Intermittent Revision Date – December 2018**

HARD COPIES UNCONTROLLED

PREFACE

The Bureau of Local Roads and Streets Manual (the Manual) has been prepared to provide uniform practices for local agencies, Bureau of Local Roads and Streets central office (Central BLRS), Bureau of Local Roads and Streets district offices (district), and consultant personnel in preparing reports and contract plans for local agencies projects. The Manual presents most of the information normally required in the development of a typical local agency project. The designer should attempt to meet all criteria and practices presented in the Manual. The designer should develop roadway designs that meet IDOT's operational and safety requirements while preserving the aesthetic, historic, or cultural resources of an area. Designers must exercise good judgment on individual projects and, frequently, they must be innovative in their approach to roadway design. This may require, for example, additional research into the highway literature.

DOCUMENT CONTROL AND REVISION HISTORY

The Bureau of Local Roads and Streets Manual is intended to provide current design and environment policies and procedures for use in developing local agency highway projects. To ensure that the Manual remains up to date and appropriately reflects changes in IDOT's needs and applicable requirements, its contents will be updated on an ongoing basis.

Central BLRS will be responsible for monitoring changes in the federal and State laws and regulations as well as in highway design and environmental requirements and will ensure that those changes are appropriately addressed through the issuance of revisions to the Manual. As changes in laws, policies, procedures, directives, and/or criteria occur between the issuance dates of new editions of the Manual, these changes will be distributed via Procedure Memorandums. When a page is revised, it will have revision marks in the outside margin indicating where the change occurred; furthermore, the page's section will indicate the latest issuance date for that section in the upper outside corner of each page.

In addition, it is important that users of the Manual inform both Central BLRS and district BLRS of any inconsistencies, errors, needs for clarification, or new ideas to support the goal of providing the best and most up-to-date information handbook. Attached is a form entitled BLRS Manual Comments and/or Corrections to be used in submitting any comments and/or suggestions.

The user should retain and refer to the interim memorandums when using the Manual until they are superseded or incorporated into an updated edition of the Manual.

This 2005 Edition of the Bureau of Local Roads and Streets Manual, dated April 2005, replaces the IDOT Federal-aid Procedures for Local Highway Improvements Manual and the Manual of Administrative Policies of the Bureau of Local Roads and Streets.

Distribution

This manual is available as a Portable Document Format (PDF) on the Illinois Department of Transportation's website. Hard copies of this manual are uncontrolled.

MANUAL FORMAT/UPDATE

December 2018

Revision History

The Central Bureau of Local Roads and Streets maintains archived copies of the Procedure Memorandums issued to update the manual.

<u>Revision Date</u>	<u>Description</u>	<u>Approval</u>
July 7, 2016	Updated Chapters 19 and 22 to address the new descriptions of Categorical Exclusions.	Salmon Danmole
July 29, 2016	Updated Chapters 27 thru 33.	Salmon Danmole
June 1, 2017	Updated Chapter 5 – Agreements, for new federal requirements with regard to Qualifications Based Selection of professional services.	Maureen Kastl
November 29, 2017	Updated Chapter 5 – Agreements, to further refine the local public agency requirements with regard to Qualifications Based Selection.	Maureen Kastl
June 30, 2018	Updated Chapters 1-4, 6, 7, 18, 21, and 44. Corrects hyperlinks, the table of contents and PDF bookmarks in Chapters 19, 22, and 27 thru 33.	Maureen Kastl
December 10, 2018	Updated Chapters 9,10,12,14, 15, and 17.	Maureen Kastl

Chapter 1

IDOT ORGANIZATION

Chapter 1 discusses the organization and functions within the Illinois Department of Transportation (IDOT), and how they interact with the Bureau of Local Roads and Streets (BLRS) and local public agencies (LPAs).

1-1 ILLINOIS DEPARTMENT OF TRANSPORTATION (IDOT)

1-1.01 Organization

IDOT is organized under the supervision of the Illinois Secretary of Transportation. IDOT consists of various offices, each of which is administered by a director. These offices are headquartered at the Harry R. Hanley Building, 2300 S. Dirksen Parkway, Springfield, Illinois, 62764, unless otherwise noted. Figure 1-1A presents the organization of IDOT, and the following sections provide brief descriptions of functions of the various offices and bureaus. For guidance on other IDOT units and bureaus, visit [IDOT's website](#).

1-1.02 Office of the Secretary

1-1.02(a) **Mission Statement**

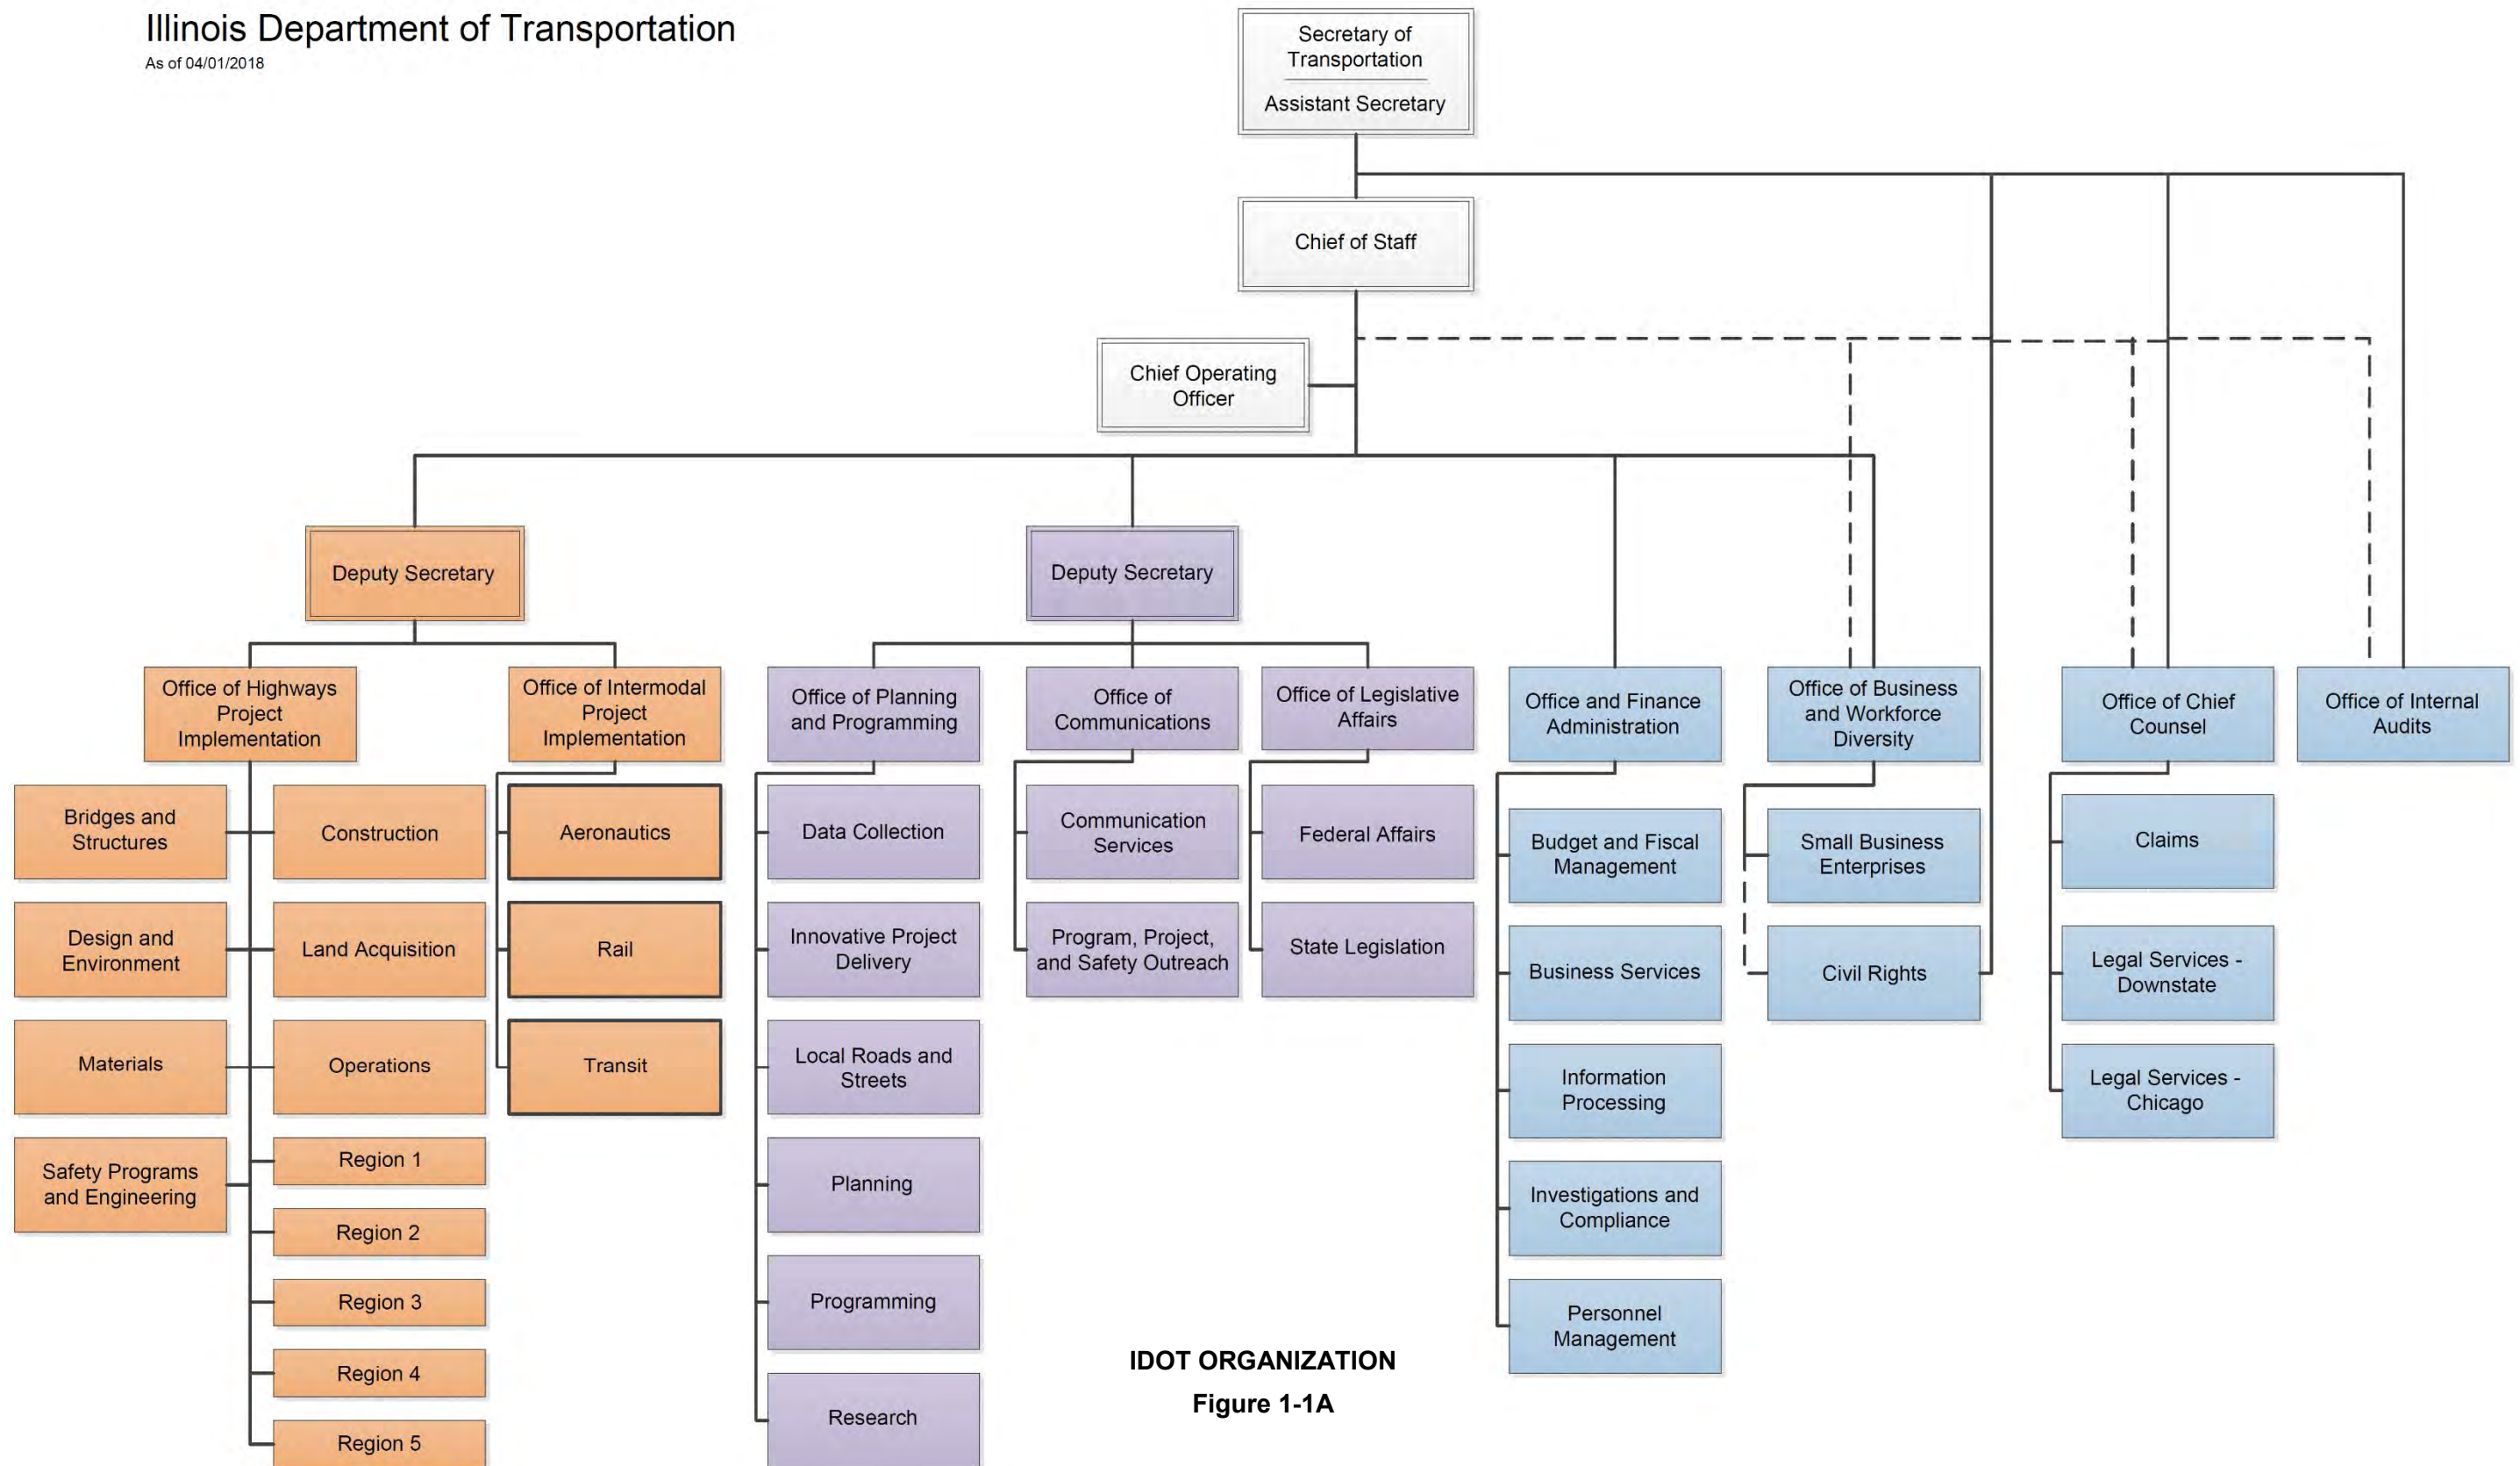

It is IDOT mission to provide safe, cost-effective transportation for Illinois in ways that enhance quality of life, promote economic prosperity, and demonstrate respect for our environment.

1-1.02(b) **Description**

IDOT's Office of the Secretary works closely with the Office of the Governor and the Illinois General Assembly to effectively and efficiently establish and implement Illinois' transportation policies. As such, the Office of the Secretary is often the first point of contact for outside requests about transportation from state and federal legislators, local elected officials, and the general public. Among the responsibilities overseen by the Office of the Secretary are:

- requests for information and research from Office of the Governor, General Assembly, and other state constitutional offices and state agencies;
- administrative, informational, and logistical support for the Secretary, Chief of Staff and Chief Operating Officer;
- Diversity Outreach and Workforce Recruitment;
- Equal Employment Opportunity (EEO) Compliance;
- Sustainability Efforts; and
- Special Transportation-Related Events.

1-1.03 Office of Highways Project Implementation

See Section 1-2 for detailed information.

1-1.04 Office of Intermodal Project Implementation

1-1.04(a) Description

The Office of Intermodal Project Implementation coordinates activities for transit, rail, and aeronautics. The Office's mission is to provide safe, efficient, affordable, reliable, and coordinated transportation of people and goods through rail, mass transit, and related modes of transportation. The Office of Intermodal Project Implementation is responsible for promoting mass transportation systems and services in the state of Illinois by developing and recommending policies and programs; developing, implementing, and administering operating, capital, and technical program projects; and, participating in local and statewide planning and programming activities. The Office conducts technical studies and engineering reviews of projects.

- Transit is responsible for promoting transit services and ensuring safe and efficient mass transportation systems throughout the State of Illinois by developing and recommending policies and programs; developing, implementing and administering operating, capital and technical program projects; and participating in local and statewide planning and programming activities. The bureau also conducts technical studies and engineering reviews of projects.
- Railroads is responsible for promoting and ensuring safe and efficient rail transportation throughout the State of Illinois by developing and recommending policies and programs and implementing programs and projects for both passenger and freight rail.
- Aeronautics is responsible for coordinating and implementing programs concerning airport construction, aviation safety, and other aeronautical activities throughout Illinois. The Illinois State Aviation System is one of the largest and most diverse airport systems in the country. Comprised of nearly 830 facilities, the Illinois Aviation System ranges in size and scope from some of the busiest airports in the world – to regional commercial passenger service and commercial air cargo airports – to dozens of local municipal airfields which serve thousands of corporate and general aviation users – to hundreds of private airstrips scattered throughout Illinois. Aeronautics partners with the owners and operators at each airport to maximize safety and assist each airport in reaching its individual potential. Illinois airports generate over \$50.9 Billion to the Illinois economy and provide the flying public with access to the entire country, connecting Illinoisans to the rest of the world. The Division also operates a fleet of aircraft to provide a safe, efficient, and reliable air transportation option for state personnel, elected officials, and others travelling in support of official state business.

1-1.04(b) Services to LPAs

The Office of Intermodal Project Implementation performs the following activities for the LPAs:

- managing of the operating and capital assistance grants to transit operators,

BUREAU OF LOCAL ROADS & STREETS

1-1-4

IDOT ORGANIZATION

June 2018

- reviewing and evaluating grant applications,
- coordinating project implementation activities for the Chicago Region Environmental and Transportation Efficiency Program (CREATE), and
- rendering financial and technical assistance and acts as agent to eligible sponsors for planning land acquisition, design, and construction of airport/heliport facilities in Illinois, including preparation of Environmental Impact Statements (EIS), inspect materials, review engineering plans and bidding documents, and approve land acquisition.

1-1.05 Office of Planning and Programming (OPP)

1-1.05(a) Description

OPP develops plans and programs aimed at improving the state's transportation system. Core functions include: oversight and coordination of the state's planning efforts, developing the annual multi-year and multimodal programs, monitoring and surveillance of the physical condition of the transportation system, evaluation of costs and benefits of new infrastructure investments, and to provide data, mapping and research to support these and other projects across the Department.

OPP consists of six central bureaus: Planning, Programming, Innovative Project Delivery, Data Collection and Mapping, and Research.

- The Bureau of Planning is responsible for proactively planning for the future of the state's transportation system. This includes long-range planning and overseeing capital grants budgets related to aviation and public transportation. This bureau also administers the Metropolitan Planning Program in cooperation with various state and local planning agencies and is responsible for transportation data and support activities.
- The Bureau of Programming develops the annual and multi-year Transportation Improvement Programs, and the construction and grants budget for multimodal elements of the transportation system.
- The Bureau of Innovative Project Delivery oversees the Department's initiatives to explore the leveraging of private resources in project implementation and agency operations. The bureau coordinates with private sector and public entities to expedite project delivery and maximize innovation in the financial, design, construction, operation and maintenance of major transportation infrastructure projects.
- The Bureau of Data Collection and Mapping maintains transportation data systems such as roadway and bridge data, roadway condition information, traffic data, and crash reports filed by motorists and law enforcement officers. The bureau is responsible for preparing the annual crash facts report, state highway map and other transportation maps for rail, ports, transit, counties and scenic byways.
- The Bureau of Research coordinates the Department's federally and state funded research activities, including all Strategic Highway Research, National Cooperative Research and Transportation Research Board programs. Research activities are primarily conducted through an intergovernmental agreement with the University of Illinois at Urbana-Champaign, which funds the Illinois Center for Transportation.

