels of bicycle use, on-street parking, potential vehicle speed reduction, and overall user safety. For certain project locations and contexts, a decision could be made during scoping that accommodations are infeasible; for most resurfacing projects assessments should be performed and decisions documented. Refer to the FHWA *Road Diet Informational Guide* and Section 17-2.02(g) for more information on these types of projects.

17-1.03 <u>Bikeway Warrants - Needs Assessment</u>

The Department shall provide on-road or off-road accommodations for bicycle travel in highway projects when any of the following warrant conditions exist:

1. The highway or street is designated as a bikeway or recommended bike route in a regionally or locally adopted bike plan or map. Note that regional or local maps should not be confused with the Illinois Official Bicycle Maps, which depict current bicycling conditions and should not affect decisions on accommodations.
2. The projected two-way bicycle traffic volume (see Section 17-1.04) will approximate 25 ADT or more during the peak three months of the bicycling season five years after completion of the project.
3. The route provides access to a park, recreational area, school, or other destination expected to attract bicycle traffic.
4. The route provides access across a natural or man-made barrier (e.g., bridges over rivers, bridges over railroad tracks/yards, bridges over freeways or expressways, highways through a national forest). Bicyclists shall be accommodated on the bridge, unless bicycles are otherwise prohibited to operate on the roadway approaches. See Sections 17-2.02(f) and 17-2.03(m) for bridge deck replacement or rehabilitation projects or for culvert replacement projects. For projects that meet no other warrants, a minimum shoulder width of 4 ft (1.2 m) with standard height parapet or bridge rail shall satisfy this warrant. For projects that meet this and other warrants, use the guidance provided in the Bicycle Facility Selection Table (Figure 17-2.A) and incorporate bridge railings appropriate for bicyclists.

5. The highway project will negatively affect the recreational or transportation utility of an independent bikeway or trail. Highway projects will negatively affect at-grade paths and trails when they are severed, when the projected roadway traffic volumes increase to a level that prohibits safe crossings at-grade, or when the widening of the roadway prohibits sufficient time for safe crossing. If certified by the State or local agency having jurisdiction as being programmed for construction no later than five years beyond the anticipated completion of the highway project, treat proposed or planned bikeways that cross or parallel a roadway as an existing facility. Specific improvements to address such facilities can potentially be included in projects.

Multilane arterial roads can create substantial barriers to bicycling and walking, if not properly planned and designed. A connected network is necessary for bicycling or walking to be practical and feasible, and this policy seeks to expand connected networks. Development centers along state routes should be conveniently accessible by foot and by bike. State routes can provide regional connections that encourage greater numbers of people to bike and walk. Not all residents and workers may have access to private vehicles, so there is also an equity aspect to consider in designing IDOT facilities.

Problems can arise when accommodations start and stop such that users do not have clearly defined ways to proceed safely from the end of a bikeway accommodation. When looking at bicycle warrants and the need for accommodation as part of a project, designers are therefore encouraged to examine the overall network available to bicyclists. Connected and integrated networks provide transportation options to likely destinations and consider reasonable termini. Corridors should be considered for accommodation as part of a longer-term plan to provide for continuous bicycle travel and for connection to contiguous routes. As an example, an intersection improvement could include bike lanes in anticipation that adjacent areas could have bike lanes added in the future. Project limits may be extended beyond highway improvements for reasonable distances to connect to bicycling facilities at nearby intersections or to avoid short accommodation gaps. Reflect such extensions in the Phase I report. Documentation requirements and procedures are covered in Sections 17-1.04 and 17-2.01.

17-1.04 Documenting Bicycle Travel Accommodation Warrants

Assess bicycle travel demand in the project scoping phase or early in the project planning stage. The concepts of identifying cycling origins and destinations, and thus travel demand, are discussed in the FHWA publication *Selecting Roadway Design Treatments to Accommodate Bicycles*. Like motorists, many bicycle riders seek direct routes and require access to destinations immediately along arterial and collector roadways. Demand can therefore seldom be assumed to be satisfied by the presence of an alternate route. Because of the potential for bicycle travel, accommodation will likely be warranted in all urban core and in most urban and suburban areas. In all contexts, consider commercial, recreational, or other development near or along highways that may generate bicycling activity.

The first use of BTA form BDE 1702 on projects is to assess and document bicycle travel needs and accommodation decisions. The BTA is to be used on all projects other than those excluded under the *Illinois Highway Code* or where accommodations are clearly infeasible, including some resurfacing projects as described in Section 17-1.02(b). Bicycle origins and destinations should be reviewed. A map to illustrate travel generators and travel paths, a checklist for organization and public coordination, an overall assessment of bike warrants and travel in the project area, and a record of local coordination are to be included in the BTA. The completed sections of the form should be reviewed by the district bicycle coordinator, as it provides the basis for evaluating whether or not a travel demand warrant for bicycle accommodation has been met. The process used in subsequent accommodation decisions is described in 17-2.01.

17-1.05 Maintenance

Normally, responsibility for ongoing maintenance of bikeway facilities on the roadway surface and not separated from other traffic is assumed to be an integral part of the roadway. The state will assume maintenance of these facilities, although local agency maintenance agreements are sometimes developed by the districts for the restriping of bike lane and crosswalks. Responsibility for maintenance of bikeway and pedestrian facilities separated from motorized traffic should be delegated by agreement with local jurisdictions or others early in the project planning process. For example, separated bike lanes will become part of local maintenance responsibilities; refer to Chapter 5.

17-1.06 Right-of-Way

Acquire right-of-way for bikeway and pedestrian facilities in accordance with existing IDOT land acquisition policies and procedures. Additional right-of-way required for bikeway and pedestrian purposes should be purchased in conjunction with the right-of-way for the overall roadway improvement.

17-1.07 Funding

Bicycle and pedestrian facilities are considered an integral part of a highway project for funding purposes and thus are eligible for federal cost participation as discussed in Chapter 5.

17-2 DESIGN GUIDANCE AND CRITERIA FOR BICYCLE FACILITIES

The Department utilizes the *Guide for the Development of Bicycle Facilities* (*AASHTO Bike Guide*) as the primary basis for design. The guide provides information on the physical infrastructure needed to support bicycling. The Bicycle Facility Selection Table, Figure 17-2.A, is based on the most recent AASHTO guidance and includes BLOS evaluations. Only on-road accommodations are listed; side paths are considered independently.

The FHWA issues guidance on the design and implementation of bicycle and pedestrian accommodations. FHWA websites and publications, including those listed at the end of this chapter, can be reviewed for additional design guidance and ideas. The *National Association of City Transportation Officials Urban Bikeway Design Guide* (*NACTO Bikeway Guide*) includes many bicycle design features which have been proven effective in locations including larger cities in the United States. Use of the *NACTO Bikeway Guide* is endorsed by FHWA and is often appropriate to enhance the safety and mobility of bicyclists. Design features in FHWA publications, the *NACTO Bikeway Guide,* or other recognized guidance documents may be proposed as long as they are fully compliant with the *ILMUTCD* and discussion in this chapter. Additional guidance and information on accommodation measures for bicyclists and pedestrians is included in the department's *Bicycle and Pedestrian Accommodations Study* (2019). In all cases coordinate bicycle facility design with the cross section criteria presented in Part IV "Roadway Design Elements" and Part V "Highway Systems."

17-2.01 Documentation Requirements and Procedures

The incorporation of context in design decisions allows for appropriate assessment of the needs of all transportation modes within a corridor, especially pedestrians and bicyclists. Urban and urban core areas, higher-density suburban areas and rural towns often have land uses that generate higher rates of bicycling and walking and a greater variety of users, including many who are less confident and therefore adequately comfortable only on separated facilities. User profiles are considered in the Bicycle Facility Selection Table and discussed in the following section, On-Road Accommodations. Reducing the comfort level of a bike facility will generally reduce the numbers and types of bicyclists using the facility.

When one or more of the warrants presented in Section 17-1.03 are met accommodation is required. Preliminary design should be guided by the Bicycle Facility Selection Table, considering options where listed. These are the base accommodation options. Local coordination and site conditions may sometimes constrain the accommodation and necessitate an adjusted design. Providing the highest-and-best bikeway facility that conditions and context dictate is better than providing no bike accommodation.

	Type and Width of Bicycle Accommodation [1/, 2/]			
Roadway Characteristics [8/]	**Paved Shoulder**	**Wider Outside Lane**	**Bicycle Lane including Buffers** [3/]	**One-way Separated Bicycle Lane** [4/, 5/]

Design Year ADT > 15,400			8 ft (2.4 m)	7 ft (2.1 m)
Suburban Roadway Four-Lane, 40-45 mph				
Design Year ADT < 13,000	6 ft (1.8 m)			7 ft (2.1 m)
Design Year ADT ≥ 13,000	8 ft (2.4 m)			7 ft (2.1 m)

BICYCLE FACILITY SELECTION TABLE

FIGURE 17-2.A (1 of 2)

Notes:

1/ A shared use path adjacent to the roadway (i.e., a side path) is an option that fulfills accommodation requirements in most situations. A side path can be selected whenever it is locally supported and the locals agree to maintain it. Two-way side paths shall be a minimum of 10 ft (3.0 m) wide.

2/ All widths shown are considered minimums for typical design situations. Wider facilities can be provided. Project-level assessments of highest-and-best facilities may also affect widths provided.

3/ Bicycle lane widths are measured from the outside lane line to the face of curb or edge of parking lane. Bicycle lane widths of 5 to 6 ft *may* be buffered; widths greater than 6 ft *must* be buffered. Buffer striping is included in the bicycle lane widths shown.

4/ One-way separated bicycle lane width shown is the minimum clear width between vertical features and allows bicycle passing. Additional width is needed for vertical elements such as raised curbs, tubular markers with striped buffer, or parking lanes. Each jurisdiction may identify larger minimum clear width restrictions based on maintenance requirements.

5/ As an alternate to a one-way SBL, a two-way SBL of a minimum 8 ft (2.4 m) clear width can be provided on one side of the roadway. Additional width is needed for vertical elements.

6/ This value assumes no rumble strips are present. If rumble strips will be installed, utilize Standard 642006 and increase the paved shoulder width to 4 ft (1.2 m) to maintain the required 3 ft (0.9 m) clear width for bicycles.

7/ Truck (Single Unit + Multi-Unit) volumes should be less than 3% of ADT in order to select a Wider Outside Lane accommodation. Refer to Figure 17-2.C for measurement of the Wider Outside Lane.

8/ Refer to Section 17-2.03. Determine Project Context in the Scoping Phase. Speeds listed refer to posted speed limits and are assumed consistent with the 85th percentile speed.

BICYCLE FACILITY SELECTION TABLE

Figure 17-2.A (2 of 2)

There are situations in which the principles of Context Sensitive Solutions (CSS) and Complete Streets conflict. Refer to Chapter 19 and 605 ILCS 5/4-219 for CSS principles and requirements. In instances where the requirements of the Complete Streets Law run counter to the consensus view of project stakeholders, the Regional Engineer will determine the accommodation solution, or lack thereof, typically in consultation with BPPE. After need has been established and the required accommodation has been identified using the Bicycle Facility Selection Table, it is the responsibility of the district to convey this information to the appropriate local agency. If the local agency believes the accommodation will not fit with their development plan for the area, the Department will request the local agency pass a resolution indicating as such and a copy will be included in the Phase I report. Proposed resolution language is included in Section 17-7. With the passage of a resolution the Department is no longer compelled by law to establish the accommodation; however, the Department may consider options to incorporate the next highest-and-best accommodation in consideration of project context and constraints.

If it is determined that the accommodation(s) in the Facility Selection Table cannot be built without excessive cost or disruptive ROW considerations, then the next highest-and-best accommodation shall be considered in order to achieve the highest comfort/safety for the user in light of the project's cost, local development plans, and ROW considerations. An example of a next highest-and-best accommodation is provision of a paved shoulder width (rural contexts) or bicycle lane width (urban contexts) less than those shown in the Bicycle Facility Selection Table. In such cases BLOS would be checked as described in Section 17-2.02. Selection of next highest-and-best accommodations shall be determined on a case-by-case basis by the district, as many variables will need to be considered. This may become an iterative process when considering all project variables. The lowest level of accommodation that may meet the intent of this policy is a shelf of sufficient width to allow for future path construction within right-of-way. In rare cases, another example could be to identify a parallel route adjacent to the state highway as the highest-and-best accommodation, but only when direct accommodation on the state route is determined infeasible and the parallel route would fill a critical gap in the bikeway network. Once all analyses and decisions are complete the BTA form should be signed by the district bicycle coordinator and included in the Phase I report.

17-2.02 <u>On-Road Accommodations</u>

On-road bicycle accommodations include paved shoulders, wider outside lanes, bicycle lanes, and separated bicycle lanes. Choice of accommodation is dependent on project context, roadway type, traffic volumes and speed; the base on-road accommodations are presented in the Bicycle Facility Selection Table. Whenever on-road accommodations are selected it is advisable to perform project-specific BLOS analysis prior to moving forward with local coordination. BLOS provides an estimate of bicyclist perceived safety and comfort – considering lane width, motor vehicle volumes, percent trucks (SU + MU), posted speed limit, and pavement condition. A better BLOS may result in more bicyclists using a facility.

Several bicyclist design user profiles have been developed through national research. There are "somewhat confident" and "highly confident" groups that makes up ten to fifteen percent of the total population. A much larger group is identified as "interested but concerned." They comprise just over fifty percent of the population and may not be comfortable in certain bike lanes, usually preferring separated facilities. Note that children were not considered in this research. In order to properly address the varying confidence levels of potential users, this policy introduces an assessment of BLOS as a part of design decision making. IDOT considers it appropriate to target BLOS C in the urban core, urban, and rural town contexts where a high number of bicyclists may desire to commute or otherwise travel on-road. This level of accommodation could encourage a substantial portion of the “interested but concerned” population segment to utilize facilities, making the accommodation provision cost effective in these contexts. In the rural context (higher speed roadways) most potential users would be in the highly confident group and a lower level of service, approximated by BLOS D, is considered acceptable. In the suburban context an intermediate BLOS C/D is the appropriate target.

The accommodations listed in the Bicycle Facility Selection Table have been checked for a reasonable range of variables and will typically provide the target minimum BLOS. When trucks (SU + MU) exceed 4 percent the results of BLOS analysis are less reliable due to data limitations of the model; coordinate the analysis with BPPE in those cases and work to provide a higher level accommodation.

Use one of the two worksheets provided in form BDE 1703 to calculate BLOS. The assessment applies to paved shoulders, bicycle lanes and shared lanes (e.g. wider outside lanes). Input needed for the calculation includes lane and shoulder widths, vehicle traffic volume, traffic speed (typically use posted speed), truck percentage, and pavement surface condition (CRS). For traffic volume typically use design year ADT. Since the pavement surface condition will deteriorate over time it is appropriate to use a “fair” condition (CRS 5 to 6) to approximate the conditions that will be near the end of the project design life. The presence of intermittent on-street parking along a paved shoulder accommodation can negatively affect BLOS. A Shoulder Accommodation worksheet is available that allows consideration of the effects of such parking, which may sometimes be present in a rural town context. Such parking effects would not be seen in other rural contexts. The Bike Lane Accommodation worksheet does not allow consideration of parking encroachment; bike lanes cannot legally be blocked by parked or standing vehicles.

When the calculation shows an accommodation would likely not provide the target minimum BLOS (C through D depending on context), consider adjusting the design width (e.g. widen for a buffered bike lane) or instead incorporating a side path. A path fulfills accommodation requirements in most situations. Local coordination would then move forward with the adjusted accommodation. Additional information on BLOS is available in Chapter 15 of the *Highway Capacity Manual*.

On-road accommodations often place cyclists and motor vehicles in close proximity to one another, especially when motor vehicles are passing (i.e. overtaking) a cyclist. Illinois law (625 ILCS 5/11-703) requires motorists to give at least 3 feet of clearance to cyclists when passing but this law is not always followed. Using engineering judgement, “Bicycle Passing Signs” (R4-I102) may be installed to increase awareness and compliance with this requirement. Refer to the Bureau of Operations’ policy OPS-T-10.

17-2.02(a) Paved Shoulders on Rural Roadways

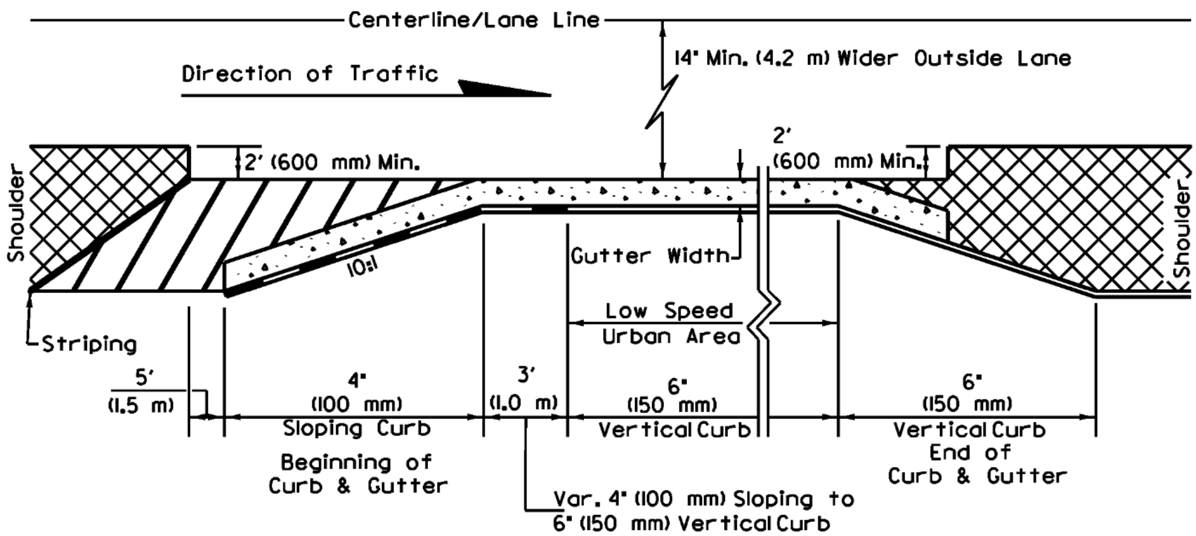
On-road bicycle accommodation on rural roadways typically consists of providing a paved shoulder. Paved shoulders can accommodate bicycle travel efficiently and offer many other benefits (e.g., added safety, reduced maintenance, rural mail delivery). The typical bicyclist in rural contexts is the recreational (i.e., highly confident) bicyclist. Other users do not feel comfortable on high-speed roadway shoulders, but there are usually no reasonable alternatives on rural roadways. Use the Bicycle Facility Selection Table to determine the appropriate width. The table specifies widths that will generally provide a BLOS D, which is considered sufficient for travel by the recreational bicyclist. When rumble strips are installed in a paved shoulder which serves as a bicycle accommodation and the width of the paved shoulder is 6 ft (1.8 m) or less the 8 in (200 mm) rumble strip design should be used to minimize the impact to the accommodation.

Where the shoulder widths shown in the Table cannot be provided, a narrower shoulder might still be considered an adequate bicycle accommodation. A 3 ft (0.9 m) minimum clear width beyond a rumble strip is required to qualify as an accommodation. If rumble strips *will or may* be installed on a paved shoulder where bicycle warrants are met, always provide a minimum 4 ft (1.2 m) paved width to maintain the required 3 ft (0.9 m) clear width for bicyclists. Edge line rumble strips may also be considered in accordance with the Chapter 34 procedures in order to minimize impacts to bicyclists. Paved shoulders *may* include word or symbol markings along with arrow markings to designate preferential bicycle use (i.e., a bike lane) only where the paved width is 5 ft (1.5 m) or more and the posted speed limit is 45 mph or less.

Transitions from rural cross sections into urban cross sections (e.g., frequent entrances, intersections) should accommodate bicyclists through movements by providing additional width in the curb and gutter section. For example, Figure 17-2.B illustrates an acceptable approach where the urban accommodation would be a wider outside lane. A consistent cross section and consistent bikeway width is preferred in addressing rider comfort and safety.

17-2.02(b) Shared Roadways and Shared Lanes

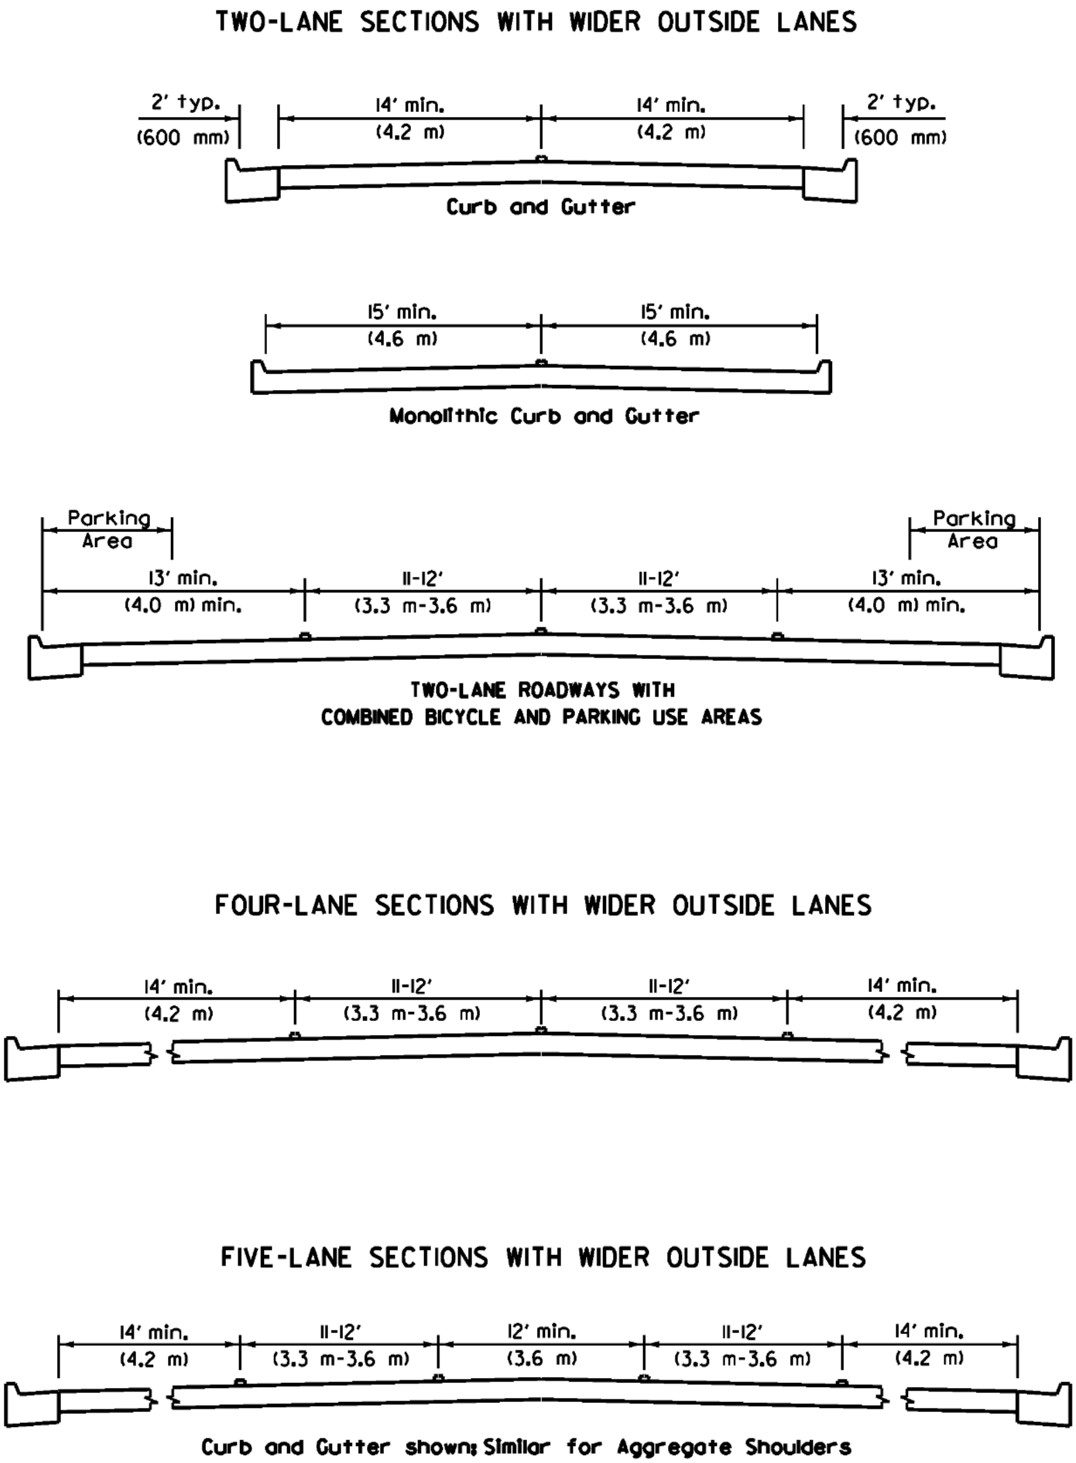
On a shared roadway facility, bicyclists and motorists share the same travel lanes without a striped separation. The *AASHTO Bike Guide* identifies a minimum outside lane width of 14 ft (4.2 m) as adequate for accommodating bicyclists in a shared lane. At this width motorists can provide the required 3 ft (0.9 m) buffer to pass bikes without encroaching into an adjacent lane. As shown in the Bicycle Facility Selection Table, a wider outside lane of 14 ft (4.2 m) or more can be considered to provide bicycle accommodation for lower-speed and lower-volume roadways. Typical cross sections are shown in Figure 17-2.C. Measure the width of the lane from the lane/centerline stripe to the joint between the pavement and the gutter. If no joint exists, as with monolithic pavement, measure width to the face of the curb. Where parking is marked or allowed along the roadway additional width for a bicycle use area is required as shown in the figure. In shared lane situations where bus traffic is common, bicycles and buses may share an outside lane with a minimum width of 16.5 ft (5.0 m) to the curb face.



PAVED SHOULDER TRANSITION INTO CURB AND GUTTER

Figure 17-2.B

Shared roadways can also sometimes be identified as a next highest-and-best accommodation where posted speed limits will be up to 35 mph (55 km/h) in restricted locations, BLOS is checked, and any issues are discussed with BPPE. Shared lane markings, typically called “sharrows,” should not be used on roadways with posted speed limits above 30 mph (50 km/h), and should be considered only where traffic volumes are fairly low. Signing options for shared urban roadways are presented in the *AASHTO Bike Guide* and include the W11-1 and R4-11 signs. Other *ILMUTCD*-compliant bicycle signing may be proposed as well.



TYPICAL CROSS SECTIONS FOR DESIGN OF SHARED ROADWAYS
FIGURE 17-2.C

17-2.02(c) Conventional and Buffered Bicycle Lanes

On-road bicycle accommodations on urban roadways typically consist of providing bicycle lanes. Two variations in the design of bicycle lanes can be applied based on the specific conditions of a project: conventional bike lanes and buffered bike lanes. The width of a bicycle lane is measured from the edge of the adjacent vehicular lane stripe to the face of curb or parking lane line as shown in Figures 17-2.D and 17-2.E. Use the Bicycle Facility Selection Table to determine the appropriate width. Five ft (1.5 m) is the minimum width of a bike lane (stripe-to-stripe or stripe-to-curb face). Gutter pans are sometimes not acceptable for bicycle travel due to the presence of debris or broken pavement, and the pavement/ gutter joint can sometimes become vertically uneven or separated from the gutter and affect bicycles with narrow tires. However, clear distance to the curb face is increased by the presence of a gutter. Widths shown in the Bicycle Facility Selection Table and used in the calculation of BLOS include the gutter pan.

Bicycle lane word or symbol markings (e.g., the helmeted bicyclist) along with arrow markings are required to designate a bicycle lane. Markings inform all users of the restricted nature of the bicycle lane. A five in. (130 mm) minimum normal line width is appropriate between a through traffic lane and a bicycle lane. Refer to *ILMUTCD* Section 9C for discussion of marking requirements. The *AASHTO Bike Guide* provides further details on bicycle lane markings.

Green pavement markings may be used as a traffic control device to clarify for all users the locations where bicyclists are expected to operate. These markings are supplemental to the other pavement markings that are required for the designation of a bicycle lane. Green pavement marking can be installed under an MUTCD Interim Approval and therefore locations are tracked and performance reported. Green pavement markings should be used only within intersections and on intersection approaches where bicyclists and other roadway traffic would have potentially conflicting weaving or crossing movements; refer to Section 17-2.02(e) for further discussion.

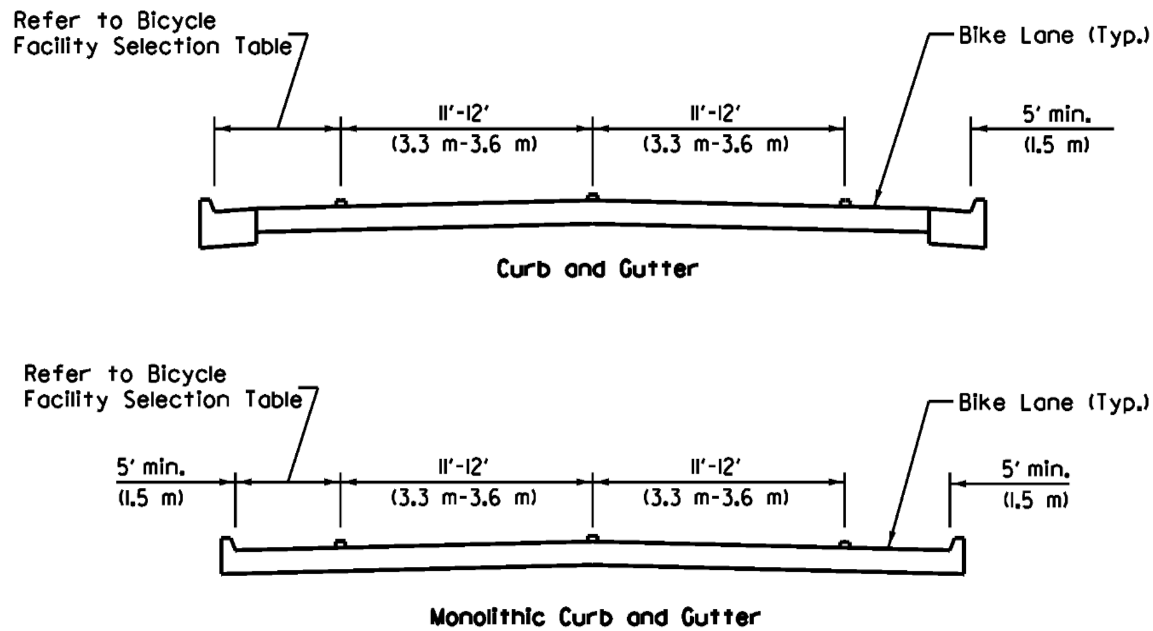
Signing is optional when designating a bicycle lane. Use *ILMUTCD* Section 9B and apply engineering judgment to develop a signing plan that provides relevant information to adequately address safety for all users.

For conventional bicycle lanes the following are typical cross section requirements:

- On curbed streets without parking, locate the bicycle lane next to the gutter, as shown in Figure 17-2.D.

- Where parking is permitted, locate the bicycle lane between the parking lane and the through traffic lanes, as shown in Figure 17-2.E. Consider providing additional parking/bike lane width, above the required minimum, to reduce the likelihood of car door/bicyclist conflicts (a.k.a. dooring crashes) under the following conditions:

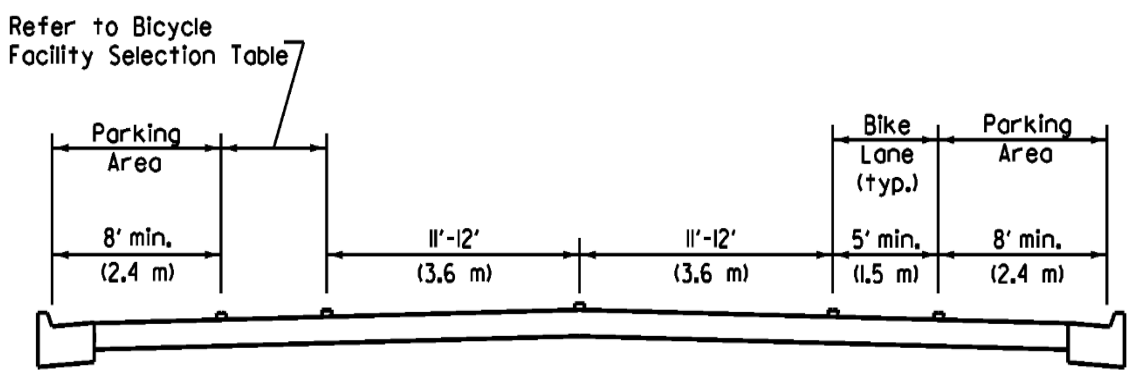
    + where there is frequent parking turnover,
    + where parked vehicles are mostly commercial vehicles, or
    + where the posted motor vehicle speed limit is above 35 mph.



Note: Bike lanes should include buffer area(s) per Section 17-2.02(c)

TYPICAL CROSS SECTIONS WITH BIKE LANES AND NO PARKING

Figure 17-2.D

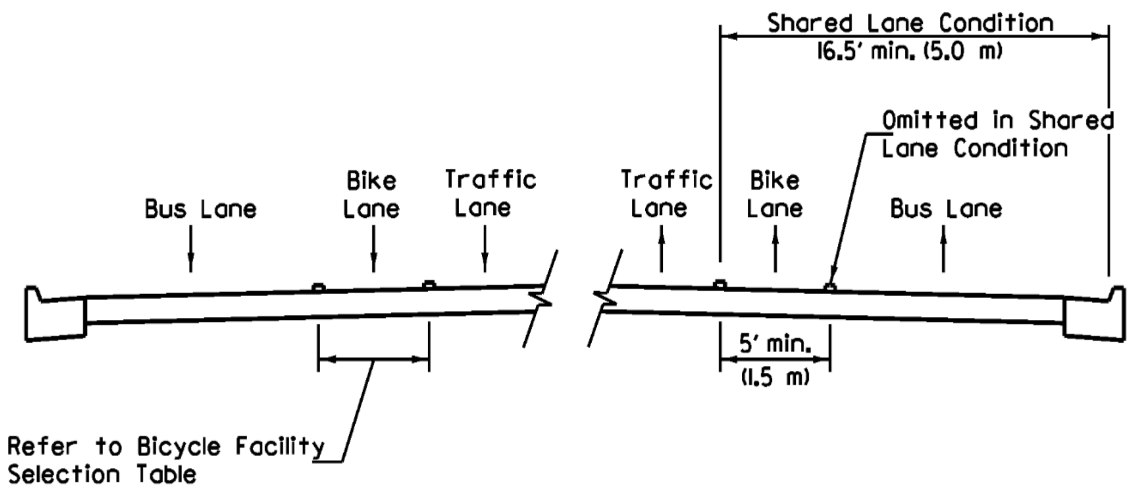


Note: Bike lanes should include buffer area(s) per Section 17-2.02(c)

TYPICAL CROSS SECTION WITH BIKE LANES AND WITH PARKING

Figure 17-2.E

Design bicycle lanes as one-way facilities that carry bicycle traffic in the same direction as adjacent motor vehicle traffic. Two-way bicycle lanes on one side of the roadway (without physical separation) and contra-flow bike lanes are unacceptable because riding against the flow of motor vehicle traffic introduces safety concerns. Wrong-way riding is a major cause of bicycle crashes nationally and violates the *Illinois Vehicle Code,* 625 ILCS 5/11-1505. Locate one-way bicycle lanes that are on one-way streets on the right side of the street, except in areas where placing the bicycle lane on the left will decrease the number of conflicts (e.g., those caused by heavy bus traffic). Place bicycle lanes that are adjacent to dedicated bus lanes between the vehicular traffic lane and the bus lane as shown in Figure 17-2.F.



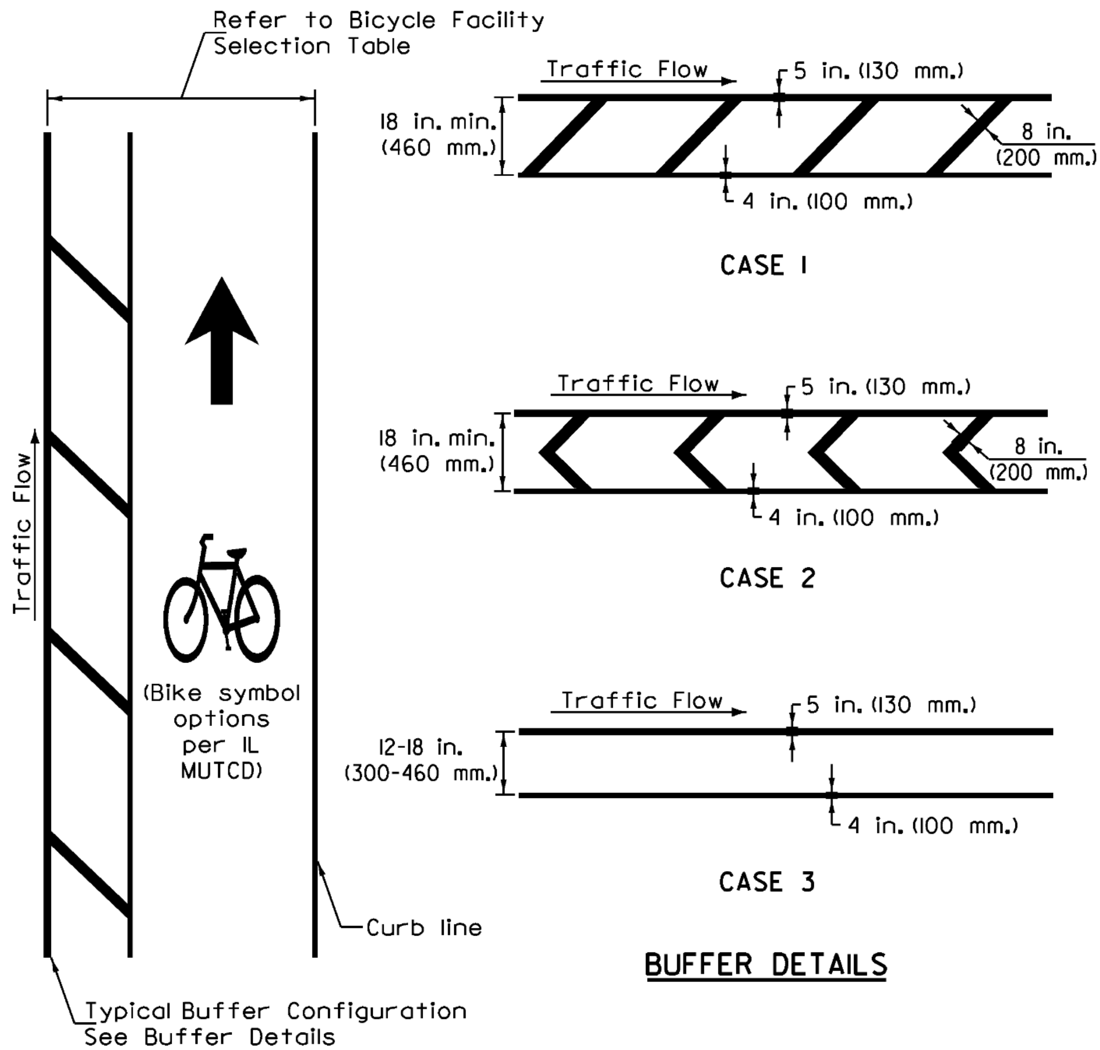
Note: Bike lanes should include buffer area(s) per Section 17-2.02(c)

BICYCLE LANES ADJACENT TO BUS LANES

Figure 17-2.F

Buffered bike lanes add a delineated buffer space to a conventional bicycle lane for the purpose of widening the bicycle travel space and providing a better level of comfort, as described by BLOS. The buffer areas can be placed on one or both sides of the primary riding area. The buffer area width(s) are included in the specified bike lane width; refer to Figures 17-2.G(1) and 17-2.G(2). Buffer areas are marked with two solid white lines (a 5 in. (130 mm) minimum line width is required on the vehicle traffic side) at least 12 in. (300 mm) apart. Where the buffer total width is 18 in. (460 mm) or more, diagonal (Case 1) or chevron (Case 2) markings are recommended for clarity. Placing a 2 ft 6 in. (760 mm) minimum buffer immediately adjacent to a parking lane can be effective in reducing dooring crashes. Buffered bike lanes should be transitioned to conventional skip-dash lines on intersection approaches and the width may be reduced where width constraints dictate. Note that the primary riding area must be a minimum of 3 ft 6 in. (1070 mm) to allow for placement of the bike lane pavement marking symbol. Bike lane widths of 7 ft (2.1 m) or more will accommodate bicycle passing within the limits of the bike lane.

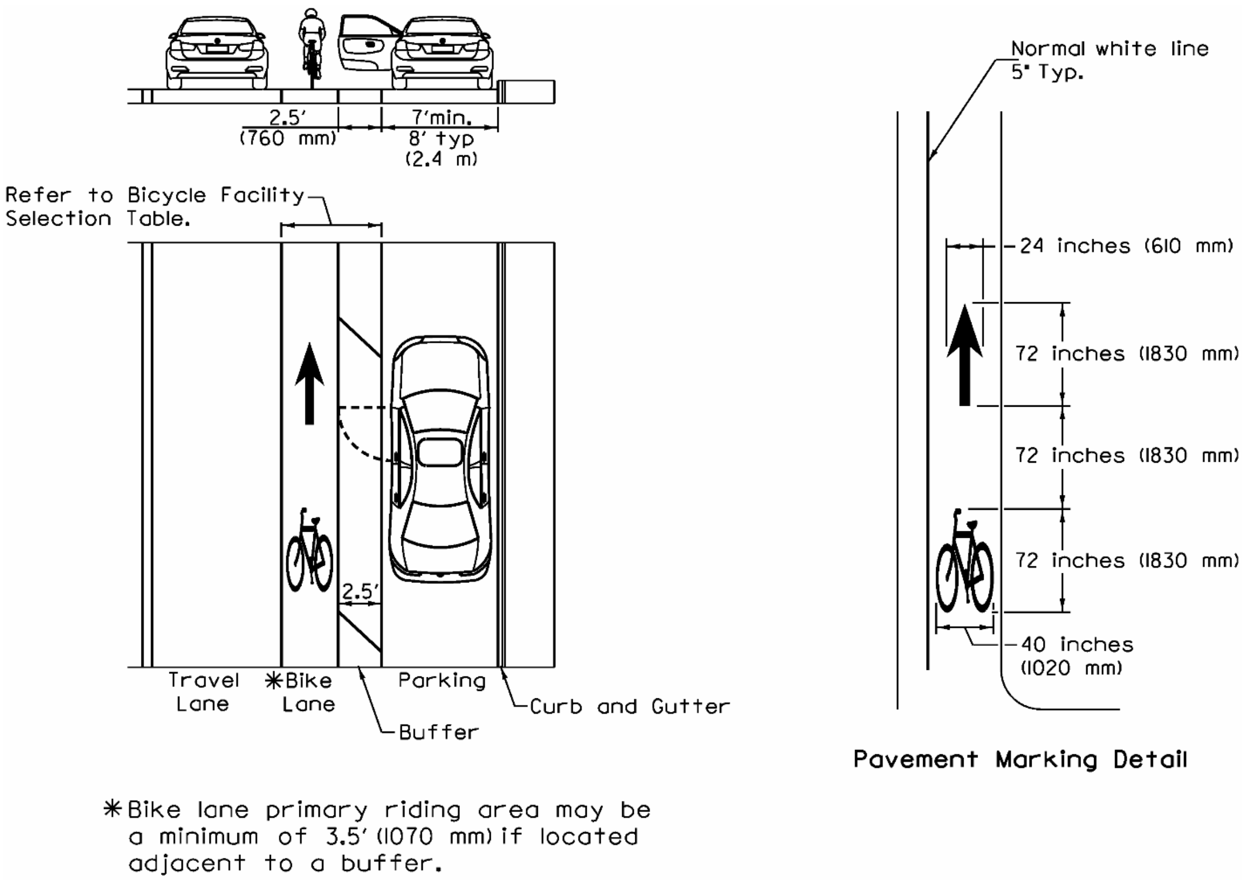
Adding bike lanes to an existing roadway cross section is a way to utilize existing infrastructure to achieve multimodal goals efficiently at low cost; refer to Section 17-2.02(g). Figure 17-2.G(3) illustrates options for accommodating bikes within a specific roadway width. Project constraints will often dictate whether conventional, buffered or separated bike lanes can be provided as part of a road diet or lane diet project. Existing drainage grates should be assessed and may need to be changed to provide properly oriented openings to ensure that narrow bicycle tires do not fall into or become wedged within large parallel openings. Refer to Section 17-2.02(h); the BPPE can suggest appropriate grate options for conventional, buffered and separated bike lanes.



Note: Separation may also be provided between bike lane striping and the parking boundary to reduce door zone conflicts, as shown on the following page.

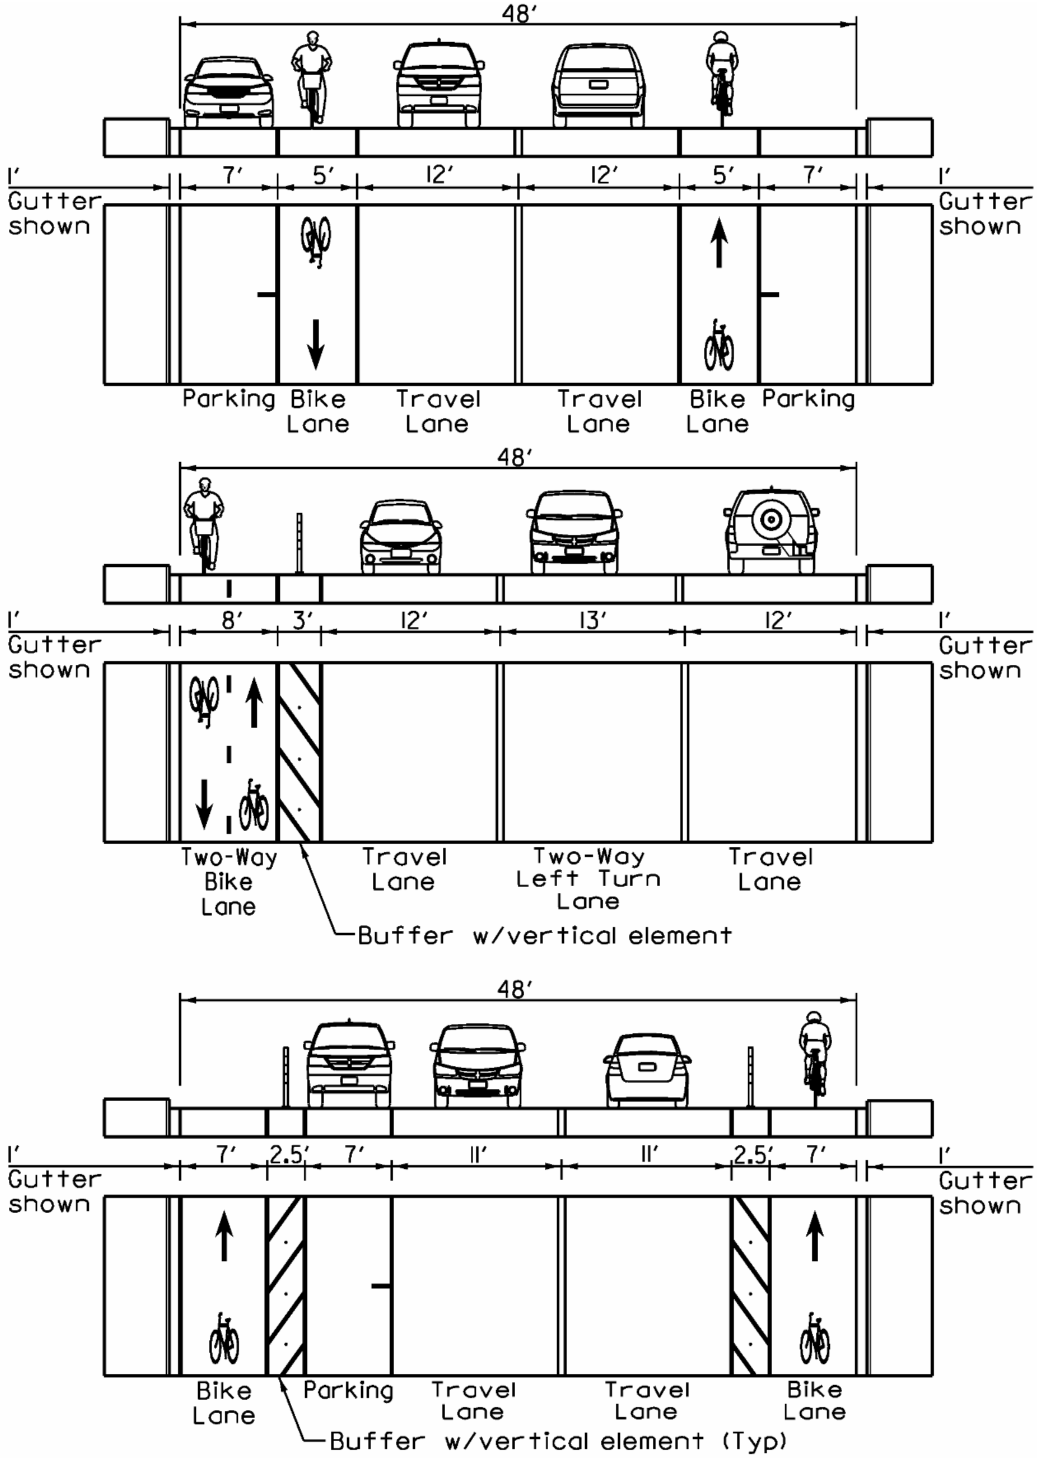
BICYCLE LANES WITH BUFFER AREAS

Figure 17-2.G
(1 of 3)



BICYCLE LANES WITH BUFFER AREAS

Figure 17-2.G
(2 of 3)



Note: Available options are shown for a 50′ f/f two-way roadway with bike accomodation and both parking and no-parking scenarios. This is for illustration purposes. A range of available options should typically be considered.

BICYCLE LANES WITH BUFFER AREAS

Figure 17-2.G
(3 of 3)

17-2.02(d) Separated Bicycle Lanes on Urban and Suburban Roadways

Separated Bicycle Lanes (SBLs) in their most common application are one-way, bike-only facilities located on both sides of two-way roadways or one side of one-way roads. Separation is provided by incorporating continuous or intermittent vertical elements within a street-side buffer that is at least 2 ft 6 in. (760 mm) wide. Compared to conventional bike lanes SBLs provide an enhanced level of perceived comfort and safety that may attract a greater range of users and better fulfill the goal of serving more potential bicyclists. Some contexts and operational conditions are appropriate for two-way separated bike lanes. Refer to Figure 17-2.G(3) for example cross sectional views of the two types of SBLs within a specific roadway width. SBLs are appropriate in many contexts as an alternative to side paths; both are separated sufficiently from traffic such that a BLOS evaluation is not required or appropriate.

For one-way accommodation, design separated bicycle lanes to carry bicycle traffic in the same direction as adjacent motor vehicle traffic for the reasons stated in Section 17-2.02(c). Since bicyclists in one-way SBLs better follow the expectations of drivers, there is potential safety advantage at crossings in comparison to two-way side paths. SBLs also provide a dedicated bikeway space as opposed to the shared-use space along a path. Two-way separated bicycle lanes on one side of the roadway (and contra-flow separated bike lanes) are not-preferred where riding against the flow of motor vehicle traffic will introduce specific safety concerns. Locate one-way SBLs that are on one-way streets on the right side of the street, except in areas where placing the SBL on the left will decrease the number of conflicts (e.g., those caused by heavy bus traffic). Refer to the *Illinois Vehicle Code,* 625 ILCS 5/11-1505.

SBLs are typically located at street level and separated from the traffic by vertical elements, such as raised curb islands, tubular markers (flexible posts) with a striped buffer, or a parking lane. A detail of a typical tubular marker is shown on Figure 17-2.I(3) in Section 17-2.02(e). Reasons for a street level configuration include control of pedestrian encroachment, provision of a detectable edge for low vision individuals, and (in retrofit projects) the possibility of using existing drainage systems with minimal modification. Raised SBLs may be considered under certain conditions and are addressed later in this section.

The street-level buffer should provide adequate separation from motor vehicles and control other curbside activities (e.g., loading). The following are considerations in the selection and design of separation elements.

Raised curb islands:

- May add considerable cost,
- Typically construct as cast-in-place features; precast options may provide less integrity,
- Provide a continuous island; with gaps primarily to facilitate necessary drainage,
- Discontinue on intersection approaches to allow for operational mixing,
- May be used in conjunction with parking where space and cost considerations allow,
- Widths typically range from 3 ft (0.9 m) to 6 ft (1.8 m); wider islands can allow additional features (e.g., low-growing vegetation) with a 6 ft (1.8 m) minimum face-to-face width also providing for pedestrian refuge at crosswalks where applicable.

Tubular markers:

- Typically add relatively minor cost beyond that of a buffered bike lane,
- Buffer widths as narrow as 2 ft 6 in. (760 mm) may be used, and these may partially overlap the usable riding area,
- Must meet minimum ILMUTCD requirements for color (the same as the pavement marking they supplement) and retro-reflectivity,
- Must be identified specifically as a local maintenance item in an agreement,
- Shall be removable to facilitate maintenance, which is typically frequent,
- Must not be bolted into place on bridge decks (epoxy pad fastening is available),
- May be considered less attractive and will require replacement when damaged. The need for regular ongoing maintenance must be committed to by the local agency.

Parking Lanes:

- Ten ft (3.0 m) is the preferred minimum separation distance to allow for parking and separation elements; curbed noses can be used to introduce the parking lane on the approach end,
- Opening of car doors (on the passenger side along two-way roads) creates the potential for dooring crashes; a striped buffer of minimum 2 ft 6 in. (750 mm) width is highly recommended for any bike lane running along the edge of a parking lane,
- Parked vehicles can restrict sight lines between motor vehicles and bicyclists; it is necessary to prohibit parking near intersections to maintain sight lines.

Measure SBL clear width between curb face and edge of tubular markers or face of curbed island. The minimum width of a one-way SBL is typically 7 ft (2.1 m) to allow for bicycle passing and the use of local maintenance equipment (e.g. for snow removal). This minimum clear width is specified in the Bicycle Facility Selection Table since passing is typically important. In constrained conditions a one-way SBL width could possibly be reduced, but only if a local agency confirms maintenance would be practical. However, the SBL should also be wide enough to accommodate anticipated bicycle volumes, noting that completion/extension of a bicycling network could increase bicycle use.

A two-way SBL of minimum clear width 8 ft (2.4 m) can be provided on one side of a roadway where operational issues and all safety concerns can be effectively mitigated. This minimum clear width cannot be reduced for two-way SBL as passing will be necessary and usually frequent. An additional 3 ft (910 mm) minimum buffer width for raised curb, or 2.5 ft (760 mm) minimum for tubular markers, is also needed. Two-way SBL provide user separation and a low-stress bicycling experience. One potential concern is that drivers may not expect the counter-flow direction of bicycle travel. Careful attention must be paid to the design of crossings of driveways and intersections to maximize bicyclist visibility. The design to accommodate counterflow bicycle traffic movements may require additional traffic signals (often bicycle signal heads) and related infrastructure. On the other hand, maintenance costs may be less for a two-way facility based on the much shorter SBL length required. Selecting the appropriate configuration for separated bike lanes, one-way versus two-way, will include location-specific consideration of safety, connectivity, ease of access, public feedback, available right-of-way, termini transitions, traffic signal controls, and maintenance. Either design option could provide good accommodation solutions. Carefully assess the constraints and circumstance that will be present along project segments and intersections and design accordingly.

Raised bicycle lanes (RBLs), also known as cycle tracks, provide for one-way bicycle accommodation elevated above the road surface beyond the curb line. Typically RBLs are at sidewalk elevation but may be at an intermediate height, 4 inches above the roadway surface. Raised bicycle lanes are considered separated from motorized traffic based on the curb height differential. A horizontal separation is also possible with a parking lane or other measure. Bicycle pavement marking symbols and arrows shall be placed at the beginning of an RBL block length (near intersections) and provided periodically along block segments. Although not intended for pedestrian use raised bicycle lanes shall be constructed within ADA tolerances since such use could occur. Where a transit stop is located along an RBL, the draft PROWAG's boarding and alighting zone may overlap with the RBL; advanced signage and pavement markings shall be provided for bicyclist awareness.

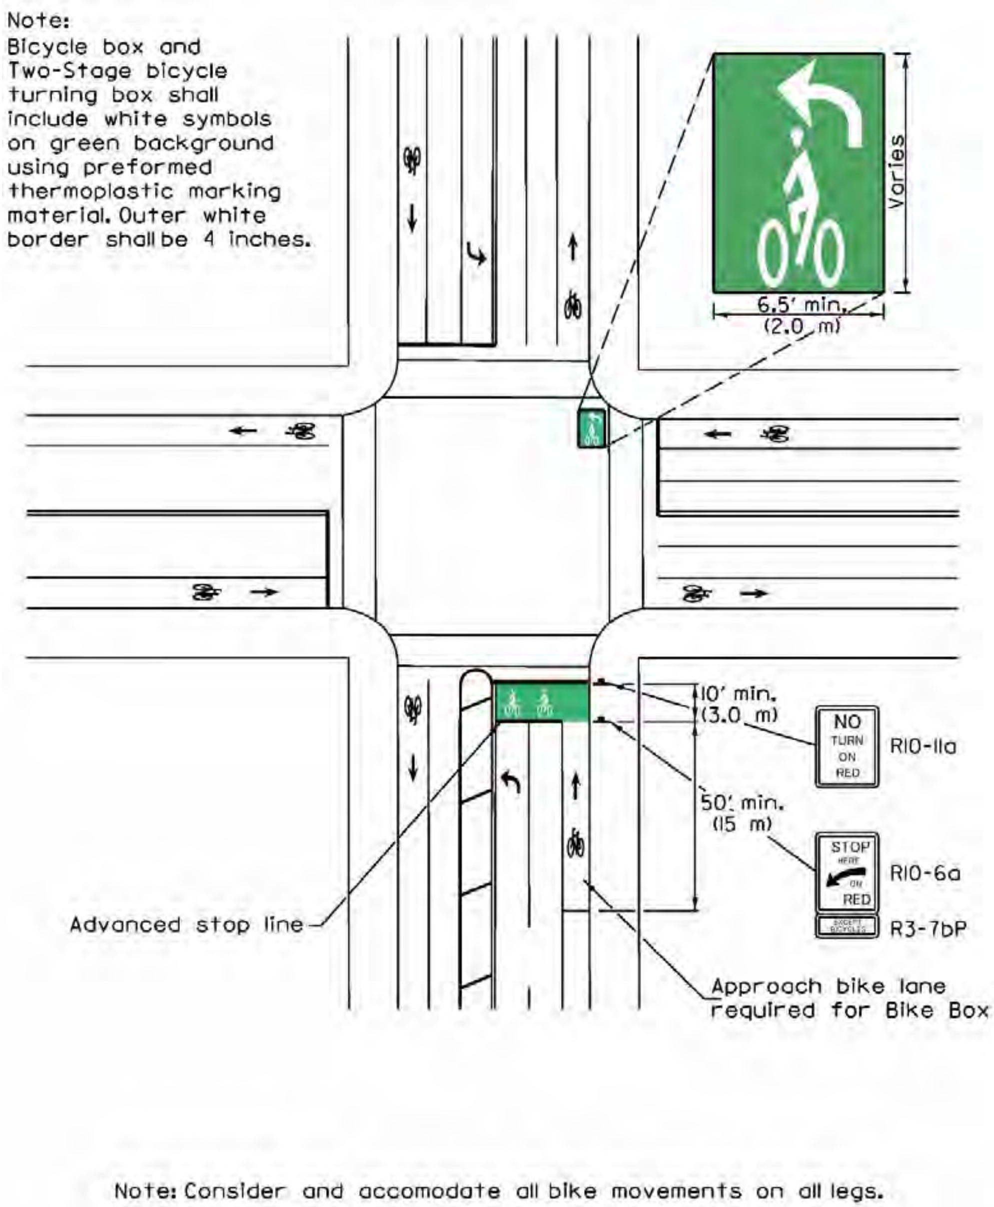
Stormwater drainage must be examined for adequate positive flow to structures with grates that do not compromise bicycle or pedestrian travel. RBLs that are proposed on bridge decks shall be coordinated with the Bureau of Structures and the BPPE.

17-2.02(e) Intersection and Interchange Treatments

Accommodations for on-road bicycle travel through conventional intersections are covered in the ILMUTCD, Part 9, including striping and signing requirements for bicycle lanes. Specific situations are further discussed and illustrated in this section. Safety and usability for bicyclists through roundabouts depend on details of the roundabout design including provisions unique for cyclists; these issues are covered in Section 17-2.04.

Local legs approaching signalized intersections may have various accommodation types, often including shared lanes or paved shoulders of widths different than those required for state route accommodations. When redesigning an intersection, maintain accommodation widths on local approaches and through the intersection so that restricted-width bottlenecks are not created, and comfortable bicyclist travel is provided on those legs. As an example, avoid reducing through lane widths when adding turn lanes on the local approaches. Considering and accommodating all bike movements during intersection design will often affect the scope of work along local legs. Where bicycle lanes are not provided, typically continue an approaching wider outside lane through intersections to accommodate bicycle through movements. Since bicyclists may be on-road even if a side path is provided, avoid outside lane width reductions through intersections in any case.

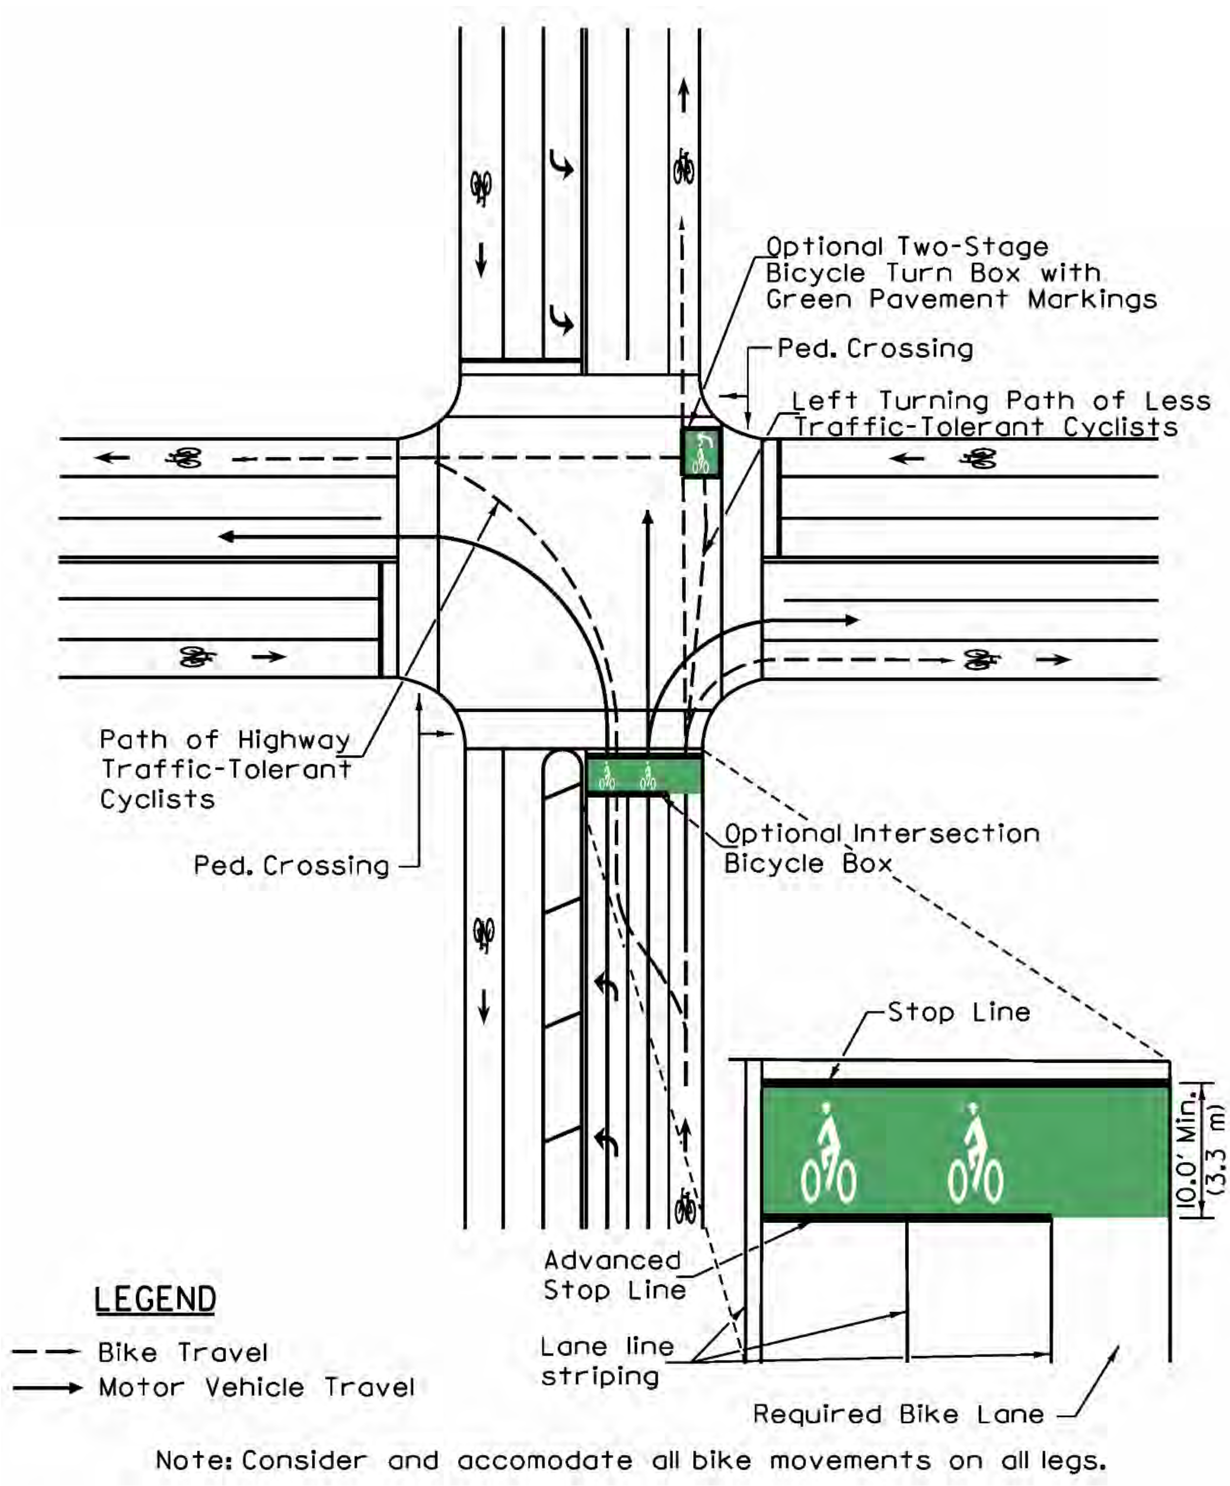
Figure 17-2.H(1) provides an example of pavement markings and signing at a signalized intersection where bike lanes are present along the routes. Typical movements for signalized intersections with bike lanes are shown in Figure 17-2.H(2). Left-turning bicyclists may follow the optional paths shown. Some bicyclists will move to the left in advance of an intersection and turn from the left turn lane, utilizing an optional bicycle box where provided on the approach. Most bicyclists will proceed straight through the intersection staying to the right on the far side, then either crossing like a pedestrian or using a two-stage bicycle turn box where provided. Either a bicycle box or the two-stage bicycle turn box may be included under an MUTCD Interim Approval; there are specific marking, signing, signalization, and reporting requirements involved, administered through the central Bureau of Operations as discussed below. Consultation with BPPE is recommended where these features will be incorporated into the design in order to discuss design details. Refer to the *AASHTO Bike Guide* and the *ILMUTCD* for additional design considerations. Dotted line extensions of bike lanes through intersections may be used consistent with *ILMUTCD* Section 3B.08. This extension marking is recommended only when guidance is appropriate related to an accommodation type, such as where a two-way separated bicycle lane transitions across an intersection to a one-way system on both sides as shown in Figure 17-2.I (3 of 3).



Note: Consider and accommodate all bicycle movements on all legs.

TYPICAL STRIPING AND BICYCLE MOVEMENTS AT INTERSECTIONS FOR STREETS WITH BICYCLE LANES

Figure 17-2.H (1 of 2)



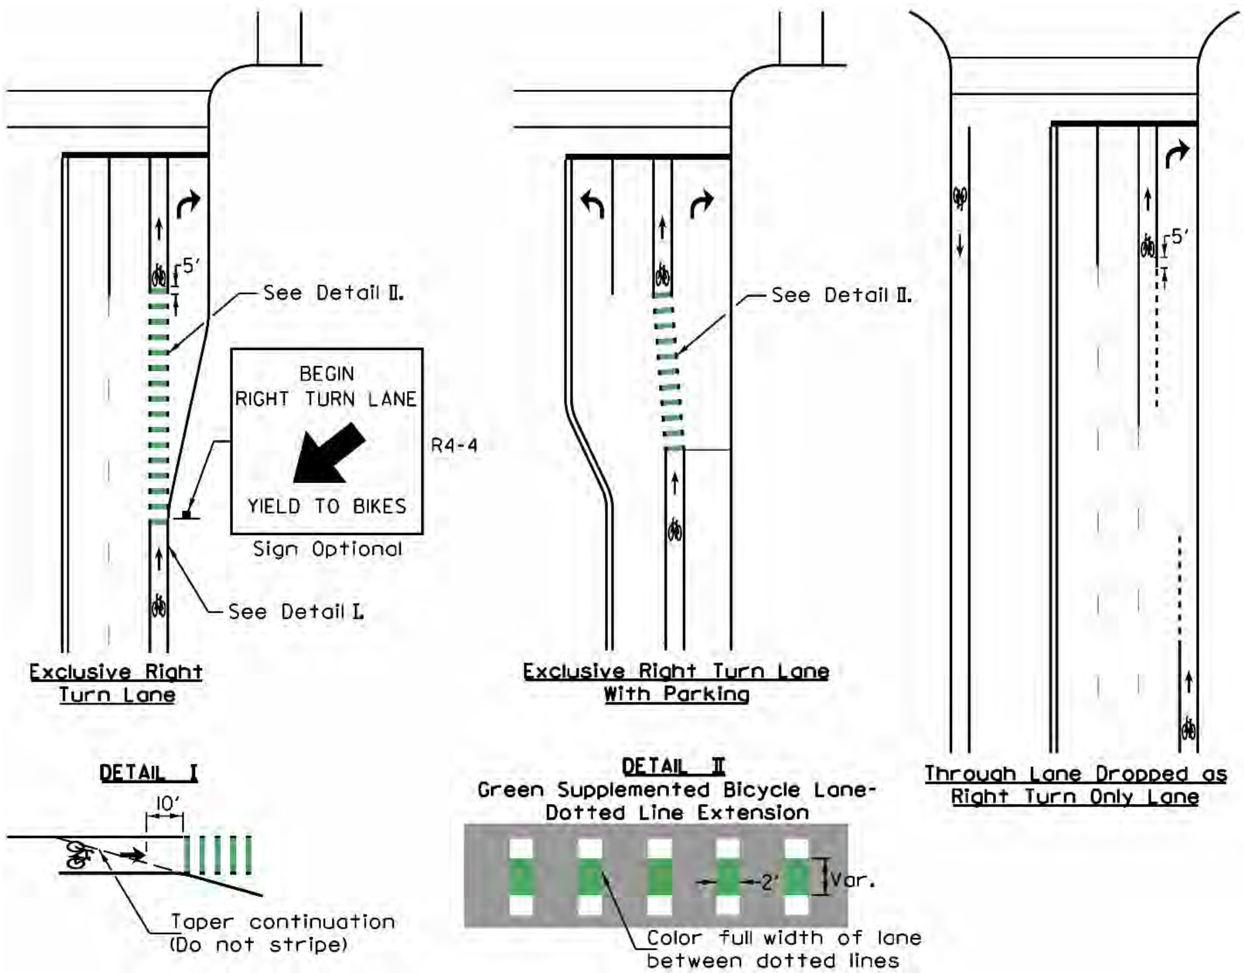
TYPICAL STRIPING AND BICYCLE MOVEMENTS AT INTERSECTIONS FOR STREETS WITH BICYCLE LANES

Figure 17-2.H
(2 of 2)

The *AASHTO Bike Guide* includes a discussion of the requirements for on-road bicycle accommodations on intersection approaches and at intersections, and the *ILMUTCD* provides examples of required pavement markings; see Figures 9C-1, 9C-4, 9C-5, and 9C-6. Additional striping considerations and details for general guidance at these locations are illustrated in Figure 17-2.I. Figure 17-2.I(1) shows the general striping required for bicycle lanes on approaches to intersections. Through bike lanes should be located to the right of the right-hand through lane and to the left of an auxiliary right turn lane for both urban or rural roadways. This placement greatly reduces the potential for last-moment conflicts with right-turning vehicles. A 5 ft (1.5 m) minimum width bike lane adjacent to the right turn lane typically provides comfortable bicyclist operating space. Where an auxiliary right turn lane is introduced, two dotted lines are used through the right turn lane tapers to designate the priority of bicyclist operations. For rural roadways these may be the only marked bike lane accommodations provided when the accommodation is located along a paved shoulder. Consider Begin Right Turn Lane Yield to Bikes (R4-4) signs to add clarity for drivers. In a situation with bike lanes where a through travel lane is dropped into a right-turn-only lane, bicyclists not motorists are the users who must yield. In such a situation the bike lane should not be striped diagonally across the travel lane, as shown in Figure 17-2.I(1).

Examples of striping and signing for bike lanes at and between intersections are shown in Figure 17-2.I(2). A possible layout for transitioning two one-way separated bike lanes to a two-way separated bike lane at an intersection is shown in Figure 17-2.I(3). In all cases strive to maintain good visibility among all roadway users and provide channelization for proper positioning of all traffic. For conventional, buffered, and separated bike lanes clearly mark intersection approaches and through movements. Checking visibility and line-of-sight between motor vehicles and bicyclists is especially important at intersections with SBLs, and the separation elements must be discontinued to provide for all crossing and merging movements.

Consider access to/from links in the bicycle network and to/from adjacent properties and side streets. When considering bicycle safety, geometry that reduces vehicle speeds for turns is encouraged since vehicle turns involve potential conflicts with bicyclists. Well-designed corner islands, possibly including mountable aprons, can accommodate large vehicle turning movements while also providing bicycle/pedestrian refuge areas and appropriately reducing the turning speeds of vehicles.



TYPICAL TREATMENTS ON APPROACHES AND AT INTERSECTIONS FOR STREETS WITH TRADITIONAL AND SEPARATED BICYCLE LANES

Figure 17-2.I (3 of 3)

IDOT is administering statewide Interim Approvals (I.A.) for bicycle boxes, two-stage bicycle turn boxes, and green colored pavement markings. Bicycle signal faces may also be considered to facilitate accommodations, and would be handled with an individual I.A. To comply with the terms of a statewide Interim Approval, any jurisdiction that utilizes these devices must report the location to IDOT, which will maintain an inventory of all installation locations. Installations must be in accordance with the terms of the Interim Approval, and the requirements and guidance on use of these devices as listed below. Contact the central Bureau of Operations to identify locations and have them added to a statewide inventory.

17-2.02(e)1 *Bicycle Boxes (I.A.-18 for Optional Use of an Intersection Bicycle Box)*

In conjunction with bike lanes, a bicycle box is a designated area on the approach to a signalized intersection consisting of an advanced stop line and bicycle symbol markings. The box is provided as a space for bicyclists to wait in front of stopped motor vehicles during the red signal phase, so they are more visible to motorists at the start of the green phase. Bike boxes can serve to mitigate conflicts between through bicyclists and right-turning motorists by allowing bicyclists to proceed first. Bicycle boxes may be installed across only one through lane. They may also be installed across a right turn lane. Turns on red should be prohibited using a NO TURN ON RED sign on an approach where a bike box is placed in front of traffic that otherwise has the potential to turn on red.

Bicycle boxes may be installed across a left turn lane at T-intersections or if a high left turning bike volume is anticipated. In other situations, bicyclists will tend not to utilize bike boxes for left turns, and the preferred treatment is to include a two-stage bicycle turn box, as described below, for left-turning bicyclists. Bike boxes shall be at least 10 ft (3.0 m) in depth, include a bicycle symbol within the box, and connect directly to a bike lane on the approach. At least 50 ft (15.2 m) of bike lane should be provided on the approach to a bike box. Green colored pavement marking shall be used within the bike box. The stop bar for motorists should coincide with the beginning of the bike box. A STOP HERE ON RED sign (R10- 6 or R10-6a) should be placed even with this stop bar, along with an EXCEPT BICYCLES (R3-7bP) plaque. This must be modified where stop bars for through lanes and turn lanes will be at staggered locations.

17-2.02(e)2 *Two-stage Bicycle Turn Boxes (I.A.-20 for Optional Use of Two-Stage Bicycle Turn Boxes)*

The two-stage bicycle turn box designates an area at an intersection for bicyclists to wait for traffic to clear before proceeding in a different direction. These boxes are used to facilitate left-turning bicycle traffic at signalized intersections. They are a preferred treatment along high-volume multi-lane roadways where bicyclists would otherwise have to make lane changes, weave across traffic on an approach to turn left at a signal. Operationally, bicyclists traverse the intersection (e.g. along an extension of the through bike lane), stop within the turn box, reorient the bike to the cross street, and wait for the green phase to proceed. The following requirements apply to two- stage bicycle turn boxes:

- Locate where visible and outside the path of potentially conflicting through and turning vehicle traffic. Where the paths of other vehicles turning on a red signal would travel through the two-stage bicycle turn box, these turns shall be prohibited using a NO TURN ON RED sign;
- Locate so bicycles will not queue into the path of moving traffic;
- Locate downstream of the cross-street crosswalk and stop bar;
- Include a bike symbol oriented in the direction of entry of the box and an arrow showing the direction of turn;

- Outline the box in solid white lines using a 6.5 ft (1.9 m) minimum length to accommodate the queued bike and include green colored pavement marking to increase conspicuity;
- Passive detection of bicycles shall be provided in the two-stage bicycle turn box, if detection is required to actuate the signal for the cross street.

17-2.02(e)3 *Bicycle Signal Faces (I.A.-16 for Optional Use of a Bicycle Signal Face)*

A bicycle signal face incorporates bicycle symbols on the lenses of the signal head. In one-way contra-flow situations these may be the only signal faces visible to users; in other cases, these signal faces are placed at an offset location from the primary signal faces on the intersection approach. When these devices are present, bicyclist are not to follow pedestrian signals or standard traffic signal heads, as they do at other signalized locations. The current Interim Approval allows these devices only where there will be no conflicting motor vehicle movements concurrent with the bike green phase. The most common applications are for bike lanes that must be placed to the right of right turn lanes and in conjunction with both contra-flow and two- way separated bike lanes. They are not allowed at PHB locations. Early coordination with the local municipality regarding these devices is highly recommended; local jurisdictions may affect device placement and direct vehicle travel paths, pursuant to 625 ILCS 5/11-1510.

When operating on shared use paths, bicyclists must follow pedestrian signal heads and use the crosswalk, unless a bicycle signal face is also present. When operating in a separated bike lane, bicyclists will typically use the vehicle signal heads. However, if these are obscured in certain geometric situations, or if bikes have a directional movement separate from vehicle movements, bicycle signal faces may be utilized. The BIKE SIGNAL sign (R10-10b) sign must supplement these signals. Where appropriate, the BIKES USE PED SIGNAL sign (R9- 5) may be mounted adjacent to the pedestrian signal heads; however, studies have indicated that compliance rates are low for bicyclists directed to follow pedestrian signals. This will be an important consideration at intersections with long crossings or unique signal phasing.

17-2.02(e)4 *Green Colored Pavement Markings (I.A.-14 for Optional Use of Green Colored Pavement for Bike Lanes)*

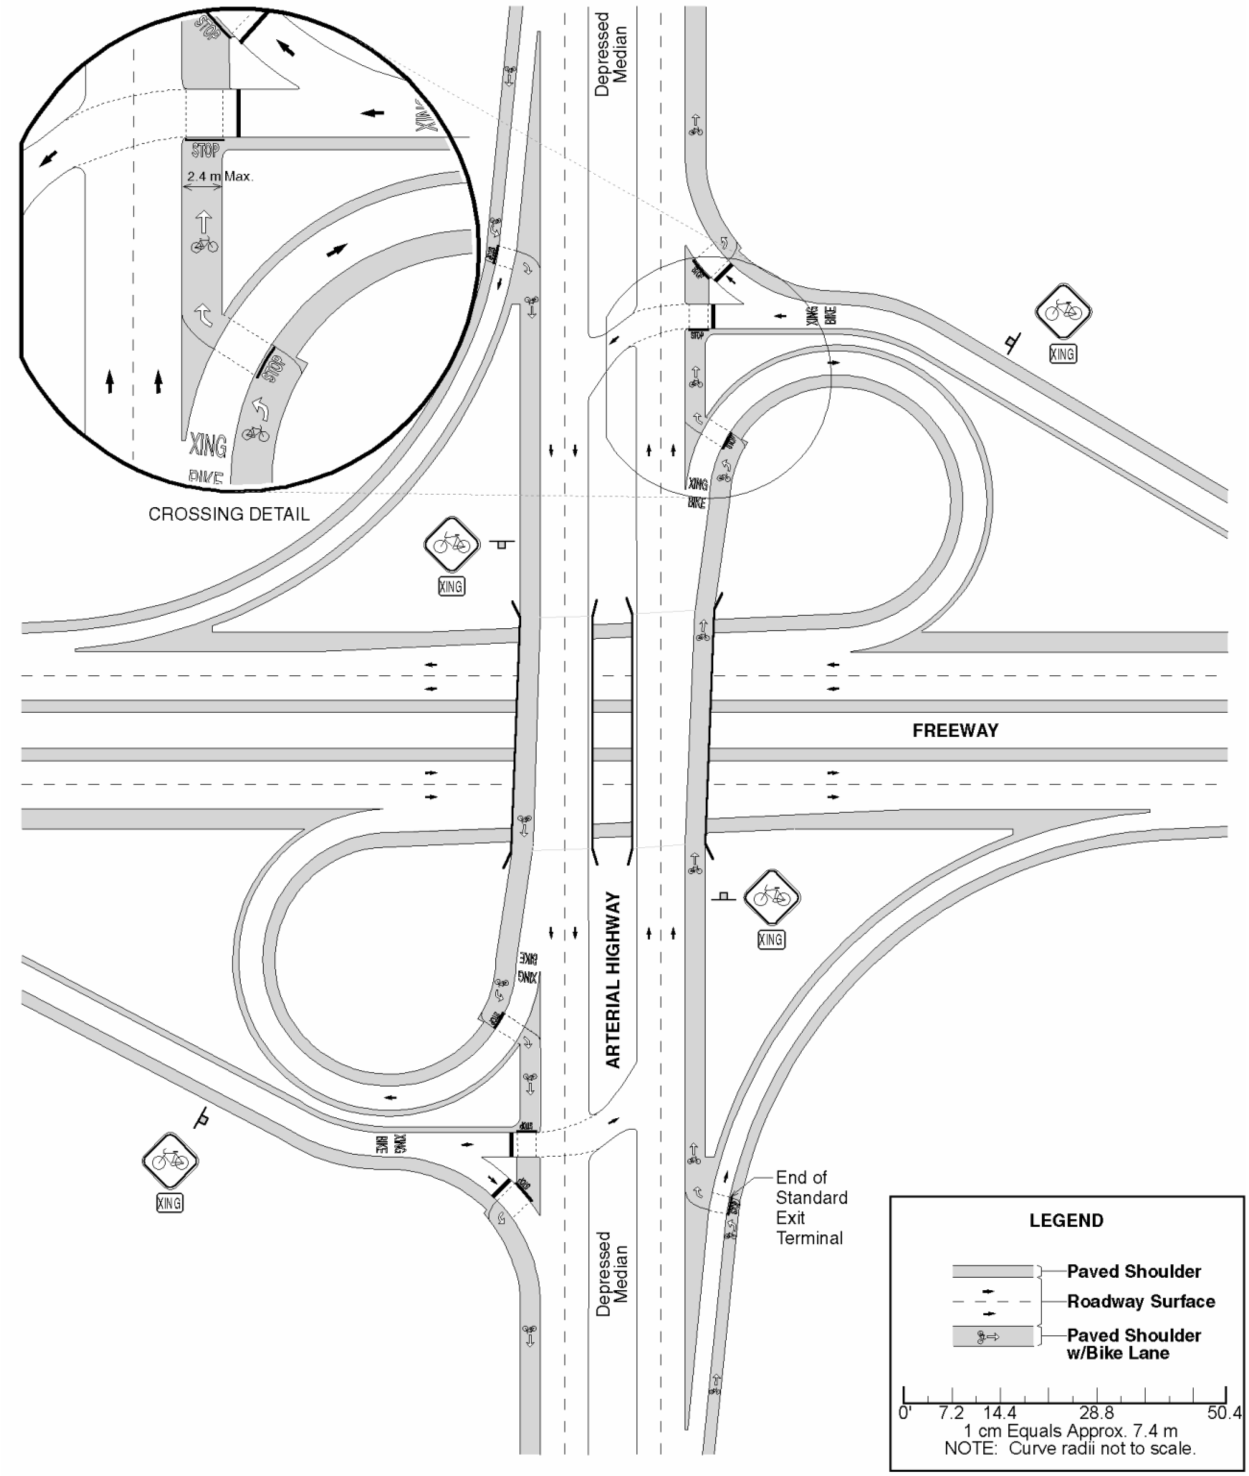
Green colored pavement marking applications on state routes must be limited to strategic locations to achieve positive operational effects on bicyclist positioning, improved comfort for bicyclists, and increased awareness for drivers of the potential for bicyclist interactions. The primary application for green colored pavement markings will be for increased conspicuity on approaches to intersections (e.g. between dashes in taper areas), within bicycle boxes, and within two-stage bicycle turn boxes. Use of green colored pavement markings in bike lanes outside approach and transition areas is not recommended due to application and maintenance costs. There is likely little benefit in conspicuity away from signalized intersections. See Interim Approval 14 for restrictions on the use of green colored pavement markings at locations other than those specifically mentioned above.

Green colored pavement markings have specific requirements related to marking material, green color limits, and retro-reflectivity; refer to the IDOT Standard Specifications.

Intersection improvement projects are sometimes undertaken separate from adjacent roadway segment improvements. For such projects a bicycle warrant analysis must be completed, and if warrants are met the intersection geometrics should be designed to accommodate bicyclists along the intersection legs. Such accommodation may include, for example, width for bicycle lanes and offset corner islands and signal poles. Pavement areas can be hatched with diagonal lines to maintain consistency with the existing adjacent lane widths through an interim period. The ultimate design must be understood, and interim measures designed in the appropriate form and width so that subsequent roadway improvements may require only restriping at the intersection, thereby minimizing costs for the overall improvements.

Bike lanes may be dropped at logical locations beyond intersections (for example to a shared lane, shoulder, or side-path facility), if necessary due to width constraints near a project improvement limit. Refer to the discussion of network considerations in Section 17-1.03. The goal is to provide the on-road bicyclist with a safe path to continue travel. At roundabouts bike lanes can be transitioned off of the pavement using angled ramps; see Section 17-2.04 for more information regarding bicycle accommodation through roundabouts. An example application of signing is the BIKE LANE ENDS sign (R3-17 and R3-17bP) to give warning to bicyclists that the on-road accommodation is ending.

Accommodating bicyclists through an interchange with free-flow ramps requires design considerations to address safety of bicyclists. Where on-road accommodation is necessary, the design shown in Figure 17-2.J reflects an acceptable approach to directing bicyclists through interchanges (shoulder accommodation is illustrated; bicycle lanes similar). Each specific interchange design requires individual consideration to meet accommodation and geometric design requirements. A diverging diamond interchange accommodates left-turning movements at signalized intersections while eliminating the need for left turn phasing. Single Point Urban interchanges involve larger open pavement areas. On-road accommodations can continue along the right side of the arterial route travelled way in each direction through these interchange types.



SHOULDER ACCOMMODATION THROUGH HIGHER SPEED INTERCHANGES

Figure 17-2.J

17-2.02(f) Accommodations on Highway Structures

Bicycle accommodations on approach roadways, either on-road or as shared-use side paths, should be carried across structures in the same form. Side path crossings are discussed in Section 17-2.03. The width of new highway structures should, at a minimum, equal the width of the traveled way plus the width of approaching bicycle lanes and/or paved shoulders. Minimum cross sections for roadways and structures will vary significantly depending on the type of bicycle facility being accommodated. Several examples of minimum cross sections for shared wider outside lanes, bicycle lanes, and separated bicycle lanes are shown in Figures 17-2.K, 17-2.L, and 17-2.M respectively.

A minimum 4 ft (1.2 m) outside railing height shall be provided on roadway structures accommodating bicycles. This railing height is necessary to provide for bicyclist safety on any structure where bicycle warrants are met or where a bike route will be specifically designated. Bicycles are considered a design vehicle in these situations. When no warrant is met, only a standard parapet is required. Details available on the Bureau of Bridges and Structures base sheets may exceed this height and have been developed in consideration of AASHTO and FHWA crashworthiness requirements, as well as future bridge overlays.

Coordinate SBL design with the Bureau of Bridges and Structures and BPPE regarding any SBL on a bridge deck. Flexible posts are typically anchored into the pavement, so their use on bridges is discouraged given the need to avoid any deck reinforcement damage, which could also cause deck deterioration. Epoxy pads are usually the best alternative fastening method on bridge decks. Retrofitting raised curbs on bridge decks would require structural analysis by the Bureau of Bridges and Structures.

Bridge deck replacement or rehabilitation projects are not typically intended to widen the traveled way but rather to improve the roadway surface and integrity of the structure. Bridge width is limited by the existing superstructure components, with very limited opportunity for widening, and as such, may not allow for the bicycle accommodations called for in the Bicycle Facility Selection Table. If an existing structure cannot provide the accommodation widths provided along the roadway, appropriately sign the facility to warn users of width restrictions. However, such restrictions (e.g., narrowing a shoulder or bike lane) should still provide an accommodation. If only a shared lane can be provided, signing for drivers and bicyclists on the approaches is especially critical. For example, the BIKES MAY USE FULL LANE sign may be appropriate in such situations.

For any corridor improvement that includes existing culverts where warrants are met, the culverts should provide for the appropriate bicycle accommodation. Assess bicycle warrants as part of spot culvert projects and provide width for the appropriate future accommodation. Hydraulic analysis is typically required in conjunction with culvert extensions.

When a project has a bridge omission and accommodations are included along the roadway, bikeway facilities will be added within the project limits in order to allow for compatible future accommodations on the omitted structures; signing may be appropriate as noted above. Funding splits shall be as outlined in Chapter 5 (5-5.02 and 5-5.05).

FIGURE 17-2.M

17-2.02(g) Road Diets and Lane Width Reductions

Bicycles also can be accommodated on a roadway by marking or re-marking the pavement to increase the width of the curb lane or to add bike lanes. For example, it may be feasible to:

- reduce the width of traffic lanes in accordance with IDOT and AASHTO criteria;
- change the median width, create raised curb medians if pedestrian refuge is needed, or remove portions of a two-way center turn lane;
- remove parking, possibly in conjunction with providing off-street parking; or
- reduce the number of through traffic lanes, subject to analysis of capacity, safety, and operational needs.

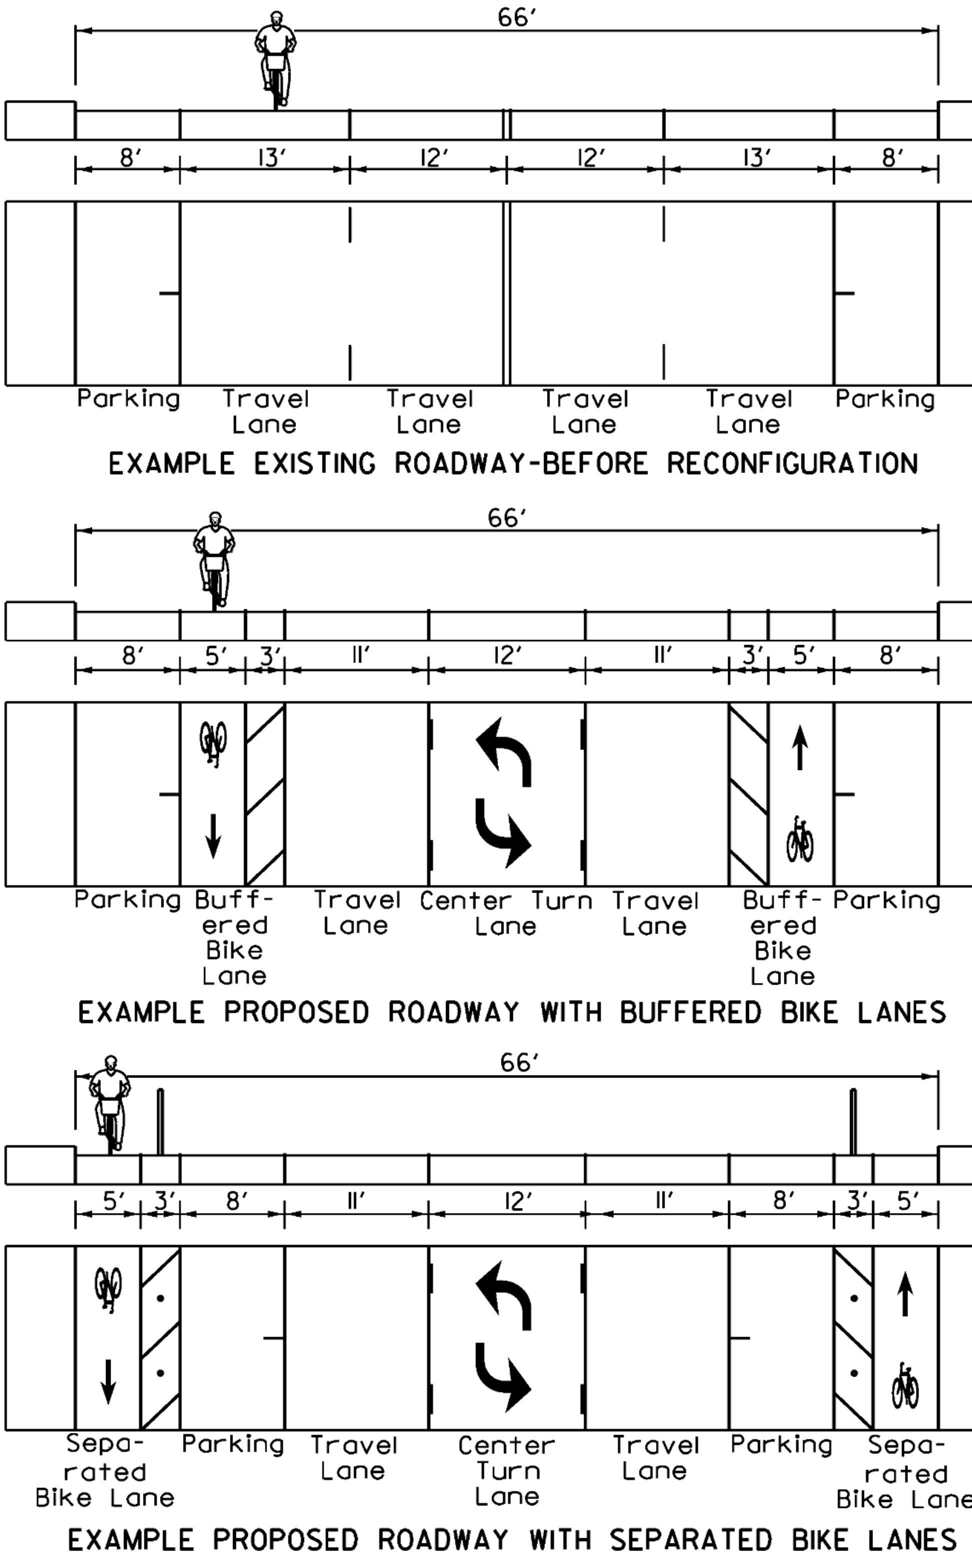
Reducing the number of through traffic lanes, when accompanied by the addition of bicycle and/or pedestrian improvements, is referred to as a road diet. Figure 17-2.N depicts example plan and cross section views of an existing 4-lane roadway and two options for a 3-lane road diet improvement within the same face-to-face roadway dimension. Districts should review the range of issues involved on the specific corridor when deciding whether to pursue a road diet. Districts may also consider and determine whether to study locally suggested road diets and can require local study on a case-by-case basis. Specific dimensions applied would be unique for each project. The following guidance applies when road diets are considered.

Safety. Studies indicate that properly designed road diets can result in both speed reduction and safety benefits. Refer to the HSM and the Crash Modification Factor Clearinghouse for details on safety analysis for these projects. Both improved BLOS and the potential reduction in severe crash frequency should be investigated and reported.

Operations. Traffic studies must be performed to evaluate future capacity and vehicle level of service. Signal system modifications are generally needed for any signalized intersections that are within the project limits. It is likely that timing and phasing changes will be required that will affect operations along cross streets. The lane reduction upstream of a road diet should be accomplished in accordance with the requirements of Chapter 36. Early coordination with both district and central office Operations staff is necessary.

Local coordination. Review and consider local complete streets policies, whenever a community has adopted them. If a road diet is an option, begin local coordination early in Phase I, applying CSS procedures as appropriate. If a road diet is selected through the local coordination process, the district should request and receive a formal resolution stating that a municipality supports a road diet. At a minimum, a public meeting that includes invitations to area residents/business owners and roadway users is typically necessary and should be completed early in the process, before a design alternative has been selected.

Similar to other project types, if the accommodation identified in the Bicycle Facility Selection Table will not fit within the constraints of the roadway width, consider next highest-and-best options in order to provide an accommodation. Appropriate accommodations can sometimes be developed by narrowing through lanes (e.g., to a minimum 10 ft (3.0 m) width), commonly referred to as a “lane diet.” Use form BDE 1703 to calculate BLOS for the accommodation width available, targeting BLOS C or C/D, and move forward to local coordination identifying the next highest- and-best accommodations. Raised median and corner islands are a key consideration for the safety of non-motorized users and can be established in conjunction with existing or new crosswalks as part of road diet projects. Additional discussion of road diets is provided in the *AASHTO Bike Guide* and FHWA's *Road Diet Informational Guide.*



ROAD DIET EXAMPLES ADDING BUFFERED OR SEPARATED BIKE LANES

Figure 17-2.N

17-2.02(h) Other Design Considerations

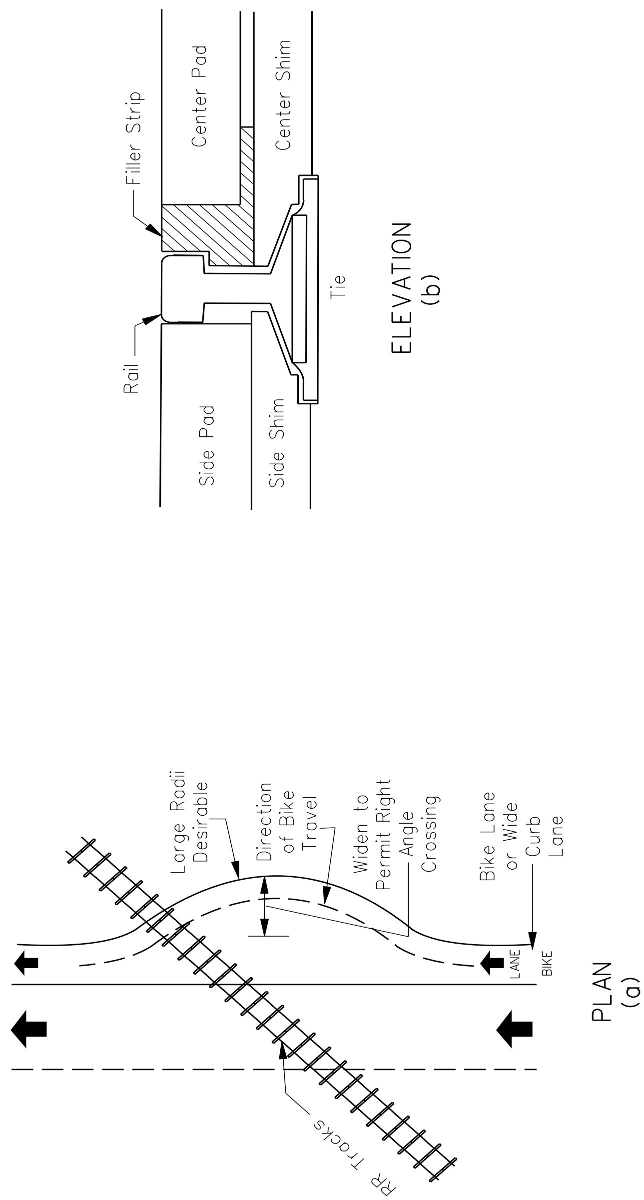
Regardless of the type of on-road bicycle accommodation improvement being developed, always consider the following items:

Drainage Grates. Drainage grates and utility covers on roads, bridge approaches, and bridges can be hazardous to bicyclists. Bicycles often have narrow tires and no shock absorbent systems, and therefore are more sensitive to older elongated-slot style drainage inlets and irregularities on the pavement surface. Current IDOT drainage grate designs suitable for bicycle travel include Types 1, 3, 3V, 4, 5, 9, 10, 11, 11V, 23, and 24. Specify that grate openings run perpendicular to bicycle travel. Types 20, 21, and 22 are conditionally acceptable if the vane length is perpendicular to bicycle travel. Other grates are acceptable for bicycles, if the opening slots do not exceed 6¼″ L x 1½″ W (159 mm L x 38 mm W). With pavement overlay projects, replace utility covers and non-conforming drainage grates and adjust them flush with the new surface.

Railroad Crossings. Bicyclists should be able to cross railroad tracks at or near a right angle to minimize the potential for a bicycle's front wheel to become trapped in the flangeway, which would cause loss of steering control. The potential for a bicyclist's front wheel to be trapped in the rail flangeway increases when the angle of approach deviates greatly (20° or more) from 90°. When the crossing angle is less than 45°, consider widening the outside lane, shoulder, or bicycle lane to improve the angle of approach; see Figure 17-2.O(a). Where this is not practical, consider using commercially available compressible flangeway fillers, such as that shown in Figure 17-2.O(b), to provide a smooth transition over the rails. Coordination with the railroad owner is required. Design the bicycle portion of the pavement surface so that it is the same elevation as the rails and consistent with the vehicular crossing surface. Remove abandoned tracks, if practical, to eliminate the hazard.

Pavement Joints and Surfaces. Consider the following factors related to pavement structures:

a. Joints and Drop-Offs. In new construction, pavement surface irregularities can cause a bicyclist to lose control and crash. Because bicycle tires may be as narrow as 1 in. (25 mm), gaps between pavement slabs and gutters or drop-offs at overlays, especially parallel to the direction of travel, can trap a bicycle wheel and result in loss of control. This loss of control can cause a bicyclist to fall or swerve into the path of motor vehicle traffic. To the extent practical, pavement surfaces should be free of irregularities and the edge of the pavement should be uniform in width. To assure pavement suitability, overlay projects should consider options to scarify the old pavement up to the gutter edge.



BIKE LANE CROSSING WITH RAILROAD

Figure 17-2.O

b. Rumble Strips. Where rumble strips are placed across the traffic lane in rural areas to warn motorists of upcoming traffic controls, provide a minimum 3 ft (900 mm) clear paved area on the paved portion of the shoulder to allow a bicyclist an opportunity to avoid the rumble strips.

When rumble strips are installed in a paved shoulder which serves as a bicycle accommodation and the width of the paved shoulder is 6 ft (1.8 m) or less, the 8 in. (200 mm) rumble strip design should be used to minimize the impact to the accommodation. The minimum width of a paved shoulder accommodation with rumble strips is 4 ft (1.2 m). This width maintains a minimum paved width of 3 ft (0.9 m) beyond the edge of the rumble strip for bicyclist use.

c. Surface Type. Many rural roadways, because of their low traffic volumes, are very conducive to bicycling. When selecting the surface type and maintenance methods, consider the impacts on bicycle use. Particularly with oil and chip (A2/A3) surfaces, the aggregate specified should be a coarse aggregate, and care should be exercised to ensure that the surface is properly rolled and swept. Any loose stones and debris allowed to accumulate on the outer edges of the roadway or shoulder can present safety concerns for bicyclists.

17-2.02(i) Bicycle Routes

It may be advantageous to sign some roadways as bicycle routes, particularly if certain roadways provide preferred alternatives to heavily traveled highways. When providing continuity to other bicycle facilities, a bicycle route can be relatively short; however, a bicycle touring route can be quite long.

Base the decision whether to provide a bicycle route on the advisability of encouraging bicycle use on a particular road instead of on parallel and adjacent highways. Consider the roadway width, BLOS, and other factors (e.g., volume, speed, type of traffic, parking conditions, grade, sight distance) when identifying appropriate bicycle routes.

Generally, bicycle traffic cannot be diverted to a less direct alternative route, unless the favorable factors outweigh the inconvenience to the bicyclist. Roadway conditions such as adequate pavement width, traversable drainage grates, railroad crossings, pavement smoothness, peak traffic volumes and times, and signal responsiveness to bicycles always should be considered before a roadway is identified as a bicycle route. Local agency support is required.

Bicycle route signing should not end at a location where bike travel conditions suddenly downgrade. Rather, provide information signing to direct the bicyclist to a relatively safe route to continue travel. Further guidance on signing bicycle routes is provided in the *ILMUTCD*.

17-2.02(j) Signing, Marking, and Traffic Control

Signing, pavement markings, and traffic control for bicycle facilities will be in accordance with the criteria presented in the *ILMUTCD* and applicable local ordinances. Signing and pavement markings are especially important at the approaches to intersections and at bike lane termini. Where a bike lane ends, bicyclists may be required to merge with motor vehicle traffic. Bicyclists should be encouraged with the appropriate signing and pavement markings to make appropriate lane changes in advance of an intersection.

Not all bicycle accommodations or bikeways need to be or should be marked as bike routes. Generally, only low-volume roads, bike lanes, and bicycle paths should be marked as designated bicycle routes. The following are some examples of what should not be marked:

- wide curb lanes that provide intermittent access to businesses along the route, but provide no connection to another part of a bike route; and
- any facility that does not meet minimum design criteria throughout its length.

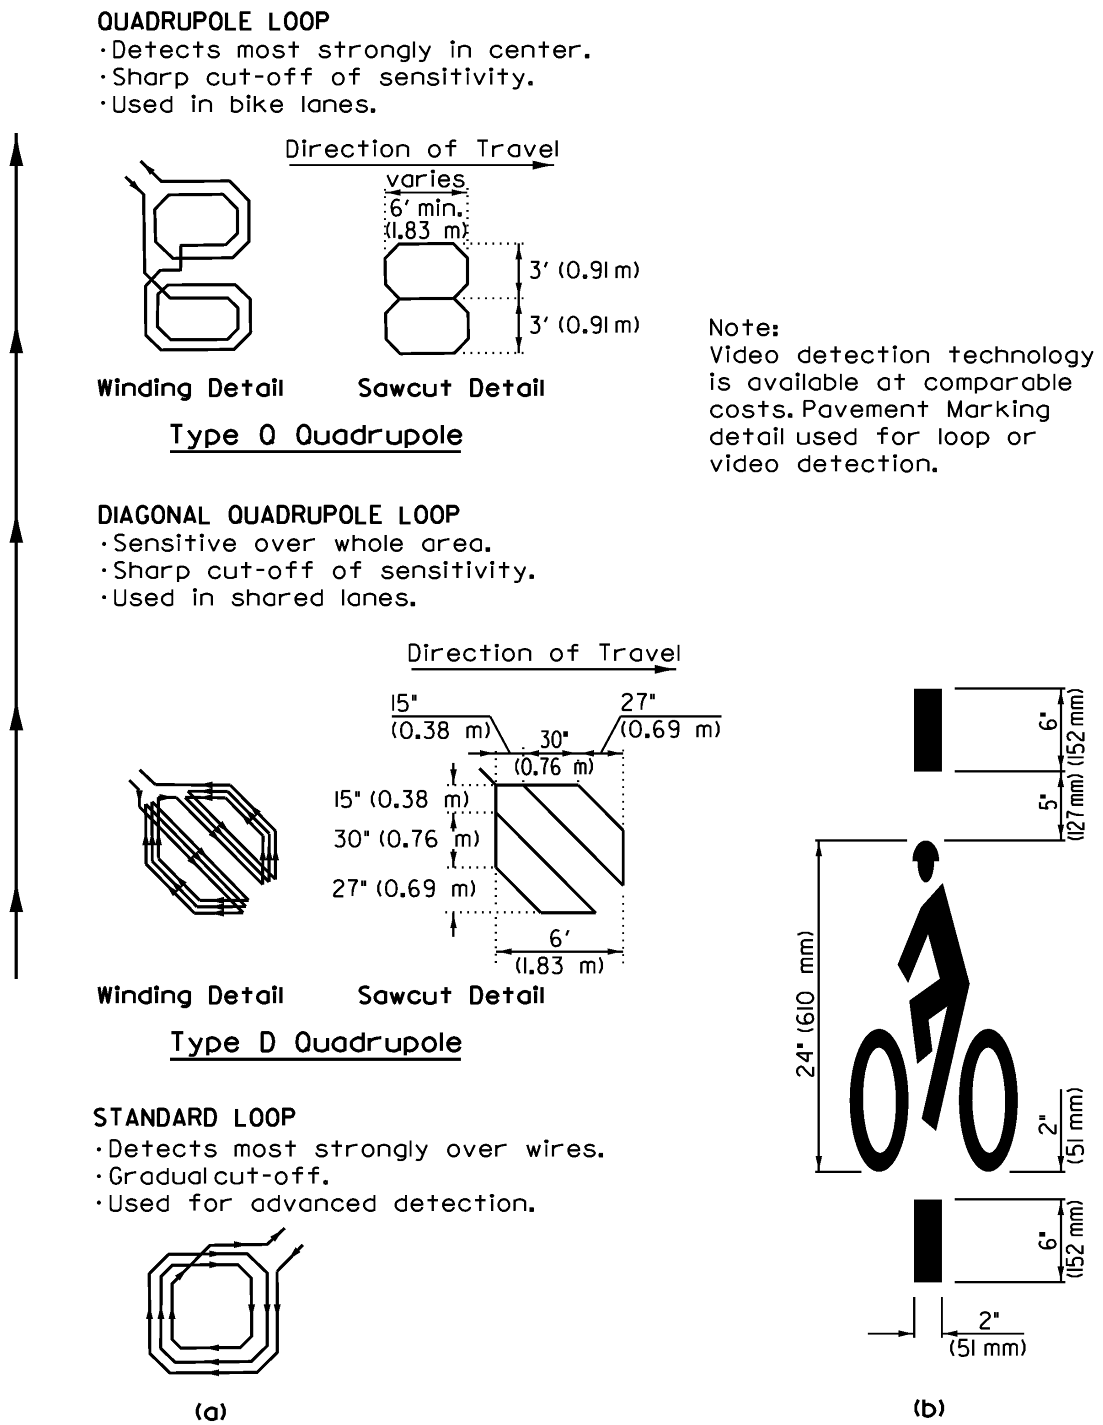
At signalized intersections where frequent bicyclists need access to a green signal phase, a number of acceptable alternative methods are available including timed signals (where a cyclist must wait for the signal to change), traffic-actuated detectors (usually recommended for bike lanes or shoulders), and push-button actuation (more common for side paths). This opportunity (to access a green signal) should be provided where a marked bikeway runs along a project corridor or crosses a project corridor. Other crossing locations to consider include those in the vicinity of potential bicycle travel from schools, parks, or other significant destinations described in Sections 17-1.03 and 17-1.04.

Traffic-actuated detection should be sensitive to bicycles and should be located in the bicyclist's expected path, including left turn lanes, if necessary. Figure 17-2.P(a) shows recommended loop types for bicycle detection, each with particular advantages. Figure 17-2.P(b) also shows a pavement-marking stencil used to designate where a bicyclist should stand to activate the detector loop. The following information on bicycle detection should be considered:

1. Quadrupole Loop Detectors. The quadrupole loop detector functions best in a bicycle path or lane situation. In such a situation, the expected position of a bicyclist can be easily predicted. This loop is less sensitive over its outer wire than over its center wires and is also relatively insensitive to motor vehicle traffic in neighboring lanes.

2. Diagonal Quadrupole Loop Detector. The diagonal quadrupole loop detector functions best in shared-roadway situations where the position of a bicycle cannot be easily predicted. This detector is equally sensitive over its entire width and is relatively insensitive to motor vehicle traffic in neighboring lanes.

Signal phasing lengths may need to be increased to allow adequate time for bicycle crossing. The AASHTO publication *Guide for the Development of Bicycle Facilities* recommends calculating clearance intervals with a bicyclist's speed of 10 mph (16 km/hr) and a perception, reaction, braking time of 2.5 seconds. Figure 17-2.Q illustrates the approximate times for bicycles to cross intersections. A conservative approach to timing is recommended to avoid having bicyclists being caught in the middle of wider intersections. At very wide intersections consider providing a median refuge area that is at least 6 ft (1.8 m) wide if signal timing would prohibit adequate crossing time. Providing for two-stage crossings is a good approach for many larger intersections and requires median pushbuttons and/or detection areas.



RECOMMENDED LOOP TYPES AND PAVEMENT MARKINGS FOR BICYCLE DETECTION LOOPS

Figure 17-2.P

Number of Lanes*	2	3	4	5	6	7	8	9
Approximate Time to Cross Intersection	4.2 sec	5.0 sec	5.8 sec	6.6 sec	7.4 sec	8.2 sec	9.0 sec	9.9 sec

**Assumes average of 12 ft (3.6 m) lane widths and no median. Consider median refuge where possible and calculate crossing time manually if median is present and no refuge is possible.*

APPROXIMATE BICYCLE TRAVEL TIMES THROUGH INTERSECTIONS

Figure 17-2.Q

17-2.03 Off-Road Accommodations (Shared-Use Paths)

Off-road bicycle accommodations are provided on shared-use paths where bicyclists, pedestrians, and some other motorized (e.g., e-bikes and e-scooters) and non-motorized users share space. Paths fulfill a primary transportation purpose by providing an opportunity for relatively safe and separated travel for both pedestrians and bicyclists. Shared-use paths comprise both facilities along roadway corridors (side paths) and those along independent rights- of-way that have minimal cross flow of motor vehicles.

As noted in the Bicycle Facility Selection Table, side paths are an option that fulfills accommodation requirements, and they are effective in many project contexts. In an urban core or urban context, side path effectiveness can be diminished due to ROW constraints, operational inefficiencies (e.g., mixing of bicyclists and high pedestrian volumes), or the presence of closely- spaced commercial driveways. The suburban and rural town contexts can very often be conducive to side paths. A side path can be selected for an accommodation whenever it is locally supported in accordance with Chapter 5 cost sharing and maintenance requirements. Note that many communities have ordinances that disallow bicycles on sidewalks, often with exceptions for children. AASHTO and NACTO, among others, identify issues that make cycling on sidewalks generally inappropriate. The unique features of paths, including design speed and their minimum 10 ft (3.0 m) width, differentiate side paths from sidewalks and allow for effective bike accommodation.

Shared-use paths can also be located along abandoned railroad rights-of-way, on former canal towpaths, river banks, and other similar areas. Paths sometimes can provide access to areas that are otherwise only served by limited-access highways that are closed to bicycles. Appropriate locations for paths can be identified during the planning process.

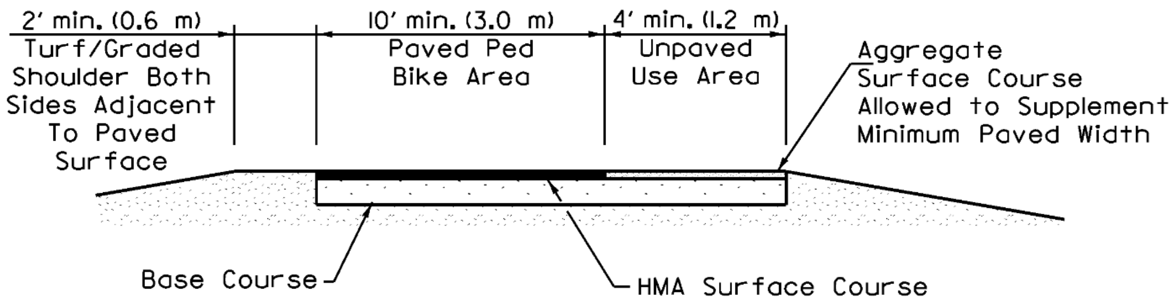
Shared-use paths will serve both transportation/utilitarian and recreational purposes and must be fully accessible to people with disabilities in accordance with the American with Disabilities Act (ADA). Refer to Section 58-1.01(a) for accessibility standards and Sections 58-1.05 through 58- 1.12 for accessibility requirements. Chapter 58 guidance is generally based on information presented in the *2010 ADA Standards for Accessible Design* and the *Illinois Accessibility Code*. However, for situations in the public right-of-way that are not specifically or adequately addressed by either of the above standards, the guidance is taken from information presented in the *Draft*

Public Rights-of-Way Accessibility Guidelines (draft PROWAG). An accessible pedestrian access route (PAR) fully compliant with ADA shall be provided for the full width of any shared-use path, with maximum cross slopes limited to 2% at all points. Paths must be firm, stable, and slip- resistant. Hard, all-weather pavement surfaces are required since unpaved surfaces are more likely to result in bicyclists losing traction, can restrict some users, and will require more maintenance. Both asphalt and PCC can provide good all-weather pavement structures.

Paths should be considered extensions of the highway system that are intended for the preferential use of bicycles and pedestrians. As such, design criteria for paths are based on both bicycle use (e.g., for curvature, sight distance) and pedestrian use (e.g., for accessibility). Design considerations include horizontal alignment, sight distance requirements, drainage, signing and markings, horizontal and vertical clearance requirements, grades, and pavement structure. Section 17-3 provides bicycle clearances and operating characteristics. During design, always be cognizant of the operating characteristics of bicycles and how they influence the design of paths. Electric-assist bikes (e-bikes) are a growing segment of overall bicycle use and may increase the number of people bicycling, as well as average bicycling speeds. E-bikes include a motor, typically electric, that can either assist rider pedaling efforts or provide self-propelled operations. Any conventional bicycle may be converted to an e-bike. In general, the behavior of people riding e-bikes is very consistent with traditional bicyclist behavior on a national level (e.g. related to compliance with traffic control devices and risky behavior). In addition to e-bikes, electric assist pedestrian mobility (personal mobility) devices such as e-scooters may be used on shared-use paths. These devices are generally not allowed to operate on sidewalks, although local ordinances vary. The acceleration and braking characteristics of e-bikes and pedestrian mobility devices may vary somewhat from traditional bicycles. The design guidance provided in this chapter is based on traditional riders and is appropriate to cover the mix of users expected to use paths. The following sections provide guidance for designing safe and functional paths. Several issues that are unique to side paths are covered in Section 17-2.03(c).

17-2.03(a) Consideration of All Users

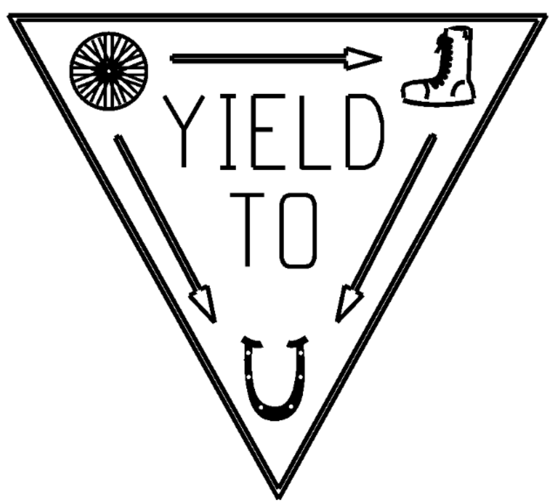
Potential users of shared-use paths include bicyclists, pedestrians, joggers, in-line skaters, and individuals with disabilities in either motorized or un-motorized wheelchairs. In most local jurisdictions in Illinois, bicycles on paths may be motorized (e-bikes) as long as operated at reasonable speeds. All potential users should be considered in the design of the facility. Where practical and where use levels are high, provide separate areas to minimize the conflicts arising from the different user speeds. If this is not feasible and usage is expected to be high, consider providing additional width, signing, and pavement markings. Figure 17-2.R shows an option for accommodating diverse users, minimizing conflicts, and delineating rights-of-way.



SHARED USE PATH CROSS SECTION WITH ADDED UNPAVED AREA

Figure 17-2.R

Using a path for both bicycles and horses is not a recommended practice. However, when circumstances dictate that horses share the same corridor as bicyclists, provide a minimum unpaved width of 4 ft (1.2 m) and provide signs to warn users of shared use (see Figure 17-2.S) and to restrict equestrians to the side area. Further guidance on equestrian trails is provided in the publication *Trails for the Twenty-First Century*.



SHARED-USED PATH ETIQUETTE SIGN

Figure 17-2.S

17-2.03(b) Width and Clearance

Widths for shared-use paths will vary in accordance with the use level, as illustrated in Figure 17-2.T. Most locations will have use levels under 300 users per peak hour. Figure 17-2.U illustrates the minimum cross sections for two-way, shared-use paths. The 10 ft (3.0 m) minimum paved width shall be used for two-way paths. Wider paved paths should be considered in areas where very high use is expected. Widths less than 10 ft (3.0 m) do not allow for appropriate operation even with low use volumes. Normal social behavior, the need for passing, and the normal mix of users and operating speeds necessitates this width to address safety concerns for all users. However, where is a substantial physical constraint or an environmental feature to be avoided, reductions to an 8 ft (2.4 m) width for short distances may be allowed. Provide signing to notify path users of narrowed path conditions.

A minimum 2 ft (600 mm) wide graded turf or gravel area should be maintained adjacent to both sides of the path pavement. Three ft (0.9 m) or more is desirable to provide clearance from trees, poles, walls, fences, guardrails, and other lateral obstructions.

As shown in Figure 17-2.T, a paved width of 7 ft (2.1 m) may be considered as a one-way bicycle accommodation where such bike travel is allowed by local ordinances and pedestrian use is low. Paths are needed on both sides of the roadway where one-way facilities are selected.

Anticipated Volume	One-Way	Two-Way
< 300 Users per Peak Hour	7 ft (1.8 m)	10 ft (3.0 m)
> 300 Users per Peak Hour	10 ft (2.1 m)	12 ft (3.6 m)(1)

Notes:

1. *With very high use, separating bicycle and pedestrian travel should be considered, as shown in Figure 17-2.U.*

(Optional Striping Shown)

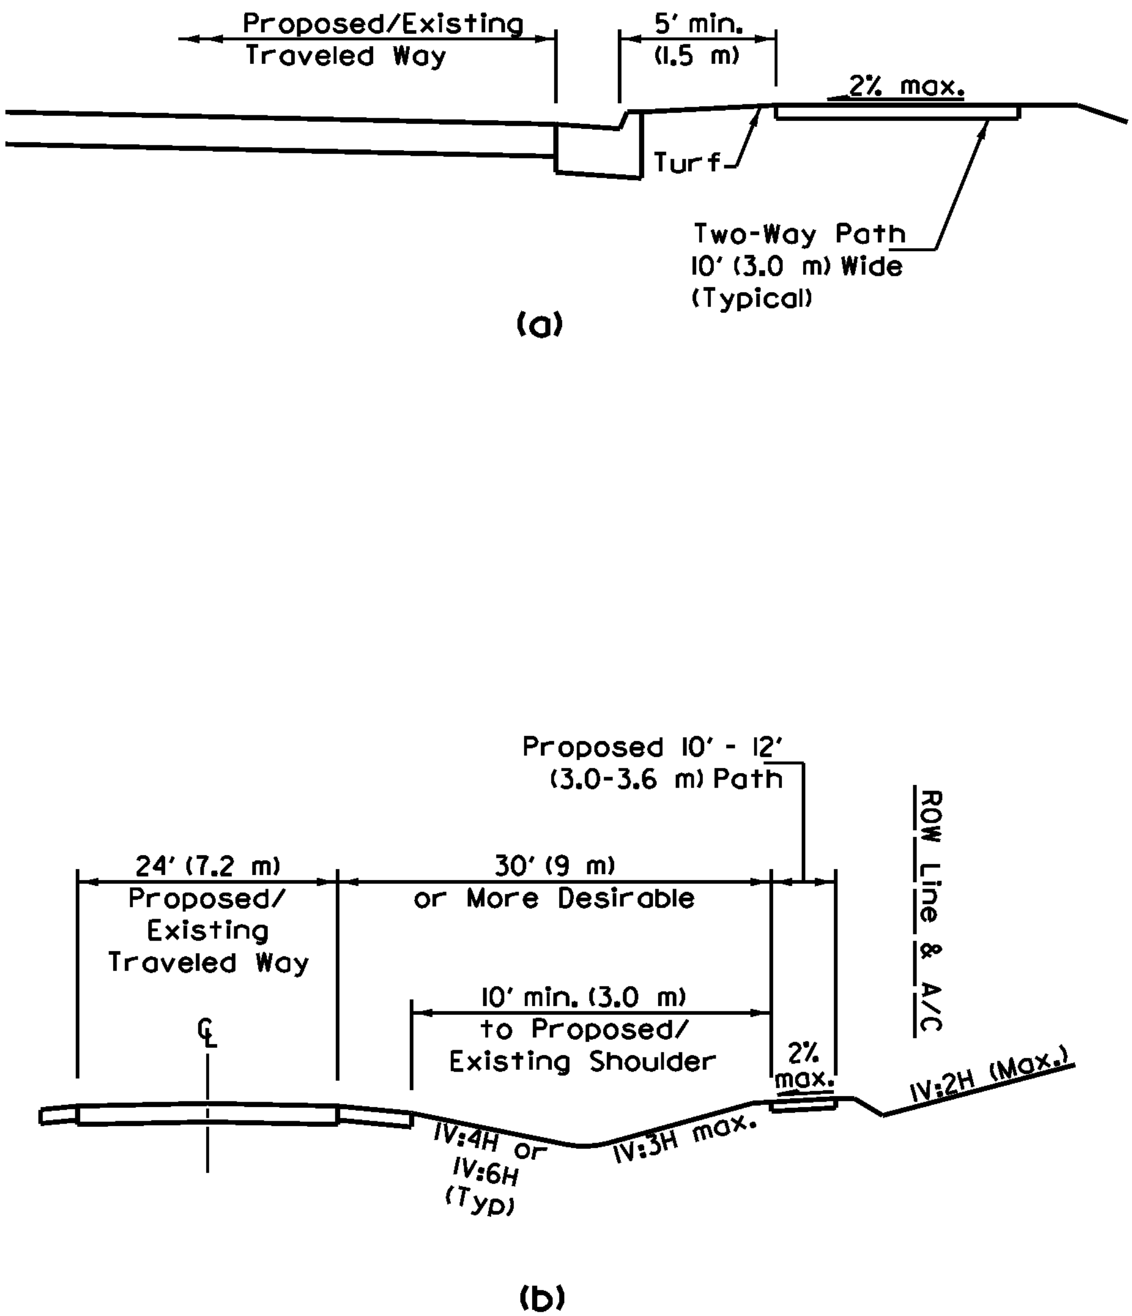
TYPICAL CROSS SECTIONS FOR TWO-WAY SHARED-USE PATHS

Figure 17-2.U

17-2.03(c) Side Path Separation from Traffic

Side paths must be sufficiently offset or otherwise separated from motorized traffic so that operational and safety needs are met. Separation should be as wide as practical while allowing bicyclists to be visible to motorists at intersections and driveways; refer to Figure 17-2.V. Along urban roadways, a path could be located much like a sidewalk, with the edge of the path located at least 5 ft (1.5 m) from the curb face and 7 ft (2.1 m) from the traveled way. In rural sections, it is desirable for a two-way shared use path to be located on the top of the back slope at least 30 ft (9.1 m) away from the edge of the traveled way. At a minimum in a high-speed rural section the path edge should be 10 ft (3.0 m) from the outside edge of the shoulder . Turf areas will typically provide an adequately delineated boundary between the roadway and the path. Maintaining minimum offsets will reinforce that the bicycle path is an independent facility and will discourage bicyclists from making unexpected and undesirable movements between the path and the traveled way. Existing side paths closer than the offset distances described should be addressed as part of a project. Where safety issues are identified for such side paths consider retrofit options that either shift the path or insert appropriate barrier separation. Concrete barrier used for this purpose should be a minimum of 3 ft (910 mm) high; standard guardrail also provides adequate separation at a slightly lower height. Refer to Section 17-2.03(m) for further discussion.

All vertical surfaces within a 2 ft (600 mm) clear distance adjacent to the bicyclists' path should be smooth to avoid snagging of clothing or incurring abrasive injuries from contact with the surface. A primary concern in this regard is protection of the sharp edges of the backside of guardrail located within 2 ft (600 mm) of the edge of a path by smooth planking or a rub rail as shown in Figure 17- 2.W. No modifications shall be made within the length of Type 1 guardrail terminals. Highway Standard 630116 provides further details. Approved crash testing for elements attached to guardrail should be investigated by the designer.



TYPICAL SIDE PATH SEPARATION FROM ROADWAY

PROTECTION OF BACKSIDE OF GUARDRAIL

Figure 17-2.W

17-2.03(d) Additional Safety Considerations

Safety rails should be considered alongside paths with front slopes steeper than 1:3. Refer to Section 17-4.07 for situations where safety rails should be considered and to Figure 17-4.D for guidance on railing placement and height. The minimum height for a bicycle safety rail is 4 ft (1.2 m). Generally, if the consequences of striking a fixed object hazard or running off the path are believed to be more serious than hitting the railing, then the barrier may be warranted. In addition, the cost effectiveness and probability of encroachment also should be considered. For example, along a lengthy tangent section of path on an elevated railroad section, the cost effectiveness of installing safety rail along the entire distance would be questionable; however, the placement of rail at clearly hazardous locations (e.g., river crossing approaches, less than minimum widths and curves, potential points of conflict) may be prudent. Select the treatment that is judged to be the most practical and cost-effective for the site. The range of treatments includes:

- eliminating the hazard (e.g., flatten embankment, remove rock outcroppings);
- relocating the hazard;
- shielding the hazard with safety railing; or
- doing nothing.

The determination of the separation distance between a path and an active railroad is dependent on the speed and frequency of the rail service, the amount of access available to the railroad from the surrounding area, and the requirements of the railroad company. For low speed and low frequency service, the separation may be as little as 10 ft – 15 ft (3.0 m – 4.6 m), with no physical barrier (e.g., fencing, landscaping). As railroad speeds and frequencies increase, the requirements for increased separation and a physical barrier increase as well. An 8 ft (2.4 m) high chain link fence or other barrier type may be required to satisfy the railroad company that path users will be adequately separated from the hazards of the trains.

The vertical clearance to obstructions should be an absolute minimum of 8 ft (2.4 m). However, vertical clearance may need to be greater to permit passage of maintenance vehicles, rescue vehicles, and ambulances. Rescue vehicles typically can exceed 9 ft (2.7 m) in height and 9 ft (2.7 m) in width. In undercrossings and tunnels, a vertical clearance of 10 ft (3.0 m) is desirable. The geographical location of the vertical obstructions, as well as alternate access points, are primary considerations for determining clearance. It is imperative that adequate clearance be provided where the path offers the primary access to a remote location. Any overhead restrictions with less than a 10 ft (3.0 m) clearance should be marked on the structure according to the *ILMUTCD.*

17-2.03(e) Design Speed

Paths should be designed for a selected speed that is at least as high as the preferred speed of the faster bicyclists. In general, use a minimum design speed of 20 mph (30 km/hr). However, where the grade exceeds 4% or where strong prevailing tail winds exist, (e.g., along a lake or river), a design speed of 30 mph (50 km/hr) is advisable. On approaches to intersections, bicyclists can be expected to slow since the path will typically cross the side street in a crosswalk fashion and caution is required. A 10 mph (15 km/hr) design speed may be applied to the curves that provide for alignment into crosswalks.

17-2.03(f) Horizontal Alignment and Superelevation

Unlike an automobile, a bicycle must be leaned while cornering to prevent it from falling outward due to centrifugal force. The horizontal curvature should not require a bicyclist to use a lean angle greater than 15° nor need more than 2% superelevation. The minimum radius is calculated by the following equation:

$$R_{min} = 0.067\ V^2/\tan\theta \qquad \text{(U.S. Customary) Equation 17-2.1}$$

$$R_{min} = 0.0079\ V^2/\tan\theta \qquad \text{(Metric) Equation 17-2.1}$$

where:
- R_{min} = minimum radius of curvature, ft (m)
- V = design speed, mph (km/hr)
- θ = lean angle from vertical, degrees

Figure 17-2.X presents minimum radii for horizontal curves using a 15° lean angle. Paths should be superelevated so that the 1% to 2% cross slope is partially counteracting the inward friction force on a bicycle as it traverses the horizontal curve, but the radius values shown in the figure are acceptable for adverse cross slopes of up to 2%.

Design Speed (V)		Lean Angle (θ) (degrees)	Minimum Radius (R_{min})	
mph	km/hr		ft	m
10	16	15	25	8
20	30	15	100	27
25	40	15	155	47
30	50	15	225	74

DESIRABLE MINIMUM RADIUS FOR PAVED PATHS BASED ON 2% SUPERELEVATION RATE AND 15° LEAN ANGLE

Figure 17-2.X

In restricted conditions a lean of up to 20° can be tolerated. The same formula is applied. Figure 17-2.Y presents minimum radii for horizontal curves where lean angles up to 20° can be tolerated. For either lean angle the radii assume a maximum superelevation rate of 2% so that ADA requirements for accommodation of users with disabilities are fully met. A minimum 1% cross slope should be maintained to facilitate drainage of the path. Where transitioning from a 1% to a 2% cross slope on tangent to a 2% superelevation rate on the high side of the curve or where reversing curvature, use a minimum transition length of 15 ft (4.6 m).

Figure 17-2.Y presents minimum radii for horizontal curves where lean angles up to 20° can be tolerated and the path is not paved. Use of unpaved paths (or portions of paths) would be very rare; additional detail is available in the *AASHTO Bike Guide*.

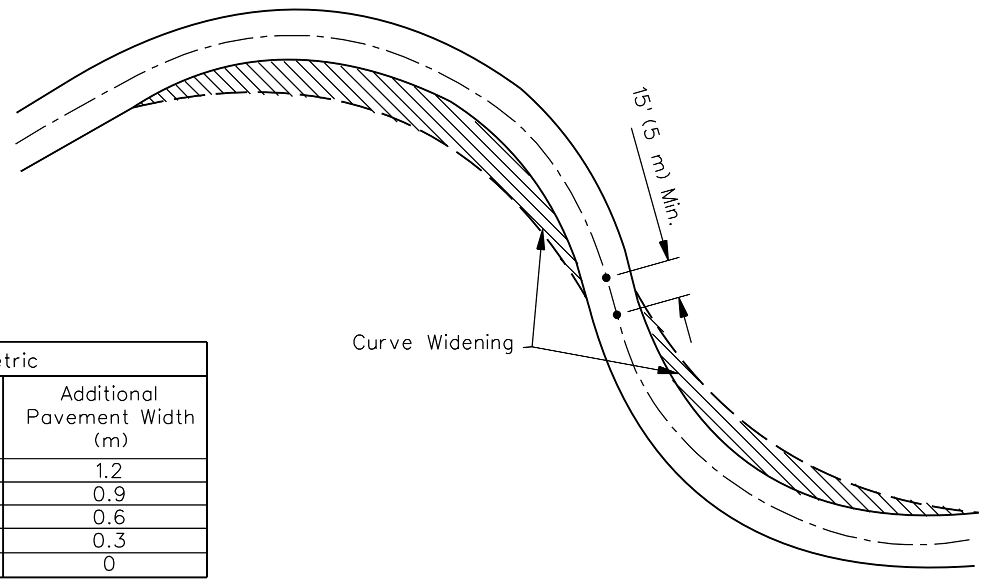
Design Speed (V)		**Side-Friction Factor (f) (Paved Surface)**	**Minimum Radius (R_{min})**	
mph	**km/hr**		**ft**	**m**
10	16	0.31	20	6
20	30	0.28	74	22
25	40	0.25	115	35
30	50	0.21	166	50

MINIMUM RADII FOR PAVED PATHS BASED ON
2% SUPERELEVATION RATE AND 20° LEAN ANGLE

Figure 17-2.Y

When a lean angle of 20° is used, the bicyclist taking the curve will occupy more horizontal space and more width needs to be provided. In these cases, the path width should be increased as noted in Figure 17-2.Z and a centerline located in the middle of the curve.

When curve radii smaller than those shown in Figure 17-2.X must be used because of limited right-of-way, topographical features, or other considerations, standard curve warning signs and supplemental pavement markings should be installed according to the *ILMUTCD*. The negative effects of sharper curves can also be partially offset by widening the pavement through the curves as shown in Figure 17-2.Z.



US Customary		Metric	
Curve Radius (ft)	Additional Pavement Width (ft)	Curve Radius (m)	Additional Pavement Width (m)
0-25	4	0-7.5	1.2
25-50	3	7.5-15	0.9
50-75	2	15-22.5	0.6
75-100	1	22.5-30	0.3
100+	0	30+	0

Note: Only use additional pavement width where curve radii are less than design speed of bike path or where a 20° lean angle is assumed.

BIKEWAY CURVE WIDENING FOR VARIOUS CURVE RADII

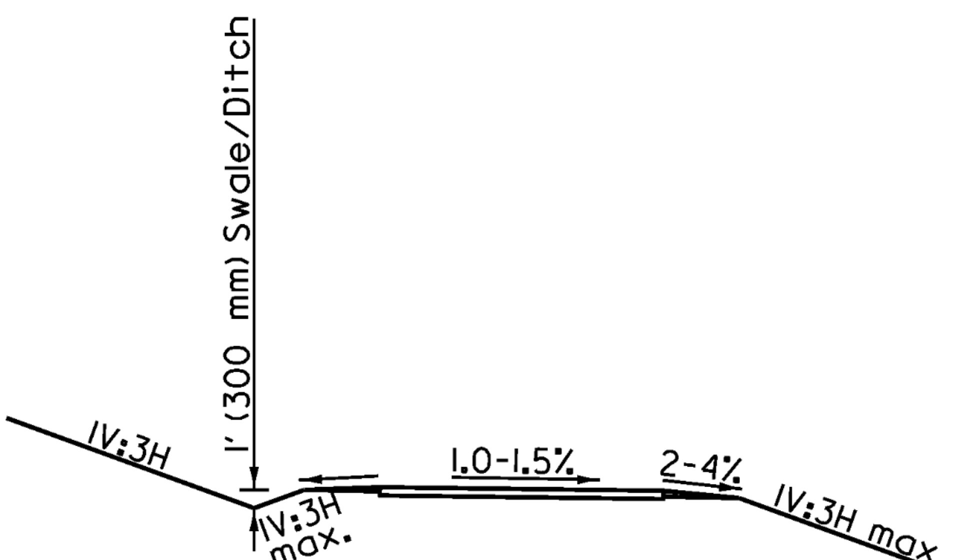
Figure 17-2.Z

17-2.03(g) Drainage

Typically design paths with cross slopes of 1% to 1.5% for drainage; ensure that a 2% maximum cross slope is not exceeded. Sloping in one direction instead of crowning is preferred and usually simplifies the drainage and surface construction. A smooth surface is essential to prevent water ponding and ice formation. Shoulders should provide further positive drainage by sloping away at 2% to 4%.

Where a path is constructed on a hillside a ditch of suitable dimensions should be provided on the uphill side to intercept the hillside drainage. Design these ditches so as not to present an obstacle to bicyclists. Figure 17-2.AA shows the dimensions of a minimum swale/ditch to redirect runoff. Where necessary, provide catch basins with drains to carry intercepted water under the path. Locate drainage grates and manhole covers outside the traveled way of bicyclists. To assist in draining the area adjacent to the path, consider preserving the natural ground cover. Include seeding, mulching, and sodding of adjacent slopes, swales, and other erodible areas in the design plans.

Side paths should pass over waterways at elevations consistent with the adjacent roadway, and path flooding would not be a concern. However, concerns related to path overtopping may be relevant for some paths along independent alignments, such as for roadway underpasses or for locations along waterways. Path usability at such locations is a pertinent issue, and studies of the potential for path flooding will be important to understand the reliability of the path system. Refer to the *IDOT Drainage Manual* for further information.



TYPICAL PATH DRAINAGE

Figure 17-2.AA

17-2.03(h) Grade

Grades on paths shall not exceed 5%, except along a roadway with a grade that exceeds 5%, in which case the path grade may match but not exceed the roadway grade. Long grades of over 2% on shared-use paths should be avoided to the extent possible. Some users, especially individuals with disabilities, may have difficulty negotiating high grades over 300 ft (90 m) in length. Consider incorporating intermediate flatter and wider landings when this distance would be exceeded.

17-2.03(i) Accessible Width

Because the intent is to create a facility to accommodate pedestrians, shared-use paths must meet accessibility requirements across the full width. Vertical discontinuities must be less than ¼ in. (6 mm) untreated or ½ in. (13 mm) beveled per ADA guidelines to accommodate individuals in wheelchairs. Additionally, grates and utility covers located in the expected paths of bicyclists or pedestrians should be flush with the pavement. Refer to Section 58-1 for accessibility standards and the criteria to be met in the design of paths.

17-2.03(j) Sight Distance

To provide bicyclists with an opportunity to see and react to the unexpected, a shared-use path should be designed with adequate stopping sight distance and intersection sight distance. The distance required to bring a bicycle to a full controlled stop is a function of:

- the bicyclist’s perception and brake reaction time,
- the initial speed of the bicycle,
- the coefficient of friction between the tires and the pavement, and
- the braking characteristics of the bicycle.

See the *AASHTO Bike Guide* for information on determining adequate sight distance.

Bicyclists frequently ride abreast of each other on paths, and on narrow paths bicyclists tend to ride near the middle of the path. For these reasons, and because of the serious consequences of a head-on bicycle crash, calculate lateral clearances on horizontal curves based on the sum of the stopping sight distances for bicyclists traveling in opposite directions around the curve. Where this is not feasible, consider widening the path through the curve, installing a yellow center stripe, installing turn or curve signs (W1-1 or W1-2) as appropriate, or a “KEEP RIGHT” (R4-7b) sign, or some combination of these alternatives.

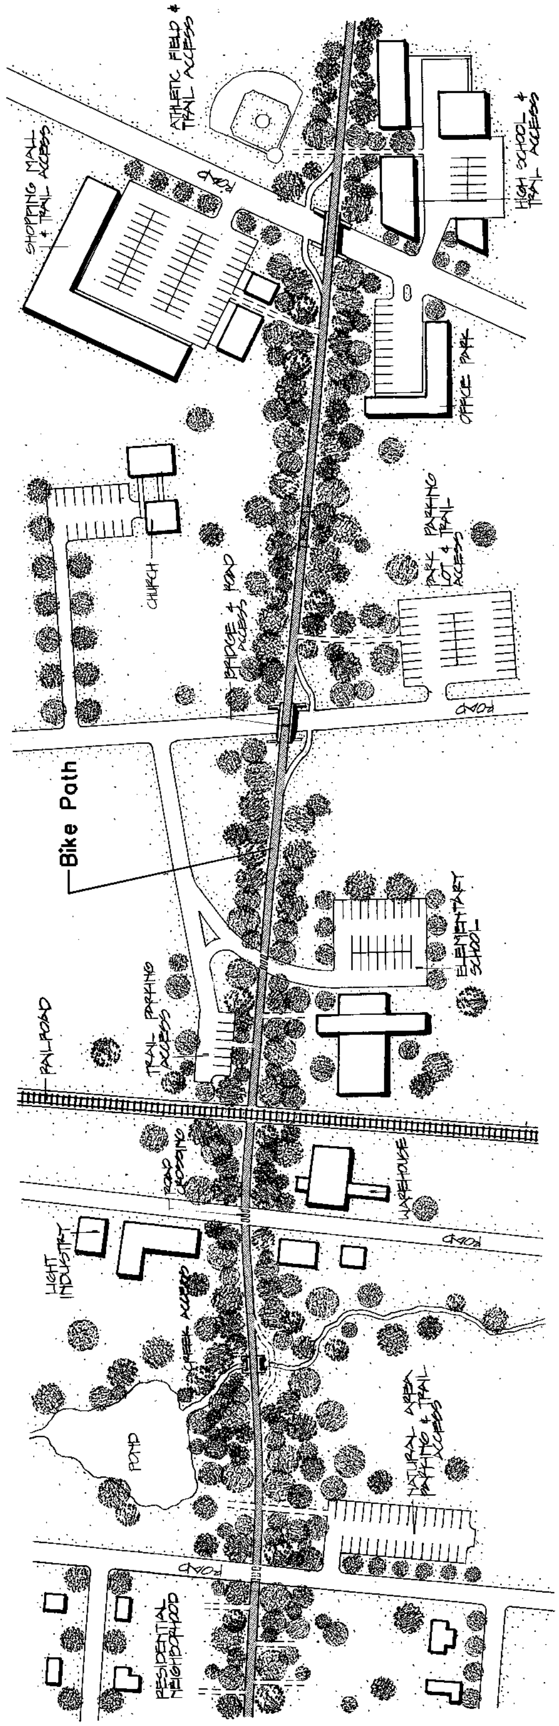
17-2.03(k) Path Intersections

Shared use paths usually cross various transportation elements. These intersections can be roadways, railroads, or other paths; all present potential conflicts and must be thoroughly analyzed to consider their impacts on the path users as well as the users of the other intersecting legs. Figure 17-2.BB illustrates how a bikeway could interact with crossing roads and railroads. All paths intersecting with roads and railroads require the installation of detectable warnings immediately adjacent to the crossing. Unauthorized access is sometimes a concern. Although rigid bollards have been used to restrict motor vehicle access to paths the hazards they create for bicyclists, and in some cases for motor vehicles, often outweigh access concerns. Refer to Section 2.03(p) for further guidance on this issue.

Where a side path crosses a street, by definition near an intersection, the path should cross in a typical crosswalk fashion, as in Figure 17-2.CC. AASHTO notes that paths should be located in close proximity to the parallel roadway at intersections so that motorists turning off the roadway can better detect the path users. Locating the crosswalk close to the parallel through edge of pavement may also lead motorists to better obey the single stop bar location. Consider including right-turn corner islands for path crossings to provide refuge areas for all vulnerable users. Regardless of location, crosswalks width must equal or exceed the full width of the path.

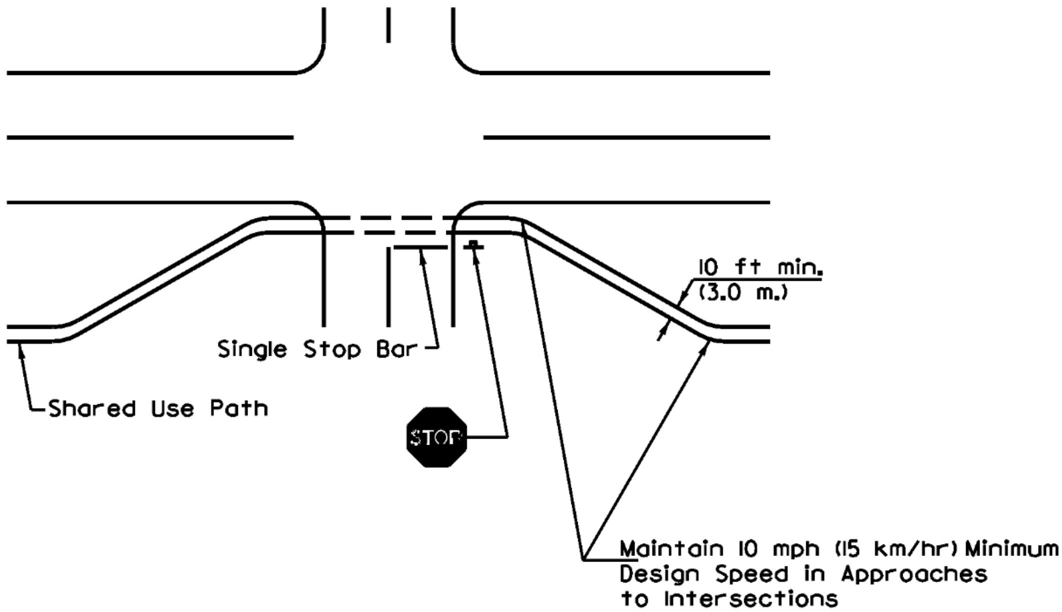
For paths on independent rights-of-way, according to AASHTO, it is preferable that any crossing of the path and a highway be at a location away from the influence of intersections with other highways. Crosswalks width must equal or exceed the full width of the path; refer to Figure 17-2.DD. Assign right-of-way and provide adequate sight distance to minimize the potential for conflicts. For further discussion of mid-block crossings see Section 17-4, Operations Policy TRA-23 (*IDOT Guidelines for Pedestrian Crossings at Uncontrolled Locations*), and the *AASHTO Bike Guide*.

Design crossings as close to a right angle as possible for safety reasons. Controlling vehicular movements at mid-block intersections is more easily and safely accomplished through the application of standard traffic control devices and normal rules of the road. Use engineering judgement in determining appropriate crossing measures such as markings, post-mounted signs, overhead signs, flashing beacons, traffic signals, or a grade separation. At crossings with high-volume, multi-lane arterial highways where a signal or a grade separation is not practicable, consider providing a median refuge area for bicyclists and pedestrians. IDOT Bureau of Operations Policy TRA-23 provides design guidelines for uncontrolled pedestrian crossing locations and includes recommended signing, striping, refuge areas and beacon treatments based on vehicle speeds, traffic volumes, and roadway cross section. These guidelines apply to roadway crossings involving either paths or sidewalks. At all roadway crossings, appropriate curb ramps and detectable warnings shall be included on the paths as discussed in Section 58-1.09.



BIKE PATH/TRAIL INTERACTION WITH VARIOUS INTERSECTIONS

Figure 17-2.BB



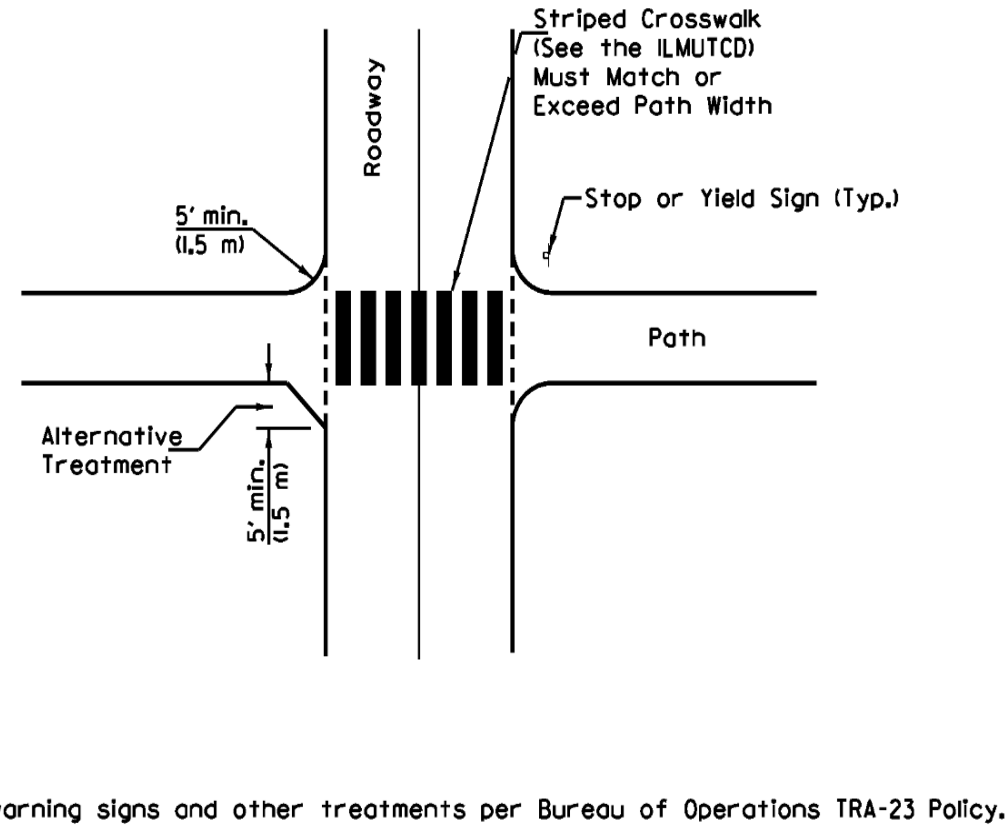
SHARED BICYCLE/PEDESTRIAN CROSSING

Figure 17-2.CC

Where paths terminate, integrate the path into the adjacent road network. Transition traffic into a safe merging or diverging situation, considering all users. Provide appropriate signing to warn and direct both bicyclists and motorists regarding these transition areas. Ensure that signs are located so that they clearly direct each user group. Do not merge a shared-use path into a bicycle lane or paved shoulder without providing an alternative connection for pedestrians away from vehicular traffic to the existing sidewalk network.

Path intersection approaches should have relatively flat grades. Check stopping sight distances at each intersection and provide adequate warning to allow bicyclists to safely stop before the intersection, considering downgrades where present.

Flare the ramps for curb cuts at intersections to allow bicycle movements from the roadway to the path. A minimum radius or flare of 5 ft (1.5 m), as shown in Figure 17-2.DD, will allow bicycles, including tandem bicycles (i.e., two-person bicycles) and bicycles with trailers, sufficient opportunity to negotiate turns. If maintenance vehicles are expected to access the path at these points, provide a 15 ft (4.5 m) flare to reduce edge rutting and turf disturbance.

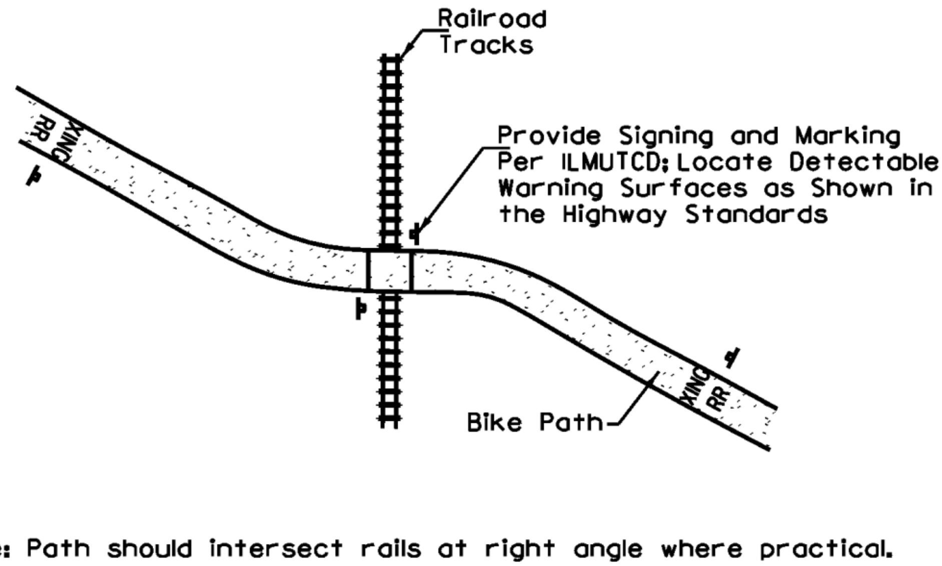


TYPICAL CURB FLARES AND STRIPING AT PATH/ROADWAY INTERSECTIONS

Figure 17-2.DD

<u>Path/Railroad Crossings</u>

Where independent paths intersect with railroads, locate the crossing as close to a right angle as practical for safety reasons, as shown in Figure 17-2.EE. Considerations noted in Section 17-2.02(h) apply. Signing and pavement markings shall be in accordance with the *ILMUTCD*. Crossbuck signs and pavement markings are minimum advanced warning requirements. In addition, ensure that adequate sight distance is provided so bicyclists can see approaching trains. Existing and planned railroad operations always should be factored into the design elements of the crossing. As train speeds and frequencies increase, the level of crossing protection should increase. It may be necessary to provide train activated crossing gates and signals, along with fencing, to ensure the safety of bicyclists and to satisfy the requirements of the railroad company. In extreme situations, rerouting the path to an adjacent roadway crossing or installing an underpass or overpass may provide the best crossing solution.

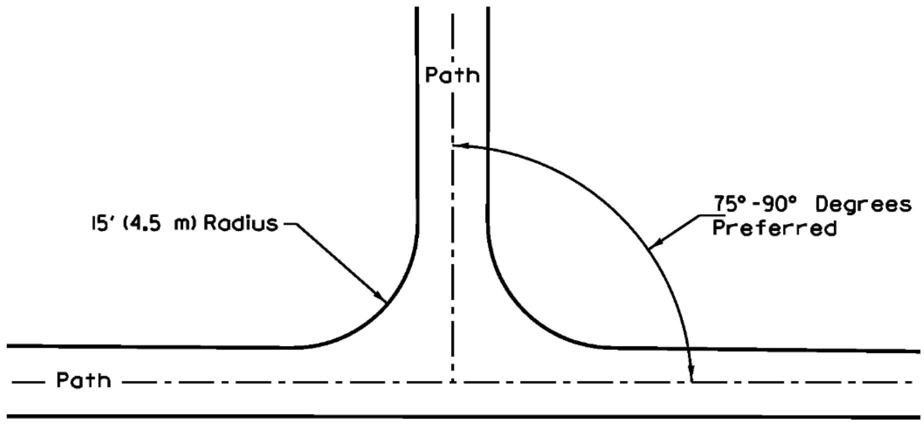


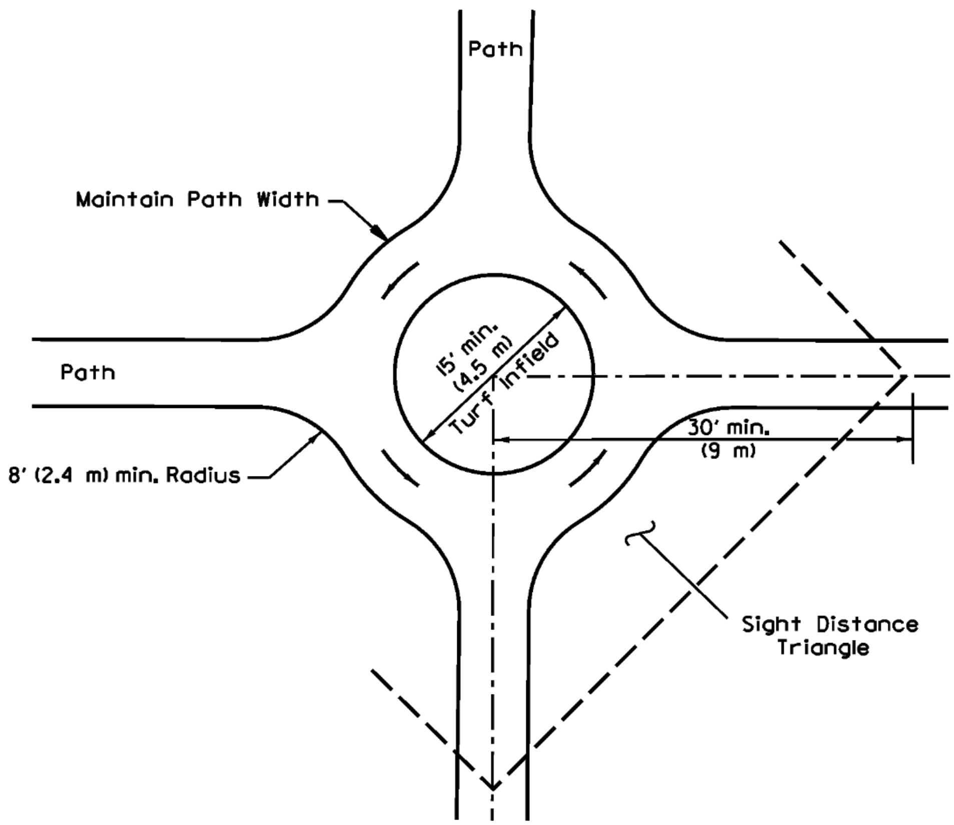
TYPICAL PATH/RAILROAD INTERSECTIONS

Figure 17-2.EE

Path/Path Crossings

Where paths intersect with other paths, the minimum return radius provided should be 15 ft (4.5 m), as shown in Figure 17-2.FF, to accommodate tandem bicycles, bicycles with trailers, and occasional vehicular movements without running off the pathway. These movements are likely to be negotiated at higher speeds and thus the larger radii are necessary. The figure also shows a circular intersection option that can be applied to slow riders where there are operational and safety concerns.





Note: Consider "KEEP RIGHT" signs.

PATH INTERSECTIONS

Figure 17-2.FF

17-2.03(l) Independent Path Structures

An overpass, underpass, bridge, or drainage facility may be necessary to provide continuity to a path. Modification of existing facilities are sometimes necessary to construct a side path under an existing bridge, most commonly along expressways. One method for retrofitting paths under bridges is illustrated in Figure 17-2.GG. Slopewall modifications typically involve full removal and reconstruction of the walls. Consult with the Bureau of Bridges and Structures in developing the structural plans.

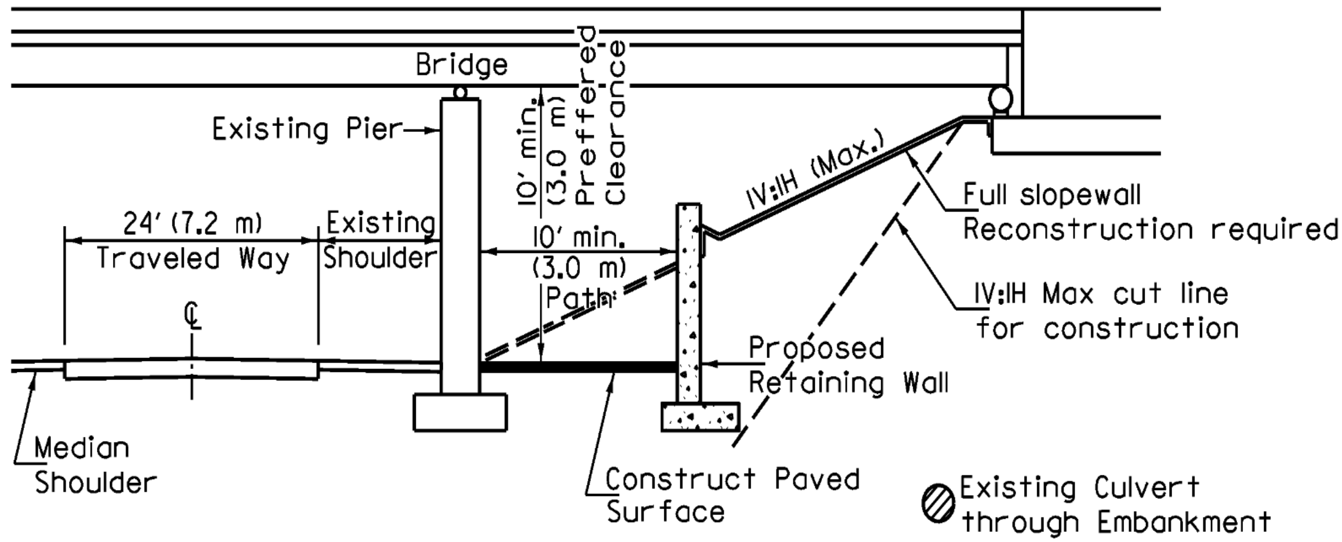
With new shared-use path structures, the minimum clear width should be the same as the path’s paved approach, and the desirable clear width should include 2 ft (600 mm) minimum shoulders on each side; see Figure 17-2.HH. Carrying the clear width across a bicycle path structure has two advantages. First, it reduces concerns about horizontal shy distance from the railing or barrier; and second, it provides needed maneuvering space to avoid conflicts with pedestrians and other bicyclists who are stopped on the bridge. Additional width would be warranted on structures over rivers where users would likely stop to enjoy the view. Users would be less likely to stop on bridges over railroads or highways or in tunnels.

Bridges designed exclusively for bicycle and pedestrian traffic should be designed for live loadings in accordance with the AASHTO publication, *Guide Specifications for Design of Pedestrian Bridges*. Bridges that must provide access for ambulances or rescue vehicles shall support specific minimum design loads.

On all bridge decks, ensure that bicycle-safe expansion joints are used. Where wood planking is used for flooring, it should be placed 45° to 90° from the direction of travel, as shown in Figure 17- 2.HH. Bridge railings on paths should be a minimum of 4 ft (1.2 m) tall. Bridge approaches should provide a safety railing as shown in Figure 17-2.HH to protect users from hazardous conditions.

Other types of bikeway structures will be necessitated by the various ways that paths can interface with roadways, rivers, or railroads. Paths can utilize the underside of a highway or railroad bridge and can cross under roadways or railroads in various ways, as illustrated in Figures 17-2.II and 17-2.JJ. Where bikeways are routed under highway bridges, drainage from the bridge above should be routed to drain away from the path surface.

Design of bikeway underpasses should proceed with recognition of the types of traffic that need to be accommodated (e.g., emergency vehicles). Minimum vertical clearance should be 10 ft (3.0 m) and the minimum width should be 10 ft (3.0 m). With tunnels or box culverts exceeding 100 ft (30 m) in length, the users’ sense of security is enhanced with larger openings (e.g., 12 ft (3.6 m) high and 14 ft (4.2 m) wide). The alignment of the approaching path should provide a clear view through the structure where practical. On long structures (e.g., under multi-lane highways) a shaft opening at the median can provide natural light and ventilation. Lighting should be considered in areas where security is a concern.



Note: Alternate bikeway is considered under bridge where separate two-way side path is proposed within or adjacent to existing right-of-way line of a freeway or expressway.

Figure 17-2.JJ

17-2.03(m) Paths on Highway Structures

Side paths should be accommodated on new and rehabilitated structures in accordance with the dimensions shown in Figure 17-2.KK. Appropriate railings must be provided. Bridge railings along shared-use paths must provide a minimum 4 ft (1.2 m) rail-height on the outside edge. The required barrier or separation element between the path and the adjacent traffic lane must be a minimum of 3 ft (910 mm) high, with the lesser height in recognition of the need for both path user safety and the need for visibility between path users and motorists. Consider the potential for sight line impediments at adjacent intersections created by barriers. Adjacent signalized intersections may need to include right-turn-on-red (RTOR) restrictions if intersection sight distance is substantially limited by a barrier adjacent to the traveled way.

Several examples of barriers and railings used for path applications on bridges are shown in Figure 17-2.LL. Specific configurations depend on the roadway speed limit, roadway classification and the facility being crossed. Barrier and railing selection can be determined in consultation with BPPE and the Bureau of Bridges and Structures.

When a project has a bridge omission with side path accommodations along the roadway, fully compatible future accommodations should be planned for the omitted structure. Where it is necessary to accommodate a shared-use path across an existing highway bridge as an interim condition, consider alternatives in light of what the geometrics of the bridge will allow. Carrying the path across the bridge is a primary goal where the bridge facility will connect to a shared-use path at both ends. Sufficient width may be provided on one side of the bridge by shifting, narrowing or restriping lanes, or by reducing median width. Consider a reduced path width if necessary. In all cases separate bicycle traffic from motor vehicle traffic by means of a crashworthy barrier. Identifying existing sidewalks as one-way shared-use facilities is not typically acceptable, since bicyclists do not have good options for crossing a roadway twice to access a path on the opposite side of the roadway. Raised sidewalks without a separation barrier do not provide for two-way bicycle accommodation adjacent to traffic lanes. Consult with BPPE and Bureau of Bridges and Structures for retrofit options. Adding a separation barrier on the deck could sometimes be an option, as illustrated in Figure 17-2.KK.

BICYCLE RAILING APPLICATIONS

Figure 17-2.LL

17-2.03(n) Paths Through Interchanges

Design of a path along an arterial roadway, as it passes through an interchange with free-flow ramps, requires design considerations to address safety of bicyclists. Providing a separate structure for bicyclists and pedestrians will maximize safety but can be cost-prohibitive. A side path can be accommodated at ramp crossings in a similar pattern to that shown for on-road accommodations, as discussed in Section 17-2.02(e) and shown in Figure 17-2.J. All interchange ramp crossings require individual consideration to meet accommodation, sight distance, and geometric design requirements.

A diverging diamond interchange (DDI) accommodates left-turning movements at signalized intersections while eliminating the need for left-turn phasing. DDIs will typically feature paths within the center of the arterial roadway to provide improved sight lines further from the bridge parapet walls, to place path crosswalk at signalized intersections, and to allow free-flow left turns onto entrance ramps without the potential for conflicts. These paths typically would be protected from traffic by barrier wall for the full length between the two intersections. A single-point urban interchange (SPUI) provides a convergence of all through and left-turning movements into a single large signalized intersection area. There are significantly wider pavement areas for path users to cross at SPUIs. The addition of path crosswalks may create greater delays in traffic when compared to the conventional diamond since SPUI signal phasing does not typically provide a red phase where crosswalks would be protected. Unique operational and safety design considerations will apply at SPUI interchanges.

17-2.03(o) Signing and Marking

Adequate signing and marking are essential on paths and the adjacent roadway, to alert bicyclists and pedestrians to potential conflicts and to convey regulatory messages to motorists and other users at highway intersections. Provide warning signs to identify conflict points and for design elements that are less than minimum criteria (e.g., less than minimum curve radii, vertical or horizontal clearances, speeds dictated by grades) to warn the user of these conditions. Additionally, use guide signing, (e.g., directions, destinations, distances, route numbers, names of crossing streets) in the same manner as they are used on highways. In general, uniform application of traffic control devices, as described in the *ILMUTCD*, will tend to encourage proper bicyclist and motorist behaviors.

A solid yellow centerline may be appropriate on path approaches to an intersection to discourage passing and help increase bicyclist awareness of the intersection. Consider a broken yellow centerline stripe (3 ft (0.9 m) stripe with 9 ft (2.7 m) gap) to separate opposite directions of travel on path segment under the following circumstances:

- for heavy volumes of bicycles,
- on curves with restricted sight distance, and
- on unlighted paths where nighttime riding is expected.

White edge lines also can be beneficial where nighttime bicycle traffic is expected. Marking should be considered for shared-use paths that are 12 ft (3.6 m) or wider to delineate lanes for bicyclists and pedestrians.

Investigate friction qualities of pavement marking materials. Some marking materials become slippery when wet. Marking materials with reflective elements typically offer better friction properties, especially in wet conditions.

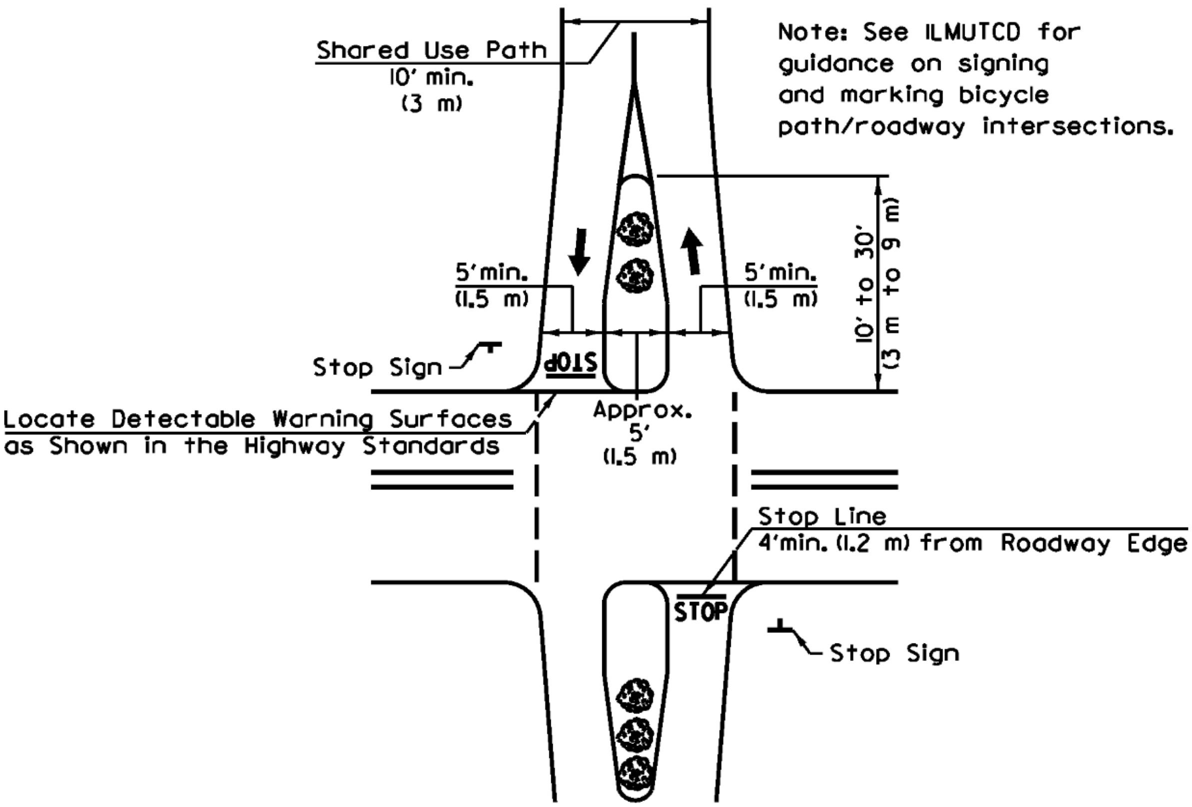
17-2.03(p) Lighting

Fixed-source lighting reduces the potential for crashes and conflicts along paths and at intersections. Additionally, lighting allows the bicyclist to see the bicycle path direction, surface conditions, and obstacles. Lighting should be considered where substantial riding at night is expected (e.g., bicycle paths serving college students or commuters, highway intersections). Lighting is important through underpasses or tunnels and when nighttime security could be an issue; see Chapter 56. Depending on the location, average maintained horizontal illumination levels of 5 lux to 22 lux should be considered. Where special security problems exist, higher illumination levels may be considered. Light standards (poles) should meet the recommended horizontal and vertical clearances. Luminaires and standards should be at a scale appropriate for a path and should be designed to deter vandalism.

17-2.03(q) Restriction of Motor Vehicle Traffic

Restriction of path use by motor vehicles may be reinforced by signing at roadway intersections. In certain situations, a physical barrier may be appropriate to prevent unauthorized motor vehicles from using the facility. Rigid bollards have often been used to restrict motor vehicle access to paths and can be an acceptable solution. However, the hazards they create for bicyclists, and in some cases motorists, can be significant. Barriers to path entry need not be proposed where unauthorized access is considered unlikely.

An alternate method of physically discouraging entry of motor vehicles is to split the entry way into two 5 ft (1.5 m) minimum sections separated by very low landscaping (e.g. groundcover, grass) as shown in Figure 17-2.MM. Motorists can thereby identify the path as a restricted feature while emergency vehicles can enter, if necessary, by straddling the landscaping.



LANDSCAPING DIVIDER FOR PATHS

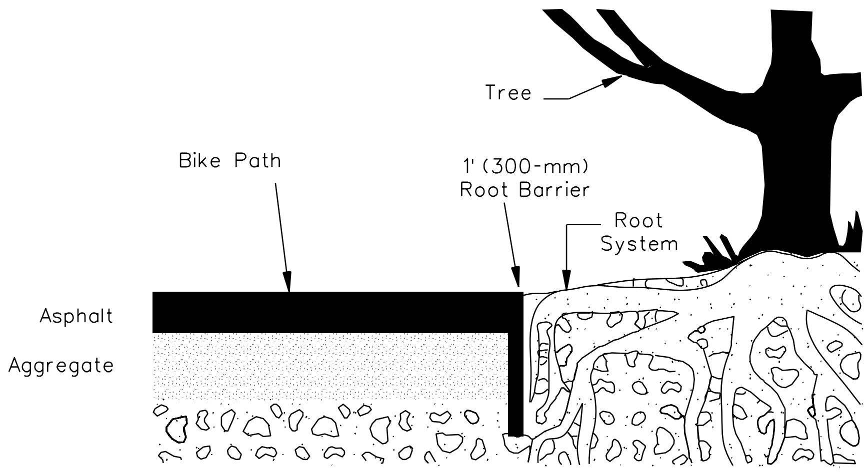
Figure 17-2. MM

17-2.03(r) Pavement Structure

Designing and selecting pavement sections for bicycle paths are in many ways similar to designing and selecting highway pavement sections. A soils investigation should be conducted to determine the load carrying capabilities of the native soil and the need for any special provisions. The investigation need not be elaborate, but should be performed by, or under the supervision of, a qualified engineer. Additionally, while loads on bicycle paths will be substantially less than highway loads, design bicycle paths to sustain, without damage, the wheel loads of occasional emergency, patrol, maintenance, and other motor vehicles that are expected to use or cross the path.

Give particular consideration to the location of motor vehicle wheel loads on the path. Where motor vehicles are driven on paths, especially if less than 10 ft (3.0 m) wide, their wheels usually will be at or very near the edges of the path. Because this can cause edge damage that will, in turn, reduce the effective operating width of the path, adequate edge support should be provided. Edge support can be either in the form of stabilized shoulders (e.g., use of geotextile fabric underlay) or in constructing additional pavement width.

Paths built along streams and in wooded areas can present unique problems. The roots of shrubs and trees can pierce through the path surfacing and cause it to bubble up and break apart in a short period of time. Preventative methods include: removal of vegetation, realignment of the path away from trees, and placement of root barriers (e.g., a 1 ft (300 mm) deep plastic shield) along the edge of the path as shown in Figure 17-2.NN.



SHARED-USE PATH ADJACENT TO TREES

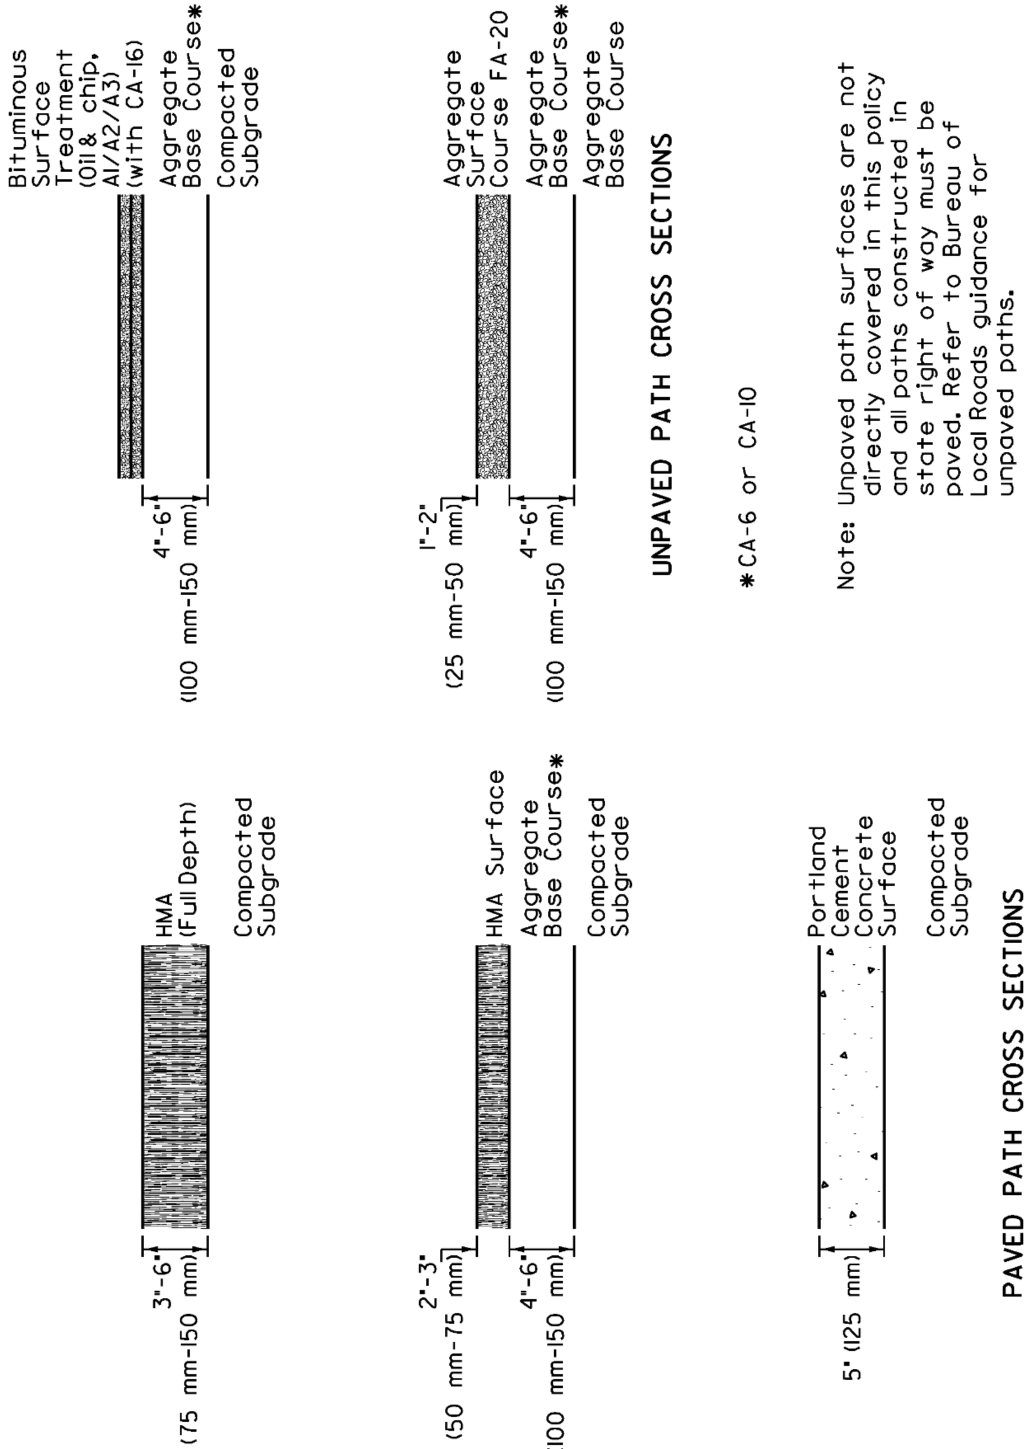
Figure 17-2.NN

At unpaved highway or driveway crossings of shared-use paths, pave the highway or driveway a minimum of 10 ft (3.0 m) on each side of the crossing to reduce the amount of gravel being scattered along the path by motor vehicles. Design the pavement structure at the crossing to adequately sustain the expected loading at that location.

Bituminous (HMA) or PCC pavement surfaces are required for side paths in state right of way. Aggregate materials provide a much lower level of service and require substantially more maintenance over the life of a project. PCC may offer advantages in wet soil conditions or in areas that may periodically flood. As guidance, Figure 17-2.OO provides examples of several acceptable pavement cross sections (an aggregate surface is also shown for reference). Consider using geotextile fabric in all areas. Fabric offers advantages that include extended pavement life, weed control, and lower maintenance.

In some situations, an HMA surface treatment (A1/A2/A3) may be adequate for paths, considering the limitations of the surface (e.g., bleeding oil on hot summer days). The proper application of this type of surface is very important. Specify a CA 16 aggregate size or smaller. The surface should be rolled, and the excess stone should be swept away, preventing accumulation at the outside edges of the path. Negotiating loose gravel on a bicycle can be very hazardous.

Figure 17-2.PP provides information regarding the advantages and disadvantages of various path surfaces.



SHARED-USE PATH CROSS SECTIONS

Figure 17-2.OO

Surface Material	Advantages	Disadvantages
Crushed Aggregate	Soft but firm surface; natural material; moderate cost; rough surface; accommodates some multi-use.	Surface can rut or erode from heavy rainfall; surface softens when set - bike tires, horses will damage surface; regular maintenance to keep consistent surface; replenishing aggregate may be a long-term expense; not for slopes >3%.
Bituminous Surface Treatment (also called Oil & Chip, Chip Seal)	Inexpensive to apply; more stable surface, durable.	Potential for oil bleeding to surface in hot weather, application methods important to minimize loose gravel.
Asphalt	Hard surface; supports most types of use; all weather; does not erode; accommodates most users simultaneously; low maintenance.	Higher installation costs; more costly to repair; not a natural surface; freeze/thaw can crack surface; heavy construction vehicles need access.
Concrete	Hardest surface; easy to form to site conditions; supports multiple use; lowest maintenance; resists freeze/thaw; best cold weather surface; best for wet conditions.	High installation cost; costly to repair; not a natural looking surface; construction vehicles will need access to the trail corridor.

SHARED-USE PATH/TRAIL SURFACE SYNOPSIS

Figure 17-2.PP

17-2.04 Accommodations Through a Roundabout

Safety and usability for bicyclists through roundabouts depend on the details of the roundabout design and provisions unique for bicyclists. When approaching a roundabout using an on-road bike accommodation, some cyclists may choose to travel like other vehicles, through the circulatory roadway, while others may choose to travel like pedestrians, along the sidewalks. Roundabouts can be designed to accommodate either choice.

Since typical on-road bicycle travel speeds are between 12 mph and 20 mph (20 km/hr to 30 km/hr), roundabouts that are designed to constrain the speeds of motor vehicles below 30 mph (50 km/hr) thereby improve safety and usability for cyclists. As described in Section 36-9.04(a), roundabouts designed for urban conditions should have a recommended maximum entry speed of 20 mph to 25 mph (30 km/hr to 40 km/hr) based on theoretical fastest path. These speeds are generally compatible with bicycle travel. Note that side paths at a roundabout are treated similarly to more typical intersection types, but clear opportunities for bicyclists to join the path from the sideroad approaches need to be provided in all such cases.

17-2.04(a) Traversing Roundabouts like Motorized Vehicles

In general, cyclists who have the knowledge and skills to ride effectively and safely on collector roadways can navigate low-speed, single-lane roundabouts without much difficulty. Cyclists and motorists will travel at approximately the same speed, making it easier for bicyclists to merge with other vehicular traffic and take the lane within the roundabout itself; these are necessary actions for safe bicycling in a roundabout. Even at multilane roundabouts, many cyclists will be comfortable traveling through like other vehicles.

Where bicycle lanes or shoulders are used on approach roadways, they should be terminated in advance of roundabouts. The full-width bicycle lane should normally end at least 100 ft (30 m) before the edge of the circulatory roadway. Terminating the bike lane helps remind cyclists that they need to merge. An appropriate taper should be provided to narrow the sum of the travel lane and bike lane widths down to the appropriate width necessary to achieve desired motor vehicle speeds on the roundabout approach.

The taper should end prior to the crosswalk at the roundabout to achieve the shortest possible pedestrian crossing distance. A taper rate of 7:1 is recommended to accommodate a design speed of 20 mph (30 km/hr), which is appropriate for bicyclists and motor vehicles approaching the roundabout. To taper a 5 ft to 6 ft (1.4 m to 1.8 m) wide bicycle lane, a 40 ft (12 m) taper is recommended. The bicycle lane line should be dotted for 50 ft to 200 ft (15 m to 60 m) prior to the beginning of the taper and dropped entirely through the taper itself. A longer dotted line gives advance notice to cyclists that they need to merge, providing more room for them to achieve this maneuver and find an appropriate gap in traffic; see Figure 17-2.QQ.

Bicycle lanes should not be located within the circulatory roadway of roundabouts. This would suggest that bicyclists should ride at the outer edge of the circulatory roadway, which can increase crashes resulting from exiting motorists who cut off circulating bicyclists and from entering motorists who fail to yield to circulating bicyclists.