HARD COPIES UNCONTROLLED

- The Bureau of Local Roads and Streets (BLRS) coordinates with local governments in all matters pertaining to highway transportation. The bureau assists LPAs with planning, finance, design, construction and maintenance of local transportation systems and promotes the coordination and cooperation of counties, townships, municipalities in the development of transportation systems. See Section 1-3 for detailed information.

1-1.05(b) Services to LPAs

OPP oversees applications for funding Economic Development (EDP), Transportation Enhancement (ITEP), and Scenic By-Ways Programs. They also provide grants for construction safety programs and maintain the Illinois Structures Information System (ISIS) and Illinois Roadway Information System (IRIS). See Section 1-3 for details of services provided by Central BLRS (CBLRS).

1-1.06 Office of Communications**1-1.06(a) Description**

The Office of Communications is responsible for managing both communications and outreach efforts between IDOT and its stakeholders (including the public, elected officials, industry partners, fellow government agencies, and civic/ non-profit partners). The primary objectives are to assist in the coverage of agency activities; increase the agency's sensitivity to its publics; interpret public opinion so that agency programs and regulations will be realistic and acceptable; and mobilize support for the agency and its programs.

- The Bureau of Communication Services supervises and participates in the preparation and dissemination of information to the general public, media and other stakeholders. This relates to printed and digital platforms, including the website, videos, and other platforms.
- The Bureau of Program, Project, and Safety Outreach provides outreach support for the agency's various activities, with particular focus on projects and programs from the program development and project implementation areas, as well as legislative affairs.

1-1.06(b) Services to LPAs

The Bureau of Communication Services develops, supervises, and participates in the preparation and dissemination of liaison services providing assistance to the general public. This bureau oversees the development and monitoring of local highway safety projects statewide and management of contract agreements.

1-1.07 Office of Legislative Affairs (OLA)**1-1.07(a) Description**

OLA is responsible for leading coordination with subject-matter experts from across the agency on legislative issues at both state and federal levels. This includes maintaining relationships both with elected officials and their staff, as well as sister agencies.

BUREAU OF LOCAL ROADS & STREETS

1-1-6

IDOT ORGANIZATION

June 2018

- The Bureau of State Affairs is responsible for coordinating analysis and development of state legislative programs and strategies, as well as resolving issues of special interest to the Secretary. The objective is to ensure that departmental policy and actions, as well as state legislation, consistently support and enhance Illinois' transportation interests.
- The Bureau of Federal Affairs is responsible for coordinating analysis and development of federal legislative programs and strategies, as well as resolving issues of special interest to the Secretary. The objective is to ensure that departmental policy and actions, as well as federal legislation, consistently support and enhance Illinois' transportation interests.

1-1.07(b) Services to LPAs

This office does not provide any direct services to LPAs.

1-1.08 Office of Finance and Administration (F&A)

1-1.08(a) Description

F&A is responsible for developing and administering the Department's budget; managing the departmental personnel systems; providing accounting and auditing functions to ensure sound fiscal management; providing centralized business services functions and IDOT facilities management; and providing management information capabilities required to meet management and engineering needs.

- The Bureau of Business Services (BoBS) provides administrative services including duplication, records management, central stockroom service, mail and messenger service and motor pool service. It provides general accounting services including general cost accounting and management of federal billing.
- The Bureau of Budget and Fiscal Management (BFM) forecasts all departmental revenues and expenditures; manages all IDOT funds; develops, defends and executes IDOT's total budget; analyzes departmental programs; performs management reviews; improves the Department's operating efficiency; and serves as financial liaison with the Bureau of the Budget, the legislature and commissions. It provides auditing services and recommendations on internal financial policies, procedures and control.
- The Bureau of Information Processing (BIP) provides departmental computer services to assist in maximizing effectiveness of resources through better information and increased productivity. This is accomplished by analyzing management information needs and data relationships; conducting feasibility studies for computer applications, designing, programming and implementing computer systems; providing daily processing of systems and maintaining effectiveness; and planning for current and future network management and support.
- The Bureau of Personnel Management (PM) provides staff services in the administration of personnel programs for all departmental employee groups. These programs include employment and placement, policy administration, organizational analysis and salary administration. The bureau administers the Personnel Code and rules of the Department of Central Management Services (CMS). The bureau provides staff services in the

HARD COPIES UNCONTROLLED

administration of programs for all Department employee groups. These programs include employee safety, workers' compensation, employee assistance and training development. Additionally, the bureau provides transactional support for the central office staff.

- The Bureau of Investigations and Compliance (BIC) is designated as the Secretary's advocate for compliance review activities. As such, it monitors the Department's projects and programs on a sample basis for compliance with quality and quantity product commitment, along with safety and legal requirements. The bureau also performs financial audit services for the Department to provide assurances of LPA and contractor compliance with state and federal regulations, laws and contract specifications. The Section Chief serves as the Department's Chief Financial Review Officer. The bureau also conducts and assists law enforcement with internal and external investigations as they relate to the Department. In addition, the bureau ensures the completion of all pre-employment criminal background checks. Lastly, the Bureau Chief serves as the Department's Law Enforcement Liaison.

1-1.08(b) Services to LPAs

BoBS prepares the monthly Motor Fuel Tax (MFT) apportionments. The bureau is responsible for offering used IDOT vehicles and equipment for sale to LPAs. The bureau also provides maps and manuals to LPAs, free of charge, and to private individuals for a fee.

BFM is responsible for processing invoices, vouchers, obligations, remittance statements, and checks, including requests for reimbursements to the City of Chicago and Cook County. The bureau evaluates fiscal provisions of federally funded engineering agreements for LPA projects. The bureau performs external audits, both fiscal and compliance, on departmental grantees and contracted entities including LPAs.

PM administers and coordinates technical development programs, including Specific Task Training and National Highway Institute courses, which are made available to LPAs. It also administers the Executive Leadership Development Program for the Illinois Association of County Engineers (IACE).

BIC performs audits of MFT funds received and expended by LPAs for compliance with State statutes and the Bureau of Local Roads & Streets' policies and procedures.

1-1.09 Office of Business and Workforce Diversity (OBWD)

1-1.09(a) Description

OBWD is responsible for overseeing the implementation of directives, policies and strategies for departmental business and diversity efforts designed to support efficient operations and ultimately aimed toward achieving departmental goals and objectives. OBWD promotes a climate of compliance with prevailing civil rights laws and minimizes departmental exposure to forfeiture of federal funds, litigation or administrative intervention.

BUREAU OF LOCAL ROADS & STREETS

1-1-8

IDOT ORGANIZATION

June 2018

- The Bureau of Small Business Enterprises (SBE) administers the Disadvantaged Business Enterprise (DBE) program in accordance with regulations from the U.S. Department of Transportation (DOT), 49 CFR part 26. It is the policy of OBWD/SBE to ensure that DBEs, as defined in part 26, have an equal opportunity to receive and participate in DOT-assisted contracts. In addition to ensure nondiscrimination in the award and administration of DOT-assisted contracts; to create a level playing field on which DBEs can compete fairly for DOT-assisted contracts; to ensure that the DBE program is narrowly tailored in accordance with applicable law; to ensure that only firms that fully meet 49 CFR part 26 eligibility standards are permitted to participate as DBEs; to help remove barriers to the participation of DBEs in DOT-assisted contracts; and to assist the development of firms that can compete successfully in the market place outside the DBE program.
- The Bureau of Civil Rights provides for the development, implementation and monitoring the departmental programs for Equal Employment Opportunity (EEO), Affirmative Action (AA), federal contract compliance (*Title VI*) and the handicapped (Section 504). It also provides counseling and informational services to employees, investigates allegations of discrimination in employment, and assists the Office of Chief Counsel (OCC) in preparing departmental responses to the allegations.

1-1.09(b) Services to LPAs

Services provided to the LPAs by this office include:

- reviewing and approving the DBE Utilization Plans, and
- overseeing the City of Chicago Federal-aid DBE program.

1-1.10 Office of Chief Counsel (OCC)

1-1.10(a) Description

OCC is responsible for providing legal counsel to the Department on both policy issues and proposed actions affecting any of its operating division or staff offices. The Office is also responsible for the prosecution of all departmental litigation in cooperation with the Attorney General. OCC administers tort liability claims, property damage claims and uncollectible receivables. It also processes lien and bond claims against contractors. In addition, the Office coordinates the purchase and service of all insurance policies and administers the Department's self-insurance program.

- The Bureau of Legal Services advises other divisions and offices within the agency concerning all legal matters and represents the Department in legally related matters with the Governor's Office, other state agencies, federal and local governmental offices and the general public. Legal Services reviews the legal aspects of the Department's legislative program; reviews new federal and state legislation, court decisions and Attorney General's opinions for the legal aspects of their effect on departmental operations; and drafts and negotiates contracts with outside entities. In conjunction with

HARD COPIES UNCONTROLLED

the Attorney General, Legal Services directs the Department's position and strategy in all major judicial and administrative proceedings.

- The Bureau of Claims represents the Department in the areas of property claims, third party torts, uncollected accounts receivable, claims against contractor performance and payment bonds and liens against public funds, including the processing and pretrial preparation of actions filed against the Department in the Court of Claims. The bureau is responsible for the administration of risk management for the Department including coordinating insurance purchases, managing self-insurance programs and approving indemnity or hold harmless agreements in various contracts.

1-1.10(b) Services to LPAs

The Bureau of Claims frequently serves as an information resource to LPAs and their attorneys regarding the defense of liability claims brought against the LPA, as well as LPA efforts to recover funds expended in the repair of highway appurtenances that have been damaged by motorists.

1-1.11 Office of Internal Audits (OIA)

1-1.11(a) Description

OIA directs and implements a comprehensive agency-wide internal audit program; conducts audits and reviews of agency programs, policies and procedures to evaluate their effectiveness; develops the agency's *Annual Audit Plan*; and monitors implementation of audit recommendations and findings.

1-1.11(b) Services to LPAs

This office does not provide any direct services to LPAs.

1-2 OFFICE OF HIGHWAYS PROJECT IMPLEMENTATION

The Office of Highways Project Implementation monitors district programs to ensure statewide uniformity of policy interpretation and compliance and to certify program coordination with federal, state and LPAs. These bureaus make certain that programs and activities support efficient program implementation across the districts. The overall objective is to ensure that highway improvement projects are constructed and operated in a cost effective and timely manner and that funds to LPAs are properly administered.

The office uses established engineering practices to develop and implement policies, procedures, standards and guidelines to accomplish highway system improvement objectives. This office monitors district programs to ensure statewide uniformity in the interpretation and application of policy and to confirm program coordination with federal, state and LPAs.

The Office of Highways Project Implementation consists of seven central bureaus and the highway regional offices, comprised of five regions or a total of nine district offices. Central bureaus include: Bridges and Structures, Construction, Design and Environment, Land Acquisition, Materials, Operations, and Safety Programs and Engineering.

1-2.01 Bureau of Bridges and Structures (BBS)**1-2.01(a) Description**

BBS develops the structural design policies and practices of the Department. The bureau accomplishes this by providing detailed planning and design of highway structures and bridge standards, including preliminary engineering (PE) and other plans and studies. This bureau also inspects major structures and structural steel for safety purposes.

1-2.01(b) Service to LPAs

The Local Bridge Unit (LBU) provides administrative and technical support to LPAs to assist them in the development of bridge construction, rehabilitation, and replacement projects, and by ensuring that measures are taken to evaluate the safety of LPA bridges, including:

- reviewing Bridge Condition Reports (BCR), Preliminary Bridge Design and Hydraulic Reports (PBDHR), and bridge plans;
- inspecting and rating bridges to determine load-carrying capacity;
- reviewing load-carrying capacity analyses and bridge posting recommendations prepared by consulting engineers;
- reviewing LPA construction and permit loadings;
- reviewing and developing bridge repair details;

The Bridge Management Unit (BMU) provides administrative and technical support to assist LPAs towards compliance with the National Bridge Inspection Standards (NBIS), including:

BUREAU OF LOCAL ROADS & STREETS

1-2-2

IDOT ORGANIZATION

June 2018

- providing specific information for NBIS inspection scheduling to minimize NBIS inspection delinquencies;
- developing policies and procedures to provide LPAs with efficient and effective methods of complying with NBIS inspection and evaluation requirements; and
- preparing and presenting training classes to provide information on basic NBIS inspection procedures, use of the Structures Information Management System (SIMS), scour evaluation, and bridge repair methods.

1-2.02 Bureau of Construction

1-2.02(a) Description

BC develops policies to maintain quality construction; approves changes in contracts; provides uniform contract interpretation; and prequalifies contractors. The bureau performs field-work and coordinates with regional offices to ensure construction projects and contracts are administered consistently across the state. The bureau also reviews value engineering proposals, coordinates industry policy and joint coop committees, evaluates and approves contractor authorizations to bid, approves subcontractors, and manages payments to contractors for construction projects. Additionally, the bureau ensures final documentation for construction projects is complete and manages accounts receivable for LPA agreements.

1-2.02(b) Service to LPAs

The services provided to LPAs include the following:

- providing uniform contract interpretation,
- approving changes in contracts for State let and federal day labor projects,
- approving all time extensions,
- approving all contractor payments for State let and federal day labor projects,
- collecting payments for State let contracts with joint agreements,
- providing construction oversight, through the districts, on State let contracts and federal day labor projects,
- handling/processing contractor claims, through the districts, for State let contracts,
- prequalifying contractors and providing this information to the LPA,
- issuing plans and proposals for projects on State letting,
- providing instructors for Technology Transfer training program classes for LPA inspectors, and
- issuing the [Schedule of Average Annual Equipment Ownership Expense](#).

1-2.03 Bureau of Design and Environment (BDE)**1-2.03(a) Description**

BDE develops standards, specifications and policies for the design of the state's highway network. BDE supports district offices in implementing departmental standards and provides guidance and support for location and environmental studies, including environmental impact statements. BDE also provides technical expertise to assist district offices in solving unique engineering, social, economic and environmental problems. This bureau coordinates and prepares federal-aid program documents; processes plans and contract documents for project lettings; works closely with the Federal Highway Administration (FHWA); and provides aerial photography, mapping and photo lab services.

1-2.03(b) Service to LPAs

BDE provides the following services to LPAs:

- conducting environmental resource surveys for LPA transportation projects,
- serving as a liaison with a variety of State and federal agencies regarding environmental related issues,
- processing plans and proposals for LPA projects being let by the State through the letting process, and determines the official State estimate for these projects,
- reviewing LPA lighting plans which affect the State highway system,
- processing agreements with LPAs for projects on the State highway system; and
- preparing the [IDOT Highway Standards](#) and [Standard Specifications for Road and Bridge Construction](#).

1-2.04 Bureau of Land Acquisition (BLA)**1-2.04(a) Description**

BLA develops policies and provides oversight of the statewide land acquisition program. This program includes such functions as relocation assistance, property management and signboard and junkyard control. The bureau is responsible for reviewing and processing all right-of-way expenditures.

1-2.04(b) Service to LPAs

BLA reviews land acquisition documents for local transportation projects when federal funds are being used to acquire the Right-of-Way (ROW) and certifies that ROW has been acquired in accordance with federal procedures for local projects constructed with federal funds.

1-2.05 Bureau of Materials**1-2.05(a) Description**

The Bureau of Materials establishes policies and procedures that provide a statewide materials inspection, acceptance, and quality assurance program. These tasks are accomplished through collaboration with stakeholders, including the nine highway districts, other central bureaus, industry, and federal, state, and local agencies. The centralized testing facility includes ten laboratories that conduct tests on hundreds of different materials used for road and bridge construction in Illinois.

- Administrative Services manages the Materials Integrated System for Test Information and Communication (MISTIC) and the Test Information Unit. This section supports MISTIC, IDOT's materials testing and inspection database, and provides support for the statewide materials certification review process. MISTIC and Test Information Unit also maintains the Trained Technician database and the webMISTIC data warehouse that provides many users throughout IDOT with interactive access to key materials testing and inspection data and laboratory inspection information.
- Concrete, Soils, and Metals Section includes five laboratories that perform tests on Portland cement concrete (PCC), cement and finely divided minerals, soils, reinforcing steel, and other miscellaneous materials. The laboratories are staffed with skilled engineering technicians who are responsible for statewide materials testing. The Technical and Product Studies Unit within this section coordinates experimental features and new product evaluations. The Bridge Investigations Unit plans and conducts research and development studies related to structural materials and components of bridges and other highway structures.
- Hot-Mix Asphalt (HMA), Aggregate, and Chemical Tests Section includes five laboratories that perform tests on HMA, aggregate, liquid asphalt, emulsions, reflective sheeting, pavement marking materials, bridge coatings, and a variety of other materials. The laboratories are staffed with skilled engineering technicians, geologists, and chemists that are responsible for statewide materials testing.

1-2.05(b) Service to LPAs

The Bureau of Materials provides support for the use of experimental products and inspection of materials. Limited field testing support services are available to LPAs upon request through the district offices.

1-2.06 Bureau of Operations (OPs)**1-2.06(a) Description**

OPs creates policies and procedures to protect public investment in new and existing transportation facilities and develops programs and policies that provide for safe, smooth and efficient traffic flow. Additional responsibilities include: monitoring maintenance operations and roadside development to implement programs that reduce maintenance costs; emergency

planning; managing statewide communication systems; ensure uniform application of traffic control devices on all streets and highways; processing applications for special vehicle movements; recommends revisions in the vehicle code; and informs the public of traffic conditions, laws and operational safety.

- Maintenance Operation develops and publishes policy regarding oversized and overweight permit movements on State highways, reviews and issues permits, collects fees, maintains accounting records, and deposits funds for State highways.
 - ensures equitable and efficient handling of all applications for oversized and overweight vehicle movements,
- Traffic Operations performs the following activities:
 - develops standards and specifications to ensure uniform application of traffic control devices on all streets and highways,
 - recommends revisions in the [Illinois Vehicle Code](#) as changes in the system and traffic patterns occur, and
 - promotes a wide range of activities to inform the public of traffic conditions, laws, and operational safety.

1-2.06(b) Service to LPAs

Traffic Operations develops the [Illinois Supplement to the Manual of Uniform Traffic Control Devices \(ILMUTCD\)](#) which all Illinois agencies are required to follow and provides information to LPAs on the proper application of traffic control devices.

Traffic Operations helps develop joint purchasing contracts that LPAs can use to purchase traffic control device materials.

1-2.07 Bureau of Safety Programs and Engineering (BSPE)

1-2.07(a) Description

BSPE is responsible for developing, maintaining and implementing engineering and behavior related safety programs, training, policies and procedures to enhance safety on Illinois roadways. The bureau administers the highways safety improvement program (HSIP) and the Safe Routes to School Program (SRTS). Other responsibilities include vehicle accident reporting; evaluation and analysis of accident data; dissemination of accident statistics to traffic safety officials; and administering the Department's portion of the state's Safety Responsibility Law.

BSPE is comprised of two sections: Safety Services and Safety Implementation. These sections work to meet federal requirements, implement federal infrastructure safety programs, coordinate State Highway Safety Program implementation efforts, crash analysis, identification and reporting.

1-2.07(b) Service to LPAs

BSE provides the following services to LPAs:

- oversight of the HSIP and SRTS funding project selection,
- coordination of Road Safety Assessments (RSA) for LPAs, and
- support of reduction of fatal and serious injury crashes on the local system.

1-2.08 Highway Regional Offices

1-2.08(a) Description

The Highway Regional Offices are accountable to the Director of Highways Project Implementation and are responsible for highway operations and functions within their respective geographic boundaries. The regions ensure that the highway programs are compatible with the protection of both the natural and the socio-economic environments. The regions strive to reduce the number of traffic accidents, property damage and fatalities through safe design, construction and maintenance of highway facilities and an active traffic management program. The regions coordinate with local officials and the public in the project development process and during construction. Regions coordinate with the central office for design approvals and construction authorizations. See Section 1-2.09 for Region One (District One) and Section 1-2.10 for Regions Two through Five (Districts Two through Nine).

1-2.09 District One

Sections 1-2.09(a) through 1-2.09(k) provides brief descriptions of each of the sections and units that comprise District One. Figure 1-2A presents the organization of District One.

1-2.09(a) EEO and Labor Compliance Section

This section ensures that all contracts are completed within the EEO and Labor Compliance Section and monitors contractor implementation of EEO/labor compliance requirements and workforce utilization. It provides advisory assistance regarding EEO and labor compliance provisions and policies.

Additionally, the section coordinates and monitors IDOT's DBE Program. This program involves ensuring that district DBE goals are met. It determines set-aside projects for DBE contractors for each letting and assists contractors in setting DBE goals and objectives.

1-2.09(b) Public Information Section

The Public Information Section provides audio-visual, graphic, photographic, and writing assistance to the district for public information regarding district programs. It also coordinates the location, scheduling, publicity, and presentations for district project public meetings and public hearings.

1-2.09(c) Bureau of Administrative Services

This Bureau of Administrative Services is responsible for efficiently planning, directing, coordinating, implementing, and monitoring IDOT's administrative and management policies and programs required for the annual improvement program, operating budget, personnel services, safety and claims activities, business services, and information services activities in District One.

1-2.09(d) Bureau of Maintenance

This Bureau of Maintenance is responsible for coordinating and implementing all activities for the preservation, maintenance, and roadside development of the State highway system in District One.