At roundabout exits, an appropriate taper should begin after the crosswalk, with a dotted line for the bike lane through the taper. The solid bike lane line should resume as soon as the normal bicycle lane width is available.

17-2.04(b) Traversing Roundabouts like Pedestrians

Because some cyclists may not feel comfortable traversing roundabouts in the same manner as other vehicles, bicycle ramps can be provided to allow access to the sidewalk or a shared use path at the roundabout. Bicycle ramps at roundabouts have the potential to be identified as pedestrian ramps, particularly by pedestrians who are blind or who have low vision, unless properly designed.

Bicycle ramps may always be used. At some roundabouts traffic speeds or other conditions (e.g., a right turn bypass lane) make circulating like other vehicles more challenging for less confident riders than is typically the case. Multilane roundabouts are more challenging for all cyclists, and bicycle ramps should always be provided along with widened sidewalk or path connections. Where bicycle ramps are provided, provide a shared-use path or a widened sidewalk of 7 ft (2.1 m) between the ramps along all edges of the roundabout. A minimum 10 ft (3.0 m) width is recommended, and appropriate shared-use path design details should be applied.

In some jurisdictions, local laws may prohibit cyclists from riding on sidewalks and local coordination is encouraged to address this. In these areas, the following options could be considered:

- Signs could be posted to remind cyclists that they must walk their bicycles on the sidewalk.
- An exception could be made to allow cyclists to ride on the sidewalks at the roundabout; with appropriate regulatory signs posted.
- The sidewalk could be designed and designated as a shared use path.

Appropriate bicycle ramps are critical to provide choice to cyclists, ensure usability by cyclists, and reduce the potential for confusion of pedestrians, particularly those who are blind or who have low vision. Bicycle ramps should be placed at the end of the full-width bicycle lane where the taper for the bicycle lane begins. Cyclists approaching the taper and bike ramp will thus be provided the choice of merging left into the travel lane or moving right onto the sidewalk/path.

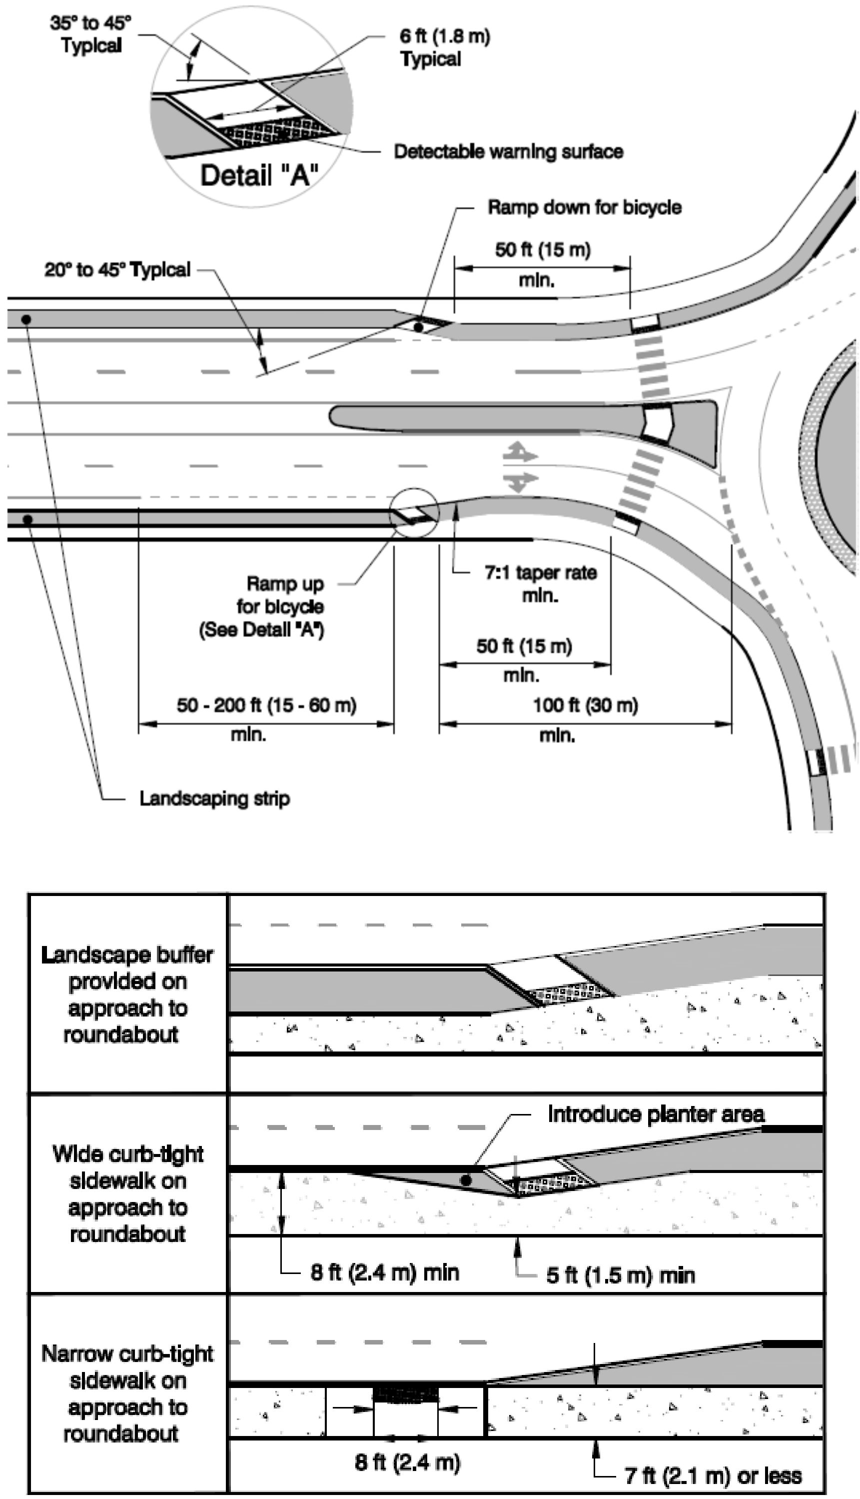
Bike ramps should not be placed directly in line with the bike lane or otherwise placed in a manner that appears to cyclists that the bike ramp and the sidewalk is the recommended path of travel through the roundabout. This encourages more sidewalk use by bicyclists, which can have a negative effect on pedestrians at the roundabout and may be less safe for bicyclists as well. Bicycle ramps should be placed at least 50 ft (15 m) prior to the crosswalk along the entry approach to the roundabout.

Wherever possible, bicycle ramps should be placed entirely within the planting strip between the sidewalk and the roadway. In these locations, the bicycle ramps should be placed at a 35° to 45°

angle to the roadway and the sidewalk to enable cyclists to use the ramp even if pulling a trailer, but to discourage them from entering the sidewalk at high speed. The bike ramp can be fairly steep, with a slope potentially as high as 20%. If placed within the sidewalk area itself, the ramp slope must be built in a manner so that it is not a tripping hazard. Figure 17-2.QQ illustrates several possible designs of bike ramps, depending on whether a planting strip is available and the available sidewalk width.

Detectable warnings are shown at the top of the bicycle ramps in Figure 17-2.QQ. These ramps are not intended for pedestrians. This detectable warning position indicates that the ramp itself is part of the vehicular area for which the detectable warning is used. If the ramp is in the sidewalk itself the detectable warning should be placed at the bottom of the ramp. Other aspects that can help keep pedestrians from misconstruing the bike ramp as a pedestrian crossing location include the angle of the ramp, the possible steeper slope of the ramp, and location of the ramp relatively far from the roundabout and crosswalk.

Bicycle ramps at roundabout exits should be built with similar geometry and placement as the ramps at roundabout entries. On exits, the angle between the bike ramp and the roadway can be as small as 20° since it is not necessary to encourage bicyclists to slow down as they reenter the roadway, but some angle is necessary so that visually-impaired pedestrians do not inadvertently travel down the ramp. Bike ramps should be placed at least 50 ft (15 m) after the crosswalk at the roundabout exit.



POSSIBLE TREATMENTS AND RAMP OPTIONS FOR BICYCLES

Figure 17-2.QQ

17-3 BICYCLE OPERATING CHARACTERISTICS

Bicycle operating characteristics, rider dimensions, and rider clearances are important considerations in design. There are many different types and sizes of bicycles, ranging from children's bicycles to tandem units for two riders, as well as buggy carts for transporting children and belongings. Typical bicycle dimensions and clearances are shown in Figures 17-3.A and 17-3.B, respectively. Figure 17-3.C illustrates the rider envelopes that are a primary basis for the minimum widths for paths, buffered bike lanes, and one-way and two-way SBLs. Minimum operating space is 3.5 ft (1.1m) for each rider. Passing between bicyclists will occur regularly along SBLs; the addition of pedestrians along paths, and considering social walking behavior, is a primary basis for the minimum 10 ft (3.0 m) width of paved paths. Providing the shy space envelopes shown in Figure 17-3.C is desirable and will further improve bicyclists comfort.

Characteristics	**Dimensions***
Width (physical space)	30 in. (760 mm)
Length	6 ft (1.8 m)
Height	7 ft (2.2 m)
Vertical Pedal Clearance	6 in. (150 mm)

**Note:* *If bike trailers are likely, the characteristic width becomes 3 ft – 3.5 ft (0.9 m - 1.0 m) wide and 9 ft (2.7 m) long. The indicated height of an adult bicyclist takes into consideration that the rider may be standing up while riding. Adult bicyclists sit between 5 ft (1.5 m) and 6 ft (1.8 m) above the riding surface while sitting on the saddle.*

TYPICAL BICYCLE AND RIDER DIMENSIONS

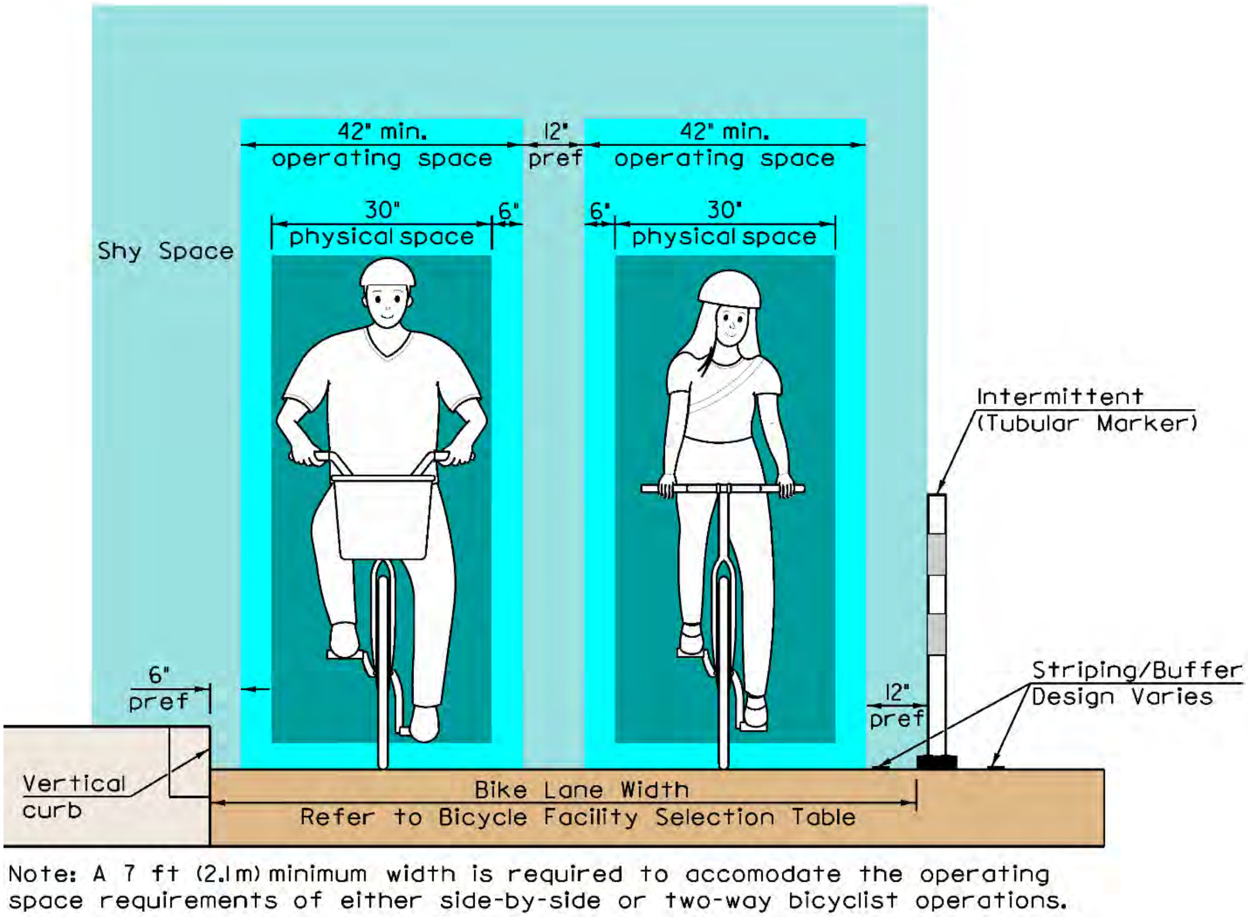
Figure 17-3.A

Lateral Clearances		Preferred Vertical Clearance	
Bike to Parked Car	2 ft (600 mm)	Bike Rider to Overhead Obstruction	3 ft (900 mm)
Bike to Curb Drop-Off	2 ft (600 mm)	**Maneuvering Clearances**	
Bike to Utility Poles, Trees, Hydrants	2 ft (600 mm)	Bike to Vehicle	3 ft (900 mm)
Bike to Soft Shoulder	1.5 ft (450 mm)	Bike to Other Bike	2.0 ft (600 mm)
Bike to Sloped Drop-Off	1 ft (300 mm)	Bike to Pedestrian	2.5 ft (750 mm)
Bike to Raised Curb	1 ft (300 mm)	Turning Radius	5 ft (1.5 m) (min)

Note: Because turning radius, sight distance, and braking of bicycles differ significantly from that of motor vehicles, design of bicycle facilities should take a conservative approach. This conservative approach should accommodate differing aspects of bikes, including the fact that riders are of different skill levels.

BICYCLE OPERATIONAL CLEARANCES

Figure 17-3.B



BICYCLE RIDER ENVELOPES FOR DESIGN

Figure 17-3.C

17-4 PEDESTRIAN ACCOMMODATIONS

17-4.01 General

Pedestrian accommodations are an integral part of urban and suburban transportation corridors. They facilitate pedestrian travel and access to public transportation, thereby contributing to alleviation of urban traffic congestion. The most pressing need for accommodation is at points of community development that result in pedestrian concentrations near or along the highway, such as at schools, public transportation stations and stops, local businesses, industrial plants, hospitals, churches, shopping centers, parking lanes, etc. Moreover, pedestrians should be included as design users at all intersections where they are expected to cross. Accommodations can include sidewalks, elevated walkways, grade-separated structures, curb ramps, crosswalks, traffic signals, and other traffic control devices.

The Department utilizes the recommended practice of the Institute of Transportation Engineers, entitled *Designing Walkable Urban Thoroughfares: A Context Sensitive Approach* and the *AASHTO Guide for the Planning, Design, and Operation of Pedestrian Facilities* in the development of pedestrian facilities.

The legal basis for bicycle and pedestrian policy is discussed in Section 17-1.02.

17-4.02 Pedestrian Warrants – Needs Assessment

The Department seeks to accommodate pedestrians within all project contexts with the exception of rural. Exceptions to the provision of accessible sidewalks on both sides, and logical crosswalks, will be quite rare within the urban and urban core project contexts. Suburban and rural town contexts will also typically include pedestrian accommodations, although in these contexts there may be more situations where constraints dictate that sidewalk be provided only along one side of a roadway. Consistent with this philosophy, there is no mechanism for tracking lack of need, excessive cost, or user safety issues to potentially justify sidewalk omissions, as there is with the BTA form for bicycle travel.

Pedestrian accommodations are specifically warranted, including provision of logical new state route crossing opportunities if they are absent, if any of the following conditions exist:

- there is current evidence of frequent pedestrian activity;
- there is a history of pedestrian-related crashes;
- the roadway improvement will create a safety impediment to existing or anticipated pedestrian travel (e.g., adding lanes so that the improvement itself acts as a barrier to pedestrian traffic);
- there is urban or suburban development that would attract pedestrian travel along or immediately adjacent to the route to be improved;

- pedestrian-attracting development is expected along the route within five years of project completion, either as documented in a local plan or anticipated as a factor of similar development history; and/or
- the roadway provides access to a park, recreation area or other significant destination, or across a natural or man-made barrier, within contexts other than rural.

If the local agency believes the accommodation will not fit with their development plan for the area, the Department will request the local agency pass a resolution indicating as such and a copy will be included in the Phase I report. Proposed resolution language is included in Section 17-7.

Overpasses and underpasses involve substantial cost and accessibility challenges and will be evaluated on a case-by-case basis considering the level of pedestrian travel, travel generators (e.g., schools, factories, stadiums, parks, transit terminals, shopping districts), the amount of other non-motorized traffic, and the potential safety impacts of not providing the accommodations. Anticipated pedestrian trip length to generators should be 1 mile (1.6 km) or less and the adverse travel distance alleviated by construction of the overpass/underpass should be greater than 0.5 miles (800 m). Refer to Section 58-1.12 for more information on grade separations.

17-4.03 Sidewalk Design Considerations

Where pedestrian accommodations are provided they must be accessible to all users. Refer to Section 58-1 for accessibility standards and the criteria to be met in the design of sidewalks and crosswalks. The typical ROW challenges associated with adding sidewalks to existing roadways underscore the importance of providing adequate sidewalks during new construction and reconstruction projects. Refer to 17-2.02(g) on road diets and lane diets for a discussion of redistribution of space within the right of way; pedestrian accommodations can be added by similar means into urban roadway projects where no (or substandard) facilities exist. Amenities along sidewalks to increase pedestrian safety and comfort levels may include sidewalk buffers, plantings, bump-outs, and street furniture. Note that on projects that will not move curb lines (e.g., resurfacing) scope constraints will typically restrict construction work beyond the curb lines.

Sidewalks are typically 5 ft (1.5 m) wide along state routes. Where conditions do not allow for a width of 5 ft (1.5 m), a minimum clear sidewalk width 4 ft (1.2 m) is permissible as long as 5 ft by 5 ft (1.5 m by 1.5 m) passing spaces are provided at least every 200 ft (60 m). Sidewalks wider than 5 ft (1.5 m) should be considered if more compatible with the local sidewalk network or if intended to accommodate a high volume of pedestrians or a wider range of users. If located directly behind a curb, sidewalks should be a minimum 7 ft. (2.1 m) wide. Preferably and especially where utilities will be present, include a 3 ft (900 mm) minimum turf sidewalk buffer, considering that an area is typically required for signs and other small appurtenances. The object free operational offset must be met and encroachments on the sidewalk PAR width must be avoided. Consider applying the enhanced lateral offset (see Section 38-9.02) for any locally-desired features being evaluated for placement within a corridor with sidewalk. Typical sections for sidewalks along urban roadways are presented in Section 48-2.03; incorporation of sidewalks on urban roadways is covered in Section 48-2.04.

Along high-speed rural roadways, sidewalks should be located as far as practical from the roadway. At a minimum along lower speed rural roadways (e.g., rural town context), the sidewalk edge should be at least 5 ft (3.0 m) from the outside edge of the shoulder. While pedestrians are not prohibited by law from traveling on roadway shoulders they should not be designed for pedestrian use or designated as pedestrian facilities.

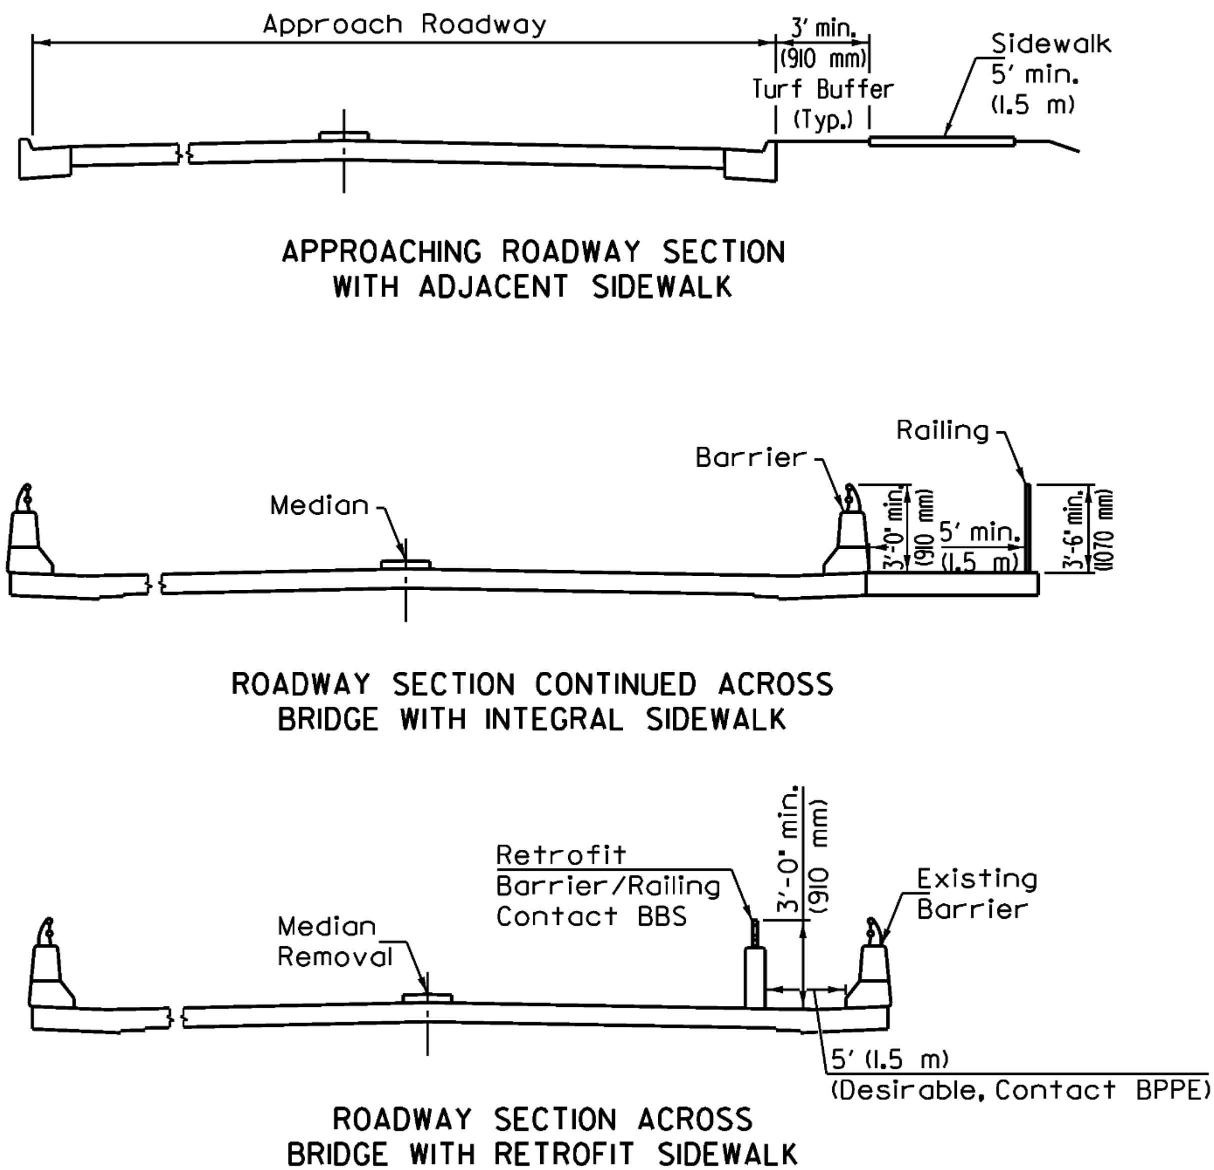
Project limits may be extended beyond highway improvements for reasonable distances to include necessary pedestrian facilities at nearby intersections, to provide access to public transportation facilities, or to avoid short sidewalks gaps either on one side or both sides of the primary route. Any such extensions should be documented to show justification and reflected in the Phase I report.

17-4.04 Sidewalks on Highway Structures

Raised sidewalks are the typical pedestrian accommodation provided on roadway bridges. Chapter 39 includes additional design considerations. Provide a 5 ft (1.5 m) minimum clear width for pedestrians on a structure. If not separated from traffic by a barrier, a sidewalk is raised 8 in. (200 mm) above the bridge deck to provide a level of separation and comfort for pedestrians. A vertical barrier is required between the travelled way and the sidewalk when speed limits exceed 40 mph, and the raised surface is optional in those cases. At lower speeds the vertical barrier should still be considered where there are high pedestrian volumes, concentration of school children, or safety concerns. Regardless of speed limit, bicycles are accommodated in the traffic lane, on the shoulder or in a bicycle lane adjacent to the traffic lane. If bicyclists are to be separated from the traveled way, provide a side path as described in Section 17-2.03(m).

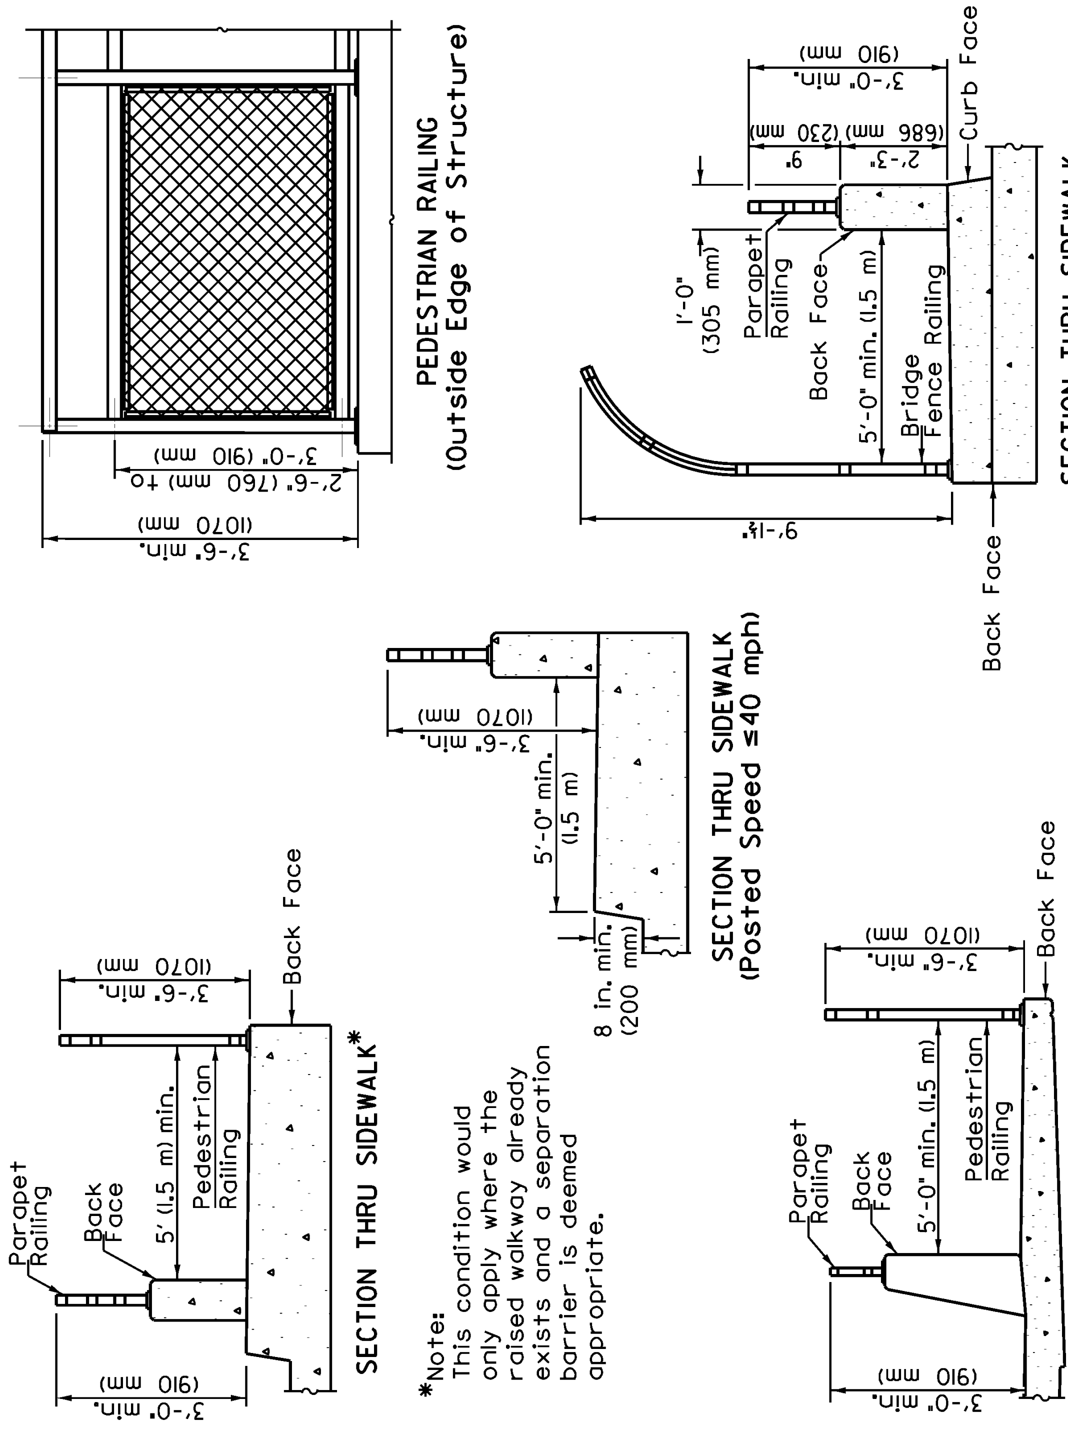
Sidewalks should be provided on new and rehabilitated structures in accordance with the dimensions shown in Figure 17-4.A. Required bridge railings along sidewalks must provide a minimum 3 ft 6 in (1070 mm) rail height along the structure edge, and 3 ft (910 mm) between the sidewalk and adjacent traffic lanes. Consider the potential for sight line impediments created by barriers and/or railings for drivers at adjacent intersections. Adjacent signalized intersections may need to include right-turn-on-red (RTOR) restrictions if intersection sight distance is restricted by a pedestrian railing. Several examples of barriers and railings used for sidewalk applications on bridges are shown in Figure 17-4.B. Specific configurations depend on the roadway speed limit, the roadway classification, and the facility being crossed. Refer to Chapters 39 and 58 for requirements of protective fencing.

When a project has a bridge omission with sidewalk accommodations along the roadway, fully compatible future accommodations should be planned for the omitted structure. Where it is necessary to accommodate pedestrians on an existing highway bridge as an interim condition, consider alternatives in light of what the geometrics of the bridge will allow. If it is necessary to accommodate pedestrians directly on the bridge deck, separate pedestrians from motor vehicle traffic with a barrier. When questions arise consult with BPPE and Bureau of Bridges and Structures for retrofit options and/or barrier and railing selection.



TYPICAL CROSS SECTIONS FOR SIDEWALKS ON HIGHWAY STRUCTURES

Figure 17-4.A



PEDESTRIAN RAILINGS ON HIGHWAY STRUCTURES

Figure 17-4.B

17-4.05 Intersection Crosswalks

Wherever pedestrians use an intersection, crosswalks are a primary geometric design element and should be considered in the initial steps of the intersection design process that is governed by Chapter 36. Signalized intersections are often the most direct and best places for pedestrians to cross a major roadway. Consider roadway width, traffic volumes, traffic speeds, and lines-of-sight when designing crossings. Assess the overall pedestrian network. Consider that the *Illinois Vehicle Code* includes in the definition of a crosswalk the prolongation or connections of the lateral lines of a sidewalk or shoulder across the intersection regardless of whether a crossing is marked or not, pursuant to 625 ILCS 5/1-113.

Pedestrian safety at intersections is typically improved with slowed turning traffic and good sight lines. Minimizing curb return radii within the constraints of operational needs can improve accommodations. Tighter radii can increase visibility of pedestrians, slow vehicle turning speeds, and reduce crossing distances.

Longer crossing distances increase pedestrian exposure to traffic and the potential for vehicle–pedestrian conflicts. Providing for multi-stage crossings can decrease overall traffic delay. Intermediate pedestrian refuge areas within raised medians and corner islands can reduce exposure and enhance pedestrian safety by providing multi-stage crossing opportunities. Refuge areas must provide 6 ft (1.8 m) minimum face-to-face width measured along the pedestrian travel path. Well- designed channelizing raised corner islands can help separate the individual conflicts between motor vehicles and pedestrians or bicyclists. They can be especially effective in conjunction with right-turn lanes and where intersection returns must accommodate larger design vehicles. Painted islands with crosswalks provide neither refuge for pedestrians nor directional guidance for persons with vision impairment. At actuated signalized intersections where raised medians provide refuge, pedestrian signal heads and pushbuttons/detectors must be installed within the median. Where corner islands are used in conjunction with dual right-turn lanes, the same requirement applies. Countdown pedestrian signal heads are required.

Leading pedestrian intervals (LPI) at signalized intersections are a low-cost pedestrian safety countermeasure that may be considered for use at urban and suburban locations. LPI consists of displaying the walk symbol to pedestrians several seconds ahead of parallel vehicular traffic receiving a green signal allowing pedestrians a ‘head start’ to occupy the crosswalk and increase their visibility to both right-turning and left-turning drivers. One downside to LPI is that it potentially creates increased vehicular delay and queues at the intersection. Accessible Pedestrian Signals (APS) is used in conjunction with LPI. The Bureau of Operations has developed guidelines using intersection factors to identify when LPI should be considered as an appropriate safety countermeasure; contact Operations to discuss the latest Operations Policy on LPI.

To the extent possible, minimize intersection skews and place crosswalks at right angles to traffic movements where they best meet both driver and pedestrian expectations. Skewed crossings tend to increase pedestrian exposure to traffic and may reduce sight distance for some users. Design return radii to minimize crossing distances considering that design turning vehicles may utilize all available roadway width in the direction of travel rather than turning into the near lane.

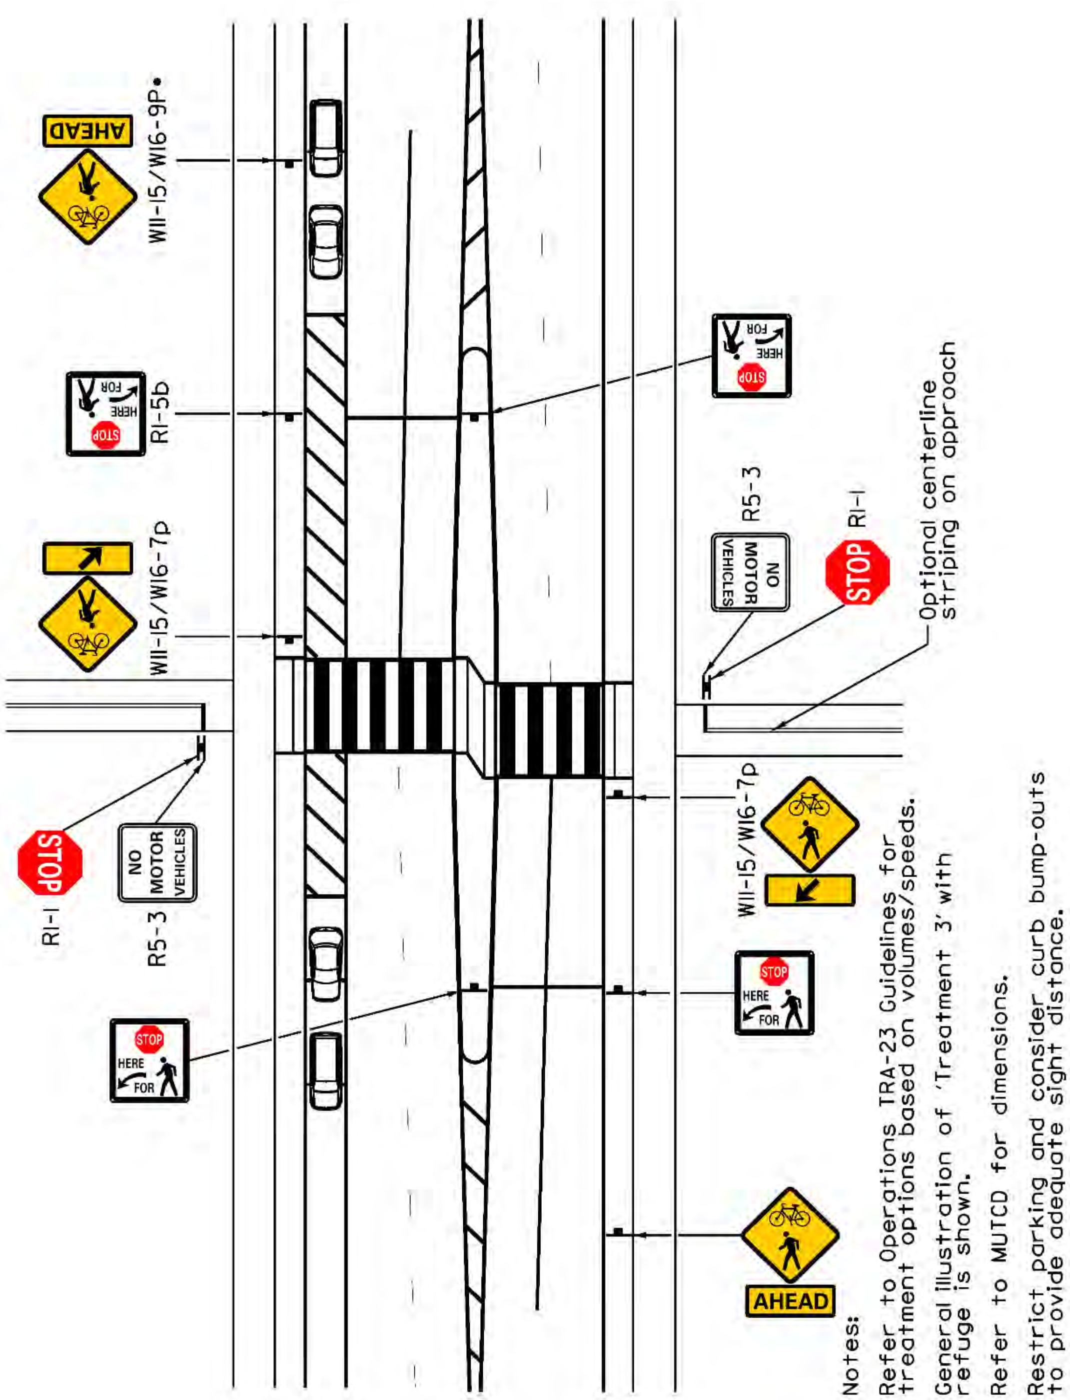
The *ILMUTCD* provides standards for marked crosswalks. All crosswalk markings must be white. For simplicity of maintenance, two transverse crosswalk lines are typically used for marking crosswalks on stop-controlled and signalized approaches. Two transverse crosswalk lines provide for good channelization and guidance and are adequately visible in conjunction with stop bars. However, longitudinal crosswalk markings (e.g. Continental style) should be considered at locations where (a) physical or level-of-use conditions are such that added visibility of the crosswalk is desired; or (b) a pedestrian crosswalk might not be expected by drivers. Studies show that crosswalks marked longitudinally can be detected much further away than crosswalks with only transverse lines. IDOT Bureau of Operations Policy TRA-23 provides design guidance for crosswalk striping that can apply to intersection markings.

17-4.06 <u>Midblock Crosswalks</u>

In areas of considerable pedestrian activity, midblock crosswalks reduce distances pedestrians must travel and focus crossing interactions where pedestrian safety can be maximized. Pavement markings legally establish a crosswalk at any non-intersection location. Designated midblock crossings must meet the same accessibility requirements as pedestrian crossings at intersections. Where safety concerns are identified at midblock crosswalks, first consider potential methods for upgrading the design, rather than simply working to remove them.

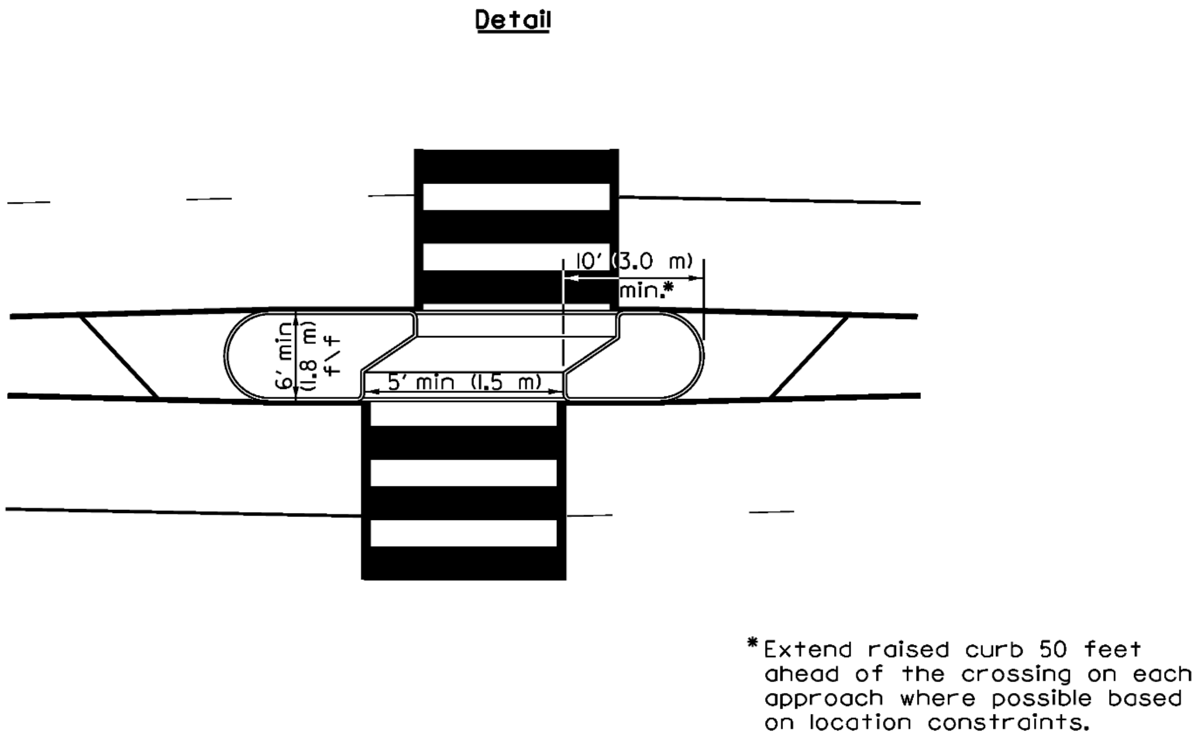
Because drivers may be less expectant of pedestrians crossing at non-intersection locations, these crossings should include enhanced visual cues and/or geometric features to increase driver awareness of the crossing and improve safe behavior by all users. IDOT Bureau of Operations Policy TRA-23 provides guidelines for establishing pedestrian crossings at midblock locations, including recommended signing, striping, and beacon treatments based on vehicle speeds, traffic volumes, and roadway cross section. A general illustration of a midblock crosswalk for a multi-use path is shown in Figure 17-4.C(1). The location and design of midblock crossings should consider pedestrian volumes, vehicle mix, desired paths for pedestrians, and adjacent land uses. Longitudinal crosswalk markings (e.g., Continental or ladder style) should typically be specified. Especially for areas where there has been a history of nighttime pedestrian crashes, crosswalk lighting should be considered. Guidance on crosswalk lighting can be found in Chapter 56 as well as FHWA's *Informational Report on Lighting Design for Midblock Crosswalks*.

Providing shorter directional crossings can maximize pedestrian safety. Raised medians that are a minimum 6 ft (1.8 m) wide face-to-face with cut-throughs provide an area of refuge for both pedestrians and bicyclists. For guidance on the use of medians to divide traffic, refer to Chapters 31 and 36 as well as the *AASHTO Green Book*. Raised medians with cut-throughs also call attention to a crossing, reduce pedestrian exposure, and allow pedestrians to address one direction of conflict at a time. Designers can sometimes provide adequate space for a raised median refuge by reducing lane or shoulder widths. Cut-throughs within raised medians may be angled to better align pedestrians toward oncoming traffic, increasing their awareness of traffic. Refer to Figure 17-4.C(2) for an example. Another measure to enhance safety is a curb bump-out. These geometric features can greatly improve sight lines at crosswalks, especially where parking or other sight line constraints will exist. It is critical that operational and maintenance issues are considered when curb bump-outs are to be included in the roadway design.



EXAMPLE MIDBLOCK CROSSWALK WITH REFUGE FOR SHARED-USE PATH

Figure 17-4.C
(1 of 2)



EXAMPLE MIDBLOCK CROSSWALK WITH REFUGE FOR SHARED-USE PATH

Figure 17-4.C
(2 of 2)

Pedestrian Hybrid Beacons (PHBs) are a type of traffic control device used to warn and control motorists at marked unsignalized midblock crosswalks and assist pedestrians in crossing. PHBs are typically not to be considered at locations where conventional signal warrants are met. The *ILMUTCD* provides guidance regarding the volume of pedestrians crossing a roadway that would merit the consideration of PHBs as well as the location and design requirements. The *ILMUTCD* also identifies specific restrictions on the locations of PHBs near intersections or entrances. The primary location for consideration of PHBs is at midblock crosswalks along multi-lane urban and suburban roadways, as covered in Operations Policy TRA-23.

Another example of a supplemental device to increase driver awareness of pedestrian presence at a midblock crosswalk is the Rectangular Rapid Flashing Beacon (RRFB). RRFBs can be utilized under an Interim Approval statewide (IA-21.38). Specific technical conditions are established by FHWA for their use. Pedestrian actuation and supplemental signs and pavement markings are required with both PHBs and RRFBs. Compliance by pedestrians and motorists can be maximized by providing a relatively “hot response” (fast activation) for pedestrians pressing a button. For PHBs, this type of activation may adversely affect progression along arterial roadways.

Consider whether the potential safety benefit of a system that reduces non-compliance by all users (e.g. improves motorist stopping behavior) warrants some disruption to vehicle traffic flow. Coordinate these issues with the Bureau of Operations.

17-4.07 Safety Rails and Handrails

Safety rails are placed along paths or sidewalks to protect pedestrians and bicyclists from hazards such as vertical drop-offs or steep slopes. Refer to Figure 17-4.D for guidance on railing placement and height. Consider the range of non-motorized users expected in applying this guidance to sidewalks and paths. Situations that should be considered for the inclusion of safety rails include areas where there are:

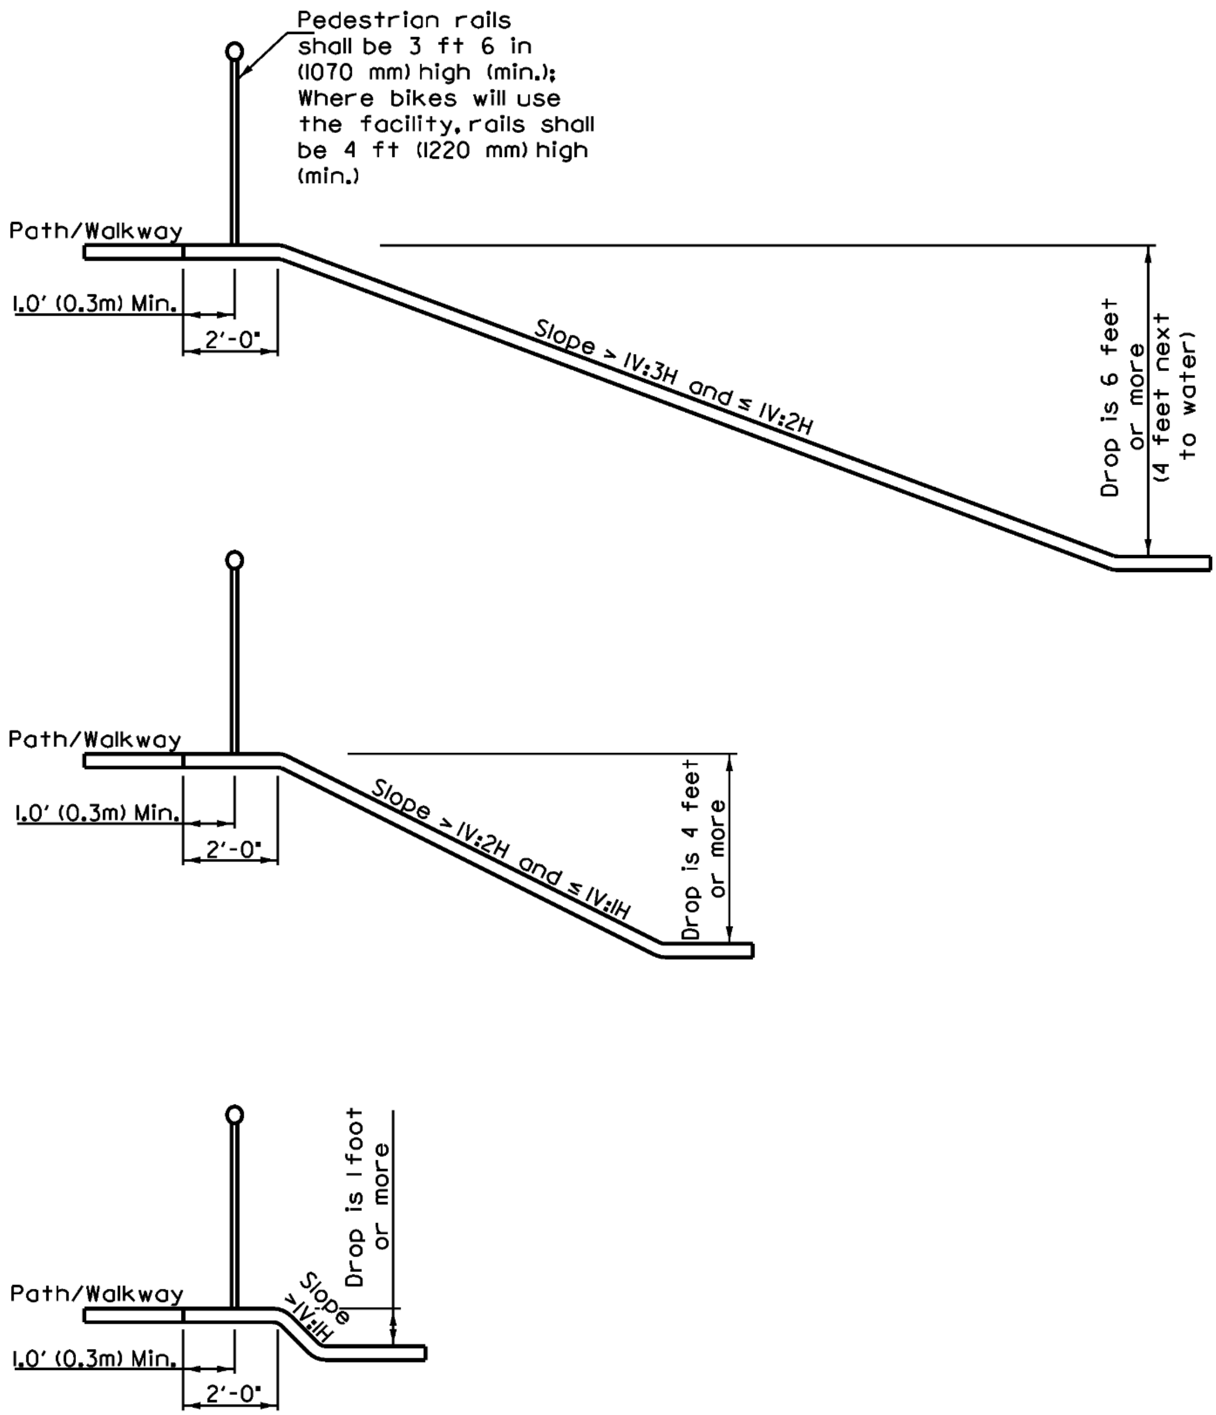
- Slopes steeper than 1:3 (for drops of 6 ft (1.8 m) or greater) or 1:2 (for drops of 4 ft (1.2 m) or greater immediately adjacent to the path,
- Drop-offs of more than one ft (300 mm) and steeper than 1:1 immediately adjacent to the path,
- Slope surfaces consisting of rough materials, such as revetment or rip-rap, immediately adjacent to the path, or
- Bodies of water at the bottom of a slope adjacent to the path.

Safety rails adjacent to pedestrian-only areas (e.g., sidewalks) should be a minimum of 3 ft 6in. (1070 mm) high. A typical design for a safety rail includes two to four horizontal elements with vertical elements equally spaced. On bridges or other locations with high vertical drops there are important opening restrictions. Opening sizes in the lower 27 in. (700 mm) should be small enough so that a 6 in. (150 mm) sphere cannot pass between them. Above 27 in. (700 mm) openings should restrict passage of an 8 in. (200 mm) sphere.

Related to accessibility, handrails are required in the following situations in accordance with ADA requirements:

- On both sides of stairways, with appropriate extensions at the top and bottom,
- On both sides of ramps, not curb ramps, where the rise of the ramp run is more than 6 in. (150 mm).

However, it is not the intent to typically provide handrails along state highways as they likely could pose a hazard to vehicle traffic. Handrails may have applications perpendicular to traffic, and when outside of the clear zone. Also note that matching the grade along a side road usually does not create a condition where a handrail is required.



SAFETY RAILS FOR WALKWAYS AND SHARED-USE PATH

Figure 17-4.D

17-4.08 Documentation

When one or more of the warrants presented in Section 17-4.02 are met, appropriate and accessible pedestrian sidewalk accommodations are required. When pedestrian accommodations will be included in the project, include documentation of the decision in the Phase I report. When urban core, urban or suburban context projects do not meet warrants, send an electronic copy of the assessment of the warrants to BPPE to obtain concurrence. Exceptions to these design treatments, either on the basis of cost or user safety, require concurrence by BPPE and will be granted at coordination meetings after a sufficient review period. Total omissions based on documented safety issues, excessive cost or lack of need on projects within 1 mile (1.6 km) of a municipality with more than 1,000 people will require concurrence of the Secretary. Signed documentation of the Secretary's concurrence on a BDE 1701 shall be included in the Phase I report.

17-4.09 Pedestrian Accommodations During Construction

The *ILMUTCD* requires that alternate pedestrian access routes (APAR) be provided whenever existing pedestrian accommodations are affected by construction; refer to *ILMUTCD* Section 6D. Accessibility must be maintained consistent with the features present in the existing facility. See Section 55-2.01(d) and the *Highway Standards* for guidance. Lengthy pedestrian detours should be avoided. In rare circumstances, provision of an APAR or a reasonable pedestrian detour may not be feasible along a roadway or across a structure. In such cases alternative accommodations such as a shuttle service may be provided.

QUESTIONS ON BICYCLE TRAVEL ASSESSMENT

Route ____________________________

Section ____________________________

County ____________________________

Warrants Met

Warrant 1: Is the highway or street designated as a bikeway or recommended bike route in a regionally or locally adopted bike plan or shown in a regionally or locally adopted map as a recommended bike route?
Describe the designation

Warrant 2: Will the projected two-way bicycle traffic volume approximate 25 ADT or more during the peak three months of the bicycling season five years after completion of the project?
Describe estimating method

Warrant 3: Does the route provide access to a park, recreational area, school, or other significant destination?
List destinations

Warrant 4: Does the project provide access across a river, railroad, highway, corridor, or other natural or man-made barrier?
Note barriers

Warrant 5: Will the highway project negatively affect the recreational or transportation utility or an independent bikeway or trail? Highway projects will negatively affect at-grade paths or trails when they are severed, when the projected roadway traffic volumes increase to a level that prohibits safe crossing at-grade, or where the widening of the roadway prohibits sufficient time for safe crossing.
List bikeway(s) affected

If any of the five warrants above are met, the Department shall provide on-road or off-road accommodations for bicycle travel. Roadway improvement corridors should also be assessed with respect to adjacent/contiguous routes. Items to be addressed in the reporting include:

- The following bicycle network considerations apply
- Key connections to be provided with this project
- Accommodations type identified as "required" or "optional" in the Bicycle Facility Selection Table
- Accommodations proposed
- Reasons for lesser accommodations (highest/best or none)
- Bicycle LOS information (urban on-road facilities only; attach BDE 1703)

17-7 PROPOSED RESOLUTION LANGUAGE FOR MUNICIPALITIES IN OPPOSITION

WHEREAS, The Illinois Department of Transportation (IDOT) has the power to approve and determine the final plans, specifications and estimates for all State highways; and

WHEREAS, IDOT's projects must adequately meet the State's transportation needs, exist in harmony with their surroundings, and add lasting value to the communities they serve; and

WHEREAS, IDOT must embrace principles of context sensitive design and context sensitive solutions in its policies and procedures for the planning, design, construction, and operation of its projects for new construction, reconstruction, or major expansion of existing transportation facilities by engaging in early and ongoing collaboration with affected citizens, elected officials, interest groups, and other stakeholders to ensure that the values and needs of the affected communities are identified and carefully considered in the development of transportation projects; and

WHEREAS, Bicycle and pedestrian ways must be given full consideration in the planning and development of transportation facilities, including the incorporation of such ways into State plans and programs; and

WHEREAS, Illinois statute (605 ILCS 5/4-220) requires IDOT to establish and solely fund bicycle and pedestrian ways in or within one mile of a municipality with a population of over 1,000 people in conjunction with the construction, reconstruction, or other change of any State transportation facility except: 1) in pavement resurfacing projects that do not widen the existing traveled way or do not provide stabilized shoulders; 2) where approved by the Secretary of Transportation based upon documented safety issues, excessive cost, or absence of need; or 3) where the municipality passes a resolution stating that a bicycle or pedestrian way does not fit within its development plan; and

WHEREAS, During the development of highway projects throughout the State, IDOT gives consideration to accommodating bicyclists and pedestrians on a need-basis; and

WHEREAS, IDOT has presented the (*local authority*), for its consideration, a bicycle and/or pedestrian improvement consisting of (*describe improvement*), solely funded by IDOT with maintenance to be provided by (*IDOT/unit of local government*);

THEREFORE, be it

RESOLVED, That the (*local authority*) has determined the improvement as proposed by IDOT does not fit within its development plan; and be it further

RESOLVED, That a suitable copy of this resolution be presented to the IDOT district office associated with the proposal.

Chapter Nineteen
PUBLIC INVOLVEMENT GUIDELINES

Pursuant to 23 CFR 771.111, each State must have procedures approved by the FHWA to carry out a public involvement/public hearing program pursuant to 23 U.S.C. 128 and 139, and Council on Environmental Quality (CEQ) regulations. Chapter 19 outlines IDOT's public involvement/public hearing procedures and fulfills this requirement.

The public involvement process provides for free and open discussions with individuals, organizations, agencies, and other interested parties to encourage early resolution of controversial and non-controversial issues related to the project. The process also ensures that potential adverse economic, social, and environmental effects are fully considered in project development. This should result in final decisions that reflect the best overall public interest in providing a safe, economic, and efficient transportation system with minimal adverse effects.

19-1 GENERAL GUIDELINES

19-1.01 Definitions

The following definitions apply to Chapter 19:

1. Context Sensitive Design. Context Sensitive Design is a model for transportation project development. Proposed transportation projects must be planned not only for their physical aspects as a facility serving specific transportation objectives, but also for their effects on the aesthetic, social, economic and environmental values, needs, constraints and opportunities in a larger community setting.

2. Context Sensitive Solutions. Context Sensitive Solutions (CSS) is an Illinois law which provides for a collaborative, interdisciplinary, and holistic approach to public involvement for the development of transportation projects. It is both a process and product, characterized by a number of attributes. It involves all stakeholders, including community members, elected officials, interest groups, and affected local, State, and Federal agencies. It puts project needs and both agency and community values on a level playing field and considers all trade-offs in decision making. Often associated with Context Sensitive Design, Context Sensitive Solutions should be a part of all phases of program delivery including long range planning, programming, environmental studies, design, construction, operations, and maintenance.

3. National Environmental Policy Act Process. Signed into law January 1, 1970, National Environmental Policy Act (NEPA) requires federal agencies to assess the environmental effects of their proposed actions, provides for public input, and requires that agencies make well-informed decisions. The NEPA process includes development of purpose and need, analysis of alternatives to address the purpose and need, public involvement, interagency coordination, and well-informed decisionmaking in determining the preferred

alternative. NEPA is completed with approval of a Categorical Exclusion (CE), Finding of No Significant Impact (FONSI), or Record of Decision (ROD).

4. Public Hearing. A type of public involvement activity referenced in public law where the public's comments are recorded, transcribed, and sent to the lead agency. A public hearing is a formal opportunity for the public to review proposed plans for transportation projects and provide comments for decision makers to consider in reaching a final decision. Federal regulations include specific requirements for what must occur prior to, during, and after a public hearing is held. Typically, public hearings are held toward the end of Phase I after a preferred alternative has been identified.

5. Public Involvement Activity. A public involvement activity is any effort by the Department to engage the public in discussion about a proposed project, for the purpose of providing information to the public and receiving information from the public. Public Involvement activities include, but are not limited to, property owner contact letters, public meetings, and public hearings.

6. Public Meeting. A type of public involvement activity where the public can comment or inquire about the nature of the project and its potential impacts. Federal regulations do not include specific requirements for public meetings, such as a transcript of the proceedings. Public meetings are therefore a more flexible public involvement activity than a public hearing.

SIP	Stakeholder Involvement Plan
SIR	State Improvement Report
SMART	Surface Maintenance at the Right Time
U.S.C.	United Sates Code

19-2 LEGAL REQUIREMENTS FOR PUBLIC INVOLVEMENT

19-2.01 Federal Requirements

Pursuant to 23 CFR 771.111, State public involvement/public hearing procedures must provide for one or more public hearings, or the opportunity for hearing(s), to be held by the State highway agency for any Federal-aid project which:

- involves the bypassing of, or going through, any city, town, or village, either incorporated or unincorporated; or
- requires significant amounts of right-of-way; or
- substantially changes the layout or functions of connecting roadways or of the facility being improved; or
- has a substantial adverse impact on abutting property; or
- has a significant social, economic, environmental or other effect; or
- FHWA determines that a public hearing is in the public interest.

The public hearing must be held at a convenient time and place, include reasonable notice to the public, indicate the availability of explanatory information, and provide information required to comply with public involvement requirements of other laws, Executive Orders, and regulations. Federal requirements describing what must be explained at the public hearing are in Section 19-3.04.

The Department must submit to FHWA a transcript (Section 19-3.04(g)) of each public hearing and a certification (Section 19-3.04(h)) that a required hearing was held, or that a hearing opportunity was offered. The transcript must be accompanied by copies of all written comments from the public, both submitted at the public hearing or during an announced period after the public hearing.

19-2.02 State Requirements

In addition to Federal requirements, the State also requires a public hearing for road closures and corridor protection. The State also has requirements for when Context Sensitive Solutions must be implemented on highway projects.

19-2.02(a) Road Closures

When the Department proposes to permanently close a road to eliminate an at-grade crossing or junction with an Interstate highway or a highway where the authority to control access has been exercised to permit access only at certain public roads, 605 ILCS 5/8-106 requires that a public hearing be held to consider the road closure. Such road closure hearing must be held in the county where the closure will occur, and must consider local traffic needs and the effect of the closing on other highways in the locality. The preparation of final construction plans shall not begin until road closure hearings have been held. See Chapter 11 for more information on road closures.

Road closure hearings may be held in conjunction with other required hearings. If the discussion of road closures extends the length of the presentation beyond the time limits discussed in this Section, separate hearings may be necessary. Because road closures should be discussed in environmental reports, the district should schedule road closure hearings prior to the preparation of the final report if not combined with other hearings. Changes in proposed road closures may be sufficient grounds for preparing revised or supplemental environmental reports. Public Hearing announcements should be in conformance with Section 19-4.01(c).

19-2.02(b) Corridor Protection

The Illinois Highway Code, 605 ILCS 5/4-510 provides means of protecting the right-of-way for future additions to State highways from future developments through the preparation and filing of a map showing the location and approximate widths of the rights-of-way needed for future additions; see Section 12-6. When the Department intends to invoke this provision, it must hold a public hearing in or near the county or counties where the land to be used is located and must publish notice of the hearing in a newspaper or newspapers of general circulation in the county or counties involved. If a public hearing is held in conjunction with the location and design studies for a project, it can also serve as the hearing required for corridor protection under 605 ILCS 5/4-510. As an alternative, the Department may hold a separate hearing specifically to receive testimony regarding the corridor protection map. For any hearing intended to fulfill the requirements of 605 ILCS 5/4-510, the notice(s) announcing the hearing should indicate that intent; see Section 19-4.01(c).

Not more than ten years after a protected corridor is established and not later than the expiration of each succeeding ten year period, the Department shall hold public hearings to discuss the viability and feasibility of the protected corridor. The Department shall retain the discretion to maintain any protected corridor but shall give due consideration to the information obtained at the public hearing. If the Department in its discretion determines that the construction of the roadway is no longer feasible, the Department shall abolish the protected corridor.

The Land Acquisition Manual describes the procedures and exhibits needed to file a Corridor Protection Map.

19-2.02(c) Context Sensitivity

Pursuant to 605 ILCS 5/4-219, *the Department shall embrace the principles of context sensitive design and context sensitive solutions in the policies and procedures for the planning, design, construction, and operation of its project for new construction, reconstruction, or major expansion of existing transportation facilities.*

Departmental policy D&E-21 provides guidelines for defining the Context Sensitive Solutions (CSS) process and its uses. Section 19-5 discusses procedures for implementing CSS for Department projects.

19-2.02(d) Projects not Involving Federal Funds

For projects not involving the use of Federal funds, the Regional Engineer will generally follow the same public involvement process as that for projects using Federal-aid funds. When State-only funded projects are subject to restricted time constraints, the Regional Engineer may elect to implement the following procedures as appropriate:

1. Where no additional right-of-way will be acquired, make releases of information to one or more news media announcing the initiation of studies and/or plans and the awarding of contracts.

2. Where minor amounts of right-of-way will be acquired, initiate property owner contact from whom right-of-way will be acquired and provide an opportunity to comment on the improvement. A representative of the Regional Engineer will record and document these comments and address them in the Phase I report. In addition, release information to one or more news media on the initiation of studies and/or plans and the award of contracts.

3. Where significant amounts of right-of-way will be acquired or the scope of the project is major is nature, the Regional Engineer will schedule one or two public meetings and an offer to hold a public hearing should be made. Comments received from these public involvement activities will be included in the State Improvement Report (SIR). In addition, release information to one or more news media on the initiation of studies and/or plans and the award of contracts.

19-3 LEVELS OF PUBLIC INVOLVEMENT

19-3.01 General

This Section describes the types of public involvement activities that may be implemented for a project and the procedures for implementing them. Public involvement activities may include property owner contact, public meeting(s), or a public hearing.

An early activity of the project team will be to design and schedule the public involvement activity(ies) for the project. The public involvement should be dynamic and flexible and may include one or more public involvement activities described in this Section, depending on the project size, impacts, complexity, or class of action. The public involvement team should be especially cognizant of any opposition to the project and should develop strategies to address conflict issues early to help minimize distruptions at the meetings/hearings. Strategies may include:

- meeting with opposition groups early to hear and try to alleviate their concerns;
- include those opposed to the project in the advisory group if CSS is being used; and
- use of conflict resolution specialists.

Once completed, each public involvement activity should be documented and included in the project file. For projects using CSS, the Stakeholder Involvement Plan (SIP) provides this documentation.

The following provides a description of the typical levels of public involvement and procedures for each (e.g. property owner contact, public meeting, or public hearing).

19-3.02 Property Owner Contact

19-3.02(a) General

Property owners are generally contacted to notify them of the project and the potential impact to their property. Property owner contact is generally suitable when the project involves acquisition of a minimal amount of right-of-way from a small number of property owners (e.g., 10 or fewer, depending on context) for projects such as:

1. 3P projects requiring involving right-of-way or easements.
2. 3R projects requiring minor amounts of right-of-way or easements.

19-3.02(b) Procedures

The district will contact each property owner from whom property will be acquired and provide them with an opportunity to comment on the project. A district representative can make contact in-person or via certified mail. The district should document in-person contacts by including a summary of the conversation in a memorandum to the file. If certified mail is used, the letter (Figure 19-3.A) should describe/include:

- reason for the contact,
- scope and schedule of the project,
- reason for the proposed right-of-way,
- exhibit map showing the property affected,
- acquisition procedures,
- policy on public involvement,
- a comment form, Figure 19-3B,
- self-addressed, stamped return envelope,
- other options for submitting comments, and
- where to get more information.

Make a record of any comments from the property owner, whether contacted in person or via certified mail, and inform the owner of any actions taken to resolve any objections or suggested changes. When public involvement requirements are satisfied by this option, the Regional Engineer shall determine what information regarding the project should be released to the media.

When property owners are not readily available (e.g., when the property is the subject to a trust agreement) send a written notice or make an in-person visit to the trust officer or manager of record to request him/her to inform the actual owner of a possible need for the property. Attempt to ascertain the name and address of the owner or power of attorney for comments. Include a time limit of not less than 21 days for response in the request. If response is not received in that time, assume the owner or legal representative is not available or interested in commenting on the project.

For larger projects with many property owners affected, it may be more practical to hold a public meeting rather than to contact owners separately; see Section 19-3.03.

Location Studies
Illinois Route 2 to Illinois Route 3
Job No.: P-91-000-00
Some County

RE: Property Tax Number 12-34-567-890

Month Day, 20xx

Mr. John Doe
123 S. 4th Street
Some Town, IL 60000

Dear Property Owner:

Reason for Contact	The purpose of this letter is to notify you that the Illinois Department of Transportation is presently in the preliminary engineering phase of a study for the improvement of Illinois Route 1 from Illinois Route 2 to Illinois Route 3 and to seek your input on the project.
Scheduling	This project is one of the projects tentatively included in our Fiscal Year XXXX Program, subject to the availability of funds.
Policy	It is the policy of the Illinois Department of Transportation to allow interested or affected persons an opportunity to comment on this project during the early stages of project development. Depending on the impacts generated from this project, other types of public involvement may result when warranted, such as a public meeting or a public hearing. Notices for these types of public involvement will be made available to the public.
Identify Property Affected	Based upon a review of the XXXX tax records of Some County, you are indicated to be the owner of the property located in the northeast corner of Illinois Route 1 and Illinois Route 2 as shown on the enclosed aerial photograph.
Describe Project	The proposed improvement generally consists of widening, resurfacing, rehabilitation, restoration, intersection channelization and traffic signal modernization. The intersection at Illinois Route 2 will be channelized to provide separate left-turn lanes and the traffic signal will be modernized. The roadway will be widened 4 ft (1.2 m) on both sides and curb and gutter provided. The proposed right-of-way that is to be acquired from your property for this improvement is indicated on the enclosed aerial preliminary plan sheet.

SAMPLE PROPERTY OWNER CONTACT LETTER

Figure 19-3.A
(1 of 2)

Reason for acquisition:	This right-of-way acquisition is needed to improve the corner turning radius at Illinois Route 2.
How to Comment:	Included in the packet is a response form to indicate your comments, if any. You may also request further discussions with us, either via the telephone or in an in person meeting. Please indicate the appropriate response and return one copy to us in the enclosed, self-addressed, stamped envelope. We would appreciate receiving any comments you may have by ___(*date*)___.
Acquisition Procedures:	Upon completion of our study, we will proceed with the plan preparation and land acquisition phase. In that phase, a representative of the Department will contact you regarding any necessary acquisition. Please note that your response, or lack thereof, will in no way influence the amount of compensation you will receive for your property if acquired as part of the project.
How to Get More Information:	If, after reviewing this letter, you have any questions or wish to arrange a meeting to discuss this improvement in more detail, please contact (Contact Person as assigned by district) at 312/884-4100. Very truly yours, Regional Engineer or District Program Development Engineer

19-3.03 Public Meetings

19-3.03(a) General

Public meetings are suitable for, but not limited to, more complex projects such as Federal Approved Categorical Exclusions (CE), projects following CSS, projects requiring a public hearing, or an EA/EIS project. These types of projects may be:

1. A small 3R project in an urban area but with several displacements;
2. A large 3R widening and resurfacing project on highway, or a major bridge replacement in a rural area;
3. A 3R project with several unusual circumstances;
4. An add lanes project (i.e., 2 to 4 lanes);
5. A bridge relocation on new alignment;
6. A road diet project being supported by the local agency(ies) through early project coordination (see Section 17-2.02(g));
7. A new intersection; or
8. Several small projects in localized area but proposed for a single construction season.

Public meetings provide an opportunity to assemble a large group at one time to discuss the purpose and status of the project, design, project impacts, alternatives (if any), and critical remaining decisions.

The meeting should be prepared for and conducted following the guidelines in Section 19-4.

19-3.03(b) Public Meeting Notice

Prior to the public meeting being held, regardless of format, a notice should be published in a newspaper near where the meeting is to be held, and other announcements should be made on social media, radio, television, and/or websites to encourage as much attendance as possible.

For content to include in the notice; see Section 19-4.01(c)

19-3.03(c) Public Meeting Formats

The following are different public meeting formats that may be used depending on the desired goal. Some of the formats may be used in the CSS process as well; see Section 19-5.

19-3.03(c)1 *Group Briefings*

Group briefings are informal meetings with special interest stakeholders and can be an effective means of both circulating information on a proposed project and gaining valuable input. If a group or organization invites district staff to attend a meeting to make a presentation or participate in discussions, the district is not subject to compliance with the *Open Meetings Act* for its involvement in the meeting. However, if the district initiates arrangements for meeting with a specific group(s) to discuss project issues, it may need to provide notice of the meeting in accordance with the *Open Meetings Act*. If the district makes staff available for presentations to some groups or organizations, it should be prepared to accept invitations from other groups or organizations if they desire a similar opportunity.

These meetings generally begin with a brief presentation by a member of the project team giving the background and goals of the proposed project, a summary of the work and decisions made to date, and a brief synopsis of the proposed schedule for completing the improvement. After this presentation, the meetings should be “open” for a question-and-answer period.

The following is a list of such stakeholders:

- Service clubs (e.g., Kiwanis, Rotary);
- Units of local government (e.g. city councils and/or county boards);
- Chambers of Commerce;
- Homeowners associations;
- League of women voters;
- Local and regional planning agencies;
- State elected officials in whose district the project is located;
- Environmental organizations;
- Minority organizations;
- Organizations representing persons with a disability; and
- Non-motorized users.

Where there may not be an existing organized group, a neighborhood leader may need to be identified, or meeting arranged by the district. For example, in neighborhoods without homeowners associations, a particular homeowner may agree to act as a leader and arrange for meetings and attendees to discuss the project with representatives of the Department. If this option is not available, the district may arrange a meeting in the neighborhood or community and invite homeowners, business owners, community leaders, etc., in small groups at different times to discuss the project.

This format has been used very effectively to gather data and ascertain community attitudes and values towards transportation projects, acquisition of properties, rerouting of traffic, interruption of services during construction, preservation of archaeological and historic properties, and the extent of concern for certain types of environmental and social impacts. Where a certain interest group may be impacted more severely than others by a project, a special meeting at a mutually acceptable time and place may be effective in gaining its understanding of the complexities of the issues, ascertaining the nature of possible resistance, and determining mitigation procedures which might resolve certain objections. Meetings of this type tend to diffuse organized opposition, especially when the opposition is based on non-factual data.

As a part of the group briefing format, use small displays and/or handouts to supplement the presentation as they may be used in facilities with limited space. Handouts containing basic project information will be useful for orientation and for future reference by attendees.

19-3.03(c)2 *Open House*

An open house offers the public an opportunity to meet with representatives of the district at a time and place that is reasonably convenient to discuss a proposed project. An open house may use any space that is readily available to the public and in the immediate area of the proposed improvement. Throughout the open house session, appropriate members of the district staff will be available to discuss the project with the public and answer questions.

An open house allows a large group of people to be able to learn about a project and ask questions in a short time. Also, the public can ask questions on a one on one basis, such as determining if there are any impacts to their property.

Section 19-4.02 discusses criteria for location and facilities suitable for an open house.

19-3.03(c)3 *Workshops*

Workshops are meetings where participants are given basic transportation requirements, economic and design constraints, and anticipated social, economic, and environmental impacts all related to a proposed project or project problem, and are then asked to study the problem and suggest a solution. In a workshop format participants are requested to analyze the provided information, identify impacts that may have been overlooked, work with others with whom they may agree or disagree, and offer solutions and explanations on their suggestions.

Workshops provide an opportunity for the public to fully understand the complexities and problems that confront Department personnel during project development. This enhances public understanding and appreciation of Department efforts. Because the public will be analyzing pertinent information, suggesting solutions to problems, and indicating preferences among impacts and tradeoffs, a sense of existing local values and preferred mitigation measures can be gained.

When workshops are announced in the news media, the announcements must clearly explain that those attending the meeting will be expected to participate in study groups. The announcement should also explain that formal comments or testimony will not be taken, but that other opportunities will be offered for that purpose. At the beginning of the meeting, the same information must again be clearly explained to those present.

Although not always controllable, workshop formats are generally more effective if the participants are limited to a number that can be divided into smaller groups of four to eight participants per group, and the number of groups is consistent with available space and manpower.

Because those attending workshops will be expected to participate for two to three hours, they must be scheduled at a time when attendees will have the time available. Weekday evenings or daytimes during weekends are the most effective. Workshop meeting places should have tables and chairs, good lighting, and other facilities appropriate for the work groups. School cafeterias are usually excellent facilities for workshops.

At the beginning of a workshop, the moderator should explain the goals and objectives of the session. If other activities have been scheduled subsequent to the workshop, those should also be announced so the participants will be aware of subsequent opportunities to comment on the project. The moderator should explain the project background to the workshop attendees. This includes an explanation of the project need, the basic constraints under which the project will be designed (economics and design criteria), the impacts that have been recognized to date, and any other information that may be pertinent to the scope of the workshop. This presentation must be concise because most of the available time should be allotted to problem solving and solution development. The opening presentation should generally be thirty minutes or less. Divide the participants into groups of four to eight people. Provide each group with the data and exhibits needed for its work and assign each group a resource person or group leader to answer questions and provide general guidance to the group. The leader may also exercise informal group control, act as group recorder, and report group conclusions. Each group will be expected to provide a recommendation and an explanation.

For workshops or other public involvement activities involving the formation of small working groups, certain practices can be applied to optimize the effectiveness of the working group process:

1. When explaining the purpose and role of the working group, emphasize that the group should function as a “horizontal” organization (i.e., members of equal standing) rather than a hierarchical organization. A horizontal organization will enhance the productivity, creativity, participation, and commitment among the group members.

2. The group must recognize and understand that, to be effective, it must have a common focus and agreement on *what* will be discussed and *how* the discussion will progress. Designation of a group facilitator is essential to accomplishing this objective. (Facilitators may be paid personnel hired by the Department or the project consultant.) The facilitator will serve as a neutral agent in the process who will function to keep the participants focused and on track in working toward agreement on specific issues, rather than allowing the group participants to attempt to address multiple issues simultaneously. He/she will direct the flow of discussion to promote open and balanced participation and will protect individuals and their ideas from personal attacks that can stifle participation. At the outset of the group’s formation, the roles and responsibilities of the facilitator and group members must be made clear so all understand how the group will function.

3. Designate a recorder for the group. Like the facilitator, the recorder will act as a neutral agent and will not judge the comments or suggestions offered by group members. The recorder will write down the main points and ideas expressed by the group in a format that can be viewed by all group members as discussions proceed (e.g., large sheets of paper on which the ideas and comments can be written). The recording of discussion points in full view of the group serves to focus attention and ensures complete and accurate documentation of the ideas and comments expressed. This "group memory" is important both for the efficiency of group meetings (e.g., it eliminates the need for group members to be preoccupied with the process of recording) and for reporting on the actions of the group.

The seating arrangement can affect small work group functioning. The recommended arrangement has the group members seated in a semicircle facing the facilitator and recorder. This helps to focus the attention of the group on the facilitator and the written record of comments and ideas. It also avoids placing any of the group members in perceived positions of authority (e.g., at the head of a table) relative to other members.

19-3.03(c)4 *Information Exchange (Citizen Working Groups/Advisory Committee)*

The districts may consider establishing an Information Exchange, see Figure Figure 19-3.D, to assist in identifying and focusing concerns and comments from a diverse array of interests. The Information Exchange involves the formation of Citizen Working Groups to analyze and react to project alternatives, impacts, and other project-related issues, and an Advisory Committee to serve as the focal point for receiving comments and recommendations from the Working Groups and to pass them to the Department.

Note: Information Exchanges are commonly used in CSS but are usually referred to as a Community Advisory Group (CAG) instead of a Working Group and Project Study Group (PSG) instead of Advisory Committee; see Section 19-5.

In using this approach, the district should discuss the expectations and rules of the exchanges and should state that this approach is not intended to make any final project decisions. Rather, the exchange will provide a forum for discussion and comment on various project-related issues. The following discussion presents an overview of the key elements of the Information Exchange process:

- Working Groups. In the Information Exchange process, Working Groups form the key mechanism for eliciting discussion and comment on the proposed project. These Groups are formed on the basis of common interests or stakeholders (e.g., public officials, resource and regulatory agencies, public interests, agricultural interests, development interests) and have the following primary objectives:

  + evaluating alternatives presented by the Department and discussing and commenting on impacts, analysis factors, and evaluation methods;

+ assessing the relative merits of the alternatives, identifying advantages and disadvantages of the alternatives, and suggesting ways to make the alternatives more acceptable; and

+ informing the Advisory Committee of the Working Groups' evaluations, assessments, concerns, and suggestions.

The issues and interests on a specific project will affect the nature and number of Working Groups that may be appropriate. As the initial step in establishing Working Groups, organizations and other interests likely to see themselves as potentially affected by the project should be identified and contacted to determine their interest in participating. The district may solicit interest through any of the various methods used for public involvement. For public officials or organizations representing specific interests, letters of invitation to those entities may be appropriate. For the public at-large, public meetings may be a more effective method of alerting potentially affected parties and determining interest.

At the organizational meeting for the Working Groups, the Information Exchange process and the objectives of the Working Groups and Advisory Committee can be further explained. In addition, the district can determine the membership in each Working Group, present and adopt Constitutions and Bylaws, and initiate selection of a Group chairperson and vice chairperson to represent the group on the Advisory Committee. Following the initial organizational meeting, the adoption of Constitutions and Bylaws, and the designation of chairpersons, the Working Groups can proceed with their activities and exchange information concerning Working Group and Advisory Committee meetings, project details and schedules, etc., through their representation on the Advisory Committee.

- Advisory Committee. The Advisory Committee may include two representatives from each of the Working Groups (the chairperson and vice chairperson of each Group), the Department of Transportation, the Federal Highway Administration, the project consultant, and others, as appropriate. The functions of the Advisory Committee include integrating the interests and values of the Working Groups into the planning process and advancing the objectives of the Information Exchange. The objectives of the Advisory Committee include the following:

  + providing policy direction for the Information Exchange;

  + evaluating alternatives for the project based on information provided by, but not limited to, public meetings/hearings; deliberations of Working Groups; consultant reports, as appropriate; and FHWA and IDOT inputs;

  + recommending alternatives for the project; and

  + If warranted, preparing a report to the Secretary of IDOT detailing the work of the Committee, including its recommendations and conclusions.

Tasks performed by the Advisory Committee in accomplishing its objectives will include actions such as:

+ evaluating the need for the project;
+ evaluating the social, economic, and environmental impacts of project alternatives;
+ serving as a communication link to the Working Groups and bringing their concerns to the decision makers (i.e., IDOT, FHWA, and public officials);
+ helping to resolve conflicts among various interests;
+ reviewing and making recommendations on the decision making process; and
+ assisting in educating the public about the proposed action and the decision making process.

See AASHTO Practitioner's Handbook 05 *Utilizing Community Advisory Committees for NEPA Studies*, December 2006, for additional guidance concerning the role of Community Advisory Committees.

19-3.03(c)5 *Virtual Public Meetings*

The Department may elect to hold virtual public meetings instead of in person meetings. If the project area or persons affected by the project lack reliable access to technology or internet service, then a virtual pubic meeting may not be feasible.

At minimum, a virtual public meeting must include the following:

- a public meeting notice that meets Section 19-4.01(c). The location of the meeting would be stated as virtual and include the website address.
- a method for the public to submit comments electronically for the project.
- the notice shall also contain a starting date and ending date of when official comments may be made a part of the public record (a minimum timeframe should be seven calendar days). Typically, it is assumed the starting time of the meeting is the starting date of when official comments can be received.
  - persons with limited internet access and/or require special accommodations under ADA should contact <insert contact name>, phone number and email address for further assistance.
- see Section 19-4.04(b) for information that should be included in the virtual public meeting.

The following considerations may assist the districts in implementing a successful virtual public meeting.

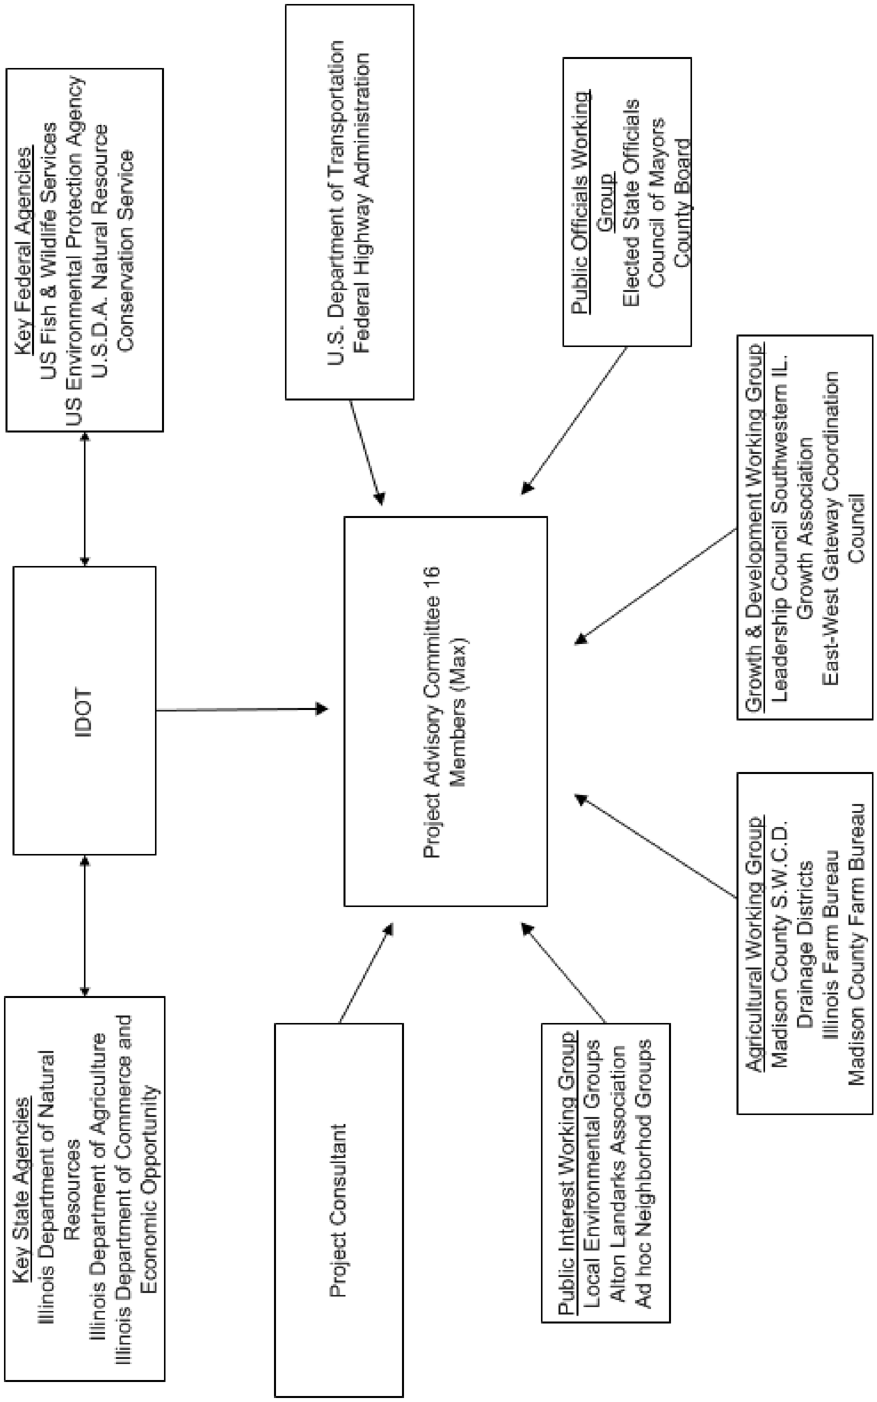
- publish public meeting notices on several social media sites (e.g. facebook, linkedin, twitter, etc.) as well as tradition newspapers. Ads on radio and television may be another option to get the public's attention. The meeting should be coordinated with the Office of Communication for use of social media sites during this process (See Order 14-8).

- host a virtual presentation of the project. The presentation should be available for streaming later if a live presentation was used for the virtual public meeting.

- a longer timeframe for the virtual public meeting (i.e. more than seven days) is recommended for larger and more complex projects.

- develop a brochure/pamphlet to be distributed that includes project information, project website, and it is suggested to have a pre-paid mailer included as part of the brochure/ pamphlet for the public to submit comments.

- in addition to the above considerations, the district should be mindful that these methods be accessible to ADA stakeholders included in the virtual public meeting process



EXAMPLE OF INFORMATION EXCHANGE PROCESS

Figure 19-3.D

19-3.04 Public Hearings

19-3.04(a) General

Federal requirements for public hearings are broadly defined in Federal regulations; see Section 19-2.01. State requirements are more specific; see Section 19-2.02. In order to have a consistent public hearing process, the Department has developed procedures for when a public hearing is warranted under Federal or State law. The procedures consider the category of action and how it intersects with public hearing requirements.

19-3.04(b) Procedures

19-3.04(b)1 *Environmental Impact Statement (EISs)*

A public hearing is required for all EISs. The timing is discussed in Section 25-2.19.

19-3.04(b)2 *Environmental Assessment (EAs)*

A public hearing is required for all EAs. The timing is discussed in Section 24-2.16.

19-3.04(b)3 *Categorical Exclusions (CEs)*

1. Federal Approved CEs. Projects that have one or more potential for unusual circumstances, see Section 23-1.04(b), may approach the threshold of requiring a public hearing. In general, these will be 3R projects where a major amount of right-of-way is required or the function of the highway is altered. Examples of these project actions may include but are not limited to:

    - the relocation of an existing marked route from one street to another which did not previously carry marked route traffic, with or without additional right-of-way.
    - the changing of a route to a one-way couple which will use a street that did not previously carry marked route traffic, with or without additional right-of-way.
    - the reconstruction of an existing marked route with additional through traffic lanes, included because a reasonable alternative would be a bypass or one-way couple.

    If the district is unsure about whether or not a Federal approved CE may warrant a public hearing, the district should discuss with FHWA at a district coordination meeting.

2. State Approved CEs. Pursuant to CE Agreement, projects on the 23 CFR 771.77(c) and 23 CFR 771.117(d) list may not have potential for unusual circumstances and the likelihood of a State approved CE involving a Federal requirement discussed in Section 19-2.01 is extremely small, especially for SMART or 3P projects.

    If the district is unsure about whether or not a State approved CE may warrant a public hearing, the district should discuss with FHWA at the district coordination meeting.

19-3.04(c) Public Hearing requirements

FHWA regulations in 23 CFR 771.111(h)(2)(iii) require the Department to provide a public hearing(s), or the opportunity for hearing(s), for Federal-aid projects as discussed in Section 19-2.01.

The district may either offer to hold a public hearing and determine if there is sufficient interest based on the response, or may hold a public hearing.

When a public hearing will be offered, the offer of the public hearing must be done with proper timing and shall include the language required by Federal regulation; see Section 19-3.04(d).

When a public hearing was offered but not held, certification of the offer shall be submitted to FHWA.

When a public hearing will be held, the following shall be met:

1. The public hearing notice shall include applicable language in Section 19-3.04(e).
2. The format of the public hearing should be appropriate for the project; see Section 19-3.04(f).
3. The items in 23 CFR 771.111(h)(2)(v) shall be explained at the hearing, as appropriate.
4. A transcript and a certification that a public hearing was held shall be submitted to FHWA; see Sections 19-3.04(g) and 19-3.04(h).

19-3.04(d) Offer of Public Hearing

19-3.04(d)1 *Timing*

When the district, in consultation with FHWA, determines that an offer for hearing(s) will be afforded for a project, the requirements shall be satisfied by publishing an offer notice in a local newspaper.

The offer of a public hearing need *not* be announced by a legal notice in the legal notice section of newspapers. Public hearing offers can be announced by use of paid advertisements in newspapers and may be supplemented by radio and TV announcements, posters, the project website, social media, or other means. Legal notices may be used if it is the only means to ensure verbatim publication and specified timing. The size of paid advertisements should be sufficient to attract attention and to contain the information that is necessary.

The district should publish the offer notice at least twice, approximately one week apart. More than two notices may be published if it is considered necessary to provide adequate coverage of those affected by the project. Publish the notice of the offer in at least one newspaper of general circulation in the vicinity of the project. If a notable segment of the local population is non-English speaking and there is a foreign language paper serving the area, it should also be used to carry the notice. The deadline for requesting a public hearing shall be at least 21 days after the notice first appears in a newspaper.

19-3.04(d)2 *Content*

See Section 19-4.01(c) for content to include in the public hearing offer.

Figure 19-4.B presents an example of a typical offer of a public hearing.

19-3.04(d)3 *Determination of Sufficient Interest*

If there is a request, or requests, to hold a public hearing, then the Regional Engineer will determine if there is sufficient interest to hold a public hearing. If a public hearing is determined to be necessary, follow Section 19.3.04(f) requirements.

If the Regional Engineer determines there is not sufficient interest, then the district shall contact each requestor by certified mail with return receipt and inform them of the lack of sufficient interest in the public hearing and advise the requestor that comments are welcome. If a personal contact is made, the district shall record comments during the contact. If the contact is by certified mail, the district shall include a stamped, self-addressed envelope and a name, telephone number, email, fax number, and telecommunications device for persons with hearing and speech impairments (TTY) number for returning comments. Use the fax number for the Regional Engineer's office and the district's TTY number.

19-3.04(e) Public Hearing Notice

When a public hearing is to be held, the district shall publish a notice in a local newspaper, on Department websites, and on other social media.

19-3.04(e)1 *Publishing Frequency*

See Section 19-4.01(d) for publishing public notice frequency.

19-3.04(e)2 *Content*

See Section 19-4.01(c) for content to include in the public hearing notice.

An example of a public hearing notice is shown on Figure 19-4.C.

19-3.04(f) Public Hearing Formats

19-3.04(f)1 *General*

Public hearings often involve a larger gathering compared to other public involvement activities. When an exceptionally large attendance is expected, it may be desirable to conduct several activities concurrently. If separate rooms are available at the hearing facility, a special room may be used for receiving testimony from persons having prepared statements for the record and who are not interested in attending the entire hearing. After the presentation is complete, comments can be recorded in the main hearing room also making two recorders available for statements. If such a process is used, it should be announced both prior to and at the public hearing and indicate that both recordings will become an official part of the record. Although some duplication of comments may occur, the shortening of the time involved at the public hearing may make the duplication acceptable.

Many of the comments expressed at public hearings concern right-of-way acquisition. The district may address these concerns by establishing a separate room or discussion center staffed with Land Acquisition personnel to dispense general information and to discuss property acquisition procedures, relocation assistance programs, and effects on individual properties. By satisfying property-related questions prior to or during the presentation, this may minimize the number of comments raised during the public hearing. Because Land Acquisition personnel should generally be available throughout the hearing, the separate, integrated use of such personnel is both effective and efficient.

The choice of the public hearing format should fit the project. The three types of format discussed below are the formal public hearing, open house public hearing, and hybrid public hearing.

Regardless of the type of format used and in accordance with 23 CFR 771.111(h)(2)(v), when a public hearing is held, the following information should be explained:

- the project's purpose, need, and consistency with the goals and objectives of any local urban planning;
- the project's alternatives and major design features;
- the social, economic, environmental, and other impacts of the project;
- the relocation assistance program and the right-of-way acquisition process; and
- the Department's procedures for receiving both oral and written statements from the public.

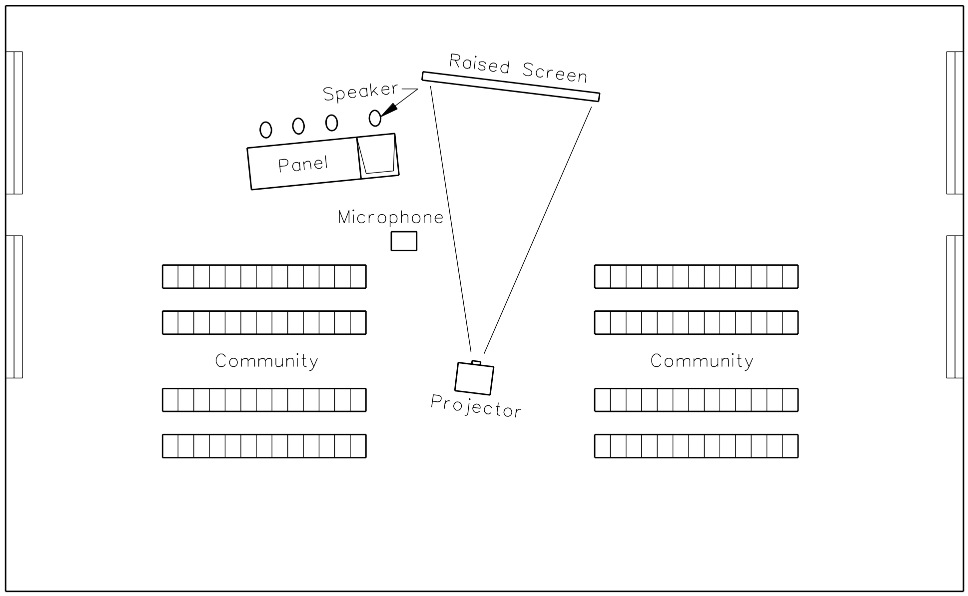
Public hearings generally require considerable time for preparation of displays and electronic presentations. The need for a video presentation and the possible need for outside media services for the development of electronic presentations may require additional lead time. The displays for the individual discussions do not necessarily need to be large because they will generally be viewed from relatively short distances. The hearing may include aerial photography with superimposed design and location features, but preliminary plan and profile sheets may also be suitable. Where visual impacts are a major concern, the district may wish to also provide exhibits produced through video imaging, computer imaging, or photomontage, which depict how alternatives will look in the project setting.

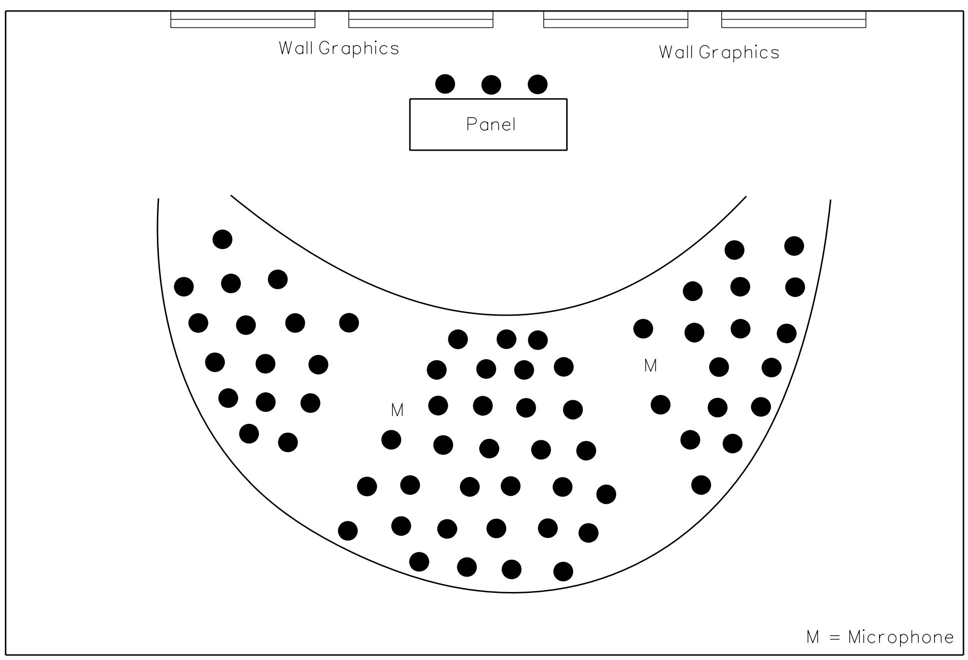
19-3.04(f)2 *Formal Public Hearing*

A formal public hearing is where a speaker(s) directly addresses the audience via a presentation and a court reporter is present to transcribe the hearing. After the presentation, members of the audience have an opportunity to address the speaker(s) publicly; see Figure 19-3.E.

This type of format can discourage participation by certain persons or groups that are intimidated by the formality and size or make-up of the audience. Conversely, formal public hearings may attract individuals that are seeking a forum, which often includes press coverage, to present their views on transportation matters or a variety of other topics. As such, the moderator may need to caution attendees occasionally to restrict their comments and statements to the project and may need to suggest a time limit for each commenter to discourage individuals from attempting to monopolize the comment period. Whatever timeframe is utilized (e.g. 5 minutes, 3 minutes, 2 minutes) the moderator must clearly state such timeframe at the beginning of the hearing and impose the same timeframe for each commenter. The notice should also include any time constraints for public testimony during the comment period.

The presentation opening the formal public hearing should normally not exceed 30 minutes and in no case should it exceed 45 minutes. The district staff should carefully develop the discussion and highlight important points because time is limited. See Section 19-4.04 for further information on the development of presentations.





FORMAL PUBLIC HEARING FORMAT

Figure 19-3.G

19-3.04(f)3 *Open House Public Hearings*

The open house public hearing format is an alternative to the formal public hearing format and may also be used wherever a public hearing is required or appropriate. It remains necessary, however, to have appropriate Department representatives present, to provide explanatory project information, to provide for the receipt of oral and written statements, and to prepare a transcript of the proceedings.

The open house public hearing format provides for a continuous flow of visitors over a period of hours in contrast to a formal public hearing that attracts a large crowd at a fixed time. The smaller number of visitors present at any given time at an open house public hearing allows personalized service through authorized IDOT staff and their consultants. The open house hearing format is less intimidating to participants and offers a more workable option for conducting hearings for large audiences.

Open house public hearings generally involve four separate activities:

1. The first is the greeting station. Here, staff members greet the public, advise them about hearing procedures, distribute handouts, obtain names and addresses, and note the opportunity to submit oral and written statements. The handout may include forms for submitting written comments during or after the meeting. While it is encouraged to ask names and addresses and have a sign-in sheet, it is not required.

2. Next, the visitors are directed to a presentation of general information about the project to orient them on the purpose of the project, alternatives under consideration, and the potential impacts. This is best accomplished by electronic means such as a video that can be repeated without variance.

3. The district staff directs the visitors to an area with displays and staff experts for small group or individual discussions on specific questions or concerns. A variety of disciplines should be represented so virtually any question can be addressed. Members of the public are free to remain in this area as long as necessary to obtain the information they desire. Staff members should remind visitors of the opportunity to submit comments at the conclusion of discussions.

4. The final activity is an opportunity to give oral comments to recorders or prepare and submit written comments. After completing their comments, visitors are free to leave. A typical setup for an open house public hearing is shown in Figure 19-3.F.

19-3.04(f)4 *Hybrid Public Hearing*

The hybrid public hearing format combines elements of the open house public hearing format with a formal public hearing format. The hybrid public hearing format should be used to the maximum extent practical.

The advantages of the hybrid public hearing format include the ability to engage the public through the open house format while offering a formal opportunity for individuals to express their views in a public forum and also hear the views of their fellow citizens. Additionally, the hybrid format may protect the project from legal challenges related to the use of the open house format alone.

There are a several methods that the districts may use to allow the public to express their views publicly. The following are some examples for the districts to consider and are encouraged to explore other methods for accomplishing the goal of giving the public a forum to express and hear views from their fellow citizens at a specified time:

- asking questions – The public is given an opportunity to ask questions and the project team gives the answers. One option is for the district to allow the public to ask the questions directly to the project staff, who immediately responds in the public forum. Another option is to collect questions from the public on written cards and have the project staff read the questions and answer them. This allows the project staff to collate similar comments and remove some of the emotion from the question and answer process.

- formal comment with time limit – The public is given an opportunity to express their views publicly. The project team may limit the amount of time each speaker is given if there is a large quantity of speakers. The project team should decide ahead of time and make it clear to the public how comments will be responded to. For example, the project team may choose to respond to each comment after it is made in public, or they may choose to address comments later in writing as part of the comment/response period.

- conversation tables – A variety of tables are setup with each table having a different topic for conversation, with at least one project team member available at each table. For example, topics could include property acquisition, historic properties, natural resources, community resources, etc. Members of the public can sit at the table with a topic they are interested in and engage in conversations with other members of the public and the project team members.

A separate room is also desirable for the formal opportunity for the public to express their views.

19-3.04(g) Transcripts

A court reporter is the preferred means to meet the requirement of having a transcript from the public hearing. If a court reporter is not available, the public hearing shall be recorded using a digital recorder. A transcript shall be made from the digital recording.

To ensure coverage, some districts have used both electronic recorders and court reporters. If a digital recorder is used, a backup recorder should be available in case of malfunction. If an activity is scheduled that may last an extensive period of time, it may be necessary to arrange for more than one court reporter so they may operate in alternating shifts to maintain alertness.

For any public hearings, the transcript will consist of a copy of the handout, the attendance list, all written comments received, a written copy of the narrative from the general information presentation, and a written copy of the verbal comments recorded by the court reporter.

19-3.04(h) Certification

In accordance with 23 CFR 771.111(h)(2)(vi), IDOT must certify in writing to FHWA that a public hearing was offered or held. This certification shall include the following, as applicable:

- A letter certifying that a public hearing was held or that a public hearing was offered (but not held).
- If a public hearing was held, include the transcript of the public hearing, along with copies of all written statements received during the hearing and during the public comment period.

Figure 19-3.H is an example letter that may be used to satisfy this requirement. The letter should address the bullet points as appropriate.

FHWA Illinois Division
3250 Executive Park Drive
Springfield, Illinois 62703

<insert project Information>

Public Hearing Certification

This letter certifies the following to be true:

The opportunity for a public hearing was offered and the offer was published on <*insert date*> in the <*insert newspaper's name*>. Based on the public's response there *was/was not* sufficient interest in the public hearing (*remove previous paragraph if there was no offer*).

OR

The public hearing notice was published on <*insert 1st publication date*> and <*insert 2nd publication date*> > in the <*insert newspaper's name*>.

A public hearing was held on <*insert date*.> at <*insert location*>.

Transcripts of the public hearing and a copy of all written statement from the public hearing and public comment period are attached per 23 CFR 771.111(h)(2)(vi) for FHWA review.

Figure 19-3.I

19-3.05 Public Engagement

The following activities may be useful for gathering additional input from the public, or providing information to the public, but do not involve face-to-face interactions like public meetings or hearings. These activities are not intended to replace other public involvement activities but may be used to increase public awareness of projects and upcoming meetings/hearings. This section presents a list of ideas that may be utilized. The district can best determine what types of public engagement works for their stakeholders:

- social media (facebook, twitter, etc.);
- newsletters, brochures, and handouts;
- television and radio ads;
- electronic signs; or
- internet sites.

19-4 PLANNING AND IMPLEMENTING THE PUBLIC INVOLVEMENT ACTIVITY

This section discusses the overall process for planning and implementing the public involvement activity, whether it is a public meeting or a public hearing. The district must carefully prepare and develop the public involvement activity not only to attract and hold the public's attention but also to create a comfortable atmosphere for discussion of highway projects.

19-4.01 Stakeholder Engagement

After the type of public involvement activity has been determined, the district must decide to whom (stakeholders), when, and how the information will be transmitted to the public to make sure interested individuals and organizations are aware of the opportunity to provide input on the project.

19-4.01(a) Stakeholder Identification

The district must determine which groups or sectors will be contacted and what means or media are most appropriate. When identifying groups to be notified, consider several general categories:

- those who live in the geographic area of the project.
- groups who are known to be or are likely to be affected by property acquisition.
- potential users of the facility.
- commuters who will likely be concerned with the effect of alternative routing both during and after project construction.
- owners of businesses along a route who may be concerned about ingress/egress.
- resource and regulatory agencies that may have an action or authority over the proposed project.

Other groups may be singled out for attention because of special communication needs. This sector could include ethnic neighborhoods, low-income neighborhoods, elderly people, non-English speaking individuals, and persons with disabilities.

19-4.01(b) Notification of Involvement Activities

Once the proper recipients of project information and interaction have been identified, the next action is to determine the most appropriate means of announcing the involvement activity. It is not necessary to publish legal notices of upcoming activities, although it is the most defensible method for documenting public notice, particularly when it is a public hearing. Paid advertisements in newspapers and on radio and television are acceptable and frequently more effective. Where local news media are reluctant to carry such advertisements, a legal notice may be one means of ensuring verbatim publication and specified timing. For an announcement in a newspaper to be effective, it must be strategically located and of sufficient size to attract attention. It may also be necessary to advertise notices in more than one newspaper or on more than one radio or TV station to provide adequate coverage.

In predominantly ethnic or non-English speaking neighborhoods, it may be appropriate to publish a notice in a foreign language newspaper. Newsletters of various clubs and organizations may also provide an effective means of notifying specific groups. A local chapter of a State or national association, a church, the Chamber of Commerce, or a service club may publish periodic newsletters and may be agreeable to including announcements of upcoming public involvement activities free of charge. Translations of notices and project documents should be made available when large numbers of non-English speaking residents will be affected by the project.

It may be appropriate to place posters or to distribute handouts or pamphlets on street corners in neighborhoods that are likely to be affected. Announcements of upcoming activities may be mailed to anyone on established mailing lists or to anyone who has shown an interest in the project or in highway projects in general. If low-income and/or minority populations will be affected by the proposed project, special efforts to announce public involvement activities may be necessary. In accordance with the Executive Order 12898 “Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations,” and the the public involvement process must be thorough and fully inclusive. It may be necessary to distribute pamphlets or project notices door to door for residents or place notices in churches or other community centers.

Appearances on radio and TV talk shows are also effective in many communities. Copies of all notices announcing upcoming public involvement activities shall be kept in the project file. A copy should also be forwarded to the Department’s Office of Communications for their use.

Public involvement activities should be advertised via the news media, posters, mailing lists, or other media as needed. General announcements are not normally required with presentations to specific groups and other activities which the general public is not expected to attend; instead, a group requesting a presentation will arrange for attendance. When the district initiates the presentation, it will arrange for attendance through appropriate invitations. There may be occasions where the group involved will release the results of these meetings to the media. Clubs or other special interest groups may have a standard practice of issuing a news release summarizing the activities and programs that occur at their meetings. Occasionally, the district may announce the results of certain non-public activities. For example, the results of opinion polls or questionnaires may be of interest to the general public and appropriate for general release.

However, pursuant to 23 CFR 771.111(h)(iv) notices for public hearings have specific requirements addressed in the following section.

19-4.01(c) Public Notice Content

19-4.01(c)1 *General Content*

In general, the notice should:

- discuss the date, time and location of the meeting/hearing,
- discuss the purpose of the meeting/hearing and the format to be used,
  - + if an open house format will be used, the notice should specifically state this and mention both the features of the open house and that all information and presentations will be available throughout the time period specified.
  - + if a hybrid format will be used, the notice should state this and specifically describe that all information and presentations will be available throughout the time period specified and that a formal opportunity will be offered to publicly express views at a specific time.
  - + if a formal format will be used, the notice should specifically state this and give the time that the formal presentation will be made and that an opportunity to provide comments on the project will occur following the presentation.
  - + If a virtual format will be used, the notice (Figure 19-4.A) should include a website instead of a physical address where a project information and or presentation can be viewed.
- include a description of the proposed improvement,
- state that all interested persons (i.e., stakeholders) are invited to attend and participate and should also state that district personnel will be present to receive input, provide information, and answer questions,
- include project website, if available (this should be standard practice for virtual public involvement activies),
- the time limit available to submit a request,
- information concerning the preparation and availability of EIS, EA, or CE, if applicable,
- include a map showing the location of the improvement, if feasible,
- discuss applicable laws, regulations, or executive orders for specific issues that may be involved with the project; see Section 19-.4.01(c)2,
- for in-person meetings explain that the location is accessible to person with disabilities; however individuals in need of special accommodations or assistance should contact the department at least 5 days before the meeting,

- include contact information:
  + fax, email, phone (including TTY) for the Regional Engineer in the body of the notice.
  + a contact person and telephone number from the Office of Communications in the upper right-hand corner.

19-4.01(c)2 *Public Notice Legal Content*

Whether it is an offer of a public hearing, or a notice of a public meeting/hearing, pursuant to 23 CFR 771.111(h)(2)(iv) the notice will indicate the availability of explanatory information and provide information required to comply with public involvement requirements of other laws, Executive Orders, and regulations. Example legal language for some specific issues which may be involved in the project is included below:

- *EA/EIS:*

  This offer/hearing will provide an opportunity for the public to provide comments on the proposed EA/EIS and provide comments regarding potential impacts to the resources discussed below. IDOT is requesting these comments to assist in the project decision making and consultation with resource agencies.

  + Corridor Protection (if applicable, see Section 19-2.02(b)):

  This hearing will afford an opportunity to provide input on the location and approximate widths of right-of-way needed for certain future additions to the highway system in accordance with the Illinois Highway Code, 605 ILCS 5/4 510..

  + Relocations:

  When individuals or businesses will be relocated due to a Federally funded project, state that right-of-way acquisition and relocation assistance information will be available as required by the Uniform Relocation Assistance and Real Property Acquisition Regulations for Federal and Federally-Assisted Programs, 49 CFR 24.

  + Section 106:

  List known historic resources that may be affected by the proposed project and the historic resources protection process, pursuant to Section 106 of the National Historic Preservation Act of 1966.

  + Parks, Recreation Areas, and Refuges (Section 4(f) de minimis impact):

  The proposed project would involve use of land from the city park. Approximately two out of forty acres included in the park would be converted for highway use. The two acres would be taken from the northeast edge and would not affect the park's activities, features, or attributes that make the property eligible for Section 4(f) protection. Through publication of this notice, the Department is requesting the public's views on the proposed use of parkland, and on FHWA's intent to make a Section 4(f) de minimus determination.

+ Floodplains (Executive Order 11988 Floodplain Management):

In accordance with the Executive Order 11988, Floodplain Management, the environmental document (EA or EIS) describes impacts to the floodplain. The comment period on the environmental document (EA or EIS) is the opportunity for early public review of the proposal for action in the floodplains. The proposed project will impact X acres of floodplain (describe floodplain and location). Accordingly, IDOT is providing the public an opportunity to comment on the potential floodplain impacts.

A statement concerning permits for construction in a regulated floodway is required for District One projects that are outside of Chicago. The Illinois Department of Natural Resources – Division of Water Resources Management (IDNR-DWRM) has delegated authority to IDOT to issue permits under the IDNR- DWRM (17 Ill. Admin.. Code 3708) rules for floodway construction in Northeastern Illinois for certain projects like bridge and culvert replacements. Example*, One alternative under consideration involves a potentially significant encroachment on the Salt Creek flood plain. The Department will process a Permit for Construction in a Regulated Floodway for the replacement of the bridge over Salt Creek.*

+ Project Level Conformity Analysis (Pariculate Matter $(PM)_{2.5}$ Hot Spot):

Pursuant to 40 CFR 93.105(e), IDOT and FHWA are seeking public comments on the project level hot spot analysis for $PM_{2.5}$. In compliance with air quality conformity requirements, a quantitative hot spot analysis has been prepared for this project and is included in the environmental document (EA/EIS) and is available for public review and comment.

19-4.01(d) Public Notice Publishing Frequency

19-4.01(d)1 *Public Notice Publishing Frequency for Public Hearings*

The public hearing shall be subject to a minimum of two notices to the public. More than two notices may be published if a special effort is needed to ensure an adequate public response or if there is considerable public interest in the project. However, the number of days prior to a public hearing are different for EISs versus EAs and CEs.

- The first notice of a public hearing on a project requiring an EA or a CE shall be published at least 15 days in advance of the public hearing.

- The first notice of a public hearing on a project requiring an EIS shall be published at least 30 days in advance of the hearing.

- In all cases, the second notice shall be published 3 to 7 days before the activity. If notices in addition to the two required notices are beneficial, they may be scheduled up to 2 months ahead or during the week preceding the involvement activity.

The unique circumstances surrounding a particular project may affect the timing of notices. If a project requiring an EA or a CE is known to be controversial or the subject of organized opposition, the district should consider extending the minimum 15-day public hearing notice timing.

19-4.01(d)2 *Public Notice Publishing Frequency for Public Meetings*

While there are no formal legal requirements for when and where public notices for public meetings should be published, the publishing frequency of the notice should occur in advance of the public meeting and should be frequent enough to engage the public.

19-4.01(e) Public Notice Examples

The following page has an example for each of the following:

- Public Meeting Notice, Figure 19-4.A
- Public Hearing Offer, Figure 19-4.B

Public Meeting
Scheduled by
Illinois Department of Transportation
For Improvement of US Route 52 near Central City

The Illinois Department of Transportation (IDOT) announced today a public meeting has been scheduled for September 22, 2017 from 7:00 P.M. to 9:00 P.M. in the Central City High School Gymnasium for the purpose of discussing the improvement of US Route 52 from its intersection with Main Street east to the corporate limits of Central City. All persons interested in this project are invited to attend the meeting.

The meeting will be conducted on an informal basis with project displays and other other information available for viewing. IDOT representatives will also be available to explain the project, answer individual questions and record comments offered by those in attendance.

One alternative under consideration involves a potentially significant encroachment on the Salt Creek flood plain. Preliminary reports, including an environmental assessment and an engineering analysis with drawings, maps, and aerial photography, will be available for inspection and viewing during the entire time the IDOT representatives are present. This same material currently is available for review and inspection at the district office.

This meeting will also serve to involve and obtain the views of the public about potential project impacts to: (*see Section 19-3.04(e) & insert as appropriate*).

The location of the meeting is accessible to persons with disabilities. If special accommodations or assistance are needed, please contact the individual listed below by September 17, 2017.

For more information, contact George Robertson, Regional Engineer, 1200 East Main Street, Richland, Illinois 62673, telephone 416/343-6420, fax 416/343-6414, TTY 217/524-4875.

PUBLIC MEETING NOTICE EXAMPLE

Public Hearing Offer
by
Illinois Department of Transportation
concerning
Improvement of US Route 52 near Central City

The Illinois Department of Transportation (IDOT) is proposing to improve US Route 52 from its intersection with Illinois Route 1 to its intersection with Main Street in Central City. The project will consist of reconstructing the existing two-lane pavement to provide four lanes, two in each direction, separated by a 14-foot painted median. The project will include the signalization of the intersections of US Route 52 and Illinois Route 1 and US Route 52 and Main Street. Curb and gutter and underground drainage will be provided as a part of this project. Alternatives under consideration have potentially significant impacts to Moore's Slough, approximately 0.5 miles east of Illinois Route 1. IDOT has prepared an Environmental Impact Statement (EIS) for the project in accordance with the National Environmental Policy Act of 1969 and this public hearing is being held to address requirements of 23 U.S.C. 128 and 139, and the Council on Environmental Quality regulations.

This meeting will also serve to involve and obtain the views of the public about potential project impacts to: (see Section 19-4.01(c)(2)).

Any interested person who believes a public hearing should be held for this project may request that a hearing be held by contacting George Robertson, Regional Engineer, 1200 East Main Street, Richland, Illinois 62673, telephone 416/343-6420, fax 416/343-6414, TTY 217/524-4875. To be considered, requests must be received by September 23, 2017. A hearing will be held if the public demonstrates sufficient interest.

Maps, drawings, aerial photography, the Environmental Assessment and other information are available for viewing and inspection by the general public in the district office at the above address. If additional information is desired, contact the Regional Engineer.

PUBLIC HEARING OFFER EXAMPLE

Figure 19-4.B

<insert contact name(s) and number(s)
for the Office of Communications>

Public Hearing
Scheduled by Illinois Department of Transportation
For Improvement of US Route 52 near Central City

The Illinois Department of Transportation (IDOT) announced today an open house public hearing has been scheduled for 7:00 P.M. on September 22, 2017 in the Central City High School Gymnasium Central City, Illinois for the purpose of discussing the improvement of US Route 52. The project limits are from the intersection with Main Street east to the corporate limits of Central City. The project will consist of reconstructing the existing two-lane pavement to provide four lanes, two in each direction, separated by a 14-foot painted median. The project will include the signalization of the intersections of US Route 52 and Illinois Route 1 and US Route 52 and Main Street. Curb and gutter and underground drainage will be provided as a part of this project. IDOT has prepared an Environmental Impact Statement (EIS) for the project in accordance with the National Environmental Policy Act of 1969 and this public hearing is being held to address requirements of 23 U.S.C. 128 and 139, and the Council on Environmental Quality regulations.

All persons interested in this project are invited to attend the meeting to express their views and comment on the project. This hearing will also serve to involve and obtain the views of the public about potential project impacts to: (see Section 19-4.01(c)(2).

Beginning at 7:00 P.M. a brief presentation on the status of the project, the proposals under consideration, and the decisions to be made. Representatives of the IDOT will be available from 6:00 P.M. until the presentation and also after the presentation to discuss the project. An opportunity will be made available for participants to comment on the project and these verbatim comments will be made part of the public record. The presentation will address topics such as the need for the project, the design alternatives under consideration, right-of-way acquisition and relocation assistance, and the tentative construction schedule.

Project documents, including an environmental impact statement and an engineering analysis with drawings, maps, and aerial photography, will be available for inspection and viewing during the entire time the IDOT representatives are present. This same material currently is available for review and inspection at the district office at Richland.

The location of the hearing is accessible to persons with disabilities. If special accommodations or assistance are needed, please contact the individual listed below by September 17, 2017.

For more information, contact George Robertson, Regional Engineer, 1200 East Main Street, Richland, Illinois 62673, telephone 416/343-6420, fax 416/343-6414, TTY 217/524-4875.

PUBLIC HEARING NOTICE EXAMPLE

FIGURE 19-4.C

19-4.02 Location and Facility Selection

A critical aspect of planning the public involvement activity is the selection of an appropriate location(s) and facility(ies). Several criteria must be considered.

19-4.02(a) Number of Locations

The number of locations should be based on the geographic area affected by the project, the availability of adequate transportation for those affected, and reasonable travel distances for the public expected to attend the involvement activities. In rural areas, it may be necessary to hold public involvement activity in each county traversed by the project.

In urban areas, the determination of needs is more difficult. In low-income neighborhoods, many persons depend upon public transportation. Accordingly, it may be a burden for these individuals to attend involvement activities outside of their immediate neighborhood. Residents of racial minority or ethnic neighborhoods may be reluctant to travel outside their neighborhood, especially to another racial or ethnic neighborhood. Where minority or ethnic neighborhoods are of considerable size, it may be appropriate to hold individual involvement activities in each affected neighborhood. Where neighborhoods are relatively small and without apparent mobility problems, it is usually appropriate to hold one involvement activity for multiple neighborhoods.

19-4.02(b) Selection of Facility

When selecting the facility(ies) where public involvement activities will occur, consider the following:

- During their normal activities, do residents of the area affected by the project normally travel the distances that will be required to attend the public involvement activity?
- Is transportation available to those interested for travel to the facility during the time the involvement activity is scheduled?
- Are there any social impediments that could affect travel to the area or neighborhood scheduled for the involvement activity?

Other criteria that should be considered when selecting a facility for a public involvement activity are listed below. Most are self-explanatory; however, the discussion of individual formats in Section 19-3 offers some insight into the application of these criteria:

- size and capacity,
- availability of the facility and/or equipment,
- comfort,
- cost,
- parking,
- accessibility for persons with disabilities, and
- acceptability to all segments of the public.

Title II of the Americans with Disabilities Act (ADA) requires all of the programs and services provided by the Department be accessible to all individuals. As a result, potential public involvement sites must be reviewed to ensure they meet accessibility standards.

19-4.02(c) Examples of Suitable Locations

<u>Presentations for Groups</u>:

- organization's regular meeting place,
- community or civic center,
- schools,
- churches,
- restaurant,
- motel or hotel meeting rooms,
- private company meeting rooms or offices, and
- district office.

<u>Open House</u>:

- school gymnasium or cafeteria,
- hotel/motel conference room,
- church meeting room
- storefront building,
- courthouse rotunda,
- central area of shopping mall,
- civic center,
- Chamber of Commerce meeting room,
- City Council chambers,
- judicial courtroom, and
- district office.

<u>Workshops</u>:

- school cafeteria or classroom,
- church meeting room,
- hotel or motel meeting rooms,
- restaurant (during off-peak hours),
- civic center, and
- service club meeting hall.

<u>Public Meetings and Public Hearings</u>:

- schools (gymnasium, auditorium, cafeteria, or classroom);
- church meeting room;
- civic center;

- City Council chambers;
- judicial courtroom;
- service club or other social club meeting hall; and
- any meeting hall generally used by the public.

19-4.02(d) Inspecting the Site

Before district personnel begin the preparation of exhibits and presentations, inspect the selected meeting site. A rough drawing of the shape of the room(s), noting the approximate dimensions may be helpful. Note other features such as stage location, projection room, light switches, electrical plug-ins, public address (PA) equipment (mixing console, microphones, microphone jacks, cables, and speakers), entrances, and emergency exits. The person(s) conducting the inspection of the meeting site should also note whether there are other rooms available for possible use for recording public statements or in answering individuals' questions concerning right-of-way, relocation, acquisition, etc.

The person(s) conducting the inspection should examine any equipment that the facility will provide to ensure that it is in good working order and that district personnel are familiar with its operation. PA equipment and projectors should be provided special attention. At the time of the site visit, if practical, discuss with the facility manager arrangements for setting up tables and chairs and for bringing equipment to the meeting room on the day(s) of the involvement activity.

When conducting the site inspection, the district representative(s) also should evaluate whether signs will be needed outside or inside the meeting facility to direct participants to the involvement activity.

19-4.02(e) Preparing the Meeting Site

When all personnel have reached the site and have set up the equipment supplied by the district, make a final check to ensure that all equipment, especially any furnished at the site, is operational (such as the PA equipment for the sound quality and function). Set up a table at each entrance that will be used for access into the meeting room. The table(s) should be used for registering attendees and for distributing printed materials. Assign personnel to each table to handle the registration and to direct attention to the available handout materials. Entrances not used for the meeting should be locked and signed (but be mindful of emergency evacuation procedures). Place other signing, as determined necessary, at the meeting location. Set up displays as previously planned and orient them with North in the same direction in each. As applicable, the district may have security personnel at the meeting site, before, during, and after the meeting.

19-4.03 <u>Preparations at the District</u>

During the course of developing a public involvement program, the district generally will have gained some insights on the profile of the potential audience. The knowledge of which sectors of the public are likely to attend, what they are likely to expect, and their likely positions may be helpful in selecting a format for the involvement activity that will be most effective.

The notices of upcoming public involvement activities will instruct persons with a disability needing special accommodations to contact the district by telephone, in writing/e-mail, fax, or by TTY to advise of their anticipated attendance and any special needs. If interpreters for hearing-impaired persons or materials for visually impaired individuals have been requested, make every effort to provide the requested services. The district may prepare recordings of printed materials when Braille materials are not available or not acceptable.

If the involvement activity will include a period for questions or informal discussion, the district staff responsible for providing information at the activity should be prepared to respond to anticipated questions. Informal "brainstorming" sessions in advance of the activity may be helpful in generating possible questions that may be asked.

When developing handout materials, in many cases some material from previous involvement activities or previous projects may be usable. For example, information regarding right-of-way and relocation assistance will remain essentially the same. For new materials that will be developed, schedule appropriate lead time for preparation of displays and written materials and for printing handouts. Allow sufficient lead time for printing and other preparation activities whether the work will be performed commercially or by the Surveys, Mapping and Modeling Section or the Print Shop in the central office. Review any activities requiring action outside the district to determine the proper lead time for completion.

The district may prepare the photo-ready copy for notices of public involvement activities. After the notices have been sent to the newspapers, the district should ensure that the notices appear in the papers at the specified time.

All personnel who will be expected to participate in the involvement activity should be familiar with the format, schedule, objectives, and any applicable time constraints for their participation. This includes the moderator, if one will be used, who may or may not be an IDOT employee.

A checklist is an excellent tool for ensuring that final preparations do not overlook required equipment and supplies such as nametags, laser pointers, projectors, laptops, displays, display stands, and handouts or reminders to involved personnel. Spare equipment and parts such as extra bulbs for projectors, a spare slide screen, extension cords, charging cables, and other equipment can be extremely valuable in keeping the meeting on schedule in the event of equipment failure.

19-4.04 <u>The Presentation</u>

19-4.04(a) General Considerations

Public participation and attitudes may depend upon how well the personnel conducting the activity understand and react to the public's viewpoints and reasons for participation. With the proper approach, both the public and the Department can use the involvement activity to benefit its interests. A frequently overlooked element that is important to the overall success of the involvement activity is the time required for completion. Normally, an audience will tolerate a two-hour meeting. With this time frame, limiting the presentation portion to 30 minutes (40 minutes on complex projects) provides sufficient time to discuss the basic features of the proposed improvement while recognizing the participants' desire to have questions answered with as little delay as possible.

To conform to the time allotted, carefully prepare and review the presentation to ensure that only necessary information is included. Practice sessions or "dry-runs" are helpful for allowing the presenter to fit the presentation to the scheduled time limits. When more than one person will be involved in the presentation, complete a practice session(s) with all of the presenters prior to the actual presentation at the involvement activity.

Most of the people attending a public involvement activity will not be familiar with the technical language associated with highway projects. Those making presentations should minimize the use of technical terms in their presentations and in their responses to questions. The personnel presenting should convey an attitude of friendliness, understanding, respect, and cooperation to promote a positive atmosphere. If non-English speaking persons are expected, it may be appropriate to provide oral and written information in more than one language. If visually impaired persons will be attending the activity, it may be appropriate to have the information from the handout materials available in Braille or on a recording.

19-4.04(b) Presentation Content

The following paragraphs discuss the general topics that should be addressed in a presentation and provide some insight on the manner in which the topics should be approached.

19-4.04(b)1 *Introduction*

The opening speaker or moderator should first welcome those in attendance and explain the purpose of the activity. The opening remarks are extremely important for they may set the tone for the entire activity. Those in attendance should understand from the explanation of the purpose whether they are providing input into the basic data gathering effort or whether they are involved in providing input on alternatives, environmental impacts, the preferred alternative, etc. The opening speaker should also explain the format to be used. The speaker should describe what is involved in a workshop, a public meeting, or a public hearing, and the method that will be used to record comments.

The moderator should introduce all staff participants and district representatives and describe their role in the program. The public must be made aware that those with the expertise required to address their questions are present. If staff participants will be available for informal questioning after the presentation and formal comment period (if one is being held), the speaker may also indicate where the various experts will be located during the informal discussion period. At this time in the program, remind the audience of handouts, if available, and briefly describe the contents of the handout. If exhibits used in the presentation correspond with information in the handouts, attendees may use the handouts to their benefit as a presentation supplement.

19-4.04(b)2 *Main Portion*

At this point, the presentation should describe the project and include the following (as appropriate):

- the project's purpose, need, and consistency with the goals and objectives of any local urban planning;
- the project's alternatives, and major design features;
- the social, economic, environmental and other impacts of the project;
- the relocation assistance program and the right-of-way acquisition process; and
- IDOT's procedures for receiving both oral and written statements from the public.

If the purpose of the meeting is to collect data, the description should briefly outline the work that is proposed and then describe the type of information that is desired from the participants. If the project is further advanced and the participants are expected to offer information concerning the development of alternatives, the description should include a discussion of some of the work completed to date. If the involvement activity occurs when the project is in an advanced stage and the purpose is to provide information that will facilitate a choice among alternatives, provide more information to indicate the status of the improvement and the scope of the options or alternatives that remain. It should include descriptions of design features and beneficial and adverse impacts.

Often when describing a project to the participants, it is helpful to use examples of similar design in the immediate area of the proposed project. For example, in describing the type of medians that are under consideration, the speaker should emphasize that the median types being considered are similar to the flush painted median as now exists on Main Street, or a curbed-barrier median as now exists on Broadway. The participants can thereby relate directly to an operational situation with which they are already familiar.

Another topic that should be addressed during the meeting presentation is the tentative schedule for the remaining steps in the project. The public should be apprised of future opportunities to participate in the project's development, when the NEPA process will be completed, when construction will be initiated, and when construction should be completed.

19-4.04(b)3 *Special Considerations*

If noise abatement measures are proposed for the project, they should be briefly discussed. Also, briefly discuss the acquisition of right-of-way and the availability of relocation assistance. If the purpose of the activity is to offer an opportunity to provide input on alternatives that are being considered, then information should also be available which would indicate the approximate right-of-way acquisition and the properties affected. Advise interested property owners of whether they will be affected and to what extent. Explain that individual questions concerning the land acquisition process will be answered by land acquisition personnel during the informal period. Indicate where the land acquisition personnel will be located during the informal period.

If the project involves use of land subject to Section 4(f), the presentation should describe the nature and extent of the proposed use (e.g., name, location and size of the facility affected, amount of land proposed for use, impacts to the functions of the facility) and proposed measures to minimize harm to the facility resulting from the intended use. The presentation should also seek input regarding the proposed use, its anticipated impacts and the measures for minimizing harm, including the intent of FHWA to make a de minimis determination, if applicable.

If a public hearing is held to satisfy the requirements for a road closure hearing, the discussion should include a statement of need for road closings, the needs of local traffic, and the effect of the closing on other highways in the locality. The discussion should further address access to schools, churches, markets, and trade or community centers. Discuss all anticipated impacts and benefits of various closing options.

19-4.04(b)4 *Closing the Presentation*

The last portion of the presentation should address the procedure that will be used during the formal comment period if included in the meeting. If there are time limitations on speakers or other procedures to be used, the participants should be aware. Remind the audience that Department personnel will be available at discussion centers to answer individual questions after the formal part of the presentation is complete. If any activities are occurring in a separate room, the participants should be reminded of them. Before closing, announce the length of time (e.g., 10 days) that written comments will be included as a part of the hearing transcript or meeting records; however, comments are welcomed at any time during the development of the project. Present the name and address of the person to whom comments should be submitted.

The information described in the preceding paragraphs should be developed to answer as many questions as possible for the participants.

19-4.04(c) Audio-Visual Aids

19-4.04(c)1 *General*

A major problem in developing public involvement activities is how to convey a large amount of technical data to the public in a manner and language that they can understand and in a relatively short time. The majority of those who attend public hearings are unable to understand the technical language and engineering drawings that are typically used by project team personnel in their studies of a particular project. Audio-visual aids are capable of significantly increasing the ability of the public to understand the information being presented.

Use the following audio-visual aids for public involvement activities as appropriate:

- projector,
- video/DVD,
- audiotape/digital recording,
- large writing pad and tripod,
- fixed exhibits,
- models,
- demonstrations, and

- markerboard.

Several of these aids may be combined for an even more effective presentation. A coordinated video and exhibit show is a good example of an effective combination.

Exhibits should remain as simple as practical, omitting contour lines, curve data, and other technical information that may not have meaning to the majority of those attending the activity. Label the exhibits to indicate the project stage such as preliminary, proposed, or draft and, if applicable, to contain a title such as Alternative 1 of 3. Identification of local landmarks shown on exhibits can be helpful in orienting viewers. Common landmarks include major street intersections, rivers, parks, large buildings, etc. They should be identified with large bold letters and should be readable from a considerable distance.

In the preparation of visual exhibits, the use of colors to depict different alternatives or features of the proposal can be important. If one alternative is shown in a particular color on one exhibit, it should be shown in the same color on all exhibits. This is also preferable when examples such as bar graphs are used for quantitative comparisons. If quantitative comparisons are appropriate, a bar graph is one means of demonstrating such comparisons quickly and simply. In general, all exhibits should be simple and as easy to understand as possible.

Another effective means of communicating with the public is the use of examples of similar existing facilities near the project area. In many cases, such examples will be helpful to the public in visualizing the scope of the project and its effects on them individually or as a community. For instance, instead of using a typical section of a proposed arterial street, an example of a local facility that is familiar to the attendees may be more effective. The familiarity of the attendees with the example facility should lead to a better understanding of how the proposed project will affect access to homes and businesses, the amount of right-of-way that might be required, and the vehicular and pedestrian characteristics of the facility. Usually, examples of this nature are superior to technical drawings in conveying a message to the public.

19-4.04(c)2 *Fixed Exhibits*

Fixed exhibits are defined as large-size drawings, maps, aerial mosaics, etc., that are prepared for use at public involvement activities to display proposed designs and alignments that are under consideration. Fixed exhibits can be very helpful during public involvement activities because some design concepts and alignments are difficult to visualize from a verbal description alone. Some fixed exhibits may serve a dual purpose in that large-scale maps or aerial mosaics are often prepared for normal use by a project team during the course of its study. Although fixed exhibits are often prepared for a specific purpose and used only once, their use may be increased by photographically reproducing them or using plastic overlays so that alternatives can be drawn on the exhibit or overlays during workshop sessions. Smaller exhibits may be enlarged photographically for use as a fixed exhibit at a public hearing.

Fixed exhibits may also be used effectively in combination with other audio-visual aids at public involvement activities. Because slide presentations have a relatively short duration and require a darkened room, fixed exhibits that duplicate slides can be used for discussion following the presentation. Handouts may also contain reduced photocopies of fixed exhibits. Some fixed exhibits may be retained for future use if they display a standard design or feature that might be a consideration in another project. Districts can establish a library of reusable exhibits so that standard design exhibits will not need to be prepared for each involvement activity.

Although fixed exhibits are useful and flexible visual aids, they have some disadvantages when compared to audio-visual aids. They require considerable space for displaying, storing, and transporting. Another limitation is the time and expense often required to prepare a large drawing or display.

19-4.04(c)3 *Presentation Software*

Presentation software (e.g. PowerPoint) may be effective because a large amount of information can be disseminated in a controlled time and repeated as needed.

19-4.04(c)4 *Video*

Video can be a practical alternative for public involvement activity presentations. Such presentations are very effective for repetitive showings of the same information to small groups. Projected videos can be used with an audience size limited only by the size of the facility and screen and the audio capability. This need might commonly occur at open houses and at briefings of small groups such as homeowners or civic organizations. Technical videos may be integrated with other audio-visual aids to demonstrate certain design techniques that may be new or not available in the project area for local familiarity. An example of this is demonstrating the effectiveness of a concrete median barrier compared to a guardrail median barrier via actual crash tests. The district may obtain technical films demonstrating the effectiveness of specific design features from a variety of sources including FHWA and TRB.

19-4.04(c)5 *Miscellaneous Audio-Visual Aids*

There are other audio-visual aids that are not as common as those which have been described. Many of these are more applicable to serving special needs that do not commonly occur. The use of models, for example, may not be appropriate on most projects; however, they may be appropriate to demonstrate complicated interchanges or complex urban joint development projects. Demonstrations for use at a public involvement activity are also generally reserved for a special situation. The district may use a demonstration to explain the effectiveness of a specific design feature such as a noise barrier.

Another visual-aid technique is the use of a large writing pad mounted on an easel and drawn on with felt tip markers. The usefulness of this technique is limited by the ability of the speaker or an aide to draw and sketch as the presentation is being made.

A large writing pad and felt tip markers may be used to record spoken comments. This is in addition to recording comments by a court reporter or electronic recorder (e.g., tape, digital). This ensures the speaker that his comment is received and interpreted correctly. Large writing pads are also effective at workshop sessions to record comments, interests, suggested alternatives, etc. The working groups usually prioritize these, and they can become a significant source of input for district decision making.

Audiotape and other electronic recording media are another aid that may be used to present information to the public and control precisely the length and content of a talk. These media are useful in the preparation of standard presentations that are repeated, such as those concerning right-of-way acquisition and relocation assistance and the Federal-State relationship.

19-4.05 Post-Activity Follow-Up

Those who attend a public involvement activity are normally interested in the results of the input provided. This includes the follow-up to questions for which answers were not available at the time of the activity. The public may determine the success or failure of a public involvement activity based on the actions taken after the activity. Therefore, follow-up is a significant action to minimize opposition and create a positive relationship with the public.

The appropriate type of follow-up will partially depend on the public's attitude at the public involvement activity. If the public has been generally supportive of the proposed project, it is probably not necessary to initiate a large-scale follow-up. It may suffice to write individual letters to those who asked questions which were not answered and to release information to the news media on any changes that were made as a result of the input.

If the public attending the activity was generally opposed to the project, a more extensive follow-up is appropriate. In this case, write those individuals who had questions that were not answered and provide the information requested or explain the results of the investigation. Issue a news release that notes some of the major comments made at the activity and the Department's reaction to these comments. The release should also include a discussion on any changes resulting from the activity. For projects of major scope where a mailing list has been developed and where public involvement activities may span a long period of time, a newsletter might be developed and mailed to those on the mailing list and to those who attended the activity. Local radio and TV talk shows may also be used to disseminate information following a public involvement activity of major scope and impact.

Project revisions are often made after public involvement activities. If project revisions are substantial, the project shall be discussed with BDE and FHWA to determine if additional public involvement activities are needed.

19-4.06 Mailing Lists

Each district should develop and maintain mailing lists for distributing information. A general mailing list should include agencies, organizations, and appropriate individuals that are generally interested in being advised of all highway projects scheduled within the district. The general list consists primarily of Federal, State, and local agencies usually interfacing with the Department on highway projects; entities such as major industries, environmental groups, and local transportation operators; and individuals, including elected officials, who have requested and have a need for project information. To serve the intended purposes, those included in the general list should be sent copies of announcements of public involvement activities and other general information as appropriate. Confirm names and addresses periodically to keep lists current and to determine whether the parties are still interested in receiving project information.

In addition to a general mailing list, the district should develop specific lists for individual projects. These project-specific lists include the general mailing list and any additional persons or groups that are interested in specific highway projects. Individuals and organizations may be added to the list when requests are received for information on a specific project or on the basis of attendance lists that are maintained as part of involvement activities. These lists may be used to distribute information on the resolution of certain problems discovered during involvement activities. The project-specific mailing lists may be retained for use with other planned projects in a particular area, or they may be discarded following completion of the project for which they were developed.

19-4.07 General Releases of Information

Releases of information to the news media can be a very effective tool for minimizing adverse public reaction during both the daily operations of the Department and the development of proposals and final plans for specific projects. Maximize effectiveness by writing the release in layman's terms and avoid using jargon and technical terms as much as possible. Releases of information involving the routine operations of the district may be at the discretion of the Regional Engineer. Releases of information on activities which are controversial or in which the Secretary has shown an interest, such as major freeway projects, should be coordinated with the Office of Communications. That Office also may initiate releases of information in response to inquiries from the news media or to address a demonstrated public interest. It may also release information concerning involvement activities for projects of statewide interest when advised of their scheduling. All releases of information should include, in the upper right-hand corner, a fax number, a TTY number, and the name and telephone number of the person the media may call for additional information.

19-4.08 Records and Reports

19-4.08(a) Public Comments

The district must record all comments received by the Department on a given highway improvement and enter these in the project file. Encourage all commentators to put their comments in writing and include their name and address. This relieves Department personnel from the responsibility of interpreting the meaning of the commentator's spoken word in recording their input. Consider providing a Comment Form that commenters may complete and return. Include on the form the date by which the form should be returned.

Record comments when they are received, whether or not they were received as a part of an involvement activity. For example, if an individual visits or calls the district and comments on a project, record that comment and include it in the project files. All comments received should be addressed.

For public hearings, all public comments shall be documented either by a court reporter or, if a court reporter is not available, a digital recording that is transcribed and a transcript produced; see Section19-3.04(g).

19-4.08(b) Reports

All comments must become a part of the project files and the Phase I report or NEPA document. For a public hearing, the transcript from the hearing is sent to FHWA; see Section 19-3.04(g). In either case, the report/document should also contain a response to each of the comments included in the summary or the transcript. If a comment is addressed in the body of the report, it is not necessary to repeat that information under “Responses.” Refer to the applicable page number of the report.

19-4.08(c) Responses

The district should acknowledge in writing all written comments received from the public, including individuals, private organizations, or government agencies. The acknowledgment should thank them for their input and provide a response to their questions or comments. If an answer will not be available for some time, acknowledge receipt of the comment with an indication that a final response will be forwarded at a later date. Verbal comments should also be acknowledged and responded to when the name and address of the commenter is available.

To reduce the workload of responding to comments after a scheduled public involvement activity, consider forwarding copies of the summary of comments and responses prepared for inclusion in the Phase I report, along with a letter thanking them for their participation, to all who attended the activity. Separate responses need not be prepared. This summary of comments and responses could also be incorporated into a newsletter.

The district should acknowledge and respond to comments received from other governmental agencies. These responses are likely to eliminate the repetition of those comments in subsequent formal contacts, such as through the circulation of environmental documents. For local agencies, the formal responses serve as resolution documentation , which can also aid in the transition by new local administrations.

.

19-5 CONTEXT SENSITIVE SOLUTIONS

19-5.01 The Stakeholder Involvement Process

Once a project has been scoped and included in the Department's Proposed Highway Improvement Program, the Regional Engineer will determine if it is to be developed using the principles of Context Sensitive Solutions (CSS). This decision shall be based on the preliminary scope of the project and if it falls under the types of projects 605 ILCS 5/4-219 specifies to embrace CSS, which includes new construction, reconstruction, or major expansion of existing transportation facilities.

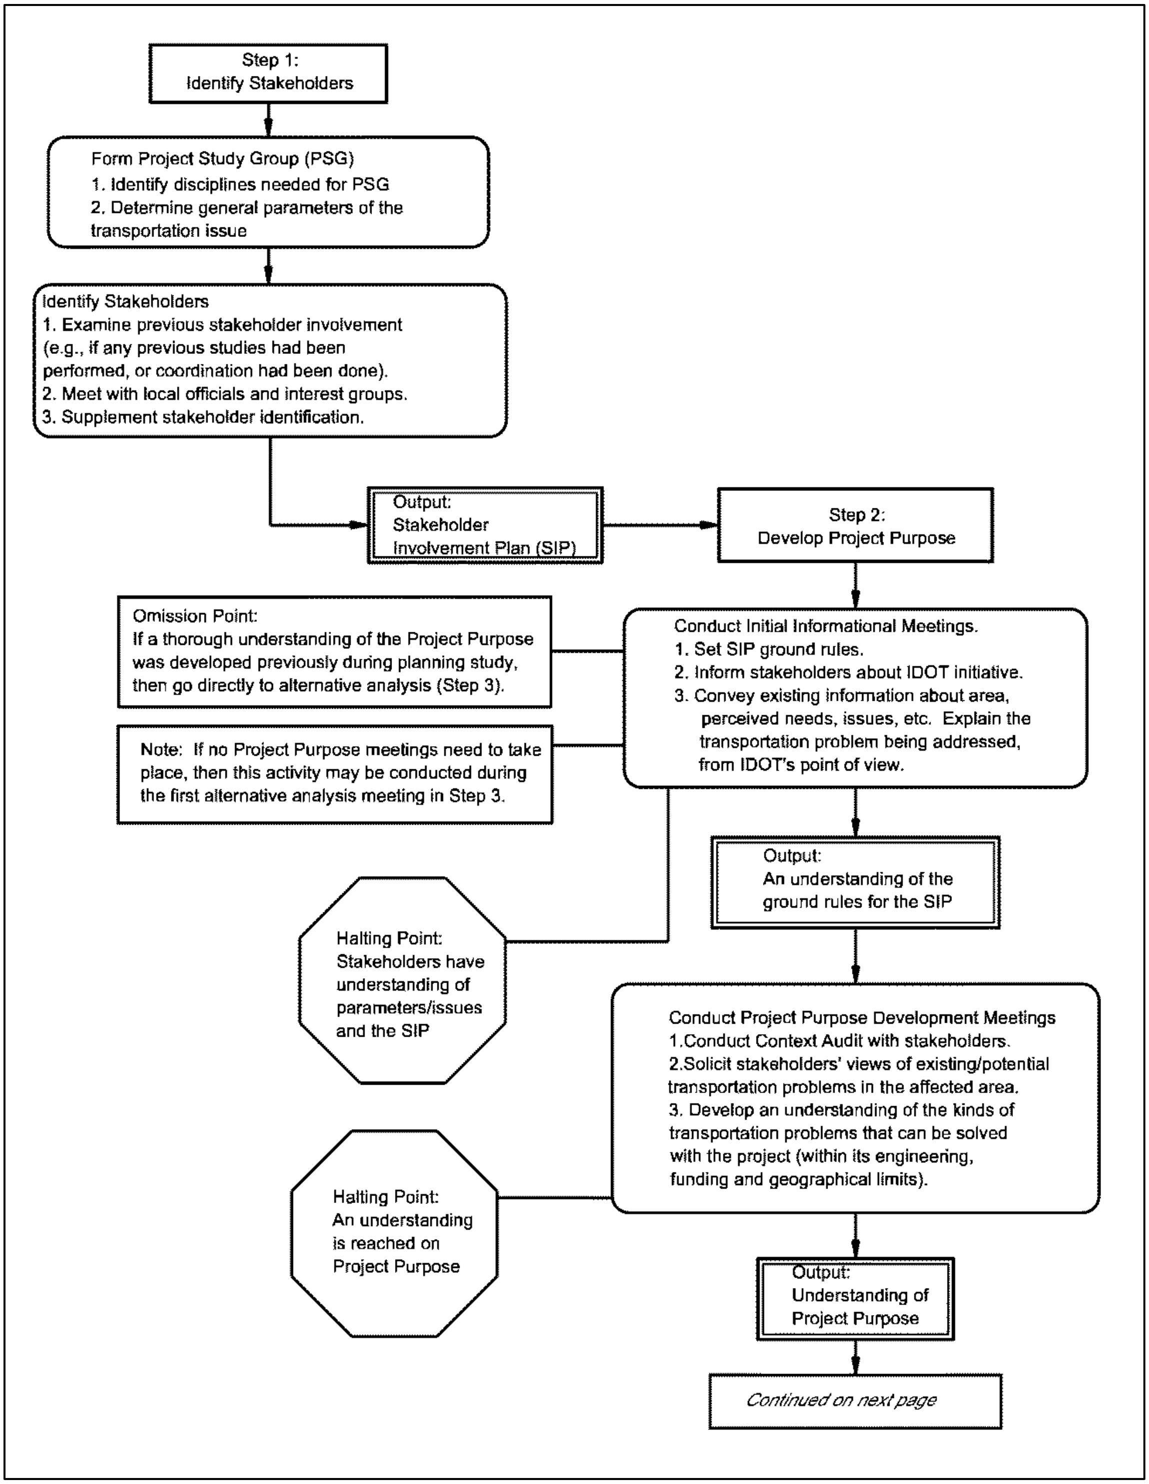
For projects that meet CSS criteria, the districts shall confirm the decision to use CSS, or the decision not to use CSS, by a memorandum to that effect signed by the Regional Engineer. The signed memorandum shall be placed in the project file. This will document compliance of the project with the terms of 605 ILCS 5/4-219. Further, any decision regarding the CSS status for a project shall be discussed at a district coordination meeting and documented.

All CSS projects must use the stakeholder involvement process for public involvement; see Figure 19-5.A. At the discretion of the Regional Engineer, this process and the CSS approach may also be used for any State highway improvement.

The stakeholder involvement process will facilitate effective identification and understanding of the concerns and values of all stakeholders (i.e., persons and entities that have a stake in the outcome of a highway project, see Figure 19-5.B, as an integral part of the project development process. It includes a formal written plan, the Stakeholder Involvement Plan (SIP), see Figure 19-5.C, which explains how stakeholders input and comments will be obtained. Public hearings may be required, depending on the project.

The purpose of the stakeholder involvement process is to promote a proactive and responsive CSS approach that seeks the input of the full range of concerned stakeholders early and often and provides for appropriate consideration of stakeholder input at key points in the project decision making process (e.g., project purpose, range of alternatives, selection of a preferred alternative).

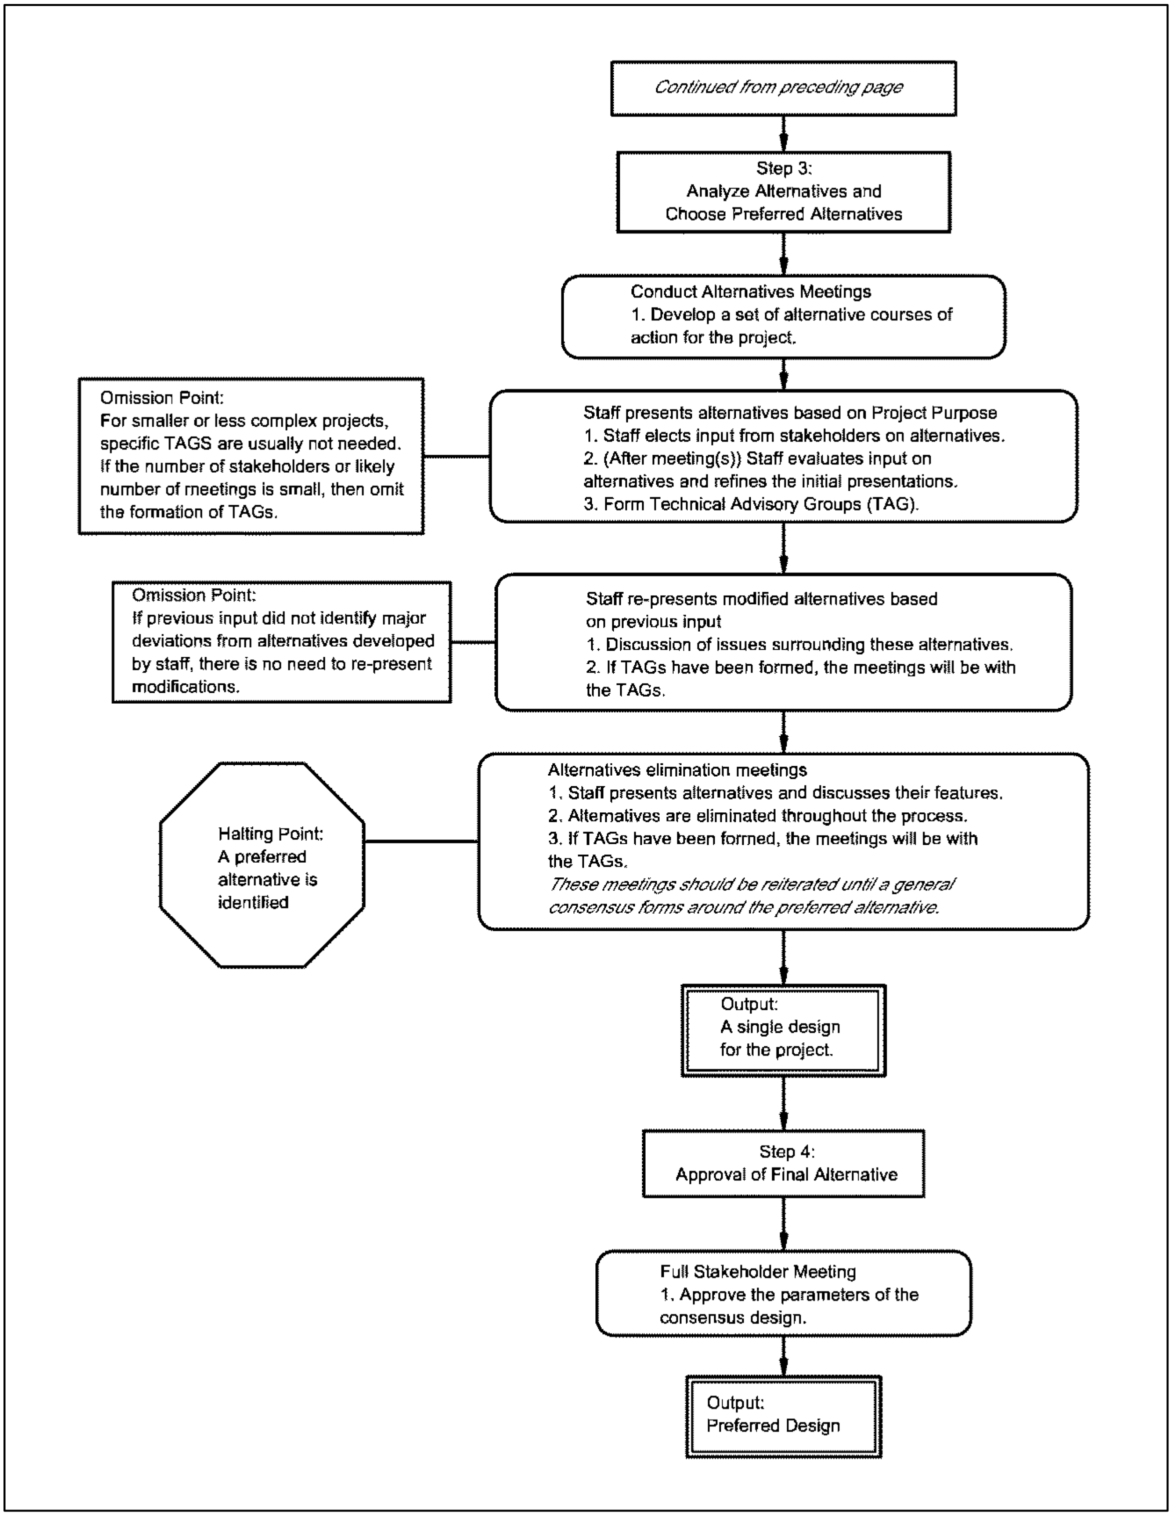
The involvement and coordination activities associated with the environmental process are an integral part of the stakeholder involvement process. The district should schedule stakeholder involvement process activities to coordinate with and accommodate the key milestones in the environmental process and, as applicable, the concurrence points for the NEPA/404 merger process; described in Section 22-4. For projects subject to the NEPA/404 merger process, consideration of the outcomes of the concurrence point meetings with the environmental regulatory and resource agencies should be a part of the iterative processes for achieving stakeholder <u>consensus</u> on project purpose and need, range of alternatives, and the preferred alternative.



STAKEHOLDER INVOLVEMENT PROCESS

Figure 19-5.A

(1 of 2)



STAKEHOLDER INVOLVEMENT PROCESS

Figure 19-5.A
(2 of 2)

The most serviceable definition of consensus is when a majority of the stakeholders agree on a particular issue, while the dissenting remainder of stakeholders agrees its input has been heard and duly considered and that the process as a whole was fair.

The stakeholder involvement process is flexible and modular and should be designed to fit the size and complexity of each project. The stakeholder involvement process includes the complementary concepts of "omission points" and "halting points." The "omission points" show where and why certain activities may be omitted from the process for a particular project. The "halting points" show under what conditions certain activities can be considered completed. Decisions made for each of these points may be found in a particular SIP, where certain activities are excluded as being unnecessary while others are continued until a result is reached. The Project Study Group should tailor the stakeholder involvement process to meet the needs of a particular project and its stakeholders.

19-5.01(a) Stakeholder Identification and Development of the Stakeholder Involvement Plan (SIP) (Step 1)

19-5.01(a)1 *Project Study Group*

Once a project is designated for CSS, a Project Study Group (PSG) should be formed. In addition to appropriate district and consultant staff, the group may include representatives from other offices/entities, including, but not limited to, the following:

- FHWA,
- Office of Planning and Programming (OP&P),
- Bureau of Design and Environment (BDE), and
- Metropolitan Planning Organizations (MPOs).

If the project is likely to involve bicycle and pedestrian issues, the district's bicycle and pedestrian coordinator also should be a part of the PSG.

Once the preliminary engineering study is started, other disciplines can be added to the PSG, or consulted as necessary to respond to issues involved with the project and to promote identification and evaluation of the full range of possible project options. The disciplines to be included or consulted should be determined early in the process and should be reflected in the SIP.

The PSG should research correspondence and other information leading to the initiation of the project and start making a list of stakeholders (e.g., individuals, organizations, agencies, that are on record as supporting or opposing a proposed transportation improvement project or issue). This initial stakeholder list should expand as the preliminary engineering study proceeds, and can grow into a contacts list for specific issues or projects; see Section 19-4.06.

For EIS projects, the PSG will identify entities to be invited to become Participating Agencies in accordance with 23 U.S.C. 139. For EIS and EA projects, the PSG should identify Cooperating

Agencies and Section 106 consulting parties. The PSG should coordinate with FHWA to identify the appropriate Tribal governments to include in project coordination.

Each district should maintain such a contacts list of concerned citizens, public officials, organizations, agencies, and others who want to be involved or informed on transportation issues in their areas. The district should determine from this list the possible stakeholders that may desire to be involved in helping the Department proceed with a preliminary engineering study on the transportation issue and should add those names to the list of stakeholders for the project. The stakeholder list will be expanded as information is gathered from contacts or meetings with local officials, chambers of commerce, planning commissions, affected property owners, environmental resource agencies, the motoring public, special interest groups, etc.

19-5.01(a)2 *Community Advsisory Group (CAG)*

Unless previous records or contact lists already exist, the best way to identify many of the stakeholders for a particular project is to meet with the elected officials and agency representatives for the project area. The PSG can ask these officials and representatives about the groups and types of people likely to be interested and/or affected, and ask them to identify any organizations through which these stakeholders can be contacted. For larger and more complex projects, it is suggested that other sources of stakeholder information (e.g., neighborhood and business organizations, environmental and preservation interest groups, transportation and growth management groups) be consulted to supplement the information received from elected officials and agency representatives.

Figure 19-5.B lists various types of stakeholders. Not all of these types will necessarily be affected on any specific project, and a particular group of stakeholders may belong in more than one category. This listing is intended to aid the PSG in formulating potential stakeholder contact lists. It is not meant to be an exhaustive checklist that must be followed in strict order.

Although State and Federal Resource Agencies may be identified as stakeholders on any project, if it is known that the project will be subject to the NEPA/404 Merger Process (see Section 22-4), the Resource Agencies shall be considered stakeholders and involved in the process early on. Once the stakeholders are identified a CAG can be formed. The CAG will served to provide input to PSG on the content of the SIP.

19-5.01(a)3 *Development of the Stakeholder Involvement Plan*

After a preliminary list of stakeholders is compiled, the PSG will develop a Stakeholder Involvement Plan (SIP), see Figure 19-5.C, that identifies who the stakeholders are, how they are going to be reached, and a tentative schedule of meetings. The SIP does not need to be extremely detailed and can be modified as the process develops. The plan does not need to be time or date driven, but could be linked to milestones or decision points that occur throughout the course of a study. The SIP should also contain the tentative ground rules under which the stakeholder involvement process will be conducted. An example outline of a SIP is included for reference.

For projects subject to 23 U.S.C. 139, primarily EISs, the CSS study group must develop a draft Coordination Plan for working with Participating Agencies in development of the environmental document. The district should contact BDE for examples of the Coordination Plan. The CSS study group should integrate the Coordination Plan requirements within the SIP to provide a single document that addresses both the SIP and Coordination Plan requirements. FHWA and the Department, as joint lead agencies, must agree upon the content of this plan before it is distributed to external stakeholders, including participating agencies.

After FHWA publishes a Notice of Intent in the Federal Register, see Section 25-2.01(e), the Department and FHWA initiate external coordination activities. FHWA invites appropriate Federal agencies to be Participating Agencies or Cooperating Agencies. FHWA invites Tribal governments to become Participating Agencies and Section 106 consulting parties. FHWA also invites State agencies that have jurisdiction by law or special expertise to be Cooperating Agencies. The Department invites State and local agencies to be Participating Agencies, as applicable. The Department sends invitations to potential Section 106 consulting parties asking them to participate in the process. See Chapter 25 for sample agency invitation letters. The invitations to Federal, State, and local agencies will include a copy of the draft SIP and will request comments. The request for comments on the SIP will be revisited as new stakeholders are identified throughout project development.

STAKEHOLDER TYPES

Figure19-5.B

Typical Stakeholder Involvement Plan (SIP) Content Outline

A. Cover Page

This typically has a graphic, project name, and who prepared the SIP.

B. Table of Contents

C. Introduction

This section discusses the project background, project limits, and other relevant introductory language.

D. Goals and Objectives

This section discusses the goals and objectives of the SIP. Example goals are as follows:

- Identify all stakeholders of the project, and ensure their opportunity for meaningful input into the project's development from beginning to end.
- Determine project context, with stakeholder input and concurrence.
- Identify transportation problems that can and should be solved by the project, with stakeholder input and concurrence.
- Identify reasonable alternative solutions to solve identified transportation problems, with stakeholder input and concurrence.
- Choose a preferred alternative solution to identified transportation problems for the project, with stakeholder input and concurrence.
- Treat all involved parties with respect and dignity, in a transparent manner and in a way that ensures their input was duly heard and considered.

E. Project Study Group (PSG) and Community Advisory Group (CAG)

This section describes who was included in the PSG and should list the CAG (person's name and the group they represent), Cooperating Agencies (CAs), Participating Agencies (PAs), and Section 106 consulting parties.

F. Public Involvement Plan Activities

This section will include a summary of all the public involvement activities for the project (i.e. workshops, informational meetings, public hearings, etc.)

G. Tentative Schedule

This section described the tentative schedule. The following is an example schedule:

- The first meeting with all stakeholders will include gaining stakeholder consensus on the ground rules of the SIP including descriptions of roles, a description of the IDOT project development process and an introduction to the stakeholders of the preliminary project concept. Further, the project study group must explain the role the requirements of the

SIP Content Outline
Figure 19-5.C
(1 of 2)

National Environmental Policy Act (NEPA) will play in the development of the project. Finally, the PSG will conduct a context audit with the stakeholders to determine characteristics contributing to the project's context. The format for this meeting, like all stakeholder meetings for this SIP, will be in a workshop format to facilitate collaboration. It should precede definition of preliminary purpose & need, and its target date will tentatively be August 2018.

- The second stakeholder meeting will draw upon the completed context audit, and will have as its goal the development of a comprehensive statement of the transportation problem to be solved by the project. The statement must be realistic under the constraints placed by engineering considerations, available funding and geographic limitations. The statement must also represent a consensus view. This meeting should also precede definition of preliminary purpose & need, and its target date is January 2019.
- The third meeting with all stakeholders is to define several possible alternatives for further consideration, and is complete once consensus is reached. It should take place after preliminary purpose & need and determination of reasonable alternatives. Its target date is June 2019.
- The fourth stakeholder meeting has the goal of attaining consensus on a preferred alternative for the project. It should be held after in-depth analysis of reasonable alternatives and before a recommended alignment is chosen. Its target date is January 2020.
- The fifth and final stakeholder meeting is intended to formally approve the final preferred alternative, and should precede official design approval. There should be a formal and comprehensive statement outlining the purpose of the project, its scope specific design elements of the final alternative. The target date for this meeting is June 2020.

H. Appendices

The appendices typically include the Project Study Group (e.g. table showing the names, affiliated organization, and contact information), a list of stakeholders, revision dates to the SIP, etc.

SIP Content Outline
Figure 19-5.C
(2 of 2)

19-5.01(b) Developing Project Problem Statement (Step 2)

The first general contact with stakeholders serves to introduce the transportation issues to be resolved to the public, exchange information, and identify concerns. This contact starts the process of coordinating with the public so they can begin to understand that their involvement is vital to the development of the project.

The contact should commence with an initial public meeting of the PSG with the stakeholders to explain the ground rules under which the SIP will be conducted. The following questions must be addressed by explicit ground rules, and agreed upon by the stakeholders:

- what is the code of conduct for the group?
- what are the purpose and goals of the process?
- what will be the method of decision making?
- what are the accountabilities of the participants?
- how is consensus defined?
- how will transparency of the process be ensured?

Once SIP ground rules are established and accepted by the stakeholders, the PSG should present its vision of the transportation problem or problems to be solved and the preliminary proposed solutions resulting from the scoping process. It is also helpful at that time to explain departmental procedures for choosing and developing projects to stakeholders.

For projects subject to 23 U.S.C. 139, primarily EISs, the Department and FHWA collaborate with Participating Agencies on the methodologies and level of detail planned for analyzing environmental effects of project alternatives. (FHWA and the Department may agree to revisit methodologies and level of detail when new information warrants doing so. If this occurs, FHWA and the Department will re-coordinate with Participating Agencies for their input.) FHWA and the Department will finalize the SIP after receiving input from Participating and Cooperating Agencies and the public.

> **Halting Point:** This activity is finished when the stakeholders understand and agree with the stakeholder involvement process ground rules and understand the Department's preliminary definition of the transportation problems and solutions for the project.

Next, the PSG should undertake an effort to complete a Community Context Audit Form, see Figure 19-5.D, for the project in concert with the stakeholders. These audits are intended to help identify various characteristics that define the context of each project. This will aid in defining the project purpose or the transportation problem to be addressed. The audit is designed to consider not only the area's history and heritage, but environmental conditions and community goals.

Illinois Department of Transportation

Community Context Audit Form

Purpose:

The Community Context Audit form is intended to be a guide to identify various community characteristics that make each transportation project location unique to its residents, its businesses and the public in general. This information will help to define the purpose and need of the proposed transportation improvements based upon community goals and local plans for future development. The audit is designed to take into account the community's history or heritage, present conditions and anticipated conditions. As you complete this audit, please consider the interaction of persons and groups within your community when considering factors such as mobility and access (vehicular, non-vehicular and transit modes), safety, local and regional economics, aesthetics and overall quality of life.

(1 of 6)

Illinois Department of Transportation

Community Context Audit Form

Section 1: Community Characteristics/ Land Use

Please conduct a visual assessment in the field and attach a project location map. If appropriate, include a photo index for the project area. If appropriate gather public opinions and concerns about the proposed project. Consider community needs as the basis for this assessment. Assess the community characteristics and indicate the community's perception of importance for each characteristic currently and based upon known / planned future conditions.

Community Characteristics	Presence		Importance		
	Yes	No	High	Med.	Low
Is this place an established city center?	☐	☐	☐	☐	☐
Is this place a multi-modal transportation center?	☐	☐	☐	☐	☐
Is this place a commercial center?	☐	☐	☐	☐	☐
Is this place a residential center?	☐	☐	☐	☐	☐
Is this place a mixed residential /commercial center?	☐	☐	☐	☐	☐
Is this place an industrial center?	☐	☐	☐	☐	☐
Is this place a rural/agricultural area? Comments	☐	☐	☐	☐	☐
Are there important cultural features or identifiers which convey information about the community within the project area? If yes, list:	☐	☐	☐	☐	☐
Are there social/community features or identifiers within the project area? If yes, list:	☐	☐	☐	☐	☐
Are there important architectural features within the project area? If yes, list:	☐	☐	☐	☐	☐
Are there important natural features within the project area? If yes, list:	☐	☐	☐	☐	☐
Is this place of historical significance to the community? If yes, list:	☐	☐	☐	☐	☐

Overall assessment of community characteristics and setting:

☐ **Urban ..** ☐ **Suburban ..** ☐ **Rural**

(Please note, this is not the identification of a functional classification. This is an assessment of the community based upon physical characteristics noted above.)

Section 2: Infrastructure Assessment

Assess the project or study area for the presence and adequacy of the following infrastructure items. If present (a yes response) and in poor condition, please make notation and provide any other relevant comments in space provided for each item. If not present (a no response), indicate in the comment section if the item needs further evaluation. Indicate the level of importance each item may have to the community currently and based upon known / planned future conditions.

COMMUNITY CONTEXT AUDIT FORM

Figure 19-5.D
(6 of 6)

Context audit meetings can be large and include all stakeholders or can be conducted as multiple smaller meetings if the project is large in scale and affects a great many stakeholders of varied interests or affects many communities. It is often helpful to conduct these smaller meetings with groups of stakeholders that have common interests, for example, based on geography or specific issues. The smaller meetings should be informal in nature, designed to learn about each group's issues. At the end of a multi-meeting process, it is recommended that a full public meeting be held to compile and complete the overarching context audit for the project.

This audit process should be simple and should deal with broad, problem-defining issues. Staffing at the meetings should be adequate for stakeholders to have their questions answered in a timely fashion. For larger projects, communications consultants may be involved in this type of outreach instead of, or in addition to, Department staff.

After the context audit is completed, the PSG should meet with the stakeholders to develop a clear statement of the transportation problem(s) to be solved by the project. This can occur at a context audit meeting, or may require a meeting or meetings subsequent to the context audit meeting on projects with a more complex context. The PSG should seek input on current transportation problems in the area the stakeholders believe need to be solved, and how the project, as preliminarily proposed, might help alleviate them. If stakeholder solutions are suggested that are technically or financially infeasible, the PSG should determine the underlying problems the suggestions were attempting to solve, and whether or not there is a feasible way to address them within the project's anticipated scope.

Translate the input into a clear problem statement, which should, and can be, solved by the project. The PSG should ensure the stakeholders understand that this statement is of perceived transportation problems, not of the preferred project scope of work. Care must be taken to make the statement realistic within the limits imposed by engineering considerations, available funding, and the logical termini, see Section 11-3.02, of the project. Once a clear problem statement is completed, it must be accepted by consensus of the stakeholders.

IDOT and FHWA develop the Purpose and Need based on many factors and relevant planning/transportation data. The PSG should ensure that the stakeholders understand that the problem statement is a *contributing factor* to the Purpose and Need. Further, Federal and State Resource Agencies (e.g., US Environmental Protection Agency, US Army Corps of Engineers) must concur in the Purpose and Need for projects subject to the NEPA/404 Merger process. For EIS projects, Participating Agencies and the public must be afforded an opportunity for involvement in defining the Purpose and Need.

> **Omission Point:** The PSG should ensure that the stakeholders understand that these issues will be revisited on projects during formal development of Purpose and Need under the NEPA process, if applicable. Further, Federal Resource Agencies (e.g., US Environmental Protection Agency, US Army Corps of Engineers) must concur in the Purpose and Need for projects subject to the NEPA/404 Merger process. For EIS projects, Participating Agencies and the public must be afforded an opportunity for involvement in defining the Purpose and Need. Purpose and Need also should be revisited for EIS projects subject to 23

U.S.C. 139 that requires that Participating Agencies and the public be afforded an opportunity for involvement in defining the Purpose and Need. It would be prudent to hold a meeting to verify that all stakeholders agree with the revised Purpose and Need.

Halting Point: This Step is finished when both the Department and the stakeholders arrive at an understanding as to the purpose of the project. If the project is subject to the NEPA/404 Merger Process, this will include concurrence on the Purpose and Need from the Resource Agencies. For projects subject to 23 U.S.C. 139, this will include having afforded Participating Agencies and the public an opportunity for involvement in defining the Purpose and Need. This step can also be concluded if the consensus is to not proceed with the project.

Developing the project purpose is the first, fundamental step in the overall project development process. Central to this concept is the understanding by all stakeholders that a transportation problem has been identified, and the Department is committing resources to address that problem. At the onset, outreach focuses on understanding community viewpoints on the nature of transportation issues associated with the identified problem. Outreach should also focus on finding out the specific values associated with the local context.

The point of this outreach is to assure congruence between the Department's assessment of the problem(s) to be addressed and those recognized by the community. If these views are different, it can become very difficult for stakeholders to agree to make trade-offs during the planning and design process. The absence of general endorsement of the problem's definition at this point is a strong indication that the process is not ready to proceed to the next step. A clear understanding between stakeholders and the Department regarding a transportation need, including what transportation issues and problems are to be addressed, is needed for progress toward solving the transportation problem.

19-5.01(c) Defining Alternatives (Step 3)

The intent of this step is to develop project alternatives or options and to ask for input into the development process for the preliminary study alternatives. The Purpose and Need that was developed in Step 2 for the project and the concerns identified from Step 2, are the driving force for the identification of the alternatives or options, and should be considered during this process. For EIS projects, Participating Agencies and the public must be afforded an opportunity for involvement in defining the range of alternatives.

On larger and more complex projects (e.g., new construction, major reconstruction), this is usually the appropriate time to form one or more "technical advisory groups" (TAGs). These groups are composed of stakeholders who volunteer to be in ongoing contact with the PSG, over and above the full public meetings that take place, and will work on analyzing alternatives generated. Several groups could be created and could each be responsible for analyzing the alternatives according to a particular subject matter (e.g., economic development, aesthetics). In some situations, consultant staff may assume these responsibilities, overseen by the PSG.

For smaller and less complex projects, a single group that handles all relevant subjects could be convened instead.

> **Omission Point:** For smaller and/or less complex projects on which the number of stakeholders or the likely number of meetings is small, the formation of TAGs can be omitted.

Staff should approach stakeholder suggestions from the standpoint of determining what problems and issues are being addressed. If suggested proposals are either technically or financially infeasible (or both), explain this plainly and respectfully. Staff should work with stakeholders to determine the underlying issues and should try to identify alternative solutions that would address the concerns within the engineering and budgetary constraints. Input obtained from these meetings generally will result in revisions to the alternatives being considered at this time. Ideally, the range of alternatives retained for further study will be narrowed at this point in the process, based on the comments received, the results of preliminary surveys, and the design analyses conducted to date.

> **Halting Point:** Once a reasonable range of alternatives have been developed and all issues that are reasonably related to the project have been identified, the process can move on to the environmental documentation and review stage. The alternatives and their respective environmental impacts will be made available for public and agency review through the environmental process.

> **Omission Point:** The process can proceed directly to the environmental documentation and review stage if, at the initial meeting(s), stakeholders did not identify any significant differences or issues omitted from previously developed alternatives.

For all but the smallest or least complex projects, several meetings for analyzing alternatives are likely to be necessary. The purpose of follow-up “alternative analysis” meetings is to present the refined alternatives generated from the first round of meetings and to begin to reduce the number of alternatives carried forward. Concerns from previous meetings, along with any current conflict resolution results, are discussed. If concerns cannot be incorporated, staff must indicate why and attempt to offer solutions that address the issues underlying these concerns.

TAGs, if formed, would continue their analysis and help make the presentation at the full meeting(s). In fact, subsequent alternative analysis meetings are best conducted with the TAGs themselves. This saves time, space, budget, and is consistent with the purpose for which the TAGs were created. At this stage, full public meetings should only happen if a new issue emerges, or an issue not previously considered relevant becomes important.

For large or complex projects, there may be a need for several rounds of meetings for refining and reducing the number of alternatives; whereas, if the project is simple, elimination of alternatives can occur in one meeting. On larger projects, consultant staff can assume these responsibilities, under the supervision of the PSG.

Halting Point: Meetings are reiterated until a preferred alternative is reached. If a preferred alternative is being identified during a corridor or feasibility study, and the project is later subject to NEPA compliance, the preferred alternative identification process will be revisited if or when the NEPA process is initiated for the project. Further, Federal Resource Agencies (e.g., US Environmental Protection Agency, US Army Corps of Engineers) must concur in the alternatives to be carried forward for further analysis and the preferred alternative on projects subject to the NEPA/404 Merger process. For EIS projects, Participating Agencies and the public must be afforded an opportunity for involvement in defining the range of alternatives.

19-5.01(d) Preferred Alternative (Step 4)

This is the last stakeholder involvement activity during initial design/NEPA and its intent is to reach consensus with the public. In order to reach this point, all reasonable concerns should have been addressed and all conflicts resolved.

The purpose of this activity is to formalize the agreed-upon consensus for the project scope. The watchwords should be “no outstanding issues” and “no surprises.” Staff should carefully determine whether issues remain unresolved or unidentified. If so, more rounds of alternative definition, analysis, and selection should be conducted before a public hearing.

A good goal to work toward throughout the entire SIP is the creation of a consensus document outlining the following:

- the purpose of the project,
- project scope, and
- design elements that each stakeholder group and the Department feel comfortable approving at this end-point.

If staff does not feel that the process has reached such a point, address all outstanding issues before scheduling the final meeting. If a corridor study is conducted and a corridor is chosen, the preferred alternative within that corridor will be selected through the NEPA process, if applicable. The decisions made in the corridor study process will be carried forward into the NEPA document to explain why the corridor was selected and others were eliminated. Resource Agencies (e.g., US Environmental Protection Agency, US Army Corps of Engineers) must concur in the preferred alternative on projects subject to the NEPA/404 Merger process.

19-5.01(d)1 *Documentation of the Stakeholder Involvement Process for CSS Projects*

A critical element to the success of the CSS stakeholder involvement process is documentation. The PSG should clearly note and explain all major decisions made during the stakeholder involvement process. This includes all choices made from the selection of stakeholders, the definition of stakeholder involvement process ground rules, other parameters of the stakeholder involvement process (e.g., type and frequency of meetings), the selection of alternatives to be studied, and the selection of the preferred alternative. Any exceptions to established departmental design criteria must be clearly and completely justified. Any design features requiring special treatment during Phase II, construction, or maintenance during the project's design life should be noted and passed on to the entities responsible for those. Include this documentation in the project file for future reference.

19-5.01(d)2 *Stakeholder Involvement in Phase II and beyond*

There may be instances where changes to design features are proposed subsequent to Phase I Engineering and the stakeholder involvement process as outlined above. The changes can occur during Phase II Project Development, construction, or operation of the project. In the case where the change represents a major departure from the design resulting from the stakeholder involvement process, the PSG is required to meet again with the stakeholders to discuss and obtain consensus on the changes to be made. Any original design features, as well as any other commitments made during Phase I, will be contained in the project's commitment file; see Section 4-3.07.

There may also be occasions where the PSG will be required to approach the stakeholders on new issues that arise during Phase II Engineering, construction, or operation of the project. The issues will generally relate to decisions including, but not limited to, architectural design features, landscaping, aesthetics, management of traffic, maintenance of access, or public health. Stakeholder consensus must be obtained on such issues before any such feature is included in the project.

19-5.02 <u>Implementing the Stakeholder Involvement Process</u>

The activities outlined above should lead to greater integration of stakeholder ideas and opinions into project development. These activities should be aimed at providing stakeholders, most of whom are not going to be transportation or engineering professionals, with a good understanding of the issues, limitations, and purpose of the project being considered. Districts should not feel that the process outlined above is a rigid checklist of activities that must be followed to the letter; rather, they should use their judgment in applying the steps in the framework to determine how best to contact and engage stakeholders.

The following are additional considerations that can guide the planning of a constructive stakeholder involvement process:

19-5.02(a) Choosing an Approach

For most of the stakeholder involvement activities detailed above, the "open house" format of meeting is generally considered to be the most conducive towards public understanding and input. However, specific involvement activities may utilize a number of other formats in providing information to and receiving input from stakeholders. Section 19-3.03 discusses other type of Public Meeting formats that may be utilized.

19-5.02(b) Follow-up

There are many types of meetings and activities that can be used to help plan for or follow-up on large-scale stakeholder meetings. It is important to reach a wide variety of stakeholders during the planning and design process and to create an atmosphere that encourages the free and open exchange of information. Section 19-4.05 provides further details on several of these techniques.

For the meeting activities described in the preceding section, prompt and open follow-up on issues raised during these meetings is necessary. The appropriate type of follow-up will partially depend on public or stakeholder attitudes at the public involvement activity. If the public has been generally supportive of the material presented at the meeting, it is probably not necessary to initiate a large-scale follow-up. It may suffice to write individual letters to those who asked questions that were not answered and to release information to the news media, via project newsletters, or through updates on the project website for any changes that were made as a result of stakeholder input.

A greater amount of follow-up is required when a particular meeting has not resolved the issues to a reasonable degree. If there was opposition or a lack of understanding regarding what the Department is trying to accomplish with the project, a more extensive follow-up program is appropriate. In this case, additional follow-up stakeholders meetings are an effective means of achieving better stakeholder understanding of issues at hand. These meetings can range from large-scale community briefings to one-on-one discussions with a particular stakeholder.

19-5.02(c) Working Towards Stakeholder Understanding.

“Project Purpose” discussions involving the community should focus on providing the community with background on known traffic safety problems or congestion/operational problems, traffic forecasts, and their anticipated effect on future traffic conditions. These help explain the Department’s perspective on problems and needs, and set the stage for discussions about potential solutions. District staff should take advantage of any and all methods and opportunities to interact with the local citizens, public officials, and any other identified stakeholders. Efforts should focus on gathering data, developing a rapport and good working relationship with the local community, and obtaining a sense of what solutions to the identified transportation needs are in the context of the involved community.

19-5.02(c)1 *Consensus Building Efforts*

It should be noted that more than one of the meeting types listed above may need to be used and may require repetition, depending on the following:

- the number of stakeholders or stakeholder groups involved,
- the scope of the problems and issues discussed, and
- the positions and views of the stakeholders on the various issues.

Keep in mind the “halting points” outlined in the SIP flowchart, Figure 19-5.A, if a consensus resolution of these issues has not been achieved, then further meetings are probably necessary.

Department staff and elected officials involved in project development may find this frustrating or time consuming. However, problems and issues raised by stakeholders do not go away if left unaddressed. Often, relatively minor problems can become major impediments to progress if ignored or left unattended.

Throughout the SIP, project development staff should seek out activists and other participants with differing viewpoints from the team members, and engage in good faith discussions with them. An important component of conflict resolution is full disclosure of all information and discussions needed to manage and resolve conflicting values of stakeholders. When parties disagree, it is sometimes due to a misunderstanding or lack of information. It is important that both sides disclose relevant information to resolve or at least manage conflict between competing values.

An essential component of the stakeholder involvement process is the concept of “consensus.” The stakeholder involvement process seeks consensus on all decisions driving the project development process, and allows for multiple iterations of each step in order to achieve it. However, there may be occasions when consensus on one or more issues is impossible. Further, there may be occasions when the consensus decision of stakeholders is infeasible on engineering, environmental, funding, operational, safety, or other grounds.

If consensus is impossible or infeasible, the PSG must take the issue back to the Regional Engineer, and confer with FHWA, as necessary, to determine how to proceed with the project. Ultimately, the Department, acting in accordance with applicable State and Federal requirements, is responsible for project development decisions on State highway improvement projects.

19-5.02(c)2 *Stakeholder Understanding of the Alternative Solutions.*

The Context Sensitive Solutions approach varies as to how the Department handles this step. In one approach, the district can develop a range of alternatives that meet identified needs and that consider identified concerns. These alternatives are then reviewed in a public outreach process. New alternatives or variations on the original alternatives can be suggested by the stakeholders and should be analyzed and addressed by the district.

In a different approach, alternatives can be developed during the various stakeholder meetings and activities. Alternatives developed in this manner are refined and analyzed by district staff and presented broadly for public review and comment. This approach often fits best in situations involving a new facility, a significant change in the nature of a facility, or where a variety of configurations are possible for the project.

The PSG considers the issues involved, along with the time and resources available, in order to make a choice about the proper approach to use.

Stakeholders can be involved in the screening and evaluation of alternatives in many ways. The results of the district’s analyses are shared broadly with the stakeholders for review and comment. Stakeholders can also be involved in conducting screening and evaluation. For example, stakeholders can be asked to conduct an exercise where they rate project criteria and then weigh alternatives. Technological tools are available for conducting this kind of interactive analysis.

Using such tools can give both the PSG and the stakeholders a much clearer view of everyone's preferences.

One of the issues in soliciting stakeholder input as it pertains to technical issues is how to convey a large amount of technical data to the public in a manner and language they can understand, and in a relatively short period of time. The majority of citizens involved in these processes do not have the time to become conversant in the technical language and engineering concepts that are typically used by team personnel in studies of particular issues. Visualization aids, especially newer computer-assisted visual renderings, can significantly improve public understanding, enabling stakeholders to quickly analyze the information being presented. As a result, the use of effective visualization techniques can be a major asset to the successful implementation of public involvement activities.