1-2.09(e) Bureau of Traffic

The Bureau of Traffic is responsible for implementing policies, procedures, and programs for the design, installation, operation, and maintenance of traffic control devices to ensure the safe and efficient operation of the State highway system in District One. The bureau issues access and roadway permits, and initiates projects and programs for the elimination of collisions and congestion. Additionally, the Traffic System Center (TSC) and the Emergency Traffic Patrol (ETP) are responsible for providing safe and efficient flow of traffic on expressways in District One. This is accomplished through specialized automated traffic surveillance, control, and information systems.

- Electrical Operations is responsible for the development and application of products and systems to meet the lighting, storm water removal, communications, mechanical, and electrical needs of District One. The bureau is additionally responsible for maintaining existing systems at an acceptable level of service while minimizing costs.

1-2.09(f) Bureau of Design

The Bureau of Design develops contract documents for the construction of new and the improvement of existing State system facilities. The bureau also administers the grade crossing improvement programs and utility permit policy for State maintained highways.

1-2.09(g) Bureau of Land Acquisition

The Bureau of Land Acquisition is responsible for the following:

- directing negotiation activities for the acquisition of private lands needed for highway improvement projects,
- providing relocation assistance to those displaced by acquisitions,
- conducting and reviewing appraisals, and determining the compensation to be offered for lands, rights, and easements needed for State transportation projects,
- providing expert valuation testimony in eminent domain proceedings;

BUREAU OF LOCAL ROADS & STREETS

1-2-8

IDOT ORGANIZATION

June 2018

- administering the [Highway Advertising and Junkyard Control Acts](#), which entails maintaining inventories of existing signs and junkyards,
- preparing and/or reviewing plans, plats, legal descriptions, appraisal maps, and pertinent documents for ROW appraisal and acquisition,
- preparing condemnation information and exhibits, and
- conducting or coordinating supplemental surveys to obtain property and land line information.

1-2.09(h) Bureau of Programming

The Bureau of Programming is responsible for integrating engineering, sociological, environmental, and economic factors in the coordination of transportation systems planning in District One. This bureau also coordinates economic and needs studies, annual and long-range programs, and transportation facility location and environmental studies. The bureau includes the following sections:

- [Data Bank](#) obtains, updates, analyzes, and disseminates physical roadway, structural, collision, and traffic characteristic data required to develop, evaluate, and prioritize the annual and multiyear Highway Improvement Program.
- [Program Development](#) develops and recommends projects for inclusion in the annual and multiyear Highway Improvement Program based on the current and future needs of the State highway system.
- [Project and Environmental Studies](#) prepares corridor and design study reports to define alternative solutions to implement programmed projects as a prerequisite to the preparation of contract plans for constructing improvements.

1-2.09(i) Bureau of Construction

The Bureau of Construction is responsible for the supervision and administration of all contracts for State and local federally funded highway improvements in District One from the time of award until construction is completed.

The Construction Supervision – STP Section ensures that federally funded local improvement projects are constructed in accordance with plans, specifications, and special provisions.

1-2.09(j) Bureau of Local Roads and Streets (BLRS)

BLRS is responsible for administering the expenditure of a wide variety of funds for transportation purposes available to LPAs in District One. The bureau also renders guidance and assistance to LPAs in planning, financing, designing, constructing, and maintaining local highway and street systems. The bureau includes the following Sections:

[Field Engineering](#) approves LPA proposals for the expenditure of MFT and Township Bridge Program (TBP) funds and ensures proper control of these funds. It also approves plans,

specifications, and estimates for LPA construction projects financed by a wide variety of local and State funds.

Program and Office is responsible for the following:

- reviewing of the approval plans, specifications, and estimates for State and/or federally funded LPA construction projects to ensure compliance with established policies, standards, and procedures,
- reviewing and recommending action on all documents (e.g., location and design reports, project agreements) required for LPAs to expend allocations of State and federal funds,
- administering the bi-annual Bridge Inspection Program for bridges on the local system, and
- compliance review and accounting for LPAs' expenditure of MFT funds.

1-2.09(k) Bureau of Materials

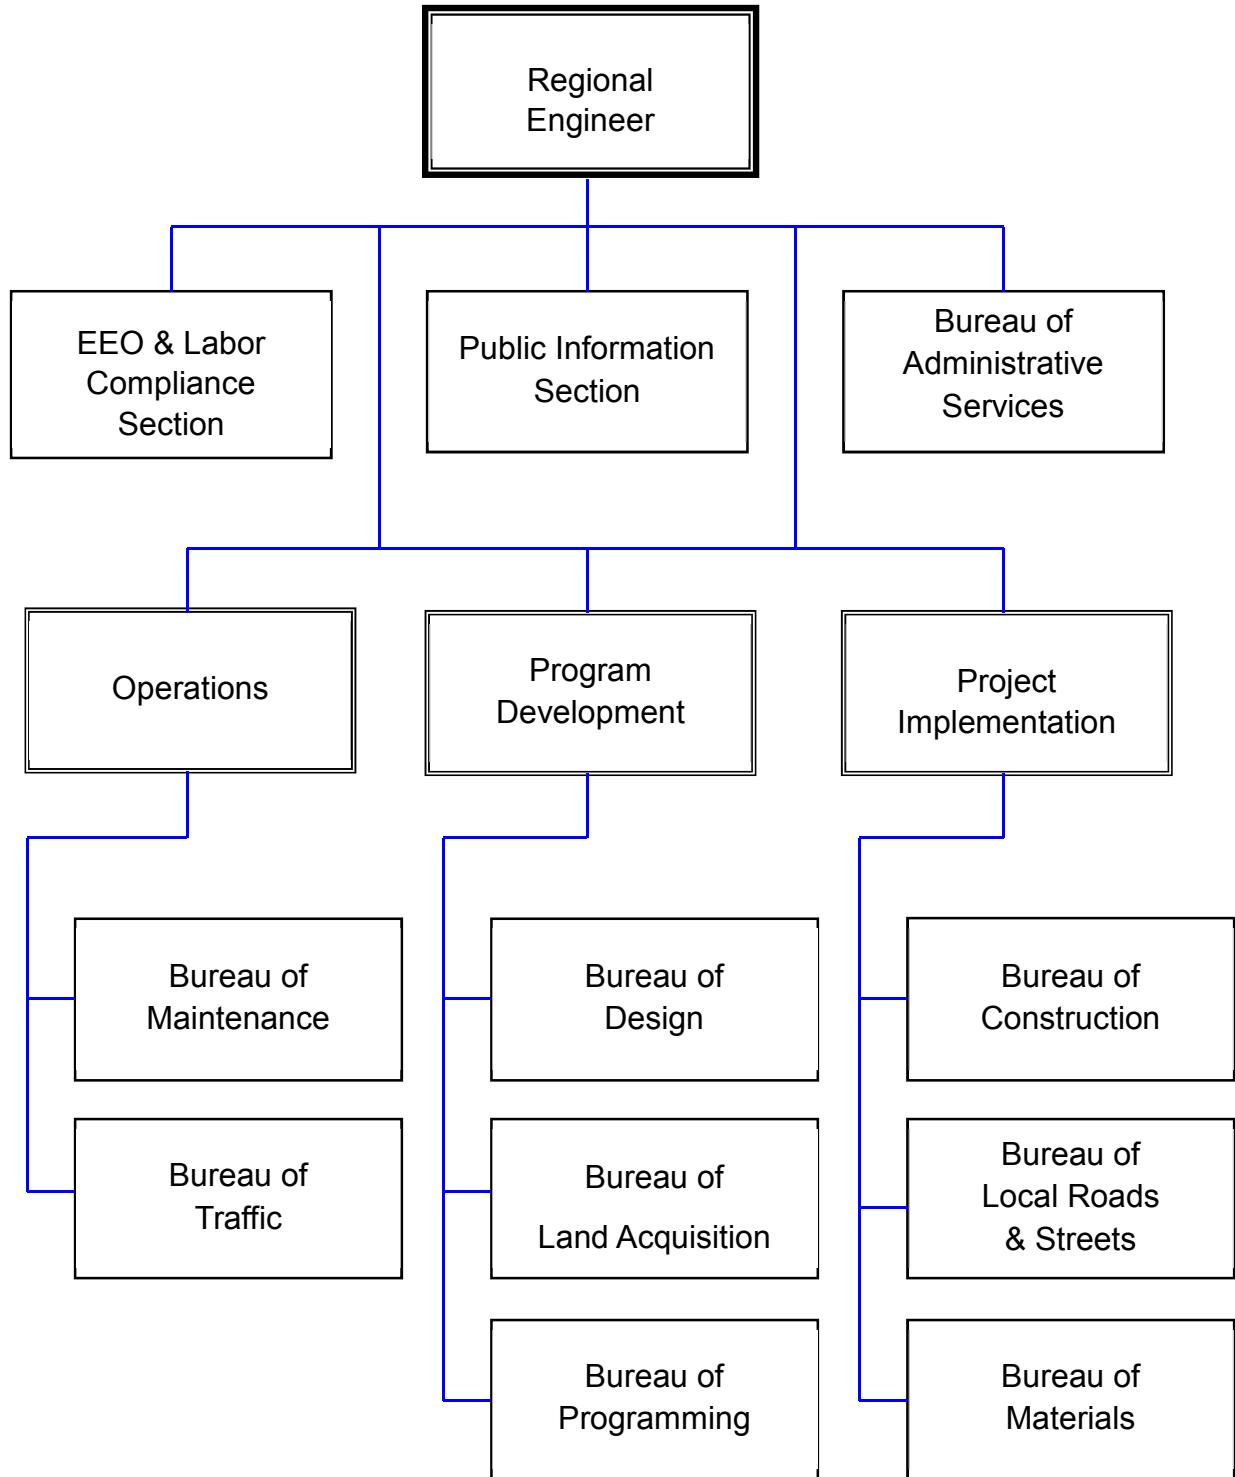

The Bureau of Materials is responsible for the inspection and testing of materials used in the construction and maintenance of highways and other agency projects in District One. Among others, key accountabilities include:

- preparing geotechnical reports, providing technical expertise, and reviewing consultant geotechnical reports, as required for highway improvements,
- providing approved laboratory and trained technician information from IDOT databases,
- assisting the LPA with mixture designs and verification,
- by agreement, providing materials sampling and testing services at plants and locations where an IDOT inspector is present, and
- providing LPA materials inspection and test information from the MISTIC system.

BUREAU OF LOCAL ROADS & STREETS
IDOT ORGANIZATION

1-2-10

June 2018

DISTRICT ONE ORGANIZATION

Figure 1-2A

1-2.10 Districts Two through Nine

Sections 1-2.10(a) through 1-2.10(c) provides brief descriptions of each of the sections and units that comprise Districts Two through Nine. Figure 1-2B presents the organization of Districts Two through Nine.

1-2.10(a) Bureau of Operations (OPs)

District OPs is responsible for coordinating and implementing all activities for the preservation, maintenance, and roadside development of the State highway system. Additionally, it is responsible for implementing policies, procedures, and programs for the installation, operation, and maintenance of traffic control devices to ensure the safe and efficient operation of the State highway system. The bureau issues roadway access and special vehicle permits, and initiates projects and programs for the elimination of crashes and congestion. A brief description for each of the Sections that comprise the bureau is included in the following:

Bridge Maintenance is responsible for the following activities:

- performing routine maintenance of all State maintained bridges, and
- performing all NBIS inspections for all State maintained bridges.

Design and Planning is responsible for the following activities:

- reviewing requests and issues permits relative to highway access to ensure traffic safety and the protection of the system without deferring private or commercial development,
- coordinating the execution of special vehicle movements over State highways,
- issuing special event and parade permits for State highways,
- maintaining and setting the timing and coordination of traffic control devices,
- reviewing and assisting in the development of traffic control device and highway lighting plans,
- maintaining highway lighting,
- overseeing the design, installation and maintenance of storm water pump stations and deep well groundwater dewatering pumps, and
- generating the district Highway Safety Improvement Program (HSIP) to address roadway safety issues. This may reside elsewhere depending on the district.

Maintenance Operations is responsible for the following activities:

- performing all normal and emergency maintenance activities to provide a safe and usable highway system,
- maintaining and inspecting interstate rest areas, and
- performing right of way vegetation management and overseeing right of way landscaping activities.

Traffic Operations is responsible for the following activities:

BUREAU OF LOCAL ROADS & STREETS

1-2-12

IDOT ORGANIZATION

June 2018

- reviewing and assisting in the development of traffic control plans for highway, projects and investigates and resolves traffic control problems encountered on district construction and maintenance projects, and detours,
- developing traffic control plans for planned and emergency road closures,
- providing for the maintenance of pavement markings including edge lines, centerlines, lane lines, no-passing zones, curbs and special markings,
- installing and maintaining all traffic signs on the State system,
- fabricating special signs,
- designing, operating and maintaining the district Intelligent Transportation System (ITS) network (District 8), and
- operating the district Emergency Patrol Vehicle (EPV) response fleet (District 8).

1-2.10(b) Bureau of Program Development (PD)

PD is responsible for integrating engineering, sociological, environmental, and economic factors in the coordination of transportation systems planning through coordination of economic and needs studies, annual and long-range programs, and transportation facility location and environmental studies. The following provides brief descriptions of the sections that comprise this bureau:

Land Acquisition is responsible for the following:

- directing negotiation activities for the acquisition of private lands needed for highway improvement projects,
- providing relocation assistance to those displaced by acquisitions,
- conducting and reviewing appraisals, and determining the compensation to be offered for lands, rights, and easements needed for State transportation projects,
- providing expert valuation testimony in eminent domain proceedings,
- preparing and/or reviewing plats, plans, legal descriptions, appraisal maps, and pertinent documents for ROW appraisal and acquisition,
- preparing condemnation information and exhibits,
- conducting or coordinating supplemental surveys to obtain property and land line information, and
- managing Department owned property.

Programming is responsible for developing and recommending projects for inclusion in the annual and multiyear Highway Improvement Programs based on the current and forecasted needs of the State highway system. The section also conducts the following activities:

- prepares traffic counts and intersection turning movements for needs studies,
- updates traffic maps,

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

June 2018

IDOT ORGANIZATION

1-2-13

- performs pavement condition rating surveys,
- maintains database of physical characteristics of transportation systems,
- produces and coordinates various visual aid programs to provide information to district personnel and the general public, and
- preparing preliminary and final cost estimates for state highway projects.

Project Support reviews and/or prepares utility adjustment agreements; approves utility permit applications; conducts inspections of utility adjustments and ensures that all district State construction projects are clear of utility conflicts, as well as inspects and monitors highway-railroad grade crossings; oversees grade crossing construction work performed by railroad forces; and prepares annual inspections of grade crossing protection equipment.

Studies and Plans performs the following activities:

- preparing plans and specifications and associated documents for all State highway improvements,
- preparing and reviewing corridor and design study reports,
- determining the environmental impact of projects and developing methods to minimize those impacts through the preparation and review of Environmental Impact Statements (EIS), Environmental Assessments (EA), and related special environmental studies for State projects,
- coordinating and conducting public hearings and public involvement programs,
- performing surveys for State projects,
 - preparing or reviewing hydraulic studies, and
- preparing or reviewing Interchange and Intersection Design Studies (IDS), capacity analysis and geometric reviews.

1-2.10(c) Bureau of Project Implementation (PI)

PI is responsible for the supervision and administration of all contracts for highway improvements from the time of award until construction is completed, and for the inspection and testing of materials used in the construction and maintenance of highways and other agency projects throughout the districts. The following describes the functions of the sections that comprise this bureau:

Construction ensures that construction projects for highway improvements are in compliance with plans, specifications, and IDOT policies for State highways and local federally funded projects. In District 5, this function is provided by the Bureau of Local Roads and Streets for local federally funded projects.

Implementation Support prepares and processes project documentation and reports, resolves discrepancies and deviations from policy, and performs materials certification reviews.

Local Roads and Streets is responsible for administering the expenditure of various funds for transportation purposes available to LPAs. Also renders guidance and assistance to LPAs in

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

1-2-14

IDOT ORGANIZATION

June 2018

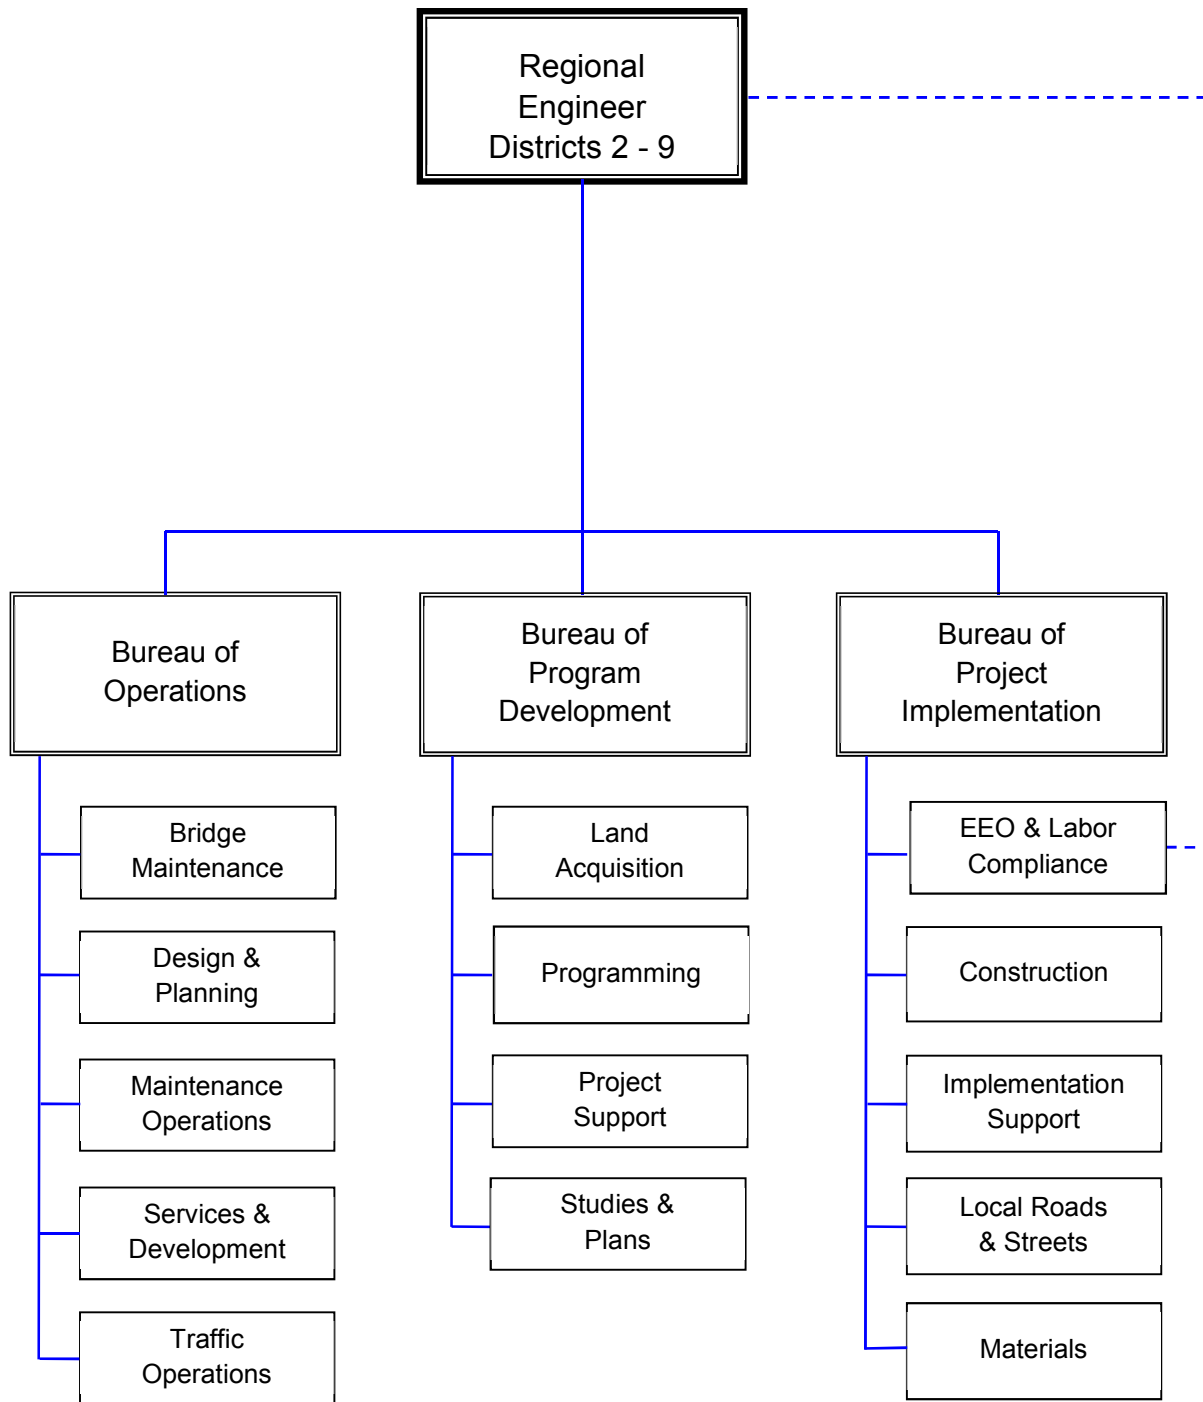

planning, financing, designing, constructing, administering NBIS, and maintaining local highway and street systems. Other responsibilities include:

- approving LPAs' proposals for expenditure of MFT, State, and federal funds and ensures proper control of these funds,
- approving plans, specifications, and estimates for LPA construction projects involving MFT, State, and federal funds,
- monitoring LPA transportation projects to ensure compliance with State and federal guidelines,
- providing engineering expertise and guidance in the resolution of LPA construction and maintenance problems,
- coordinating and performing administrative activities required to assist LPAs in developing, constructing, and maintaining local street and highway projects using MFT, State, and federal funding,
- reviewing and approving plans, specifications, and estimates for MFT, State, and/or federally funded LPA construction projects to ensure compliance with established policies, standards, and procedures,
- reviewing and recommending action on all documents (e.g., environmental assessments, location and design reports, project agreements) required for LPAs to expend allocations of State and federal funds;
- administering the NBIS Bridge Inspection Program for bridges on the local system, and
- providing documentation review and accounting for the LPAs expenditures of MFT funds.