19-5.02(c)3 *Stakeholder Understanding of the Recommendation.*

If clear communication with stakeholders has occurred during the alternatives analysis stage, stakeholder understanding of the benefits and impacts of various transportation solutions should clear the way to a consensus option. Results of effective stakeholder involvement may include agreement that further study is needed, support for a solution or approach, revision of design right-of-way or construction details, or even the delay, postponement, or cancellation of the project. A true measure of the success of a SIP, regardless of the solution implemented, is the degree the community at large, and each stakeholder, can feel a sense of involvement and ownership of the recommended solution.

Chapter Twenty

REQUIREMENTS FOR MAJOR PROJECTS

BUREAU OF DESIGN AND ENVIRONMENT MANUAL

Chapter Twenty
REQUIREMENTS FOR MAJOR PROJECTS

Table of Contents

Chapter Twenty
REQUIREMENTS FOR MAJOR PROJECTS

Subsection (h) of 23 U.S.C. 106, "Project approval and oversight," sets forth specific requirements that apply to "Major Projects." As defined in Subsection (h) and associated guidance issued by FHWA, "Major Projects" include those with a total estimated cost of $500 million or more that are receiving Federal financial assistance, or for such other projects as may be identified by FHWA. FHWA may choose to apply this designation in situations that include, but are not limited to, where FHWA determines a project requires a substantial portion of a State Transportation Agency's program resources, has a high level of public or congressional interest, is an unusually complex project, or is likely to exceed $500 million in total cost during the life of the project.

The requirements described in Subsection (h) for Major Projects include preparation and submittal of the following plans and updates:

1. Project Management Plan. This plan will document the procedures and processes that are in effect to provide timely information to the project decision-makers to effectively manage the scope, costs, schedules, and quality of, and the Federal requirements applicable to, the project and the role of the agency leadership and management in the delivery of the project.

2. Financial Plan. This plan will be based on detailed estimates of the cost to complete the project and will provide for the annual submission of updates that are based on reasonable assumptions of future increases in the cost to complete the project.

Pursuant to 23 U.S.C. 106 (i), "Other Projects" having an estimated total cost between $100 million and $500 million, when not classified as Major Projects, are required to have a financial plan. However, these plans do not require FHWA approval and the project estimates do not need to be validated through a formal Cost Estimate Review. See Section 20-4 for requirements for Other Projects.

The Transportation Infrastructure Finance and Innovation Act (TIFIA) program is a Federal financial assistance program that provides Federal credit assistance in the form of direct loans, loan guarantees, and standby lines of credit to finance surface transportation projects of national and regional significance. Regardless of total project cost, TIFIA loan proceeds require the borrower to submit annual financial plan updates throughout the life of the loan, which can extend beyond completion of construction for the project. If TIFIA or other programs are used, one financial plan may be submitted to meet both TIFIA and Major Project requirements.

The following sections provide guidance for implementing the above requirements on IDOT projects that meet the $500 million total estimated cost threshold or that FHWA otherwise designates as Major Projects.

See the appropriate Chapter in Part III, Environmental Procedures, regarding environmental coordination guidelines for Major Projects.

20-1 MAJOR PROJECT DETERMINATIONS

All costs associated with the project from the NEPA phase through final construction must be included in determining the total estimated project cost, regardless of the source of funding. The scope of the Major Project is defined in the NEPA decision document - whether a Record of Decision (ROD), Finding of No Significant Impact (FONSI) or Categorical Exclusion (CE) and includes all work associated with implementing the undertaking.

20-1.01 Operationally Independent Non-Concurrent Construction Projects

For purposes of the Major Project requirements, the scope of work can be reduced to component projects where the overall project will be built over a long period of time. To be applicable, the "operationally independent non-concurrent construction projects" need to be separated by at least five years between the completion of one project and the start of the other. There also must be work that is not expected to begin construction for at least 20 years after initial construction commences. In addition, the completed non-concurrent project, once opened, needs to effectively operate even if the rest of the work described in the environmental document is never built.

The operationally independent non-concurrent construction projects need to be identified so they can be incorporated into the Final Environmental Impact Statement (FEIS) or Environmental Assessment (EA). Approval of the FHWA Division Office is needed for this approach, and the Division must consult with and obtain concurrence from the FHWA Headquarters Project Delivery Team in the Office of Innovative Program Delivery (OIPD), before making its determination.

This determination by FHWA is solely for the purposes of applying Major Project requirements, and specifically Financial Plan and Project Management Plan requirements, and has no effect on project planning or NEPA review. Once the determination has been made concurring with the operational independence of non-concurrent construction projects, Major Project requirements will apply to the initial portion of the project rather than the overall project. If the initial portion of the project is still deemed a Major Project on its own merits, the required Project Management and Financial Plans for the operationally independent and non-concurrent project should only cover the scope for that portion of the project.

20-1.02 Construction Phasing

Construction phasing is another option to be addressed within the Major Project requirements when the project will be implemented over a long period of time, so that incremental funding and building phases of the overall project are logically planned and completed.

In the event there are insufficient financial resources immediately available to complete the entire project as defined in the NEPA decision document, Financial Plans may identify fundable incremental improvements or phases (a “phasing plan”) that will address the purpose and need of the overall project in the short term (23 U.S.C. 106(h)(3)(C)). For projects with Financial Plans that include phasing plans, the total cost of the overall project, not the cost of any fundable incremental improvement or phase, is still used to determine whether the project meets the $500 million threshold (23 U.S.C. 106(h)(1)).

In general, the inclusion of a phasing plan does not alter the contents of the Financial Plan as described in this guidance, but does have an impact on how the overall project can meet fiscal constraint requirements under 23 U.S.C. 134 and 135. If a phasing plan is included in an approved Major Project Financial Plan, and fiscal constraint requirements are met for the funded phase, then pursuant to 23 U.S.C. 106(h)(3)(C), the overall project is deemed to meet fiscal constraint requirements under 23 U.S.C. 134 and 135.

Fundable incremental improvements or phases do not need to meet the operationally independent and non-concurrent construction project criteria, but should be segments that can be opened to the public and effectively operated without the completion of subsequent segments or other additional transportation investments. The decision to adopt a phasing plan for a Major Project needs to be closely coordinated with FHWA, as this decision does not relieve or waive any of the other regular planning or NEPA requirements, and could require re-evaluation of fiscal constraint and/or NEPA reviews. Ideally, the phasing plan would be identified so it could be incorporated into the Final Environmental Impact Statement (FEIS) or Environmental Assessment (EA). Approval of the FHWA Division Office is needed for this approach, and the Division must consult with the FHWA Headquarters, Project Delivery Team in the Office of Innovative Program Delivery, before making its determination.

Fundable incremental improvements or phases should be presented as one individual funded phase in the Financial Plan. As additional fundable incremental improvements or phases are identified, they should be added to the single funded phase in the Financial Plan, including what was previously financed and constructed. Additionally, the Financial Plan should document the entire project’s scope, cost, and schedule as defined by the NEPA decision document approving the project, and be updated annually. A Project Management Plan is still required even if the first phase is less than what would be considered as a Major Project.

The decision to adopt a phasing plan for a Major Project needs to be closely coordinated with FHWA.

Section 20-2 follows which provides Project Management Plan guidance. See Section 20-3 regarding additional Financial Plan requirements.

20-2 PROJECT MANAGEMENT PLAN

References: FHWA *Major Project Guidance Memorandum*, January 19, 2007
FHWA *Project Management Plan Guidance*, May 22, 2017

20-2.01 Purpose

The Project Management Plan is the guide for implementing a Major Project. It documents assumptions and decisions regarding communication, management processes, execution, and overall project control. The ultimate purpose of the Project Management Plan is to clearly define the roles, responsibilities, procedures, and processes that will result in the Major Project being managed so that it is completed:

- on-time;
- within budget;
- with the highest degree of quality;
- in a safe manner for both the individuals working on the project and for the traveling public; and
- in a manner that will maintain the public trust, support, and confidence in the project.

The Project Management Plan addresses all phases of the Major Project's life cycle and ensures the project will be managed holistically and as a continuum; not incrementally as the project progresses. The Project Management Plan establishes the metrics by which the success of the project is defined.

When a Major Project has multiple project sponsors, a single Project Management Plan should be prepared.

20-2.02 Submittal Process and Approval

The responsible district will prepare Project Management Plans for IDOT Major Projects. The district will obtain a written endorsement of the Project Management Plan from the IDOT executive leadership confirming the commitment of achieving the project objectives and officially initiating the use of the requirements set forth in the Project Management Plan. The executive endorsement signature page should include language noting that the effectiveness of the Project Management Plan will be continuously evaluated and revised, as appropriate, as the project progresses in order to provide for the most effective management of the project in meeting its defined objectives. Once the executive leadership endorsement is obtained, a draft Project Management Plan shall be submitted to the FHWA for review at least 60 days prior to approval of the NEPA decision document. The FHWA will provide comments and the district shall submit a final Project Management Plan for approval within 90 days of the date of the signed NEPA decision document (CE, FONSI or ROD).

The FHWA Division Office will coordinate with FHWA Major Projects Team in the Office of Infrastructure to review the Project Management Plan and any plan updates that require FHWA review. FHWA will respond whether the plan conforms to applicable requirements no later than 60 days after the document is received by the FHWA Major Projects Team. The FHWA approval of the Project Management Plan and updates rests with the FHWA Division Office; however, the Division Office must receive a concurrence email from the FHWA Major Projects Team. For all Major Projects, the Project Management Plan should be submitted and approved by FHWA prior to the approval of the Initial Financial Plan.

The Project Management Plan is a living document which may be revised throughout the course of the project. Updates may be issued to ensure that the documented procedures, processes, and roles are current. Project Management Plan updates with significant changes to the project should be submitted to FHWA for review and approval. Other plan updates should be submitted for recordkeeping purposes.

Significant changes that will necessitate submittal of the updated Project Management Plan to FHWA for review and approval include organizational structure changes to the project management team or changes to the project management procedures or processes.

The Project Management Plan should be approved prior to authorization of Federal-aid funds for right-of-way acquisition and prior to authorization of Federal-aid funds for construction.

20-2.03 Contents

The following topics form the basic contents for the Project Management Plan. The intent of the following paragraphs is not to establish a prescriptive format, but to provide a general framework in which modifications can be made to produce a Project Management Plan that will most effectively serve IDOT and FHWA throughout the project.

1. Project Purpose, Goals, Objectives, and Metrics. A well-defined project purpose is instrumental to project success. The Project Management Plan should document the project purpose consistent with the NEPA purpose and need statement. The plan should also list goals and objectives of the overall project, and how those goals and objectives will be measured and quantified. Project goals and objectives explain what needs to be achieved by the project. While project goals broadly define the long-term vision for the project, the project objectives define strategies or implementation steps to attain such goals. Objectives are specific, measurable, short-term actions that set the framework for establishing quantitative and qualitative metrics for the project and define what is considered a successful project. For example, one commitment may be to complete the project within a certain budget. The extent to which this commitment will be met is a quality measure. Completing the project at 10% under budget would be a possible outcome and would be a more favorable outcome than completing the project at 1% under budget. Metrics included in the plan should cover schedule, budget (including cost containment), quality, safety, scope control, public trust and confidence, and Federal requirements.

   The quality requirements for the project should be stated up-front, so that all involved and concerned parties can understand the basic management philosophies that will be incorporated to meet these requirements. The Project Management Plan should be clear and specific on how quality will be measured and should include appropriate targets and tolerances.

2. Project Description and Scope of Work. The Project Management Plan should document the complete description of the project, along with the history of its development and important project decisions. It should contain a clearly defined project scope as defined in the NEPA decision document. A clearly defined scope of work will document design, construction, environmental, railroad/utilities, and right of way activities and outline which items of work have been dedicated in the baseline cost budget and will assist in controlling and minimizing future potential scope increases. A map of the defined project can be included for added clarity.

3. Project Organizational Management. The project management team should be organized, from a managerial, technical, oversight, and decision-making perspective, to achieve all of the stated project goals and objectives. The Project Management Plan should include an organizational chart for clarity, with a brief description of roles and responsibilities for each individual or organizational team. Normally, an executive oversight committee (or steering committee) will be shown at the top of the chart to provide overall project direction. The executive oversight committee would be primarily composed of executive level FHWA, IDOT, and local officials and should meet on a periodic basis. The day-to-day project management team is normally led by a project manager who would report to and support the executive oversight committee.

   This section of the plan should define the relationships between public and private stakeholders and their organizational structures. Also, if the Major Project is in multiple states, describe each state's roles and responsibilities.

   In addition to technical and functional support teams for right-of-way, utilities, design, construction, project controls (e.g., scheduling, cost, document control), QA/QC, etc., consideration should be given to creating separate teams for media and public information, civil rights, environmental monitoring and review, safety, and security.

   The project team must have experienced key personnel dedicated to the success of the Major Project, with the requisite technical, managerial, leadership, and communication skills needed to proficiently perform the required tasks. Project teams that integrate consultants and Department personnel in the project management and functional/support teams can be successful, but the use of consultants must be carefully structured and reviewed to ensure proper oversight. At least one Department manager should be directly responsible and accountable for the project management team and each functional/support team.

4. Project Phases and Phasing. The planning and project development portion of the project can include many stages and a range of potential alternatives. The Project Management Plan should include a description of the procedures and processes for a Major Project to facilitate effective management of day-to-day project activities and to

promote understanding by the project management team of the broader context of the project timelines and potential influences on the project.

Additionally, project sponsors often fund and/or construct portions of the project incrementally. If the overall project scope is being delivered as part of several smaller, incremental projects as discussed in Section 20-1.02, the Project Management Plan should document and describe all operationally independent and non-concurrent construction phases approved for the project.

5. Procurement and Contract Administration. Document and formalize how procurement and contract administration activities are to be conducted to comply with all applicable federal, State, and local laws, regulations, rules, and mandates. This section should discuss how procurement decisions are to be made, including selection of consultants, contractors, and contracting methods. Consideration should be given to the size and length of contracts as they relate to bonding capacity, the number of likely bids, and other market conditions. It is also important to note that the strategy of using multiple contracts may introduce additional coordination and interface issues among separate contracts.

   This section should address how the contract will be administered and the requirements for performance reporting, payments, claims administration, and records management will be monitored and documented. In addition, it should document the process for contract closeout, including analysis of the results of the contract.

6. Cost, Budget and Schedule. Cost and schedule data are included in the Financial Plan and annual updates (see Section 20-3) required for all Major Projects. The initial Financial Plan is required prior to the first federal authorization for construction funds. The Project Management Plan should specifically reference the Financial Plan and Annual Updates as an integral part of the Project Management Plan and should discuss the process and frequency for validation of cost estimates and schedules. The Project Management Plan should include the current cost and schedule information, broken down into major cost elements and significant schedule milestones. The initial financial arrangements for the project, including any proposed loans and/or bonds also should be discussed. The financing for Major Projects must be consistent with any fiscally constrained plans, Statewide Transportation Improvement Programs (STIPs), Transportation Improvement Programs (TIPs), etc. The Financial Plan Annual Updates will document any subsequent budget and financing revisions.

   Prior to preparation of the Initial Financial Plan, the Project Management Plan should have a mechanism in place for providing an annual report updating the project cost estimate.

   Independent validations of the cost and schedule at key milestones are important to avoid unexpected cost overruns and project delays. The Project Management Plan should provide for independent validations by an unbiased team that does not have a stake in the outcome of the validation. FHWA will conduct its own independent validations of the cost estimate as appropriate at key milestones throughout the project continuum (e.g., prior to approval of the FEIS or EA and again during preparation of the Initial Financial Plan, which will precede the initial FHWA construction authorization). FHWA may also review project cost estimates any time the Financial Plan Annual Update shows a significant cost increase, delay, or scope change from the previous Annual Update. Independent validations conducted by IDOT should be coordinated with FHWA for verification.

7. Project Documentation, Reporting and Tracking. The Project Management Plan should include discussion on how project records will be managed, including definition of the project document control, reporting and tracking system. The project document control, reporting and tracking system will be a key element in ensuring the consistency of the project with the budget and schedule to the maximum extent practical, that the project will be completed with the highest degree of quality, and that compliance will be established with all applicable Federal regulations.

   The project document control, reporting and tracking system should provide for collecting, assessing and maintaining timely, independent, and accurate project status information and data. It should provide current information on project progress, changes, and issues for use in identifying trends, forecasting project performance, and proactively addressing potential problems.

   The need for continuously and accurately reporting cost increases, schedule changes, items of deficient quality and the causes, impacts, and measures to mitigate these issues is paramount for effectively administering the project and protecting the public investment in the project. Any apparent reporting deficiencies or questionable data should be promptly addressed and resolved. IDOT and FHWA must have timely and complete information on the project status to be able to take appropriate action to effectively address any problems, if necessary.

   FHWA recommends monthly reports on project cost, schedule and status and monthly status meetings with the project management team, IDOT and FHWA representatives and representatives of other agencies, as appropriate. The monthly status meetings should include discussion of project costs, schedule, quality issues, compliance with Federal requirements, and other status items in sufficient detail to make all involved parties aware of any significant status issues and actions planned to address any adverse effects.

   The following is a sample format for a monthly status report. It is provided as an example and is not intended to be prescriptive. (Refer to the FHWA *Project Management Plan Guidance* for additional detail on the content of each section of the report.)

   a. Executive Summary. The executive summary should provide a clear and concise description of the current project status, including any major issues that impact the project scope, budget, schedule, quality, safety, etc.

b. Project Activities and Deliverables. The purpose of this section is to highlight (1) project activities and deliverables for the current reporting period (i.e., the previous month) and (2) activities and deliverables planned for the next two reporting periods.

c. Action Items/Outstanding Issues. This section should identify and track the progress in resolving highly significant or sensitive issues that require action and direction to address.

d. Project Schedule. This section should include an updated master project schedule reflecting the current status of project activities.

e. Project Cost. This section should include an updated cost spreadsheet reflecting the current projected cost, compared with the approved budget and the baseline budget.

f. Project Quality. The purpose of this section is to (1) summarize the QA/QC activities during the reporting period and (2) highlight any significant items of deficient quality identified.

g. Other Status Reports. IDOT and FHWA may agree that other reports may be beneficial for ensuring project status issues are fully and openly communicated. Examples include reports on contractor safety performance, wrap-up insurance payments and reserves, and/or actual DBE use compared to DBE-use goals.

8. Project Management Controls (Scope, Cost, Schedule, Claims, etc.). A project controls team normally helps to manage the scope, total cost, and overall master schedule for the project. The team also assists the project management team to meet the projects schedule and budget objectives. The project controls team also produces project reports that include quantification of delays and cost increases and initiatives being analyzed to address the delays and cost increases. The following are project management controls that should be used on most Major Projects and that should be documented, as appropriate, in the Project Management Plan (Refer to the FHWA *Project Management Plan Guidance* for additional details.):

a. Risk Management Plan. This plan documents a systematic process to identify, analyze, and respond to project risk throughout all phases of the project.

b. Scope Management Plan. This plan documents the philosophy regarding scope management, the process for approving scope changes, and for verifying the planned scope of work is actually completed.

c. Scheduling Software. This item describes the scheduling software to be used for the project and the frequency and detailed process for reviewing and validating schedules.

d. Cost Tracking Software. This item describes the software to be used to track and report costs for the project and the frequency and detailed process for reviewing and validating cost estimates.

e. Project Metrics. This item describes the metrics by which the success of the project is measured (e.g., cost, schedule, public opinion).

f. New and Innovative Contracting Strategies. This item discusses management processes for new and innovative procurement strategies to be incorporated in the project (e.g., Design-Build, Public-Private-Partnerships, cost-plus-time bidding, lane rental, bid options).

g. Value Engineering Analysis. Refer to Section 11-7.03 for requirements and guidance on value engineering analyses.

h. Partnering. This item documents a formalized partnering process to enhance working relationships between the project delivery team and contractors. It should describe the level of organizational involvement and professional facilitation required, including any partnership development and team-building workshops.

i. Contractor Outreach Meetings. If contractors are to be consulted during the early design process, this item discusses the level of involvement by contractors and any procurement restrictions on contractors involved in outreach meetings.

j. Change Order and Extra Work Order Procedures. These are procedures for addressing change orders and extra work orders during project construction that will ensure appropriate review, efficient processing, and consistency with project objectives.

k. Claims Management Procedure. This item describes the claims review and management process to be followed in cases of contractor claims. It should document the roles and responsibilities of those reviewing and approving the claims, including legal reviews.

l. Other Programs. This item describes how other unique programs (e.g., Owner Controlled Insurance Programs (OCIPs), Transportation Infrastructure Finance and Innovation Act (TIFIA) loan program) are to be managed.

9. Design Quality Assurance/Quality Control (QA/QC). The Project Management Plan should set the general requirements for QA/QC to be used during the design phase. A reference to standard design QA/QC documents may be appropriate, plus any enhanced QA/QC procedures to be incorporated due to the complexity and visibility of the Major Project. FHWA guidance suggests that, at a minimum, the design QA/QC procedures include the following:

- an overall Design QA/QC Plan;

- design criteria to be adhered to;

- design criteria specific to the individual project;

- procedures for preparing and checking individual plans, specifications, estimates, calculations, and other items;

- procedures for preparing and checking any unique or highly specialized designs;

- procedures for coordinating work performed by different persons for related tasks to ensure that conflicts, omissions, or errors do not occur between drawings or between drawings and other design documents;

- procedures for coordinating and obtaining permits from permitting agencies, utility companies, and railroad companies. This should include procedures for ensuring that all permitting, utility, and railroad requirements are incorporated into the design of the project and procedures for coordinating submittals and agency reviews so that the overall project schedule is not delayed;

- level, frequency, and methods of review of the adequacy of the total project design and methods by which:

  + all final design documents will be independently reviewed;
  + verified for constructability, completeness, clarity and accuracy; and
  + back-checked;

- level and frequency of audit and oversight design reviews (concerning QA/QC and validity of consultant payments) to be performed by IDOT, FHWA, independent consultants, and/or other agencies;

- procedures for reviewing and checking design drawings and documents required during construction;

- qualifications for all key design personnel; and

- documentation and submission procedures to ensure the established design QA/QC procedures have been followed.

10. Construction Quality Assurance/Quality Control (QA/QC). The Project Management Plan should also set the general requirements for QA/QC to be used during the construction phase. A reference to standard construction QA/QC documents may be appropriate, plus any enhanced QA/QC procedures to be incorporated due to the complexity and visibility of the Major Project. FHWA guidance suggests that, at a minimum, the construction QA/QC procedures include the following:

    - an overall Construction QA/QC Plan;

    - guidance on:

  + construction standards to be adhered to for performing construction inspection;

  + documents to be used that will define materials to be certified, materials to be tested, sampling procedures, and testing procedures; and

  + recordkeeping and reporting procedures and nonconformance plan;

- agency or party responsible for QA/QC (i.e., responsibilities of the contractor versus IDOT for sampling, testing, monitoring, and reporting test results);

- frequency and agency involvement for construction coordination (progress) and/or partnering meetings;

- procedures for coordinating with permitting agencies, utility companies and railroad companies during construction to ensure all requirements are incorporated into the project so that the overall project schedule is not delayed;

- level and frequency of inspections to identify and correct any deficiencies in the project construction that do not meet the requirements of the plans, specifications, and other binding documents;

- level and frequency of audit and oversight construction reviews (concerning QA/QC and validity of contractor payments) to be performed by IDOT, FHWA, independent consultants, and/or other agencies;

- qualifications for all key construction personnel; and

- documentation and submission procedures to ensure the established construction QA/QC procedures have been followed.

11. Environmental Monitoring. The final NEPA decision document and other agreements can define the required mitigation for the Major Project. In addition, environmental permits may be obtained during project design that will specify additional requirements to be adhered to during construction. The Project Management Plan should establish the general requirements for ensuring all environmental commitments are included in the design and construction of the project, and that a proactive approach is used for overseeing and inspecting environmental work during construction to help guard against cost overruns and project delays. In addition, many Records of Decision include requirements for environmental compliance actions on an ongoing basis after a facility is open to traffic (e.g., storm water management, wetlands performance). FHWA guidance suggests that for a Major Project with a substantial amount of sensitive environmental issues, environmental monitoring procedures should include some or all of the following:

    - an overall Environmental Monitoring Plan to verify that environmental commitments from the NEPA document, environmental permits and other environmental approvals are implemented in accordance with the scope as described;

- roles and responsibilities of the environmental monitoring staff;
- any strategic stationing or positioning of staff members to maintain ongoing contact with resource agencies and a working knowledge of the project's environmental issues to ensure follow-through on all commitments from the FEIS and environmental permits;
- any planned proactive coordination with resource agencies during project design and construction to ensure early and ongoing communication of environmental issues and requirements;
- any fluctuating work schedules among environmental monitoring staff to ensure continuous coverage of key contractor schedules and activities that may involve environmental effects;
- coordination of environmental monitoring staff's daily activities with the project management and construction management teams to monitor and observe critical contractor activities;
- recordkeeping and reporting procedures;
- procedures for addressing noncompliance and violations;
- permit modification procedures related to construction activities, including strategies for guarding against cost overruns and project delays while still ensuring good environmental stewardship; and
- post-construction environmental performance for wetlands, storm water, vegetation, wildlife crossings, endangered species, etc.

12. Right-of-Way. This discussion should address policies and processes for appraisals, acquisitions, relocations, demolitions, construction/utility easements, scheduling, and reporting.

13. Safety and Security. This section should define the requirements to be incorporated to ensure the project is conducted in a safe and secure environment for all individuals working on the project. Accident prevention during execution of a Major Project should be a primary concern of all participants and should be a responsibility of all management levels for the project. Safety should be considered an integral part of an efficient and quality project and should never be compromised for the sake of production. FHWA guidance suggests that safety and security procedures include the following:

- safety and health standards;
- roles and responsibilities of the safety/security staff;

- requirement for contractors (i.e., prime contractors, subcontractors) to have a Safety Director and an approved safety manual or plan available to all employees;
- requirement for contractors to hold periodic on-site safety meetings;
- requirement for contractors to conduct periodic on-site safety inspections;
- requirement for contractors to provide safety training for all new employees and refresher training for all employees;
- requirement for contractors to conduct drug screening for all new hires;
- requirement for contractors to publish daily housekeeping and clean-up procedures;
- provisions for possible employee sharing of savings from accident prevention;
- provisions for having first-aid and medical kits readily available;
- provisions for having a site-security plan, possibly including such items as restricted parking near vulnerable structures, physical barriers (e.g., fences, barricades), coordinated efforts with local law enforcement officials during heightened threat levels, video surveillance, alarm systems, emergency telephones, etc.;
- provisions for having an emergency preparedness and incident management plan including roles and responsibilities, emergency evacuation procedures, communications, first responder awareness training, and field drills;
- provisions for establishing an employee identification (ID) system;
- provisions for level and frequency of audit and oversight safety/security reviews to be performed by IDOT, FHWA, independent consultants, and/or other agencies; and
- provisions for periodic reporting (normally monthly) on safety and security matters.

In addition, appropriate threat and vulnerability assessments should be made and taken into consideration throughout the project's life cycle, recognizing that transportation elements of a Major Project could have a significant impact on regional safety and security plans.

14. Traffic Management. This section of the Project Management Plan should define the requirements for providing monitoring and oversight of the contractor's day-to-day maintenance of traffic operations, to ensure the project is conducted in the safest and

most efficient manner for the traveling public. FHWA guidance suggests traffic management procedures include the following:

- maintenance of traffic standards;
- roles and responsibilities of traffic management staff;
- provisions for reviewing maintenance of traffic plans and proposals at various design reviews for conformance with approved standards and familiarity with traffic phasing, traffic shifts, and lane closures proposed during construction;
- provisions for coordinating with local agencies during design and construction regarding placement of temporary signing and traffic control devices within their jurisdictions;
- provisions for coordinating with local agencies during design and construction regarding traffic restrictions and management for special events;
- provisions for coordinating with all local emergency agencies during design and construction to ensure adequate passage for emergency vehicles through construction zones;
- provisions for coordinating traffic maintenance with multiple contractors to integrate temporary signing and traffic control devices among various contracts;
- provisions for coordinating with contractors concerning specific language to be used on variable message signs during construction;
- provisions for conducting periodic reviews during construction (including nighttime inspections) for conformance with plans, specifications, and approved standards and to ensure all traffic control devices are functioning properly;
- provisions for having an incident management plan for crashes occurring within the project limits, including crash prevention strategies, emergency procedures, reporting requirements and mitigation strategies;
- provisions for coordinating with and assisting the media and public information team and local new media concerning traffic pattern changes, periods of lane closures, traffic delays, availability of alternative routes, work zone crashes, etc.;
- provisions for level and frequency of audit and oversight traffic management reviews to be performed by IDOT, FHWA, independent consultants, and/or other agencies; and
- provisions for periodic (normally monthly) traffic management reporting.

15. Project Communications Management. The Project Management Plan should document all external communications planned for the Major Project. A critical objective for all

Major Projects is to maintain the trust, support, and confidence of the media and the public throughout the life of the project. A Media and Public Information Plan, that will promote proactive, effective, and responsive project communications, is a key component in meeting this objective. FHWA guidance suggests examples of key strategies that should be incorporated into the plan, including the following:

- establish a public information team or office to be responsible for all media and public information efforts for the project;
- proactively convey current project status information to the media and the public, including scheduled milestone completion dates; major contracts advertised, awarded or completed, and total cost projections;
- proactively convey updated commuter and traffic information, including traffic patter changes, periods of lane closures, traffic delays, work zone crashes, availability of alternative routes, and alternative forms of transportation (including benefits and possible subsidies);
- proactively convey, to the greatest extent possible, construction impacts to local residents and businesses and measures to be implemented for mitigation of the impacts;
- provide timely responses to questions and requests for project information from the media and the public; and
- provide information to increase awareness and understanding of the benefits of the project to encourage a sense of ownership and pride in the project for the affected community and other stakeholders.

In addition to external project communications, reporting and tracking, internal communications and communications with stakeholders should be addressed as an integral part to a successful project. The Project Management Plan should include a discussion addressing communications between project team members and stakeholders that covers how informal and formal communications will be conducted and managed.

16. Civil Rights Program. IDOT and FHWA should make a commitment to provide a strong civil rights program for the Major Project. This section of the Project Management Plan should outline the specific goals and requirements related to Disadvantaged Business Enterprises (DBE), Small Business Enterprises (SBE), Equal Employment Opportunity (EEO), and other civil rights programs for contractors, consultants, and the project delivery team. A separate civil rights team or office may be created that would be responsible for administration and oversight of the civil rights program for the project.

Procedures and requirements should be established for periodic (normally monthly) reporting on the civil rights program and for review and audit of the program.

Procedures should be defined for prompt handling of negative findings and complaints regarding the program, including the use of appropriate sanctions, if necessary.

The civil rights team/office should interface with the public information team/office to ensure that disadvantaged communities are included in public outreach programs. Consideration should be given to conducting DBE outreach sessions that bring DBEs and prime contractors together in “one-on-one” meetings to discuss large, upcoming contracts. These types of sessions have shown positive results in helping to meet or exceed DBE goals.

17. Closeout Plan. The Project Management Plan should include a Closeout Plan that discusses the requirements for providing a coordinated transition from construction to operations and the roles and responsibilities of various agencies and offices in accomplishing the transition.

18. Other Possible Sections. The Project Management Plan could also include sections on:

- human resources management, including management of project teams and their roles and responsibilities, project team performance assessment and other human resource issues; and
- any other project functions IDOT or FHWA believe would be beneficial to help in meeting the goals and objectives for the Major Project.

19. Appendices. Appendices to the Project Management Plan could include any prior interagency agreements or other applicable documents that would aid users of the plan in understanding prior commitments and previously established roles.

20-3 FINANCIAL PLAN

References: FHWA *Major Project Guidance Memorandum*, January 19, 2007
FHWA *Major Project Financial Plan Guidance*, December 18, 2014
FHWA *Major Project Program Cost Estimating Guidance*, January 2007

20-3.01 General

These Financial Plan requirements apply to Major Projects as described in 23 U.S.C. 106 (h).

Section 20-3.06 describes the review and approval process for Major Projects. Section 20-4 describes the financial plan requirements for Other than Major Projects under 23 U.S.C. 106 (i).

The Initial Financial Plan will provide information on the immediate and long-term financial implications resulting from project initiation. The Annual Updates of the Financial Plan should provide information on actual cost, expenditure, and revenue performance in comparison to initial estimates and updated estimates of future years' obligations and expenditures. The annual updates will provide information on cost and revenue trends, current and potential funding shortfalls, and the financial adjustments necessary to ensure completion of the project. The projected uses of funding for the project must meet the fiscal constraint requirements for the IDOT planning process.

20-3.02 Purpose

A Financial Plan is a comprehensive document that reflects the project's cost estimate and revenue structure and provides reasonable assurance that there will be sufficient financial resources available to implement and complete the project as planned. A Financial Plan provides a description of how a project will be implemented over time by identifying project costs and the financial resources to be used in meeting those costs. The plan should clearly explain the assumptions about cost and revenue upon which the plan is based. Additionally, the Annual Updates to the plan will enable decision makers to track the financial progress of the project over time by highlighting significant deviations from the Initial Financial Plan and subsequent Annual Updates explaining the mitigation actions taken to adjust for those deviations. In essence, the Financial Plan process is a subset of the overall Project Management Plan that is required for each Major Project.

20-3.03 Timing

The Initial Financial Plan should be prepared as early in the Major Project development process as practical. The cost estimate developed during the environmental process is used to determine if the action is subject to the Major Project requirements. If the estimated cost is over $500 million, a cost estimate review is completed no later than FEIS. Accordingly, a Financial Plan could be submitted to the FHWA Division Office at the time of issuance of the Record of Decision if all other elements of the Financial Plan have been completed. The Initial Financial Plan for a Major Project could also be submitted and approved by FHWA prior to right-of-way acquisition but, in all cases, should be submitted and approved by FHWA before the first authorization of Federal-aid funding for construction. On a design-build project, the Initial Financial Plan should be approved prior to FHWA concurrence in the award of the design-build contract. The FHWA Division Office will approve all Financial Plan documents, even when the FHWA Headquarters Project Delivery Team is involved in the review and concurrence process. In these cases, the FHWA Office of Innovative Program Delivery (OIPD) will provide formal concurrence to the Division Office.

Financial Plans must be updated annually. The Initial Financial Plan should indicate the reporting date for Annual Updates to the plan. IDOT has the option of determining the effective date of the Annual Update submission and may choose a date one year after approval of the Initial Financial Plan or, more commonly, at the end of the IDOT fiscal year or end of the federal fiscal year. The Annual Updates must reflect changes in total and remaining project cost and/or available funding. The annual updates shall be submitted to FHWA for approval no more than 90 days after the effective date established in the Initial Financial Plan.

The scope of the Annual Updates should be sufficient to identify and resolve any cost and/or funding (including cash flow) changes that have occurred since submission of the previous plan or update. This would include any changes in project scope that impact the cost estimate and/or completion schedule for the project. In the event of major changes in cost or funding, the updates may need to revise the cost and funding figures for future years in addition to those for the current year.

20-3.04 Methodology

The Initial Financial Plan and Annual Updates should be prepared in accordance with the guidelines provided in this Chapter and recognized financial reporting standards (e.g., *Guide for Prospective Financial Information* of the American Institute of Public Accountants included as Attachment A in the FHWA *Financial Plans Guidance*). In unique or unusual circumstances, alternative formats may be acceptable with prior concurrence of the FHWA Division Office and the FHWA Project Delivery Team.

20-3.05 IDOT Certification

The Initial Financial Plan and each Annual Update should include a certification, signed by the IDOT Secretary, indicating that the content is “accurate and reasonable to the best of my knowledge and belief.” The Secretary may specifically delegate in writing the signature authority for major project financial plans. (See Attachment A of the FHWA *Financial Plans Guidance* for a sample Letter of Certification.)

20-3.06 FHWA Review and Approval

The Initial Financial Plan and Annual Updates shall be submitted to the FHWA Division Office for review and approval. The FHWA Division Office and FHWA Projects Delivery Team will coordinate the review and approval of the Initial Financial Plan and all Annual Updates. The review will evaluate such items as the reasonableness of the cost projections, the viability of the identified funding sources, including whether they are contained in the fiscally constrained STIP/TIP/Long Range Plan, and the likelihood the funding commitments will provide sufficient resources to complete the project as planned. The FHWA review and determination of acceptability should be completed within 30 to 60 days from the date the FHWA Project Delivery Team receives the document. A concurrence memorandum from the Director of OIPD will be sent to the Division Office prior to approval of the Initial Financial Plan. A concurrence e-mail from the FHWA Project Delivery Team will be sent to the Division Office prior to the approval of Annual Updates. After project construction is completed, the FHWA Project Delivery Team will send a concurrence e-mail which will include the statement that all major project requirements have been met. In all cases during the construction period, the approval of the Initial Financial Plan and Annual Updates will be by the FHWA Division Office.

20-3.07 Content

The Initial Financial Plan should consist of at least eight main sections:

- Project Description,
- P3 (Public-Private Partnership) Assessment
- Cost Estimate,
- Implementation Plan,
- Financing and Revenues,
- Cash Flow,
- Risk Identification and Mitigation Factors, and
- Annual Update Cycle

The following paragraphs provide a detailed explanation of the content for each of the required sections:

1. Project Description. The purpose of this section is to describe the scope of the project. Since the scope of the overall project is established by the environmental document, it must outline the environmental process and indicate the date of the NEPA decision document to ensure that the entire project is contained in the financial plan. Additionally, it is recommended to include a graphic depicting the project location.

   If a phasing plan is presented, a detailed description of the scope of the funded phase is required. It should document that the funded phase can be opened to the public and operated without the remaining construction being completed.

2. P3 Assessment. This section should describe the process used to determine the appropriateness of P3 to deliver the project. The discussion should include the existence or absence of legislative authority allowing P3 type procurement; the plan to manage P3; and the comparison of benefits and challenges of procuring the project as P3 compared to traditional procurement methods, including innovation, project delivery schedule, cost and schedule impacts, quality, operations and maintenance efficiencies, and increased likelihood of project delivery. Additionally, the narrative should include the

risk allocation analysis comparing P3 with traditional delivery methods and relative access to and cost of capital.

3. Cost Estimate. The purpose of this section is to present the current estimate of the total cost of the project and the remaining cost-to-complete. This should include all costs and the value of all resources necessary to perform the preliminary engineering, including the cost of NEPA and other environmental documentation, right-of-way, environmental mitigation, construction, project management, Transportation Demand Management and Transportation System Management, public outreach, and costs associated with external third party work (e.g., utility adjustments, railroad relocations.) All costs should be calculated in accordance with standard accounting methods and generally do not include the costs of acquiring revenue (taxation, mortgage interest payments, etc.). For further information on estimating costs for Major Projects *Major Project Program Cost Estimating Guidance* is available on the FHWA Major Projects website. The total cost of the project should be presented as the sum of the costs for each major segment and element of the project. This section should include a narrative describing the assumptions used in developing the cost estimates. All costs should be presented in "year of expenditure" dollars (i.e., dollars that are adjusted for inflation) because it is important for the Financial Plan to be consistent in presenting both costs and revenues in comparable dollars.

   At least one FHWA Cost Estimate Review (CER) should have been conducted for the entire project within 12 months prior the submission of the Initial Financial Plan. The FHWA and the project sponsor should participate during the entire CER. Alternatives to CER process may be considered with prior FHWA consultation.

4. Implementation Plan. This portion of the Initial Financial Plan should present the schedule for completing the project. Completion is usually established as the date (month and year) when the project sponsor expects to accept all of the construction work; but it should not include warranty periods. The Implementation Plan should describe the methodology used to develop the schedule and include discussion of assumptions for future inflation, cost escalation, etc. These factors are key considerations in developing the schedule because estimated expenditures for project implementation must be covered by projected revenues. This section should discuss the likelihood of occurrence, and the possible impacts on the implementation schedule, for a wide array of potential changes in costs and/or revenues. For example, cost increases might result from unforeseen environmental and subsurface conditions, inflation, litigation, technological innovations, contractor problems, overtime costs needed to meet the project schedule, changes in government rules and regulations affecting the project, value engineering savings, etc. Changes in revenues could result from lower than expected toll or tax collections, or a diversion of project funds to other projects.

5. Financing and Revenues. The plan should describe all funding sources for the project and should clearly describe these funds either as committed or as anticipated amounts, with an evaluation of the likelihood of the anticipated amounts actually being realized. The discussion should note where the funding sources are identified in the fiscally constrained IDOT STIP/TIP/Metropolitan Long Range Transportation Plan. Funds that

are identified in a Statewide Long Range plan are not fiscally constrained and will not automatically be considered committed. As a result, such funds must be evaluated for future commitment and availability.

Federal funds should be described by funding category under existing legislation and as potential amounts under future legislation. Projected expenditures of Federal-aid funds should be constrained by anticipated annual limitations on Federal-aid fund obligations.

If special funding techniques (e.g., advance construction) are to be used, the plan should include estimated annual conversion amounts.

Any portions of the project that are likely to be funded with other than Federal-aid funds should be discussed. The amount and sources of revenue for the non-Federal share should be clearly identified. If the availability of these funds is limited to certain parts or phases of the project, those limits should be explained. The Financial Plan should never assume there will be future Federal or non-Federal discretionary allocation made for the Major Project. If and when such discretionary allocations are enacted, they may be included in the project revenue in the next annual update.

The plan should address the potential for unanticipated changes in expected revenue and the impact on the project. Changes might include delays or decreases in receipt of project funding, reductions in user fees earmarked for the project, changes in government rules affecting the project, etc.

The cost of financing for the project should be estimated separately from the total project cost. It should include the issuance costs, interest costs and other aspects of borrowing funds, and each financing facility (e.g. bonds, loans etc.) should be shown separately as estimates in the Initial Financial Plan and Annual Updates.

6. Cash Flow. The key objective of this section is to demonstrate that revenue will be available to permit annual project fund obligations and expenditures as presented in the Implementation Plan, consistent with the STIP/TIP/Metropolitan Long Range Transportation Plan.

   The plan should include an annual schedule of cash needs versus available cash to meet those needs. This will demonstrate that the project schedule for payments to construction contractors and others can be met. The cash flow analysis should extend through the point at which all project expenditures have been met and all Advance Construction conversions have been completed.

   Annual Updates should include the original projected cash flow, actual expenditures and revised estimates for future construction. Significant deviations from the Initial Financial Plan should be explained. If phasing plan is presented, cash flow should only be provided for the funded phase.

7. Risk Identification and Mitigation Factors. This section should discuss the risk analysis for the project. It should identify risks to project completion and revenue sufficiency and

describe potential mitigation measures for addressing those risks. The following are examples of issues that should be addressed:

a. Capital Program Impacts. Major Projects will significantly impact the IDOT transportation project capital program, thus the Financial Plan for these projects should be coordinated with the Statewide Long Range Transportation Plan and the Statewide Transportation Improvement Program. This coordination will evaluate the impact to the transportation capital program during the period of analysis covered by the Financial Plan.

b. Cost Containment. This section should describe all special project cost containment strategies being used or planned for later use. These might include design-to-estimated cost for individual project elements (i.e., limit design so as not to exceed a target construction cost), design-build, use of cost control teams, management cost control strategies, vendor participation via warranties or guarantees, value engineering, incentive and disincentive clauses, etc.

c. Responsibilities. The plan should describe the major responsibilities, financial and otherwise, of the various parties involved in the project and should contain evidence of agreements or commitments.

d. Special/Unique Arrangements. The plan should describe any special or unique agreements, laws, rules, or regulations in addition to NEPA and Title 23 that apply to the Major Project. These could include Federal or State project-enabling legislation, financial agreements and covenants, accounting system reports and audits, etc.

e. Cost Monitoring. If pertinent, the plan should discuss the liability for subsequent operation and maintenance costs as project segments come on-line. On some Major Projects, the opening of certain segments to traffic could require significant operational resources (e.g., a tunnel or complex traffic management system) while other elements of the project are not complete and still require significant construction expenditures.

When Financial Plans call for funding mechanisms other than existing revenue streams to meet the non-Federal revenue needs or to meet cash flow demands, the likelihood of the mechanisms being implemented must be thoroughly analyzed. This would apply to mechanisms such as new taxes, future toll increases not currently authorized, contributions from third parties, and short-term or long-term borrowing. The analysis must address whether authority exists to pursue the mechanisms or must be granted through legislation or other means. In evaluating this portion of the Financial Plan, the Federal focus will be on the likelihood of realizing the non-Federal revenues, not on the choice of mechanism.

8. Annual Update Cycle. The Initial Financial Plan will identify the schedule for the future Annual Updates. It may be advantageous to time the submittal of the Annual Updates to coincide with the beginning of either the State fiscal year or the Federal fiscal year,

rather than the anniversary of the approval of the Initial Financial Plan. If the annual updates are submitted on a schedule that does not correspond to the beginning of the Federal fiscal year, it still will be permissible to display Federal-aid obligations and expenditures on a Federal fiscal year basis.

20-3.08 Annual Updates

Each Annual Update of the Financial Plan should be presented in both total cost (actual cost to date) and cost-to-complete estimates (shown in year-of-expenditure dollars). These updates should use the same project elements of segment breakpoints as used in the Initial Financial Plan to present the costs and revenues. Any significant change in the total project cost or revenue since the last estimate should be clearly presented and should include a discussion of the major reasons for the significant changes.

In the Annual Updates, each of the eight main sections from the Initial Financial Plan should be updated to reflect any changes that have occurred since approval of the initial plan. The following subjects should be addressed and incorporated in the appropriate sections of the annual updates:

1. Cost and Revenue History. The presentation should clearly summarize significant cost and/or revenue changes from the Initial Financial Plan estimates and discuss the reason(s) for the changes. Any identified or potential funding shortfall should be discussed in detail, along with the steps that have been taken, or that will be available, if needed, to address the shortfall(s). As appropriate, the annual updates should discuss mitigating measures that increase project funding and/or reduce project costs, including changes in project scope and design undertaken specifically in response to revenue shortfall. Significant changes in project scope also should be discussed and their impact on project costs, both to date and in the future, should be explained. Where appropriate, Annual Updates should track project milestones and compare initial cost and revenue estimates to the actual costs and revenues at the milestone points.

2. Cost and Revenue Trends. This discussion should clearly identify the trends that have impacted project costs and revenues in the past year(s) and the probable reasons for these trends. This may be as simple as identifying a change in the anticipated rate of inflation, the availability of materials, the cost of supplies, or the wages paid to project personnel; or as complicated as assessing changes in the competitive arena that have impacted construction bid prices. For each of the trends identified, the Annual Updates should discuss the implications of the trends for the remainder of the project and should explain any adjustments in the Financial Plan necessary to respond to those trends.

3. Summary of Significant Cost Reductions. If any changes in the project have reduced the cost by at least $10 million, the changes should be discussed individually. The discussion should include the original cost estimate, the reduced actual or projected cost, and a brief explanation of how and/or why the reduction was achieved. These changes should be grouped by element and include any scope changes made to the project.

4. Summary of Significant Cost Increases. If any items have increased the cost of the project by at least $10 million, the items should be discussed individually. The discussion should include the original cost estimate, the increased actual or projected cost, and a brief explanation of why the increase was necessary. Those increases in cost should be grouped by element and/or changes to the project scope.

5. Summary of Schedule Changes and Trends. This discussion should identify the changes that have affected the project completion date and/or funded phase since the Initial Financial Plan or the last Annual Update. The discussion should clearly identify the primary reason(s) and trends that have impacted the schedule change.

20-4 REQUIREMENTS FOR OTHER THAN MAJOR PROJECTS

References: FHWA *Major Project Financial Plan Guidance*, December 18, 2014

Subsection (i) of 23 U.S.C. 106, "Project approval and oversight," sets forth requirements for preparation of an annual Financial Plan for "Other Projects," which are projects not otherwise selected as Major Projects, and have an estimated total cost of $100 million up to $500 million. Phasing and Operationally Independent Non-Concurrent Construction Projects can also be applied to these projects in order to address projects implemented over extended periods of time.

In accordance with FHWA guidance implementing Subsection (i), the responsible district must prepare an Initial Financial Plan and Annual Updates for projects with an estimated total cost of $100 million up to $500 million. The estimated total cost will be based on the full scope of the project for the limits defined by the environmental process or for the limits that are considered an operationally independent non-concurrent construction project.

These Other Projects with an estimated total cost exceeding $100 million, but not designated by FHWA as Major Projects, must have an Initial Financial Plan and Annual Updates to be available to FHWA for review upon request.

The content of the Initial Financial Plan and Annual Updates should address the same sections as those for Major Projects and should be consistent with the guidance in Section 20-3. It is anticipated that the level of detail will be more straightforward for these plans. Also, optional reporting formats for presenting information on multiple IDOT projects of this type will be considered on a case-by-case basis. FHWA will not approve these Initial Financial Plans, but they will be subject to FHWA review to ensure they were completed in accordance with Title 23 requirements for content and timeliness.

For these projects, the Initial Financial Plan may be developed and completed at the earliest feasible point in the project development process. However, it must be finalized prior to construction contract authorization and obligation of Federal funds for construction under the design/bid/build process and prior to contract award for design/build projects.

Chapter Twenty-two

GENERAL ENVIRONMENTAL PROCEDURES

All projects administered by IDOT must meet applicable Federal and State laws and regulations requiring identification and evaluation of the project's environmental impacts. In aggregate, Part III of the BDE Manual describes the applicable environmental procedures for State highway projects. Chapter 22 presents information which has a general application to all IDOT projects. This includes environmental documentation, coordination, and general NEPA compliance procedures. The subsequent chapters in Part III discuss more specific applications of the environmental procedures (e.g., preparation of an EIS).

The appendices in Part III accomplish the following:

- Appendix A presents duplicated regulation and guidance to support the environmental procedures.
- Appendix B presents acronyms and definitions which apply to environmental procedures.
- Appendix C presents descriptions of legal authorities for key environmental requirements and descriptions of functional responsibilities of governmental agencies responsible for implementing environmental requirements.
- Appendix D presents guidance on the preparation of an EA/EIS.

22-1 COORDINATION BETWEEN BDE MANUAL AND KEY ENVIRONMENTAL DIRECTIVES AND GUIDANCE

The literature on environmental procedures is too voluminous to reproduce in its entirety. Therefore, Appendix A duplicates selected environmental documents.

IDOT has developed criteria and information for its specific application of the environmental procedures which supplements the national documents duplicated in Appendix A. The IDOT-specific information is presented in *Part III, "Environmental Procedures"*. Where applicable, a reference is provided to allow the user of the BDE Manual to coordinate the IDOT specific information with the duplicated documents in Appendix A.

The *Council on Environmental Quality (CEQ) Regulations* are intended to apply to Federal agencies. For Federally funded or regulated IDOT projects, the provisions of the regulations constitute policy guidance for IDOT and should be viewed accordingly.

22-2 ENVIRONMENTAL DOCUMENTATION AND PROCESS FOR FEDERAL ACTIONS

References: 23 U.S.C. 139 "Efficient Environmental Reviews for Project Decision Making"
40 CFR 1500-1508 "CEQ Regulations for Implementing NEPA"
23 CFR 771 "Environmental Impact and Related Procedures"
FHWA Technical Advisory T 6640.8A "Guidance for Preparing and Processing Environmental and Section 4(f) Documents"
FHWA *SAFETEA-LU Environmental Review Process Final Guidance*

22-2.01 Introduction

The primary purpose of environmental documentation is to ensure that the policies and goals defined in NEPA (See Section 22-4) are incorporated into the ongoing programs and actions of the Department. Environmental documentation is intended to accomplish more than mere disclosure; it will be used in conjunction with other relevant material to plan actions and to make decisions.

Environmental documentation is also required to reflect compliance with other applicable Federal and State laws, regulations, and Executive Orders (e.g., addressing protection of threatened and endangered species, farmland protection, historic preservation, protection of bald eagles and golden eagles, environmental justice, protection of flood plains and protection of wetlands).

22-2.02 Policy

References: 40 CFR 1502.1 "Early application of NEPA"
CEQ Q&A, Question 17 "Consultants and Conflict of Interest"
CEQ Q&A, Question 27a "Identifying Consultants in List of Preparers"

All environmental documentation shall provide full and fair discussion of environmental impacts and shall inform decision-makers and the public of the reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. Preparers of environmental documentation shall focus on the significant environmental issues and alternatives and shall reduce paperwork and the accumulation of extraneous background data. Documentation shall be concise, clear, and to the point and shall be supported by evidence that the necessary environmental analyses have been performed. Use of metric values in environmental documents is optional. Where dual units are used, they may be shown in either order provided the selected approach is consistently applied in the documents for a particular project. The preferred method will be to show US Customary values first with metric values in parentheses.

Consultants may be employed to prepare all types of environmental documentation; however, the responsibility for all conclusions and determinations involved in environmental decisions remains with IDOT and FHWA. Environmental work by consultants leading to a project decision shall be carefully reviewed to ensure that complete and objective consideration has been provided to all relevant project impacts and alternatives.

22-2.03 Environmental Documentation for Federal Projects

Reference: 23 CFR 771.115 “Classes of Action”

The term “environmental documentation”, as used in this Manual, refers to the information prepared to analyze the potential environmental impacts of project alternatives. Depending upon the specific circumstances involved, the environmental documentation for a project will be one of the following three types:

- documentation included in Phase I Report (Categorical Exclusions (CEs) (Chapter 23),
- Environmental Assessment (EA) Document (Chapter 24), or
- Environmental Impact Statement (EIS) Document (Chapter 25).

The selection of the appropriate type of environmental documentation for a project is based upon the following two factors:

- the project’s potential for significant environmental impacts, and
- the involvement of Federal funding participation or Federal approvals.

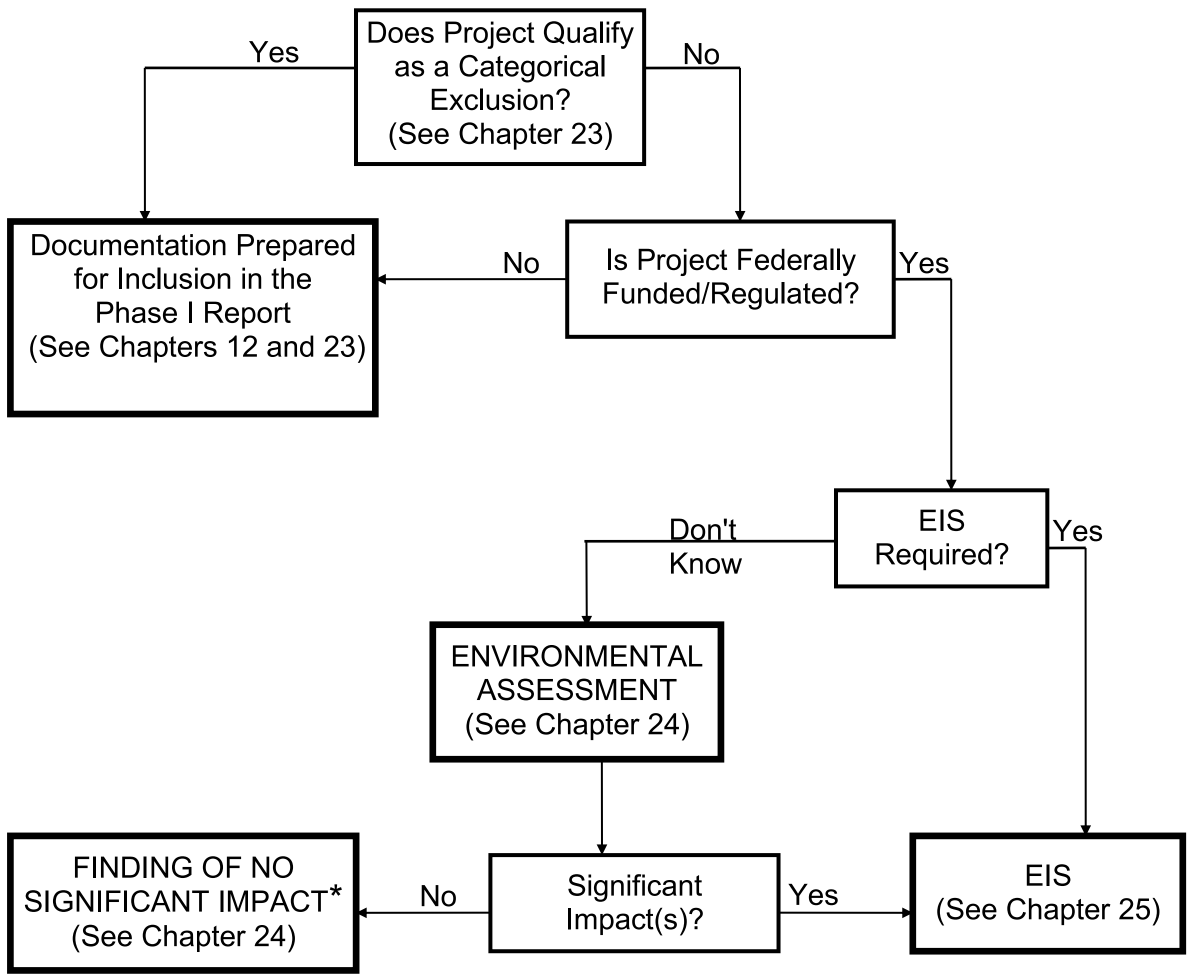
Figure 22-2.A illustrates the decision-making process for selecting the appropriate environmental documentation format. The determinations in the selection process must be supported by the appropriate environmental studies.

22-2.04 Environmental Process for Federal Projects

The environmental process for Federal Projects is discussed throughout Part III of the BDE Manual.

22-2.05 Environmental Process and Documentation for Non-Federal Project

For a discussion on this topic, please see Section 22-7.



* *A Finding of No Significant Impact (FONSI) is a separate document from the EA. It summarizes the basis for FHWA's determination that a project will not cause significant impacts that would require preparation of an EIS.*

SELECTION OF ENVIRONMENTAL DOCUMENTATION TYPE

Figure 22-2.A

22-3 GENERAL NEPA REQUIREMENTS

This section discusses general requirements which IDOT projects must follow to satisfy NEPA, if the project is Federally funded or regulated.

22-3.01 Purpose/Policy

References: 40 CFR 1500.1 "Purpose of NEPA"
40 CFR 1500.2 "NEPA Policy"

40 CFR 1500.1 defines the purpose of the *National Environmental Policy Act* of 1969. The following excerpts highlight some of its key provisions:

- *NEPA establishes policy, sets goals, and provides means for carrying out the policy.*
- *NEPA procedures must insure that environmental information is available to public officials and citizens before decisions are made and before actions are taken.*
- *NEPA documents must concentrate on the issues that are truly significant to the action in question, rather than amassing needless detail.*
- *The NEPA process is intended to help public officials make decisions that are based on understanding of environmental consequences, and take actions that protect, restore, and enhance the environment.*

40 CFR 1500.2 sets forth the policy for compliance with NEPA. The policy provides that Federal agencies shall to the fullest extent possible:

- *Implement procedures to make the NEPA process more useful to decision makers and the public; to reduce paperwork and the accumulation of extraneous background data; and to emphasize real environmental issues and alternatives.*
- *Use the NEPA process to identify and assess the reasonable alternatives to proposed actions that will avoid or minimize adverse effects of these actions upon the quality of the human environment.*
- *Encourage and facilitate public involvement in decisions which affect the quality of the human environment.*
- *Use all practicable means to restore and enhance the quality of the human environment and avoid or minimize any possible adverse effects of their actions upon the quality of the human environment.*

22-3.02 Application

References: 40 CFR 1500.1(a) "Application of NEPA"
23 CFR 771.109(a) "Application of 23 CFR 771"

The NEPA procedures apply to all Federally regulated and Federally funded projects; e.g., a State-only funded project which requires an individual Section 404 permit also might require an Environmental Impact Statement to comply with NEPA for the Federal action (granting the permit). In this example, the Federal Highway Administration may not be involved in the project; therefore, the flow of information and activities will be modified to suit the lead Federal agency involved (i.e., the US Army Corps of Engineers).

Section 22-7 presents the environmental process for non-Federal projects.

22-3.03 Integration of NEPA and Planning

References: 23 USC 134 "Metropolitan Transportation Planning"
23 USC 135 "Statewide Transportation Planning"
23 CFR 450.212 "Transportation Planning Studies and Project Development (Statewide Transportation Planning and Programming)"
23 CFR 450.318 "Transportation Planning Studies and Project Development (Metropolitan Transportation Planning and Programming)"
Appendix A to Part 450 "Linking the Transportation Planning and NEPA Processes"
40 CFR 1501 "NEPA *and Agency* Planning"
Chapter 2 "Project Development Network (New Alignment)"
Part II, Project Development

The *CEQ Regulations* issued to implement the *National Environmental Policy Act* (NEPA) include provisions that address the relationship between NEPA and planning. 40 CFR 1501.2 states, in part, that:

> *Agencies shall integrate the NEPA process with other planning at the earliest possible time to ensure that planning and decisions reflect environmental values, to avoid delays later in the process, and to head off potential conflicts*.

The *Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users* (SAFETEA-LU) implemented several changes in parts 134 and 135 of the United States Code intended to enhance consideration of environmental issues and impacts within the transportation planning process and encourage the use of the products from planning in the NEPA process.

In 23 U.S.C. 134(h) "Scope of Planning Process," paragraph (1)(E) requires the metropolitan planning process to provide for consideration of projects and strategies that will "…protect and enhance the environment…." The same requirement is included in paragraph (1)(E) of 23 U.S.C. 135(d) "Scope of Planning Process" for statewide planning.

In 23 U.S.C. 134(i) "Development of Transportation Plan," paragraph (4)(A) requires metropolitan planning organizations "…to consult, as appropriate, with State and local agencies responsible for land use management, natural resources, environmental protection, conservation, and historic preservation concerning the development of a long-range transportation plan." The same requirement is included in paragraph (2)(D)(i) of 23 U.S.C. 135(f) "Long Range Statewide Transportation Plan."

Also in 23 U.S.C. 135(f), paragraph (4) "Mitigation Activities" includes a provision requiring long-range transportation plans to "…include discussion of potential environmental mitigation activities and potential areas to carry out these activities, including activities that may have the greatest potential to restore and maintain the environmental functions affected by the plan." This paragraph also includes a requirement that the discussion of mitigation activities "…be developed in consultation with Federal, State, and tribal wildlife, land management, and regulatory agencies."

The changes in the referenced sections of the U.S.*C.* are reflected in the provisions of the current planning regulations in 23 CFR 450.212 and 450.318. Appendix A to Part 450 provides additional information to explain the linkage between the transportation planning and project development/National Environmental Policy Act (NEPA) processes.

Chapter 2 and *Part II, "Project Development"* of the BDE Manual, referenced above, include discussion of IDOT procedures for integrating the NEPA process with other Department planning activities.

22-3.04 Lead/Cooperating/Participating Agencies

References: 23 U.S.C. 139 "Efficient Environmental Reviews for Project Decision Making"
40 CFR 1501.5 "Responsibilities of, and Procedures for, Determining Lead Agencies"
40 CFR 1501.6 "Cooperating Agency's Responsibilities"
40 CFR 1508.5 "Definition of Cooperating Agency"
40 CFR 1508.16 "Definition of Lead Agency'
23 CFR 771.109(c) "Role of Federal Funding Applicant; Local Public Agencies as Cooperating Agencies"
23 CFR 771.111(d) "Requesting Involvement of Cooperating Agencies
CEQ Q&A, Question 14 "Coordination Between Lead and Cooperating Agencies"
CEQ Q&A, Question 22 "State and Federal Agencies as Joint Lead Agencies"
FHWA SAETEA-LU Final Guidance, Questions 14-20 "Lead Agencies"
FHWA SAETEA-LU Final Guidance, Questions 21-29 "Participating Agencies"
FHWA SAETEA-LU Final Guidance, Questions 30 and 31 "Cooperating Agencies"

FHWA will be the Federal lead agency for most IDOT projects subject to the NEPA process, although FHWA and IDOT typically act as joint lead agencies; see 23 CFR 771.109(c)(2). The cited references from 40 CFR 1500 discuss the responsibilities of the lead agency and cooperating agencies. The cited questions from the FHWA *SAFETEA-LU Environmental Review Process Final Guidance* provide additional guidance regarding lead and cooperating agencies and discuss procedural requirements, roles, and responsibilities associated with participating agencies.

Section 24-2 describes the role of Cooperating Agencies in the preparation of an EA.

Section 25-2 describes the role of Cooperating and Participatory Agencies in the preparation of an EIS.

22-3.05 Proposed Action

References: 40 CFR 1502.4(a) “Scope of Proposal(s) Covered in Environmental Document”
40 CFR 1508.23 “Definition of Proposal”
23 CFR 771.107(b) “Definition of Action”
23 CFR 771.111(f) “Logical Termini, Independent Utility, Effect on Other Projects”
Section 22-6.04 “Logical Termini”

IDOT must properly define the proposed action to ensure a meaningful evaluation of alternatives and to avoid commitments to transportation improvements before they are fully evaluated. This should occur as part of the planning process for the development of the Department’s annual, multi-year, and long-range programs of projects. For reference, 23 CFR 771.107(b) defines “action” as:

> *A highway or transit project proposed for FHWA or UMTA funding. It also includes activities such as joint and multiple-use permits, changes in access control, etc., which may or may not involve a commitment of Federal funds.*

Section 22-6.04 discusses the determination of logical project termini for the proposed action.

The proposed action may include completed and/or incomplete portions of a highway section and one or more future highway projects. Avoid piecemealing a proposed improvement in separate environmental reports. The proposed action should include the total length of highway between logical termini, even if only a short length is proposed for construction within the multi-year and long-range program. The environmental report should clearly identify the length of the proposed action and furnish any available information on long-range possibilities of future improvements for the proposed action.

22-3.06 Environmental Studies

References: 23 U.S.C. 139 “Efficient Environmental Reviews for Project Decision Making”
40 CFR Part 1502.24 “Methodology and Scientific Accuracy”

Chapter 26 “Special Environmental Analyses”
Chapter 27 “Environmental Surveys”
FHWA SAFETEA-LU Final Guidance, Question 38 “Developing the Methodologies for the Analysis of Alternatives”

Environmental studies provide the technical data and information necessary to identify and evaluate the nature and extent of environmental impacts of a proposed action (and associated mitigation measures that may be appropriate). Chapters 26 and 27 and the IDOT environmental technical manuals discuss the procedural and technical aspects of the environmental studies. These include, for example, air quality analyses, water quality analyses, Section 4(f), noise analyses, cultural impact analyses, wetland technical reports, and biological assessments. 40 CFR 1502.24 identifies the basic objective of the environmental studies:

> *Agencies shall insure the professional integrity, including scientific integrity, of the discussions...*

The environmental studies typically will be conducted in conjunction with actions for which an EIS will be prepared. They also will be performed for actions processed as an EA or a Categorical Exclusion, if necessary, to address specific substantive issues. To maximize benefits, the district should initiate these studies as early as practical and continue the studies throughout project development. Some studies will be initiated by BDE upon receipt of an Environmental Survey Request from the district (e.g., wetlands, biological, cultural resources) and others will be prepared by the district (e.g., socio-economic, agriculture, water quality). The evolution of the environmental studies should be commensurate with the decisions which are being made during project development. The environmental studies will be used:

- to determine the type of environmental processing (i.e., EIS, EA, CE) for a specific project (including determination of the presence of unusual circumstances for proposed CE projects);
- as the basis for scoping decisions;
- to determine the significance of project impacts; and
- as the basis for discussions in reports.

The discussions of the study results should indicate whether resources are present that could be affected, how those resources would be affected, what attempts were made to avoid or minimize the impact, and what mitigation measures are proposed to address the unavoidable impacts. Generic descriptions of impacts that “may” occur as a result of highway projects (e.g., highway projects may result in the conversion of farmland) should be avoided in favor of descriptions of the specific effects anticipated to result from the project alternatives under study.

22-3.07 <u>Significance of Environmental Impacts</u>

Reference: 40 CFR 1508.27 “Definition of ‘Significantly’ (Affecting) as Used in NEPA”

In evaluating the significance of impacts, the district shall consider the nature of the changes which may be caused by the action and the magnitude and importance of those changes. It is important to contact agencies which have special expertise or jurisdiction by law and individuals and organizations directly affected by the proposal to fully assess project impacts. Documentation of such contacts and those concerning the resolution of identified problems shall be included in the appropriate environmental document.

22-3.08 Evaluation of Alternatives and Selection of Preferred Alternative

References: 23 U.S.C. 139 "Efficient Environmental Reviews for Project Decision Making"
40 CFR 1502.14 "Alternatives Including the Proposed Action"
23 CFR 771.125(a)(1) "Identification of Preferred Alternative in FEIS"
Paragraph II.C of FHWA Technical Advisory T6640.8A "Alternatives Discussion in EAs"
Paragraph V.E of FHWA Technical Advisory T6640.8A "Alternatives Discussion in EISs"
FHWA SAFETEA-LU Final Guidance, Questions 36-38 "Alternatives Analysis"
FHWA SAFETEA-LU Final Guidance, Questions 39-46 "Preferred Alternative"
CEQ Q&A, Questions 1 through 3 "Evaluation of Alternatives"
CEQ Q&A, Questions 4 through 6 "Identification of Preferred Alternative and Environmentally Preferable Alternative"

When a proposed project may adversely affect resources, such as wetlands, floodplains, Section 4(f) properties, or threatened and endangered species, districts must ensure that the evaluation of alternatives appropriately addresses avoidance, minimization, and mitigation options as required by regulations applicable to these resources. In addition, if the preferred alternative will affect such resources, districts must ensure that adequate justification is provided to explain why avoidance alternatives were not selected, in accordance with the regulations applicable to the resource(s) involved.

In selecting the preferred alternative for implementation, all of the social, economic, environmental, and engineering factors involved must be carefully weighed. Input from environmental agencies with relevant expertise and from the public should be sought at each step when narrowing the choices among alternatives to ensure, to the maximum extent practical, that the decision-making process fully and fairly considers all relevant information.

All alternatives considered in the selection process, the alternative(s) considered to be environmentally preferable, and the preferred alternative shall be identified in the decision statement for the action.

22-3.09 Public Access to Preliminary Environmental Documents

Federal environmental directives, including NEPA and 23 CFR 771, encourage an open process which fully involves the public. In addition, the Federal Freedom of Information Act (FOIA) directs that information be made available to the public to the greatest extent practical. However, although public involvement is strongly encouraged, there is a need to ensure that no segment of the public obtains an unfair advantage through premature access to project information.

This principle applies to preliminary environmental documents, which the general public should not have access to these documents. Such access not only provides individuals or groups involved with an unfair advantage over the remaining public, it also may promote attempts by such entities to influence decision making at inappropriate times in project development.

The FOIA and the implementing regulation of the U.S. Department of Transportation (49 CFR 7.71) provide an exemption to address these cases. These directives provide that, where material is intended for public release at a specified time in the future and premature disclosure would be detrimental to the orderly processing of a Federal project, this material can be withheld during the development of the environmental document. Such material must be released after the environmental action is taken.

22-3.10 Cooperating Agency access to Preliminary Environmental Documents

This procedure is applicable to all State highway projects involving Federal funding, authorization, or approvals for which an Environmental Impact Statement or Environmental Assessment is being prepared. The Department may provide a preliminary environmental document (EIS or EA) to a cooperating agency as discussed in Section 24-2.13 and Section 25-2.16. In these instances, the letter of transmittal shall be sent and include a statement such as the following:

> *The Federal Highway Administration has determined that this preliminary document is an intergovernmental exchange that may be withheld under the Freedom of Information Act. Premature release of this material to any segment of the public could give some sectors an unfair advantage and would have a detrimental effect on intergovernmental coordination and the success of the cooperating agency concept. For these reasons, we respectfully request that the public not be given access to this preliminary document.*

22-3.11 Time Limits

References: 23 U.S.C. 139 "Efficient Environmental Reviews for Project Decision Making"
40 CFR 1501.8 "Time Limits"
CEQ Q&A, Question 35 "Time Required for NEPA Process"
23 CFR 771.119(d), (e), and (h) "Time Limits in EA/FONSI Processing"
23 CFR 771.123(h) and (i) "Time Limits in DEIS Processing"
23 CFR 771.127(a) "Time Limits for Record of Decision"
FHWA SAFETEA-LU Final Guidance, Questions 47-57 "Coordination and Schedule"
FHWA/IDOT Statewide Implementation Agreement for Establishment of Timeframes for Environmental Impact Statements and Environmental Assessments

The *CEQ Regulations* include provisions for establishing time limits on various steps in the NEPA process. These time limit provisions are not mandatory. Section 1309 of the *Transportation Equity Act* for the 21st Century (TEA-21) mandated "Environmental Streamlining" for transportation projects and imposed requirements for cooperatively determining time frames for development of EISs and EAs. IDOT and FHWA have executed a Statewide Implementation Agreement (SIA) for establishing time frames for EISs and EAs for IDOT projects. This SIA is included in Appendix A. It applies to all EIS and EA documents initiated after October 1, 2003. Pursuant to the SIA, time frame negotiations should typically occur in conjunction with FHWA/IDOT coordination meetings. The meeting minutes will document the approval of the time frame for the project by the appropriate FHWA and IDOT district personnel. FHWA will monitor all milestone dates. FHWA and IDOT will provide a copy of the time frames to the involved environmental review and permitting agencies.

For EIS projects, 23 U.S.C. 139 requires development of a coordination plan for public and agency participation and imposes deadlines on certain aspects of the environmental process. Provisions in 23 U.S.C. 139(g) encourage, but do not require lead agencies to include a schedule in the coordination plan. Questions 47 through 57 in the FHWA *SAFETEA-LU Environmental Review Process Final Guidance* provide direction on these topics.

22-3.12 Limitations on Actions

References: 23 U.S.C. 139 "Efficient Environmental Reviews for Project Decision Making"
40 CFR 1506.1 "Limitations on Actions During NEPA Process"
23 CFR 771.113 "Timing of Administration Activities"
CEQ Q&A, Question 10 Limitations on Actions

The cited references for 40 CFR 1506, 23 CFR 771 and the CEQ Questions and Answers discuss limitations on actions that IDOT and FHWA can take during the NEPA process.

22-3.13 Other Agency Adoption

References: 40 CFR 1506.3 “Adoption of EIS
CEQ Q&A, Question 30 “Adoption of EIS by Cooperating Agency”

As discussed in the cited references, agencies other than FHWA and IDOT may adopt environmental documents prepared by IDOT.

22-3.14 Re-evaluations of CE, FONSI, or ROD

References: 23 CFR 771.129 “Re-evaluations of Environmental Documents”
Section XI of FHWA Technical Advisory T6640.8A “Re-evaluations
CEQ Q&A, Question 32 EIS Validity”

22-3.14(a) General

The National Environmental Policy Act (NEPA) requires Federal and state agencies to consider and disclose the environmental impacts of their proposed actions as part of their decisionmaking. Prior to FHWA authorizing a project to go to final design, right-of-way acquisition or construction, the environmental approval must be analyzed to determine if the approval remains valid. Sometimes there are changes to the proposed action, new information or circumstances, or there is a lapse of time between preparation of the environmental document and implementation of the action. These circumstances may trigger the need to re-evaluate and document those changes to verify the NEPA determination remains valid.

The following sections discuss this process in further detail.

22-3.14(b) Definitions

1. **Project Scoping** – A project development activity that involves determining and documenting project goals and objectives, tasks, deliverables, schedule, cost and delivery method.

2. **Re-evaluation**. A re-evaluation is a review of any proposed changes in an action, affected environment, anticipated impact, applicable requirements or mitigation measure as they relate to the environmental document or decision. The re-evaluation is a document, e-mail, and/or meeting minutes prepared by the Department that evaluate any new or updated information that affects the project's impacts or significance and documents whether the NEPA determination should remain the same or change.

3. **Significance**. Significance as used in NEPA requires considerations of both context and intensity:

Context. This means that the significance of an action must be analyzed in several contexts such as society as a whole (human, national), the affected region, the affected interests, and the locality. Significance varies with the setting of the proposed action. For instance, in the case of a site-specific action, significance would usually depend upon the effects in the locale rather than in the world as a whole. Both short- and long-term effects are relevant.

Intensity. This refers to the severity of impact. Responsible officials must bear in mind that more than one agency may make decisions about partial aspects of a major action. The following should be considered in evaluating intensity:

- Impacts that may be both beneficial and adverse. A significant effect may exist even if the Federal agency believes that on balance the effect will be beneficial.
- The degree to which the proposed action affects public health or safety.
- Unique characteristics of the geographic area such as proximity to historic or cultural resources, park lands, prime farmlands, wetlands, wild and scenic rivers, or ecologically critical areas.
- The degree to which the effects on the quality of the human environment are likely to be highly controversial.
- The degree to which the possible effects on the human environment are highly uncertain or involve unique or unknown risks.
- The degree to which the action may establish a precedent for future actions with significant effects or represents a decision in principle about a future consideration.
- Whether the action is related to other actions with individually insignificant but cumulatively significant impacts. Significance exists if it is reasonable to anticipate a cumulatively significant impact on the environment. Significance cannot be avoided by terming an action temporary or by breaking it down into small component parts.
- The degree to which the action may adversely affect districts, sites, highways, structures, or objects listed in or eligible for listing in the National Register of Historic Places or may cause loss or destruction of significant scientific, cultural, or historical resources.
- The degree to which the action may adversely affect an endangered or threatened species or its habitat that has been determined to be critical under the Endangered Species Act of 1973.
- Whether the action threatens a violation of Federal, State, or local law or requirements imposed for the protection of the environment.

22-3.14(c) Re-evaluation Factors

Several factors should be considered to determine when a documented re-evaluation is necessary. If one or more of the following factors exist, then a documented re-evaluation should be prepared.

- Changes to any laws or regulations, such as newly listed threatened or endangered species; after the environmental process was completed.
- Changes in project scope or new design refinements that result in the identification of new impacts, additional right of way, or will require additional study of environmental factors before construction authorization;
- Phase II postponed/stalled for several years and now there are plans to advance to Phase III;
- Requesting Federal authorization in Phase II (final design and land acquisition) or Phase III; or
- Several years have passed since the original environmental decision date (CE, FONSI, or ROD) and project is now advancing to Phase II; or
- Project is partially constructed, and has gone inactive/dormant for several years and now will complete Phase III;

22-3.14(d) Re-evaluation Document Elements

The intent of a re-evaluation is to document any changes that have occurred compared to what was documented in the CE, EA and FONSI, or EIS and ROD so that a determination can be made if the original environmental approval remains valid. Elements to be contained in the re-evaluation document should include:

- new logical termini, if applicable;
- additional study area(s), if applicable;
- any changes to impacts and mitigation;
- any changes to laws or regulations;
- the following statement: "*This re-evaluation was prepared in accordance with the requirements of the Federal Highway Administration Rules and Regulations set forth in 23 CFR 771.129*." ;
- a determination on whether the original environmental decision (CE, FONSI, or ROD) is still valid or whether the project now requires a higher level of processing; and

- The date the original CE, FONSI, or ROD was signed and dates of subsequent re-evaluation(s).

22-3.14(e) Re-evaluation Format

The format of the re-evaluation will most likely be dependent on the NEPA Category of Action. And should be commensurate with the changes that have occurred with the project. The following sections of the BDE Manual discuss re-evaluations for each type of NEPA document and will contain more appropriate information on the suggested format:

- Re-evaluation of Categorical Exclusion (CE), see Section 23-1.06
- Re-evaluation of Finding of No Significant Impact (FONSI), see Section 24-2.23
- Re-evaluation of Record of Decision (ROD), see Section 25-1.03

22-4 CONCURRENT NEPA/404 PROCESSES

22-4.01 Background

A Statewide Implementation Agreement (SIA) (see Appendix A) is in effect that provides for concurrent *National Environmental Policy Act* (NEPA) and Section 404 processes on Federal-aid highway projects in Illinois. The purpose of the SIA is to ensure appropriate consideration of the concerns of the US Army Corps of Engineers (Corps), the US Environmental Protection Agency (USEPA), the US Coast Guard (USCG), and the US Fish and Wildlife Service (USFWS), especially regarding compliance with the Section 404(b)(1) Guidelines, as early as practical in highway project development. The USCG is involved in the SIA for those projects over navigable waters.

The intent is also to involve the State agencies, including the Illinois Environmental Protection Agency (IEPA), Illinois Historic Preservation Agency (IHPA), Illinois Department of Agriculture (IDOA), and Illinois Department of Natural Resources (IDNR), at key decision points early in the process to minimize the potential for unforeseen issues during the Section 404 permit review.

22-4.02 Applicability

All State highway projects needing Federal Highway Administration (FHWA) action under NEPA and an individual permit from the Corps under Section 404 of the *Clean Water Act* are eligible for processing under the NEPA/404 SIA. Decisions on whether to process specific eligible projects under the concurrent NEPA/404 procedures will be made in accordance with Part III of the SIA. The procedures that follow shall apply to all projects processed under the concurrent NEPA/404 process described in the SIA.

22-4.03 Procedures

22-4.03(a) General

As reflected in the executed SIA, Section 404 permit issues (i.e., relating to possible discharges of dredge and fill material into waters of the United States, including wetlands) should be considered throughout the highway planning and development process. Careful consideration should be given to comments provided by the Corps and the natural resource agencies relative to Section 404 issues, whether received during the systems planning phase, the scoping and NEPA compliance activities for individual projects, or the design-phase Section 404 permit application process.

The normal scoping and environmental coordination with the Corps, USEPA, USCG, and USFWS will continue for applicable projects, as reflected in the executed SIA. In addition, concurrence will be specifically requested from these agencies regarding the Purpose and Need, Alternatives To Be Carried Forward, and the Selected Alternative for applicable projects as described in the executed SIA and the following subsections of these procedures.

22-4.03(b) Concurrence Point Meetings

The SIA provides that the concurrence reviews for Purpose and Need, Alternatives To Be Carried Forward, and the Preferred Alternative normally will be addressed at joint meetings of the SIA signatories and the State agencies. The intent is to promote efficient use of staff resources and time by consolidating reviews of a number of projects at these periodic meetings. The number and location of projects to be addressed will be key considerations in determining where meetings will occur.

The FHWA/BDE will develop schedules and agendas for these meetings in consultation with the IDOT districts. BDE will contact each district to request information concerning projects that have been developed sufficiently to enable preparation of the information necessary to support a request for concurrence on one or more of the three points specified. These contacts by BDE will be accomplished two to three months prior to the tentative range of dates being considered for the joint meeting(s). This should allow the districts sufficient time to prepare information for the regulatory and natural resource agencies regarding the projects and concurrence points to be addressed. It also should afford time for review of the information by BDE and FHWA and for incorporation of any necessary changes. In addition, it will accommodate the 30-day period that the regulatory and natural resource agencies will have to review the information in advance of the meetings, as provided in the SIA.

After receiving information from the districts on the number and locations of projects for discussion, BDE will confer with the FHWA on arrangements for the meetings. FHWA will transmit to BDE and to other involved Federal and State agency offices a final meeting schedule, indicating the date(s), time(s), and location(s) of the meetings plus a list of projects to be discussed. FHWA also will disseminate the written project concurrence point information to the regulatory and natural resource agencies after it has been reviewed and revised as necessary.

At the concurrence point meetings, each district will be responsible for presenting its projects to the outside agencies. The presentation should be less than 30 minutes and should summarize the key points from the information package for the project. Each district also will be responsible for keeping minutes of the proceedings at the meeting pertaining to its projects (e.g., key issues raised, responses to issues, and action on concurrence point requests). Written information and exhibits prepared to describe the projects presented at the meeting should be attached to and incorporated into the minutes by reference to eliminate the need for repeating the information. Meeting minutes should be concise and should cover only what occurred at the meeting. They should not include actions, discussions, or decisions that were not covered in the meeting. Where issues are raised that cannot be resolved at the concurrence point meeting (e.g., because additional information is needed), the minutes should note the issue(s) and indicate how the matter will be addressed. Either the minutes of a subsequent meeting or an exchange of correspondence should document the follow-up on the issue(s). FHWA will consolidate and distribute the various project-specific minutes as a package for each concurrence point meeting.

If a regulatory or natural resource agency does not concur regarding one or more of the concurrence points, the district and BDE will jointly determine the appropriate course of action to respond to the dispute after discussion as necessary with the regulatory or natural resource agency involved and FHWA.

22-4.03(c) Concurrence Point Information

The advance information package for each project should include general project identification information (route designation(s), location/termini, city or county(ies)) and the information for the specific concurrence point(s) to be addressed. The concurrence point information should present essentially the same content as will be in the section of the project environmental documentation corresponding to the concurrence point(s) (i.e., the “Purpose and Need” concurrence point information should be similar to the information which will be in the “Purpose and Need” section of the environmental document). To the fullest extent practical, the information should address the items necessary for determining compliance with the Section 404(b)(1) “Guidelines for Specification of Disposal Sites For Dredged or Fill Material” (see Section 22-4.05). If districts wish to obtain preliminary comments from the regulatory and natural resource agencies, BDE, and FHWA regarding information being developed to support concurrence point requests, it is recommended this be accomplished through the district’s regularly scheduled coordination meetings, where possible. As a project proceeds through the three concurrence points, the information package should be cumulative (i.e., the information prepared for the first point should be a part of the package for the second, and the information for the first two should be in the submittal for the third).

22-4.03(d) Special Concurrence Point Meetings

In most instances, concurrence points should be addressed at the regularly scheduled meetings. If a district cannot attend a regularly scheduled meeting, for major or complex actions, or those on expedited schedules, separate NEPA/404 concurrence meetings may be scheduled in lieu of the regularly scheduled concurrence meetings. FHWA and IDOT may also request signatory agency concurrence via e-mail. As with the other joint concurrence point meetings, the district will be responsible for preparing the necessary concurrence point information and making it available in advance of the anticipated meeting date for necessary reviews by BDE, FHWA, and the regulatory and natural resource agencies, as described above.

22-4.03(e) Prevention, Minimization, and Mitigation of Adverse Effects to Aquatic Resources

Options for preventing, minimizing, and mitigating adverse effects to aquatic and wetland resources should be considered as an integral part of the merger process. As project details are refined, the potential for adverse impacts on the aquatic resources must be discussed with the regulatory and resource agencies. The discussions should focus on identification and evaluation of practicable alternatives for preventing, minimizing, and mitigating the adverse effects. These considerations generally will be addressed as a part of the concurrence point discussions on Alternatives to be Carried Forward and the Preferred Alternative.

22-4.04 Section 404(b)(1) Compliance Information Outline

This subsection presents an outline that should be used for determining the appropriate level of information needed for compliance with the 404(b)(1) "Guidelines for Specification of Disposal Sites for Dredged or Fill Material" in the Section 404 permit process.

22-4.04(a) Discussion of Alternatives

The 404(b)(1) "Guidelines for Specification of Disposal Sites for Dredged or Fill Material" (40 CFR 230) provide that "...no discharge of dredged or fill material shall be permitted if there is a practicable alternative to the proposed discharge which would have less adverse impact on the aquatic ecosystem, so long as the alternative does not have other significant adverse environmental consequences." Furthermore, the Guidelines provide that "Where the activity associated with a discharge which is proposed for a special aquatic site...[sanctuaries and refuges, wetlands, mud flats, vegetated shallows, riffle and pool complexes]...does not require access or proximity to or siting within the special aquatic site in question to fulfill its basic purpose (i.e., is not 'water dependent'), practicable alternatives that do not involve special aquatic sites are presumed to be available, unless clearly demonstrated otherwise. In addition, where a discharge is proposed for a special aquatic site, all practicable alternatives to the proposed discharge which do not involve a discharge into a special aquatic site are presumed to have less adverse impact on the aquatic ecosystem, unless clearly demonstrated otherwise."

When the recommended or selected project alternative will involve a discharge of dredged or fill material into waters of the United States, the environmental documentation must include exhibits delineating aquatic habitat and any special aquatic sites in the project area. In addition, sufficient information must be provided to demonstrate why alternatives that would have less impact on the aquatic ecosystem either are not practicable or that such alternatives would have other significant adverse environmental consequences. Furthermore, when the recommended or selected project alternative will involve a discharge of dredged or fill material into a special aquatic site, information must be provided to clearly explain why practicable alternatives that do not involve special aquatic sites are not available.

22-4.04(b) Items for 404(b)(1) Compliance Evaluation

To the fullest extent practicable, project environmental studies for projects anticipated to require an individual Section 404 permit should address the information the Corps and the USEPA will need for evaluating compliance with the Section 404(b)(1) Guidelines. The following is an outline of the information evaluated under the 404(b)(1) Guidelines. Districts should contact the BDE Location and Environment Section, as necessary, for guidance on responding to these items:

1. Information for determining that the activity will not violate applicable State water quality standards or effluent standards prohibited under Section 307 of the CWA or jeopardize the existence of Federally listed endangered or threatened species or their habitat.

2. Information to establish that the activity will not cause or contribute to significant degradation of waters of the United States, including adverse effects on human health, life stages of organisms dependent upon aquatic ecosystems, ecosystem diversity, productivity and stability and recreational, aesthetic, and economic values.

3. Information to demonstrate that appropriate and practicable steps have been taken to avoid and minimize potential adverse impacts of the discharge on the aquatic ecosystem (i.e., description of measures considered and measures to be implemented), including the following, as applicable:

- actions concerning the location of the discharge,
- actions concerning the material to be discharged,
- actions controlling the material after discharge,
- actions affecting the method of dispersion,
- actions related to technology,
- actions affecting plant and animal populations, and
- actions affecting human use.

4. Information addressing the potential of the proposed discharge to cause short-term or long-term environmental effects related to any of the following:

- physical substrate;
- water circulation and fluctuation:
  + alteration of current patterns of water circulation, and
  + alteration of normal water fluctuations/hydroperiod;
- suspended particulates/turbidity;
- contaminant availability;
- aquatic ecosystem structure and function (including both secondary and cumulative impacts);
- water column impacts;
- alteration of salinity gradients;
- Federally listed threatened or endangered species and their habitat;
- other wildlife (e.g., mammals, birds, reptiles, amphibians);
- special aquatic sites:
  + sanctuaries and refuges,
  + wetlands,
  + mud flats,

    + vegetated shallows, and
    + riffle and pool complexes;

- municipal and private water supplies;
- recreational and commercial fisheries;
- water-related recreation;
- aesthetics; and
- parks, national and historical monuments, wilderness areas, research sites, and similar preserves.

5. Information to support determination that the proposed dredged or fill material is not a carrier of contaminants or that levels of contaminants are substantively similar at extraction and disposal sites and not likely to result in degradation of the disposal site. Factors to consider include the following:

- physical characteristics of material;
- hydrography in relation to known or anticipated sources of contaminants;
- results from previous testing of the material or similar material in the vicinity of the project;
- known significant sources of persistent pesticides from land runoff or percolation;
- spill records for petroleum products or designated hazardous substances;
- other public records of significant introduction of contaminants from industries, municipalities, or other sources; and
- known existence of substantial material deposits of substances which could be released in harmful quantities to the aquatic environment by the proposed discharge activities.

6. Information regarding the following factors for the proposed dredged or fill material disposal site:

- depth of water at disposal site;
- current velocity, direction, and variability at disposal site;
- degree of turbulence;
- water column stratification;
- discharge vessel speed and direction;

- rate of discharge;
- dredged material characteristics (constituents, amount and type of material, settling velocities);
- number of discharges per unit of time; and
- other factors affecting rates and patterns of mixing.

See Section 26-19 “Surface Water Resources and Aquatic Habitat” for guidance on obtaining and analyzing the information on aquatic resources in the project’s area of potential effect.

22-5 COORDINATION

FHWA SAFETEA-LU Final Guidance, Questions 30 and 31 “Cooperating Agencies”
Chapter 19 “Public Involvement Guidelines”
Chapter 26 “Special Environmental Analyses”

The primary objective of coordination is to emphasize cooperative consultations among staff, other organizations, and state and federal agencies before the final environmental report (e.g. FEIS) is prepared. This is intended to avoid the submission of adverse comments on a completed document. This section discusses policies and practices on coordination for all State highway projects. The necessary coordination for a specific environmental process (e.g., an EIS) is discussed in the applicable chapter (e.g., Chapter 25 for an EIS).

22-5.01 General

During the development of a proposed highway project, the Department often must coordinate with a variety of agencies to address compliance issues pursuant to Federal and State requirements. Other coordination may be informal and intended to discuss certain aspects of upcoming highway projects such as potential effects of the project on specific resources or cost participation by local agencies for improvements associated with or necessitated by a State highway project that affects local-system facilities. (Cost participation issues should be addressed with the affected local agencies as early as practical in project development; see Chapter 5.) Some agencies also have opportunities to review packages of information that are circulated for comment as described in Section 22-4. In addition, notices of upcoming public involvement activities afford another mechanism for agencies to obtain information on proposed projects. All of these actions contribute to interagency coordination.

22-5.01(a) Policy

Every reasonable effort shall be made in project development to inform and solicit the aid of agencies, organizations, and persons who have an interest in the project or who have information or expertise on environmental factors relevant to the project. Special efforts shall be made to begin such coordination as early as practicable in project development and to use procedures which will encourage and allow public participation in constructing the value judgments necessary to select wisely among project alternatives.

22-5.01(b) Procedures

To achieve proper coordination, IDOT has adopted the following procedures which collectively apply to all highway projects:

1. The Integrated Survey Process.

   Section 27-1 describes this process, which determines the need and necessity of environmental surveys and coordination for projects that may adversely affect the environment.

2. Applicability of Programmatic Agreements, Programmatic Evaluations, and Memorandums of Understandings.

   Appendix A discusses these documents which basically describes sets of circumstances that require the Department to coordinate a project or where the Department may act on a regulatory agencies behalf. For example, under the "CE Agreement" the Department may approve certain types of projects on behalf of the FHWA.

3. NEPA Procedures.

   These procedures discuss the processing of Categorical Exclusions (Chapter 23), Environmental Assessments (Chapter 24), and Environmental Impact Statements (Chapter 25).

4. Public Involvement Procedures.

   These procedures are discussed in Chapter 19

5. Special Environmental Analyses.

   Depending on the resource impact, certain coordination will be required and is further discussed in Chapter 26.

22-5.01(c) Lines of Communication

The IDOT districts are typically the primary points of contact for coordination with the public, project consultants, and contractors. The following applies to the means of communication:

1. District Meetings. IDOT districts should encourage agencies, organizations, and persons who have special expertise or jurisdiction by law for any environmental impact of a proposed project to attend the regularly scheduled coordination meetings held by the districts. This will allow these entities to receive early notification and firsthand

information on undertakings and to provide firsthand knowledge on environmental issues relevant to these undertakings. Other coordination-type meetings should be scheduled and undertaken, as needed, to resolve potential environmental problems as early as practical in project development. Information provided and received at all such meetings should be documented for potential use in decision making and in environmental reports or Phase I Reports.

2. Scoping Meetings. If practical, the regularly scheduled district meetings discussed in Item #1 should also serve as scoping meetings, where appropriate. Formal scoping meetings may be appropriate for complex projects that involve several Federal agencies. Where scoping occurs, either at the regular district coordination meetings or in a specially convened meeting, these should be especially well documented, including who participated, what information was provided and received, what decisions were made, and who agreed and who dissented with specific determinations.

3. Public Involvement. Chapter 19 discusses this in detail.

4. Correspondence. Correspondence is a key element in coordination activities. Correspondence received on an environmental issue should be acknowledged. If the correspondence responds to a request for comments on a public involvement activity or an environmental document, the correspondence should be acknowledged as described in the procedures for public involvement (see Chapter 19) or as described in 40 CFR 1503.4. For other correspondence on environmental matters, the appropriate form of written acknowledgment may be an individual response letter. Substantive comments should be addressed in sufficient detail to allow the commenter to obtain a clear understanding of the status of the issue and its disposition.

22-5.02 Coordination with Federal and State Regulatory and Resource Agencies

Coordination with Federal and State regulatory and natural resource agencies is dependent on the nature and severity of project impacts. Specific coordination requirements are identified in Chapter 26 “Special Environmental Analyses.” The following sections provide an overview of agency involvement and their areas of interest.

Section 22-5.01 discusses policy and procedures for accomplishing effective coordination on all State highway projects. A key component of the coordination process is the interactions with agencies that have jurisdiction or expertise regarding resources and/or issues a proposed project may affect. These agencies may be requested to serve as cooperating agencies and/or, for projects involving an EIS, may be invited to serve as participating agencies in accordance with 23 U.S.C. 139; see Chapter 25.

When it is determined an agency should be a cooperating agency for a specific project, the request to the agency should be made as early as practical in project development and should include the best available information on the proposed undertaking (e.g., project scope, alternatives, pertinent issues that have been identified).

To facilitate early identification and coordination with appropriate agencies based on the resources and issues associated with particular projects, the following sections provide brief descriptions of the respective areas of jurisdiction and/or expertise for key Federal and State agencies that are most often involved with proposed IDOT projects. Refer to the websites for the respective agencies for information on programs and responsibilities, regulations, resources, and contacts.

The lists provided are not intended to cover all potential agency involvements; only those that occur most often. Districts must be alert to the potential for project issues that may require involvement of additional agencies not addressed in the following sections.

22-5.02(a) Federal Agencies

Agency	Jurisdiction/Expertise
U.S. Department of the Interior (USDOI)	• <u>Distribution of Environmental Documents to USDOI Agencies for Formal Comment</u> When transmitting draft and final Environmental Impact Statements (EIS) to DOI during formal comment periods direct the transmittals to the following office: Natural Resources Management Team Office of Environmental Policy and Compliance Office of the Secretary U.S. Department of the Interior MS-2462-MIB 1849 C Street Washington DC, NW 20240 Provide __ copies for a draft EIS and __ copies for a final EIS; see Chapter 25. • <u>Individual Section 4(f) Evaluations</u> In accordance with 23 CFR 774.5(a), prior to Section 4(f) approval, all individual Section 4(f) Evaluations must be provided to USDOI for coordination and comment.
U.S. Fish and Wildlife Service (USFWS), USDOI	• <u>*Endangered Species Act*</u> Projects that may affect Federally-listed threatened or endangered species or designated critical habitat and/or that require an “incidental take” permit for impacts to listed species; see Section 26-9. • <u>*Bald and Golden Eagle Protection Act*</u> Projects that may affect eagle nesting sites and/or winter night roost sites and/or if an “eagle permit” or migratory bird permit is required (e.g., for destruction/”take” of an active

Agency	Jurisdiction/Expertise
	nest); see Section 26-15. • *Migratory Bird Treaty Act* Projects that may affect migratory birds during their nesting season and/or if a migratory bird permit is required (e.g., for destruction/"take" of an active nest); see Section 26-15. • *Fish and Wildlife Coordination Act* Projects involving modification of a water body (e.g., stream channelization); see Section 26-19. • *Wild and Scenic Rivers Act* Projects that may affect a designated Wild and Scenic River segment under the jurisdiction of USFWS. • Concurrent NEPA/404 Processes Projects subject to the Statewide Implementation Agreement for "Concurrent NEPA/404 Processes for Transportation Projects in Illinois" in Appendix A; see Section 22-4. • Project Effects on Federal Wildlife and Waterfowl Refuges Projects that may affect Federally owned/managed wildlife and waterfowl refuges; see Section 26-2. • Project Effects on Federal Lands Projects involving use of any Federal lands (e.g., Shawnee National Forest). • Wetland Impacts Requiring an Individual 404 Permit Projects involving wetland impacts that are sufficient to trigger the requirement for an individual Section 404 permit.
National Park Service (NPS), USDOI	• *Wild and Scenic Rivers Act* Projects that may affect a designated Wild and Scenic River segment under the jurisdiction of NPS or a river included in the Nationwide Rivers Inventory; see Section 26-19. • *Land and Water Conservation Fund Act* (LAWCON) Projects involving conversion of land acquired or improved with LAWCON funds to other than public outdoor recreation use; see Section 26-3.
U.S. Army Corps of Engineers	• Concurrent NEPA/404 Processes Projects subject to the Statewide Implementation

Agency	Jurisdiction/Expertise
	Agreement for "Concurrent NEPA/404 Processes for Transportation Projects in Illinois" in Appendix A; see Section 22-4. • *Rivers and Harbors Act* - Section 10 Permits Projects involving structures or work (other than bridges and causeways) affecting the navigable waters of the United States; see Section 28-2.
U.S. Environmental Protection Agency (USEPA)	• Concurrent NEPA/404 Processes Projects subject to the Statewide Implementation Agreement for "Concurrent NEPA/404 Processes for Transportation Projects in Illinois" in Appendix A; see Section 22-4. • *National Environmental Policy Act* USEPA has developed a set of criteria for rating draft EISs. The rating system provides a basis upon which USEPA makes recommendations to the lead agency for improving the draft EIS. • *Clean Air Act*, Section 309 This Section authorizes USEPA to review other Federal-agency projects requiring an EIS and to make those reviews public. It also provides that if the agency responsible for the project does not make sufficient revisions in response to the review, and the project remains environmentally unsatisfactory, USEPA may refer the matter to the Council on Environmental Quality for mediation. • *Clean Air Act* USEPA administers implementation of the provisions of this Act for regulating air emissions from stationary and mobile sources. The agency establishes National Ambient Air Quality Standards (NAAQS) to protect public health and public welfare and to regulate emissions of hazardous air pollutants. It also administers regulations for achieving conformity with the NAAQS; see Sections 26-11, 26-12 and 26-13. • *Clean Water Act*, Section 401 USEPA administers the regulations for implementing the Section 401 Water Quality Certification provisions. For any Federal permit or license to conduct any activity which may result in any discharge into waters of the US, the

Agency	Jurisdiction/Expertise
	regulations require certification or a waiver of certification that the activity will not cause a violation of applicable water quality standards. For actions in Illinois, Illinois Environmental Protection Agency is the certifying agency for Section 401; see Sections 22-5.02(b) and 28-2. • *Clean Water Act*, Section 404(b)(1) Analysis Projects involving discharge of dredged or fill material requiring an individual Section 404 permit and compliance with the Section 404(b)(1) "Guidelines for Specification of Disposal Sites for Dredged or Fill Material"; see Section 28-2. • *Comprehensive Environmental Response, Compensation and Liability Act* (CERCLA)/*Resource Conservation and Recovery Act* (RCRA) USEPA administers Federal regulations and programs for addressing the control and management of hazardous waste and other regulated substance contamination. Illinois Environmental Protection Agency administers State regulations under the Illinois *Environmental Protection Act* that apply in lieu of the Federal regulations for actions in this State; see Section 22-5.02(b).
U.S. Forest Service (USFS), U.S. Department of Agriculture (USDA)	• *Wild and Scenic Rivers Act* Projects that may affect a designated Wild and Scenic River segment under the jurisdiction of USFS. • National Forest Projects that affect the Shawnee National Forest.
Natural Resources Conservation Service, USDA	• *Farmland Preservation Policy Act* Projects requiring additional right-of-way outside any corporate limits, subject to certain specified exemptions; see Section 26-10.04.
Federal Emergency Management Agency, Department of Homeland Security (DHS)	• *National Flood Insurance Act* Projects involving encroachments in floodways; see Section 26-7.
U.S. Coast Guard, DHS	• Concurrent NEPA/404 Processes Projects subject to the Statewide Implementation

Agency	Jurisdiction/Expertise
	Agreement for "Concurrent NEPA/404 Processes for Transportation Projects in Illinois" in Appendix A; see Section 22-4. • *Rivers and Harbors Act* - Section 9 Permits Projects involving construction of bridges or causeways over navigable waters of the US; see Section 28-2.
U.S. Department of Housing and Urban Development (HUD)	• *Housing and Community Development Act* Projects involving use of land acquired with HUD Open Space Lands funds; see Section 26-4.
Advisory Council on Historic Preservation	• *National Historic Preservation Act* Projects having an adverse effect on a property included on, or eligible for inclusion on, the National Register of Historic Places; see Section 26-5.04.

22-5.02(b) State Agencies

Agency	Jurisdiction/Expertise
Illinois Department of Natural Resources (IDNR)	• *Illinois Endangered Species Protection Act* Projects determined to be in the vicinity of a State-listed threatened or endangered species, in accordance with the "Memorandum of Understanding By and Between IDNR and IDOT" in Appendix A; see Section 26-9. • *Interagency Wetland Policy Act of 1989* Projects involving unavoidable adverse wetland impacts, in accordance with the IDOT Wetlands Action Plan and the "Memorandum of Understanding By and Between IDNR and IDOT" in Appendix A; see Section 26-8. • Illinois Natural Area Inventory (INAI) Sites Projects determined to be in the vicinity of a site listed on the INAI, including Illinois Natural Area Inventory sites, dedicated Illinois Nature Preserves and registered Land and Water Reserves, in accordance with the IDOT Wetlands Action Plan and the "Memorandum of Understanding By and Between IDNR and IDOT" in Appendix A; see Section 26-9.

Agency	Jurisdiction/Expertise
	• Impacts to Natural Resources Projects that could adversely affect streams, forest/trees, prairie/savanna areas, or properties owned, leased or managed by IDNR, in accordance with the "Memorandum of Understanding By and between IDNR and IDOT" in Appendix A; see Section 27-1. • *Land and Water Conservation Fund Act* (LAWCON) Projects involving conversion of land acquired or improved with LAWCON funds to other than public outdoor recreation use; see Section 26-3. • *Open Space Lands Acquisition and Development Act* (OSLAD) Projects involving conversion of land acquired or improved with OSLAD funds to other than public outdoor recreation use; see Section 26-4. • *Rivers, Lakes and Streams Act* Projects involving: + construction in floodways of rivers, lakes and streams under the jurisdiction of the IDNR Office of Water Resources (OWR); + construction in those rivers, lakes, streams, and waterways considered "public waters"; or + new construction within the regulatory floodways of rivers, lakes, and streams in Cook, DuPage, Kane, Lake, McHenry, and Will counties excluding the City of Chicago. See Section 28-3.
Illinois Environmental Protection Agency	• *Clean Water Act*, 401 Water Quality Certification Projects involving work that may result in any discharge into waters of the US and that is subject to a Federal permit requiring an individual 401 water quality certification (i.e., for which IEPA has neither waived certification nor issued blanket certification); see Section 28-2. • *Clean Water Act*, 303(d) Impaired Waters Projects that may affect a water resource included in the IEPA list of "impaired" waters; see Section 26-21. • *Clean Water Act*, National Pollutant Discharge Elimination System (NPDES) Permits

Agency	Jurisdiction/Expertise
	Projects that: + will require a point-source NPDES permit; + will involve clearing, grading, and/or excavation activities disturbing one acre (4047 m^2) or more of land area; or + occur in an area covered by an NPDES Metropolitan Separate Storm Sewer System (MS4) permit. See Chapter 41. • Illinois *Environmental Protection Act* Projects determined, through the IDOT special waste screening process, to have potential for involvement with special wastes or other regulated substance contamination; see Section 27-3.
Illinois Department of Agriculture	• Illinois *Farmland Preservation Act* Projects requiring additional right-of-way, subject to certain specified exemptions, as defined in the IDOT Agricultural Land Preservation Policy Statement and Cooperative Working Agreement in Appendix A; see Section 26-10.05.
Illinois Historic Preservation Agency	• *National Historic Preservation Act* Projects involving Federal funding, approvals, permits or licenses that have the potential to cause effects on properties included on, or eligible for inclusion on, the National Register of Historic Places; see Section 26-5.04. • *Illinois Historic Preservation Act* Projects that do not involve Federal funding, approvals, permits or licenses, do not otherwise comply with the National Historic Preservation Act and have the potential to cause effects on properties included on, or eligible for inclusion on the Illinois Register of Historic Places; see Section 26-5.06.

22-5.03 District Coordination Meetings

The district conducts periodic coordination meetings, which involve personnel from the central offices, FHWA, and other agencies, as appropriate. These meetings provide a forum for discussing various project-related issues (e.g., scope of the project, exceptions to design criteria, meeting ADA standards to the maximum extent practicable, Federal funding participation, progress of environmental clearances, and level of environmental processing).

22-5.03(a) Scheduling Coordination Meetings

BDE will develop an annual coordination meeting schedule in cooperation with districts and FHWA to eliminate meeting conflicts among districts and to allow appropriate central office personnel to be available. The district should distribute a tentative agenda and associated project information, draft reports, exhibits, etc., approximately two weeks in advance of each meeting.

22-5.03(b) Appropriate Representation

Invite persons to the meetings who have a role in project development and decision making, such as central office environmental specialists, district specialists and, if applicable, the consultant's project manager, environment leads, and specialists.

If projects to be discussed significantly affect other agencies or require special expertise or coordination, the district should invite the applicable agencies to the coordination meeting. Highlight in the invitations and agendas the projects and issues requiring the expertise of the other agencies. State agencies (e.g., Illinois Department of Natural Resources, Illinois Historic Preservation Agency, Illinois Department of Agriculture, Illinois Environmental Protection Agency) and Federal agencies (e.g., Department of the Interior, Army Corps of Engineers) may be involved frequently. Consultant environmental staff should attend coordination meetings if environmental issues on their projects are an agenda topic.

22-5.03(c) Topics for Discussion

Coordination meetings should address such topics as the need for and adequacy of environmental reports, need for special reports, typical sections, intersection design studies, design exceptions, meeting ADA standards to the maximum extent practicable, etc. The scoping of environmental reports (see 40 CFR 1501.7, 23 CFR 771.119(b) and 771.123(b)) is also an appropriate topic for coordination meetings. When other agencies are present, the coordination meeting may serve as the scoping meeting as discussed in Section 25-2.04.

Submit an agenda to the intended participants at least two weeks prior to the meeting. Include the following items in the agenda for each project to be discussed:

- a short description of the project, its location, and the desired action or reason for including the project on the agenda, including environmental issues, as appropriate;
- the route designation and transportation system (e.g., NHS), funding, and anticipated construction year;
- design policy to be used;

- status of environmental surveys;
- measures for minimizing and mitigating adverse socio-economic and environmental impacts; and
- district contact person for the project and, as appropriate, the project consultant.

Also indicate on the agenda projects to be advertised in the Professional Transportation Bulletin and include in the agenda any topics of general concern intended for discussion. Include documentation with the agenda, as necessary, to support the desired action for specific projects.

22-5.03(d) Information Presented

The information presented at a coordination meeting usually depends on:

- the project development stage,
- coverage at previous coordination meetings, and
- the scope of the project.

A complex project on new alignment may involve many topics and presentations at numerous meetings over the duration of the study. If a minor project requires discussion, a brief presentation may be sufficient.

Because several projects may be discussed at each coordination meeting, information that has been previously presented and discussed need not be repeated. However, the meeting should include a brief summary of important points previously discussed and any decisions reached on each project.

If design exceptions, or maximum extent practicable (MEP) determinations for ADA will be requested, the district must provide supporting documentation/ justification. The supporting documentation/justification for design exceptions and MEP's ultimately will be included in the Phase I report.

The district should also make available appropriate information on the mitigation of impacts, effects on sensitive areas, detours, and stream crossings. Explain any channel work proposed in stream crossings so that the degree of impact can be determined.

22-5.03(e) Documentation

At all coordination meetings, the district must maintain a record on who attended and what transpired. Although a verbatim transcript is not necessary for coordination meetings, a recording may be useful to the district if questions arise on the accuracy of typed minutes. Prepare minutes promptly and send to each agency that was represented at the meeting. The transmittal letter should describe the process for correction of the minutes and set a time limit for submitting any corrections.

The suggested format for the minutes is shown in Figure 22-5.A. Identify each project discussed in the minutes, and provide special attention to any scoping actions because documentation may be required later. Each project should be covered on a separate page(s).

22-5.03(f) Recommended Practices

The following practices are recommended for coordination meetings to improve their effectiveness:

- Use video-teleconference, where practical.
- Schedule meetings for projects eligible for field approval prior to or after the regular meeting. Indicate the schedule for these meetings in the agenda and provide appropriate information for action in advance of the meeting.
- Schedule separate meetings for large or complex project issues, including the review of report comments.
- Avoid getting bogged down on minor issues that can be resolved over the phone or within the district.
- Keep the discussion focused on the desired action.
- Use slides, photographs, aerial photos, and other visual exhibits to clarify issues.
- Provide appropriate handouts such as location maps, ADT/DHV schematics, typical section drawings, crash history information, synopsis of environmental issues, and critical path items.
- Submit completed forms for Nationwide Section 404 Permit 23 to BDE prior to the coordination meeting.
- Provide meeting minutes to participants within two weeks following the meeting.

MINUTES OF COORDINATION MEETING

DISTRICT 1

May 9, 2009

ATTENDANCE

- Federal Agencies
- State Agencies
- Local Agencies

- FHWA
- IDOT Central Office
- District

PROJECT #1

- Project location, identification information
- Description of existing conditions, traffic data, and any high-crash locations
- Description of proposed work and status of development
- Information presented (e.g., on environmental surveys, impacts, mitigation)
- Comments and input received, including scoping actions/information (see Section 22-5.01(c))
- Design exceptions presented and action taken
- Environmental report concurrence

CEQ Q&A, Question 34d “Enforceability of ROD”
CEQ Q&A Question 39 “Imposing Enforceable Mitigation for EA and FONSI”
IDOT Departmental Policy D&E-19 “Follow-Through on Project Commitments”

Often the end result of coordination activities is IDOT commitments to provide measures to mitigate the adverse impact of a project. No other single factor is as significant in IDOT’s ability to interact effectively with other entities as the Department’s record and credibility for fulfilling its past commitments. It is important that commitments be honored, for the follow through on one project may affect negotiations, approvals, and processing for many other projects.

It is sometimes difficult to ensure that a commitment made at the planning stage of project development will be implemented at a later stage (e.g., design, construction, or maintenance). To ensure that a commitment is not neglected, special efforts should be made to identify and emphasize commitments in environmental reports or Phase I Reports. Commitments must be identified in the decision statement and/or a special subsection of each report. Decision statements could serve as an appropriate mechanism for transmitting important information among bureaus within the IDOT district offices.

22-6 GUIDANCE ON SPECIAL TOPICS

22-6.01 Purpose and Need

References: 23 USC 139 “Efficient Environmental Reviews for Project Decision Making”
40 CFR 1502.13 “Purpose and Need”
Paragraph II.B of FHWA Technical Advisory T6640.8A “Purpose and Need for EAs”

FHWA SAFETEA-LU Final Guidance, Questions 32-35 “Purpose and Need”
July 23, 2003 Memorandum from Federal Highway Administrator, Guidance on "Purpose and Need"

This discussion provides guidance for the “Purpose and Need” section of environmental documents. This guidance was prepared by the Federal Highway Administration’s Washington Office of Environmental Policy and issued on September 18, 1990. It has been edited to be consistent with the format of the BDE Manual. The guidance emphasizes the importance of the “Purpose and Need” discussion in establishing a sound basis for evaluating alternatives and environmental impacts. Although the FHWA guidance is within the context of an EIS, the information also applies to an EA as appropriate for the project.

For guidance on writing a Purpose and Need for an EA or EIS, see Appendix D.

22-6.01(a) Introduction

The Purpose and Need section is in many ways the most important chapter of an environmental impact statement (EIS). It establishes why the agency is proposing to spend large amounts of taxpayers’ money while at the same time precipitating significant environmental impacts. A clear, well-justified Purpose and Need section explains to the public and decision makers that the expenditure of funds is necessary and worthwhile and that the priority the project is receiving relative to other needed highway projects is warranted. In addition, although significant environmental impacts are expected to result from the project, the Purpose and Need section should justify why impacts are acceptable based on the project’s importance.

As importantly, the project purpose and need drives the process for consideration of alternatives, in-depth analyses, and ultimate selection. The *Council on Environmental Quality (CEQ) Regulations* require that the EIS address the “no-action” alternative and “rigorously explore and objectively evaluate all reasonable alternatives.” Furthermore, a well-justified purpose and need is vital to meeting the requirements of Section 4(f) (49 USC 303) and the Executive Orders on Wetlands (E.O. 11990) and Floodplains (E.O. 11988) and the Section 404(b)(1) Guidelines. Without a well-defined, well-established, and well-justified purpose and need, it will be difficult to determine which alternatives are reasonable, prudent, and practical, and it may be impossible to dismiss the no-action alternative.

The transportation planning process, which includes regional, subarea, and corridor planning, can serve as the primary source of information for establishing purpose and need as well as evaluating alternatives. Information and forecasts of vehicular miles of travel, travel demand, highway and travel speeds, traffic diversion, time of day characteristics, and traffic crash rates can be provided by the planning process. This information can be used to evaluate congestion, air quality, safety, and other environmental issues for various transportation alternatives including the no-action alternative. Planning can also estimate the benefits and costs associated with highway and transit projects that can be used in the development of project Purpose and Need.

22-6.01(b) Safety Considerations

As mentioned previously, a clear, well-written Purpose and Need section in an EA or EIS explains why the expenditure of funds is necessary and worthwhile and why the project is warranted. In addition, the Purpose and Need section should justify why expected environmental impacts are acceptable based on the project's importance. The Purpose and Need drives consideration of alternatives and is vital to meeting the requirements of Section 4(f) (49 USC 303), Executive Orders on Wetlands (E.O. 11990) and Floodplains (E.O. 11988), and the Section 404(b)(1) Guidelines in determining which alternatives are reasonable, prudent, and practical.

If safety problems are recognized as one of the reasons for proposing a project then an identification of these issues is a key consideration in developing a well-defined, well-established, and well-justified Purpose and Need. Safety issues will be a factor in the development of alternatives to be considered and in the determination of which alternatives are reasonable, prudent, and practical.

Each Phase I Study is required to contain a safety analysis of the section of the facility on which the improvement is being proposed. This safety analysis is a very important tool which will help to identify the level of safety issues/problems that are involved in the project and to what extent safety is an element of the project Purpose and Need. As such, a safety analysis is required to be completed for all EAs and EISs prior to finalization of the project Purpose and Need.

The safety analysis should be summarized in the Purpose and Need Section of all EAs and EISs. The summary should provide sufficient data and information to justify all conclusions derived from the safety analysis. The types of data and information used in the safety analysis will vary based on the complexity and characteristics of the project. However, examples of typical types of data and information that might be included in the summary are as follows:

- the number, type, location and severity of crashes through tables and maps;
- locations of 5% Selected Sections;
- identification of trends;
- identification of the safety problems;

- identification of possible low costs countermeasures that can be implemented immediately; and
- identification of the proposed project's potential to address identified safety problems and to eliminate 5% Sections.

22-6.01(c) Consideration of Alternatives

In urbanized areas, the urban transportation planning process required by Section 134 of Title 23 should result in plans and programs that are consistent with the comprehensively planned development of an area and that integrate transportation, land use, and environmental considerations. Comprehensive planning, which includes transportation, should establish the basic purpose and need for specific projects and the system-wide consequences of operational improvements and the no-action alternative. For example, the planning process should identify the need for a transportation improvement between points "x" and "y" at some future date. Further, in a high percentage of cases, a decision on the appropriate mode (highway or transit) and the basic project concept (e.g., freeway on new location, upgrade of existing facility, light rail transit, bus/high occupancy vehicle lanes, approximate travel demand) can be determined. In other cases, it may not be possible to resolve these issues until the conclusion of the project development process. Scoping meetings early in the environmental process are an excellent means to reach agreement with the participants on the basic purpose and need for the project, the consequences of the no-action alternative, operational improvements and, where possible, the mode and project concept.

After the basic purpose and need for the project are established, a number of lines can theoretically still be drawn to connect points "x" and "y." If the project's purpose and need are so vague as to only stipulate that a transportation improvement between "x" and "y" is needed, then reasonable alternatives would cover a wide range and must be evaluated to comply with the *CEQ Regulations*. As the project's purpose and need are refined, a number of alternatives will drop out, thereby permitting a more focused analysis of those alternatives that truly address the problem to be solved. As alternatives are eliminated from consideration, it is recommended that the concurrence of those cooperating agencies with jurisdiction by law be sought in that decision.

Similarly, the type of improvement to be considered, even after the planning process, may be wide ranging — from upgrading an existing facility to a multilane freeway on new location. The traffic demands, safety concerns, system continuity considerations, etc., will help define reasonable alternatives, and products from the transportation planning process should serve as a primary source for this information.

Beyond the *CEQ Regulations'* requirement of evaluating all alternatives (or a reasonable number representative of the full spectrum of reasonable alternatives), there are other more action-limiting requirements for alternatives under Section 4(f), the Executive Orders on Wetlands and Floodplains, and the Section 404(b)(1) guidelines. To address these requirements and conclusively demonstrate that some alternatives are not prudent or practical, a well-justified purpose and need are vital.

The use of land from a Section 4(f) protected property (i.e., significant publicly owned public park, recreational area, or wildlife and waterfowl refuge, or any significant historic site) may not be approved unless a determination is made that there is no feasible and prudent alternative to such use or FHWA determines the impact qualifies as *de minimis*. There are numerous factors that could render an alternative “not prudent” because of unique problems, including cost and environmental impacts. If an alternative does not meet the project’s purpose or satisfy the needs, then the alternative is not prudent provided the Purpose and Need section can substantiate that unique problems will result by not building the project.

If a proposed action is to be located in a wetland or if it entails a floodplain encroachment with significant impacts, a finding must be made that there is no practicable alternative to the wetland taking or floodplain encroachment. Any alternative which does not meet the need for the project is not practicable. If the project’s purpose and need are not adequately addressed, specifically delineated, and properly justified, resource agencies, interest groups, the public, or others will be able to generate one or possibly several alternatives which avoid or limit the impact and “appear” practicable. Sometimes long, protracted negotiations or additional analyses are needed to demonstrate that an alternative is not practicable, whereas a well-described justification of the project’s purpose and need would have clearly established that finding.

If an alternative does not satisfy the purpose and need for the project, as a rule, it should not be included in the analysis as an apparent reasonable alternative. There are times when an alternative that is not reasonable is included based on the request of another agency or due to public expectation. In such cases, it should be clearly explained why the alternative is not reasonable (or prudent or practicable), why it is being analyzed in detail and, that because it is not reasonable, it will not be selected.

22-6.01(d) Basic Ingredients of Purpose and Need

The purpose and need should be as comprehensive and specific as possible. For example, rather than simply stating that additional capacity is needed between two points, information on the adequacy of current facilities to handle the present and projected traffic (e.g., what capacity is needed and the level of service for the existing and proposed facilities) should be discussed. Other information on factors (e.g., safety, system linkage, social demands, economic development, and modal interrelationships) that the proposed project will attempt to address, should be described as fully as possible. This will assist in pinpointing and refining the alternatives that should be analyzed. If the purpose of and need for the proposed project are rigorously defined, the number of “solutions” that will satisfy the conditions can be more readily identified and narrowly limited.

The Purpose and Need section of the project may, and probably should, evolve as information is developed and more is learned about the project and the corridor. For example, assume that the only known information regarding purpose and need is that additional capacity is needed between points “x” and “y.” At the outset, it may appear that commuter traffic to a downtown area is the problem, and only this traffic needs to be served. A wide range of alternatives may meet this need. As the studies progress, it may be learned that a shopping center, university, major suburban employer, and other traffic generators contribute substantially to the problem and require transportation service. In this case, the need is further refined so that not only commuter trips but also student, shopping, and other trips will be accommodated. These refinements would clearly reduce and limit the number of alternatives that could satisfy the project's purpose and need, thereby reducing the number and range of reasonable, prudent, and practical alternatives. If an alternative is suggested that does not serve the university or other traffic generator, and such service is a vital element of the project, the alternative may be eliminated from future study because it does not meet the need for the project.

In the example above, it should be noted that products of the urban transportation planning process should identify many of the elements which contribute to the transportation problems. To the extent that the planning process develops these products and these products are used in project development, it may not be necessary to prepare additional studies.

Some of the elements that may assist in explaining a project's purpose and need (e.g., capacity, safety, system linkage), are described on page 14 of FHWA Technical Advisory T6640.8A "Guidance for Preparing and Processing Environmental and Section 4(f) Documents." (See Appendix A of Part III of the BDE Manual.) This discussion is included here as additional information. All of the elements which are relevant should be as fully developed as possible and utilize as specific data as possible to compare the present, future no-action, and future build conditions. Data should be presented on such factors as reduction in vehicular hours of travel; improvements in travel speeds on the system; reduction in traffic crashes; injuries and fatalities; savings in cost to the traveling public; enhanced economic development potential; increased tax base; improved access to public facilities; etc. It is not sufficient to state that the project is needed to provide increased capacity and improve safety. Supporting data must be provided.

22-6.01(e) Using Purpose and Need in Decision Making

As noted above, the purpose and need define what can be considered reasonable, prudent, and practical alternatives. The decision-making process should first consider those alternatives that meet the purpose and need for the project at an acceptable cost and level of environmental impact relative to the benefits which will be derived from the project.

At times, it is possible that no alternative meets all aspects of the project's purpose and need. In such a case, it must be determined if the alternatives are acceptable and worth pursuing considering the cost, environmental impact, and less than optimal transportation solution. To properly assess this, it is important to determine the elements of the purpose and need that are critical to the project, as opposed to those that may be desirable or simply support it. The critical elements are those that, if not met at least to some minimal level, would lead to a "no-action" decision. Determining critical needs could include policy decisions as well as technical considerations.

Other times, the cost or level of environmental impact are not acceptable and an alternative that only partially meets the purpose and need or the no-action alternative must be considered. If the costs are justified relative to the transportation benefits, then a less than full-build alternative may be acceptable.

In the vast majority of cases, however, at least one alternative will fully meet the purpose and need at an acceptable cost and level of impact. In cases where more than one alternative fully meets the purpose and need, a number of factors including cost, traffic service, safety, public support, environmental impact, etc., will be considerations in reaching the decision on which is the preferred alternative. The requirements of Section 4(f), the Wetland and Floodplain Executive Orders, and the Section 404(b)(1) Guidelines, of course, play an important role in this process.

22-6.01(f) Key Points to Remember

In summary, the Purpose and Need section in an environmental document presents why the proposed action, with its inherent costs and environmental impacts, is being pursued. If properly described, it also limits the range of alternatives that may be considered reasonable, prudent, and practicable in compliance with the *CEQ Regulations*, Section 4(f), the Executive Orders on Wetlands and Floodplains, and the Section 404(b)(1) guidelines. Further, it demonstrates the problems that will result if the project is not implemented.

There are three key points to remember on the Purpose and Need section of environmental documents. The section should be:

- a justification of why the improvement must be implemented,
- as comprehensive and specific as possible, and
- re-examined and updated as appropriate throughout the project development process.

22-6.01(g) Additional Information

Reference: Paragraph V.D. of FHWA Technical Advisory T6640.8A “Purpose of and Need for Action”

The cited reference provides additional information which applies to defining the purpose and need for the proposed action.

22-6.02 Indirect and Cumulative Environmental Impacts

References: 40 CFR 1502.16(b) “Discussion within Environment Consequences Section”
40 CFR 1508.7 “Definition of Cumulative Impact”
40 CFR 1508.8 “Definition of Direct and Indirect Effects”
CEQ Q&A, Question 18 “Uncertainties on Indirect Effects”
Considering Cumulative Effects under the National Environmental Policy Act (NEPA), CEQ, January 1997
FHWA Interim Guidance: Indirect and Cumulative Impacts in NEPA

22-6.02(a) Background

Indirect and cumulative environmental impacts will be considered and addressed as a normal component of environmental analyses for highway projects. The primary focus of the IDOT approach will be to ensure that the Department is conducting a good-faith effort to identify and disclose potential indirect and cumulative impacts that may occur. This will be demonstrated if the environmental document discloses all information of which the Department could reasonably have been expected to have knowledge.

22-6.02(b) Applicability

The procedures in this section are applicable to the following types of highway projects initiated by the Department:

- constructing highways on new alignment,
- adding lanes to an existing highway, and
- constructing a new interchange on an existing freeway or adding ramps to an existing interchange that will increase access to an area.

22-6.02(c) Definitions

The following definitions apply:

1. Reasonably Foreseeable. Deemed likely to occur in the future based on the best available planning information for the project area (e.g., formal planning documents, information from community officials, local land-use/zoning/permitting processes). The term is not intended to imply that district project development personnel or local officials are expected or encouraged to speculate on anticipated development in lieu of or beyond the scope of formal planning processes. To the extent that community officials are willing to provide their views on anticipated development in their locale, the information should be summarized in the project environmental document and appropriately analyzed and discussed according to these procedures. The sources of the information also should be cited in the environmental document.
2. Indirect Impacts. Those environmental impacts, such as conversion of agricultural land or habitat, that will result from reasonably foreseeable non-highway actions (e.g., land-use changes such as residential or business development) that will accompany or occur after completion of a highway project and that are assumed to be induced by the highway project.
3. Cumulative Impacts. The total impacts on specific environmental resources anticipated to result from the proposed highway project and other highway and non-highway development in the project area. In determining cumulative impacts, the district should

consider both development that the project will induce and development that is unrelated to the project but which will affect the same resources.

22-6.02(d) Identifying and Disclosing Reasonably Foreseeable Indirect and Cumulative Environmental Impacts

In evaluating cumulative impacts, districts should apply the guidance in the CEQ publication *Considering Cumulative Effects Under the National Environmental Policy Act.* The publication is available on the CEQ website and also can be accessed through the FHWA website. In the early planning phase of project development, districts should contact local community officials and planning and zoning authorities to determine the existence of land-use plans, planning information, and permitting processes that will identify anticipated development in the project area. These contacts also should explore the extent to which the development has been determined to be, or is perceived to be, related to or induced by the highway project. Districts should advise local officials that the information they provide will be incorporated in the project environmental documentation as part of the discussion of indirect and cumulative impacts. Where development has preceded the proposed highway project, the district should nonetheless evaluate whether planning information for the area indicates the highway may prompt further development. The influence of the development in "inducing" the highway project should be reflected in the discussion of the improvement's purpose and need.

The spatial extent of analysis for potential indirect and cumulative impacts generally should correspond to the area over which the highway project is anticipated to affect traffic patterns and volumes based on traffic forecasts for the highway system with and without the improvement. The temporal extent of such analyses should correspond to the time frame reflected in current planning documents for the area or, in their absence, the time frame for which local officials will project planning information. The following provides specific direction on how indirect and cumulative impacts should be addressed for different levels and types of planning information available for the project area:

1. No Formal Planning Process Nor Current Planning Document for Project Area. If there is no local or regional planning process for the project area or if there is such a process but no current planning document, the district should contact community officials to determine if they will provide information regarding anticipated development in the project area. If local officials do not provide such information, disclose in the coordination section of the environmental document that there is no formal local planning process nor current planning document, as appropriate, and that contacts with local officials did not elicit information on anticipated development for the project area. The district should evaluate whether the current approved highway program includes any other current or anticipated improvements which could result in cumulative impacts when combined with the project under development. Any such cumulative impacts should be discussed in the environmental consequences section of the environmental document. Indirect and cumulative impacts need not be discussed further except to respond to comments or concerns of review agencies and the public.

If local officials do provide information regarding anticipated development in the project area, summarize the information in the coordination section of the environmental document. Also note the source of the information and that there is no formal planning process nor current planning document available for the area. Analyze the information to identify development which the highway project could induce (i.e., for which the highway project would be a necessary condition) or which would involve cumulative impacts on resources which the highway project would affect. Discuss the anticipated indirect and cumulative impacts of the development in the environmental consequences section of the environmental document and any cumulative impacts that would result from other highway projects indicated in the current approved IDOT highway program.

2. Current Planning Document in Place for Project Area. If there is a current planning document in place for the project area, disclose the existence of the document in the coordination section of the project environmental document. Analyze the information to identify development which the highway project could induce (i.e., for which the highway project would be a necessary condition) or which would involve cumulative impacts on resources which the highway project would affect. Discuss the anticipated indirect and cumulative impacts of the development in the environmental consequences section of the environmental document and any cumulative impacts that would result from other highway projects indicated in the current approved IDOT highway program.

   If the district determines that the information in the current planning document is not consistent with actual land-use decisions in the area, this finding should be disclosed in the coordination section of the environmental document. The district should consider and discuss in the environmental consequences section potential indirect and cumulative impacts relative to the development projected in the planning document and relative to the patterns of development that actually are occurring.

22-6.02(e) Compatibility with Comprehensive Resource Plans

The district should confirm whether comprehensive resource plans (e.g., watershed or basin plans) have been prepared for the project area. Where such plans exist, the district should determine and disclose in the environmental document the compatibility of the reasonably foreseeable indirect and cumulative impacts relating to the project with the basic assumptions and objectives of the resource plan(s). The district also should determine and discuss in the environmental document, the compatibility of the reasonably foreseeable indirect and cumulative impacts relating to the project with statewide comprehensive resource plans (e.g., Illinois Wildlife Action Plan, Illinois Statewide Comprehensive Outdoor Recreation Plan).

22-6.02(f) Mitigation

The district must disclose indirect and cumulative environmental impacts in the environmental documents for highway projects subject to these procedures. However, the document must not necessarily include a discussion of mitigation for indirect or cumulative non-highway impacts. The document should include information describing any mitigation proposed for the direct impacts of the highway project. In addition, when the district has knowledge of mitigation proposals or commitments by others (e.g., developers or resource agencies) relating to indirect or cumulative impacts associated with a proposed highway project, the environmental document for the highway project should disclose this information.

The district also should confirm and disclose in the environmental document whether local governments with jurisdiction in the project area have ordinances in place for protection of environmental resources, particularly those affected by the anticipated indirect and cumulative impacts associated with the project.

22-6.02(g) Format for Documentation in Environmental Reports

There is no prescribed format for discussing indirect and cumulative impacts in project environmental documents. These impacts may be incorporated, as appropriate, in the discussion of each environmental resource issue area or consolidated in a separate “indirect and cumulative impacts” topic in the environmental consequences section. BDE recommends use of the first option in most cases. It allows reviewers to more conveniently identify the total anticipated impacts for each environmental issue area, which may be desirable for review agencies interested in selected areas. The second option may be preferred where concerns have been expressed regarding indirect and cumulative impacts. In these instances, it may be helpful to consolidate the discussion of indirect and cumulative impacts in a separate section to clearly demonstrate that they have been addressed.

22-6.03 Logical Termini

References: 23 CFR 771.111(f) “Logical Termini, Independent Utility, Effect on Other Projects”
Section 22-3.06 “Proposed Action”

This discussion provides guidance in determining logical project termini for proposed actions. This guidance was prepared by the FHWA’s Office of Environment and Planning and issued on November 5, 1993. It has been edited to be consistent with the format of the BDE Manual. This guidance provides several working examples to illustrate the factors involved in choosing termini. These factors are then applied to issues such as project purpose and need, environmental impacts, and avoidance of segmentation.

22-6.03(a) Introduction

In developing a project concept which can be advanced through the stages of planning, environment, design, and construction, the project sponsor must consider a “whole” or integrated project. This project should satisfy an identified need, such as safety, rehabilitation, economic development, or capacity improvements, and should be considered in the context of the local area socioeconomics and topography, the future travel demand, and other infrastructure improvements in the area. Without framing a project in this way, proposed improvements may miss the mark by only peripherally satisfying the need or by causing unexpected side effects which require additional corrective action. A problem of "segmentation" may also occur where a transportation need extends throughout an entire corridor, but environmental issues and transportation need are inappropriately discussed for only a segment of the corridor.

The Federal Highway Administration (FHWA) regulations outline three general principles in 23 CFR 771.111(f) that are used to frame a highway project:

> *In order to ensure meaningful evaluation of alternatives and to avoid commitments to transportation improvements before they are fully evaluated, the action evaluated in each Environmental Impact Statement (EIS) or finding of no significant impact (FONSI) shall:*
>
> > *(1) Connect logical termini and be of sufficient length to address environmental matters on a broad scope;*
> >
> > *(2) Have independent utility or independent significance, i.e., be usable and be a reasonable expenditure even if no additional transportation improvements in the area are made; and*
> >
> > *(3) Not restrict consideration of alternatives for other reasonably foreseeable transportation improvements.*

The aim of this guidance is to discuss criteria that can be used to select logical termini (project limits) for development of a project. The primary discussion will be on the first of the three factors mentioned above. However, all three are interrelated and necessary to the development of an integrated project.

The remainder of this guidance is divided into three sections. Section 22-6.03(b) defines logical termini. Section 22-6.03(c) discusses several case studies covering factors that are relevant in choosing termini, and Section 22-6.03(d) offers some conclusions.

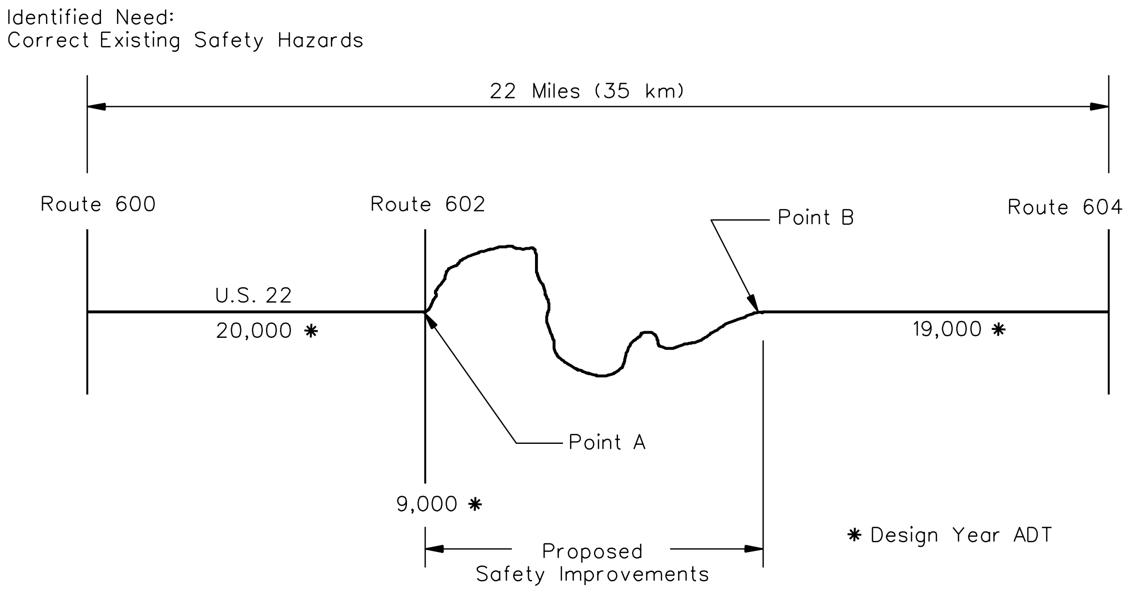
22-6.03(b) A Definition of Logical Termini

Logical termini for project development are defined as (1) rational end points for a transportation improvement, and (2) rational end points for a review of the environmental impacts. The environmental impact review frequently covers a broader geographic area than the strict limits of the transportation improvements. In the past, the most common termini have been points of major traffic generation, especially intersecting roadways. This is due to the fact that in most cases traffic generators determine the size and type of facility being proposed. However, there are also cases where the project improvement is not primarily related to congestion due to traffic generators, and the choice of termini based on these generators may not be appropriate. The next section will show some examples where this is the case.

Choosing a corridor of sufficient length to look at all impacts need not preclude staged construction. Therefore, related improvements within a transportation facility should be evaluated as one project, rather than selecting termini based on what is programmed as short range improvements. Construction may then be “staged” or programmed for shorter sections or discrete construction elements as funding permits.

22-6.03(c) Sample Project Concepts and Discussion

Case #1



CASE #1

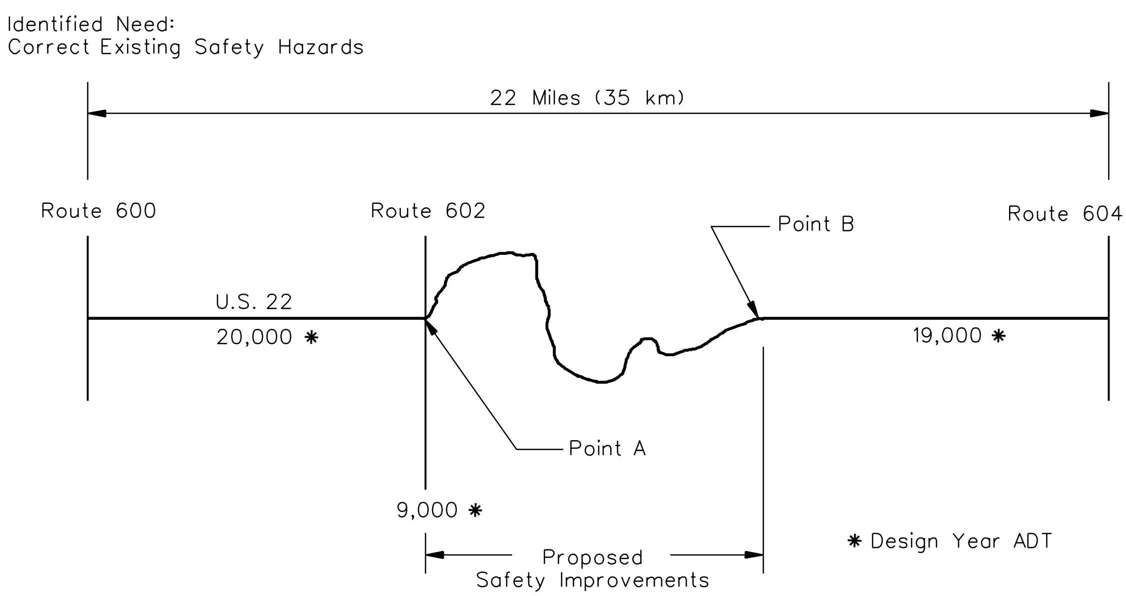
Figure 22-6.A

US 22 is a rural two-lane facility without access control. A number of crashes have been identified, and the need for the project is to correct site-specific geometric deficiencies between Point A (Route 602) and Point B (no intersecting roadway).

Discussion: In this Case, the selection of A and B as termini is reasonable, given the scope of the project. In fact, for projects involving safety improvements, almost any termini (e.g., political jurisdictions, geographical features) can be chosen to correspond to those sections where safety improvements are most needed. The first criterion, that the project connect logical termini and be of sufficient length to address matters on a broad scope, is largely irrelevant due to the limited scope of most safety improvements. Furthermore, even if other safety improvements are needed beyond those in segment A-B, the project termini need not be expanded to include these other improvements. The other two criteria still need to be met to choose A and B as termini: The safety improvements have independent utility (i.e., they can function as stand-alone improvements without forcing other improvements which may have impacts), and these improvements do not restrict consideration of other reasonably foreseeable transportation improvements (such as major safety improvements in an adjoining section; e.g., Point B to Route 604, which could involve changes in alignment of the segment currently under review).

Also, all environmental requirements must still be met. For instance, straightening of a curve through park land cannot take place without completing the necessary Section 4(f) analysis.

Case #2



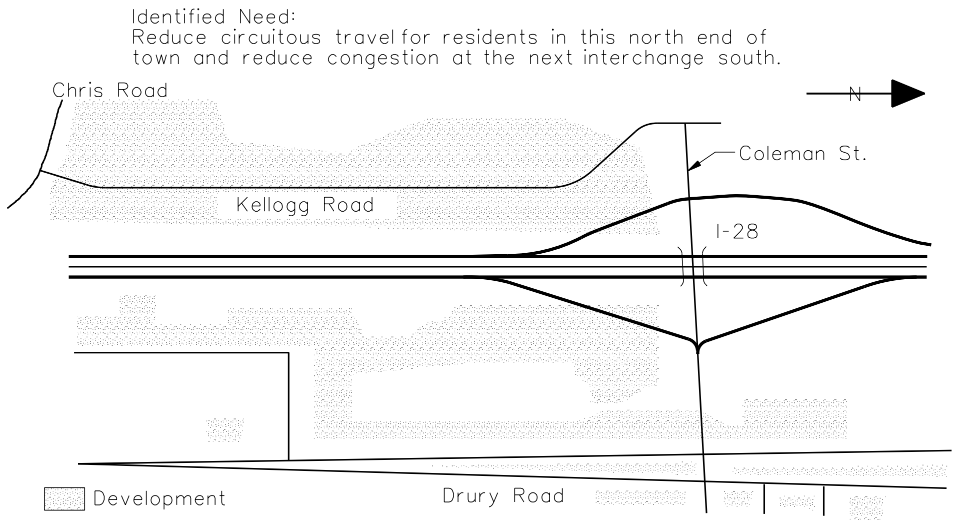
CASE #2

Figure 22-6.B

US 26 is on the eastern fringe of a rapidly growing urban area. Over the next 20 years, traffic growth and congestion are predicted for the section of roadway closest to the urban area, between Route 100 and Route 200. Because US 26 also serves as a through facility to points east, congestion will increase on the other sections also. It is proposed to deal with the worst of the congestion problems by widening the road to four lanes between Point A (Route 100) and Point B (Route 200).

Discussion: Widening between Point A and Point B could be implemented as a reasonable project with a logical termini, but several conditions would have to be met.

Case #3



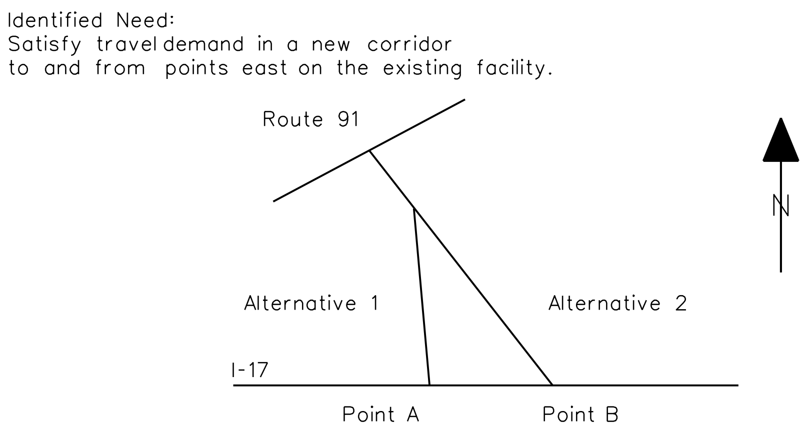
CASE #3

Figure 22-6.C

The proposed project is a new interchange with I-28 at the north edge of a growing urban area with options to upgrade an existing north-south feeder/collector route, Kellogg Road, on a new location. The next interchange south is at capacity now due to (1) new housing in the north end of town, and (2) a rapidly expanding commercial area at the existing interchange. The identified purposes of this project are to reduce circuitous travel for north end residents and to reduce congestion at the next interchange south.

Discussion: At first glance, the logical termini for analysis are the points where the new interchange ties in with existing facilities (Kellogg Road and Drury Road). Would this action force other project improvements? In this example, Kellogg Road and Drury Road may be overloaded by interchange traffic. If this is considered now, there may be design options to address this without substantial change or disruption. If this is dealt with later, the options may be more limited. If the only remaining option in the future is to widen Kellogg Road and Drury Road, there may be considerable disruption, relocations, etc., which could possibly have been avoided. For this particular project, the eastern project terminus was the intersection of Coleman Street and Drury Road, because there was adequate capacity on Drury road to absorb the traffic and no additional improvements would be forced. The western project terminus was further away from the intersection, because Kellogg Road did not have sufficient capacity to accommodate the traffic from the interchange. The terminus in this case was where Kellogg Road intersected with Chris Road. It was demonstrated that Chris Road had the capacity to handle the additional traffic and that no additional improvements would be forced. Options for upgrading Kellogg Road included widening of the existing Kellogg Road or a north-south feeder road on new alignment. Even if the project sponsor had decided not to upgrade Kellogg Road, the environmental document should have covered the environmental impacts resulting from the congestion of this route (e.g., community disruption, possible air quality violations).

Case #4



CASE #4

Figure 22-6.D

This proposed facility is on new alignment, connecting Route 91 with I-17. Alternative 1 is shorter, connecting to I-17 at Point A, and Alternative 2 would tie in further east, at Point B. The primary travel on this new facility is to and from points east on I-17. I-17 is four lanes west of Point B and six lanes east of Point B. Alternative 2 has been designated as the preferred option by the project sponsor. Alternative 1 was proposed by a citizen's group to reduce the number of relocations and community disruption. Cost estimates are $50 million for Alternative 1 (to tie in at Point A) and $63 million for Alternative 2 (to tie in at Point B).

Discussion: It is likely that an incomplete picture of the costs and impacts of Alternative 1 is being provided by only carrying the analysis as far as Point A. For both alternatives, consideration of impacts should continue to Point B or east of B if there are likely to be any weaving or merging problems which will force changes in the facility beyond B. In this example, the four-lane section between A and B, if overloaded by Alternative 1, would force further improvements on I-17 which would likely have additional impacts.

Failure to take this into account would underestimate the cost and overall impacts of Alternative 1 and skew decision making. As a result of these factors, if Alternative 1 is considered a reasonable alternative, the discussion of impacts should extend to impacts occurring at Point B. If I-17 will be able to accommodate the increased traffic from Alternative 1 without widening, then the discussion could simply be a demonstration of that fact.

22-6.03(d) Conclusions

The aim of this guidance has not been to present all possible ways of determining logical project termini but, rather, to present a thought process that can be used to make these determinations on a case-by-case basis. For the vast majority of highway projects, the choice of logical termini will be obvious and non-controversial. For those few complex projects where other considerations are important, the termini chosen must be such that:

- environmental issues can be treated on a sufficiently broad scope to ensure that the project will function properly without requiring additional improvements elsewhere, and

- the project will not restrict consideration of alternatives for other reasonably foreseeable transportation improvements.

By following this guidance, proposed highway projects will be more defensible against litigation claims of project segmentation, and decision makers and the public will have a clearer picture of the transportation requirements in the project area and a better understanding of the project purpose and need.

22-6.04 Congestion Management Process (CMP) Alternatives

CMP requirements apply to the following Transportation Management Areas (TMAs) in Illinois, regardless of air quality attainment status: Chicago (Chicago Metropolitan Agency for Planning jurisdiction), St. Louis (East-West Gateway Council of Governments jurisdiction), Peoria (Tri-County Regional Planning Commission jurisdiction), the Quad Cities (Bi-state Regional Commission jurisdiction), and Rockford (Rockford Metropolitan Agency for Planning jurisdiction). These areas must address congestion management through a cooperatively developed and implemented process for new and existing transportation facilities that incorporates use of travel demand reduction and operational management strategies. The CMP must include methods to:

- monitor and evaluate the performance of the multimodal transportation system (i.e., performance indicators),

- identify the causes of recurring and non-recurring congestion,

- identify and evaluate alternative strategies,

- provide information supporting the implementation of actions, and

- evaluate the effectiveness of implemented actions.

Each TMA must also develop appropriate performance measures as part of the CMP to assess the extent of congestion and support the evaluation of the effectiveness of transportation improvements in reducing congestion within the TMA. The TMA may also establish thresholds for congestion reduction that must be met for a project to be considered for Federal funding. In TMAs where performance measures have been established, the district will need to coordinate with Metropolitan Planning Organization staff to ensure that a proposed project's effectiveness in reducing congestion has been evaluated through the CMP. In cases where thresholds have also been developed, the district must coordinate to ensure the project meets those thresholds. The results of coordination for the CMP will be reflected in the congestion management strategies incorporated in the project scope and alternatives, as appropriate.

In areas designated as nonattainment for carbon monoxide or ozone, additional requirements apply for analysis of CMP alternatives. When projects within these areas would significantly increase capacity for single-occupancy vehicles (i.e., by adding lanes to an existing highway or constructing a new highway), the alternatives section must include information on CMP alternatives. Lane additions for safety improvements or for elimination of bottlenecks are not considered to be projects that significantly increase capacity for single-occupancy vehicles. The following paragraphs provide recommended wording for use in addressing this requirement:

Congestion Management Process Alternatives

The provisions of 23 CFR 450.320 place restrictions on the use of Federal funds for projects in Transportation Management Areas (TMAs) designated as nonattainment for carbon monoxide and/or ozone. In these areas, Federal funds may not be programmed for any project that will significantly increase capacity for single-occupancy vehicles (SOVs) unless the project is addressed through a Congestion Management Process (CMP). The CMP is required to provide an appropriate analysis of alternatives to the proposal for adding SOV capacity, including all reasonable congestion management strategies. If the analysis demonstrates that other alternatives and/or congestion management strategies cannot fully satisfy the need for additional capacity and that, therefore, the additional SOV capacity is warranted, the CMP must identify all reasonable strategies that will maintain the functional integrity of the additional lanes. All identified reasonable strategies must be incorporated into the project. The CMP for each affected TMA is addressed in materials available from the Metropolitan Planning Organization responsible for the area.

[The following paragraphs provide recommended text to use for projects in the Chicago metro area. This text should be modified as appropriate (e.g., regarding references to the affected planning area, the responsible Metropolitan Planning Organization, the documents referenced for the CMP) for projects in other TMAs.]

Individual projects involving addition of SOV capacity were evaluated, selected, and prioritized in the course of developing the Fiscal Year [*insert appropriate years*] Transportation Improvement Program (TIP) and the long-range [*insert appropriate year*] Regional Transportation Plan (RTP) for Northeastern Illinois. The Northeastern Illinois CMP is documented via various materials that are available through the Chicago Metropolitan Agency for Planning (CMAP). The following are examples:

- Congestion Mitigation Handbook, September 1998
- Congestion Management System for Northeastern Illinois, [*insert appropriate year*] Annual Status Report

- [Date of most recent] Regional Transportation Plan for Northeastern Illinois
- Arterials and Streets Infrastructure and Operations for Mobility, Access, and Community in Metropolitan Chicago, January 2009
- Travel Demand Management, Strategy Paper, March 2009
- Congestion Reduction Demonstration for Northeastern Illinois A Proposal for Direct Highway Pricing, Transit, Technology, and Supporting Strategies, December 31, 2007

The development process for the TIP and Regional Transportation Plan constitutes the CMP for Northeastern Illinois. This process documents warranted projects for adding SOV capacity and, as applicable, also documents that regional and/or project-specific alternatives (e.g., Transportation Demand Management measures, High-Occupancy Vehicle measures, Transit Capital Improvements, Congestion Pricing, Growth Management, Incident Management) would not obviate the need for adding SOV capacity. Planned projects resulting from the CMP are documented in the annual CMP status report referenced above. [*Include the following sentence, when applicable.*] For this project, it has been determined that stand-alone CMP alternatives will not satisfy the project purpose and need and, therefore, this undertaking is a warranted project for adding SOV capacity.

Reasonable project-specific CMP strategies, including Traffic Operational Improvements, Transit Operational Improvements, Non-motorized modes/measures (Pedestrian/Bicycle), Intelligent Transportation System (ITS), and Access Management, have been incorporated into this project to the extent practical. Specific strategies incorporated include [*list the strategies (as described in the Congestion Management Handbook) such as adding turning lanes, modernizing signals, signal interconnect, ITS (adding dynamic message signs, highway advisory radio, fiber optic, etc.), sidewalk/bicycle accommodations, access consolidation, and/or barrier median to control access, etc.*]. [*Add the following, if applicable:*] With respect to Transit Operational Improvements, coordination occurred with [PACE/Metra/CTA]. Based on this coordination the following transit improvements were included in the project: [*briefly describe any included transit projects and reference pertinent correspondence*].

As documented in the above information, this project results from the CMP for Northeastern Illinois as a warranted project for adding SOV capacity and all reasonable congestion management strategies have been incorporated into the project to sustain its effectiveness.

22-7 ENVIRONMENTAL DOCUMENTATION AND PROCESS FOR NON-FEDERAL PROJECTS

22-7.01 Environmental Documentation for Non-Federal Projects

22-7.01(a) "Categorical Exclusion" Projects

For actions that do not involve Federal funding or approvals and which qualify as "Categorical Exclusions" as discussed in Section 23-1.03, the environmental documentation for the project shall be a part of the Phase I Report (See Section 12-3.06).

22-7.01(b) Non "Categorical Exclusion" Projects

For projects that do not involve Federal funding or approvals and which do not qualify as "Categorical Exclusions" as discussed in Section 23-1.03, the environmental documentation shall be a part of the State Improvement Report; see Section 12-1.02 for the types of projects and Section 12-3.05 for the content.

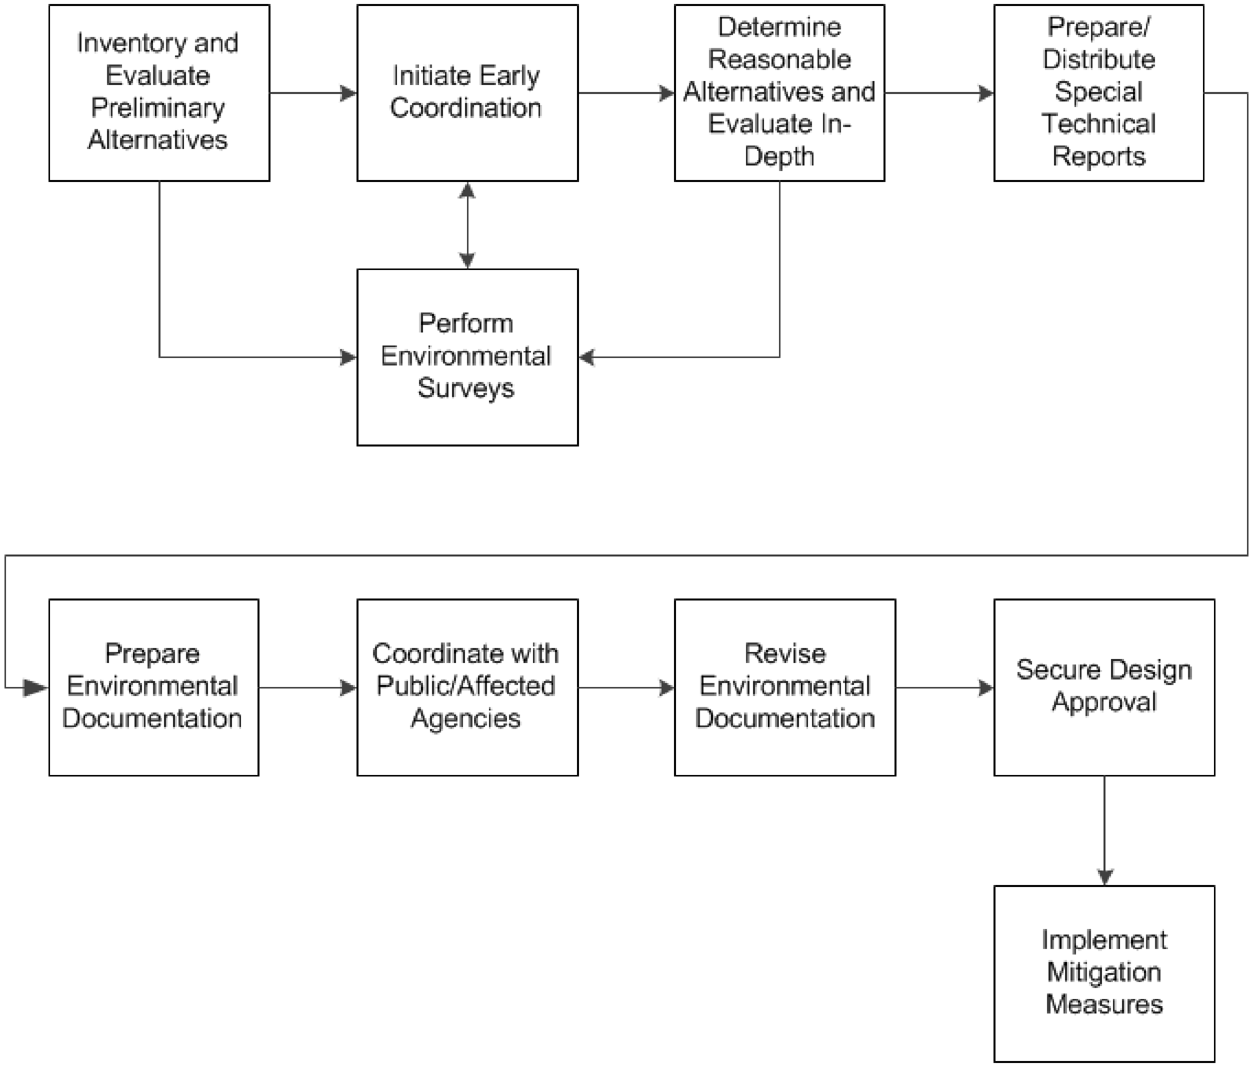
The process for addressing environmental issues on non-Federal projects will depend upon whether the projects qualify as Categorical Exclusions (CEs) as described in Section 23-1.03. Non-Federal actions that qualify as CEs will follow the environmental process as described in Section 23-2, except that FHWA will not be involved. For non-Federal actions that do not qualify as CEs, the environmental process described in this section will apply, as presented in Figure 22-7.A. This is followed by a brief description of each step within the network.

22-7.02 Environmental Process for Non-Federal Projects

22-7.02(a) Inventory and Evaluate Preliminary Alternatives

If the project is one which the Regional Engineer has determined will use the principles of Context Sensitive Solutions (CSS), the public involvement process should commence once the project is assigned to the project study group. The project study group shall use the Stakeholder Involvement Process (SIP) as outlined in Section 19-5.01 to conduct public involvement for CSS projects.

After the district office determines the preliminary project purpose and need, it will initiate activities to inventory and evaluate the affected environment and to develop and evaluate preliminary project alternatives. The compilation of environmental inventories should be pursued only to the extent necessary to provide high-quality information on the environmental impacts of the proposed action and to facilitate decision making. By limiting inventory work to an optimum level, the amassing of needless detail can be avoided, thus reducing paperwork.



PROCESS FOR NON-FEDERAL PROJECTS

Figure 22-7.A

The district should identify the range of the environmental inventory by evaluating environmental databases and submitting an environmental survey request, as appropriate, to BDE. Environmental concerns involved may include:

- Section 6(f) or OSLAD properties;
- archaeological and historical properties;
- floodplains;
- sensitive noise receptors;
- prime farmland;
- wetlands;
- threatened or endangered species habitat, nature preserves, and natural areas;
- wild and scenic rivers;
- status of air quality attainment;
- water quality of streams or lakes;
- special waste sites;
- social/economic characteristics of the affected population;
- visual quality/aesthetics;
- well-head protection areas;
- groundwater recharge areas; and
- other biological areas.

After the inventory has been prepared, the district should perform a preliminary evaluation of the magnitude and importance of the potential environmental impacts of the alternatives under study. This will assist in initiating the early coordination process and in further refining the alternatives. The evaluation of preliminary alternatives should be sensitive to those environmental resources for which analysis of alternatives for avoidance and minimization of adverse impacts is required (e.g., wetlands floodplains, historic sites, and threatened and endangered species). In addition, districts should recognize that avoidance of environmental resources requiring special compliance procedures for impacts should be the preferred course of action. Avoidance of such resources will help to shorten project development time by avoiding the reporting and coordination necessary for compliance.

Reference: AASHTO Practitioner's Handbook 11 Complying with Section 4(f) of the US DOT Act, May 2009

22-7.02(b) Perform Environmental Surveys

Based on the environmental survey request and Special Waste Assessment Screen/Survey Request form, as appropriate, BDE will perform a record survey to assess published information and determine the need for further investigation of the following:

- wetlands,
- archaeological and historical resources,
- Federal and State threatened and endangered species or their critical/essential habitat,
- well-head protection zones and regulated recharge areas, and
- special waste sites.

As determined necessary on the basis of the records survey or special waste assessment screening process, BDE will coordinate, as appropriate, with the responsible agencies and the district for further field surveys. BDE will provide the environmental survey information to the district as it becomes available to assist in the evaluation of project alternatives.

Reference: Chapter 27 "Environmental Surveys"

22-7.02(c) Initiate Early Coordination

Coordination with governmental agencies and the public is an important aspect of the project development process and should begin as early as practical in project planning. This coordination facilitates obtaining information from other entities and individuals which may assist in the inventorying of the affected environment and in the evaluation of alternatives.

If the project is one which the Regional Engineer has determined will use the principles of Context Sensitive Solutions (CSS), the public involvement process should commence once the project is assigned to the project study group. The project study group shall use the Stakeholder Involvement Process (SIP) as outlined in Section 19-5.01 to conduct public involvement for CSS projects.

References: Section 22-5 "Coordination"
Chapter 19 "Public Involvement Guidelines"

22-7.02(d) Determine Reasonable Alternatives and Evaluate In-Depth

The district should evaluate the potential impacts of the preliminary alternatives on the inventory of environmental resource concerns and should consider the information and comments provided by other agencies and the public in determining the scope of issues of importance and, ultimately, the reasonable alternatives worthy of in-depth evaluation. The cost and level of effort for preliminary environmental evaluations of an alternative should be commensurate with its likelihood of being implemented. Collectively, the alternatives selected for in-depth study should be representative of the full range of alternatives and should gain public acceptance that no reasonable alternative has been omitted.

The district must evaluate in detail the environmental impacts of each selected reasonable alternative in accordance with the scope determined through the environmental inventory process and early coordination with other agencies and the public. The district, in cooperation with BDE, will initiate those detailed studies and associated coordination with other agencies and the public necessary to further evaluate the environmental impacts of the proposed project alternatives

References: Section 22-5 “Coordination”
Chapter 19 “Public Involvement Guidelines

22-7.02(e) Prepare/Distribute Special Technical Reports

For environmental concerns requiring in-depth analysis (e.g., wetlands, noise), it may be appropriate to prepare “technical reports” discussing the analyses and findings for the issues involved. BDE will determine “technical report” requirements. As appropriate to respond to requests identified during early coordination, these “technical reports” will be coordinated with agencies and other interested entities. Technical reports should be reviewed by BDE prior to making them available to other parties. The key conclusions from these reports will be summarized in the environmental documentation for the Phase I Report.

Reference: Chapter 26 “Special Environmental Analyses”

22-7.02(f) Prepare Environmental Documentation

At this stage of project development, the district will have received input from appropriate agencies and the public, will have evaluated the selected reasonable alternatives in depth, and will have received input on any special technical reports. The environmental information resulting from these activities should be summarized in the Phase I Report as described in Section 22-2.05(b).

References: Chapter 26 “Special Environmental Analyses”
Section 22-2.05 “Environmental Documentation for Non-Federal Actions”

22-7.02(g) Coordinate with Public/Affected Agencies

In Section 22-7.03, the district will have made a preliminary identification of those agencies which may have an interest in the project. The district will coordinate the information regarding the project alternatives and the evaluation of their environmental impacts with the public and appropriate agencies prior to submitting the project for design approval.

If the project is one which the Regional Engineer has determined will use the principles of Context Sensitive Solutions (CSS), the public involvement process should commence once the project is assigned to the project study group. The project study group shall use the Stakeholder Involvement Process (SIP) as outlined in Section 19-5.01 to conduct public involvement for CSS projects.

Reference: Chapter 19 “Public Involvement Guidelines

22-7.02(h) Revise Environmental Documentation

The district will evaluate any comments received as a result of coordinating the environmental information for the project with the public and appropriate agencies and will incorporate additional information or changes in information as necessary to respond to the comments.

22-7.02(i) Secure Design Approval

The district will submit the Phase I Report, including appropriate environmental documentation, to BDE for projects requiring central office Design Approval. BDE will review the environmental documentation and will advise the district of any changes or additional information needed prior to approval.

22-7.02(j) Implement Mitigation Measures

Those involved in preparing and processing the environmental documentation for the project should assist those involved in subsequent aspects of project development and implementation in facilitating the fulfillment of any environmental commitments for the project. The district must ensure that its procedures for follow-through on commitments provide for including information on mitigation measures and other commitments (e.g., for wetlands compensation plans, erosion control plans, special provision for management and monitoring of special waste) in the project plans, as necessary, and for implementing and monitoring the measures during construction and maintenance, as appropriate.

22-8 REFERENCES

In addition to Part III and the duplicated information in Appendix A, many other references are available in the literature to assist in the preparation of environmental documents. Section 22-8 briefly discusses selected references. This list is not comprehensive and is intended only to provide an overview of selected information that may be of interest.

22-8.01 National

The following briefly discusses national publications which may provide useful resource information to the preparers of environmental documents:

1. AASHTO Practitioner's Handbook 01 *Maintaining a Project File and Preparing an Administrative Record for a NEPA Study*, July 2006. Preparing the administrative record for a complex project can be a major challenge. This handbook provides a starting point for undertaking this important task. It includes key issues for consideration during NEPA and when litigation is imminent or under way.

2. AASHTO Practitioner's Handbook 02 *Responding to Comments on an Environmental Impact Statement*, July 2006. This guidance provides information for developing responses to comments on both a Draft EIS and Final EIS, and covers the issues associated with responding to comments on an Environmental Assessment.

3. AASHTO Practitioner's Handbook 03 *Managing the NEPA Process for Toll Lanes and Toll Roads*, July 2006. Conducting NEPA studies for projects involving toll lanes and toll roads involves many sensitive issues and complex considerations. This handbook covers issues associated with the NEPA process and related issues.

4. AASHTO Practitioner's Handbook 04 *Tracking Compliance with Environmental Commitments/Use of Environmental Monitors*, November 2006. This handbook provides recommendations for tracking compliance with environmental commitments from the environmental review phase through design, construction, operations, and maintenance phases of a transportation project.

5. AASHTO Practitioner's Handbook 05 *Utilizing Community Advisory Committees for NEPA Studies*, December 2006. A Community Advisory Committee (CAC) is a public participation technique that can be employed to gain stakeholder feedback, identify and resolve local concerns, and build community support during the NEPA process. Although not required, a CAC can be an effective means of addressing specific issues and hearing a variety of stakeholder views.

6. AASHTO Practitioner's Handbook 06 *Consulting under Section 106 of the National Historic Preservation Act*, February 2007. This handbook clarifies and provides information on the successful integration of Section 106 and NEPA with a specific focus on Section 106 as it applies to transportation projects for which the project applicant is a State Department of Transportation (DOT).

7. AASHTO Practitioner's Handbook 07 *Defining the Purpose and Need and Determining the Range of Alternatives for Transportation Projects*, August 2007. One of the most important tasks in any NEPA study is the definition of the project's purpose and need. This handbook provides recommendations for defining the purpose and need, and determining the range of alternatives in Environmental Impact Statements and Environmental Assessments for transportation projects in accordance with NEPA.

8. AASHTO Practitioner's Handbook 08 *Developing and Implementing an Environmental Management System in a State Department of Transportation (DOT)*, September 2007. DOTs face ever-mounting pressure to enhance environmental and business performance and to demonstrate their commitment to environmental stewardship. This handbook provides recommendations for developing and implementing an Environmental Management System (EMS) to help meet these goals and expectations.

9. AASHTO Practitioner's Handbook 09 *Using the SAFETEA-LU Environmental Review Process (23 USC 139)*, January 2008. Section 6002 of SAFETEA-LU established an environmental review process for highway and transit projects that involve preparation of an Environmental Impact Statement (EIS). This handbook provides assistance to practitioners in complying with the Section 6002 requirements, while also using this process to achieve better, faster, and more efficient environmental reviews.

10. AASHTO Practitioner's Handbook 10 *Using the Transportation Planning Process to Support the NEPA Process*, February 2008. Thoughtful consideration of environmental needs during the planning process can shorten the environmental review process. This handbook is intended to help transportation planners and NEPA practitioners improve linkages between the planning and NEPA processes, while also complying with recent legislative changes that require increased consideration of environmental issues in the planning process.

11. AASHTO Practitioner's Handbook 11 *Complying with Section 4(f) of the US DOT Act,* May 2009. This Handbook provides guidance to assist practitioners in managing all aspects of compliance with Section 4(f). It is intended to help practitioners take advantage of the flexibility afforded by recent changes to Section 4(f) while ensuring that all requirements are met. It addresses the full range of Section 4(f) compliance options, including individual Section 4(f) evaluations, *de minimis* impact determinations and programmatic Section 4(f) evaluations.

12. *Aesthetics in Transportation — Guidelines for Incorporating Design, Art, and Architecture into Transportation Facilities*, 1980. Although the aesthetic design of transportation facilities is important in the open countryside, it is especially critical in urban areas. This publication contains examples of aesthetic applications in various situations.

13. *A Design Guide for Wildlife Protection and Conservation for Transportation Facilities*, AASHTO, 1976. This publication is a guide for the consideration of wildlife and habitat impacts when transportation system facilities are being planned, designed, constructed, operated, and/or maintained.

14. *Aligning National Environmental Policy Act Processes with Environmental Management Systems, A Guide for NEPA and EMS Practitioners*, Council on Environmental Quality (CEQ), April 2007. An Environmental Management System (EMS) is a structure of procedures and policies used to systematically identify, evaluate, and manage environmental impacts of ongoing activities, products, and services. CEQ prepared this guide to assist Federal agencies in aligning the statement of policy in Section 101 of NEPA and the analysis and decision processes of Section 102 with the elements of an EMS when establishing, implementing, and maintaining their EMS.

15. *Collaboration in NEPA – A Handbook for NEPA Practitioners*, CEQ, October 2007. This handbook is intended to assist Federal agency personnel responsible for conducting environmental reviews in expanding the effective use of collaboration, with other governmental entities and affected and interested parties as part of the NEPA process.

16. *Considering Cumulative Effects under the National Environmental Policy Act (NEPA)*, CEQ, January 1997. This handbook introduces the NEPA practitioner and other interested parties to the complex issue of cumulative effects, outlines general principles, presents useful steps and provides information on methods of cumulative effects analysis and date sources.

17. *Environmental Guidebook*, FHWA. This is a collection of FHWA position papers, interpretation of regulations, and agreements with other agencies on the implementation of NEPA.

18. *Environmental Policy Statement*, 1994, FHWA. This statement provides a formal expression of the FHWA's commitment to the protection and enhancement of the environment and the incorporation of environmental stewardship in all of its programs and policies.

19. *Guide for Transportation Landscape and Environmental Design,* AASHTO, 1991. The *Guide* addresses all modes of transportation and the interaction of landscape considerations with transportation improvements. It places a special emphasis on supplying technical information that will assist the planner, designer, project engineer, landscape architect, supervisor, and/or transportation manager in providing landscape features which integrate into the transportation system, producing an environmentally pleasing facility.

20. *A Guide to Wetland Functional Design*, FHWA, 1990. This document was developed as a conceptual guide to replacing wetland functions identified by WET II.

21. *Guidelines on Citizen Participation in Transportation Planning*, AASHTO, 1978. This publication focuses on the needs of agency administrators and professionals in the planning process and public participation programs in State agencies, but it is also relevant at regional and local levels for all transportation modes.

22. *Hazardous Waste Guide for Project Development*, AASHTO, 1990. This *Guide* is for those projects where it is unknown whether or not a hazardous waste potential exists.

The *Guide* provides steps to determine if there is hazardous waste present and what tasks are involved if there is one present.

23. *Improving the Quality of Environmental Documents, AASHTO/ACEC, 2006*. This reports documents an initiative by transportation practitioners nationwide to improve the quality of EISs and EAs to comply with NEPA.

24. *Incorporating Biodiversity Considerations into Environmental Impact Analysis under NEPA*, CEQ, 1993. This Report is intended to provide background on the emerging, complex subject of biodiversity; outline some general concepts that underlie biological diversity analysis and management; describe how the issue is currently addressed in the NEPA process; and provide options for agencies undertaking NEPA analyses that consider biodiversity.

25. *Interim Guidelines for Hazardous Waste*, 1988, FHWA. This guidance provides an overview of the legal and policy/procedure issues important in the consideration of hazardous waste sites. It is intended to provide a framework for states to use in developing effective processes for addressing such sites in highway project development.

26. *NHI Course #142005 Manual* NEPA and Transportation Decisionmaking. This course considers FHWA's policies and procedures for applying the *National Environmental Policy Act* for the project development processes related to transportation facilities.

22-8.02 State

22-8.02(a) Manuals

The Bureau of Design and Environment has published or is developing a series of environmental technical manuals which contain information on methods to use for technical investigations and analyses that support highway project environmental impact studies and documents. These manuals plus the environmental memoranda issued by BDE provide guidance on technical study methods, pertinent environmental data, and other background information. References to these manuals are important; in many cases, they refer to specific technical procedures which are required in specific circumstances. Whereas Part III stipulates what must be done, where, and when, the technical manuals address how.

22-8.02(b) BDE Memoranda and Policies

The BDE periodically distributes memoranda which address environmental issues. These are segregated as follows:

1. Procedure Memoranda (PM). These are the most important to the application of environmental policies and procedures. Procedure Memoranda summarize and give background for updates to the environmental chapters where the full update is

automatically incorporated in the BDE Manual. Active PMs are shown on the BDE Procedure Memorandums internet site.

2. Departmental Policies. These policies should be referenced as needed in the preparation of environmental documents.

3. Technical Environmental Memoranda (TEM). As a way of disseminating information to the districts related to environmental regulations, laws, permits, and best practices, BDE will at times issue a TEM. The content of a TEM is considered “guidance” instead of “policy” so the TEM’s are not incorporated in the BDE Manual. When a TEM is issued, it will be posted on BDE’s Environmental Policy Unit’s SharePoint site (accessible via InsideIDOT >Sites>Design and Environment>Policy>Environmental Policy Unit) and also emailed to the Environmental Coordinators in each District. Also maintained on the SharePoint site is a disposition of past TEMs that have been retired.

Chapter Twenty-three

CATEGORICAL EXCLUSIONS

BUREAU OF DESIGN AND ENVIRONMENT MANUAL

Chapter Twenty-three
CATEGORICAL EXCLUSIONS

Table of Contents

Chapter Twenty-three
CATEGORICAL EXCLUSIONS

Chapter 23 discusses IDOT procedures for those projects classified as Categorical Exclusions. IDOT and FHWA are both committed to addressing environmental requirements under the *National Environmental Policy Act* (NEPA) and doing so in a streamlined and efficient manner.

23-1 GENERAL

23-1.01 Definition

FHWA environmental regulations (23 CFR 771.115) define Categorical Exclusions (CEs) as "Class II" actions that meet the definition as described in 40 CFR 1508.4, and based on past experience with similar actions are actions that:

- do not induce significant impacts to planned growth or land use for the area;
- do not require the relocation of significant numbers of people or businesses;
- do not have a significant impact on any natural, cultural, recreational, historic, or other resource;
- do not involve significant air, noise, or water quality impacts;
- do not have significant impacts on travel patterns; and
- do not otherwise, either individually or cumulatively, have any significant environmental impacts.

Therefore, these actions are excluded from the requirement to prepare an Environmental Assessment (EA) (see Chapter 24) or Environmental Impact Statement (EIS) (see Chapter 25). The FHWA has listed examples of Class II actions in 23 CFR 771.117. Most projects developed by IDOT do not have significant environmental impacts and therefore qualify as CEs.

Per 23 CFR 771.117, FHWA and IDOT have approved a Programmatic Agreement between Federal Highway Administration and the Illinois Department of Transportation regarding the Processing of Actions Classified as Categorical Exclusions for Federal-Aid Highway Projects (See Appendix A).

The Programmatic Agreement, herein referred to as "CE Agreement," has been developed to address the development and approval of CEs in a streamlined and efficient manner.

References:

40 CFR 1508.4 - Categorical Exclusion
Subsection 23 CFR 771.115(b) of 23 CFR 771.115 - Classes of Actions
Section I of FHWA Technical Advisory T6640.8A - Categorical Exclusion (CE)

23-1.02 Applicability to Federal Actions

These procedures apply to any Federal "action", defined in 23 CFR 771.107(b) as follows:

> *A highway or transit project proposed for FHWA or FTA funding. It also includes activities such as joint and multiple use permits, changes in access control, etc., which may or may not involve a commitment of Federal funds.*

For example, a project may require an Interstate access justification approval by FHWA, and the entire project would therefore be subject to all Federal requirements regardless if Federal funding was involved or not. Another example would be a project that requires a Section 404 Clean Water Act permit.

References:

Subsection 23 CFR 771.117(a) of 23 CFR 771.117 - FHWA categorical exclusions
Subsection 23 CFR 771.107(b) of 23 CFR 771.107 - Definitions
Paragraph I.A. of FHWA Technical Advisory T6640.8A - Documentation of Applicability

23-1.03 Applicability to Non Federal Actions

Although Categorical Exclusion (CE) is a Federal concept, these procedures are also generally applied to State-only or State/locally funded projects that are not otherwise considered a Federal "action" (see definition of Federal "action" above) to: 1) provide a consistent method of documenting the lack of any significant environmental impacts of CE-type projects; and 2) ensure compliance with State environmental laws and regulations.

23-1.04 CE Classifications

The CE Agreement establishes two categories of CEs, those that may be approved by IDOT on behalf of FHWA (State Approved CEs) and those that require FHWA approval (Federal Approved CEs).

23-1.04(a) State Approved Categorical Exclusions

Actions qualifying as a CE, as listed in Appendix A and Appendix B of the CE Agreement; and that do not involve the potential for unusual circumstances (see Section 23-1.04(b) or Section V of the CE Agreement), may be approved by IDOT on behalf of the FHWA. No separate review or approval of such “State Approved CEs” by FHWA is required.

Actions qualifying as a State Approved CE are not required to be discussed at district coordination meetings (see Section 22-5.03) unless there are issues related to the project’s scope, design exceptions, or meeting ADA standards to the maximum extent practicable.

The district will use Chapter 26 for any special environmental analyses needed.

References:

Subsections (c) and (d) of 23 CFR 771.117 - FHWA Categorical Exclusions
Paragraph I.A. of FHWA Technical Advisory T6640.8A - Documentation of Applicability for CE projects

23-1.04(b) Federal Approved Categorical Exclusions

Actions qualifying as a CE, as listed in Appendix A and Appendix B of the CE Agreement; but that do exceed one or more of the impact thresholds, results, or requirements as discussed in the potential for unusual circumstances listed below (also listed in Section V of the CE Agreement), must be approved by FHWA. The list of potential for unusual circumstances is as follows:

1) Requires one or more residential or business relocations and/or the acquisition of more than 10 acres (4 ha) total for a non-linear improvement (spot improvement, e.g. bridge, intersection) or the acquisition of more than 3 acres per mile (0.75 ha per kilometer); or

2) The project is defined as a “Type I project” per 23 CFR 772.5 and therefore requires a noise analysis; or

3) Results in an "adverse effect" finding to a historic property, as defined in 36 CFR 800.16(l); or

4) Requires the use of properties as defined and protected by Section 4(f) of the Department of Transportation Act (49 U.S.C. 303) that cannot be documented with either an FHWA de minimis determination or a programmatic Section 4(f) evaluation; or

5) Involves impacts that would require an Individual Section 404 Permit from the U.S. Army Corps of Engineers; or

6) Through Section 7 of the Endangered Species Act consultation, results in a finding of “may affect, likely to adversely affect” a federally listed or candidate species, or proposed or designated critical habitat; or;

7) Requires substantial changes in access, access control, or travel patterns. IDOT will present such information to FHWA to determine if changes are substantial; or

8) Requires the use of a temporary road, detour or ramp closure, unless the use of such facilities satisfies the following conditions:

a) Provisions are made for access by local traffic and so posted,
b) Businesses dependent on through-traffic will not be adversely affected,
c) To the extent possible, there is no interference with any local special event or festival,
d) There is no substantial change to the environmental consequences of the action, and
e) There is no substantial controversy associated with such facilities.

9) Involves State designated Nature Preserves; or

10) Exceeds the IDNR threshold for an increase in 100-year flood water surface elevations, or has potential for a "significant encroachment" to floodplains, as defined in Executive Order 11988; or

11) Requires a permit from U.S. Coast Guard under Section 9 of the Rivers and Harbors Act of 1899; or

12) Requires the acquisition of lands under the protection of Section 6(f) of the Land and Water Conservation Act of 1965 or other unique areas or special lands that were acquired in fee or easement with public-use money and have deed restrictions or covenants on the property; or

13) Involve impacts to a stream listed on the National Park Service's National Rivers Inventory site and would adversely affect the listings Outstandingly Remarkable Value; or

14) Has potential for controversy on environmental grounds as determined by FHWA, or Inconsistency with Federal, State, or local requirements relating to the environment or planning.

Through the planning, screening, and coordination process, the district will determine if the potential for unusual circumstances result from the project. Further studies may be warranted, and the type and depth of additional studies will vary with the facts and circumstances of each situation and will help determine if the CE classification is appropriate.

The district will use Chapter 26 for any special environmental analyses needed.

Actions qualifying as a Federal Approved CE must be discussed at a District Coordination Meeting.

References:

Subsections (c) and (d) of 23 CFR 771.117 - FHWA Categorical Exclusions
Paragraph I.B. of FHWA Technical Advisory T6640.8A - Consideration of Unusual Circumstances

23-1.05 Compliance with Other Requirements

CEs still require compliance with other applicable State and Federal environmental requirements (e.g., Section 4(f), Section 106, *Endangered Species Act*, Executive Order 11990 - Wetlands, Executive Order 11988 - Floodplain Management, *Comprehensive Environmental Response, Compensation, and Liability Act* (CERCLA)). CE approval may only be granted after all applicable requirements are satisfied.

References:

Chapter 26 Special Environmental Analyses

23-1.06 Re-evaluation of CE Designation

Per 23 CFR 771.129, after approval of a CE and prior to requesting further Federal approval, the Department will re-evaluate the project to determine if the project still qualifies to be classified as a CE (i.e., the project will have no significant impacts as defined by NEPA). The process for reevaluating state and Federally approved CEs is discussed below.

23-1.06(a) For state-approved CE:

BDE 488 (The Certification of Acceptance/Project Status) can be used to document the re-evaluation. If the district determines that an unusual circumstance is now present, then the district must coordinate this change with FHWA and request the project to be changed to a Federally approved CE. If the district determines that no unusual circumstances are present, then BDE 488 suffices as the re-evaluation documentation.

23-1.06(b) For Federally approved CE:

An email shall be sent to the FHWA Transportation Engineer prior to request for Federal authorization that details any changes to the project since the original CE determination (documented in the Phase I report) was signed which includes, but is not limited to the following:

- Substantial design changes,
- Substantial changes in the scope of the project,
- Changes to state or Federal environmental rules, environmental requirements, or environmental legislation that will affect changes to or within the environment in which the project will be located,
- Increase in the amount of right of way, permanent or temporary,
- Increase in the number of relocations or displacements of residences or businesses,
- Addition to, or the identification of new, unusual circumstances, or
- Updated natural resource and cultural resource clearances.

The email shall also include a statement on whether the district initially determines that the project still has no significant impacts or whether the project shall now be processed as an EA or EIS.

The FHWA will make an official final determination on whether the CE remains valid or an EA or EIS must be prepared.

References:

23 CFR 771.129 "Re-evaluations of Environmental Documents"
Re-evaluations of CE, FONSI, or ROD, Section 22-3.14

23-2 THE CE PROCESS

This section discusses and describes each step in the CE process. During each step, the following should also be considered:

- Lines of Communication. The rigid application of the process would lead to predetermined, precise points and is neither realistic nor desirable. Communication between units must be continuous. This will result in fewer problems and fewer "surprises" in the process.
- Lead Agency. It is assumed that the Federal Highway Administration is the lead agency for FHWA-funded projects. If another Federal agency is the lead agency, other procedures may be required.
- Application. This section applies to all CE projects involving State highway projects regardless of the source of funding.

23-2.01 Initiate CE Process

For actions that will be processed as a CE, this is often known at the time of project initiation. The district will initiate the CE by assigning a team and assemble project information which may include:

- planning reports or studies,
- record plans (as-builts),
- letters/correspondence on the project,
- traffic data,
- documentation on any public or private meetings,
- original surveys,
- aerial photos,
- statistical data documenting need for improvement,
- scoping data providing recommended improvement,
- Maintenance Management Information System (MMIS) data,
- appropriate information from engineering and Department databases,
- verification that the project is included in the applicable Transportation Improvement Program/State Transportation Improvement Program,
- existing right-of-way,
- information and decisions from the programming process, and
- results of the preliminary field check of project location.

The district can, if necessary, conduct an on-site field review early in the project development to identify current environmental or engineering factors that the project may involve. For Federal Approved CEs, the district will notify FHWA of any scheduled field reviews so FHWA can attend, if appropriate.

If the district intends to use the Professional Transportation Bulletin to hire a consultant, the district must determine what level of environmental prequalification will be required for the project based on anticipated impacts.