Materials is responsible for the following:

- preparing geotechnical reports for State projects, provides technical expertise, and reviews consultant geotechnical reports, as required for highway improvements,
- providing approved laboratory and trained technician information from IDOT databases,
- may assist the LPA with mixture designs and verification,
- with proper coordination and on a case by case basis, may provide materials sampling and testing services at plants and locations where an IDOT inspector is present, and
- providing LPAs materials inspection and test information from the MISTIC system.

1-3 CENTRAL BUREAU OF LOCAL ROADS AND STREETS (CBLRS)

1-3.01 General

Figure 1-3A presents the organization of the CBLRS.

1-3.02 Local System and Services Unit

The Local Systems and Services Unit performs the following activities:

- develops and manages the bureau's operating budget,
- manages the bureau's procurement processes, and
- manages the bureau's personnel resources.

1-3.03 Local Program Development Section

The Local Program Development Section is responsible for local roads and streets not assigned to a particular unit and the examination and approval of county engineer candidates.

1-3.03(a) Local Planning and Programming Unit

The Local Planning and Programming Unit performs the following activities:

- distributes and tracks federal and state funds to LPAs,
- develops and monitors the annual and multiyear LPA programs,
- disburses and monitors MFT allocations and special incentive program funds,
- acts as a clearinghouse for highway jurisdictional issues, including transfers, and
- provides technical assistance and liaison to IDOT districts and LPAs within the above processes.

1-3.03(b) Local Policy and Technology Unit

The Local Policy and Technology Unit has two sub-units which are responsible for the following activities:

Policy and Procedures Sub-Unit:

- formulating and disseminating policies, procedures, specifications, special provisions, and design criteria that are responsive to the needs of local governments and IDOT.
- serving as liaison with LPAs, FHWA, other bureaus in IDOT, district offices, and consultants to obtain their input in the development of policies and procedures,
- evaluating and initiating actions based on technical research conclusions and changes in State and federal laws and regulations to ensure compliance,

BUREAU OF LOCAL ROADS & STREETS

1-3-2

IDOT ORGANIZATION

June 2018

- providing technical and administrative advice to assist local governments in the planning, inventory, inspection, repair, design, rehabilitation, construction, and maintenance of highway projects,
- analyzing State and federal legislation to determine the need for new construction specifications,
- monitoring, analyzing the impacts, and developing IDOT's positions on proposed legislation that affect IDOT and LPAs,
- incorporating legislative changes to IDOT's *Road, Bridge and Other Related Laws of Illinois*, and
- maintaining the *Local Roads and Streets Manual*.

Technology Transfer Sub-Unit

The Technology Transfer Unit administers the Local Technical Assistance Program (LTAP) and the Technology Transfer Center (T²). LTAP is a federally funded program.

To qualify for the funding, the T² Center must, at least, comply with the following requirements:

- Mailing List. The center must maintain a mailing list of LPAs, consulting engineers, and miscellaneous customers.
- Publishing Newsletters. The center publishes the *Illinois Interchange Newsletter*. The newsletter contains articles that address the LPA needs and provides more efficient and economical means of highway/street construction and maintenance.
- Technology Transfer. Maintains a video/publication/CD-ROM/online library and a reference library. Videos provided by the library may be reproduced or loaned. The publications are free of charge. Materials from either the reference library or IDOT's library may be loaned for a two-week period.
- Training for Agencies and Others. The classes, seminars, and workshops are tuition free and on a first-come, first-serve basis with the exception of LPAs. LPAs receive first priority.
- Special Programs. The center sponsors and co-sponsors special programs and services, provides exhibits, and makes presentations for LPA conferences.

1-3.04 Local Project Implementation Section

The following describes the activities of the Project Development and Project Support Units within the Local Project Implementation Section of Central BLRS.

1-3.04(a) Local Project Support Unit

The Local Project Support Unit has three sub-units which are responsible for the following activities:

Fiscal Control Sub-Unit:

- pays invoices for Grade Crossing Protection projects, local let projects, PE projects, utility projects, and ROW projects,
- evaluates joint agreements and engineering agreements and establishes Contract Obligation Documents (CODs) for all the above, and
- sets up accounts receivable for overpayments.

Agreements Sub-Unit:

- processes joint agreements for state let projects,
- processes joint agreements for PE, local let construction, ROW, utilities, and grants, and
- processes engineering agreements and authorize federal funds.

MFT Program and Documentation Sub-Unit:

- provides technical support, advice, and education to IDOT staff and LPAs on the use of the MFT Access Database,
- provides quality control / quality assurance, oversight, and training for district MFT documentation reviews, and
- disseminates, manages, and monitors corrective actions required by documentation reviews and audit reports completed by BIC.

1-3.04(b) Local Studies and Plans Unit

The Local Studies and Plans Unit has two sub-units which are responsible for the following activities:

Plan Preparation Sub-Unit:

- prepares plans and proposals for state and local lettings, and day labor projects,
- publishes the Weekly Notice to Contractors Bulletin, and
- authorizes federal funds for construction and ROW and assigns federal project numbers.

Project Development Sub-Unit:

- reviews (for policy conformance) and approves Phase I reports and grants design variances,
- forwards LPA Environmental Survey Requests (ESR) to BD&E and acts as liaison between BD&E on any environmental issues,

BUREAU OF LOCAL ROADS & STREETS

1-3-4

IDOT ORGANIZATION

June 2018

- reviews for National Environmental Policy Act (NEPA) conformance and recommends approval to FHWA of EAs and EISs,
- is responsible for timely and accurate responses to inquiries by the public, the districts, and LPAs,
- provides concurrence in categorical exclusion and design approval of federally funded projects,
- attends district early coordination meetings,
- attends district county engineer meetings,
- provides guidance to the districts and LPAs in the development and construction of projects,
- coordinates the Emergency Relief Program (ER), and
- serves as the State Project Officer for Federal Emergency Management Agency (FEMA) declared disasters.

Chapter 2

ADMINISTRATIVE POLICIES AND PROCEDURES

2-1 APPLICABLE ILLINOIS STATUTES

The following sections briefly discuss the Illinois laws that govern the policies and procedures set forth by the Illinois Department of Transportation (IDOT). The Road, Bridge and Other Related Laws of Illinois published by IDOT is a reprint of chapters and paragraphs of the Illinois Compiled Statutes (ILCS) that deal specifically with road, street and bridge matters. This document is arranged in ascending numerical order of these chapters and is intended for use as a ready reference for road and street officials.

2-1.01 Illinois Highway Code

The Illinois Highway Code, [605 ILCS 5/1-101 et seq.](#) contains a description of the systems of highways in Illinois. It provides the legal authority for the administration of highways by the State and counties. It also provides for the administration of township and road district roads, and municipal streets. Other provisions covering highways and bridges are also included.

2-1.02 Bikeway Act

The Bikeway Act, [605 ILCS 30/0.01 et seq.](#) provides the legal authority for the construction and maintenance of bikeways.

2-1.03 Illinois Vehicle Code

The Illinois Vehicle Code contains the Rules of the Road ([625 ILCS 5/11](#)). The Rules of the Road includes the statutes on traffic signs, signals, pavement markings, speed restrictions, and parking regulations. It also contains the size, weight, and load restrictions for vehicles, and provisions for permits, and vehicle restrictions ([625 ILCS 5/15](#)).

2-1.04 Other Applicable Statutes

The following presents a brief description of the chapters in ILCS most frequently referred to by the Bureau of Local Roads and Streets (BLRS) and the local public agencies (LPAs):

1. [Chapter 5 – General Provisions](#). This chapter includes the Open Meetings Act, [5 ILCS 120/1 et seq.](#) and the Intergovernmental Cooperation Act, [5 ILCS 220/1 et seq.](#)
2. [Chapter 20 – Executive Branch](#). This chapter discusses various State agencies and certain Acts that are under the control of these agencies. This includes many of the responsibilities of IDOT.
3. [Chapter 30 – Finance](#). This chapter discusses investments of public funds, bonds, and debts.

BUREAU OF LOCAL ROADS & STREETS

2-1-2

ADMINISTRATIVE POLICIES AND PROCEDURES

June 2018

4. [Chapter 35 – Revenue](#). This chapter includes the Property Tax Extension Limitation Law, [35 ILCS 200/18-187 - 200/18-245](#) and the Motor Fuel Tax Law, [35 ILCS 505/1 et seq.](#)
5. [Chapter 50 – Local Government Officers and Employees](#). This chapter discusses purchase contracts and professional services selection.
6. [Chapter 55 – Counties](#). This chapter discusses powers and duties of a county board. Some of the topics discussed are as follows:
 - trust agreements for funds retained pending construction completion;
 - competitive bids;
 - names of streets and highways, including numbers of buildings and lots;
 - removal of obstructions from streams, lakes, ponds, and other water courses;
 - county motor fuel tax; and
 - establishment of building or set-back lines.
7. [Chapter 60 – Townships](#). This chapter includes discussion on the corporate power of townships and the procedure for vacancies in offices.
8. [Chapter 65 – Municipalities](#). This chapter includes the Illinois Municipal Code, [65 ILCS 5/1-1-1 et seq.](#). The Illinois Municipal Code establishes the organization, territory, finance structure, local improvements, and the corporate powers and functions of the municipality. Some of the pertinent topics include the following:
 - local improvement procedures restricted to certain municipalities,
 - improvements affecting property not within municipality,
 - general powers over streets and public ways,
 - certain joint municipal and township construction projects,
 - persons displaced by Federal-aid system of streets and highways, and
 - jurisdiction over roads by agreement.
9. [Chapter 220 – Utilities](#). The Public Utilities Act, [220 ILCS 5/1-101 et seq.](#), Illinois Underground Utility Facilities Damage Prevention Act, [220 ILCS 50/1 et seq.](#), Telegraph Act, [220 ILCS 55/0.01 et seq.](#), and the Telephone Company Act, [220 ILCS 65/0.01 et seq.](#) are included in this chapter.
10. [Chapter 415 – Environmental Safety](#). The Environmental Protection Act, [415 ILCS 5/1 et seq.](#) covering air, water, land pollution, special waste, and the Illinois Groundwater Protection Act, [415 ILCS 55/1 et seq.](#) are included in this chapter.
11. [Chapter 505 – Agriculture](#). This chapter includes the Farmland Preservation Act, [505 ILCS 75/1 et seq.](#)
12. [Chapter 520 – Wildlife](#). This chapter includes the Illinois Endangered Species Protection Act, [520 ILCS 10/1 et seq.](#)

2-2 UNITED STATES CODE AND CODE OF FEDERAL REGULATIONS

The following sections briefly discuss federal laws and regulations that govern policy and procedures set forth by IDOT for Federal-aid projects.

2-2.01 United States Code (U.S.C.)

The U.S.C. is the codification by subject matter of the general and permanent laws of the United States. It is divided by broad subjects into 50 titles. The following titles most frequently affect federally funded highway projects.

1. Title 23 – Highways. This title covers Federal-aid highways, highway safety, and research and technology.
2. Title 42 – The Public Health and Welfare. This title includes the National Environmental Policy (Chapter 55), the Uniform Relocation Assistance and Real Property Acquisition Policies for Federal and Federally Assisted Programs (Chapter 61), and other environmental laws.
3. Title 49 – Transportation. This title discusses the operation of the United States Department of Transportation.

2-2.02 Code of Federal Regulations (C.F.R)

The C.F.R. is a codification of the general and permanent rules published by the executive departments and agencies of the federal government. It is divided into 50 titles that correspond with the U.S.C. titles and represent broad areas subject to federal regulation. Each title is divided into chapters that usually bear the name of the issuing agency. Each chapter is further subdivided into parts covering specific regulatory areas. Federally funded highway projects are mainly affected by the following titles:

1. Title 23 – Highways. Chapter 1 of this title contains the regulations of the Federal Highway Administration.
2. Title 40 – Protection of Environment. This title contains regulations of the Environmental Protection Agency and the Council on Environmental Quality.
3. Title 49 – Transportation. This title contains regulations issued by the Office of the Secretary of Transportation.

2-3 BLRS POLICIES AND PROCEDURES**2-3.01 Legal Authority and Responsibility****2-3.01(a) State Statutes**

When federal, State, or Motor Fuel Tax (MFT) funds are used in whole or in part for the construction of a local road or street, IDOT approval is mandatory. The responsibility for general oversight has been delegated to BLRS, with direct oversight given to the district.

2-3.01(b) Federal Laws and Regulations

Authority for the construction of Federal-aid highways in Illinois is given to IDOT. IDOT is not relieved of its responsibility by authorizing performance of the work by a LPA. IDOT must ensure the LPAs comply with all federal laws and regulations.

2-3.02 BLRS Manual

The BLRS Manual (the Manual) contains the policies and procedures for the construction and maintenance of local roads and streets with federal, State, and MFT funds under the supervision of IDOT.

The Manual is divided into four parts. Part I presents general information about the operation of IDOT, the road system, funding, and other issues not affected by funding type. Part II discusses the policies and procedures for MFT and State funded projects. Part III discusses the policies and procedures for federally funded projects. Part IV contains project design criteria that are required to be used regardless of fund type.

This Manual provides information on:

- the BLRS's responsibilities for vouchering MFT funds and Township Bridge Program (TBP) funds to the LPAs;
- the LPA (i.e., municipalities, counties, road districts) responsibilities for maintaining complete records of disbursements, refunds, transfers, and balances involving all MFT and State funds transferred to the LPAs;
- design guidelines for local roads and streets including functional classification, engineering analyses, roadway design, sidewalk and shared-use paths, Americans with Disabilities Act (ADA), traffic control devices, pavement design, bridges and culverts, and hydraulics;
- guidelines for selecting engineering services, addressing environmental impacts, right-of-way acquisitions, railroads, and utilities;
- policies and procedures for preparing plans, specifications, estimates, proposals, contracts, highway system revisions, resolutions, agreements, and other miscellaneous documents;

- letting, award, and construction procedures;
- maintenance administration and operations for local facilities; and
- guidelines and procedures for projects involving federal funding, including:
 - + environmental analyses and reports,
 - + public involvement guidelines, and
 - + FHWA coordination, review, and approval.

The Manual will be updated on a regular basis to reflect changes in policies and procedures.

2-3.03 BLRS Procedure Memoranda (PM)

It is often necessary to revise existing policies and procedures and provide new information to the districts and to the LPAs in a timely manner prior to revising the Manual. The Central BLRS (CBLRS) will issue Procedure Memoranda (PM) to disseminate such information.

2-3.04 BLRS Circular Letters (CL) and Regional Engineer Memoranda

It is often necessary to issue notices or information that does not create new policy or change existing policy. The CBLRS will issue Circular Letters (CL) and Regional Engineer Memoranda to disseminate such information.

The CLs are used to update or issue BLRS pamphlets and booklets, special provisions, and forms, to announce special funding opportunities, and to provide advisory or general information issued by other IDOT bureaus and other agencies. The CLs are sent to the county engineers, public works directors, municipal engineers, other officials, and consulting engineers, if appropriate. These letters can also be received electronically through the [CBLRS subscription service](#) under the “Stay Connected” tab. Copies and an up-to-date list of current CLs may be obtained from [IDOT’s website](#) under the “LPA Resource” tab.

Regional Engineer memoranda are circulated only within IDOT. They provide the district with information and procedure changes that do not directly affect LPAs.

2-3.05 Forms

2-3.05(a) General

To maintain uniformity and simplicity in the administration of federal, State, and MFT funds for LPAs, BLRS has provided forms for the LPA’s use. These forms include general requirements for LPA projects processed through BLRS; however, they are not intended to address specific situation for every LPA. All forms are periodically revised to meet the latest statutory and/or regulatory requirements. The current versions of all forms are available on [IDOT’s website](#). In order to ensure that the most recent forms are used, LPAs should consult and/or obtain forms from [IDOT’s website](#).

2-3.05(b) Signature Requirements

All forms submitted to IDOT must contain the original signature of the appropriate local official. Signatures applied by rubber stamp are not acceptable. An official other than the official designated on the form may sign a form if authorized by resolution or ordinance of the governing body. This resolution/ordinance giving signature authority must contain the name of the individual, title, the forms in which the authority is given, and any ending date for this authority. The resolution must be submitted to the district annually and the district notified if the signature authority is rescinded.

In the case of a road commissioner, a letter or other document giving this same authority to the county engineer or a member of the county engineer's staff must be notarized and on file. Multiple road commissioners may be listed with their signatures on one document. This document does not need to be submitted to the district but must be made available upon request. A change/departure of any individual listed, a new/revised document will be required.

In the district, the forms must be signed by the Regional Engineer or someone authorized to sign for the Regional Engineer. The Regional Engineer may delegate approval authority to another individual on the Regional Engineer's staff when appropriate.

2-3.05(c) Modifications

If a standard IDOT form is modified by any LPA, all department references shall be removed from the form. This includes the IDOT logo, form number, revision/effective date, and any other distinguishing mark. Unless otherwise noted in the Manual, each District or CBLRS may elect not to accept a non-standard form.

2-3.06 Policy and Procedures Exceptions

Policies and procedures set forth in this Manual have been developed in accordance with the federal and State laws and regulations in cooperation with the Illinois Association of County Engineers (IACE), the Illinois Municipal League (IML), the Township Officials of Illinois (TOI), and other agencies and organizations. When it is impractical to meet the requirements or procedures set forth in Parts I, II, or III of this Manual, a LPA may submit an exception request to the district substantiating the reason for such request. The district, in consultation with the CBLRS, will approve the request if it is acceptable. The procedure for obtaining exceptions of design criteria is discussed in [Section 27-7](#).

2-4 PROJECT IDENTIFICATION

2-4.01 LPA Section Designation

All LPA projects processed through IDOT must have a section designation. The section designation is assigned by the LPA in coordination with the district using the following guidelines.

The section designation has four parts separated by hyphens (e.g., 03-00132-01-RS). The four parts of the section designation from left to right include:

1. Year. The first two digits are the last two digits of the calendar year in which the section is established.
2. Agency Sequence. The second sequence consists of five characters, usually all numeric. Each LPA usually assigns these sequence numbers in numerical order. For township or road district projects, the first two characters represent a code number assigned to each township or road district by alphabetical order for each county. When an improvement is made to a location that had previously been constructed, the original sequence number may be retained. When a road, street, or bridge is to be improved in two or more stages or possibly other future improvements planned, the same sequence number should be used for all stages or other planned future improvements.

Each park district, forest preserve district, and conservation district will be assigned a five-character sequence to be used for all projects, with the first character being alphabetic.

3. Subsection. The subsection for the first use of any sequence number is 00. The subsection number is increased numerically for each use of the same sequence number by the LPA.
4. Section Suffix. The last of the section designation consists of two letters describing the type of work. See Figure 2-4A for a list of section suffixes based on the type of work.

Section numbers for general maintenance are discussed in [Section 14-2](#).

BUREAU OF LOCAL ROADS & STREETS

Suffix	Type of Work	Suffix	Type of Work
AA	Agency Authorization	MB	MFT Bond
AC	Agency Credit	MG	Building and Maintain County Garage
AM	Asset Management	MS	Miscellaneous
AS	Aggregate Surface	PA	Painting
BD	Building Demolition	PL	Planning
BI	Bridge Investigation	PK	Parking Lots
BR	Bridge	PP	Pavement Preservation
BT	Bike Trails	PV	Pavement
CG	Curb and/or Gutter	PW	Pavement Widening
CH	Channelization	RD	Roundabout
CS	County Engineer's Salary	RF	IMRF or Social Security
DR	Drainage	RP	Rigid Pavement

LA	Land Acquisition	WR	Widening and Resurfacing
LS	Landscaping		
LT	Lighting		

SECTION SUFFIX DESIGNATIONS

Figure 2-4A

2-4.02 State Job Numbers

A State job number is needed for any project involving State or federal funds. Each phase of a project must have a unique state job number. State job numbers are generated by the State Job Number Generator System (SJNG). State job numbers starting with a "P" indicates the planning phase / Phase I engineering, occasionally it may represent both Phase I and II engineering for simpler projects or projects with a single stage. A "D" indicates the design

phase / Phase II engineering, a “R” represents there is a land acquisition, a “C” represents construction and construction engineering / Phase III engineering, and there are a few others not typically used for LPA projects.

The SJNG system requires the user to provide:

- Route – The federal route identification,
- Section Number,
- Location – Either the County or Municipality should be provided,
- County, and
- Project relationships (documents associated phases).