40 CFR 1501.2 - Early Application of NEPA
Subsection 23 CFR 771.115 of 23 CFR 771.115(b) - Definition of Class II (CE) Action
Section 22-3.06 Proposed Action

23-2.02 Plans, Specifications, and Estimates (PSE) Projects

Per Section 12-3.10, there are certain types of projects that occur within existing right-of-way, will not require an Environmental Survey Request (ESR) (See Section 27-1) and, therefore, will not generate a Phase I document. These projects only require Plans, Specifications, and Estimates (PSE). However, NEPA compliance is still required when federal funds are used. BDE 488 (Certification Acceptance/Project Status) or BDE 2301 (Categorical Exclusion Determination and Approval) may be used to document NEPA compliance.

23-2.03 Inventory Project Area

Based on the project scope, the district office with technical assistance from BDE will inventory the affected environment. The district should identify the full range of the environmental resources by evaluating environmental databases, and, if required, submit an ESR.

Resources involved may include:

- Section 4(f) and/or 6(f) properties;
- archaeological and historical properties;
- floodplains;
- sensitive noise receptors;
- prime farmland;
- wetlands;
- threatened or endangered species habitat, nature preserves, and natural areas;
- wild and scenic rivers;
- status of air quality attainment;
- water quality of streams and lakes;
- special waste;
- social/economic characteristics of the population;
- visual quality factors;
- wellhead protection areas;
- groundwater recharge areas; and
- other biological resources (biodiversity, riparian habitat, etc.).

References:

FHWA Technical Advisory T6640.8A - Background
Chapter 27 Environmental Surveys

23-2.04 Initiate Early Coordination

The ESR process involves coordination with State and Federal agencies and the public (see Chapter 19), as appropriate, and the level of coordination is generally dependent on the complexity of the project. Potential reasons for public coordination by the district could include road closures, Section 4(f) impacts (*de minimis* impacts), Section 106, historic bridge advertisements, and addressing controversy. The district will coordinate with the IDNR if the project involves property purchased with LAWCON or OSLAD funds (see Chapter 26).

If the district conducts public involvement, it should occur before requesting CE determination so that the results of public involvement activities can be considered in determining the appropriateness of the CE classification. Minutes of the meeting or a memorandum to the file, as appropriate, shall document the discussions. Public Involvement activity should also be documented on BDE Form 1201 Phase I Approval and included in the Project Report.

Chapter 27 Environmental Surveys

23-2.05 Evaluate Project Alternatives and Project's Potential for Unusual Circumstance

The district should develop alternatives based on the Purpose and Need for the project and be sensitive to environmental resources for which avoidance and minimization of adverse impacts is necessary (e.g., wetlands, floodplains, Section 4(f) properties/historic sites, threatened and endangered species). In addition, the district should recognize that avoidance of protected environmental resources (some of which are potentials for unusual circumstances) through project design will help shorten project development time by eliminating the need for the reporting and coordination necessary for compliance.

Once avoidance and minimization of adverse impacts has been completed, the district shall review the project for the potential for unusual circumstances. The list of unusual circumstances is in Section 23-1.04(b) and in Section V of the CE Agreement. If the project has one or more potential for unusual circumstances, then the project must be discussed with FHWA at a district coordination meeting to determine if the project may proceed as a Federal Approved CE or if an EA or EIS is required.

References:

Subsection 23 CFR 771.113(a) of 23 CFR 771.113 -Timing of Administration Activities

23-2.06 CE Determination

Once the above steps have been completed, a determination that the project qualifies as a CE; as well as the appropriate classification (State Approved or Federal Approved) under which it should be processed, can be made.

Projects which are determined to qualify as a State Approved CE do not need concurrence by the FHWA and are not required to be discussed at a coordination meeting unless there are issues related to the project's scope, design exceptions, or meeting ADA standards to the maximum extent practicable.

Projects which are determined to qualify as a Federal Approved CE must be presented at a coordination meeting. During the meeting, the district will present its recommendation for a Federal Approved CE determination, explain the basis for the recommendation, and discuss any potential(s) for unusual circumstances. The FHWA may then concur in the determination, request additional information for review (e.g. written reports or technical documents), or request additional studies, analyses, and coordination activities regarding the project's environmental impacts. As the district completes additional studies, analyses, and coordination activities regarding the project's environmental impacts, these results should be discussed with FHWA at subsequent coordination meetings. The district may discuss these results as each study is completed or wait to consolidate the discussion of several studies. Once FHWA concurrence is given, it should be documented in the minutes of the coordination meeting.

Note: A CE determination, or concurrence thereof by the FHWA, is a preliminary step which helps to ensure a project is being processed appropriately and it should not be confused with CE Approval.

References:

Subsection 23 CFR 771.117(b) of 23 CFR 771.117 - Categorical Exclusions
23 CFR 774 - Parks, Recreation Areas, Wildlife and Waterfowl Refuges, and Historic Sites (Section 4(f)) Section 22-5 Coordination

23-2.07 CE Approval

Once a CE determination has been made, and once all environmental clearances have been obtained, the CE can be approved.

State Approved CEs are approved by the Regional Engineer or their designee, as discussed in the CE Agreement.

Federal Approved CEs are approved by the FHWA. This approval is typically obtained at a coordination meeting or via emailed correspondence.

23-2.08 Documentation of Environmental Commitments

If there are commitments made during the CE process, they should be documented in the Phase I report and the district commitment file.

References:

D&E-19 Follow-through on Project Commitments

23-2.09 Documentation of the CE Determination and Approval

The level of documentation required is dependent upon whether the project is a Federal action or not (see Section 23-1.02).

23-2.09(a) Documentation for Federal Actions

For Federal actions, the following items are to be included in the Phase I Engineering report when a report is required or otherwise in the project files:

1. Environmental Surveys and Special Reports. The environmental surveys and special reports required to support a CE determination must summarize the results of any necessary environmental screening, surveys, coordination, and special reports for natural resources, cultural resources, air, noise, and special waste.
2. Coordination. Coordination required to support a CE determination must be summarized in the Phase I Engineering Report. For example, where coordination with the Natural Resources Conservation Service and/or the Illinois Department of Agriculture is required, the Phase I Engineering Report should include a brief summary of the results of the coordination (a copy of Form NRCS-CPA-106, when required, and/ or a synopsis of comments received and the related responses).
3. Permits. The report must indicate those permits (e.g., Section 404, Section 402 National Pollutant Discharge Elimination System (NPDES), Section 10, IDNR Office of Water Resources) that will be required for the project.
4. CE Certification Paragraph. The purpose of the certification paragraph is to document that the project scope and impacts fall within the thresholds of a CE.

   For State Approved CEs, the certification paragraph reads as follows:

   IDOT has addressed all environmental requirements for this project and determined that it has met the following requirements for a State Approved CE in the CE

Programmatic Agreement (approved 10/14/15): (1) the scope is consistent with the project scope listed in [[Appendix (A or B), Item (include number)]] and (2) none of the circumstances in Section V exist. Therefore, on behalf of FHWA, IDOT hereby approves this project as a State Approved CE.

For Federal Approved CEs, the certification paragraph reads as follows:

After reviewing the project information provided, FHWA has determined that this project will not have any significant impacts on the human environment and approves its designation as a Federal Approved CE.

Each of the above paragraphs is contained on form BDE 2301 (Categorical Exclusion Determination and Approval) which shall be completed, signed as appropriate, and included in the project report or project file.

5. Wetland Finding. If the CE involves wetland impacts, the report shall also include the following paragraph:

   The FHWA issued a programmatic Wetland Finding for CEs on October 14, 2015 in compliance with Executive Order 11990, Protection of Wetlands. The Programmatic Wetland Finding is contained in the CE Agreement, available online in the BDE Manual (Appendix A).

   This paragraph is also contained on form BDE 2301 (Categorical Exclusion Determination and Approval) and the “yes” or “no” box must be checked as appropriate to document the involvement of wetland impacts.

23-2.09(b) Documentation for Non-Federal Actions

For non-Federal actions, the following items are to be including in the Phase I Engineering report, when a report is required, or otherwise in the project files:

1. Environmental Surveys and Special Reports. The environmental surveys and special reports must summarize the results of any necessary environmental screening, surveys, coordination, and special reports for natural resources, cultural resources, air, noise, and special waste.

2. Coordination. Coordination must be summarized in the Phase I Engineering Report.

3. Permits. The Phase I Engineering Report must indicate any state-issued permits needed for the project.

BUREAU OF DESIGN AND ENVIRONMENT MANUAL

Chapter Twenty-four
NEPA SCOPING TO CE/EA/EIS

Table of Contents

Section **Page**

Chapter Twenty-four
NEPA SCOPING TO CE/EA/EIS

Chapter 24 discusses procedures for conducting NEPA scoping and NEPA Class of Action Determination (CE, EA, or EIS).

24-1 GENERAL

NEPA scoping includes data compilation for project development before a class of action (CE, EA, or EIS) determination is made. NEPA scoping can be any length of time that is necessary to gather and evaluate information prior to making a class of action determination. Once data has been fully compiled during the NEPA scoping phase, consultation with FHWA will provide a determination if the project will be processed as a CE, EA, or EIS.

If the project is determined to require processing as an EA or EIS, then the required processing timeframes are 12 months for an EA and 24 months for an EIS.

References:

Time Limits, 40 CFR 1501.10

24-1.01 Definitions

1. Categorical Exclusion – See Chapter 23.

2. Environmental Assessment - The Council on Environmental Quality (CEQ) regulations in 40 CFR 1508.9 state that an Environmental Assessment (EA) is a concise public document that serves to briefly provide sufficient evidence and analysis for determining whether to prepare an Environmental Impact Statement (EIS) or a Finding of No Significant Impact (FONSI).

3. FONSI - A FONSI is a Federal agency decision document that presents the reasons why an action will not have a significant effect on the human and natural environment and for which an EIS will not be prepared (CEQ regulations in 40 CFR 1508.13).

4. Environmental Impact Statement – See Chapter 25.

References:

Classes of Action, 23 CFR 771.115(a)
Definition of Class III (EA) Action, 23 CFR 771.115(c)
Definitions, 40 CFR 1508.9
Finding of No Significant Impact, 40 CFR 1508.13

24-1.02 Applicability

24-1.02(a) NEPA Scoping

NEPA scoping is utilized when the class of action (CE, EA, or EIS) is undetermined or when the project will likely be processed as an EA or EIS and revolves around two factors:

- whether or not the district is confident the project will get Phase II funding; and
- whether or not the district is confident the project will be constructed.

If the district is not confident, the district may utilize the Plannning and Environment Link (PEL) Process (See Section 11-7.04).

24-1.02(a)1 *Environmental Assessment*

The decision to prepare an EA is project-specific and should be based on a number of factors including, but not limited to, the context and intensity of anticipated environmental impacts and the level of public interest or potential controversy in the project.

References:

When to Prepare an Environmental Assessment, 40 CFR 1501.3
Whether to Prepare an Environmental Impact Statement, 40 CFR 1501.4(b)
When to Prepare an Environmental Assessment, 23 CFR 771.119(a)
Forty Most Common Questions Concerning CEQ's NEPA Regulations Memorandum - Question 40 "Mitigation of Significant Impacts – Appropriateness of EA"

24-1.02(a)2 *Finding of No Significant Impact (FONSI)*

A FONSI will be a brief summary document as noted in 40 CFR 1508.13 and shall be prepared for a proposed action:

- that is not categorically excluded, or;
- for which an EIS will not be prepared.

References:

When to Prepare a FONSI, 40 CFR 1501.4(e)
Environmental Assessments, 23 CFR 771.119(g)
Findings of No Significant Impact, 23 CFR 771.121(a)

24-2 THE NEPA SCOPING TO NEPA CLASS OF ACTION DETERMINATION (CE, EA, OR EIS) AND EA PROCESS

This section discusses the general process for a project processed using NEPA Scoping and determining the NEPA Class of Action (CE, EA, or EIS) and how an EA is processed. This is followed by a description of each activity. The district shall consider the following:

1. Lines of Communication. Communication among the district, BDE, and FHWA should be ongoing throughout the development of the EA. The districts will provide updates to BDE and FHWA at coordination meetings on the project status, activities, and decisions that are being made. This will avoid problems that may otherwise arise late in the process, causing needless delays.

2. Lead Agency. FHWA is the lead agency for FHWA-funded projects. If another Federal agency is the lead agency, other procedures may be required.

3. Application. This section applies to all EA projects involving State highways regardless of the source of funding.

4. References. Some of the references in the process are to 40 CFR 1500 excerpts that are specifically applicable to projects processed with an EIS. Although not explicit in the Federal regulations, these references also are applicable to EAs.

5. EIS. If at any stage of the EA process the potential for significant impacts is identified, it will be necessary to prepare an EIS; see Chapter 25.

24-2.01 NEPA Scoping Activities

The district will determine the preliminary scope and general location of the proposed project and present the proposed project at a coordination meeting.

The district will begin to determine the types of information that will be used in accomplishing the environmental process, which may include:

- statistical data documenting need for improvement;
- planning reports or studies;
- traffic data;
- engineering and Department databases;
- information and decisions from the planning/programming process;
- existing right-of-way information;
- documentation on any public or private meetings;
- letters/correspondence on the project;
- preliminary field check of the project location;
- biological, cultural, and regulated substances field surveys (BDE);
- State and Federal environmental databases and reports; and

- verification that the project is included in the applicable Transportation Improvement Program/State Transportation Improvement Program.

References:

Apply NEPA Early in the Process, 40 CFR 1501.2
Proposed Action Section 22-3.06
Special Environmental Analyses, Chapter 26
Environmental Surveys, Chapter 27
AASHTO Practitioner's Handbook 01 – Maintaining a Project File and Preparing an Administrative Record for a NEPA Study, August 2016

24-2.01(a) Satisfying Planning Requirements

Early in the process, the district should determine what planning requirements will need to be satisfied prior to completing the NEPA process:

- in an urbanized area
  + the project must be included in the conformed fiscally constrained portion of the Metropolitan Transportation Plan, and;
  + a subsequent phase of project development (e.g., final design, acquire right-of-way, utility relocations, or construction) must be included in the Metropolitan Planning Organization's (MPO's) Transportation Improvement Program (TIP).
- in a non-urbanized area
  + the project must be consistent with the Long Range Transportation Plan, and
  + a subsequent phase of the project development (e.g., final design, acquire right-of-way, utility relocations, or construction) must be included in the Statewide Transportation Improvement Program (STIP).

Due to the amount of time it takes to include the project in the appropriate planning documents, the district should work with the appropriate planning organizations to initiate the process. The district also should coordinate with FHWA to ensure that the subsequent phase is included in the TIP or STIP and that it adequately demonstrates commitment to advance the project. FHWA cannot sign the CE, FONSI, or ROD until this has occurred.

24-2.01(b) Context Sensitive Solutions

For projects that the Regional Engineer has determined the principles of Context Sensitive Solutions (CSS) will be used, the district shall form a CSS Project Study Group (PSG) in accordance with the procedures described in Section 19-5. Public involvement commences once the project is assigned to the PSG.

For projects that the Regional Engineer has determined the principles of CSS will not be used, the district will write a memorandum to the project file that is signed by the Regional Engineer documenting compliance of the project with the terms of 605 ILCS 5/4-219.

References:

Context Sensivitive Solutions, Section 19-5

24-2.01(c) Develop Draft Stakeholder Involvement Plan (SIP)

For projects using the principles of CSS, the PSG develops a draft Stakeholder Involvement Plan (SIP) to document stakeholder involvement activities. As part of the SIP development, the district, FHWA, and BDE will coordinate to identify governmental entities that should be invited to serve as cooperating agencies in the NEPA process for the proposed project and Tribes and consulting parties to satisfy Section 106 requirements for historic properties.

FHWA and the Department, as joint lead agencies, should agree upon the content of the draft plan before it is distributed to external stakeholders.

References:

Collaboration in NEPA – A Handbook for NEPA Practitioners, Council on Environmental Quality, October 2007

AASHTO Practitioner's Handbook 05 – Utilizing Community Advisory Committees for NEPA Studies, December 2006

24-2.01(d) Establishment of Timeframes

The district will develop a draft timeframe agreement establishing milestones and responsibilities for major activities through the NEPA process and submit it to BDE for review. Subsequently, FHWA, the district, and BDE will reach consensus on the timeframe agreement. The purpose of the timeframe on projects is to provide a tool for managing document review, preparation, coordination, and approval steps.

FHWA and the Department will ensure that involved environmental resource and permitting agencies receive a copy of the timeframe agreement. For projects following CSS, the timeframe is a part of SIP.

The timeframes may be revised, if necessary, as a result of input from cooperating agencies or if new issues arise or priorities change. Revisions to the timeframes will be addressed in accordance with the terms of the Statewide Implementation Agreement, and updated timeframes will be provided to BDE and FHWA.

In coordination with FHWA, the district will monitor all milestone dates for the negotiated timeframes.

References:

Illinois Statewide Implementation Agreement between the Federal Highway Administration and the Illinois Department of Transportation for Establishment of Timeframes for Environmental Impact Statements and Environmental Assessments.

24-2.02 Begin External Coordination Activities

IDOT and FHWA will send letters to entities inviting them to be Cooperating Agencies (CAs) and Section 106 consulting parties. For projects using the principles of CSS, these agencies are outlined in SIP. The district will draft letters discussed below and submit them to BDE and FHWA, along with a map of the study area, the Area of Potential Affect (if different than the study area), and a list of Section 106 consulting parties. After any necessary revisions, FHWA and the district will send out their respective letters as follows:

FHWA sends letters to:

- Cooperating Agencies
  + Federal agencies (Figure 24-2.A)
  + State agencies (Figure 24-2.B)
- Section 106 Consulting Parties
  + Tribes (Figure 24.2.C)
  + State Historic Preservation Officer (Figure 24-2.D)

The district sends letters to:

- Section 106 Consulting Parties
  + Non-Governmental Local Interest Groups (Figure 24-2.E)
  + State and Local Government entities

The district will also develop a spreadsheet showing all Cooperating agencies, Section 106 consulting parties, and status of coordination and responses; see Figure 24.2.F.

After the response deadline, which is usually 30 days, the district will collect all responses and update the SIP based on responses, or lack thereof, to the invitation letters. The following reflects the status of the responses:

- Federal and non-Federal agencies invited as CAs must accept invitation in writing. If they do not respond they are not a CA.
- Any entity, except SHPO and local government agencies, invited to be a Section 106 consulting party must accept in writing to be a consulting party. The SHPO and local government agencies are 106 consulting parties even if they do not respond.

Thirty days after the coordination letters are sent, the district will send a copy of the draft SIP to all agencies who accepted the invitation to be a CA or consulting party. As new stakeholders are identified throughout the environmental review process, the SIP will be reviewed and revised, if necessary.

Subject: [name of study] invitation for cooperating agency status

Dear [Address Title] [Last Name]:

The Federal Highway Administration (FHWA) is requesting your agency to become a cooperating agency for the [name of study]. Please respond to our office at the above listed address in writing, with an acceptance or denial of this invitation to be a cooperating agency prior to [30 day Response Deadline Date].

THE PROJECT

The FHWA, in cooperation with the Illinois Department of Transportation (IDOT), is starting the National Environmental Policy Act (NEPA) scoping process for the [name of study]. The NEPA class of action will be determined when more information is collected. The study area is located in [project location including local agencies and counties]; see enclosed map.

The study area covers approximately [area in square miles] and is located [description of study area]. It contains environmentally sensitive resources, including [list primary resources/locations potentially affected].

The project will include an evaluation of transportation system needs across the entire study area. [list primary technical tools used to identify transportation system needs and potential environmental impacts, e.g. GIS, transportation demand models, field studies.]

FHWA LETTER TO FEDERAL COOPERATING AGENCIES

Figure 24-2.A
(1 of 2)

COOPERATING AGENCY

In accordance with 40 CFR 1501.6 of the Council on Environmental Quality's regulations for implementing the procedural provisions of NEPA, FHWA is required to invite agencies with jurisdiction by law or with special expertise with respect to environmental issues to be cooperating agencies.

We propose that your agency's role in the development of the above project should include the following as they relate to your area of expertise or jurisdiction by law:

- provide meaningful and early input on defining the purpose and need, determining the range of alternatives to be carried forward, and the methodologies and level of detail required in the alternatives analysis; and
- participate in coordination meetings and joint field reviews, as appropriate.

To consider your agency as a cooperating agency, FHWA and IDOT must receive a written response from your agency within the stated deadline agreeing to engage in the project in this role. If your agency declines to be a cooperating agency, please indicate the reason for declining this request and provide a copy to CEQ pursuant to 40 CFR 1501.6(c).

If you have any questions or would like to discuss in more detail the study or our agencies' respective roles and responsibilities, please contact [FHWA and BDE/BLRS contact names, emails and phone numbers].

Thank you for your cooperation and interest in this project.

Sincerely,

[FHWA signature]

[Agency]
[Address]
[City], [State] [Zip Code]

Subject: [name of study] invitation for Section 106 consulting party status

Dear [Address Title] [Last Name]:

The Federal Highway Administration (FHWA) is inviting your Tribe to become a Section 106 consulting party for the [name of project]. If you wish to engage in this role, please send FHWA a response prior to [30-day Response Deadline Date].

THE PROJECT

The FHWA, in cooperation with the Illinois Department of Transportation (IDOT), is starting the National Environmental Policy Act (NEPA) scoping process for the [name of study]. The NEPA class of action will be determined when more information is collected. The study area is located in [project location including local agencies and counties]; see enclosed map.

The study area covers approximately [area in square miles] and is located [description of study area]. It contains environmentally sensitive resources, including [list primary resources/locations potentially affected].

The project will include an evaluation of transportation system needs across the entire study area. [list primary technical tools used to identify transportation system needs and potential environmental impacts, e.g. GIS, transportation demand models, field studies.]

SECTION 106 CONSULTING PARTY

Section 106 of the National Historic Preservation Act requires Federal agencies to (1) take into account the effect of their undertakings on historic properties and (2) afford the Advisory Council on Historic Preservation (ACHP) a reasonable opportunity to comment. The Section 106 process is outlined in 36 CFR Part 800.

These regulations require Federal agencies to identify parties entitled to be consulting parties and invite them to participate as such in the Section 106 process. Since your Tribe has expressed an interest in the county(ies) that the project is located in, we are inviting you to be a consulting party. Consulting parties may be asked to provide information on historic properties in the project area, identify issues relating to the project's potential effects on historic properties, and if applicable, consult to resolve adverse effects to historic properties.

FHWA LETTER TO TRIBES

Figure 24-2.C
(1 of 2)

If you would like to be a Section 106 consulting party, please send FHWA a response within the stated deadline to engage in the project in this role.

If you have any questions or would like to discuss in more detail the study or our agencies' respective roles and responsibilities, please contact [FHWA Environmental Engineer name, email, and phone number].

Thank you for your cooperation and interest in this project.

Sincerely,

COORDINATION ACTIVITY SPREADSHEET

Figure 24-2.F

24-2.03 Perform Environmental Survey (Records Phase)

The district shall submit an Environmental Survey Request (see Section 27-1) in order for BDE to perform a record search to access published information and determine the need for further investigation of the following:

- wetlands;
- archaeological resources, historic standing structures and bridges;
- Federal/State threatened or endangered species or their designated critical habitat;
- Illinois Natural Areas Inventory Sites;
- Nature Preserves; and
- Regulated substances.

BDE provides this information to the district as it becomes available to assist in the progression of activities in the NEPA scoping process.

Concurrent with the survey work by BDE, the district conducts activities (e.g., researching environmental databases, contacting environmental resource agencies) to support an inventory of the project's affected environment for resources and issues of concern. Examples of resources/issues of concern, in addition to those being addressed by BDE, include:

- Section 4(f) and/or Section 6(f) properties,
- Wild and Scenic Rivers,
- noise analysis,
- project specific air quality analyses,
- social/economic characteristics,
- visual quality,
- floodplains,
- water quality of surface waters,
- prime farmland,
- upland plant communities,
- groundwater recharge areas,
- wellhead protection areas, and
- wildlife resources (biodiversity, riparian habitat, etc.).

References:

Purpose, 40 CFR 1500(b)

24-2.04 Finalize Context Sensitive Solutions Stakeholder Involvement Plan

For projects following the principles of Context Sensitive Solutions, the Project Study Group (PSG) coordinates with FHWA and BDE to finalize the SIP. The SIP should be posted on the project website and may need to be updated as the project progresses.

References:

Collaboration in NEPA – A Handbook for NEPA Practitioners, Council on Environmental Quality, October 2007

AASHTO Practitioner's Handbook 05 – Utilizing Community Advisory Committees for NEPA Studies, December 2006

24-2.05 Conduct Context Audit

Following devlopement of the SIP, the CSS project study group initiates contacts with stakeholders to conduct a context audit. The purpose of the context audit is to help identify various characteristics that define the context for the project. The CSS project study group applies the context audit procedures.

References:

AASHTO Practitioner's Handbook 05 – Utilizing Community Advisory Committees for NEPA Studies, December 2006

24-2.06 Develop Problem Statement

After the context audit is completed, the CSS project study group meets with stakeholders to develop a clear problem statement. The CSS project study group seeks stakeholder input on current transportation problems in the area and how the proposed project might help alleviate them.

The CSS project study group translates the stakeholder input into a clear statement of the transportation problems that should be, and can be, solved by the project. Once a clear problem statement is completed, it must be accepted by consensus of the stakeholders.

IDOT and FHWA will consider the accepted problem statement when developing the project purpose and need. The problem statement is stakeholder driven and is one consideration in developing the Purpose and Need.

References:

AASHTO Practitioner's Handbook 05 – Utilizing Community Advisory Committees for NEPA Studies, December 2006
AASHTO Practitioner's Handbook 07 – Defining the Purpose and Need and Determining the Range of Alternatives for Transportation Projects, August 2007

24-2.07 Conduct Purpose and Need Coordination

The district will:

- use technical analyses to develop a draft Purpose and Need,
- consider the accepted CSS problem statement while developing a draft Purpose and Need, and
- submit the draft purpose and need to BDE for coordination with FHWA.

After BDE and FHWA agree the draft Purpose and Need is sufficient for distribution, then the district will coordinate with the Community Advisory Group for their input.

Next, the district may coordinate with the general public for their input in the form of public workshops or meetings, solicitations of verbal or written input, postings on websites, distribution of printed materials, or other involvement techniques or media.

If the Purpose and Need changes after input from the stakeholders, the district will coordinate the revised Purpose and Need with FHWA and BDE.

For projects subject to the NEPA/404 Merger Process, see Section 22-4, the district, FHWA, and BDE seek concurrence on the Purpose and Need at the NEPA/404 Merger meeting. The decision will be documented through the meeting minutes, which will be provided by the district and distributed by FHWA to the Merger Agreement signatory agencies, and all other participants in the meeting.

After the purpose and need is complete, the district will update the timeframes agreement and send it to BDE and FHWA.

References:

Concurrent NEPA/404 Processes, Section 22-4

24-2.08 Conduct Alternative to be Carried Forward Coordination

For projects using the principles of CSS, the objective of the CSS Community Advisory Group (CAG) is to reach consensus acceptance of the range of alternatives.

The district will consider input from the CAG, technical analyses of travel performance, potential impacts to environmental resources, etc., to develop the Alternatives to be Carried Forward, which means those alternatives that are to be studied in detail, including the “no build.” A Preferred Alternative will be selected from the Alternatives to be Carried Forward.

For projects subject to the NEPA/404 Merger Process, the district will submit the Alternatives to be Carried Forward concurrence package to BDE and FHWA. The district, FHWA, and BDE seek concurrence on the Alternatives to be Carried Forward at the NEPA/404 Merger meeting. The decision will be documented through the meeting minutes which will be provided by the district and distributed by FHWA to the Merger Agreement signatory agencies, and all other participants in the meeting.

After the Alternatives to be Carried Forward is complete, the district will update the timeframes agreement and send it to BDE and FHWA.

References:

Concurrent NEPA/404 Processes, Section 22-4

AASHTO Practitioner's Handbook 05 – Utilizing Community Advisory Committees for NEPA Studies, December 2006
AASHTO Practitioner's Handbook 07 – Defining the Purpose and Need and Determining the Range of Alternatives for Transportation Projects, August 2016

24-2.09 Perform Environmental Survey (Field Phase)

In this step, the district will submit an Environmental Survey Request (ESR) addendum to BDE for the alternatives to be carried forward. BDE determines if field work is necessary to verify or further evaluate the location, nature, and extent of potential resource involvement. If determined necessary, BDE coordinates with the responsible agencies and the district for the field survey(s). BDE provides the district documentation of the survey results and recommendations on resources identified.

The Field Survey phase is performed in coordination with other activities and can take a minimum of twelve months to receive results due to required time of year to conduct field surveys. This should be accounted for in the timeframe agreement.

BDE will coordinate with the resource agencies regarding the requirements for analysis methodologies to be used in the field surveys.

24-2.10 Evaluate Alternatives In Depth

For each Alternative to be Carried Forward, the district must identify and evaluate in detail those environmental impacts that will likely be caused by the construction and operation of the proposed action. This includes:

- coordination with affected local, State, and Federal agencies and the public; and
- an evaluation of the potential environmental impacts that may involve:
  - social/economic (including environmental justice);
  - floodplains and hydrologic assessment;
  - agricultural;
  - wetlands;
  - historic/archaeological;
  - endangered and threatened species;
  - project specific air quality analyses;
  - wildlife resources;
  - aesthetics;
  - upland plant communities;
  - noise analysis;

- + regulated substances;
- + Section 4(f)/6(f);
- + surface water resources;
- + aquatic resources;
- + groundwater resources;
- + water quality; and
- + other issues as applicable (e.g., Wild and Scenic Rivers, Wellhead Protection Zones, egulated ground-water recharge areas).

Paragraph V.E. of FHWA Technical Advisory T6640.8A - Alternatives
Selection of Preferred Alternative, Section 22-3.08
Logical Termini, Section 22-6.04

24-2.11 Conduct Preferred Alternative Coordination

For projects using the principles of CSS, the objective of the CSS Community Advisory Group (CAG) is to reach consensus acceptance of the Preferred Alternative.

The district will consider input from the CAG, technical analyses of travel performance, potential impacts to environmental resources, etc., to select a Preferred Alternative.

For projects subject to the NEPA/404 Merger Process, the district will submit the Preferred Alternative concurrence package to BDE and FHWA. The district, FHWA, and BDE seek concurrence on the Preferred Alternative at the NEPA/404 Merger meeting. The decision will be documented through the meeting minutes which will be provided by the district and distributed by FHWA to the Merger Agreement signatory agencies, and all other participants in the meeting.

After the Preferred Alternative identification is complete, the district will update the timeframes agreement and send it to BDE and FHWA.

References:

Concurrent NEPA/404 Processes, Section 22-4
Collaboration in NEPA – A Handbook for NEPA Practitioners, Council on Environmental Quality, October 2007
AASHTO Practitioner's Handbook 05 – Utilizing Community Advisory Committees for NEPA Studies, December 2006

24-2.12 Class of Action Determination

Based on the preferred alternative impacts, the district, in consultation with BDE and FHWA, determines whether the project will be processed as a CE, EA, or EIS. Documentation of the decision should be done via email or at a coordination meeting and shall be included in the project file. If the project is determined to be processed as a:

- CE, determine if the project will be processed as a Federally-approved CE or a state-approved CE (See Section 23-2.06).
- EA, continue to the next section of this Chapter.
- EIS, proceed with the Notice of Intent (see Section 25-2.02).

24-2.13 Department Review of the Preliminary EA (Review #1)

The "preliminary EA" is considered any version of the EA that is not ready and complete for public review and comment. Using information gathered from prior activities, the district prepares the preliminary EA. The preliminary EA will be reviewed by the district and BDE using the following process:

- The district submits the preliminary EA to BDE in MS Word format.
- BDE has 60 days to review and evaluate the preliminary EA and notifies the district of any revisions before proceeding with further reviews.
- The district will address all comments and prepare a disposition of comments.

At this time, FHWA does not receive a copy or review of the preliminary EA unless there is a demonstrated need and requested in writing by the Regional Engineer.

References:

Synthesis of Data Needs for EA and EIS Documentation – A Blueprint for NEPA Document Content, prepared at the request of AASHTO, January 2005

Improving the Quality of Environmental Documents, Joint AASHTO/ACEC Committee in Cooperation with FHWA, May 2006

24-2.14 Preliminary EA Review (Review #2)

The district will submit to BDE a revised preliminary EA and disposition of comments with BDE's comments addressed in MS Word format.

- BDE will submit the preliminary EA to FHWA, and disposition of comments if applicable, for review. BDE and FHWA will have 30 days to complete the review.
- Concurrently:

- + BDE submits the preliminary EA to the IDOT Office of Chief Counsel for legal sufficiency review. Office of Chief Counsel has 28 days to provide comments to BDE.
- + For projects with Environmental Justice concerns, BDE submits the preliminary EA to IDOT Civil Rights Officer for review in compliance with the Community Impact Assessment Manual.

- BDE sends its comments and FHWA's comments to the district. BDE may transmit the comments together, depending on when they are available.
- The district will address all comments, prepare a disposition of comments, and send both to BDE.
- This review process will continue with BDE and FHWA until the preliminary EA is deemed to be signature ready. The EA is considered "signature ready" when IDOT and FHWA both agree it contains all appropriate information to make the EA available for public review and comment.
- After all comments on the preliminary EA are addressed, the district provides the preliminary EA to any cooperating agencies that requested a copy for their review and comment.

References:

Synthesis of Data Needs for EA and EIS Documentation – A Blueprint for NEPA Document Content, prepared at the request of AASHTO, January 2005

Improving the Quality of Environmental Documents, Joint AASHTO/ACEC Committee in Cooperation with FHWA, May 2006

24-2.15 Signature Ready EA

At this stage, the district will have received input from BDE, the Office of Chief Counsel, FHWA, and cooperating agencies, as applicable, on the preliminary EA. The document is considered a "signature ready EA" when both IDOT and FHWA agree that the document is acceptable for making available to the public for review. The following process applies to the preparation and processing of the signature ready EA for approval to make available to the public:

- The district submits to BDE an electronic copy of the signature ready EA, which include the cover sheet, containing the signature block; see Figure 2 in Appendix D.
- The Engineer of Design and Environment signs the cover sheet for the Department.
- BDE submits the EA to the FHWA Division Office.
- The FHWA Division Office signs the cover sheet of the EA. This signature approves the EA for public review.
- BDE then returns the signed cover sheet to the district.

24-2.16 Make EA Available to the Public

The district is responsible for notifying the cooperating agencies, Section 106 consulting parties, and the public that the signed EA is available for review and providing a link to the document. If the project utilizes CSS, these stakeholders will be identified in the Stakeholder Involvement Plan (SIP). See Figure 24-2.H for a list of resource agencies.

The minimum 30-day time period of availability for comment begins on the date the public is notified of its availability (through newspaper, website, letters, etc.). The notice of availability of the EA shall briefly describe the project and its impacts (particularly any impacts involving wetlands, floodplains, Section 4(f) resources, and business/residential relocations), in accordance with 23 CFR 771.119.

The district shall make the EA available for review by the public on the Department website, the district office and other areas, as appropriate.

Figure 24-2.G provides a Sample EA Notice of Availability for publication in newspapers, etc. Prior to submitting the Notice of Availability, the Office of Communication should be contacted so that the notice can be published on social media and other sites as required.

Collaboration in NEPA – A Handbook for NEPA Practitioners, Council on Environmental Quality, October 2007
AASHTO Practitioner's Handbook 05 – Utilizing Community Advisory Committees for NEPA Studies, December 2006

24-2.18 Evaluate for Major Project Requirements

After identification of the Preferred Alternative, if the project cost exceeds $500 million, FHWA has Major Project requirements that must be satisfied prior to completing the NEPA process (i.e., before FHWA can issue a FONSI). These requirements may include an independent cost estimate review by FHWA, preparation of a financial plan, and completion of a project management plan. Chapter 20 contains deteailed information on meeting these requirements.

References:

Requirements for Major Projects, Chapter 20

24-2.19 Planning Requirement Prior to NEPA Approval

Before FHWA can approve a FONSI the appropriate planning requirements must be satisfied:

- in an urbanized area
  + the project must be included in the conformed fiscally constrained portion of the Metropolitan Transportation Plan, and;
  + a subsequent phase of project development (e.g., final design, acquire right-of-way, utility relocations, or construction) must be included in the Metropolitan Planning Organization's (MPOs) Transportation Improvement Program (TIP).
- in a non-urbanized area
  + the project must be consistent with the long range Statewide Transportation Plan, and;

+ a subsequent phase of the project development (e.g., final design, acquire right-of-way, utility relocations, or construction) must be included in the Statewide Transportation Improvement Program (STIP).

At this time, the district should coordinate with the appropriate planning entities to verify the planning requirements have been satisfied so that the FONSI can be signed.

24-2.20 Prepare EA Errata and Recommend FONSI

Following the public availability period and public hearing or offer of public hearing, the district will prepare an Errata to the EA to:

- reflect changes in the proposed action or mitigation measures resulting from comments received on the EA or at the public hearing, if one is held, and the effect of the changes;
- include any necessary findings, agreements, or determinations (e.g., for compliance with wetlands requirements, Section 106, Section 4(f)); and
- incorporate pertinent comments received on the EA and the responses to those comments.
- Include public hearing transcripts, if applicable;
- Include certification that a public hearing was held, or an offer for a public hearing was made.

If the district determines the Preferred Alternative will have no significant impacts, the district will prepare a draft FONSI. A FONSI is a Federal agency decision document that presents the reasons why an action will not have a significant effect on the human and natural environment and for which an EIS will not be prepared (CEQ regulations in 40 CFR 1508.13). The following process will apply to the EA Errata and draft FONSI:

1. The district will submit the EA Errata and draft FONSI to BDE.
2. BDE will review and evaluate the two documents and will notify the district of any required revisions.
3. After the district has incorporated any necessary changes, the EA Errata and draft FONSI will be submitted to FHWA through BDE.
4. The FHWA comments on the EA Errata and draft FONSI and those comments will be transmitted to the district through BDE.
5. After all BDE and FHWA comments have been addressed by the district, BDE will send the following to FHWA:
    a. letter recommending a FONSI;
    b. FONSI; and
    c. EA Errata (including public hearing transcript (if applicable) and certification that a public hearing was held, or an offer for a public hearing was made).

Part II of Appendix D provides guidance on how to write an Errata and Finding of No Significant Impact (FONSI).

References:

When to Prepare a FONSI, 40 CFR 1501.4(e)

Section III of FHWA Technical Advisory T6640.8A – Finding of No Significant Impact (FONSI)
Forty Most Common Questions concerning CEQ's NEPA Regulations Memorandum - Question 37a "Level of Detail in FONSI"

24-2.21 Draft Project Management Plan for Major Projects

For projects subject to the Major Project requirements, prior to signing of the FONSI. the district prepares a draft Project Management Plan in accordance with the guidance in Section 20-2.

The district coordinates the draft Project Management Plan with BDE for submittal to FHWA. The FHWA will coordinate with FHWA Office of Innovative Program Delivery (IPD) Project Delivery Team as appropriate, review, and provide comments to BDE.

References:

Requirements for Major Projects, Chapter 20

24-2.22 Issue FONSI or Proceed to EIS

If FHWA determines that the project will have no significant impacts, the FHWA will sign the FONSI. The district will send a notice of availability of the FONSI to Federal, State, and local government agencies that asked to be informed, provided comments on the EA, or that otherwise would have an interest in the undertaking. IDOT will post the FONSI on the IDOT website.

Note: If the EA involves an individual Section 4(f) Evaluation, the district also must also send the EA Errata and final Section 4(f) Evaluation to the USDOI (consistent with USDOI policy).

If it is determined the project involves one or more significant impacts, FHWA will not approve the FONSI. In this case, the district coordinates with BDE and FHWA to initiate the process for preparing an Environmental Impact Statement (EIS); see Chapter 25.

References:

Timing of Administration Activities, 23 CFR 771.113(a)
Findings of No Significant Impact, 23 CFR 771.121(a, b, and c)
Section III of FHWA Technical Advisory T6640.8A – Finding of No Significant Impact (FONSI)
Paragraph IV.B. of FHWA Technical Advisory T6640.8A - Distribution of FONSI

Forty Most Common Questions Concerning CEQ's NEPA Regulations Memorandum - Questions 37b and 38 "Public Availability of FONSI"
Collaboration in NEPA – A Handbook for NEPA Practitioners, Council on Environmental Quality, October 2007

24-2.23 Re-evaluation of a Finding of No Significant Impact (FONSI)

The district is responsible for determining if there have been any changes compared to what is disclosed in the FONSI for the following items:

- Substantial design changes,
- Substantial changes in the scope of the project,
- Changes to state or Federal environmental rules, environmental requirements, or environmental legislation that will affect changes to or within the environment in which the project will be located,
- Increase in the amount of right of way, permanent or temporary,
- Increase in the number of relocations or displacements of residences or businesses,
- the anticipated impacts, and
- proposed mitigation measures.

The re-evaluation shall also include a statement on whether the district initially determines that the FONSI is still valid or whether the project shall now be processed as an EIS. FHWA will make an official final determination on whether or not the FONSI is still valid or an EIS is required.

Making this determination is called a re-evaluation and must occur any time after a FONSI is issued and before major approvals (i.e., final design, land acquisition, construction, etc.) are requested and authorized. However, before undertaking any re-evaluation, the district should discuss the project and its history with BDE and FHWA to determine the type of documentation that will be required and if additional public involvement, see Chapter 19, is necessary. The re-evaluation can then be documented via an email, memorandum to the file, or a new EA. The documentation should be commensurate with the changes in the project impacts.

Note: BDE has prepared a re-evaluation template that can assist the district in preparing a re- evaluation. Please contact BDE Project Coordination Unit for a copy of this document.

The district will submit the re-evaluation via e-mail to the FHWA Transportation Engineer requesting concurrence with the conclusions in the re-evaluation. If there are substantial changes since the FONSI was issued, FHWA will use the re-evaluation to determine if the FONSI remains valid or if an EIS is required.

References:

Re-evaluations, 23 CFR 771.129
Re-evaluations of CE, FONSI, or ROD, Section 22-3.14
Section XI of FHWA Technical Advisory T6640.8A - Re-evaluations

24-2.24 Determine Applicability of Limitation on Claims (Statute of Limitations)

23 U.S.C. 139 establishes a 150-day statute of limitations on claims against US Department of Transportation and other Federal agencies for certain environmental and other approval actions, provided a notice is published in the Federal Register announcing the permit, license, or approval is final pursuant to the law under which the agency action is taken. The statute of limitations provision is intended to expedite the resolution of issues affecting transportation projects.

Before the completion of the FONSI, IDOT will consult with FHWA to determine if a limitation on claims is appropriate for the project. If so, IDOT will submit a draft limitation on claims notice in MS Word format to FHWA at the same time the draft FONSI is submitted; see Figure 25-2.N for a sample notice.

References:

FHWA *SAFETEA-LU Environmental Review Process Final Guidance*, Section 3 "Statute of Limitations"
AASHTO Practitioner's Handbook 09 – Using the SAFETEA-LU Environmental Review Process (23 USC 139), January 2008

24-2.25 Finalize Project Management Plan for Major Projects

For projects subject to the Major Project requirements, the district revises the draft Project Management Plan to respond to FHWA comments. The district coordinates the final Project Management Plan with BDE for submittal to FHWA within 90 days of the date the FONSI is signed.

References:

Requirements for Major Projects, Chapter 20

24-2.26 Implement Mitigation Measures

Those involved in preparing and processing the EA should assist those involved in subsequent aspects of project development and implementation in facilitating the fulfillment of commitments made as a part of the NEPA process. In accordance with Departmental Policy D&E-19, each district must ensure that its procedures for follow-through on commitments provide for including information on mitigation measures and other commitments (e.g., Wetlands Compensation Plan, Erosion Control Plan, Special Provisions for management and monitoring of regulated substances) in the project plans, as necessary, and for implementing and monitoring the measures during construction and maintenance, as appropriate.

After FONSI approval, if there are changes to the project scope, or portion of the design changes in a way that commitments will change or there is a substantial change in ROW acquisition, it is the district's responsibility to coordinate with the appropriate district project development and land acquisition staff, BDE, and FHWA.

Chapter Twenty-five

ENVIRONMENTAL IMPACT STATEMENTS

Chapter Twenty-five
ENVIRONMENTAL IMPACT STATEMENTS

Table of Contents

Section **Page**

Chapter Twenty-five
ENVIRONMENTAL IMPACT STATEMENTS

Chapter 25 discusses procedures for preparing and processing Environmental Impact Statements. These procedures shall be used if an EIS is determined to be the appropriate class of action following the procedures as described in Section 24-2.01 through Section 24-2.12 .

25-1 GENERAL

25-1.01 Definitions

1. Environmental Impact Statement (EIS). A detailed written statement prepared for major Federal actions significantly affecting the quality of the human environment, which discusses the environmental impact of the proposed action; any adverse environmental effects which cannot be avoided should the proposal be implemented; alternatives to the proposed action; the relationship between local short-term uses of the human environment and the maintenance and enhancement of long-term productivity; and any irreversible and irretrievable commitments of resources which would be involved in the proposed action should it be implemented.

2. Supplemental Environmental Impact Statement (SEIS). A detailed written statement on changes in the proposed action and/or on the identification and analysis of new circumstances or information not addressed in the Draft or Final EIS, which would introduce new or changed environmental effects of significance on the quality of the human environment.

3. Tiering. “Tiering” means covering broad or more general matters in a Tier I EIS with a Tier II EIS addressing narrower, more specific matters. Tiering is intended to be an aid in focusing on issues that are ready for decision and excluding issues already decided or not yet ready; see 40 CFR 1508.28, 23 CFR 771.111(g).

25-1.02 Applicability

25-1.02(a) Environmental Impact Statement (EIS)

An EIS is required for all Federally-funded highway projects (or other Federally-regulated highway activities) determined to be likely to cause significant impacts on the environment. 23 CFR 771.115(a) lists project types that normally will require the preparation of an EIS.

References:

Statutory Requirements for Statements, 40 CFR 1502.3
Major Federal Action Requiring the Preparation of Environmental Impact Statements, 40 CFR 1502.4

Class of Actions, 23 CFR 771.115(a)

25-1.02(b) Supplemental EIS

The cited references describe those circumstances where a Supplemental EIS may be appropriate.

References:

Draft, Final, and Supplemental Statements, 40 CFR 1502.9(c)
Supplemental Environmental Impact Statements, 23 CFR 771.130
Supplemental EISs, Section XII of FHWA Technical Advisory T6640.8A

25-1.02(c) Tiering

Tiering of EISs should be used when it will improve or simplify the environmental processing of proposed IDOT actions. Preparation of tiered EISs should be considered for complex transportation proposals (e.g., major urban transportation investments). The first tier EIS would focus on broad issues such as mode choice, general location, area wide air quality, and land use implications of the transportation improvement alternatives being considered. The first tier EIS(s) should use information from appropriate corridor planning and other planning studies. A subsequent site-specific environmental document will be required to focus on more detailed project impacts and mitigation measures (e.g., addressing details of route location, highway interchange configurations, etc.). If tiered EISs are used, the subsequent document(s) shall state where the preceding document is available.

References:

Tiering, 40 CFR 1502.20
Early Coordination, Public Involvement, and Project Development, 23 CFR 771.111(g)

25-1.03 Record of Decision (ROD) Re-evaluation(s)

The district is responsible for determining if there have been any changes compared to what is disclosed in the ROD for the following items:

- Substantial design changes,
- Substantial changes in the scope of the project,
- Changes to state or Federal environmental rules, environmental requirements, or environmental legislation that will affect changes to or within the environment in which the project will be located,
- Increase in the amount of right of way, permanent or temporary,

- Increase in the number of relocations or displacements of residences or businesses,
- the anticipated impacts, and
- proposed mitigation measures.

The re-evaluation shall also include a statement on whether the district initially determines that the ROD is still valid or whether a Supplemental EIS is now required. FHWA will make an official final determination on whether or not the ROD is still valid or a Supplemental EIS is required.

Making this determination is called a re-evaluation and must occur any time after a ROD is issued and before major Federal approvals (i.e., final design, land acquisition, construction, etc.) are authorized. However, before undertaking any re-evaluation, the district should discuss the project and its history with BDE and FHWA to determine the type of documentation that will be required (e.g., email, memorandum to the file, or new EA) and if additional public involvement (see Chapter 19) is necessary. The district will submit the re-evaluation to the FHWA Transportation Engineer requesting concurrence with the conclusion in the re-evaluation. If there are substantial changes since the ROD was issued, FHWA will use the re-evaluation to determine if the ROD remains valid or if a Supplemental EIS is required.

Note: BDE has prepared a re-evaluation template that can assist the district in preparing a re-evaluation. Please contact BDE Project Coordination Unit for a copy of this document.

25-2 THE EIS PROCESS

The following section discusses the general process for an action processed as an Environmental Impact Statement (EIS). This is followed by a description of each activity. The user also should consider the following:

1. Lines of Communication. The rigid application of the process would lead to predetermined, precise points at which communication occurs between units. This is neither realistic nor desirable. Communication between units must be continuous. This will result in fewer problems and fewer surprises in the process.

2. Lead Federal Agency. It is assumed that the Federal Highway Administration (FHWA) is the lead Federal agency for FHWA-funded projects. If a different agency is the lead Federal agency, other procedures may be required.

3. Application. This section applies to all EIS projects involving State highways regardless of the source of funding.

25-2.01 Class of Action Determination

Based on Section 24-2.01 through 24-2.12, if a significant impact or significant public controversy is identified, an EIS is required. Follow the procedures below after the decision that an EIS is required.

25-2.02 Publish Notice of Intent

The district prepares a draft Notice of Intent (NOI) and submits the draft NOI to BDE who will coordinate with FHWA on acceptable format and content. BDE bureau chief will sign a letter requesting FHWA to publish NOI and FHWA will ensure NOI is published in the *Federal Register*. The date the NOI is published starts the 2-year timeframe for the project.

FHWA Technical Advisory T6640.8A discusses the format, content, and processing of the NOI in more detail (See Appendix A in the BDE Manual). Figure 25-2.A presents the required format for the NOI and includes information necessary for project initiation. The NOI format is available from BDE as an electronic document.

DEPARTMENT OF TRANSPORTATION

Federal Highway Administration

Environmental Impact Statement: [*County or City*], Illinois

AGENCY: Federal Highway Administration (FHWA), DOT

ACTION: Notice of Intent

SUMMARY: The FHWA is issuing this notice to advise the public that an environmental impact statement will be prepared for [project name and description]…

FOR FURTHER INFORMATION CONTACT: *[Name]*, Division Administrator, Federal Highway Administration, 3250 Executive Park Drive, Springfield, Illinois 62703, Phone: [*Office Phone Number]*. *[Name]*, Deputy Director of Highways, Region *[Number]* Engineer, Illinois Department of Transportation, *[Office Address]*, Phone: *[Office Phone Number]*.

SUPPLEMENTARY INFORMATION: The FHWA, in cooperation with the Illinois Department of Transportation (IDOT), will prepare an environmental impact statement (EIS) for … *[In this section, provide (1) a brief narrative description of the proposed action (e.g., location of the action, type of construction, length of the project, needs to be addressed by the action); (2) a brief description of possible alternatives (e.g., upgrade existing facility, construction on new alignment, no action (should always be listed), multi-modal design); (3) any other federal approvals anticipated, such as 404 permits; and (4) a brief description of the proposed scoping and public involvement process for the particular action, including whether, when, and where any scoping meeting(s) or public hearing(s) will be held.]*

(Catalog of Federal Domestic Assistance Program Number 20.205, Highway Research, Planning and Construction. The regulations implementing Executive Order 12372 regarding intergovernmental consultation on Federal programs and activities apply to this program.)

Issued on: *[FHWA will enter the date.]* ____________________________

[Name]
Division Administrator
Springfield, Illinois

[Note: Left margin should be 1.5 inches (40 mm) minimum and all others 1 inch (25 mm).

All typing must be double spaced except for the information identifying the person signing the document.]

REQUIRED FORMAT FOR NOTICE OF INTENT

Figure 25-2.A

25-2.03 Department Review of the Preliminary DEIS

At this stage of project development, the district will have received input from the appropriate agencies and the public, will have evaluated in depth the alternatives carried forward, identified a Preferred Alternative. An internal review of the preliminary version of the DEIS will be reviewed by the Department prior to submitting to FHWA. The following process applies to the review of the preliminary DEIS:

- The district reviews the preliminary DEIS and ensures its comments are addressed.
- The district submits the preliminary DEIS to BDE in MS Word format.
- BDE has 60 calendar days to review and evaluate the preliminary DEIS and notifies the district of any revisions before proceeding with further reviews.
- The district will address all comments and prepare a disposition of comments.

At this time, FHWA does not receive a copy or review of the preliminary DEIS unless there is a demonstrated need and requested in writing by the Regional Engineer.

Improving the Quality of Environmental Documents, Joint AASHTO/ACEC Committee in Cooperation with FHWA, May 2006

25-2.04 Preliminary DEIS Review

The district will submit to BDE a revised DEIS with BDE's comments addressed in MS Word format.

- BDE will submit the DEIS to FHWA for review. BDE and FHWA will have 30 days to complete the review.
- Concurrently, BDE submits the preliminary DEIS to the IDOT Office of Chief Counsel for legal sufficiency review. Office of Chief Counsel has 30 days to provide comments to BDE.
- BDE sends its comments and FHWA's comments to the district. BDE may transmit the comments together, depending on when they are available.
- This review process will continue with BDE and FHWA until the DEIS is deemed to be signature ready.
- After all comments are addressed, the district provides the preliminary DEIS to any cooperating agencies that requested a copy during the scoping process.

Improving the Quality of Environmental Documents, Joint AASHTO/ACEC Committee in Cooperation with FHWA, May 2006

25-2.05 Signature Ready DEIS

At this stage, the district will have received input from BDE, the office of Chief Counsel, FHWA, and cooperating agencies, as applicable, on the preliminary DEIS. The following process applies to the preparation and processing of the signature ready DEIS for approval to circulate:

- The district submits to BDE an electronic copy of the signature ready DEIS, which include the cover sheet, which contains the signature block; see Figure 3 of Appendix D. The calendar date for return of comments shall be shown on the DEIS cover sheet. The minimum 45-day time period of availability for comment is calculated based on the date of publication of the Notice of Availability in the *Federal Register*. The maximum number of days for the comment period is 60 days, unless FHWA and participating agencies agree to a longer period.
- The Engineer of Design and Environment signs the cover sheet for the Department.
- BDE submits the cover sheet for the DEIS to the FHWA Division Office.
- The FHWA Division Office signs the cover sheet of the DEIS. This signature approves the DEIS for circulation.
- BDE then returns the signed cover sheet to the district.
- The district will prepare and submit to FHWA a copy of the approved DEIS in the format that meets USEPA requirements outlined in *e-NEPA: Electronic Submittal of Environmental Impact Statements to EPA*.

References:

Draft Environmental *Impact Statements, 23 CFR 771.123(e)*
Synthesis of Data Needs for EA and EIS Documentation–A Blueprint for NEPA Document Content, prepared at the request of AASHTO, January 2005
Improving the Quality of Environmental Documents, Joint AASHTO/ACEC Committee in Cooperation with FHWA, May 2006

25-2.06 Circulate approved DEIS

The district has the responsibility for notifying appropriate governmental agencies, public officials, interest groups, and the public of the availability of the DEIS (See Figure 25-2.B) and providing a link to the document. If the project utilizes CSS, these stakeholders will be identified in SIP. The district should ensure the entities discussed previously receive notification of the DEIS no later than the date of the Notice of Availability (NOA) in the Federal Register.

The following describes the distribution of the DEIS:

- FHWA will upload the DEIS to USEPA's electronic filing system for publication of the NOA in the Federal Register. FHWA will notify BDE when the DEIS has been successfully uploaded to the USEPA site. The NOA will be published on Friday of the week following that in which USEPA received the electronic submittal of the DEIS from FHWA.
- The district will prepare letters to transmit the DEIS to identified stakeholders. The transmittal letter shall state: (1) the calendar date comments are due, (2) where to send comments, and (3) that the FEIS will be furnished to those who make substantive comments on the DEIS or request a copy.
- The district shall make the DEIS available to the public for review on the Department's website and a hardcopy available at the district.

Figure 25-2.C provides a Sample DEIS Availability Notice, for publication in newspapers, etc. Prior to submitting the Availability Notice, the Office of Communication should be contacted so that the notice can be published on social media and other sites as required.

SAMPLE DEIS AVAILABILITY NOTICE

Figure 25-2.C

25-2.07 Implement Public Hearing Process

Public involvement is a critical element of the EIS process. Chapter 19 and the cited references discuss public involvement requirements for public hearings and public information meetings. Figure 25-2.D provides a Sample DEIS Public Hearing Notice. FHWA regulations require that the draft EIS must be available at the public hearing and a minimum of 15-days in advance of the public hearing. The Department has additional public notice requirements that must be met. The initial public notice must be published 30 days in advance of the public hearing and a second public notice shall be published 3 to 7 days prior to the public hearing.

In accordance with 23 CFR 771.111(h)(2)(vi), anytime a public hearing is held, the Department must submit to FHWA a transcript of the public hearing and a certification that a required hearing or hearing opportunity was offered. For more information, please see Section 19-3.04(g) and Section 19-3.04(h).

PUBLIC HEARING
for
ILLINOIS ROUTE 29
DRAFT ENVIRONMENTAL IMPACT STATEMENT

The Illinois Department of Transportation (IDOT) will hold an open house public hearing to seek public comment on the Draft Environmental Impact Statement (DEIS) for the IL Route 29 project and proposed road closures of a proposed four-lane facility from IL Route 6 near Peoria, IL to I-180 in Bureau County.

When?	Where?
June 14, 2006 4:00 pm to 7:00 pm	Three Sisters Park Pavilion 17201 North State Route 29, Chillicothe, IL
June 15, 2006 4:00 pm to 7:00 pm	Henry Senachwine High School Gymnasium 1023 College Street, Henry, IL

IDOT will hold two open-house public hearings to present the [[see 23 CFR 771.111(h)(2)(v), suggest listing those items here]]. All interested parties are invited to attend and participate in the public hearings. You may attend any time between 4:00 pm and 7:00 pm. NO FORMAL PRESENTATION WILL BE GIVEN. IDOT personnel and representatives from their consultant team will be on hand to answer questions and receive comments about the proposed project. A court reporter will be available at the hearings to take oral testimony. The public also may submit written comments. All comments received by June 25th will be included in the official hearing record. Property acquisition and relocation assistance information will be available. Exhibits and maps of the proposals developed in the study will be available for review during the entire time as will copies of the Draft Environmental Impact Statement (DEIS).

This hearing will provide an opportunity for the public to provide comments about potential impacts to cultural resources, in compliance with Section 106 of the National Historic Preservation Act of 1966, as amended and to assist in consultation with the Illinois State Historic Preservation Officer. [[**include a list of other findings from EOs, other laws, as applicable; for example, hot spot analysis, floodplain **]].

The DEIS also is available for public review and comment at IDOT's website (insert url here) and at the area(s) listed below. The document discusses the alternatives that were evaluated, including IDOT's preferred alternative, and the project's potential impacts on the natural and man-made environment in the study area. Comments on the DEIS can be sent to [Name of Regional Engineer], P.E. at the address listed at the bottom of this ad any time before June 25, 2006.

<Insert area(s) name & address>

The hearing locations are accessible to persons with disabilities. Persons with disabilities needing special accommodations or additional information should contact the person listed below at least 5 days prior to the public hearing.

[*Name of District Office Contact*], P.E.

Fax: (309) 671-3498

Sample DEIS Public Hearing Notice

Figure 25-2.D

25-2.08 Evaluate and Respond to Substantive Comments on DEIS

The district evaluates all comments (from the public, resource agencies, and other stakeholders) on the DEIS and/or Section 4(f) Evaluation, where applicable, and prepares responses to these comments as appropriate. Possible responses include:

- modifying alternatives including the proposed action;
- developing and evaluating alternatives not previously given serious consideration;
- supplementing, improving, or modifying analyses;
- making factual corrections; or
- explaining why the comments do not warrant further agency response, citing the sources, authorities, or reasons supporting that position and, if possible, indicating those circumstances that would trigger reappraisal or further response.

It is important for the Department and/or FHWA to resolve any interagency disagreements before the preparation of the Final EIS (FEIS).

Copies of all comments must be included in the FEIS per requirements of 40 CFR 1503.4. The responses to comments must be included in the FEIS in table format. The copies of comments and comment–response table shall be included as an appendix.

Comments that are received after the formal comment period, but before the FEIS is signed by FHWA, shall be incorporated into the FEIS, where practical. When the comments are received after the FEIS has been submitted to FHWA but before signature, the comments shall be forwarded to FHWA. The transmittal of the comments to FHWA shall include an explanation that the comments were received late, and it shall indicate the response to the comments.

The comments and responses to comments shall be reviewed by BDE and FHWA during the review of the preliminary FEIS.

AASHTO Practitioner's Handbook 02–Responding to Comments on an Environmental Impact Statement, August 2016

25-2.09 Evaluate for Major Project Requirements

Once the Preferred Alternative is chosen, the district, in cooperation with FHWA and BDE, determines if the total estimated project cost (construction, right-of-way, and engineering) is greater than $500 million. If the cost exceeds $500 million, the project is subject to the Major Project requirements, see Chapter 20, which include: Cost Estimate Review, Financial Plan, and Project Management Plan. If the cost is greater than $100 million and less than $500 million, only a Financial Plan is required, unless otherwise designated as a Major Project at the discretion of FHWA. The FHWA Division Office will coordinate review of Major Project components with the FHWA Major Project Team.

If the project is a Major Project, the district determines if it can be divided into operationally independent phases of work. There are three approaches to addressing such projects; maintain the project as one undertaking, develop a phasing plan for various phases over an extended time frame, or define operationally independent non-concurrent construction projects.

When applicable, the district prepares documentation of the basis for either of the second two options and submits it to BDE for coordination with FHWA for FHWA IPD Project Delivery Team approval. The benefits of a phasing plan are explained in Chapter 20. Operationally independent non-concurrent construction projects, which have a total estimated cost less than $500 million, are only subject to the Major Projects requirements when they are designated by FHWA as a Major Project. If the operationally independent non-concurrent construction projects exceed $100 million, the district must still address the financial plan requirement, but those financial plans are approved by IDOT.

The required Major Projects components and their timing are:

- A Cost Estimate Review, which should be completed prior to the ROD, normally about 30 days prior to ROD approval.
- An Initial Financial Plan, which should be submitted after the Cost Estimate Review is completed and must be submitted prior to the first authorization of Federal-aid funding for construction. A draft Project Management Plan, which should be submitted 60 days before the ROD approval and the Final Project Management Plan within 90 days of ROD approval. A draft Project Management Plan must be submitted before a ROD can be issued.

If the total estimated project cost is not greater than $500 million, and FHWA does not otherwise designate the action as a Major Project, the district shall:

- document that the project is not subject to Major Project requirements,
- when applicable, complete a financial plan which will be approved by the Department (see Chapter 20 for financial plan requirements), and
- proceed to the next activity.

References:

Requirements for Major Projects, Chapter 20

25-2.10 Planning Requirement Prior to NEPA Approval

Before FHWA can approve a Record of Decision (ROD) the appropriate planning requirements must be satisfied:

- in an urbanized area
  - + the project must be included in the conformed fiscally constrained portion of the Metropolitan Transportation Plan, and;
  - + a subsequent phase of project development (e.g., final design, acquire right-of-way, utility relocations, or construction) must be included in the Metropolitan Planning Organization's (MPOs) Transportation Improvement Program (TIP).
- in a non-urbanized area
  - + the project must be consistent with the long range Statewide Transportation Plan, and
  - + a subsequent phase of the project development (e.g., final design, acquire right-of-way, utility relocations, or construction) must be included in the Statewide Transportation Improvement Program (STIP).

Early in project development (Section 25-2.01(a)), the district should have initiated coordination with the appropriate planning agencies to ensure that these requirements will be met prior to approval of the ROD. At this time, the district should coordinate with the appropriate planning entities to verify the planning requirements have been satisfied so that the ROD can be signed.

25-2.11 Determination of Combined Final EIS/Record of Decision (FEIS/ROD) or Separate FEIS & ROD

MAP-21, Section 1319(b), directs FHWA, to the maximum extent practicable, to develop a single document that combines the FEIS and ROD, unless certain conditions exist:

- The FEIS makes substantial changes to the proposed action that are relevant to environmental or safety concerns; or
- There are significant new circumstances or information relevant to environmental concerns and that bear on the proposed action or the impacts of the proposed action.

The district and BDE should seek FHWA's determination if the project can be issued as a combined FEIS/ROD. FHWA will then consult with their Headquarters' staff and legal counsel to determine whether a combined FEIS/ROD is practicable. If a combined FEIS/ROD is determined to be practicable, proceed to Section 25-2.24. If the FEIS and ROD will be separate, proceed to 25-2.27.

25-2.12 Procedures for Combined FEIS/ROD or Separate FEIS and ROD

25-2.12(a) Procedures for Combined FEIS/ROD

25-2.12(a)1 *Opportunity for Discussion of Resource Agency Comments*

The district will collate all resource agency comments and prepare a draft response for FHWA and BDE review. Once FHWA and BDE and the district concur on adequate responses, FHWA will offer to meet with resource agencies to discuss the draft responses. This meeting may occur in person or by phone call. In consultation with FHWA and BDE, the district will revise the responses as necessary. It may be necessary to revise the FEIS document to address the agencies' comments.

25-2.12(a)2 *Determine Applicability of Limitation on Claims (Statute of Limitations)*

23 U.S.C. 139 establishes a 150-day statute of limitations on claims against US Department of Transportation and other Federal agencies for certain environmental and other approval actions, provided a notice is published in the Federal Register announcing the permit, license, or approval is final pursuant to the law under which the agency action is taken. The statute of limitations provision is intended to expedite the resolution of issues affecting transportation projects.

Before the completion of the combined FEIS/ROD, IDOT will consult with FHWA to determine if a limitation on claims is appropriate for the project. If so, IDOT will submit a draft limitation on claims notice in MS Word format to FHWA at the same time the draft combined FEIS/ROD is submitted; see Figure 25-2.D for a sample notice.

References:

Efficient Environmental Reviews for Project Decision-making, 23 U.S.C. 139(l)

FHWA *SAFETEA-LU Environmental Review Process Final Guidance*, Section 3 "Statute of Limitations"

AASHTO Practitioner's Handbook 09–Using the SAFETEA-LU Environmental Review Process (23 U.S.C. 139), January 2008

25-2.12(a)3 *Prepare/Review Preliminary Combined FEIS/ROD*

Before the final preparation and distribution of the combined FEIS/ROD, a preliminary version must be reviewed by the Department and FHWA to evaluate its adequacy for distribution. If the project is a Major Project, see Section 25-2.21, the preliminary FEIS/ROD should summarize any operationally independent phases of work identified and the results of a cost estimate review. The following process applies to the review of the preliminary FEIS/ROD:

- The district submits the preliminary FEIS/ROD and the table of response to comments to the DEIS to BDE in MS Word format.

- BDE reviews and evaluates the preliminary FEIS/ROD and response to comments and notifies the district within 30 days of any required revisions.

- After the district has incorporated any necessary changes, the preliminary FEIS/ROD and response to comments are submitted to BDE for review. The district prepares a disposition of all comments received from FHWA and BDE. The disposition will be included with subsequent submittals of the FEIS/ROD. BDE will submit to FHWA for a 30 day concurrent review and evaluation. Repeat this step as necessary.

- After BDE and FHWA deem the preliminary FEIS/ROD and response to comments acceptable, FHWA submits the document to FHWA legal counsel for a legal sufficiency review. Any comments from the legal sufficiency review will be communicated to IDOT BDE, who will coordinate the comments to the district. The district incorporates changes as necessary to address comments received as part of FHWA's legal sufficiency review.

- For projects meeting the criteria described in 23 CFR 771.125(c), the FHWA Division Office coordinates the FEIS/ROD with FHWA Headquarters for prior concurrence.

Once FHWA and BDE comments have been addressed, the district will prepare the FEIS/ROD for approval.

NOTE: Prior to approving a ROD, a subsequent phase of the project must be included in the fiscally constrained portion of the STIP or TIP (See Section 25-2.01(a) and Section 25-2.22).

Improving the Quality of Environmental Documents, Joint AASHTO/ACEC Committee in Cooperation with FHWA, May 2006

25-2.12(a)4 *Obtain Approval of Combined FEIS/ROD*

- The following process applies for obtaining approval of the FEIS/ROD:

- The district submits to BDE a minimum of 3 hard copies of the signature ready FEIS/ROD, which include the cover sheet bound in the documents. The district also shall submit 1 unbound cover sheet.

- The district also submits to BDE a transcript of each public hearing held and a certification that a public hearing was held. With the hearing transcript(s), the district provides copies of all written statements from the public, both submitted at the public hearing(s) or during an announced period after the hearing(s).

- The Engineer of Design and Environment signs the FEIS cover sheet (Figure 5 of Appendix D) for the Department. BDE forwards all copies of the FEIS/ROD and the unbound cover sheet to the FHWA Division Office along with the public hearing information.

- The FHWA Division Administrator signs all copies of the FEIS/ROD and the unbound cover sheet.

Please note that the district must provide a signed version of the FEIS/ROD to FHWA Division Office in PDF format which meets the USEPA requirements outlined in *e-NEPA: Electronic Submittal of Environmental Impact Statements to EPA*. There is no public review or comment period when a combined FEIS/ROD is issued.

Section 4(f) Evaluations and Determinations, Section 26-2

25-2.12(a)5 *Circulation of Combined FEIS/ROD*

The district has the primary responsibility for circulating the FEIS/ROD.

The following describes the distribution of the FEIS/ROD:

- District will submit the FEIS/ROD in PDF format to FHWA Division Office (See USEPA's website on filing format-http://www.epa.gov/compliance/nepa/submiteis/index.html).

- The FHWA Division Office electronically submits the FEIS/ROD to the USEPA, Office of Federal Activities in Washington, D.C. for publication of the Notice of Availability in the Federal Register.

- FHWA Division Office provides the transmittal memo to the district who forwards the FEIS/ROD to FHWA Headquarters and the FHWA legal counsel for information purposes.

- USEPA will publish in the *Federal Register* the Notice of Availability for the FEIS/ROD. The Notice will be published on Friday of the week following that in which USEPA received the FEIS/ROD.

- Figure 25-2.B identifies the recipients to receive the FEIS/ROD. The district shall also distribute the FEIS/ROD to any entity that made substantive comments on the DEIS and is not included in Figure 25-2.B, or requested a copy of the FEIS/ROD; the district also shall make the FEIS/ROD available for public review on the Department website and at the district office.

- The district shall provide copies of the FEIS/ROD free of charge unless the IDOT Regional Engineer concludes that a fee, which is not more than the actual printing cost, should be charged. IDOT shall inform the FHWA of requests for FEIS/RODs that it is unable to fill with free copies. IDOT will direct the party to the IDOT website or the nearest location where they may review the FEIS/ROD. If FHWA receives a specific request for a copy of the FEIS/ROD, FHWA will ask the Department to fulfill the request.

- Where the FEIS/ROD is voluminous and the number of comments on a DEIS is large, the district, BDE, and FHWA may jointly decide on alternative arrangements for distribution of the FEIS/ROD (e.g., CDs, DVDs).

- If FHWA receives a request from the public for a copy of the FEIS/ROD, FHWA will ask the Department to fulfill the request.

A FEIS/ROD that has been signed by FHWA shall (1) be posted on the IDOT website to make it available publicly; (2) be included with copies of the FEIS/ROD that are used as a reference for further development and implementation of the project by Department units; (3) be included in the project files; and (4) otherwise be made available to those Department units involved in subsequent project development and implementation.

25-2.12(b) Procedures for Separate FEIS and ROD

25-2.12(b)1 *Prepare/Review Preliminary FEIS (Separate FEIS and ROD)*

Before the final preparation and distribution of the FEIS, a preliminary version of the FEIS and response to comments must be reviewed by the Department and FHWA to evaluate its adequacy for approval and release for public review. For Major Projects, see Section 25-2.21, the preliminary FEIS should summarize any operationally independent phases of work identified and the results of a cost estimate review. The following process applies to the review of the preliminary FEIS:

- The district submits the preliminary FEIS and response to comments to BDE in MS Word format.

- BDE reviews and evaluates the preliminary FEIS and response to comments and notifies the district within 30 days of any required revisions.

- After the district has incorporated any necessary changes, the preliminary FEIS and response to comments are submitted to BDE for review. The district prepares a disposition of all comments received from BDE. BDE will submit to FHWA for a 30 day concurrent review and evaluation. The district will include a disposition of BDE and FHWA comments will all subsequent submittals of the FEIS. Repeat this step as necessary.

- After BDE and FHWA agree the preliminary FEIS and response to comments are acceptable, FHWA submits the document to FHWA legal counsel for a legal sufficiency review. Any comments from the legal sufficiency review will be communicated to IDOT BDE, who will coordinate the comments to the district. The district incorporates changes as necessary to address comments received as part of FHWA's legal sufficiency review.

- For projects meeting the criteria described in 23 CFR 771.125(c), the FHWA Division Office coordinates the FEIS with FHWA Headquarters for prior concurrence.

Once FHWA and BDE comments have been addressed, the district will prepare the FEIS for approval.

NOTE: Prior to approving a ROD, a subsequent phase of the project must be included in the fiscally constrained portion of the STIP or TIP; see Section 25-2.01(a) and 25-2.22.

25-2.12(b)2 *Prepare/Process FEIS for Approval (Separate FEIS and ROD)*

The following process applies for obtaining approval of the FEIS:

- The district submits to BDE a minimum of 3 hard copies of the signature ready FEIS, which include the signature page bound in the documents. The district also shall submit one unbound signature page.

- The district also submits to BDE a transcript of each public hearing held and a certification that a public hearing was held. With the hearing transcript(s), the district provides copies of all written statements from the public, both submitted at the public hearing(s) or during an announced period after the hearing(s).

- The Engineer of Design and Environment signs the FEIS cover sheet (Figure 6 of Appendix D) for the Department. BDE forwards the FEIS (all copies and the separate signature sheets) to the FHWA Division Office along with the public hearing information.

- The FHWA signs the FEIS.

Please note that the district must provide a signature version of the FEIS to FHWA Division Office in PDF format which meets the USEPA requirements outlined in *e-NEPA: Electronic Submittal of Environmental Impact Statements to EPA*.

Section 4(f) Evaluations and Determinations, Section 26-2

25-2.12(b)3 *Circulate FEIS (Separate FEIS and ROD)*

The district has the primary responsibility for circulating the FEIS.

The following describes the distribution of the FEIS:

- District will submit the FEIS in PDF format to FHWA Division Office (See USEPA's website on filing format-http://www.epa.gov/compliance/nepa/submiteis/index.html).

- The FHWA Division Office electronically submits the FEIS to the USEPA, Office of Federal Activities in Washington, D.C. for publication of the Notice of Availability in the Federal Register.

- FHWA Division Office provides the transmittal memo to the district who forwards the FEIS to FHWA Headquarters and the FHWA legal counsel for information purposes.

- USEPA will publish in the *Federal Register* the Notice of Availability for the FEIS. The Notice will be published on Friday of the week following that in which USEPA received the FEIS.

- The district shall distribute the FEIS to any entity that made substantive comments on the DEIS, or requested a copy of the FEIS; the district also shall make the FEIS available for public review on the Department website and at the district office.

- The district shall provide copies of the FEIS free of charge unless the IDOT Regional Engineer concludes that a fee, which is not more than the actual printing cost, should be charged. IDOT shall inform the FHWA of requests for FEISs that it is unable to fill with free copies. IDOT will direct the party to the IDOT website or the nearest location where they may review the FEIS. If FHWA receives a specific request for a copy of the FEIS, FHWA will ask the Department to fulfill the request.

- Where the FEIS is voluminous and the number of comments on a DEIS is large, the district, BDE, and FHWA may jointly decide on alternative arrangements for distribution of the FEIS (e.g., CDs, DVDs).

- If FHWA receives a request from the public for a copy of the FEIS, FHWA will ask the Department to fulfill the request.

- There is a minimum 30-day waiting period after the Notice of Availability for the FEIS is published before FHWA can issue the ROD. If FHWA receives substantive comments during this waiting period, then FHWA will respond to the comments in the ROD.

Paragraph VII. A. and Paragraph VI.C. of FHWA Technical Advisory T6640.8A-Cover Sheet and Table of Contents

25-2.12(b)4 *Evaluate and Respond to Substantive Comments on FEIS (Separate FEIS and ROD)*

The district evaluates all comments on the FEIS and prepares a draft Record of Decision (ROD). The district identifies and responds in the draft ROD to those comments that are substantive. The district summarizes and responds to comments on the FEIS as appropriate.

The district will ensure that a subsequent phase (e.g., final design, acquire right-of-way, utility relocations, or construction) of the project is incorporated into the fiscally-constrained portion of either the Metropolitan Planning Organization's (MPO's) Transportation Improvement Program (TIP) or in the Statewide Transportation Improvement Program (STIP). (See 25-2.01(a) and 25-2.22).

The district submits the draft ROD to BDE in MSWord format. BDE forwards it to FHWA. BDE and FHWA will concurrently review the ROD. The district will revise the ROD to address FHWA and BDE comments, as necessary. Once all IDOT and BDE comments on the ROD are sufficiently addressed, the ROD is ready for signature.

Collaboration in NEPA–A Handbook for NEPA Practitioners, Council on Environmental Quality, October 2007
AASHTO Practitioner's Handbook 02–Responding to Comments on an Environmental Impact Statement, July 2006

25-2.12(b)5 *Determine Applicability of Limitation on Claims (Statute of Limitations)*

The Efficient Environmental Reviews for Project Decision-making, 23 U.S.C. 139 establishes a 150-day statute of limitations on claims against US Department of Transportation and other Federal agencies for certain environmental and other approval actions, provided a notice is published in the Federal Register announcing the permit, license, or approval is final pursuant to the law under which the agency action is taken. The statute of limitations provision is intended to expedite the resolution of issues affecting transportation projects.

Before the completion of the ROD, IDOT will consult with FHWA to determine if a limitation on claims is appropriate for the project. If so, IDOT will submit a draft limitation on claims notice in MS Word format to FHWA at the same time the draft ROD is submitted; see Figure 25-2.D for a sample notice.

25-2.12(b)6 *Approval of ROD (Separate FEIS and ROD)*

After all comments on the ROD are satisfactorily resolved, the ROD will be processed and approved as follows:

- BDE will submit the ROD, with a cover letter signed by the Engineer of Bureau of Design and Environment, requesting FHWA's signature.
- The FHWA Division Administrator may sign the ROD no sooner than 30 days after the *Federal Register* public availability notice for the FEIS, or 90 days after such notice for the DEIS, whichever is later.

A ROD that has been signed by FHWA shall (1) be posted on the IDOT website to make it available publicly; (2) be included with copies of the EIS that are used as a reference for further development and implementation of the project by Department units; (3) be included in the project files; and (4) otherwise be made available to those Department units involved in subsequent project development and implementation.

Ensuring Validity of Environmental and Design Documents, Section 22-3.1

25-2.13 Draft Project Management Plan for Major Projects

For projects subject to the Major Project requirements, prior to approval of the Record of Decision, the district prepares a draft Project Management Plan in accordance with the guidance in Section 20-2, addressing the following topics, at a minimum:

- Project Description and Scope of Work;
- Goals and Objectives;
- Project Organizational Chart, Roles, and Responsibilities;
- Project Phases;
- Procurement and Contract Management;
- Cost, Budget and Schedule;
- Project Reporting and Tracking;
- Internal and Stakeholder Communications;
- Project Management Controls;
- Design Quality Assurance/Quality Control;
- Construction Quality Assurance/Quality Control;
- Environmental Monitoring;
- Right-of-Way;
- Safety and Security;
- Traffic Management;
- Project Communications (Media and Public Information);
- Civil Rights Program;
- Closeout Plan;
- Project Documentation; and
- Appendices.

The district coordinates the draft Project Management Plan with BDE for submittal to FHWA. The FHWA will coordinate with FHWA Office of Innovative Program Delivery (IPD) Project Delivery Team as appropriate, review, and provide comments to BDE.

References:

Requirements for Major Projects, Chapter 20

25-2.14 Finalize Project Management Plan for Major Projects

For projects subject to the Major Project requirements, the district revises the draft Project Management Plan to respond to FHWA comments. The district coordinates the final Project Management Plan with BDE for submittal to FHWA within 90 days of the date the ROD is signed.

DEPARTMENT OF TRANSPORTATION

Federal Highway Administration

Notice of Final Federal Agency Action on Proposed Highway in Illinois

AGENCY: Federal Highway Administration (FHWA), DOT

ACTION: Notice of limitation on claims for judicial review of actions by FHWA and other Federal agencies

SUMMARY: This notice announces actions taken by the FHWA and other Federal agencies that are final within the meaning of 23 U.S.C. 139(l)(1). The actions relate to the proposed Illinois Route 29 (IL 29) highway project, for construction of an access-controlled, four-lane freeway on new right-of-way between the existing IL 6 interchange near Mossville and the proposed Chillicothe interchange north of Chillicothe in Peoria County, and the widening of IL 29 to four-lanes, largely on existing right-of-way, from north of Chillicothe to Interstate 180 (I-180) in Peoria, Marshall, Putnam, and Bureau Counties, Illinois. Those actions grant licenses, permits and approvals for the project.

DATES: By this notice, the FHWA is advising the public of final agency actions subject to 23 U.S.C. 139(l)(1). A claim seeking judicial review of the Federal agency actions of the highway project will be barred unless the claim is filed on or before [*insert date 150 days after publication in the Federal Register*]. If the Federal law that authorizes judicial review of a claim provides a time period of less than 150 days for filing such claim, then that shorter time period still applies.

FOR FURTHER INFORMATION CONTACT: [*Name*], P.E., Division Administrator, Federal Highway Administration, 3250 Executive Park Drive, Springfield, Illinois 62703, Phone: (217) 492-4600, E-mail address: [*First_Name.Last_Name*]@ dot.gov. The FHWA Illinois Division Office's normal business hours are 7:30 a.m. to 4:15 p.m.

SAMPLE STATUTE OF LIMITATIONS NOTICE

Figure 25-2.D
(1 of 3)

You also may contact [*Name of Regional Engineer*], P.E., Illinois Department of Transportation, Deputy Director of Highways, Region Three Engineer, 401 Main Street, Peoria, Illinois 61602, Phone: (309) 671-3333. The Illinois Department of Transportation Region Three's normal business hours are 8:00 a.m. to 4:30 p.m.

SUPPLEMENTARY INFORMATION: Notice is hereby given that the FHWA and other Federal agencies have taken final agency actions by issuing licenses, permits and approvals for the following highway project in the State of Illinois: construction of an approximately 10-mile, access-controlled, four-lane freeway on new right-of-way between the existing IL 6 interchange near Mossville and the proposed Chillicothe interchange north of Chillicothe, and the approximately 25-mile widening to a four-lane expressway of IL 29, largely on existing right-of-way, from north of Chillicothe to I-180. The actions by the Federal agencies, and the laws under which such actions were taken, are described in the Final Environmental Impact Statement (FEIS) for the project approved on April 23, 2009; and the Record of Decision (ROD) issued on January 19, 2010; and other documents in the FHWA administrative record. The FEIS, ROD and other documents in the FHWA administrative record are available by contacting FHWA or the Illinois Department of Transportation at the addresses above. Project information can be viewed and downloaded from the project website http://www.dot.il.gov/il29/default.aspx. The FEIS also can be downloaded from http://www.dot.il.gov/desenv/env.html, or hard copies of the FEIS and the ROD are available upon request.

This notice applies to all Federal agency decisions as of the issuance date of this notice and all laws under which such actions were taken, including, but not limited to:

1. General: National Environmental Policy Act (NEPA), 42 U.S.C. 4321-4351 and Federal-Aid Highway Act, 23 U.S.C. 109.
2. Air: Clean Air Act, 42 U.S.C. 7401-7671(q).
3. Land: Section 4(f) of the Department of Transportation Act of 1966, 49 U.S.C. 303.
4. Wildlife: Endangered Species Act, 16 U.S.C. 1531-1544 and 1536; Migratory Bird Treaty Act, 16 U.S.C. 703-712.
5. Historic and Cultural Resources: Section 106 of the National Historic Preservation Act of 1966, 16 U.S.C. 470(f) et seq. (as amended); Archaeological and Historic Preservation Act (AHPA), 16 U.S.C. 469-469(c).

25-2.15 Implement Mitigation Measures

Those involved in preparing and processing the EIS should assist those involved in subsequent aspects of project development and implementation in facilitating the fulfillment of commitments made as a part of the NEPA process. In accordance with Departmental Policy D&E-19, each district must ensure that its procedures for follow-through on commitments provide for including information on mitigation measures and other commitments (e.g., Wetlands Compensation Plan, Erosion Control Plan, Special Provisions for management and monitoring of special wastes) in the project plans, and for implementing and monitoring the measures during construction and maintenance, as appropriate.

Chapter Twenty-six
SPECIAL ENVIRONMENTAL ANALYSES

26-1 GENERAL

26-1.01 Introduction

Although the *National Environmental Policy Act* (NEPA) is the major mandate for environmental considerations, there are other laws, executive orders, regulations, agreements, etc., which require special studies, analyses, coordination, and documentation on specific environmental issues. Chapter 26 addresses these other special requirements.

26-1.02 Policy

As practical, impact analyses and related surveys, studies, and coordination made necessary by environmental laws and requirements other than NEPA shall be integrated with the development of environmental information for inclusion in environmental reports or Phase I Engineering Reports.

26-1.03 Topics

Special analyses discussed in this Chapter addresses the following topics:

- Section 4(f) Evaluations and Determinations,
- Section 6(f) Land Conversion Request,
- OSLAD Land Conversion Request,
- Historic Act Compliance,
- Noise Analyses,
- Floodplain Encroachments,
- Wetlands,
- Threatened and Endangered Species/Natural Areas Impact Assessments,
- Evaluations of Farmland Conversion Impacts,
- Transportation Air Quality Conformity Requirements and Documentation,
- Transportation Conformity Project-Level Qualitative Hot-Spot Analysis in $PM_{2.5}$ and PM_{10} Nonattainment and Maintenance Areas,

- Mobile Source Air Toxics,
- Microscale Analysis,
- Migratory Birds,
- Wildlife Resources,
- Tree/Vegetation Assessments,
- Invasive Species and Noxious Weeds,
- Surface Water Resources and Aquatic Habitat,
- Nationwide Rivers Inventory,
- Impaired Waters/TMDLs, and
- Groundwater.

26-1.04 Applicability

Many of the special environmental analyses discussed in this Chapter are the result of Federal requirements. Although the Federally required analyses primarily affect Federally funded or regulated projects, some may apply to State-only (or State and local) funded projects where the projects affect resources covered by the Federal requirements. In addition, several of the special analyses discussed are the result of State requirements. These State requirements are often more stringent than those at the Federal level, and they may potentially affect any State project if the project involves the specific types of resources the State requirements address. Carefully review the Applicability discussion for each topic within Chapter 26 to determine the need for compliance with both Federal and State requirements on specific projects.

Information from special analyses should be (or, in some cases, is required to be) included in a project's environmental report (EIS or EA) or Phase I engineering report.

26-2 SECTION 4(F) EVALUATIONS AND DETERMINATIONS

26-2.01 Introduction

When a project involving approvals or funding from an agency of the US Department of Transportation proposes use of publicly owned land from a public park, recreational area, wildlife and waterfowl refuge, or any land from a historic property, special analyses are required for compliance with Section 4(f) of the Department of Transportation Act of 1966.

This Section provides guidance for identifying resources subject to Section 4(f), determining uses requiring Section 4(f) approval and exceptions to the approval requirement, conducting the required analyses, and documenting concurrences and approvals and discusses the applicability and requirements for Section 4(f) compliance.

26-2.02 Legal Authority

Section 4(f) of the Department of Transportation Act of 1966 (49 U.S.C. 303) provides that the Secretary of the U.S. Department of Transportation may approve a transportation program or project requiring the use of publicly owned land of a public park, recreation area, or wildlife and waterfowl refuge, or land of an historic site of national, State, or local significance (as determined by the Federal, State, or local officials having jurisdiction over the park, recreation area, refuge, or site) only if:

- There is no prudent and feasible alternative to using that land; and
- The program or project includes all possible planning to minimize harm to the park, recreation area, wildlife and waterfowl refuge, or historic site resulting from the use.

Or

- The use, including any measures to minimize harm (such as any avoidance, minimization, mitigation, or enhancement measures), will have a *de minimis* impact on the property.

26-2.03 Procedures

26-2.03(a) Definitions

1. All Possible Planning. All reasonable measures identified in the Section 4(f) evaluation to minimize harm or mitigate for adverse impacts and effects must be included in the project:

   a. With regard to public parks, recreation areas, and wildlife and waterfowl refuges, the measures may include, but are not limited to, design modifications or design goals, replacement of land or facilities of comparable value and function, or monetary compensation to enhance the remaining property or to mitigate the adverse impacts of the project in other ways.

   b. With regard to historic sites, the measures normally serve to preserve the historic activities, features, or attributes of the site as agreed by FHWA and the official(s) with jurisdiction over the Section 4(f) resource in accordance with the consultation process under 36 CFR 800 (see Section 26-5 Historic Act Compliance).

c. In evaluating the reasonableness of measures to minimize harm, FHWA will consider the preservation purpose of the statute and:

- The views of the official(s) with jurisdiction over the Section 4(f) property,

- Whether the cost of the measures is a reasonable public expenditure in light of the adverse impacts of the Section 4(f) property and the benefits of the measure to the property, and

- Any impacts of benefits of the measures to communities or environmental resources outside of the Section 4(f) property.

d. All possible planning does not require analysis of feasible and prudent avoidance alternatives, since such analysis will have already occurred in the context of searching for alternatives that avoid Section 4(f) properties altogether or is not necessary as in the case of a *de minimis* impact determination.

e. A *de minimis* impact determination subsumes the requirement for all possible planning to minimize harm by reducing the impacts on the Section 4(f) property to a *de minimis* level.

2. Constructive Use. Occurs when the transportation project does not incorporate land from a Section 4(f) property, but the project's proximity impacts on an adjacent or near-by Section 4(f) property, after incorporation of impact mitigation, are so severe that the activities, features, or attributes that qualify the property for protection under Section 4(f) are substantially impaired.

3. *De minimis* Impact.

a. For historic sites, *de minimis* impact means FHWA has determined, in accordance with 36 CFR 800, that no historic property is affected by the project or that the project will have "no adverse effect" on the historic property in question.

b. For parks, recreation areas, and wildlife and waterfowl refuges, a *de minimis* impact is one that will not adversely affect the features, attributes, or activities qualifying the property for protection under Section 4(f).

4. Feasible and Prudent Avoidance Alternative.

a. A feasible and prudent avoidance alternative avoids using Section 4(f) property and does not cause other severe problems of a magnitude that substantially outweighs the importance of protecting the Section 4(f) property. In assessing the importance of protecting the Section 4(f) property, it is appropriate to consider the relative value of the resource to the preservation purpose of the statute.

b. An alternative is not feasible if it cannot be built as a matter of sound engineering judgment.

c. An alternative is not prudent if:

- It compromises the project to a degree that it is unreasonable to proceed with the project in light of its stated purpose and need;
- It results in unacceptable safety or operational problems;
- After reasonable mitigation, it still causes:
  - + severe social, economic, or environmental impacts;
  - + Severe disruption to established communities;
  - + Severe disproportionate impacts to minority or low income populations; or
  - + Severe impacts to environmental resources protected under other Federal statutes;
- It results in additional construction, maintenance, or operational costs of an extraordinary magnitude;
- It causes other unique problems or unusual factors; or
- It involves multiple factors prudence, defined above, that while individually minor, cumulatively cause unique problems or impacts of extraordinary magnitude.

5. Historic Site. For purposes of 23 CFR 774, the term "historic site" includes any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register. The term includes properties of traditional religious and cultural importance to an Indian Tribe that are included in, or are eligible for inclusion in, the National Register.

6. Individual Section 4(f) Evaluation. Documentation prepared when a project requires the use of a Section 4(f) property that is greater than *de minimis* and a Programmatic Section 4(f) Evaluation cannot be applied to the situation.

7. Official(s) with Jurisdiction (OWJ).

a. In the case of historic properties, the OWJ is the State Historic Preservation Officer (SHPO) for the State wherein the property is located. When the Advisory Council on Historic Preservation (ACHP) is involved in a consultation concerning a property under Section 106 of the National Historic Preservation Act (NHPA), the ACHP is also an OWJ over that resource for purposes of 23 CFR 774. When the Section 4(f) property is a National Historic Landmark, the National Park Service is also an OWJ over that resource for purposes of 23 CFR 774.

b. In the case of <u>public parks, recreation areas, and wildlife and waterfowl refuges</u>, the OWJ(s) is the official(s) of the agency or agencies that own or administer the property in question and who is empowered to represent the agency on matters related to the property.

c. In the case of portions of <u>Wild and Scenic Rivers</u> to which Section 4(f) applies, the OWJ(s) is the official(s) of the Federal agency or agencies that own or administer the affected portion of the river corridor in question. For state administered, Federally designated rivers, the OWJ includes both the state agency designated by the respective Governor and the Secretary of the Interior.

<u>Note</u>: As of June 2022, Illinois has only one designated Wild and Scenic River, which is a 17.1-mile stretch of the Middle Fork Vermilion River in Vermilion County.

8. <u>Programmatic Section 4(f) Evaluation</u>. A time-saving procedural option for preparing an individual Section 4(f) evaluation for certain minor uses of Section 4(f) property. FHWA has approved five programmatic evaluations for use nationwide. Through applying a specific set of criteria, the evaluation of avoidance alternatives is standardized and simplified.

9. <u>Section 4(f) Property or Resource</u>. Publicly owned land of a public park, recreation area, or wildlife and waterfowl refuge of national, State, or local significance, or land of an historic site (regardless of ownership) of national, State, or local significance.

10. <u>Significant</u>. For the purposes of Section 4(f), the term "significant" means comparing the availability and function of the park, recreation area, or wildlife and waterfowl refuge, with the park, recreation or refuge objectives of the agency, community or authority, the property in question plays an important role in meeting those objectives.

11. <u>Use</u>. Except as set forth in 23 CFR 774.11 (Applicability) and 23 CFR 774.13 (Exceptions), a "use" of Section 4(f) property occurs when:

- Land is permanently incorporated into a transportation facility;
- There is a temporary occupancy of land that is adverse in terms of the statute's preservation purposes as determined by the criteria in 23 CFR 774.13(d); or
- There is a constructive use of a Section 4(f) property as determined by the criteria in 23 CFR 774.15.

<u>Permanent Use</u>**.** Occurs when land from a Section 4(f) priority is either purchased outright as a transportation right-of-way or when the applicant for Federal-aid funds has acquired a property interest that allows permanent access onto the property such as a permanent easement.

<u>Temporary Use</u>**.** A temporary occupancy of land that does not meet the exception criteria set forth in 23 CFR 774.15(d). The property is not permanently incorporated into a

transportation facility, but the activity is considered to be adverse in terms of the preservation purpose of Section 4(f).

26-2.03(b) Applicability and Exceptions

Exceptions, 23 CFR 774.13
FHWA Section 4(f) Policy Paper, July 20, 2012

Section 4(f) applies only to agencies within the US Department of Transportation (U.S. DOT) (e.g., Federal Highway Administration (FHWA), Federal Transit Administration, Federal Aviation Administration, Federal Railroad Administration) and only to projects that involve a U.S. DOT action, such as Federal-aid funding, Interstate Access approval, or NEPA approval. Where such funding approvals are involved for highway projects initiated by the Department, FHWA will determine applicability of Section 4(f).

The Interstate System is not considered to be a historic site subject to Section 4(f), with the exception of those individual elements formally identified by FHWA for Section 4(f) protection on the basis of national or exceptional historic significance.

26-2.03(c) Steps to Determine Section 4(f) Applicability and Evaluation

26-2.03(c)1 *The following are five steps to determine if Section 4(f) is applicable to a property in the project area. More detail is given below for each step.(Step 1) Gather Information*

Multiple factors contribute to determining whether a property is afforded protection as a Section 4(f) resource and, if so, which evaluation is appropriate for the resource. The following items may need to be obtained to determine appropriate applicability of Section 4(f) for a project:

- US DOT involvement (e.g., Federal-aid funding, Interstate Access approval, NEPA approval)

  + If there is no US DOT involvement, Section 4(f) does not apply.
- Official designations (i.e., by a Federal, state, or local agency) as a park, recreation area, or refuge
- OWJ(s) of resources and potential resources (e.g., school playgrounds, golf course)
- Property ownership, including leasing arrangements
- Property boundaries
- Public accessibility
- Existing and planned comprehensive and management plans
- Proposed project scope (e.g., roadway or non-roadway)
- Proposed project duration
- Proposed ROW needs (i.e., acquisition, permanent easement, temporary easement)
- Anticipated NEPA processing (i.e., CE, EA, EIS)

This list is not comprehensive, and additional information may be needed throughout the remaining steps.

26-2.03(c)2 *(Step 2) Identify Parks, Recreations Areas, Wildlife and Waterfowl refuges, and Historic Sites*

Parks, Recreation Areas, Wildlife and Waterfowl Refuges

In order for a park, recreation area, and wildlife and waterfowl refuge to be a Section 4(f) resource all four criteria must be true:

1. Criterion 1 – Publicly Owned

   Owned or leased by a unit of public government (e.g., Federal, state, city, village, county, township, or local parks authority) and designated as a park, recreation area, or wildlife and waterfowl refuge;

   “Publicly owned” includes situations where the facility/land is privately owned, but a public agency has a long-term interest (lease, permit) as determined by FHWA.

2. Criterion 2 – Open to the General Public

   The general public is permitted access at any time when the property is open;

   Publicly owned wildlife and waterfowl refuges are considered open to the public to the extent that public access does not interfere with the primary purpose of the refuge (e.g., public access may be restricted to preserve or protect wildlife and waterfowl during certain seasons or at certain locations within the refuge).

3. Criterion 3 – Major Purpose

   Clearly established, used, and managed as a park, recreation area, or wildlife and waterfowl refuge;

   Incidental, secondary, and occasional uses or dispersed park, recreational, or refuge activities do not constitute a major purpose;

   The OWJ determined/designated its major purpose a park, recreation area, or wildlife and waterfowl refuge.

4. Criterion 4 – Significant

   A public park, recreation area, or wildlife and waterfowl refuge must be a significant property. For the purposes of Section 4(f), the term significant means that in comparing the availability and function of the park, recreation area or wildlife and waterfowl refuge, with the park, recreation or refuge objectives of the agency, community or authority, the property in question plays an important role in meeting those objectives. Except for certain multiple-use land holdings, significance determinations are applicable to the entire property and not just to the portion of the property proposed for use by a project.

Significance determinations are made by OWJ(s) over the property, and the meaning significance should be explained if the OWJ(s) is not familiar with Section 4(f). Management plans or other official forms of documentation are important when determining significance.

If a determination from the OWJ(s) cannot be obtained, and a management plan that addresses significance is not available, the property will be presumed to be significant. All significance determinations are subject to review by FHWA.

EXAMPLES: All park- and recreation-type properties need to be assessed against the four criteria to determine Section 4(f) applicability. The following example properties can be unclear. Additional research and consideration may be required to determine if the four criteria are true and accurately determine applicability.

- School playgrounds – While the primary purpose of a public school playgrounds is generally for structured physical education classes and recreation for students, these properties may also serve significant public recreational purposes. When a public school playground serves only school activities and functions, the playground is not considered a Section 4(f) resource. When a public school playground is open to the public and serves either organized or substantial walk-on recreational purposes that are determined to be significant (Criterion 4), it is considered Section 4(f) resource.

  The term playground refers to the area of the school property developed and/or used for public park or recreation purposes, such as baseball diamonds, soccer fields, tennis courts, track and field facilities, and other features such as jungle gyms or swing sets. This can also include open space or practice fields if those areas serve primarily as a park or recreation function. Section 4(f) would apply only to the playground areas and not to the entire campus, unless the campus is also a significant historic site.

- Shared use paths and trails – Certain trail types are excepted from the requirement for Section 4(f) approval.

- Public golf courses – Golf courses that are owned, operated and managed by a public agency for the primary purpose of public recreation and are determined to be significant are Section 4(f) resources. Section 4(f) does not apply to privately owned and operated golf courses, even when they are open to the general public. Golf courses that are owned by a public agency, but managed and operated by a private entity, may still be Section 4(f) resources depending on the structure of the management agreement.

  The fact that green fees or reservations (tee times) may be required by a facility does not alter the Section 4(f) resource identification, as long as the standards of public ownership (Criterion 1), public access (Criterion 2), and significance (Criterion 4) are met.

If a golf course is on or eligible for listing in the NRHP, then the requirements for public ownership (Criterion 1) and public access (Criterion 2) do not apply because a historic site afforded Section 4(f) protections may be privately or publicly owned.

- <u>Museums, Aquariums, and Zoos</u> – Publicly owned museums, aquariums, and zoos generally are not considered parks, recreational areas, or wildlife and waterfowl refuges and are therefore not Section 4(f) resources, unless they are significant historic sites. If the facility offers additional park or recreational opportunities, it will need to be evaluated on a case-by-case basis to determine the primary purpose of the resource.

- <u>Fairgrounds</u> – Publicly owned fairgrounds that function primarily for commercial purposes (e.g., stock car races, horse racing, county or state fairs), rather than as park or recreation areas, are not Section 4(f) resources. When fairgrounds are open to the public and function primarily for public recreation other than an annual fair, Section 4(f) applies only to those portions of land determined significant for park or recreational purposes, unless they are significant historic sites.

- <u>Cemeteries</u> – Cemeteries would only be considered Section 4(f) resources if they are determined to be on or eligible for the NRHP as historic sites deriving significance from association with historic events, from age, from the presence of graves of persons of transcendent importance, or from distinctive design features.

- <u>Planned Section 4(f) Resources</u> – Section 4(f) applies when the public agency that owns the property has formally determined and designated its future function to be significant for park, recreation area, or wildlife and waterfowl refuge purposes. Evidence of formal designation would be the inclusion of the publicly owned land and its function as a Section 4(f) property into a city or county Master Plan, for example. A mere expression of interest or desire is not sufficient.

  When privately owned properties of this type are formally designated into a Master Plan for future park development, Section 4(f) is not applicable because the property is not publicly owned (Criterion 1).

  When a planned facility is presently publicly owned (Criterion 1), presently formally-designated for future Section 4(f) purposes, and presently significant (Criterion 4), it is considered a Section 4(f) resource.

<u>Historic Sites.</u>

In order for a historic site to be a Section 4(f) resource, all of the following must be true:

- Publicly or privately owned regardless of whether it is open to the public;
- Significant nationally, to a state, locally, or to a community;

- Individually eligible for or listed in the National Register of Historic Places (NRHP) in accordance with the Section 106 process; however, a historic site of local historical significance ineligible for or on the NHRP may be a Section 4(f) resource. FHWA makes the determination based on information formally provided by an official indicating its local significance;

- If the historic site is an archeological site, then the site must warrant preservation in place, including sites discovered during construction.

Note: FHWA has the final determination regarding Section 4(f) applicability of all sites and should be consulted with questions and for confirmation regarding the identification of Section 4(f) resources.

26-2.03(c)3 *(Step 3) Determine "Use"*

If a Section 4(f) resource was identified, determine if there will be a "use" or if the "use" qualifies as an exception.

"Use" of a Section 4(f) property occurs when:

- Land is permanently incorporated into a transportation facility;

- There is a temporary occupancy of land that is adverse in terms of the statute's preservation purposes (23 CFR 774.13(d)), or;

- There is a constructive use of a Section 4(f) property (23 CFR 774.15).

Note: FHWA has the final determination regarding Section 4(f) applicability and should be consulted with questions and for confirmation regarding the identification of Section 4(f) uses.

26-2.03(c)4 *(Step 4) Screen for Applicability of Exceptions*

Seven exceptions to the requirement of Section 4(f) approval have been identified by the FHWA. Specific criteria for meeting and documenting each exception are identified in 23 CFR 774.13 (a)-(g) and must be adhered to:

(a) Use of historic transportation facilities in certain circumstances (23 CFR 774.13(a));

(1) Common post-1945 concrete or steel bridges and culverts that are exempt from individual review under Section 106;

(2) Improvement of railroad or rail transit lines that are in use or were historically used for the transportation goods or passengers, except for: 1-stations, 2-Abandoned bridges or tunnels on railroad lines, and 3-Historic sites unrelated to the railroad or rail transit lines; and

(3) Maintenance, preservation, rehabilitation, operation, modernization, reconstruction, or replacement if FHWA concludes the work will not adversely affect the historic qualities of the facility and the OWJ does not object to the conclusion.

(b) Archeological sites that are on or eligible for the National Register when the FHWA concludes the resource if important chiefly because of what can be learned by data recovery and preservation in place has minimal value and the OWJ does not object with the conclusion (23 CFR 774.13(b));

(c) Designations of park and recreation lands, wildlife and waterfowl refuges, and historic sites that are made, or determinations of significance that are changed, late in the development of a proposed action (23 CFR 774.13(c));

(d) Temporary occupancies of land are so minimal as to not constitute a use within the meaning of Section 4(f) (23 CFR 774.13(d)). The following five conditions must be satisfied:

(1) Duration must be temporary (i.e., less than the time needed for construction of the project) and there should be no change in ownership of the land;

(2) Scope of the work must be minor (i.e., both the nature and the magnitude of the changes to the Section 4(f) property are minimal);

(3) There are no anticipated permanent adverse physical impacts, nor will there be interference with the protected activities, features, or attributes of the property, on either a temporary or permanent basis;

(4) The land being used must be fully restored (i.e., the property must be returned to a condition which is at least as good as that which existed prior to the project); and

(5) There must be documented agreement of the OWJ(s) over the Section 4(f) resource regarding the above conditions.

(e) Projects for the Federal lands transportation facilities described in 23 U.S.C. 101(a)(8) (23 CFR 774.13(e));

(f) Certain trails, paths, bikeways, and sidewalks, in the following circumstances (23 CFR 774.13(f)):

(1) Trail-related projects funded under the Recreational Trails Program, 23 U.S.C. 206(h)(2);

(2) National Historic Trails and the Continental Divide National Scenic Trail;

(3) Trails, paths, bikeways, and sidewalks that occupy a transportation facility right-of-way without limitation to any specific location within that right-of-way, so long as the continuity of the trail, path, bikeway, or sidewalk is maintained;

(4) Trails, paths, bikeways, and sidewalks that are part of the local transportation system and which function primarily for transportation;

a. During early consultation, it should be determined whether or not a management plan exists that addresses the primary purpose of the facility in question;

(g) Transportation enhancement activities, transportation alternatives projects, and mitigation activities, where (23 CFR 774.13(g)):

(1) The use of the Section 4(f) property is solely for the purpose of preserving or enhancing an activity, feature, or attribute that qualifies the property for Section 4(f) protection; and

(2) The OWJ(s) over the Section 4(f) resource agrees in writing to paragraph (g)(1) of this section.

If an exception is not applicable, screen the use of the Section 4(f) resource for *de minimis* applicability.

26-2.03(c)5 *(Step 5) Screen for de minimis applicability*

In cooperation with FHWA, the district considers any avoidance, minimization, and mitigation or enhancement measures incorporated into the project and evaluates whether the impact to the Section 4(f) resource, resulting from the proposed use, may be considered *de minimis*.

If it is determined that the impact is *de minimis*, no further alternatives analysis is required for FHWA to approve use of the Section 4(f) resource.

De minimis impact determinations must be made for each Section 4(f) property and not for a project in its entirety. The impacts and impact avoidance, minimization, and mitigation or enhancement measures must be considered on an individual resource basis. When there are multiple resources for which *de minimis* impact determinations are appropriate, however, the procedural requirements of Section 4(f) can and should be completed in a single process, document and circulation, so long as it is clear that distinct determinations are being made. Also in these cases, the written concurrence of the OWJ(s) may be provided for the project as a whole, so as long as the *de minimis* impacts determinations have been made on an individual resource basis.

If *de minimis* is not applicable, screen the use of the Section 4(f) resource for applicability of a Nationwide Section 4(f) Programmatic Evaluation.

i. *De minimis* impact processing

The district and FHWA evaluate applicability of a *de minimis* impact determination. If applicable, the district obtains FHWA concurrence to pursue a *de minimis* impact determination at a district coordination meeting, via e-mail or phone.

The district initiates coordination with the OWJ(s). For historic properties, the State Historic Preservation Officer (SHPO) is the OWJ. For parks, recreation areas, or wildlife and waterfowl refuges, the OWJ is the agency/agencies that own or manage the property.

ii. *De minimis* impact coordination requirements

The *de minimis* impact coordination requirements for historic properties differ slightly from those for parks, recreation areas, and wildlife and waterfowl refuges (23 CFE 774.5(b)).

For historic sites, the following coordination requirements must be met:

- FHWA considers the views of any consulting parties participating in the National Historic Preservation Act Section 106 consultation (see Chapter 26-5);
- The Section 106 process results in a determination of either "no adverse effect" or "no historic properties affected"; the notification letter from IDOT of the Section 106 effect determination includes notice that FHWA will make a de minimis impact determination based on SHPO's concurrence; and the SHPO concurs with the Section 106 effect finding in writing.

For publicly owned public parks, recreation areas, or wildlife and waterfowl refuges, the following criteria must be met:

- FHWA informs the OWJ(s) of its intent to make a *de minimis* impact determination;
- The public is afforded notice and opportunity to review and comment concerning the project's effects on the protected activities, features, or attributes of the Section 4(f) resource;
  + This requirement can be satisfied in conjunction with other public involvement procedures for the project (e.g., a public hearing, public meeting) and/or through other sufficient activities specifically to seek Section 4(f) public involvement (e.g., website, social media, and newspaper notices seeking comments). A formal meeting is not required;
- Following the public comment period, the OWJ(s) concurs in writing that the project will not adversely affect the activities, features, or attributes that make the resource eligible for Section 4(f) protection.

If the OWJ(s) does not agree with the assessment of impacts, the district is encouraged to work with the OWJ(s) to seek ways to reduce the impacts Section 4(f) resource so the OWJ(s) can concur with a *de minimis* impact determination.

If any of the coordination requirements cannot be met, *de minimis* is not applicable, and the 4(f) use needs to be screened for applicability of a Nationwide Section 4(f) Programmatic Evaluation.

If the coordination requirements are met, the district coordinates with FHWA and formally documents the *de minimis* impact determination .

iii. *De minimis* impact determination documentation

A *de minimis* impact determination shall include sufficient supporting documentation to demonstrate that the impacts, after avoidance, minimization, mitigation, or enhancement measures are taken into account, are *de minimis.* Accordingly, the district must prepare documentation in accordance with the checklist format below to ensure FHWA has sufficient information to make a *de minimis* determination on a proposed use of a Section 4(f) resource.

Format of *de minimis* Documentation:

1. Project Description.

   - Project number (e.g., State, Federal, Section number);
   - Official project name;
   - Project location (e.g., roadway designations, termini);
   - Project type (e.g., new alignment, widening, safety improvement);
   - Project size (e.g., total project length in miles);
   - NEPA Class of Action (i.e., Categorical Exclusion, Environmental Assessment, or Environmental Impact Statement);
   - Purpose and Need Summary; and
   - Project status.

2. Section 4(f) Resource.

   - Resource type (e.g., historic property, park, recreation area, wildlife/waterfowl refuge);
   - Resource name;
   - Official(s) with jurisdiction (OWJ) name; and
   - Description of role/significance in the community.

3. Description of Intended Section 4(f) Resource Use.

   - Acres (ha) to be taken and/or impacted (used);
   - Type of impact (e.g., right-of-way acquisition, permanent incorporation/change in ownership, perpetual easement);
   - Existing function of impacted areas;
   - Relationship of impacted areas to Section 4(f) function and significance to resource; and
   - Resulting function of impacted areas.

4. Description of Efforts to Avoid, Minimize, and Mitigate or Enhance Resource.

   - Avoidance and minimization efforts made and benefits to the resource; and
   - Commitments for mitigation or enhancement.

5. Evidence of Opportunity for Public Review and Comment.

   - Type of public availability (e.g., internet posting, public meeting, mailers);
     + The notice of the opportunity for public involvement must include at a minimum a description of the project and Section 4(f) resource, and language to the effect that "this is an opportunity for the public

to review and comment on the effects of the project on the activities, features, and attributes that qualify (**Name of Section 4(f) Resource**) for protection under Section 4(f).

- Date of action;
- Summary of comments; and
- Notification to OWJ of public availability and summary of comments.

6. Evidence of Coordination with OWJ.

- Meeting minutes and agendas;
- Correspondence; and
- OWJ written concurrence with a "No Adverse Effect" determination.
  - + Written concurrence must explicitly state "concur with a determination that there will be no adverse effect" to the resource. The concurrence cannot predate the completion of public involvement for the *de minimis* impact determination.

7. Supporting Documentation.

- Map of project area indicating relationship of project to resource; and
- Supporting photographs of resource.

8. Written Request for FHWA to Make a *De Minimis* Impact Determination.

- Formal statement that IDOT has determined there will be no adverse effect and that the OWJ(s) concurs with this determination; and
- Format requested for FHWA determination .

iv. *De minimis* impact determination and environmental class of action

While the general process for FHWA to make a *de minimis* impact determination will be consistent, the steps may vary depending on the environmental Class of Action (i.e., Categorical Exclusion, Environmental Assessment, or Environmental Impact Statement). Steps for the three classes are as follows:

1. <u>Categorical Exclusions (CE)</u>. The district will submit to the appropriate FHWA Transportation Engineer the completed *de minimis* impact determination for review. The FHWA Transportation Engineer will review within 30 days and coordinate with the Department to obtain additional documentation or information if required. If the *de minimis* impact determination documentation is sufficient and FHWA concludes that the *de minimis* impact determination is appropriate, then the FHWA Transportation Engineer may formally make the *de minimis* impact determination and document via e-mail with the following statement:

   *(**Name of Project**) will result in the use of (**Name of Resource**), a Section 4(f) resource. FHWA hereby makes a de minimis impact determination for this use as it will not adversely affect this resource's activities, features, and attributes. The de minimis impact determination*

> *is based on the impact avoidance, minimization, and mitigation or enhancement measures detailed in the documentation submitted on (**Date**).*

The *de minimis* impact determination documentation shall a part of the project report.

2. <u>Environmental Assessment (EA)/Finding of No Significant Impact (FONSI)</u>. Documentation supporting a *de minimis* impact determination will be included in the EA under the Section 4(f) discussion. If all required *de minimis* impact coordination and public involvement is complete prior to approval of the EA, evidence of this will be included in the appendix of the EA. If any required *de minimis* impact coordination and public involvement occurs after the EA is approved, include evidence of this coordination and/or public involvement and any additional commitments with the FONSI request.

   The FHWA Transportation Engineer, in consultation with the BDE Location and Environment Section, will evaluate the documentation during the review of the EA or FONSI. The FHWA Transportation Engineer will coordinate with the strict office to obtain additional documentation or information if required. If the *de minimis* impact determination documentation is sufficient and FHWA concludes that the *de minimis* impact determination is appropriate, then the FHWA Transportation Engineer may formally make the *de minimis* impact determination will be documented in the FONSI with the following statement:

   > *(**Name of Project**) will result in the use of (**Name of Resource**), a Section 4(f) resource. FHWA hereby makes a de minimis impact determination for this use as it will not adversely affect this resource's activities, features, and attributes. The de minimis impact determination is based upon the impact avoidance, minimization, and mitigation or enhancement measures detailed in the attached Environmental Assessment.*

3. <u>Environmental Impact Statement (EIS)/Record of Decision (ROD)</u>. Documentation supporting a *de minimis* impact determination will be included in the FEIS under the Section 4(f) discussion. The complete *de minimis* impact determination documentation, including evidence of the opportunity for public involvement, will be included in the appendix of the FEIS. The *de minimis* impact determination will be made in the ROD. If coordination and additional commitments occur after FHWA approves the FEIS, evidence of the coordination and commitments will be sent to FHWA with the draft ROD. The FHWA Transportation Engineer, in consultation with the BDE Location and Environment Section, will evaluate the documentation during the review of the FEIS or ROD. The FHWA Transportation Engineer will coordinate with the district office to obtain additional documentation or information if required. If the *de minimis* impact determination documentation is sufficient and FHWA concludes that the *de minimis* impact determination is appropriate, the *de minimis* impact determination will be documented in the ROD with the following statement:

*(**Name of Project**) will result in the use of (**Name of Resource**), a Section 4(f) resource. FHWA hereby makes a de minimis impact determination for this use as it will not adversely affect this resource's activities, features, and attributes. The de minimis impact determination is based upon the impact avoidance, minimization, and mitigation or enhancement measures detailed in the Environmental Impact Statement*

26-2.03(c)6 Screen for Nationwide Section 4(f) Programmatic Evaluation applicability

The conditions for applicability of the programmatic Section 4(f) evaluations relate to the type of project, severity of impacts to Section 4(f) resource, evaluation of alternatives, establishment of a procedure for minimizing harm to the Section 4(f) resource, adequate coordination with appropriate entities, and NEPA class of action. There are five approved Nationwide Section 4(f) Programmatic Evaluations:

1. "Programmatic Section 4(f) Evaluation and Approval for FHWA Projects that Necessitate the Use of Historic Bridges."

2. "Final Nationwide Section 4(f) Evaluation and Approval for Federally-Aided Highway Projects with Minor Involvements with Public Parks, Recreation Lands, and Wildlife and Waterfowl Refuges."

3. "Final Nationwide Section 4(f) Evaluation and Approval for Federally-Aided Highway Projects with Minor Involvements with Historic Sites."

4. "Section 4(f) Statement and Determination for Independent Bikeway or Walkway Construction Projects."

5. "Section 4(f) Evaluation and Approval for Transportation Projects That Have a Net Benefit to a Section 4(f) Property."

Procedures for documentation and approval are outlined in each Nationwide Section 4(f) Programmatic Evaluation in Appendix A.

<u>Note</u>: If a Nationwide Section 4(f) Programmatic Evaluation is not applicable, an Individual Section 4(f) Evaluation must be prepared.

26-2.03(c)7 Prepare an Individual Section 4(f) Evaluation

The Section 4(f) evaluation documentation shall include:

- description of the proposed action, including a concise statement of the project purpose and need (When a Section 4(f) evaluation is being done as part of an Environmental Impact Statement (EIS) or Environmental Assessment (EA), the corresponding section of the NEPA document can be referenced);
- description of the Section 4(f) resource;
- description of the alternatives, including avoidance alternatives;

- description of impacts;
- discussion of mitigation measures;
- discussion of coordination activities; and
- documentation of coordination with the OWJ(s).

The following paragraphs describe the preparation and processing of individual Section 4(f) evaluations.

For Parks, Recreation Areas and Wildlife/Waterfowl Refuges:

1. The district prepares a draft Section 4(f) evaluation and coordinates it with FHWA and BDE for review and comment. After addressing FHWA and BDE comments, the district electronically submits a copy of the signature-ready draft evaluation to FHWA.

2. FHWA electronically signs the cover sheet of the draft Section 4(f) evaluations and returns to BDE. BDE coordinates the signed draft with the district. The district provides an electronic copy of the draft evaluation to FHWA. FHWA distributes the draft evaluation to the US Department of the Interior, the US Department of Agriculture, and the US Department of Housing and Urban Development, as applicable, for review and comment. The district provides the draft evaluation for review and comment to the owner(s) of the Section 4(f) resource and, if applicable, other State/local OWJ(s). The recipients of the draft evaluation have 45 days to comment.

3. The district and FHWA coordinate to evaluate the comments received and incorporate appropriate revisions in the final Section 4(f) evaluation. The district submits a preliminary final evaluation to FHWA and BDE for review and comment.

4. The district addresses FHWA and BDE comments and submits an electronic copy of the signature-ready final evaluation to FHWA.

5. FHWA submits the signature-ready final evaluation to FHWA legal counsel for a 30-day legal sufficiency review. FHWA provides comments from the legal sufficiency review to BDE for coordination with the district. The district incorporates changes as necessary to address the comments and submits an electronic copy of the final evaluation to FHWA for signature.

6. FHWA signs the cover sheet of the final evaluation and returns a copy to BDE. BDE coordinates the signed final evaluation with the district. The district provides FHWA with an electronic link of the signed final evaluation for distribution to Federal agencies. The district provides the signed final evaluation to the owner(s) of the Section 4(f) resource and, as applicable, to other State/local OWJ(s).

For Historic Properties:

The Section 4(f) process for historic properties is essentially the same as that for parks, recreation areas, and wildlife and waterfowl refuges; except that a Section 106 Memorandum of Agreement (MOA) must be completed before the final evaluation is approved. The MOA, signed by all parties involved in the Section 106 process, must be included in the final Section 4(f) evaluation. It also may be included in the draft evaluation if it has been signed at that time.

Note that BDE review of Section 4(f) evaluations for Federal Approved CE projects is not required ~~except when the 4(f) evaluation is included in combined Section 106/4(f) documentation. Provide~~

Section 4(f) evaluations to BDE for review when they are associated with EA or EIS projects and/or when they are combined with Section 106 compliance documentation.

26-3 SECTION 6(F) LAND CONVERSION REQUEST

26-3.01 Introduction

Special procedures are required when lands that have Land and Water Conservation (LAWCON) funds involved in their purchase or development, will be used for highway purposes. This Section discusses these procedures. Similar procedures may be required where lands are involved that have been improved or developed with funds under Section 1010 of the *Urban Park and Recreation Recovery Act* of 1978. There are few such sites in the State. Specific procedural requirements will be addressed on a case-by-case basis.

26-3.02 Legal Authority

16 U.S.C. 4601-8(f)(3), commonly known as Section 6(f) of the *Land and Water Conservation Fund Act* of 1965 (Public Law 88-578), requires that:

> *...No property acquired or developed with assistance under this section shall, without the approval of the Secretary, be converted to other than public outdoor recreation uses. The Secretary shall approve such conversion only if he finds it to be in accord with the then existing comprehensive Statewide outdoor recreation plan and only upon such conditions as he deems necessary to assure the substitution of other recreation properties of at least equal fair market value and of reasonably equivalent usefulness and location.*

"Secretary" refers to the Secretary of the US Department of Interior. The authority to approve Section 6(f) land conversions has been delegated to the Regional Directors of the National Park Service (NPS).

The Illinois Department of Natural Resources (IDNR) publishes the Statewide Comprehensive Outdoor Recreation Plan (SCORP) for Illinois. The most recent plan is available ono the IDNR website or may be requested from the IDNR Planning Division.

26-3.03 Policy

Special efforts will be made in the development of a project to identify and preserve public outdoor recreational areas and facilities.

26-3.04 Procedures

26-3.04(a) Applicability

Section 6(f) procedures will be followed for all projects initiated by the Department, regardless of project type or funding source.

26-3.04(b) Coordination

Early and ongoing coordination with the official having jurisdiction over the Section 6(f) land, the IDNR and the NPS Regional Director should be diligently pursued.

26-3.04(c) Report Requirements

When a project proposes use of land in which LAWCON funds have been involved in its purchase or development, Section 6(f) requires the approval of the Secretary of the Interior for the conversion of the land to other than public outdoor recreational use. Section 6(f) does not otherwise require a special report. Discuss involvement with the Section 6(f) land in the environmental documentation for the project and in any documentation for compliance with Section 4(f) (see Section 26-2) when the project involves the use of Section 6(f) land from a significant publicly owned public park, recreational area, or wildlife and waterfowl refuge.

For a State-only funded highway project involving Section 6(f) lands, information on the Section 6(f) involvement should be incorporated in the action's Phase I engineering report.

26-3.04(d) Conversion Request

Requests to convert LAWCON-assisted properties in whole or in part to other than public outdoor recreational uses must be submitted, in writing, through the IDNR to the appropriate NPS Field Director. NPS will consider the conversion request if the entity proposing the conversion (i.e., IDOT) has met the prerequisites described below. As applicable, districts should submit a request for Section 6(f) land conversion approval the IDNR Division of Grant Administration for submittal to the appropriate NPS Field Director. The district should submit the request after CE/FONSI/ROD approval and prior to design approval. Formal review periods for conversion requests are not specified in the regulation. IDNR has advised that the typical time frame for NPS response to conversion requests is 60 to 90 days.

The conversion request should include information to address each of the following points (i.e., based on information extracted from NPS regulations on compliance responsibilities for LAWCON-assisted properties; 36 CFR 59.3 "Conversion Requirements"):

1. Alternatives. All practical alternatives to the proposed conversion have been evaluated.

2. Value. The fair market value of the property to be converted has been established and the property proposed for substitution is of at least equal fair market value as established by an approved appraisal (i.e., prepared according to Uniform Federal Appraisal Standards), excluding the value of structures or facilities that will not serve a recreational purpose.

3. Replacement Property. The property proposed for replacement is of reasonably equivalent usefulness and location as that being converted. Depending upon the situation and at the discretion of the NPS Field Director, the replacement property does not need to provide identical recreational experiences or be located at the same site, provided it is

in a reasonably equivalent location. Generally, the replacement property should be administered by the same political jurisdiction as the converted property. Equivalent usefulness and location will be determined based on the following criteria:

- Property to be converted must be evaluated to determine what recreational needs are being fulfilled by the facilities, which exist, and the types of outdoor recreational resources and opportunities available. The property being proposed for substitution must then be evaluated in a similar manner to determine if it will meet the recreational needs that are at least similar in magnitude and impact to the user community as the converted site. This criterion is applicable in the consideration of all conversion requests with the exception of those where wetlands are proposed as replacement property. Wetland areas and interests therein which have been identified in the wetlands provisions of the Statewide Comprehensive Outdoor Recreation Plan shall be considered to be of reasonably equivalent usefulness with the property proposed for conversion regardless of the nature of the property proposed for conversion.

- Replacement property need not necessarily be directly adjacent to or close to the converted site. This policy provides the administrative flexibility to determine a location recognizing that the property should meet existing public outdoor recreational needs. Although, generally, this will involve the selection of a site serving the same community(ies) or area as the converted site, there may be exceptions. For example, if property being converted is in an area undergoing major demographic change and the area has no existing or anticipated future need for outdoor recreation, then the district should seek to locate the substitute area in another location within the jurisdiction.

- The acquisition of one parcel of land may be used in satisfaction of several approved conversions.

4. <u>Eligibility Requirements</u>. The property proposed for substitution must meet the eligibility requirements for LAWCON-assisted acquisition. The replacement property must constitute or be part of a viable recreational area. Unless *each* of the following additional conditions is met, land currently in public ownership, including that owned by another public agency, may not be used as replacement land for land acquired as part of a LAWCON project:

- The land was not acquired by IDOT or the selling agency for recreation.

- The land has not been dedicated or managed for recreational purposes while in public ownership.

- No Federal assistance was provided in the original acquisition unless the assistance was provided under a program expressly authorized to match or supplement LAWCON assistance.

- Where IDOT acquires the land from another public agency, the selling agency must be required by law to receive payment for the land so acquired.

In the case of development projects for which the State match was not derived from the cost of the purchase or value of a donation of the land to be converted but from the value of the development itself, public land that has not been dedicated or managed for recreational/conservation use may be used as replacement land, even if this land is transferred from one public agency to another without cost.

5. Partial Conversion—Effect on Remainder. In the case of assisted sites that are partially rather than wholly converted, the impact of the converted portion on the remainder shall be considered. If such a conversion is approved, the unconverted area must remain recreationally viable or be replaced as well.

6. Coordination. All necessary coordination with other Federal agencies has been satisfactorily accomplished including, for example, compliance with Section 4(f) and NEPA.

7. Environmental Review. The guidelines for environmental evaluation have been satisfactorily completed and considered by NPS during its review of the proposed Section 6(f) action. Where the proposed conversion arises from another Federal action, final review of the State's proposal shall not occur until the NPS Regional Office is assured that all environmental review requirements including NEPA related to that other action have been met.

8. SCORP. The proposed conversion and substitution are consistent with the Statewide Comprehensive Outdoor Recreation Plan (SCORP) and/or equivalent recreational plans.

26-4 OSLAD LAND CONVERSION REQUEST

26-4.01 Introduction

Special procedures, similar to those applicable under Section 6(f), are required when lands that have Open Space Land Acquisition and Development (OSLAD) grant program funds involved in their purchase or development will be converted to other than public outdoor recreational uses.

26-4.02 Legal Authority

The OSLAD program is a State-funded grant program authorized by the *Open Space Lands Acquisition and Development Act,* 525 ILCS 35/1, *et seq*. The Illinois Administrative Code provisions for the OSLAD grant program (17 Ill. Adm. Code 3025) incorporate by reference essentially the same compliance procedures as required for the Land and Water Conservation Fund (LAWCON) Section 6(f) grant program; see Section 26-3. However, because the OSLAD program is State-funded, concurrence of the National Park Service is not required for proposed conversion of OSLAD-assisted lands to other than public outdoor recreational use.

26-4.03 Policy

Special effort shall be made in the development of a project to identify public outdoor recreational areas and to comply with applicable requirements when projects propose the conversion of such areas to other than public outdoor recreational use.

26-4.04 Procedures

The following procedures will apply:

1. Applicability. Compliance procedures for proposed conversion of OSLAD-assisted lands are applicable to all projects proposing such conversion, regardless of project type or funding source.

2. Coordination. Early and ongoing coordination with the official having jurisdiction over the OSLAD-assisted land and IDNR should be diligently pursued.

3. Report Requirements. When a project proposes the use of land in which OSLAD funds have been involved in its purchase or development, the IDNR Division of Grant Administration, in the Office of Architecture, Engineering and Grants, must approve conversion of the land to other than public outdoor recreational use; however, a special report is not required. Discuss involvement with the OSLAD-assisted land in the environmental documentation for the project and in any documentation for compliance with Section 4(f) (see Section 26-2) when the project would involve use of OSLAD-assisted land from a significant publicly owned park, recreational area, or wildlife and waterfowl refuge.

For a State-only funded highway project involving OSLAD-assisted lands, information on the involvement should be incorporated in the Phase I engineering report.

4. Conversion Request. Requests to convert OSLAD-assisted properties in whole or in part to other than public outdoor recreational uses must be submitted to the IDNR in writing. IDNR will approve conversions only upon the substitution of replacement property having equal fair market value and comparable outdoor recreational usefulness, quality, and location. As applicable, districts should submit a request for OSLAD land conversion approval to the IDNR Division of Grant Administration for review and approval. The district should submit the request prior to design approval. Formal review periods for conversion requests are not specified in the OSLAD regulation.

IDNR regulations do not specify information requirements for conversion requests; however, the information specified in the Section 6(f) requirements to support fair market value and comparable outdoor recreational usefulness, quality, and location (see Section 26-3.04(d)) should serve as a guide for the items to address in preparing OSLAD conversion requests.

26-5 HISTORIC ACT COMPLIANCE

26-5.01 Introduction

In the development of State highway projects, it is necessary to consider the effects of the undertaking on properties included in or eligible for inclusion in the *National Register of Historic Places* (NRHP) or included in the *Illinois Register of Historic Places* (IRHP). This Section describes the procedures for identifying historic resources, evaluating their significance, and assessing and addressing effects on those resources that meet the eligibility criteria for the NRHP or that are included in the IRHP.

26-5.02 Legal Authority

The following legal authority regulates or influences the policies and procedures for historic act compliance:

- 16 U.S.C. 470f, Section 106 of the *National Historic Preservation Act* of 1966, as amended,
- 16 U.S.C. 470h-2, Section 110(f) of the *National Historic Preservation Act* of 1966, as amended,
- Exec. Order No. 11593, Protection and Enhancement of the Cultural Environment (1971),
- 23 U.S.C. 138 and 49 U.S.C. 303, Section 4(f) of the *Department of Transportation* Act of 196,
- Protection of Historic Properties, 36 CFR 800,
- *The Illinois State Agency Historic Resources Preservation Act,* 20 ILCS 3420/1 *et seq*.,
- *The Illinois Historic Preservation Act,* 20 ILCS 3410/1 *et seq*., and
- Rules for Review of State Agency Undertakings, 17 Ill. Admin. Code 4180.

Appendix C provides brief descriptions of each of the directives in the preceding list.

26-5.03 Policy

In the development of a proposed State highway project, appropriate measures shall be taken to evaluate the undertaking's effect on properties included in or eligible for inclusion in the NRHP and properties included in the IRHP. Where such properties will be affected, coordination will be initiated with consulting parties, as appropriate, including the Advisory Council on Historic Preservation (ACHP), in accordance with applicable Federal and State historic preservation directives. Special efforts will be made to minimize harm to any national historic landmark that may be directly and adversely affected by a proposed Federally funded/ regulated undertaking.

Throughout project development, avoidance of historic properties should be a priority.

26-5.04 Federal Requirements

26-5.04(a) Definitions

1. Area of Potential Effects. The geographic area or areas within which an undertaking may directly or indirectly cause alterations in the character or use of historic properties, if any such properties exist. The area of potential effects is influenced by the scale and nature of an undertaking and may be different for different kinds of effects caused by the undertaking.

2. Comment. The findings and recommendations of the Council formally provided in writing to the head of a Federal agency under Section 106.

3. Consultation. The process of seeking, discussing, and considering the views of other participants and, where feasible, seeking agreement with them regarding matters arising in the Section 106 process.

4. Council. The ACHP or a Council member or employee designated to act for the Council.

5. Day or Days. Refers to calendar days.

6. Effect. Alteration to the characteristics of a historic property qualifying it for inclusion in or eligibility for the NRHP.

7. Historic Property. Any prehistoric or historic district, site, building, structure, or object included in or eligible for inclusion in the NRHP maintained by the Secretary of the Interior. This term includes artifacts, records, and remains that are related to and located within such properties. The term includes properties of traditional, religious, and cultural importance to an Indian Tribe and that meet the NRHP criteria. The term "eligible for inclusion in the National Register" includes both properties formally determined as such in accordance with regulations of the Secretary of the Interior and all other properties that meet the NRHP criteria.

8. Illinois State Archaeological Survey (ISAS). The entity that conducts all archaeological investigations for IDOT projects, in accordance with an intergovernmental agreement between IDOT and the University of Illinois at Urbana-Champaign.

9. Indian Tribe. An Indian Tribe, band, nation, or other organized group or community that is officially recognized by the US government.

10. Local Government. A city, county, parish, township, municipality, borough, or other general purpose political subdivision of a State.

11. Memorandum of Agreement. The document that records the terms and conditions agreed upon to resolve the adverse effects of an undertaking upon historic properties.

12. National Historic Landmark. A historic property that the Secretary of the Interior has designated a national historic landmark.

13. National Register. The NRHP maintained by the Secretary of the Interior.

14. National Register Criteria. The criteria established by the Secretary of the Interior for use in evaluating the eligibility of properties for the NRHP (36 CFR 60.4).

15. Programmatic Agreement. A document that records the terms and conditions agreed upon to resolve the potential adverse effects of a Federal agency program, complex undertaking, or multiple undertakings.

16. Senior Policy Official. The senior policy level official designated by the head of the lead Federal agency pursuant to Section 3(e) of Executive Order No. 13287.

17. State Historic Preservation Officer (SHPO). The official appointed or designated pursuant to Section 101(b)(1) of the *National Historic Preservation Act* to administer the State historic preservation program or a representative designated to act for the SHPO. The SHPO for Illinois is the Director of the State Historic Preservation Agency.

18. Undertaking. A project, activity, or program funded in whole or in part under the direct or indirect jurisdiction of a Federal agency, including those carried out by or on behalf of a Federal agency; those carried out with Federal financial assistance, and those requiring a Federal permit, license or approval.

26-5.04(b) Applicability

These procedures apply to all Federally funded/regulated highway project initiated by the Department that have the potential to cause effects on historic properties. See Chapter 20 of the *Bureau of Local Roads and Streets Manual* for historic act compliance procedures applicable to local highway projects.

26-5.04(c) Procedures

The following guidance reflects the assumption that FHWA, in most cases, will be the lead Federal agency for a project subject to the Section 106 requirements. If a different Federal agency is the lead (e.g., Corps of Engineers for a State-only funded project requiring a Section 404 permit), that agency would fulfill the functions indicated for FHWA. See the *AASHTO Practitioner's Handbook 06– – Consulting Under Section 106 of the National Historic Preservation Act,* February 2007, for additional guidance on the Section 106 process.

The steps in the Section 106 process will be coordinated, as appropriate, with the overall planning schedule for each project and with any reviews required under other authorities (e.g., the *National Environmental Policy Act* (NEPA), the *Native American Graves Protection and Repatriation Act*, the *Archaeological Resources Protection Act*, Section 4(f)). Where it is consistent with the Section 106 procedures, information developed for other reviews (e.g., NEPA) may be used to meet the requirements of Section 106.

Figure 26-5.A presents a flowchart that graphically illustrates the process for compliance with the Section 106 requirements. Following Figure 26-5.A are descriptions of the activities referenced within the flowchart.

PROJECT ACTIVITY

Activity Title: Identify Proposed Projects Potentially Subject to Section 106

Activity No.: 01

Responsible Unit: District

Activity Description:

For Categorical Exclusion (CE) projects, the district checks the exempt project list in Appendix A of the "Minor Projects Delegation Programmatic Agreement" (see Part III Appendix A) to determine if the project type is exempt from submittal to BDE. If the project is on the exempt list, the district documents, in the project file, that the project is on the exempt list and notes which number qualifies it as exempt, and no further action is required. If the district determines the project meets the criteria for Category A (Minor Projects Requiring No Review by IDOT Cultural Resources Staff) in the Programmatic Agreement for Minor Projects Delegation (see Part III Appendix A), the district documents the basis for determining that the action is exempt from further review by BDE and the SHPO. The district retains the documentation in project files.

For an Environmental Assessment (EA) project or an Environmental Impact Statement (EIS) project, or for a CE project that does not meet the criteria in Appendix A of the Programmatic Agreement for Minor Projects Delegation, the district proceeds to Activity 02.

References:

Effect, 36 CFR 800.16(i)
Historic Property, 36 CFR 800.16(l)
Programmatic Agreement for Minor Projects, Appendix A

PROJECT ACTIVITY

Activity Title: Submit ESR to BDE

Activity No.: 02

Responsible Unit: District

Activity Description:

The district prepares an Environmental Survey Request (ESR) for the proposed project using the form and instructions available on the Department website. The district submits the completed form and applicable supporting information to BDE.

References:

Environmental Surveys, Chapter 27

PROJECT ACTIVITY

Activity Title: Determine Involvement of Other States

Activity No.: 03

Responsible Unit: BDE

Activity Description:

BDE evaluates the information in the ESR to determine if any other States are involved in the project. If another State is involved, BDE advises the FHWA Division Office. The FHWA Division Office, as the lead Federal agency, coordinates with the involved SHPOs to determine their respective roles (i.e., whether they may agree to designate a lead SHPO). The FHWA Division Office advises BDE of the results of coordination with the SHPOs. BDE then proceeds to Activity 04.

If another State is not involved, BDE proceeds directly to Activity 04.

References:

Undertakings Involving More than One State, 36 CFR 800.3(c)(2)

PROJECT ACTIVITY

Activity Title: Evaluate Project per Category B Criteria

Activity No.: 04

Responsible Unit: BDE

Activity Description:

For CE projects, BDE evaluates the proposed project to determine if it is a type included in Category B (Minor Projects Requiring Review by IDOT Cultural Resource Staff to Determine if Field Survey is Required) in the Programmatic Agreement for Minor Projects Delegation.

If BDE determines the project is a type included in Category B, it evaluates the project to determine the need for field survey and coordination with the SHPO. If BDE determines that the field survey is not warranted, it applies a stamp to the ESR indicating the finding is "no historic properties affected." BDE returns the ESR with the finding to the district. The district retains the ESR in project files.

If BDE determines either that the proposed project does not qualify as a Category B action or that it involves circumstances requiring field survey and coordination with the SHPO, it proceeds to Activity 05.

For EA projects and EIS projects, BDE proceeds to Activity 05.

References:

Programmatic Agreement for Minor Projects, Appendix A

PROJECT ACTIVITY

Activity Title: Identify and Invite Consulting Parties

Activity No.: 05

Responsible Unit: BDE

Activity Description:

BDE, in consultation with FHWA, identifies entities that should be invited to participate as consulting parties in the Section 106 process, including the following, as appropriate:

- SHPO,
- Indian Tribes,
- representatives of local governments, and
- individuals and organizations with a demonstrated interest in the project.

Interested Tribes are provided initial notification through ISAS Project Notification System (PNS) when BDE requests an archaeological survey. The notification includes a request for information the Tribes may have that could assist in identifying properties of religious and cultural significance.

For EA and EIS projects, FHWA contacts all Tribes early in project development (possibly prior to the PNS notification) and works with BDE/districts and the Illinois SHPO to identify other parties to contact. The district contacts each of the identified parties (e.g., by letter or e-mail) to formally invite their participation and seek their input on historic properties in the project area and potential impacts to those properties. The district compiles a list of all consulting parties and shares any information provided by the parties with BDE and FHWA. The district retains in the project files a list of who was contacted.

References:

Consulting Parties, 36 CFR 800.2(c)

PROJECT ACTIVITY

Activity Title:	Develop Involvement Plan for Consulting Parties and the Public
Activity No.:	06
Responsible Unit:	BDE

Activity Description:

The district develops a plan that identifies the points for involving consulting parties and the public in the Section 106 process. The plan identifies the appropriate points for seeking the consulting party, public input, and for notifying the public of proposed actions associated with the Section 106 process. The level of involvement documented in the plan reflects the nature and complexity of the project. The plan addresses public involvement for the Section 106 process in the context of other public involvement activities for compliance with NEPA. Use public involvement opportunities that are scheduled as part of the normal project development process to inform the public of ongoing Section 106 activities and seek the public's input. Key Section 106 issues to include during public involvement events are:

1. notification that the Section 106 process is under way, and public input on potential historic properties and effects to historic properties is being sought;
2. communicating the results of efforts to identify historic properties;
3. communicating the results of the effect findings; and
4. seeking input on measures to resolve adverse effects to historic properties.

On projects the Regional Engineer has determined will use the principles of Context Sensitive Solutions (CSS), the district coordinates with the CSS Project Study Group (PSG) to ensure the Stakeholder Involvement Plan (SIP), as outlined in Section 19-5, addresses considerations associated with the Section 106 process. The district coordinates the SIP with BDE and FHWA and retains the SIP and other CSS documentation in the project file.

For most EA projects and all EIS projects, the district consults with BDE and FHWA to develop the plan.

References:

Initiation of the Section 106 Process, 36 CFR 800.3
Public Involvement Guidelines, Chapter 19

PROJECT ACTIVITY

Activity Title: Determine Area of Potential Effects

Activity No.: 07

Responsible Unit: BDE

Activity Description:

For CE projects, BDE coordinates with the SHPO as needed to determine and document the area of potential effects (APE) for the proposed project. This may be an iterative process, as necessary to obtain SHPO concurrence. See Section 26-5.04(a) for the definition of the term "area of potential effects" from 36 CFR 800.16.

For EA and EIS projects, BDE, SHPO, and FHWA consult to develop the APE. The district coordinates the APE with consulting parties and the public as described in the involvement plan developed in Activity 06.

References:

Determine Scope of Identification Efforts, 36 CFR 800.4(a)
Area of Potential Effects, 36 CFR 800.16(d)

PROJECT ACTIVITY

Activity Title: Collect Data

Activity No.: 08

Responsible Unit: BDE

Activity Description:

BDE forwards the ESR to the ISAS for survey. At this point, the PNS generates the email notification to interested Tribes.

ISAS reviews existing information on historic properties, including any data concerning possible historic properties not yet identified, and conducts field surveys, as appropriate.

For EA and EIS projects, the district is responsible for providing BDE a project photo log of standing structures over 50 years old. The district also sends BDE any information received from consulting parties and the public regarding potential historic properties.

References:

Determine Scope of Identification Efforts, 36 CFR 800.4(a)
Environmental Surveys, Chapter 27

PROJECT ACTIVITY

Activity Title: Identify Historic Properties

Activity No.: 09

Responsible Unit: BDE

Activity Description:

For CE projects, in consultation with the SHPO and interested Tribes, BDE uses the information gathered in Activity 08 and takes the steps necessary to identify historic properties within the APE.

BDE makes a reasonable and good faith effort to carry out appropriate identification efforts, which may include background research, consultation, oral history interviews, sample field investigation, and field survey.

In consultation with the SHPO and interested Tribes and guided by the Secretary of the Interior's standards and guidelines for evaluation, BDE applies the NRHP criteria (36 CFR 60.4, see Section 26-5.04(f)) to properties identified within the APE.

If BDE determines any of the NRHP criteria are met and the SHPO concurs, the property is considered eligible for the NRHP for Section 106 purposes. If BDE determines the criteria are not met and the SHPO concurs, the property is considered not eligible. If BDE and SHPO do not concur, BDE coordinates with FHWA to resolve the determination. If resolution cannot be reached, FHWA obtains a determination of eligibility from the Keeper of the National Register (Department of the Interior) in accordance with 36 CFR 63.

For EA projects and EIS projects, BDE prepares eligibility recommendations and submits them to FHWA. FHWA consults with the SHPO by letter to seek concurrence with the determination. The SHPO may stamp the FHWA letter "Concur," write a letter of concurrence, or write a letter disagreeing with the determination. If the SHPO disagrees with the determination, FHWA obtains a determination of eligibility from the Keeper of the National Register in accordance with 36 CFR 63. FHWA submits the eligibility documentation to BDE. BDE forwards a copy of the documentation to the district to include in the EA or EIS. The district coordinates the determination in accordance with the involvement plan developed in Activity 06.

If historic properties are in the APE, BDE consults with the district to determine if there are feasible and prudent alternatives for avoiding the site(s).

Secretary of the Interior's Standards and Guidelines for Archeology and Historic Preservation

PROJECT ACTIVITY

Activity Title: Determine if Historic Properties May Be Affected

Activity No.: 10

Responsible Unit: BDE

Activity Description:

BDE evaluates the project scope and the information obtained in Activity 09 to determine whether the project may affect historic properties.

For CE projects, if BDE determines that there are no historic properties present or that there are historic properties present but the project will have no effect on them as defined in 36 CFR 800.16(i), BDE provides documentation of this finding to the SHPO. In accordance with 36 CFR 800.11(d), the documentation includes the following:

- a description of the project, specifying the Federal involvement, and its area of potential effects, including photographs, maps, drawings, as necessary;
- a description of the steps taken to identify historic properties, including, as appropriate, efforts to seek information from consulting parties, Indian Tribes, etc.; and
- the basis for determining no historic properties are present or affected.

If the SHPO concurs or does not object within 30 days of receipt of an adequately documented finding, responsibilities under Section 106 are fulfilled. BDE documents the determination that no historic properties will be affected and provides the documentation to the district. The district retains the documentation in project files.

If the SHPO objects within 30 days of receipt of an adequately documented finding, BDE coordinates with FHWA and the SHPO to resolve the disagreement. If the disagreement is resolved, responsibilities under Section 106 are fulfilled. BDE documents the determination that no historic properties will be affected and provides the documentation to the district. The district retains the documentation in project files.

If the SHPO disagrees with the finding, FHWA follows the process in 36 CFR 800.4(d)(1)(ii).

The district notifies all consulting parties, including Indian Tribes, in accordance with the involvement plan developed in Activity 06 and makes the documentation available for public inspection.

PROJECT ACTIVITY

Activity Title:	Determine if Historic Properties May Be Affected
Activity No.:	10 *(Continued)*
Responsible Unit:	BDE

Activity Description:

For EA and EIS projects, BDE submits documentation of findings that there are no historic properties present or that historic properties are present, but the project will have no "effect" on them as defined in 36 CFR 800.16(i) (see Section 26-5.04(a)). FHWA considers the recommendation and, if in agreement, seeks concurrence from the SHPO. If the SHPO concurs or does not object within 30 days of receipt of an adequately documented finding, responsibilities under Section 106 are fulfilled. The SHPO may stamp the FHWA letter "Concur," write a letter or concurrence, or write a letter disagreeing with the finding. If the SHPO disagrees with the finding, FHWA follows the process in 36 CFR 800.4(d)(1)(ii).

FHWA provides the documentation of coordination with the SHPO to BDE. BDE forwards the documentation to the district and the district includes it in the EA or EIS.

References:

Finding of No Historic Properties Affected, 36 CFR 800.11(d)

PROJECT ACTIVITY

Activity Title: Apply Criteria of Adverse Effect

Activity No.: 11

Responsible Unit: BDE

Activity Description:

In consultation with the SHPO and BDE, FHWA applies the criteria of adverse effect to historic properties within the APE.

The criteria of adverse effect provide that an adverse effect is found when a project may alter, directly or indirectly, any of the characteristics of a historic property that qualify it for inclusion in the NRHP, in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association.

Examples of adverse effects on historic properties include, but are not limited to:

- physical destruction of or damage to all or part of the property;
- alteration of a property, including restoration, rehabilitation, repair, maintenance, stabilization, hazardous material remediation, and provision of handicapped access, that is not consistent with the Secretary of the Interior's standards for the treatment of historic properties and applicable guidelines;
- removal of the property from its historic location;
- change of the character of the property's use or of physical features within the property's setting that contribute to its historic significance;
- introduction of visual, atmospheric, or audible elements that diminish the integrity of the property's significant historic features;
- neglect of a property that causes its deterioration, except where such neglect and deterioration are recognized qualities of a property of religious and cultural significance to an Indian Tribe; and
- transfer, lease, or sale of property out of Federal ownership or control without adequate and legally enforceable restrictions or conditions to ensure long-term preservation of the property's historic significance.

FHWA considers any views provided by consulting parties, the public, and Tribes, as appropriate, regarding the project's effects on historic properties. BDE submits documentation of its preliminary findings regarding the results of application of the criteria of adverse effect to FHWA. The documentation includes:

PROJECT ACTIVITY

Activity Title: Apply Criteria of Adverse Effect

Activity No.: 11 *(Continued)*

Responsible Unit: BDE

Activity Description:

- a description of the project, specifying the Federal involvement, and its area of potential effects including photographs, maps, and drawings, as necessary;
- a description of the steps taken to identify historic properties;
- a description of the affected historic properties, including information on the characteristics that qualify them for the NRHP;
- a description of the project's effects on historic properties;
- an explanation of why the criteria of adverse effect were found applicable or inapplicable, including any conditions or future actions to avoid, minimize, or mitigate adverse effects; and
- copies or summaries of any views provided by consulting parties and the public.

For projects that have an adverse effect, a Section 4(f) evaluation may also be required. The Section 4(f) evaluation may be combined with the Section 106 documentation to streamline and condense the processes. The district should consult with BDE and FHWA to discuss how the Section 106 documentation and Section 4(f) evaluation may be combined.

FHWA considers the recommendation and, if in agreement, seeks concurrence from the SHPO. If the SHPO concurs with FHWA's findings or does not object within 30 days of receipt of adequately documented findings, BDE proceeds directly to Activity 12. If the SHPO disagrees with the findings, FHWA follows the process in 36 CFR 800.5(c)(2).

For CE projects, BDE may make a "no adverse effect" finding in consultation with the SHPO. If the finding is "adverse effect," then FHWA must make the finding in consultation with the SHPO.

For EA projects and EIS projects, FHWA makes either a "no adverse effect" or "adverse effect" finding in consultation with the SHPO and BDE.

PROJECT ACTIVITY

Activity Title:	Apply Criteria of Adverse Effect
Activity No.:	11 *(Continued)*
Responsible Unit:	BDE

References

Assessment of Adverse Effects, 36 CFR 800.5
The Secretary of the Interior's Standards for the Treatment of Historic Properties, 36 CFR 68

PROJECT ACTIVITY

Activity Title:	Coordinate with Consulting Parties and the Public
Activity No.:	12
Responsible Unit:	BDE

Activity Description:

BDE provides documentation, as described in Activity 11, of the effect findings to the district. The district provides the documentation to consulting parties and the public in accordance with the involvement plan developed in Activity 06.

FHWA sends the documentation to interested Tribes who have requested to be consulting parties in the Section 106 process. Information concerning the location of archaeological properties and properties of religious or cultural significance will not be included in documents to be made available for public inspection, in accordance with 36 CFR 800.11(c)(1).

If the SHPO concurs with the finding of no adverse effect, the Section 106 process is complete. The district retains the documentation in the project files and includes it in the NEPA document.

If there is a finding of adverse effect, proceed to Activity 13.

Consulting Party Review, 36 CFR 800.5(c)
Finding of No Adverse Effect or Adverse Effect, 36 CFR 800.11(e)

PROJECT ACTIVITY

Activity Title: Consult to Resolve Adverse Effect

Activity No.: 13

Responsible Unit: BDE

Activity Description:

BDE sends a request to FHWA to notify the ACHP of the adverse effect finding.

BDE provides two copies of documentation described in Activity 11 to FHWA for submittal to the ACHP with the notice.

The ACHP advises FHWA whether it will participate within 15 days of receipt of the notice. FHWA notifies the SHPO and BDE by e-mail if no response has been received within 15 days or sends the SHPO and BDE a copy of the ACHP response letter, if one is received. BDE forwards a copy of the FHWA e-mail/ACHP letter to the district for inclusion in the project file and NEPA document.

FHWA consults with BDE, the district, the SHPO, and other consulting parties, including Indian Tribes, as appropriate, to develop and evaluate alternatives or modifications to the project that could avoid, minimize, or mitigate adverse effects on historic properties.

PROJECT ACTIVITY

Activity Title: Develop and Execute MOA or PA

Activity No.: 14

Responsible Unit: BDE/District

Activity Description:

BDE and FHWA consult with the SHPO, the ACHP, and other consulting parties, including Indian Tribes, to seek ways to avoid, minimize, or mitigate the project's adverse effects. If BDE, district, FHWA, SHPO, and ACHP (if they are participating in the consultation) agree on how the project's adverse effects will be resolved, they will enter into a Memorandum of Agreement (MOA) or project-specific Programmatic Agreement (PA) to document the terms and conditions agreed upon for resolving the adverse effects. After FHWA and BDE are satisfied with the terms of the MOA/PA, BDE coordinates ratification by IDOT and local agencies, as appropriate, and sends those signed copies to FHWA. There will be one original copy of the MOA/PA for each ratifying party. FHWA sends the document with signatures to the SHPO for ratification. Upon receipt of the document with the SHPO's signature, FHWA signs the MOA/PA and, if the ACHP is participating, sends it to the ACHP for signature. The MOA/PA is considered effective upon the date of FHWA signature, or signature by the ACHP, if they are participating in the consultation.

FHWA obtains signatures of Tribes and other concurring parties, as applicable. After FHWA receives all required signatures on the MOA/PA, they send a copy of the executed agreement to all signatories and consulting parties. FHWA submits a copy of the executed agreement to the ACHP, along with documentation of the following:

- any substantive revisions or additions to the documentation provided to the ACHP in Activity 13,
- an evaluation of any measures considered to avoid or minimize the project's adverse effects, and
- a summary of the views of consulting parties and the public.

After submittal of the executed MOA/PA to the ACHP, BDE proceeds to Activity 15. If the SHPO does not agree to the terms of an MOA or PA for resolving the project's adverse effects, FHWA follows the process in 36 CFR 800.6(b)(v).

After distribution of the executed MOA or PA, BDE proceeds to Activity 15. A copy of the MOA or PA is included in the project file and in the EA or EIS.

PROJECT ACTIVITY

Activity Title: Develop and Execute MOA or PA

Activity No.: 14 *(Continued)*

Responsible Unit: BDE/District

References:

Resolve Adverse Effects, 36 CFR 800.6(b)
Memorandum of Agreement, 36 CFR 800.6(c)

PROJECT ACTIVITY

Activity Title:	Implement MOA or PA
Activity No.:	15
Responsible Unit:	BDE/District

Activity Description:

After execution of an MOA or PA, BDE and district carry out any assigned tasks in accordance with the provisions of the MOA or PA.

When all provisions of the MOA or PA have been fulfilled, BDE prepares documentation to confirm that all provisions have been satisfied. BDE provides copies of the documentation to FHWA, the SHPO, the district, and the Illinois Historic Preservation Agency (IHPA) and Illinois State Museum. The district retains the documentation in the project files. For archaeological resource information, the IHPA and State Museum retain the documentation in the Statewide Archaeological Files.

26-5.04(d) Unanticipated Discovery During Construction

If any unanticipated discoveries of historic properties, sites, artifacts, or objects occur during the implementation of any project, the district will coordinate with BDE and BDE will coordinate with FHWA to comply with 36 CFR 800.13 and the Illinois *Human Skeletal Remains Protection Act,* 20 ILCS 3440/0.01 *et seq*., as appropriate. This will involve stopping work in the immediate area and informing the SHPO and County Coroner of the unanticipated discoveries or effects within two business days. BDE will coordinate with ISAS to ensure that any necessary archaeological investigations are conducted according to the provisions of the Illinois *Human Skeletal Remains Protection Act*.

If any unanticipated effects on historic properties are found to be occurring during the implementation of any project, the district will coordinate with BDE and BDE will coordinate with FHWA to comply with 36 CFR 800.13 and inform the SHPO immediately.

If any human remains are encountered during the implementation of any project exempted under the provisions of the Minor Projects Delegation Programmatic Agreement, the district will cease work in the immediate area, notify BDE, and ensure the human remains are left undisturbed. Where there is a discovery of human remains or burials on Federal lands, BDE will coordinate with FHWA to ensure compliance with the *Native American Graves Protection and Repatriation Act* (NAGPRA),) (25 U.S.C. 3001.). In the event of an inadvertent discovery of human remains or burials on non-Federal lands during transportation construction activities, the district will cease work in the area of the discovery and notify BDE. BDE will ensure compliance with the Illinois *Human Skeletal Remains Protection Act* and will notify FHWA of the discovery. FHWA will notify the Federally recognized Indian Tribes with an interest in that county.

Work on the portion of the site where human remains are found cannot resume until a plan for the treatment of the human remains is developed and approved in consultation with the SHPO and any appropriate consulting parties. BDE will coordinate with FHWA to ensure the plan complies with the Illinois *Human Skeletal Remains Protection Act*, and all other appropriate Federal and State guidelines, statutes, rules, and regulations.

26-5.04(e) Coordination with the National Environmental Policy Act

The regulations in 36 CFR 800 encourage agencies to coordinate Section 106 compliance with steps taken to meet the requirements of the *National Environmental Policy Act* (NEPA). Consider Section 106 responsibilities as early as possible in the NEPA process and public participation, analysis, and plan review so that they can meet the purposes of both statutes in a timely and efficient manner. The determination of whether an undertaking is a “major Federal action significantly affecting the quality of the human environment” and, therefore, requires preparation of an EIS should include consideration of the undertaking’s likely effects on historic properties. A finding of adverse effect on a historic property does not necessarily require an EIS under NEPA.

If a project, activity, or program is categorically excluded from NEPA review, the undertaking still must be evaluated to determine if it qualifies as an undertaking that requires review under Section 106.

Section 106 documentation will be included in the CE project file, EA, or EIS. Documentation should include correspondence among all agencies and consulting parties, and the project MOA/PA, as applicable. The NEPA document will contain a summary of any Section 106 commitments.

26-5.04(f) National Register Criteria for Evaluation

The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association and that:

- are associated with events that have made a significant contribution to the broad patterns of our history;
- are associated with the lives of persons significant in our past;
- embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; and
- have yielded, or may be likely to yield, information important in prehistory or history.

Ordinarily cemeteries, birthplaces, or graves of historical figures, properties owned by religious institutions or used for religious purposes, structures that have been moved from their original locations, reconstructed historic buildings, properties primarily commemorative in nature, and properties that have achieved significance within the past 50 years shall not be considered eligible for the National Register. However, such properties will qualify if they are integral parts of districts that do meet the criteria or if they fall within the following categories:

- a religious property deriving primary significance from architectural or artistic distinction or historical importance;
- a building or structure removed from its original location, but which is significant primarily for architectural value, or which is the surviving structure most importantly associated with a historic person or event;
- a birthplace or grave of a historical figure of outstanding importance if there is no appropriate site or building directly associated with his/her productive life;
- a cemetery that derives its primary significance from graves of persons of transcendent importance, from age, from distinctive design features, or from association with historic events;
- a reconstructed building when accurately executed in a suitable environment and presented in a dignified manner as part of a restoration master plan, and where no other building or structure with the same association has survived;

- a property primarily commemorative in intent if design, age, tradition, or symbolic value has invested it with its own exceptional significance; and

- a property achieving significance within the past 50 years if it is of exceptional importance.

26-5.05 State of Illinois Requirements

In addition to the Federal requirements for historic preservation, the *Illinois State Agency Historic Resources Preservation Act,* 20 ILCS 3420/1, *et seq*. and the *Rules for Review of State Agency Undertakings,* 17 Ill. Admin. Code 4180, et seq. establish State-level historic preservation requirements applicable to State agency undertakings. Section 4(g) of the *Illinois State Agency Historic Resources Preservation Act* provides that:

> *(g) When an undertaking is being reviewed pursuant to Section 106 of the National Historic Preservation Act of 1966, the procedures of this law shall not apply and any review or comment by the Director on such undertaking shall be within the framework or procedures of the federal law.*

IDOT highway projects typically are developed in accordance with Federal requirements, including Section 106 of the *National Historic Preservation Act*, so that they may be eligible for Federal funding participation. Accordingly, for the vast majority of IDOT highway projects, the above-referenced provision applies, and the projects are not subject to the State historic preservation requirements. In the event that a project is subject to the State requirements, the *Rules for Review of State Agency Undertakings* will be used to determine the actions necessary for compliance.

26-6 NOISE ANALYSES

26-6.01 Introduction

In the development of a project, it may be necessary to undertake special technical analyses to identify and evaluate any potential traffic noise impacts related to the project. The following information includes:

- criteria and procedures for these analyses,
- noise abatement measures and related coordination, and
- the noise abatement criteria prescribed by Federal regulations.

26-6.02 Complementary Technical Manual

The *IDOT Highway Traffic Noise Assessment Manual* (Manual) provides technical information and technical procedures associated with the provisions of this topic. The Manual contents will comply with the procedures described herein.

26-6.03 Legal Authority

The following legal authority regulates or influences the policies and procedures for noise analyses:

- 42 U.S.C. 4901-4918, popularly known as the *Noise Control Act of 1972* (Public Law 92-574),
- 23 U.S.C. 109(h) and (i), which are amendments to the *Federal-Aid Highway Act of 1970* (Public Laws 93-87 and 91-605),
- 42 U.S.C. 4331 and 4332, which are portions of the *National Environmental Policy Act of 1969* (Public Law 91-190),
- Procedures for Abatement of Highway Traffic Noise and Construction Noise, 23 CFR 772, and
- "Highway Traffic Noise: Analysis and Abatement Guidance" by the U.S. Department of Transportation, Federal Highway Administration June 2010, as revised December 2011.

26-6.04 Policy

Special efforts shall be made in the development of a project to comply with Federal and State requirements for noise control; to consult with the affected community regarding local noise requirements, noise impacts, and abatement measures; and to mitigate highway-related noise impacts, where feasible and reasonable. The reasonableness evaluation for noise abatement will include the solicitation of viewpoints from benefited receptors if necessary.

26-6.05 Procedures

26-6.05(a) Definitions

1. Auxiliary Lane. The American Association of State Highway Transportation Officials (AASHTO) defines an auxiliary lane as the portion of the roadway adjoining the traveled way for speed change, turning, weaving, truck climbing maneuvering of entering and leaving traffic, and other purposes supplementary to through-traffic movement (AASHTO, 2001).

   The Department will take a broad approach to defining auxiliary lanes with respect to defining a Type I project for noise analysis. FHWA states that auxiliary lanes 2,500 ft (762 m) or longer should be considered a Type I project. For auxiliary shorter than 2,500 ft (762 m) in length, consideration for auxiliary lanes should be limited to those that could be used as a through lane (including bus or truck lanes) rather than lanes used for parking, speed change, turning or storage for weaving. For interstates, auxiliary lanes considered to be Type 1 projects are those that are:

   a. more than 2,500 ft (762 m), and;

   b. between two closely spaced interchanges or carried through one or more interchanges.

   The final determination regarding Type I project classification will be left to the IDOT district and the Bureau of Design and Environment, on a case-by-case basis.

2. *Benefited Receptor*. The recipient of an abatement measure that receives a noise reduction of 5 dB(A) or greater. A benefited receptor does not need to be an impacted receptor.

3. *Common Noise Environment*. A group of receptors within the same Activity Category in Figure 26-6.A that are exposed to similar noise sources and levels; traffic volumes, traffic mix, and speed; and topographic features. Generally, common noise environments occur between two secondary noise sources, such as interchanges, intersections, and cross-roads.

4. *Date of Public Knowledge*. The date of environmental approval of the Categorical Exclusion (CE), the Finding of No Significant Impact (FONSI) for an Environmental Assessment (EA), or the Record of Decision (ROD) for an Environmental Impact Statement (EIS), as defined in 23 CFR 771.

5. *Department*. The Illinois Department of Transportation (IDOT).

6. *Design Year*. The future year used to estimate the probable traffic volume for which a highway is designed. For NEPA, IDOT uses the latest approved traffic projections from the appropriate Metropolitan Planning Organization (MPO) for all projects within the planning area of an MPO. For locations outside the planning area of an MPO, except for 3R projects, the design year traffic volumes shall be consistent

with the traffic projections used for design. For the purpose of a noise analysis, 3R projects shall use a design year of 20 years after the anticipated year of completion.

7. *Existing Noise Levels*. The worst hourly noise level resulting from the combination of natural and mechanical sources and human activity usually present in a particular area at the time the noise analysis is performed.

8. *Facility or Existing Highway*. Any of the freeways, expressways, or various classes of roads and streets that make up the highway system under the jurisdiction of the Department.

9. *Feasibility*. The combination of acoustical and engineering factors considered in the evaluation of a noise abatement measure. The acoustical criterion for feasibility requires a minimum 5 dB(A) traffic noise reduction at a minimum of two impacted receptor locations.

10. *Impacted Receptor*. The recipient that has a traffic noise impact.

11. *L_{eq}*. The equivalent steady-state sound level, which in a stated period of time, contains the same acoustic energy as the time-varying sound level during the same time period, with L_{eq}(h) being the hourly value of L_{eq}.

12. *Multifamily Dwelling*. A residential structure containing more than one residence. Each residence in a multifamily dwelling shall be counted as one receptor when determining impacted and benefited receptors.

13. *Noise Abatement Criteria*. Noise impact thresholds for considering noise abatement for various land uses. Defined in 23 C.F.R. Part 772.

14. *Noise Barrier*. A physical obstruction (i.e., standalone noise walls, noise berms (earth or other material), and combination berm/wall systems) that is constructed between the highway noise source and the noise sensitive receptor(s) that lowers the noise level at the receptor location.

15. *Noise Reduction Design Goal*. The optimum desired dB(A) noise reduction determined from calculating the difference between future build noise levels with abatement, to future build noise levels without abatement. The noise reduction goal is at least 8 dB(A) for at least one benefited receptor location.

16. *Permitted*. A definite commitment to develop land with an approved specific design of land use activities as evidenced by the issuance of a building permit.

17. *Property Owner*. An individual or group of individuals who hold(s) a title, deed, or other legal documentation of ownership of a property or a residence.

18. *Reasonableness*. The combination of social, economic, and environmental factors considered in the evaluation of a noise abatement measure.

19. *Receptor*. A discrete or representative location of a common noise environment(s), for any of the land uses listed in Figure 26-6.A.

20. *Residence*. A dwelling unit. Either a single-family residence or each dwelling unit in a multifamily dwelling.

21. *Statement of Likelihood*. A statement provided in the NEPA environmental document based on the feasibility and reasonableness analysis completed at the time the NEPA document is being approved.

22. *Substantial Construction*. The granting of a building permit by the local governing entity with permitting authority, prior to right-of-way acquisition or construction approval for the highway.

23. *Substantial Noise Increase*. One of two types of highway traffic noise impacts. For a Department project, this is defined as an increase in noise levels of greater than 15 dB(A) or greater in the design year over the existing noise level.

24. *Traffic Noise Impacts*. Design year build condition noise levels that approach or exceed the noise abatement criteria (NAC) listed in Figure 26-6.A for the future build condition; or design year build condition noise levels that create a substantial noise increase over existing noise levels. For purposes of this policy, approach is defined as within 1 dB(A) of the NAC. Substantial increase is considered to be at least 15 dB(A).

25. *Type I Project*.

    The FHWA definition of a Type I Project includes the following:

    - The construction of a highway on new location; or,
    - The physical alteration of an existing highway where there is either:
      + *Substantial Horizontal Alteration*. A project that halves the distance between the traffic noise source and the closest receptor between the existing condition to the future build condition; or,
      + *Substantial Vertical Alteration*. A project that removes shielding and therefore exposes the line-of-sight between the receptor and the traffic noise source. This is done by either altering the vertical alignment of the highway or by altering the topography between the highway traffic noise source and the receptor; or,
    - The addition of a through-traffic lane(s). This includes the addition of a through-traffic lane that functions as a High Occupancy Vehicle (HOV) lane, High-Occupancy Toll (HOT) lane, bus lane, or truck climbing lane; or

- The addition of an auxiliary lane, except for when the auxiliary lane is a turn lane; or,
- The addition or relocation of interchange lanes or ramps added to a quadrant to complete an existing partial interchange; or
- Restriping existing pavement for the purpose of adding a through-traffic lane or an auxiliary lane; or
- The addition of a new or substantial alteration of a weigh station, rest stop, ride-share lot or toll plaza.

If any part of a project is determined to be a Type I project under this definition, then the entire project area as defined in the NEPA environmental document is a Type I project.

26. *Type II Project*. A Federal or Federal-aid highway project for noise abatement on an existing highway. IDOT does not maintain a Type II program.

27. *Type III Project*. A Federal or Federal-aid highway project that does not meet the classifications of a Type I or Type II project. Type III projects do not require a noise analysis.

28. *Undeveloped Lands*. Those tracts of land or portions thereof that do not contain improvements or activities devoted to frequent human habitation or use (including low-density recreational use) and for which no such improvements or activities are permitted.

29. *Worst Hourly Traffic Noise*. The noise level resulting from the highest hourly volume a facility can handle while maintaining stable flow. This traffic volume will be either the design hourly volume or the maximum volume that can be accommodated under level of service C (i.e., where high traffic volumes begin to restrict speed and drivers' maneuverability).

26-6.05(b) Applicability

The noise analysis and abatement procedures described in this section shall apply to all Type I projects initiated by the Department, whether Federally funded or State-only funded (or State and local-funded, as appropriate), or requires FHWA approval regardless of funding sources.

26-6.05(c) Traffic Noise Analysis

In the development of proposed projects, expected traffic noise impacts shall be determined and analyzed, and the overall benefits that can be achieved by noise abatement measures to mitigate these impacts shall be determined, giving weight to any adverse social, economic, and environmental effects.

The traffic noise analysis shall be conducted in the following manner:

- Identify existing activities, developed areas, and undeveloped lands that may be affected by noise from the highway. Land uses shall be characterized based on the activity categories and descriptions listed in Figure 26-6.A. Undeveloped lands permitted for development by the date of public knowledge shall be evaluated for traffic noise impacts and noise abatement (if impacts are identified) based on the permitted land use description.

- Predict the traffic noise levels for each reasonable alternative carried forward under detailed study (including the "no-action" alternative) using the most current version of the FHWA-approved Traffic Noise Model (TNM) which is described in "FHWA Traffic Noise Model" Report No. FHWA-PD-96-010, or any other model determined by the FHWA to be consistent with the methodology of the FHWA TNM. The pavement type in TNM shall be the average pavement type unless a different pavement type has been approved by FHWA.

- When determining traffic noise impacts, primary consideration shall be given to exterior areas where frequent human use occurs *for Activity Categories A, B, C and E. Tra*ffic noise impacts for land uses within Activity Category D shall be predicted for interior areas only if no exterior use areas are identified. See the *IDOT Highway Traffic Noise Assessment Manual* for additional guidance.

- Determine the existing noise levels using field measurements, modeling, or both, using the most current version of the FHWA-approved TNM or any other model determined by the FHWA to be consistent with the methodology of the FHWA TNM. Modeling of existing conditions may not be appropriate when the project involves construction of a new roadway in a new location where there is no existing traffic noise contribution. Predicted noise levels shall be validated through comparison between measured and predicted noise levels at selected representative receptors. The $L_{eq}(h)$ noise metric shall be used to quantify the measurements of both existing and predicted noise levels.

Activity Category	$L_{eq}(h)$	Evaluation Location	Activity Description
A	57	Exterior	Lands on which serenity and quiet are of extraordinary significance and serve an important public need and where the preservation of those qualities is essential if the area is to continue to serve its intended purpose.
B	67	Exterior	Residential.
C	67	Exterior	Active sport areas, amphitheaters, auditoriums, campgrounds, cemeteries, day care centers, hospitals, libraries, medical facilities, parks, picnic areas, places of worship, playgrounds, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, recreation areas, Section 4(f) sites, schools, television studios, trails and trail crossings.
D	52	Interior	Auditoriums, day care centers, hospitals, libraries, medical facilities, places of worship, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, schools, and television studios.
E	72	Exterior	Hotels, motels, offices, restaurants/bars, and other developed lands, properties or activities not included in A-D or F.
F	---	---	Agriculture, airports, bus yards, emergency services, industrial, logging, maintenance facilities, manufacturing, mining, rail yards, retail facilities, shipyards, utilities (water resources, water treatment, electrical), and warehousing.
G	---	---	Undeveloped lands that are not permitted.

*Note: The Noise Abatement Criteria are noise impact thresholds for considering abatement. Abatement must be considered when predicted traffic noise levels for the design year approach (i.e., within 1 decibel of) or exceed the noise abatement criteria, or when the predicted traffic noise levels are substantially higher (i.e., more than 15 decibels or greater) than the existing noise level. The Noise Abatement Criteria are **not** attenuation design criteria or targets. The goal of noise abatement measures is to achieve the feasibility noise reduction criteria and the noise reduction design goal. The reductions may or may not result in design year noise levels at or below the Noise Abatement Criteria.*

Figure 26-6.A Noise Abatement Criteria

[Hourly A-Weighted Sound Level-decibels (dB(A))]

- Compare the predicted design year build traffic noise levels based on traffic characteristics that yield the worst traffic noise impact for the preferred alternative, or for each alternative under detailed study, with the existing noise levels and with the noise abatement criteria (see Figure 26-6A). This comparison shall also include predicted traffic noise levels for the "no-action" alternative in the design year. Such information shall be used primarily to describe the noise levels of proposed highway improvements in contrast with noise levels likely to be reached in the same area if no highway improvement is undertaken. Noise impacts are defined when the predicted traffic noise levels for the design build year approach (defined by the Department as "within 1 decibel of") or exceed the Noise Abatement Criteria provided in Figure 26-6.A, or when the predicted traffic noise levels for the design year are substantially higher (defined by the Department as "15 decibels greater") than the existing noise levels. The results of the impacts analysis must be disclosed and shall be summarized in the NPEA document (see Section 26-6.09).

- Examine and evaluate noise abatement measures (see Section 26.05(d)) for existing activities, developed lands, and undeveloped lands for which development is permitted where traffic noise impacts have been identified.

- Design year build noise levels shall be predicted for undeveloped lands for which there will be no development permitted by the date of public knowledge. The results shall be documented in the NEPA environmental documents and noise analysis documents. The information presented may include a prediction of noise contours or a prediction of distances from the highway for which impacts would likely occur so that local jurisdictions may use information for site planning if the undeveloped land would be developed in the future. A noise abatement evaluation is not warranted for these undeveloped lands provided that development is not permitted by the date of public knowledge. See Section 26-6.05(e) for additional information to be provided to local officials for undeveloped lands.

The following figure (Figure 26-6.B) identifies potential sensitive land uses and the potential locations to be considered as benefited receptors within that land use. See the IDOT Highway Traffic Noise Assessment Manual for additional guidance.

Receptor Type	FHWA Activity Category	Receptor Unit(s)
Single-family Residence	B	Each residential unit with exterior use area (i.e., patio, yard, deck, etc.)
Multi-family Residence	B	Each residential unit with access to the exterior common area (i.e., pool, benches, or building entrance) or with exterior use areas (i.e., patio or balcony)
Nursing Home	C	Each residential unit with access to an exterior common area (i.e., benches or main entrance) or with exterior use areas (i.e., patio or balcony)
School	C	Each classroom with access to an exterior use area (i.e., benches, playground, main entrance)
Hospital or In-patient Medical Facility	C	Each hospital room with a bed(s) with access to an exterior use area (i.e., benches or main entrance)
Cemetery	C	Each exterior area of anticipated gathering (i.e., benches, information board)
Auditoriums	C	Each exterior area of anticipated gathering (i.e., bench or main entrance)
Day Care Center	C	Each exterior area of anticipated gathering (i.e., playground or main entrance)
Campground	C	Each campsite within the noise study area.
Sports Fields	C	Each exterior area of anticipated gathering (i.e., dugout, bleachers, field)
Places of Worship	C	Each exterior area of anticipated gathering (i.e., benches, patio, gazebo, or main entrance)
Golf Courses	C	One receptor per hole in the worst-case noise location (tee box, fairway, green), in addition to other exterior use areas (i.e., benches, putting green)
Parks / Recreational Area	C	Each exterior use area (i.e., gazebo, picnic tables, play equipment)
Trails and Trail Heads	C	Each exterior area of anticipated gathering (i.e., bench, information board)
Libraries*	C	Each exterior area of anticipated gathering (i.e., bench, patio, gazebo)
Office*	E	Each business with an exterior use area (i.e., bench or picnic tables)
Hotel/Motel*	E	Each hotel/motel room with access to an exterior use area
Restaurants/Bars*	E	Each exterior area of anticipated gathering (i.e., group of tables)
Medical Office or Out-patient Medical Office*	E	Each exterior area of anticipated gathering (i.e., bench or tables)
Undeveloped Lands	G	Uses with an NAC and a building permit that have access to a planned exterior use area

Figure 26-6.B
Potential Benefited Receptor Units

26-6.05(d) Noise Abatement

26-6.05(d)1 General Considerations

When traffic noise impacts are identified, noise abatement shall be considered and evaluated for feasibility and reasonableness. The assessment of noise abatement should give weight to the benefits and costs of abatement and the overall social, economic, and environmental effects by using feasible and reasonable noise abatement measures presented herein.

In determining and abating traffic noise impacts, primary consideration is given to exterior areas. Abatement may be recommended only where outdoor frequent human use occurs and abatement would provide a noise reduction benefit. If a noise impact is identified, the abatement measures evaluation shall be conducted as discussed below.

Abatement measures that are feasible and reasonable shall be recommended to be incorporated into the project plans and specifications. The FHWA will not approve NEPA environmental documents or plans and specifications for Federally funded projects unless such measures are identified and incorporated to mitigate the identified noise impacts.

26-6.05(d)2 Noise Abatement Measures

The information in this subsection is written primarily for Type I projects that are Federally funded or require Federal approval; however, the provisions regarding conditions for providing abatement measures and information on types of measures also applies to appropriate State-only funded Type I projects. All noise assessments and noise abatement evaluations for State-only funded projects should be submitted to BDE for review and concurrence.

The following are noise abatement measures that may be incorporated into Federally funded Type I projects to reduce highway-generated noise impacts when the abatement measure has been determined to be feasible and reasonable pursuant to this section. At a minimum, noise abatement in the form of noise barriers shall be considered. The remaining noise abatement measures can be considered as an alternative abatement measure(s) for the Department but are not required to be evaluated. The costs of such measures may be included in Federal-aid participating project costs with the Federal share being the same as that for the system on which the project is located:

- construction of noise barriers, including acquisition of property rights, either within or outside the highway right-of-way. Landscaping is not a viable noise abatement measure;
- traffic management measures (e.g., traffic control devices and signing for prohibition of certain vehicle types, time use restrictions for certain vehicle types, modified speed limits and exclusive lane designations);
- alteration of horizontal and vertical alignments;
- acquisition of real property or interests therein (predominantly unimproved property) to serve as a buffer zone to preempt development that would be adversely impacted by traffic noise; or,

- noise insulation of Activity Category D land use facilities listed in Figure 26-6.A. [noise insulation for public use or nonprofit institutional structures (e.g., places of worship, schools, hospitals, libraries, etc.). Public use or nonprofit institutional structures means the facility is open for public use, owned by the public or that a nonprofit organization owns the facility; post-installation maintenance and operational costs for noise insulation are not eligible for Federal-aid funding or State funding.]

For Federally funded projects, Federal funds may be used for noise abatement measures when a traffic noise impact has been identified (see Section 26-6.05(c)) and the noise abatement measure is determined to be feasible and reasonable based on the following evaluations.

26-6.05(d)3 Feasibility Evaluation

A noise abatement measure is determined to be feasible by achieving IDOT's highway traffic noise reduction feasibility criterion of at least 5 dB(A) at impacted receptors. The noise reduction shall be achieved for at least <u>two impacted receptors</u>.

The noise abatement measure also needs to be determined to be possible to design and construct to be considered feasible. Factors including but not limited to safety, barrier height, topography, drainage, utilities, maintenance, and access issues should be considered. See the *IDOT Highway Traffic Noise Assessment Manual* for additional guidance.

26-6.05(d)4 Reasonableness Evaluation

A noise abatement measure is determined to be reasonable when all three of the following reasonableness evaluation factors are met:

- cost effectiveness of the highway traffic noise abatement measure;
- achievement of IDOT's noise reduction design goal; and,
- consideration of the viewpoints of the benefited receptors (property owners and residents).

Each of these three reasonableness evaluation factors is further described below.

<u>Reasonableness Criterion 1: Noise Reduction Design Goal</u>

The first component of reasonableness is achieving the noise reduction design goal for highway noise abatement measures. The noise reduction design goal is to achieve a traffic noise reduction of at least 8 dB(A) for at least one benefited receptor. The noise reduction goal should be achieved for as many receptors as possible while still achieving the cost effectiveness.

<u>Reasonableness Criterion 2: Cost-Effectiveness</u>

The second component of reasonableness is cost effectiveness. The estimated build cost of each noise abatement measure may not exceed the allowable noise abatement cost based on a cost per benefited receptor comparison. The base value for the allowable noise abatement cost shall be $30,000 per benefited receptor. Benefited receptors are those that would have at least a 5 dB(A) traffic noise reduction (regardless of whether the receptor was impacted).

The estimated build cost for noise barriers should be determined using the current standard unit cost approved by IDOT. The current unit cost used by IDOT to determine the estimated build cost for noise barriers is $30 per square foot. This unit cost is based on actual IDOT Phase III construction costs (materials and installation) and engineering design. This unit cost and the allowable cost will be evaluated every five years by IDOT and will be based on actual construction costs. Estimated build costs for other noise abatement measures being evaluated should be based on estimated Phase I costs.

***Receptor* Type**	**Potential Benefited *Receptor* Unit(s)**
Single-family Residence	Each residential unit
Multi-family Residence	Each residential unit with access to the exterior common area or with exterior use areas, such as a patio or balcony
Nursing Home	Each residential unit with access to the exterior common area
School	Each classroom
Hospital	Each hospital room with a bed(s)
Hotel/Motel	Each hotel/motel room
Cemetery	Each point of anticipated gathering (i.e., bench, information board)
Places of Worship	Each point of anticipated gathering (i.e., bench, patio, gazebo)
Parks	Each gazebo, group of picnic tables, playground
Trails and Trail Heads	Each point of anticipated gathering (i.e., bench, information board)
Libraries	Each point of anticipated gathering (i.e., bench, patio, gazebo)
Business	Each business unit
Undeveloped Lands	Each unit with a building permit

Figure 26-6.B – Potential Benefited Receptor Units*

* To be considered benefited, each receptor unit location must receive at least a 5 dB(A) traffic noise reduction to be considered as part of the cost-effective evaluation.

<u>Cost Effectiveness Determination</u>

Other cost effectiveness determination factors shall be considered to potentially adjust the allowable noise abatement base value cost of $30,000 per benefited receptor to account for project-specific factors. Consideration of the following three reasonableness factors can be used to adjust the allowable noise abatement base cost of $30,000 per benefited receptor. These other reasonableness factors include:

- the absolute noise level of the benefited receptors in the design year build scenario before noise abatement;
- the incremental increase in noise level between the existing noise level at the benefited receptor and the predicted build noise level before noise abatement; and
- the date of development compared to the construction date of the highway.

The base value of $30,000 per benefited receptor will be adjusted considering these three factors and based on Figure 26-6.C. Only one value from each of the three factors may be used for each receptor, resulting in a potential maximum allowable noise abatement cost of $45,000 per benefited receptor. If the estimated build cost of noise abatement per benefited receptor is less than the adjusted allowable noise abatement cost per benefited receptor, then the noise abatement measure achieves the cost-effective reasonableness criterion. For additional guidance on the use of optional reasonableness factors, see the *IDOT Highway Traffic Noise Assessment Manual*.

Absolute Noise Level Consideration

Predicted Build Noise Level Before Noise Abatement	Dollars Added to Base Value Cost per Benefited Receptor
Less than 70 dB(A)	$0
70-74 dB(A)	$1,000
75-79 dB(A)	$2,500
80 dB(A) or greater	$5,000

Increase in Noise Level Consideration

Incremental Increase in Noise Level Between the Existing Noise Level and the Predicted Build Noise Level Before Noise Abatement	Dollars Added to Base Value Cost per Benefited Receptor
Less than 5 dB(A)	$0
5-9 dB(A)	$1,000
10-14 dB(A)	$2,50
15 dB(A) or greater	$5,000

New Alignment / Construction Date Consideration

Project is on new alignment OR the receptor existed prior to the original construction of the highway	Dollars Added to Base Value Cost per Benefited Receptor
No for both	$0
Yes for either	$5,000

Note: No single optional reasonableness factor shall be used to determine that a noise abatement measure is unreasonable.

Figure 26-6.C

FACTORS FOR ADJUSTING THE ALLOWABLE NOISE ABATEMENT COST PER BENEFITED RECEPTOR BASE VALUE OF $30,000 USING OTHER REASONABLENESS FACTORS

Cost Averaging

Cost averaging of noise abatement among common noise environments may be used when conducting the reasonableness evaluation. For a single noise abatement measure to be considered as part of a cost averaging evaluation, the estimated build cost of noise abatement per benefited receptor may not exceed two times the adjusted allowable noise abatement cost per benefited receptor. Noise abatement measures achieve the cost reasonableness criterion if the common noise environment collective average estimated build cost of noise abatement per benefited receptor is less than the collective average adjusted allowable cost per benefited receptor. See the *IDOT Highway Traffic Noise Assessment Manual* for further guidance and an example cost-averaging evaluation.

Third Party Funding

Third party funding is not allowed on a Federal or Federal-aid project if the noise abatement measure would require the additional funding from the third party to be considered feasible and/or reasonable. Third party funding is acceptable on Federal or Federal-aid highway project to make functional enhancements to a noise abatement measure already determined feasible and reasonable.

Assessing Feasibility and Reasonableness of Modifying Existing Noise Barriers.

In order to represent the existing noise environment, the noise model for the existing condition must include any existing solid barrier of considerable mass designed specifically to abate noise; therefore, existing modeled noise levels must include any existing barriers in the model. The noise analysis for a new Type I project should consider the effectiveness of existing noise barriers and consider whether they require retrofit or modification based on the new Build conditions. See the IDOT *Highway Traffic Noise Assessment Manual* for procedures for assessing feasibility and reasonableness of existing noise barriers.

Reasonableness Criterion 3: Benefited Receptor Viewpoints

The third component of reasonableness is obtaining the viewpoints of benefited receptors, either during Phase I Preliminary Engineering and Environmental Studies or in Phase II Design. The timing of viewpoints solicitation is at the discretion of IDOT and FHWA. See the IDOT *Highway Traffic Noise Assessment Manual* for additional guidance.