2-4.03 Federal Project Numbers

Each phase of a project using federal funds requires a unique federal project number. The federal project number consists of seven alphanumeric digits randomly generated by the SJNG System. When the user establishes a State Job Number in SJNG, the user indicates the project is federal and the unique federal project number is assigned. The relationship between the state job number and the federal project number is one to one.

The alpha prefixes that precede the federal project number in many systems designate the federal fund type. They are not generated by the SJNG system, as they are not part of the unique federal project number. However, users should continue to input those prefixes into PPS or other systems as required.

2-4.04 MFT System

The MFT is a computer system used by the CBLRS and the districts for cost accounting of the LPA’s MFT, State, and federal funds designated for use by the LPA. The system also provides a means of tracking projects that use these funds.

The MFT System provides a record of all MFT allotments and transactions, and a current balance of MFT funds for each LPA. It also contains a project record of each LPA project. The records are available by the LPA MFT section number. Contact the district to obtain specific information.

2-5 IDOT PUBLICATIONS

There are various publications issued by IDOT, federal and State agencies, and engineering groups relative to transportation facilities matters. A list of some of these publications may be found in the following locations.

2-5.01 IDOT Website

2-5.01(a) General

IDOT operates an official [website](#) that contains general information about the Department and its programs. Several manuals, policy memoranda, forms, and other information needed in the development of a project are available.

2-5.01(b) Subscription Service

BLRS offers a [subscription service](#) under the “Stay Connected” tab on IDOT website for LPAs and others. Electronic versions of circular letters, notices of web updates, and other information not circulated during normal course of business are sent automatically to subscribers. Use the subscriber web page to enroll.

2-5.02 BLRS Publications

In addition to the Manual, other publications issued and maintained by BLRS and listed on the [Technology Transfer Center \(T2\)](#) can be viewed or downloaded. Printed versions of these publications can be obtained by contacting CBLRS. Listed below are a few of the more popular BLRS documents available on the IDOT website:

1. [Highway Jurisdiction Guidelines for Highway and Street Systems](#). This booklet provides LPA officials with a quick reference to assist in formulating, analyzing, and resolving jurisdiction/maintenance disputes. The importance of evaluating each situation in light of its own peculiarities cannot be overemphasized. It is intended that the provisions of this pamphlet be a reference and not the final authority.
2. [Signing of Road District and Township Highways](#). This booklet provides highway commissioners with a quick reference to signs and their uses, and traffic control devices. Any reference to the “manual” is to the *Manual on Uniform Traffic Control Devices (MUTCD)* or the [Illinois Supplement to the Manual on Uniform Traffic Control Devices \(ILMUTCD\)](#). This publication should not be used as a substitute for engineering judgment. It is intended that the provisions of these guidelines be a reference and not the final authority on the signing of township highways. Conformance with the latest editions of the [ILMUTCD](#) is required by the Illinois Vehicle Code, [625 ILCS 5/11-304](#).
3. *Motor Fuel Tax Funds – Source, Distribution, and Use – [Counties, Municipalities, and Road Districts](#)*. These booklets provide the LPA officials with a quick reference to the source, distribution, and uses of MFT funds. It is the intent that provisions of these

documents are a reference and not the final authority on the receipt or expenditure of MFT funds.

4. [Specifications and Special Provisions – Development and Usage for Local Agencies](#). This booklet provides LPAs and consultants with a quick reference to the development and use of specifications and special provisions. It is intended that the provisions of this booklet be a reference and not the final authority.
5. [Road, Bridge and Other Related Laws of Illinois](#). This book is issued for the convenience of road and street officials and others. It contains various chapters of the [Illinois Compiled Statutes](#), which are related to road and bridge matters. Users should always verify if statutes have been amended by current legislation.
6. [Illinois Grade Crossing Protection Fund: Resource Guide](#). This booklet provides LPA officials with a quick reference to the Grade Crossing Protection Fund (GCPF) as established by the Motor Fuel Tax Law, [35 ILCS 505/8](#). It is the intent that provisions of this booklet be a reference and not the final authority.

2-5.03 Other Department Documents

IDOT publishes a variety of manuals and documents. These publications disseminate IDOT's policies, standards, specifications, and procedures to be followed in the design, construction and maintenance of streets and highways on the State highway system. Some also have application to the local highway system. Reference to these IDOT publications are at the end of each of the appropriate chapters in this manual and typically will be hyper-linked within the chapters.

Many of these publications are available for review and/or downloading on [IDOT's website](#). IDOT is moving away from printing hard copies. The printed manuals are available free in limited quantities to LPA, from the Division of Highways Manual Sales Office. Consultants and other individuals can purchase these manuals from the Manual Sales Office. An order form with a list of available documents can be obtained from [IDOT's website](#) or by contacting the Manual Sales Office.

2-5.04 Federal Publications

There are several publications by both federal agencies and/or national associations (AASHTO, ATSSA, ITE, TRB, etc.), which disseminate various policies, standards, specifications, and procedures which may have been adopted or used in developing IDOT's policies, standards, specifications, and procedures in the design, construction, and maintenance of streets and highways on the State highway system. Many have application to the local highway system. Reference to these federal publications is at the end of each of the appropriate BLRS Manual chapters.

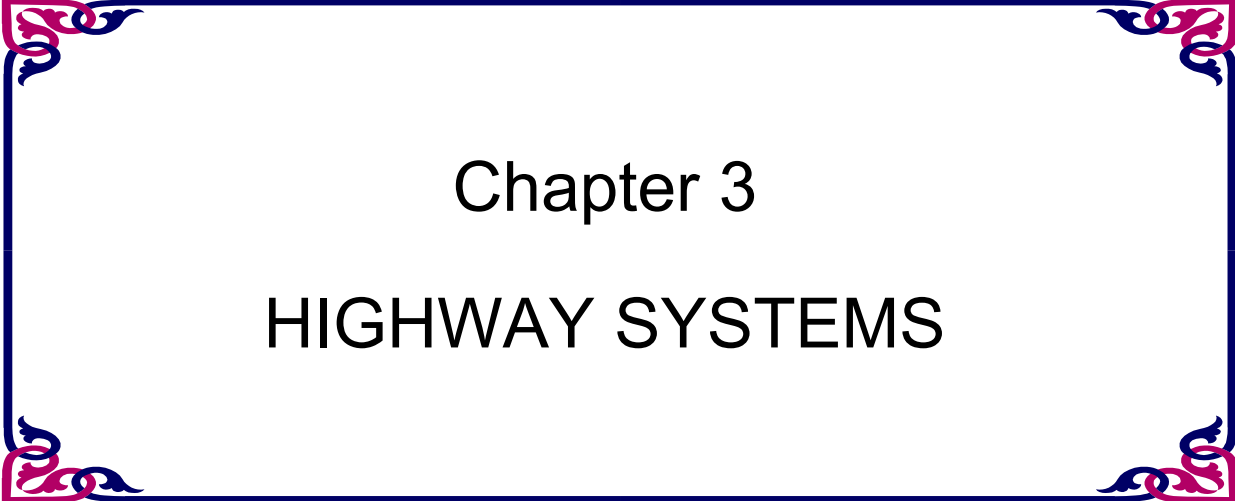

2-6 ACRONYMS

This is a summary of the acronyms used within this chapter.

AASHTO	American Association of State Highway and Transportation Officials
ADA	Americans with Disabilities Act
ATSSA	American Traffic Safety Services Association
BLRS	Bureau of Local Roads and Streets
CFR	Code of Federal Regulations
CL	Circular Letter
FHWA	Federal Highway Administration
GCPF	Grade Crossing Protection Fund
IACE	Illinois Association of County Engineers
IDOT	Illinois Department of Transportation
ILCS	<u>Illinois Compiled Statutes</u>
ILMUTCD	<u>Illinois Supplement to the Manual of Uniform Traffic Control Devices</u>
IML	Illinois Municipal League
ITE	Institute of Transportation Engineers
LPA	Local Public Agency
MFT	Motor Fuel Tax
PM	Procedure Memoranda
SJNG	State Job Number Generator System
T2	Technology Transfer Center
TBP	Township Bridge Program
TOI	Township Officials of Illinois
TRB	Transportation Research Board
USC	United States Code

Chapter 3

HIGHWAY SYSTEMS

3-1 HIGHWAY SYSTEMS

This Section discusses two highway system designations — the Federal-aid Highway System and the Illinois System of Highways. Under the Federal-aid Highway System, highways are segregated according to federal funding purposes. The Illinois system is segregated according to jurisdiction and/or maintenance responsibilities. Note that some highways may be under both systems (e.g., Interstates, marked routes).

3-1.01 Federal-Aid Highways

3-1.01(a) National Highway System

The National Highway System (NHS) is a network of highway routes and connections to transportation facilities. NHS represents approximately 4% to 5% of the total public road mileage in the United States. A specific highway route may be on more than one subsystem. Specifically, NHS includes the following subsystems:

1. Interstate. The current Interstate system of highways retains its separate identity within NHS. There are also provisions to add mileage to the existing Interstate subsystem.
2. (Selected) Other Principal Arterials (OPA). These are selected highways in rural and urban areas that provide access between an arterial and a major port, airport, public transportation facility, or other intermodal transportation facility.
3. Strategic Highway Network (STRAHNET). This is a network of highways that are important to the United States' strategic defense policy and which provide defense access, continuity, and emergency capabilities for defense purposes. In Illinois, the STRAHNET is the entire marked Interstate system (including toll facilities marked as Interstate routes).
4. Major Strategic Highway Network (STRAHNET) Connectors. These are roads and highways that provide access between major military installations and highways that are part of the Strategic Highway Network (Interstate system).
5. Major Intermodal Connectors. These are selected streets and highways (primarily in urban areas) that provide access between another NHS designated route (Interstate or OPA) and a designated major port, airport, public transportation facility, freight facility, or other intermodal transportation facility.

3-1.01(b) Non-NHS Federal-Aid Highways

These highways consist of non-NHS roads and streets that are functionally classified as arterials, rural major collectors, and urban collectors. See [Section 27-3](#) for a description of functional classifications.

3-1.02 Illinois System of Highways

3-1.02(a) Definition

According to the State law, any public way for vehicular travel that has been laid out in pursuance of any law of Illinois, or which has been established by dedication, or used by the public as a highway for 15 years is considered a highway. The term “highway” includes rights of way, bridges, drainage structures, signs, guardrails, protective structures, and all other structures and appurtenances necessary or convenient for vehicular traffic. A highway in a rural area may be called a “road,” while a highway in a municipal area may be called a “street” ([605 ILCS 5/2-202](#)).

3-1.02(b) Administrative Classification

The Illinois General Assembly has segregated the Illinois system of highways into four distinct highway systems and associated highway authorities. Each authority has jurisdiction that confers the obligation and the authority to administer, control, construct, maintain, and operate the highway system subject to the provisions of the Illinois Highway Code. Figure 3-1A identifies each system and the corresponding authority.

For a listing of mileage for each classification, see the [Illinois Highway and Street Mileage Statistics](#) from the Illinois Department of Transportation’s (IDOT) Office of Planning and Programming (OPP) under the Report tab of IDOT’s website.

System	ILCS Reference	Highway Authority (605 ILCS 5/2-213)
State Highway System	605 ILCS 5/2-101	Illinois Department of Transportation
County Highway System	605 ILCS 5/2-102	County Board
Township and District Road System	605 ILCS 5/2-103	Highway Commissioner*
Municipal Street System	605 ILCS 5/2-104 65 ILCS 5/1-1-2(2)	Corporate Authority of Municipality (See Section 3-1.03(d))

* *The highway authority is the county board for discretionary functions and the county engineer for administrative functions for County Unit Road Districts.*

ADMINISTRATIVE HIGHWAY CLASSIFICATION

FIGURE 3-1A

3-1.02(c) State Highway System

The State highway system consists of all highways under the jurisdiction of the Illinois Department of Transportation. This system contains all Interstate highways, all other marked State and U.S. routes, and some unmarked routes.

BUREAU OF LOCAL ROADS & STREETS
HIGHWAY SYSTEMS

June 2018

3-1-3

The Illinois Highway Code, [605 ILCS 5/2-101](#) defines rural highways and their municipal extensions that are part of the State highway system.

The following items apply to the State highway system, but are not all inclusive:

1. State Takeover of Highways. At its discretion, IDOT may add additional highways to the State highway system by laying out new highways or taking over highways from the county highway system, township and district systems, or the municipal street system. These additions must form a logical part of the State highway system for traffic purposes. Before any highway is taken over, IDOT is required to notify the proper local officials in writing of its intention and the date when it will assume the maintenance and care of these highways ([605 ILCS 5/4-203](#)).
2. State Highway Extensions through Municipalities. In all cases where traffic on a State highway runs through a municipality, or where the municipality is the terminus of the State highway, IDOT is required to locate the route on existing or new streets so as to form a continuous route and serve the needs of traffic ([605 ILCS 5/4-205](#)). Any State highway route in a municipality may be relocated upon other streets to better serve traffic demands provided the municipality assumes jurisdiction of the abandoned route. IDOT is responsible for leaving the abandoned route in reasonable condition for traffic ([605 ILCS 5/4-206](#)).
3. Change in State Highway Status. IDOT may enter into a written contract with any highway authority for the jurisdiction, maintenance, administration, engineering, or improvement of any highway or portion thereof ([605 ILCS 5/4-409](#)).

3-1.02(d) County Highway System

The county highway system is under the authority of the county board and consists of the following highways ([605 ILCS 5/2-102](#)):

- State-aid roads and their municipal extensions constructed prior to July 1, 1959, and for which the county was responsible for maintenance, in whole or in part.
- Certain highways improved as Federal-aid highways (formally known as Federal-aid secondary highways), which the county has agreed to maintain pursuant to an agreement between the county and IDOT.
- Highways on which construction was completed after July 1, 1959, and which became part of the system under the provisions of the Illinois Highway Code.
- Highways added to the system under the provisions of the Illinois Highway Code.
- Any access road constructed under [105 ILCS 5/10-22.36A](#) and connecting school grounds with any highway described in the preceding paragraphs.

The following applies to the county highway system:

1. Description of County Highway System. As nearly as possible, the county highway system shall be the highways that connect principal municipalities and trading points

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS
HIGHWAY SYSTEMS

3-1-4

June 2018

(traffic generators) within the county with each other, and also with principal municipalities and trading points (traffic generators) in other counties ([605 ILCS 5/5-102](#)).

2. **Total Mileage.** [605 ILCS 5/5-104](#) limits the mileage that can be included in the county highway system. The total mileage of highways in the county highway system shall not exceed 35% of the total rural public highway mileage in a county having less than 500,000 inhabitants or 75% of the total rural public highway mileage in a county having 500,000 or more inhabitants. County highways within a municipality are not included in the overall total mileage. When 80% of the maximum permissible county highway system has the proper geometrics, surfacing, and drainage, as determined by IDOT, the county highway system may be increased by 10%. IDOT will be responsible for determining the total rural public highway mileage for each county ([605 ILCS 5/5-104](#)).
3. **System Changes.** Temporary closing or changes to the system, including additions and deletions from, may be made by a resolution of the county board, subject to the approval of IDOT. Highways removed from the county system that do not become part of the State highway system become part of the township and district road system, if in a rural area, or the municipal street system, if in a municipality ([605 ILCS 5/5-105](#)). It will be necessary for the county to enter into a jurisdictional transfer agreement with the appropriate entity, either the State, township, or municipality for the responsibility of the portion of roadway being removed from the county highway system ([605 ILCS 5/4-409](#)). Permanent changes are required to be indicated on IDOT's county map system in accordance with [605 ILCS 5/5-103](#). See [Section 5-2](#) for details on jurisdictional transfers. These provisions do not apply to the vacation or relocation of a county highway pursuant to [605 ILCS 5/5-107](#), [605 ILCS 5/5-109](#), or [605 ILCS 5/5-110](#).

When considering changes that would result in a disconnected highway system, particularly between counties, sufficient justification will be required. Without this justification, IDOT approval of the addition or deletion will be subject to the adoption by the adjoining county of a resolution designating the necessary addition or deletion to its county highway system to form a connected system or maintain continuity ([605 ILCS 5/5-102](#)). There are a few exceptions to this, and those exceptions must be due to unusual circumstances. A stub connection to a public park, recreational area, or a school ground is also considered an acceptable addition.

[605 ILCS 5/4-409](#) authorizes any local highway authority to enter into a written contract (agreement) with any other highway authority for the jurisdiction, maintenance, administration, engineering, or improvement of any highway or portion thereof. All changes in the status of county highways brought about by these actions must be accomplished by a written contract (agreement) entered into by the county board and any other highway authority involved. Any proposed jurisdictional change will require the approval of IDOT.

4. **Municipal Extensions of County Highways.** The county board, by resolution approved by IDOT, may designate an existing street as a municipal extension of a county highway. The street will remain part of the municipal street system until construction by the county commences, then only the portion being constructed or improved will become part of the

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS
HIGHWAY SYSTEMS

June 2018

3-1-5

county highway system ([605 ILCS 5/5-106](#)). The county should obtain concurrence from the municipality prior to designating a municipal extension. Approval by the corporate authorities of municipalities with populations over 500 is required before counties may construct or maintain a street within the corporate limits of a municipality. Approval is not required if the municipality has a population of 500 or less ([605 ILCS 5/5-408](#)); however, counties are encouraged to obtain concurrence from municipalities with a population of 500 or less ([605 ILCS 5/1-102](#)).

5. Relocation. Relocations of county highways may be made during the improvement of the county highway according to plans approved by the county board and IDOT. Upon completion of the relocated highway and its opening to public travel, the new location will become the location of the county highway and the original location will be considered abandoned as a county highway ([605 ILCS 5/5-107](#)). If the highway is not vacated, it will become part of the township or district road system or municipal street system. If the highway is vacated, it will revert to the adjacent property owners.
6. Change in Municipal Corporate Limits. Annexation or disconnection of territory by municipalities does not change the termini of county highways or their extensions.
7. Numbering of County Highways. All county highways are required to be designated by a number. IDOT is responsible for assigning a number to each county highway. IDOT may from time to time renumber county highways ([605 ILCS 5/5-108](#)).

3-1.02(e) Township and District Road Systems

The township and district road system consists of the following ([605 ILCS 5/2-103](#)):

- all rural public roads not part of the State highway system, the county highway system, or the municipal street system and not under the jurisdiction of any department, board, commission, agency, or municipal corporation of the State of Illinois;
- any access road constructed under the School Code, [105 ILCS 5/10-22.36A](#) connecting school grounds with the roads described above; and
- any non-dedicated subdivision road that has been maintained or improved with MFT funds under [605 ILCS 5/5-701.15](#) and [605 ILCS 5/6-701.8](#).

The following regulations apply to the township and district road systems:

1. Road Districts. District road systems are maintained by road districts. Road districts may be one of the following types:
 - a. Township Road District. Each township of the counties under township organization is defined as a road district for road purposes ([605 ILCS 5/6-102](#)). No township road district may continue in existence if the total mileage of roads forming the district becomes 4 miles or less. In these cases, the road district is abolished, and the township board of trustees then administers the road system. They shall contract with the county, a municipality, or a private contractor to maintain the few remaining roads ([605 ILCS 5/6-130](#)).

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS
HIGHWAY SYSTEMS

3-1-6

June 2018

- b. Consolidated Township Road District. Any two or more townships in a county under township organization may be merged into a consolidated township road district ([605 ILCS 5/6-108](#)).
 - c. Road Districts in Townships Not Under Township Organization. In counties under the commission form of government not under township organization (commission form), road districts are established by the county board ([605 ILCS 5/6-105](#)).
 - d. County Unit Road Districts. Counties having less than 500,000 inhabitants may be organized into county unit road districts for road construction and maintenance purposes. This type of road district is permitted for counties under the township or the commission form of government ([605 ILCS 5/6-111](#)).
 2. Funding. Because the highway commissioner has jurisdiction of its highways, the highway commissioner must approve the expenditure of township road district funds and the construction, repair, and maintenance of township roads within the road district.
 3. Creation of New Districts (Commission Form).
 - a. Organization of Territory within Municipalities. Whenever the territory of any municipality with a population not less than 15,000 is a part of two or more road districts in a county not under township organization, the municipality, by resolution, may request the county board to organize it into a separate road district. The county board must approve this request ([60 ILCS 1/15-5](#)).

After a separate road district is formed by a municipality, any territory annexed or disconnected by the municipality will be disconnected from or annexed to the adjacent road district by resolution of the county board ([60 ILCS 1/15-10](#)).

All powers vested in a road district organized by the municipality, including the power of the highway commissioner and the district clerk will be vested and exercised by the municipality. Consequently, the offices and election of the highway commissioner and the district clerk are no longer applicable ([605 ILCS 5/6-104](#)).
 - b. Alteration of Boundaries. The county boards in counties not under township organization have the full and complete power and jurisdiction to alter the boundaries of road districts, create new road districts, and consolidate road districts ([605 ILCS 5/6-105](#)). Note that these procedures are not applicable for a road district created from territory within a municipality as identified in paragraph 3.a. above.
 4. Inclusion of Dedicated Public Roads or Streets. In counties with fewer than 3,000,000 inhabitants, roads or streets in platted subdivisions and dedicated to public use are considered part of the township or district road systems, without any hearing or petition, if they conform to the rules and conditions established by the county board. The highway commissioner is responsible for determining if these roads and streets conform to the county regulations. If the highway commissioner refuses or fails to make an order to include the roads or streets into the system, any three interested persons may appeal to the county engineer to determine if the roads or streets conform to the regulations. If

HARD COPIES UNCONTROLLED

the county engineer agrees with the request, the county engineer will prepare an order to incorporate the roads or streets into the system. Roads and streets that do not conform, and other roads and streets dedicated to public use, but which are not in platted subdivisions, may be included in the system. However, any hearings, petitions, and procedures as described in [605 ILCS 5/6-303](#) and [605 ILCS 5/6-305](#) must be followed ([605 ILCS 5/6-325](#)).

5. Status of Road Coincident with a Federal-Aid Highway. A designated Federal-aid highway coincident with a township or road district road is considered a township or road district road under the jurisdiction of the highway commissioner until it has been improved as a Federal-aid project or involved in a jurisdictional transfer agreement.

When the county or municipality proposes to improve a Federal-aid highway that is coincident with a township or district road, it will be necessary to transfer jurisdiction of that road to the county or municipality upon completion of the improvement ([605 ILCS 5/3-104, 104.1, and 108](#)). However, pursuant to [605 ILCS 5/3-104.3](#), a township or road district may improve, as a Federal-aid project, any highway under its jurisdiction that is part of the Great River Road under United States Code 23 U.S.C. 148.

6. Change in Township and Road District Road Status Due to Municipal Annexation. See the discussion in Section 3-1.02(f).
7. Vacating Township and Road District Roads. The process of vacating an existing right-of-way or road is found in [605 ILCS 5/6-301 - 5/6-316](#).

3-1.02(f) Municipal Street System

Municipal streets consist of existing or new streets within municipal limits that are not part of the State or county system. Streets beyond municipal limits can be included in the jurisdiction of the municipal system. In addition, roads constructed under the School Code, [105 ILCS 5/10-22.36A](#) connecting school grounds to municipal streets or roads may also be included in the municipal street system ([605 ILCS 5/2-104](#)).

The corporate authority of each municipality regulates the use of the streets. The term municipality includes a city, village, or incorporated town. The corporate authority is:

- for cities, the city council or similar body;
- for municipalities under the commission form of government, the council; and
- for villages or incorporated towns, the board of trustees.

The following applies to the municipal street system:

1. Municipal Street Extensions Outside Corporate Limits. The corporate authorities of the municipality must designate these municipal street extensions by resolution. Two copies of the resolution must be sent to the IDOT Regional Engineer.
2. Change in Status of Municipal Streets.
 - a. Annexation. Township and road district roads, brought into a municipality by the annexation of territory, automatically lose their status as township or road district

roads. These roads become municipal streets under the jurisdictional responsibility of the municipality ([605 ILCS 5/6-203](#)). The new boundary will extend to the far side of any adjacent highway and includes all of every highway within the area annexed ([65 ILCS 5/7-1-1](#)).

- b. Municipal Extensions of County Highways. Municipal extensions of county highways that are included within the corporate limits of a municipality because of incorporation or annexation remain under the jurisdiction of the county unless it is deleted from the county highway system and a formal agreement is executed transferring jurisdiction to the municipality.
- c. County Highway Extensions. County highway extensions that are excluded from a municipality by disconnection of territory remain under municipal jurisdiction until a formal agreement is executed transferring jurisdiction to the county.
- d. Disconnection of Territory. Municipal streets that are excluded from municipal corporate limits by disconnection of territory will remain under municipal jurisdiction until a formal agreement is executed transferring jurisdiction to another highway authority ([605 ILCS 5/4-409](#)).
- e. Jurisdiction Transfers. [Section 5-2](#) presents the procedures for all necessary jurisdictional transfers.

3-1.03 New Construction/Reconstruction

3-1.03(a) Local Highway Authority

When a local highway authority improves its streets or roads at an intersection with a State highway, the following will apply:

- The improvement must be made to the edge of the State highway pavement. However, the improvement may terminate at the end of the existing State side road approach if the side road approach is of a higher type than the local improvement.
- Drainage facilities on State right-of-way within the improvement should be replaced or extended, if needed, by the local highway authority unless there is an agreement with the State defining the different responsibilities.
- Parking lanes are the responsibility of the local highway authority.
- All improvements by the local highway authorities within the limits of the State right-of-way must meet IDOT criteria and policies; see the Bureau of Design and Environment (BDE) Manual. If any part of the LPA project uses funds (see [Chapter 4](#)) through IDOT, the LPA project will be processed through the District Local Roads and Streets. If none of the funds are through IDOT, the LPA project will be processed through the District Permit process.

3-1.03(b) IDOT

When IDOT initiates an improvement to a State highway, the street and side road approaches will be improved by IDOT in accordance with current policies for that particular type of

improvement. Drainage facilities on the State right-of-way within the improvement will be replaced or extended, if needed, by IDOT unless there is an agreement with the local authority defining different responsibilities.

3-1.03(c) Maintenance

Maintenance of street and side road approaches within the limits of the State right-of-way is the responsibility of the local highway authority, except where IDOT upgrades a street or side road approach to a higher type than the adjoining local approach or as established on an IDOT/local agency agreement. In this case, IDOT is responsible for maintaining the upgraded portion of the approach. When a local highway authority upgrades its street or side road approach to an equal or higher type than the State approach, the local highway authority is responsible for maintaining the approach. Questions concerning maintenance issues within the State ROW should be directed to the District office. In addition, the following will apply:

1. Snow and Ice Removal. Local highway authorities are responsible for snow and ice removal on the street or side road approach to the edge of the intersecting State highway pavement, in accordance with local policy, regardless of differing type approaches.
2. Parking Lanes. Local highway authorities are responsible for maintaining parking lanes adjacent to through lanes on the State right-of-way.
3. Drainage. Drainage facilities at intersecting street or side roads within the State right-of-way will be the joint responsibility of IDOT and local highway authority unless there is an agreement defining different responsibilities (i.e., the material and labor are split between IDOT and the local agency). The District Bureau of Operations Maintenance Field Engineer should be contacted to discuss any proposed improvement of drainage facilities.

3-1.03(d) Traffic Control Devices

Policies concerning traffic control devices (e.g., signs, signals, pavement markings) within the State ROW should be directed to the District office.

3-2 AUTHORITY OF LOCAL OFFICIALS

3-2.01 Posted Speed Limit

The following definitions apply to this Section:

1. Urban District. The territory contiguous to and including any street that is built up with structures devoted to business, industry, or dwelling houses situated at intervals of less than 100 ft for a distance of a quarter of a mile or more ([625 ILCS 5/1-214](#)).
2. Residence District. The territory contiguous to and including a highway not comprising a business district when the property on such highway for a distance of 300 ft or more is in the main improved with residences or residences and buildings in use for business.

For purposes of establishing maximum speed limits, a residence district must be at least a quarter of a mile long with residences or residences and buildings in use for businesses spaced no more than 300 ft apart ([625 ILCS 5/1-172](#)).

3-2.01(a) **Statutory Speed Limits**

The Illinois Vehicle Code, [625 ILCS 5/11-601](#) establishes the maximum statutory speed limit for the following:

1. Urban District for Any Vehicle. The maximum speed limit in an urban district for all vehicles is 30 mph for a street and 15 mph for an alley.
2. Outside An Urban District. The maximum speed limit outside an urban district is 55 mph for local roads and streets.

3-2.01(b) **Establishing Altered Speed Limits**

In establishing speed limits on non-State facilities, the following will apply ([625 ILCS 5/11-604](#)):

1. Maximum Speed Limits. The county board can establish maximum speed limits for all county highways, township roads, and district roads. The maximum speed limit cannot exceed 55 mph. A municipality or park district may establish maximum speed limits on all streets that are within its corporate limits and are not under the jurisdiction of IDOT, and for which the county or highway commissioner does not have maintenance responsibility.
2. Alteration of Speed Limits. IDOT has established a "*Policy on Establishing and Posting Speed Limits on The State Highway System*". However, the Illinois Vehicle Code does not require LPAs to obtain department approval for speed zones on roads under their respective jurisdictions. While the procedures contained in this policy may be used for altering speed limits on any public highway, use of such procedures by an LPA is not required by statute. LPAs should refer to [625 ILCS 5/11-604](#) for additional information and specific regulations regarding the alteration of speed limits on local roads. Consideration may be given for performing an engineering or traffic study to validate speed alterations, which may be considered good practice even when not required by statute.

The local authority or park district may:

- decrease the speed limit within an urban district, but not to less than 20 mph;
- increase the speed limit within an urban district, but not to more than 55 mph;
- decrease the speed limit outside an urban district, but not to less than 35 mph; or
- decrease the speed limit within a residence district, but not to less than 25 mph, except as defined in the first bullet.

The local authority or park district may only alter a speed limit restriction six times per mile along a highway or street, and the difference in the speed limit between adjacent altered speed zones shall not be greater than 10 mph.

3. Schools. Speed limits adjacent to schools may be set at 20 mph for the times when children are present ([625 ILCS 5/11-605](#)).

3-2.02 Traffic Control Devices

3-2.02(a) General Authority

Local authorities may erect traffic control devices, provided that they meet the warrants and criteria stipulated in the [Illinois Supplement to the Manual on Uniform Traffic Control Devices \(ILMUTCD\)](#), on any locally designated facility. This includes signs, pavement markings, traffic signals, or any other device that may regulate traffic. Placement of any traffic control devices on township and road district roads requires written approval of the county engineer or superintendent of highways ([625 ILCS 5/11-304](#)).

3-2.02(b) State Highways

State or local authorities are not allowed to place or maintain traffic control devices on any highway under IDOT jurisdiction unless IDOT has granted prior permission ([625 ILCS 5/11-303\(b\)](#)).

3-2.02(c) Establishment of Through Highways

State or local authorities may designate any highway under their jurisdiction as a through highway and erect stop signs or yield signs at specified entrances provided that their necessity is established through an engineering and traffic investigation. Proper measures for establishing any street or highway as a through highway or designating an intersection as a stop or yield intersection are set forth under [625 ILCS 5/11-208 \(a\)6 and \(b\)](#) and [625 ILCS 5/11-302](#). The county engineer is responsible for providing written approval for all designations of a through highway and the installation of traffic control devices by the highway commissioner on township and road district roads. In addition, IDOT may, at its discretion and where traffic conditions warrant, give preference to traffic on the State highway over traffic crossing or entering the State highway by installing appropriate traffic control devices.

3-2.02(d) Designation of Truck Routes

Local authorities may by ordinance or resolution, Form [BLR 03210](#), designate any highway under their jurisdiction as a Class II or Class III truck route ([625 ILCS 5/1-126.1](#)) and in accordance to [625 ILCS 5/15-111\(f\)](#). Legally configured 80,000 pound (36,000 kg) trucks can traverse the designated highways where appropriate regulatory signs are erected as required by [625 ILCS 5/15-111\(f\)](#). Consideration should be given to the ability of the highway and structures to accommodate the anticipated loads before establishing this type of designation.

Pursuant to [625 ILCS 5/15-116](#), it is the responsibility of the local agency with jurisdiction over a Class II or Class III designated highway to report its location to the department by submitting a copy of the resolution(s) designating the highway, location maps, and reference contact names and telephone numbers.

3-2.03 Posted Weight Limit

Local authorities may restrict the usage of highways under their jurisdiction by passing an ordinance or resolution and posting and maintaining signs at each end of the affected highway in the following situations ([625 ILCS 5/15-316](#)):

1. Temporary Restrictions. Due to highway deterioration or climate conditions, temporary closures or weight restrictions may take place for no longer than 90 days in any one calendar year whenever a highway will be seriously damaged or destroyed.
2. Permanent Restrictions. Permanent restrictions may be imposed prohibiting the operation of trucks or other commercial vehicles or limiting their weight on designated highways.
3. Restrictions on Elevated Structures. Only IDOT, after conducting an investigation, may determine the maximum weight limits on bridges or other elevated structures constituting a part of a highway. ([625 ILCS 5/15-317](#)).

A local agency may also perform, or have performed, an investigation of the bridge to determine the structure's load carrying capacity. The results, sealed by an Illinois Licensed Structural Engineer, must be submitted to and approved by IDOT's Bureau of Bridges and Structures (BBS).

Upon notification from IDOT of a required weight limit, the local agency shall erect signs as soon as possible, but no later than 30 days after notification. Suitable signs stating the maximum weight limit must be posted and maintained before each end of the structure. When a structure is to be closed, the local agency should immediately erect barriers that will prohibit traffic access to such structure. If temporary, the barriers shall remain in place until permanent barriers can be installed. See [Section 6-4.03](#) for additional information.

3-2.04 Procedure for Removing Abandoned Railroad Structures and Grade Crossings

Many highway-railroad, grade-separation structures, at-grade crossings, and related track materials of rail lines that have been abandoned remain in place on intersecting public

highways. These structures constitute obstructions and encroachments on these highways and should be removed.

Unless otherwise agreed to by the local agency or IDOT, abandoned railroad structures and abandoned railroad crossings should be removed by the railroad company at their own expense. Should the railroad be unwilling to do the removal, the local agency should contact the Illinois Commerce Commission (ICC) to request that the issue be resolved through a stipulated agreement or ICC hearing.

3-2.05 Permits

3-2.05(a) Size/Weight

With respect to highways under their jurisdiction, local authorities may permit an applicant to operate or move a vehicle or a combination of vehicles of a size or weight of vehicle or load exceeding the maximum criteria only for nondivisible loads (e.g. composed of a single object, which cannot reasonably be dismantled or disassembled). All divisible loads including, but not limited to grain, sand or gravel must be hauled at or below the legal weight (e.g., 80,000 pounds (36,000 kg) for a 5-axle legally configured vehicle). The applicant of the permit must follow the procedures specified in [625 ILCS 5/15-301](#).

3-2.05(b) Utilities

Written consent of the controlling highway authority is required before any ditch, drain, track, rail, pole, wire, pipeline, or other equipment of a public utility company, municipal corporation, or other public or private entity may be located, placed, or constructed on, under, or along any highway ([605 ILCS 5/9-113](#)).

3-2.05(c) Entrances

In constructing a public highway, the highway authority is required to provide entrance culverts or crossings wherever ditches are created at junctions with other highways or at entrances and openings of adjoining premises. Replacement or modification of existing entrance culverts or crossings proposed by entities or property owners other than the highway authority may be made with the consent of the highway authority, provided the applicant constructs a replacement or modification of a type and size specified by the highway authority. The replaced or modified structure becomes the property of the public ([605 ILCS 5/9-105](#)).

3-2.06 Establishment of Freeways

The designation, establishment, and limiting of freeway access by the corporate authorities of a municipality or county board are authorized under [605 ILCS 5/8-101](#). Although the statutes do not require formal approval of the corporate action by IDOT, it is necessary for the municipality to advise IDOT of its action. The municipality should consider posting this designation along the highway designated to advise the property owners and general public of this fact.

3-3 ACRONYMS

This is a summary of the acronyms used within this chapter.

BBS	Bureau of Bridges and Structures
BDE	Bureau of Design and Environment
ICC	Illinois Commerce Commission
IDOT	Illinois Department of Transportation
ILCS	<i>Illinois Compiled Statutes</i>
<i>ILMUTCD</i>	<i>Illinois Supplement to the Manual of Uniform Traffic Control Devices</i>
LPA	Local Public Agency
NHS	National Highways System
OPA	Other Principal Arterial
OPP	Office of Planning and Programming
STRAHNET	Strategic Highway Network
USC	United States Code

Chapter 4

LOCAL ROADS AND STREETS FUNDING

Local Public Agencies (LPAs) receive funding for their local roads and streets from a variety of sources including federal and State programs, the Motor Fuel Tax (MFT) fund, and local sources. This Chapter provides an overview of each source that provides funding for projects on local facilities for which Bureau of Local Roads and Streets (BLRS) is involved in some part of the administration. Guidance for obtaining these funds and the implementation of these programs can be found in [Chapter 9](#) for State and MFT funds and in [Chapter 17](#) for federal funds.

4-1 FEDERAL PROGRAMS

Federal programs provide funding for transportation projects through the Highway Trust Fund (HTF). Funds are collected through revenue from certain highway user taxes, primarily the federal gasoline tax and a variety of tire and truck sales taxes. These taxes are credited to the HTF to be used for transportation spending. All states receive federal funding. The amount is dependent, among other factors, on the revenue contribution of each individual state.

The functional classification of a road or street facility is one of the factors that affect federal funding eligibility. [Section 27-3](#) discusses the functional classification system. Facilities on the local system (e.g., those off the State highway system) may be functionally classified as local, collector (minor or major), or arterial (minor or principal). Other factors affecting federal funding eligibility is fund type, population (urban / rural), and scope of work. The LPA should contact the District office for clarification on eligibility requirements.

A federal highway bill is passed by Congress for a specific time period and determines the formula and discretionary programs to fund specific types of improvements, eligibility criteria, funding levels, level of funding participation, requirements to receive federal funds, etc. Each new federal highway bill may be similar or significantly different than the previous bill. If a new federal highway bill has not been passed prior to the ending of the current bill an extension is typically passed to provide additional funding of the current bill, typically called a continuing resolution. Figure 4-1A (new) shows a comparison of past federal highway bills in the formula and discretionary programs.

Section 4-1 provides a brief discussion on those categorical Federal-aid programs in the current federal highway bill or programs from previous bills with funds still available that provide funds available to local governments for transportation improvements. Unless otherwise noted, federal funds can generally be used to fund 80% of eligible costs.

The current federal highway bill is called *Fixing America's Surface Transportation Act (FAST Act)*. The Federal Highways Administration (FHWA) publishes [A Guide to Federal-Aid Programs and Projects](#) which provides additional information on current and inactive programs and projects.

4-1.01 National Highway Performance Program (NHPP)

NHPP funding can be used for state or local projects on the National Highway System (NHS) or NHS connector routes for roads, bridges, tunnels, ferry boat facilities, transit facilities, truck parking facilities, bicycle transportation facilities, pedestrian walkways, ITS, bus terminal facilities and commuter parking facilities.

The NHS is a network of selected principal arterial routes identified as essential for international, interstate, and regional commerce and travel, national defense, and the transfer of people and goods to and from major inter-modal facilities.

The previous federal transportation bill, *Moving Ahead for Progress in the 21st Century*, (MAP-21) expanded the size of the NHS by adding principal arterials and state border crossings not currently on the NHS and other connector highways that provide motor vehicle access between arterial routes on the NHS and a major inter-modal transportation facility. All state and local roads that are part of the NHS are designated in Illinois Roadway Information System (IRIS) and Illinois Roadway Analysis Database System (IROADS). Although NHS funding is important nationwide, very few miles of the local highway systems in Illinois are on the NHS. See [Section 3-1](#) for additional information on NHS. The new *FAST Act* directs DOTs, within 90 days of enactment, to issue guidance to states on the reclassification of roads recently added to the NHS per MAP-21 and to identify any needed functional classification changes to rural and urban principal arterials.

4-1.02 Surface Transportation Program

4-1.02(a) General

The *FAST Act* renames the Surface Transportation Program (STP) to the Surface Transportation Block Grant Program (STBGP) and increases the amount of funding that is sub-allocated to metropolitan areas based on population from 51% to 55% over five years. However, within the *Bureau of Local Roads and Streets Manual* the term STP will continue to be used instead of STBGP. STP provides federal funds for the following types of projects:

- highway projects on all functional classes, except facilities functionally classified as “local”;
- bridge projects on any public road, including “local” functional classes;
- transit capital projects; and
- public bus terminals and facilities.

The basic objective of STP is to provide Federal-aid for improvements to facilities not on the NHS. The Program is aimed at providing more flexibility in determining transportation solutions and enhanced planning and management systems to the states and local governments.

STP funds also may be used for activities such as environmental provisions, modifications to meet accessibility for persons with disabilities, infrastructure-based intelligent transportation system capital improvements, and privately owned inter-city bus terminals and facilities.

STP funds are distributed to each state based on its lane-miles of Federal-aid highways, total vehicle-miles traveled on those highways, and estimated contributions to the Highway Account of the HTF. Because of its emphasis on highway facilities that do not have national importance, STP provides the largest source of Federal-aid funds available for local facilities in Illinois.

The *FAST Act* continues *MAP-21's* new approach to core formula program funding, authorizing a lump sum total instead of individual authorizations for each program. Once each State's share of the total is calculated, it is divided up by program within the State. From the State's STP apportionment, the following sums are to be set aside:

- A proportionate share of funds for the State's Transportation Alternatives (TA) program.
- 2% for State Planning and Research (SPR).
- For off-system bridges, an amount not less than 15% of the State's FY 2009 Highway Bridge Program apportionment (may not be taken from amounts sub allocated based on population).
- The set-aside for Transportation Enhancements is eliminated.

A State's STP allocation is further subdivided according to Federal-aid provisions. These are discussed in the following Sections.

STP funds both urban and rural provides up to 80% funding for improvements.

4-1.02(b) Urban

Urban areas receive an STP sub-allocation based on the state's urban population. Illinois identifies these funds as "STU." Urban areas are those areas identified by the U.S. Census Bureau as having a contiguous population of 50,000 or more (urbanized areas) or 5,000 or more but less than 50,000 (small urban areas). The urban area boundaries are established by the State, in cooperation with the Metropolitan Planning Organizations (MPOs) and other appropriate local officials and approved by FHWA. For the STU sub-allocation, the distribution formula segregates urban population densities into the following two categories:

- Areas with population greater than 5,000 but no more than 200,000; and
- Urbanized areas with population greater than 200,000.

The STU sub-allocation provides specific funding amounts for each urban area nationwide with populations exceeding 200,000. There are six metropolitan areas in Illinois meeting the 200,000-population level — Chicago, Peoria, Rockford, Round Lake Beach, Quad Cities (Rock Island-Moline-Bettendorf-Davenport), and East St. Louis/St. Louis. There are eight areas in Illinois that have populations over 50,000 but less than 200,000. The Central BLRS (CBLRS) specifies the STU sub-allocation of funds based on percentages of population of the urban area.

By law, any urban area of over 50,000 must undertake a process to develop transportation plans and programs formulated based on transportation needs and with due consideration to comprehensive, long-range land use plans, development objectives, and social, economic, environmental, and energy conservation goals. The structure for this type of program must include a designated MPO agreed to by the local units of government and officially designated by the Governor as the recognized body. For those areas with population greater than 5,000 but no greater than 200,000, the CBLRS specifies the STU sub-allocation of funds based on percentages of population of the urban area. Further distribution of STU funds in these areas is coordinated by the designated MPO.

4-1.02(c) Rural

STP funds used in rural areas, all areas outside of urbanized, and small urban areas are identified by Illinois as "STR".

Prior to the recent federal highway authorization bills, four counties in District One (Will, Kane, Lake, McHenry) received funds that were provided for improvement to Federal-aid Secondary (FAS) designated routes. An agreement was reached by the Illinois Department of Transportation (IDOT) and the four District One counties to distribute a minimum of \$2 million of STR funds per year to the counties as replacement funds for FAS funds that are no longer available.

District One distribution of STR funds by IDOT is determined as follows:

- 50% of the annual allotment is allocated equally to the counties; and
- 50% of the annual allotment is allocated based on the proportion of total population per county.

The formula for distribution of the STR funds to Districts 2 through 9 is as follows:

- 10% divided equally among the downstate counties, Districts 2 through 9; and
- the balance being allocated to the downstate counties on the basis of the following three factors with equal weight being given to each factor:
 - + non-urban area,
 - + non-urban population, and
 - + non-urban mileage (total all systems).

Federal requirements stipulate that up to 15% of the STR sub-allocation can be spent on rural minor collectors.

4-1.02(d) Bridges

STP funds may be used to replace or rehabilitate bridges (e.g., structures longer than 20.0 ft (6.1 m) on any public road. Allowing STP funding for work on a bridge is intended to reduce the number of bridges on the STP-Bridge eligibility list. See [Section 6-1](#) for the definition of a bridge.

4-1.03 Safety

4-1.03(a) The Highway Safety Improvement Program (HSIP)

HSIP is a core Federal-aid funding program with the goal of achieving a significant reduction in traffic fatalities and serious injuries on all public roads. Highway safety improvement projects correct or improve a hazardous road location or feature or address a highway safety problem.

See IDOT's website for additional information on the [Illinois Highway Safety Improvement Program \(HSIP\)](#).

4-1.03(b) High Risk Rural Roads (HRRR) Special Rule

The *FAST Act* also continues the High Risk Rural Roads (HRRR) Special Rule, which requires states in which the fatality rate on rural roads increased over the most recent two-year period to obligate a specified amount of funds toward HRRR safety projects in the next fiscal year. This penalty is not additional money allocated to the state, but instead a portion of the HSIP amount the state already receives. During HRRR penalty years, Central Bureau of Local Roads and Streets must identify HSIP projects that qualify as HRRR projects that: 1) are located on a rural major/minor collector on a local road; and 2) fall outside of an urbanized area.

4-1.03(c) Local Rail/Highway Grade Crossing Safety Program

The federal rail safety program is a set-aside of the federal HSIP funds to reduce the number of fatalities and serious injuries at public highway-railway crossings through the elimination of hazards and/or the installation/upgrade of warning devices at crossings. These include flashing light signals and gates, circuitry upgrades, or approach work at railroad/highway grade crossings. IDOT selects eligible rail safety projects on the local highway system. See [Section 40-2](#) for more information on safety at railroad/highway crossings.

The program provides up to 90% federal funding for improvements.

4-1.04 Transportation Alternatives (TA)

The *FAST Act* eliminates the *MAP-21* Transportation Alternatives Program (TAP) and replaces it with a set-aside of STP funding for Transportation Alternatives (TA). These set-aside funds include all projects and activities that were previously eligible under TAP and covers the Illinois Transportation Enhancement Program (ITEP), the Illinois Safe Routes to School Program (SRTS), and the Recreational Trails Program (RTP). Fifty percent of the State's apportionment of TA is sub-allocated to areas based on their population, with the remaining 50% for anywhere in the State.

Metropolitan Planning Organizations (MPOs) of urbanized area with populations over 200,000 will administer the sub-allocation of TA funds through a competitive process and select the projects from eligible entities in consultation with IDOT.

The remaining TA funds will be administered through IDOT under ITEP, SRTS, RTP.

4-1.04(a) Illinois Transportation Enhancements Program (ITEP)

ITEP encompasses a broad range of activities that go beyond the traditional accommodations for cars, trucks, and transit. However, these projects must relate to surface transportation.

ITEP projects are eligible for up to 80% federal funding, except for the purchase of right-of-way, which is funded at up to 50% of federal funds. The Office of Planning and Programming (OPP) is responsible for determining which projects are eligible for ITEP funds.

See IDOT's website for additional information on the [Illinois Transportation Enhancement Program \(ITEP\)](#).

4-1.04(b) The Illinois Safe Routes to School Program (SRTS)

SRTS is a federally funded program which supports projects and programs that enable and encourage walking and bicycling to and from school. The program applies to schools serving grades Kindergarten through 8th grade. The program provides up to 80% federal funding for infrastructure and non-infrastructure projects.

See IDOT's website for additional information on the [Illinois Safe Routes to School Program \(SRTS\)](#).

4-1.04(c) Recreational Trails Program (RTP)

The *FAST Act* continues the Recreational Trails Program (RTP) as a set-aside of TA to provide funds to develop and maintain recreational trails and trail-related facilities for both non-motorized and motorized recreational trail uses. This program will continue to be administered by the Illinois Department of Natural Resources (IDNR). RTP projects are eligible for up to 80% federal funding.

4-1.05 Illinois STP - Bridge Program

MAP-21 eliminated the Highway Bridge Program (HBP) as a core funding program. IDOT, along with the Illinois Association of County Engineers (IACE), and the Public Works Committee of the Illinois Municipal League (IML), have found consensus that the HBP process for distribution of funds based on deficient square footage of bridge area is a sound and equitable premise for fund allocation. The Department has therefore decided to continue using this process for fund allocation through the Illinois STP-Bridge Program.

Illinois STP-Bridge funds provides up to 80% funding for improvements.

4-1.05(a) General

The Illinois STP-Bridge Program (STP-Bridge) provides funds for bridges that are structurally deficient and/or functionally obsolete and have a sufficiency rating of 80 or less and are located on a public road. A bridge is defined as any structure having a length greater than 20.0 ft (6.1 m). See [Section 6-1](#) for the definition of a bridge.

A bridge is structurally deficient if the deck, superstructure, substructure, or culvert has an evaluation rating of 4 or less, or if the structural evaluation or waterway adequacy has an appraisal rating of 2 or less. The bridge is functionally obsolete if the deck geometry, underclearances, or the approach roadway alignment has an appraisal rating of 3 or less, or if the appraisal rating for structural evaluation or waterway adequacy is 3. These evaluation and appraisal ratings and the sufficiency rating can be found in the Illinois Structure Information System (ISIS) as discussed in [Section 6-2](#). A STP-Bridge eligible bridge having a sufficiency rating of 80 or less is eligible for rehabilitation. A STP-Bridge eligible bridge that has a sufficiency rating of less than 50 is eligible for replacement.

In addition to the eligibility requirements above, there are also limitations to the type of work that may be completed based on the functional classification for the roadway which the bridge carries. The STP-Bridge Program funds may be used to rehabilitate or replace any eligible bridge located on a roadway with a functional classification of at least a major collector. The STP-Off System Bridge Program funds may be used to rehabilitate or replace any eligible bridge located on a minor collector or local road.

As with the discontinued Highway Bridge Program, the purpose of this program is to remove structurally deficient and functionally obsolete bridges from the inventory. As such, STP-Bridge funds may not be used to rehabilitate or replace small structures or replace a small structure with a bridge. The STP-Bridge funds also may not be used to construct a small structure or bridge where one does not already exist.

In addition to rehabilitating or replacing eligible bridges, the following work is eligible for the use of STP-Bridge funds:

- approach roadways pursuant to Section 4-1.05(b);
- bridge painting (spot painting is not eligible) – sufficiency rating (SR) of 80 or less can be funded as a sole item of work;
- seismic retrofit – no SR restriction; can be funded as a sole item of work;
- historic bridges – inventory for historic significance and preservation in accordance with 23 U.S.C. 144(o);
- bridge inspection – routine NBIS, fracture critical, special, damage and underwater bridge inspections are eligible, including underwater scour evaluation, training, and equipment purchase, and/or rental;
- initial cost for posting signs immediately adjacent to the bridge;
- anti-icing/de-icing applications – the bridge must be STP-Bridge eligible; and
- scour countermeasures – countermeasures must be designed but may be used at any structure with scour problems or potential scour problems.

Removal of an eligible bridge without replacement, or without replacement with an eligible bridge, may also qualify for funding as long as the through roadway is maintained. The eligible bridge may be replaced with a non-eligible bridge (AASHTO length less than or equal to 20.0 ft (6.1 m),

but in such a case only portions of the project germane to the removal of the bridge are eligible for STP-Bridge funding.

Bridges that have been closed for greater than five years will not be included in the calculations to determine an individual county's STP-Bridge allotment. These structures will have their Bridge Status, Illinois Structure Information System (ISIS) Item 41, coded as "E – Closed, Permanent Closure." The eligibility of the bridge will be restored when the bridge owner places the bridge replacement / repair project into their highway improvement program. The Bridge Status will then be changed to "B – Closed, replacement/repair anticipated within 5 years."

4-1.05(b) Approach Limits for STP-Bridges Projects

1. The following shall be considered in establishing reasonable touchdown points for approach work to be funded with STP-Bridge funds. These requirements include the following:
 - a. Replacement. Total replacement of a structurally deficient or functionally obsolete bridge with a new facility constructed in the same general traffic corridor. A nominal amount of approach work, sufficient to connect the new facility to the existing roadway or to return the gradeline to an attainable touchdown point in accordance with good design practice is also eligible. The replacement structure must meet the current geometric, construction and structural standards required for the types and volume of projected traffic on the facility over its design life.
 - b. Rehabilitation. The project requirements necessary to perform the major work required to restore the structural integrity of a bridge, as well as work necessary to correct major safety defects, are eligible except as noted under ineligible work. Bridges to be rehabilitated both on or off the Federal-Aid System shall, as minimum, conform with the provisions of 23 C.F.R. § 625, Design Standards for Federal-aid Highways, for the class of highway on which the bridge is a part.
 - c. Ineligible Work. Except as otherwise prescribed by the Department, the costs of long approach fills, causeways, connecting roadways, interchanges, ramps, and other extensive earth structures, when constructed beyond the attainable touchdown point, are not eligible under the STP-Bridge program.
2. The following guidelines shall be used in establishing reasonable touchdown points:
 - a. Existing Location (Bridge Project Only). When replacing or rehabilitating a bridge to current Department standards on existing grade and location, all approach work items required to transition back into the existing roadway and safety appurtenances pertaining to the bridge are eligible. The cost of any temporary detour required to maintain traffic while the structure is being built is eligible.

BUREAU OF LOCAL ROADS & STREETS
LOCAL ROADS AND STREETS FUNDING

June 2018

4-1-9

- b. Existing Location (Roadway Project with Bridge Included). This applies to projects that upgrade a roadway that also results in rehabilitation or replacement of an eligible bridge. When replacing or rehabilitating a substandard bridge to minimum standards or greater, on existing grade and location, bridge work items will be limited to 50 ft of approach work at beginning and end of bridge. All approach work items in the 100 ft are eligible for consideration for STP-Bridge funding. (This allows the coverage of the cost of approach slabs, select material behind the abutments, guardrail attachments and other approach work items.) If a detour is required, associated roadway costs required to maintain traffic while the structure is being built are eligible. This section applies to a roadway segment project which has a bridge project included within it.
 - c. New Location. When replacing a bridge that must be raised or relocated due to substandard vertical and horizontal alignment, substandard clearances, hydraulic design issues, constructability issues, etc., the minimum amount of approach roadway work necessary to tie the relocated alignment back into the existing roadway is eligible. The alignment will conform to current Department standards based on the functional classification and projected traffic volumes for that particular roadway.
3. In accordance with previous paragraphs 1 and 2 of this Section, every deficient bridge scheduled for rehabilitation or replacement shall be evaluated individually by the LPA to establish reasonable touchdown points for approach work. IDOT may approve the reasonable touchdown points for eligible bridges if the total length of the approach work does not exceed 1,200 ft.

4-1.05(c) Waiver Process for STP-Bridge Program

1. Sufficiency Rating. Under the Illinois STP-Bridge Program, eligible bridges with a sufficiency rating between 50.0 and 80.0 are eligible for rehabilitation work only. However, if the LPA with jurisdiction over the bridge prefers to do a bridge replacement, the LPA is required to submit a waiver request to the Department for review and approval. Justification for replacement of the structure versus rehabilitation is required as part of the waiver request. Requests should be initiated through the appropriate District Local Roads and Streets office and directed to the Local Bridge Unit (LBU) within the IDOT Central Bureau of Bridges and Structures (BBS).
2. Touchdown Points. If the LPA determines that the reasonable touchdown points should exceed the criteria in Section 4-1.05(b) Item 3, the project shall be submitted to IDOT with supporting documentation for review and approval. The issue may also be addressed at a federal project coordination meeting. A statement from the county engineer that all elements are designed to the operating speed, which does not exceed the posted or statutory speed, shall be considered sufficient documentation by both IDOT that the touchdown points are reasonable.

HARD COPIES UNCONTROLLED

4-1.06 Illinois Major Bridge Program

IDOT dedicates federal funds from the NHPP and/or STP programs for its Major Bridge Improvement Program. Bridges under the jurisdiction of a LPA and eligible for STP-Bridge funding that have a total project cost for all engineering, utilities, land acquisition, and construction for replacement or rehabilitation of more than \$1,000,000 are candidates for this Program. Funds for this Program can only be used to fund up to 80% of the construction and construction engineering. The LPA is responsible for the cost of preliminary engineering, land acquisition, utilities, and other pre-construction activities. All other requirements of STP-Bridge are applicable.

4-1.07 STP-Bridge Soft Match Credit Program

Illinois allows up to 80% of the State and local source amount expended on off-system bridge construction to be credited to the non-federal share of STP-Bridge eligible bridge replacement or rehabilitation projects. The bridge work must follow the structural design policies for the STP-Bridge funding program as defined in the Section 4-1.05 and [Chapter 36](#).

4-1.07(a) Purpose

One of the primary objectives of this Program is to provide an alternative process for counties to remove deficient bridges from the bridge inventory. Although the design requirements applicable to the STP-Bridge apply, the Program allows a number of requirements that would apply to projects receiving STP-Bridge funds to be waived. The federal contract requirements and clearances by federal agencies are waived, but all State and local contract requirements and clearances must be met.

The criteria and guidelines for approval of the STP-Bridge Soft Match Credit Program are provided in the following Sections.

4-1.07(b) Project Eligibility

To be eligible for the STP-Bridge Soft Match Credit, the bridge must meet the following criteria:

1. The bridge must be on the Illinois STP-Bridge Selection List. See Section 4-1.05 for STP-Bridge eligibility requirements.
2. The bridge must be on a road with a functional classification of a local road or rural minor collector.
3. The bridge must not have been replaced nor had major rehabilitation within 10 years of the planned new construction date, regardless of type of funds used.
4. The bridge must not be controversial. The following items may raise concerns and can be used for general guidance in determining whether a bridge is controversial:
 - unresolved right-of-way agreements/acquisition,
 - historic bridge implications,
 - environmental problems,

- permit problems/delays, and/or
 - pending/potential lawsuits.
5. Only construction from back-to-back of abutment is eligible for credit, using the same basis as items that are designed based on [Section 36-2](#) structural guidelines.
 6. Only actual construction (e.g., hard construction) costs are eligible for earning credit. Right-of-way acquisition, preliminary engineering, and construction engineering are not eligible.

4-1.07(c) Submittal and Crediting Process

In addition to normal bridge project submittal requirements, the county desiring the STP-Bridge Soft Match Credit must submit the following items to the district:

1. Planning. During the preliminary engineering phase, submit the following:
 - a. A request for consideration of the project for the Program from the county engineer. See Figure 4-1A for a sample request and certification letter.
 - b. A certification by the owner and county engineer stating the project is not controversial. See Figure 4-1A for a sample request and certification letter.
 - c. A Bridge Condition Report must be submitted and approved in accordance with Section 10-2. Department waivers must be requested for exceptions to the STP-Bridge policy for credit structures, when required (e.g., replacement of a structure with a sufficiency rating of 50 or greater).
2. Project Completion. After the project is completed, the district is responsible for forwarding the following items to the CBLRS:
 - a. a certification by the county engineer that the project being considered has been constructed in accordance with the design standards applicable to the STP-Bridge, that the structure has been added to the inventory and is not deficient (i.e., deck, super and substructure appraisal ratings are 6 or higher), and geometrics are sufficient;
 - b. Form [BLR 13510](#), Final Report, Notice of Completion and Acceptance of Improvement Constructed Under the Illinois Highway Code; and
 - c. notification of final eligible construction cost of the bridge within the guidelines of this policy. See Figure 4-1B for an example Notification of STP-Bridge Soft Match Credit Eligible Cost.

4-1.07(d) BLRS Responsibilities

Once the project has been completed, IDOT is responsible for completing the following tasks:

1. District. The district will:
 - make a final inspection of the project and document its completion; and

BUREAU OF LOCAL ROADS & STREETS
LOCAL ROADS AND STREETS FUNDING

4-1-12

June 2018

- notify the CBLRS of the final eligible construction cost of the project upon completion.
2. Central BLRS. The CBLRS will conduct the following:
- maintain and credit a “special discount” in the name of the county for 80% of eligible costs of construction. Inform the districts annually of the county balances in the special accounts.

Approve and execute agreements with Federal authorization for STP-Bridge projects that utilize the STP-Bridge Soft Match Credit.

4-1.07(e) Use of the Soft Match Credit

The eligible costs may apply as credit toward the 20% local match required on Federal-aid bridge projects. This credit provision does not increase an agency’s allocation of HBP funds but will permit usage of funds already allocated to an agency at a rate up to 100%. The project should be included in the LPA and district highway programs at a HBP funding level of 100%.

If a county desires to use their Soft Match Credit on a project, they must submit a letter to the district indicating their desire to do so along with the cost estimate and project information. The federal share agreed to at the time of project authorization may not be increased by subsequent additions of off-system bridge credits. The Soft Match Credit can only be applied to the construction phase of a bridge project at the time of construction authorization.

Agreement language under “Division of Cost” for using the Soft Match Credit should be as follows:

**Illinois STP-Bridge = 100%*

**Soft Match Credit not to exceed \$_____ (This amount should be whatever the county wants, equal to or less than the current balance of credit for the county at the time of authorization.) with balance to _____ (This should be the name of the LPA or State.).*

[Name], Regional Engineer
Attn: Bureau of Local Roads and Streets
[District address]

[date]

Subject: STP-Bridge Soft Match Credit Request

[County name] County requests that Section **[number]** and Structure Number **[SN]** located **[bridge location]** be approved as an eligible STP-Bridge Soft Match Credit project. A Bridge Condition Report is attached.

I certify that the above project meets the criteria outlined in the Illinois Department of Transportation STP-Bridge Soft Match Credit program and that, to the best of my knowledge and belief, the bridge is non-controversial. I understand that if said project is deemed to be controversial, the project would not be considered eligible for the STP-Bridge Soft Match Credit program.

Sincerely,

[Name], County Engineer

Bridge Office Use Only:

Project is on the Illinois STP-Bridge Selection List

[Date]

Subject: STP-Bridge Soft Match Credit Eligible Cost

[County name] County certifies that Section **[number]** and Structure Number **[SN]** located over **[location]** has been constructed in accordance with the design standards applicable to the STP-Bridge, that the structure has been added to the inventory and is not deficient.

I also certify that \$ **[cost]** is the final eligible construction cost of the completed project and understand that 80% of this amount will be credited to the county's STP-Bridge Soft Match Credit account upon approval by IDOT. A detailed breakdown of the eligible pay items and construction costs for back-to-back abutment is attached.

Sincerely,

[Name], County Engineer

NOTIFICATION OF STP-BRIDGE SOFT MATCH CREDIT ELIGIBLE COST

Figure 4-1B

HARD COPIES UNCONTROLLED

4-1.08 Congestion Mitigation and Air Quality Improvement (CMAQ)

The CMAQ Program provides a flexible funding source to State and local governments for transportation projects and programs designed to help meet the requirements of the Clean Air Act as amended in 1990. Funding is available to areas that do not meet the National Ambient Air Quality Standards (NAAQS). These are considered nonattainment areas. Funding is also available to areas that were previously in nonattainment but are now in compliance. These are referred to as maintenance areas. Funds are distributed to states based on a formula that considers an area's population by county and the severity of its air quality problems within the nonattainment and maintenance areas. Greater weight is given to carbon monoxide nonattainment and maintenance areas. Eligible activities for funding include:

- transit improvements,
- travel demand management strategies,
- traffic flow improvements, and
- public fleet conversions to cleaner fuels.

Illinois currently has two nonattainment areas, Chicago and Metro East, and one maintenance area, Jersey County eligible for funding under CMAQ.

4-1.09 Metropolitan Planning (PL)

The *FAST Act* continues *MAP-21's* approach to formula program funding, authorizing a lump sum total instead of individual authorizations for each program. Once each State's combined total apportionment is calculated, an amount is set aside for the State's Metropolitan Planning (PL) program via a calculation based on the relative size of the State's FY 2009 Metropolitan Planning apportionment.

PL funds are available for MPOs to carry out the metropolitan transportation planning process required by 23 U.S.C. 134, including development of metropolitan area transportation plans and transportation improvement programs. Eligible activities include conducting inventories of existing routes to determine their physical condition and capacity, determining the types and volumes of vehicles using these routes, predicting the level and location of future population, employment, and economic growth, and using such information to determine current and future transportation needs. Under 23 U.S.C. 134, MPOs are responsible for developing, in cooperation with the State and affected transit operators, a long-range transportation plan and a transportation improvement program (TIP) for the area. Both the plan and the TIP must be fiscally constrained. The TIP also must be prioritized, and consistent with the transportation plan, and must include all projects in the metropolitan area that are proposed for funding with either Title 23 or Federal Transit Act (Title 49, U.S.C., Chapter 53) money.

4-1.10 Federal Lands Access Program (FLAP)

In Illinois, FLAP provides funding for public land highways. The Shawnee National Forest in southern Illinois and the Midewin National Tallgrass Prairie in Will County contain the only Public Lands highways eligible for FLAP funds within the State. Illinois receives an allocation to be used on the Forest Highways. FHWA also makes discretionary funds available.

4-1.11 Construction of Ferry Boats and Ferry Terminal Program (FBP)

MAP-21 replaced the ferry boat discretionary program with a formula program. Discretionary program funds remain available to awarded projects and will be released as those projects are completed or a determination is made to cancel the award. Under *FAST Act*, the formula was changed and FBP funds are distributed to eligible entities based on the number of passengers carried (35 percent), vehicles carried (35 percent), and total route miles (30 percent). The federal share of FBP funds is 80%.

4-1.12 Emergency Relief (ER)

The ER Program provides funding to assist State and local governments with the expense of repairing serious damage to Federal-aid highways after FHWA has determined that natural disasters or catastrophic failures have occurred. Federal requirements specify that ER funds may only be used for emergency repairs to restore essential highway traffic, to minimize damage resulting from a natural disaster or catastrophic failure, or to protect the remaining facility and make permanent repairs. Emergency repairs are eligible for 100% federal reimbursement. The federal participation ratio for restoration work is 80%. Basic eligibility criteria are as follows:

1. The Governor must make a formal proclamation of the existence of a disaster.
2. There must be at least \$700,000 of eligible damage in the State.
3. Damage must be on a Federal-aid highway.
4. Damage must require work that is beyond "heavy maintenance" (e.g., work frequently performed by the applicant's maintenance crews).
5. Only sites with damage repair estimated to cost \$5,000 or more may be eligible.
6. Damage must have occurred as a direct result of the disaster.

For more information on the ER Program on Federal-aid highways, review the following documents or contact the district:

- *FHWA Emergency Relief Manual*, and
- *A Guide to the Federal-Aid Highway Emergency Relief Program*.

4-1.13 Federal Flexible Match (FFM)

Provisions introduced in TEA-21 and expanded/revised in subsequent federal highway bills allowed new flexibility to the Federal-Aid Highway Program's matching requirements by allowing certain public donations of cash, materials, and services to satisfy the local matching

requirements. Title 23 USC - “Highways,” Chapter 3 - “General Provisions,” Section 323 - “Donations and Credits,” outlines the legal basis for the FHWA Innovative Finance Management tool known as flexible match or soft match. Flexible match allows a wide variety of public and private contributions to be counted toward the non-Federal match (local match).

The following benefits may be realized through the Federal Flexible Match (FFM) Program:

- Acceleration of projects that receive donated resources,
- Allowing LPAs to reallocate funds that otherwise would have been used to meet Federal matching requirements, and
- Promoting public-private partnerships by providing incentives to seek private donations.

IDOT limits FFM credits to use during construction and construction engineering and recognizes up to 80% of the value of FFM as direct federal match. FFM does not increase the specific approved amount of federal funding awarded for projects selected through a solicitation process. In these cases, the additional federal funding will need to come from an approved LPA federal funding source, such as Surface Transportation Program funds. The FFM request should not be submitted unless federal funding is expected to be used for some portion of the project.

4-1.13(a) Eligible Items for Flexible Match

Flexible match may be used for federal highway programs except for the Emergency Relief Program. Flexible match can be applied toward all or any portion of the required matching share. This flexible match will only affect individual approved projects; carryover or credit of flexible match funds for other projects is not allowed. Figure 41-1C outlines the eligibility of flexible match donations or credits and their associated donors:

Type of Donation/Credit	Source of Donation/Credit	
	Private	Local Government
Funds ⁽¹⁾	Yes	Yes
Land or ROW ⁽²⁾	Yes	Yes
Materials ⁽³⁾	Yes	Yes
Services	Yes	Yes (In-House)

Notes:

- 1) Funds must be received prior to project authorization by FHWA.
- 2) Land may be donated by a non-governmental owner in accordance with 23 CFR 710.505 or contributed by a local government in accordance with 23 CFR 710.507. For any donated property that was originally acquired with federal funds, only the non-federal share of the property may be counted as the donation.
- 3) Federal “Buy America” requirements apply.

LPA FEDERAL FLEXIBLE MATCH (FFM)

FIGURE 41-1C

Donations or credits must be earned or given in a previous phase of the same project and clearly documented to be utilized as flexible match. Anticipation of flexible match will not be allowed. For example: preliminary engineering (PE) or land acquisition may be applied to construction, but construction items cannot be applied to PE or land acquisition. If material cannot be stockpiled near the jobsite, it may not be applied as credit during construction which utilizes that material. However, after the material is accepted, in-place, and its value clearly documented, application to use the material donation as a credit in a later stage of the project which has not yet received federal authorization might be permissible. Material contributed to a project needs approval for it to be required in a construction contract.

The donations or credits may consist of funds, land, materials, equipment rental, and/or services that are directly associated with the specific project. Only that portion germane to the project will be eligible for FFM credit. These flexible match donations must not have been used as match for any other federally-funded project. Also, the dollar amount of the in-kind donations must be included in the total project cost; these in-kind donations cannot both reduce the project cost and be used as flexible match.

4-1.13(b) Required Documentation

LPAs should notify IDOT, by letter through the District BLRS office, as early in the project as possible of their intent to utilize FFM. A proposed project description and funding schedule (see Figure 4-1D) should also accompany this letter. IDOT will in turn request FHWA concurrence with the LPA's intent. This letter of intent to utilize FFM on a project should be submitted prior to, and separate from, the request to approve the dollar amount of FFM earned for the project.

It is the responsibility of the LPA to maintain adequate records and documentation to verify the flexible match on any given project. The fair market value of the non-monetary donations to be used on a project must be determined and documented by the LPA to be considered for flexible match. Land must be appraised to determine fair market value by an IDOT-approved appraiser. If the value of a land parcel is less than \$10,000 it may be appraised by the County Engineer or Municipal Engineer for their projects. Contributions of land can be by fee title or any lesser property interest, i.e., dedicated right-of-way. Materials must be based on actual cost to obtain including delivery. The services must be based on the local prevailing wage rate or actual LPA expenditures with supporting invoices or time cards. All documentation supporting the claimed flexible match amount must be submitted and approved by FHWA prior to authorization for utilizing the flexible match.

Preliminary engineering performed by consultants can only be considered when the work performed is a donation from the private entity. Preliminary engineering provided by LPA employees may be used as FFM for all federal programs except Emergency Relief and will be approved based on actual expenditure documentation.

Upon completion, a local city official, county engineer, or consultant that has been contracted by the local authority to act as the same, will certify the flexible match items have been completed in accordance with all applicable guidelines. This certification should be submitted with all documentation required to justify the requested FFM amount.

<i>FFM Earned (80% of Local Contribution)</i>	<i>FFM Applied (Additional to 80% Fed)</i>
\$16,000	
	\$16,000

<i>Project Phase</i>	<i>Total</i>	<i>Federal Funds Used (80% Fed + FFM)</i>	<i>% Federal Funds</i>	<i>Local Funds or Contribution</i>	<i>% Local</i>
Step 1: FFM Earned	\$20,000	\$0	0%	\$20,000	100%
Step 2: FFM Applied	\$100,000	\$80,000 + \$16,000 or \$96,000	96%	\$4,000	4%
Summary	\$120,000	\$96,000	80%	\$24,000	20%

LPA FEDERAL FLEXIBLE MATCH (FFM)

FIGURE 4-1D

To allow sufficient time for review and approval, LPAs must submit all final FFM documentation preferably in a single submittal to the District prior to the date of federal authorization. This should be done far enough in advance to allow sufficient time for review by IDOT and approval by FHWA. No changes to the FFM amount will be allowed after final award of the contract.

4-1.13(c) Implementation Procedures

Prior to proceeding with a project that utilizes FFM, FHWA approval is required. The initial funding schedule submitted through the district with the LPA's intent to use FFM letter (as well as the cost estimate submitted at the same time as the joint agreement) should show the type, source, and amount of FFM, and the phases in which it is anticipated to be donated and applied. MPO guidelines should be followed for use of FFM on Surface Transportation Program and Congestion Mitigation and Air Quality Program funds within their respective areas. This FFM cost estimate is to be submitted by the LPA to the IDOT District BLRS.

4-1.14 Miscellaneous

4-1.14(a) High Priority Projects (prior to *MAP-21*)

High Priority Projects are those that are specified by the Congress. The total of High Priority funds available nationwide in a given year are a specified percentage of the total allocated under federal funding.

4-1.14(b) National Scenic Byways Programs (prior to *MAP-21*)

Federal funds are allocated for research and marketing projects to assist the byways of Illinois. SPR funding is allocated annually and must be completely utilized before a byway can reapply for the next year's funding allotment. Scenic Byways are designated on the criteria that they have scenic cultural, national, recreational, or archeological qualities. Illinois currently has designated seven National Scenic Byways — Meeting of the Great Rivers, the Great River Road, the Lincoln Highway, the Historic National Road, the Illinois River Road, Route 66, and the Ohio River Scenic Route.

4-1.14(c) Bridge and Tunnel Inspection

To provide for continued improvement to bridge and tunnel conditions essential to protect the safety of the traveling public and allow for the efficient movement of people and goods on which the U.S. economy relies, *MAP-21* required inspection and inventory of highway bridges and tunnels on public roads. No dedicated funds are provided for inspections, but it is an eligible use of NHPP, STP, HSIP, and Research funds.

4-1.14(d) Storm Sewers

Work on a highway project involving the construction, repair, rehabilitation, or replacement of storm sewers and combined sewers (when permitted by law) is eligible for Federal-aid funding for sewers that are structurally deficient. Generally, participation will be based on the sewer size needed solely for highway purposes.

4-1.14(e) Bicycle Facilities

The implementation of pedestrian and bicycle accommodations may be authorized for Federal-aid participation as either incidental features of highways, or as independent projects, where all the following conditions are satisfied:

1. The safety of the motorist, bicyclist, and/or pedestrian will be enhanced by the project.
2. The project is initiated or supported by the appropriate State and local highway agencies and/or the Federal Land Management Agency. Projects must be located and designed pursuant to a plan, which provides due consideration for safety and contiguous routes.
3. Independent bicycle projects, incidental bicycle projects, and non-construction bicycle projects must be principally for transportation rather than recreational use, and must meet the project conditions for authorization, where applicable.
4. A public agency has formally agreed to:
 - accept the responsibility for the operation and maintenance of the facility;
 - ban all motorized vehicles, other than maintenance vehicles or snowmobiles, where permitted by State or local regulations, from pedestrian walkways and bicycle paths; and
 - ban parking, except in the case of emergency, from bicycle lanes that are contiguous to traffic lanes.
5. The estimated cost of the project is consistent with the anticipated benefits to the community.
6. The project will be designed in substantial conformity with the latest official design criteria.

4-1.14(f) Value Engineering

Value Engineering (VE) is the systematic application of recognized techniques by a multi-disciplinary team to identify the function of a product or service, establish a worth for that function, generate alternatives through the use of creative thinking, and provide the needed functions to accomplish the original purpose of the project, reliably and at the lowest life-cycle cost without sacrificing safety, necessary quality, and environmental attributes of the project. The purpose of VE is to improve project quality, reduce project costs, foster innovations, eliminate unnecessary and costly design elements, and to ensure efficient investments. VE is applicable to all Federal-aid highway projects with an estimated cost of \$50 million or more and all federal-aid bridge projects with an estimated cost of \$40 million or more. Local projects utilizing VE should be coordinated with the District VE Coordinator at the initiation of the project. See [Section 17-2](#) for VE Procedures.

4-1.14(g) Asset Management

Asset management is a business process and a decision-making framework that covers an extended time horizon, draws from economics as well as engineering, and considers a broad range of assets. The asset management approach incorporates the economic assessment of trade-offs among alternative investment options and uses this information to help make cost-effective investment decisions.

In accordance with Section 303, Title 23, United States Code (U.S.C.) Federal funds may participate in the costs incurred by local highway agencies for management systems related to the development, establishment, and implementation of a system for managing each of the following:

- Highway pavement of Federal-aid highways
- Bridges on and off Federal-aid highways
- Highway safety
- Traffic congestion
- Public transportation facilities and equipment
- Intermodal transportation facilities and systems

The management systems listed above and the data collection and data management that support these systems are funded as a direct project cost. Costs associated with updating data components may be considered necessary expenses associated with running a functioning management system, but in implementing the management system, it may be necessary to augment the system data with updated annual or biennial data collection.

4-2 STATE PROGRAMS

4-2.01 General

The State of Illinois provides funding to local governments for transportation-related improvements under a variety of programs. Section 4-2 provides a brief discussion on these various sources of funding. In all cases, any interested parties should contact the district for more information on these Programs.

4-2.02 Township Bridge Program (TBP)

4-2.02(a) Source and Distribution

[605 ILCS 5/6-901](#) provides a State-funded program of \$15 million per year to construct bridges on the township or district road system. Funds appropriated to IDOT for this Program are apportioned to the counties in the same manner as MFT revenues for the use by road districts. Each county will subsequently allocate these funds to all eligible road districts in that county. The allocation to the road districts will be made in the same manner and be subject to the same conditions as are MFT revenues allocated for use of the district road system. However, no allocation will be made to any road district that has not levied taxes for road and bridge purposes at the maximum rates permitted without referendum as established by each individual section: [605 ILCS 5/6-501](#), [605 ILCS 5/6-508](#), and [605 ILCS 5/6-512](#). The rate will be determined by dividing the current year's tax levy amount by the previous year's assessed valuation, as adjusted. The district road system may permanently transfer, into the regular road fund ([605 ILCS 5/6-501](#)), joint bridge tax fund ([605 ILCS 5/6-508](#)), or county unit road tax ([605 ILCS 5/6-512](#)), a sufficient amount of money so that the levy and/or the transfer are at least equal to the maximum rates permitted without referendum. Road districts not currently levying the required rate because of the Property Tax Extension Limitation Law (PTELL) are eligible if they were levying at the required rate prior to PTELL and continue to levy the maximum amount after the imposition of PTELL.

For every \$4 of State TBP funds used, \$1 of local funds must be committed to the project. Local funds are defined as any other source of funds available to the district road system other than federal and State funds that have been appropriated through IDOT.

Funds apportioned but not obligated by the LPA within 48 months of the date when the apportionment is made, will lapse. Funds that have lapsed will not be available to the county treasurer for use by the road districts but, instead, will be deposited in the Township Bridge Lapse Pool; see Section 4-2.03.

4-2.02(b) Use of TBP Funds

The following will apply to the use of TBP Funds:

BUREAU OF LOCAL ROADS & STREETS
LOCAL ROADS AND STREETS FUNDING

4-2-2

June 2018

1. Project Scope. TBP provides State funding for the construction or rehabilitation of bridges 20 ft (6 m) or more in length, measured back-to-back of the abutment along the roadway centerline on the district road system, including a reasonable vertical and horizontal approach. It also includes the necessary engineering and right-of-way costs to complete the project.
2. Project Selection. The highway commissioners, in cooperation with the county engineer, are responsible for selecting the bridges to be constructed based on the following (in order of priority) ([605 ILCS 5/6-902](#)):
 - safe and expeditious transportation of school pupils,
 - movement of agricultural equipment and products,
 - rural free delivery mail routes, and
 - meeting anticipated traffic needs of the general public.
3. Use in Combination with Other Funds. Funds allocated through the Program may be used in conjunction with any other source of funds to complete a project. This includes matching of federal funds for bridge projects. The only condition is that at least for every \$4 of the TBP fund, \$1 must come from local funds ([605 ILCS 5/6-905](#)). Local funds are defined as any other source of funds, including MFT, available to the road district other than federal and State funds that have been appropriated through IDOT.
4. Funding Limitations. Project costs are eligible for payment from those available funds apportioned prior to the award of the contract for the project. Exceptions that may be funded considering subsequent apportionment are indebtedness ([605 ILCS 5/6-903](#)) and contract additions.

4-2.03 TBP Lapse Pool

Pursuant to [605 ILCS 5/6-906](#), funds apportioned to the counties for the Township Bridge Program are considered lapsed if they are not obligated within 48 months to the date of the apportionment. IDOT has established an administrative program whereby allocated TBP funds that have lapsed are placed in a TBP Lapse Pool. This fund provides additional monetary assistance to townships that have insufficient financing for larger bridges that are beyond the normal scope of the Township Bridge Program. The State will provide a maximum of 80% of the construction and construction engineering cost. The LPA must provide the remaining 20%.

The following items are considered when evaluating candidates for this funding:

1. Posting. Structures with low load postings or closures receive a higher priority than non-posted structures.
2. Average Daily Traffic Volume (ADT). Structures with traffic volumes less than 25 ADT are generally eliminated from consideration.
3. Adverse Travel. Longer adverse travel required by a bridge closure receives a higher priority.

BUREAU OF LOCAL ROADS & STREETS
LOCAL ROADS AND STREETS FUNDING

June 2018

4-2-3

4. Cost. Structure replacement costs greater than 2 years of TBP allotment to the county receives higher priority.
5. Safety. Information pertaining to crashes or hazardous conditions and how they will be rectified will be considered.
6. School and Mail Routes. Routes used for schools or mail delivery receive a higher priority.
7. Growth. New growth, either residential or industrial, relating to increased traffic is considered.
8. Letting Dates. Preference is given to those structures that can be replaced within 1 year.

4-2.04 Illinois Grade Crossing Protection Fund (GCPF)

Safety at railroad/highway grade crossings has long been a matter of public concern. The extreme severity of grade crossing crashes creates a safety issue of major significance.

Each month, \$3,500,000 from the MFT fund, see Section 4-3, is deposited into an account in the State Treasury, known as the Grade Crossing Protection Fund (GCPF), for the improvement of railroad/highway crossings on local highway systems. Each fiscal year not less than \$12,000,000 must be used for the construction or reconstruction of rail/highway grade-separation structures. Up to \$2,000,000 per year can be spent on pedestrian overpasses and underpasses. The normal maximum GCPF for a project is \$12,000,000.

Additionally, GCPF are available for incentive payments to local highway agencies in exchange for the closure of existing highway/rail grade crossings. Depending on the level of vehicular traffic, the incentive payments can range from \$50,000 to \$70,000.

The Illinois Commerce Commission (ICC) may also order up to \$2,000,000 per year in GCPF for the improvement of grade crossing surfaces and up to \$300,000 per year for the maintenance and renewal of 4 quadrant gate vehicle detection systems located at non high-speed rail grade crossings.

Funds can only be used upon approval from ICC and for projects that improve the safety of at-grade crossings and grade-separation structures. GCPF can be used for improvements at railroad crossings on the county, township, road district, and municipal road and street systems. However, the fund cannot be used for improvements at railroad crossings on the State highway system.

Through a cooperative effort of ICC, IDOT, railway companies, and LPAs, hazardous crossing locations are identified and, where practical, corrective measures are funded by the program. GCPF is primarily used for the following types of improvements:

- the construction or upgrade of crossing protection (e.g., new or additional signals, gates, circuitry upgrades);
- the construction or improvement of any highway necessary for access to property due to a crossing closure; and/or

BUREAU OF LOCAL ROADS & STREETS
LOCAL ROADS AND STREETS FUNDING

4-2-4

June 2018

- the construction, reconstruction, relocation, or removal of grade-separated structures.

Figure 4-2A summarizes the typical cost divisions for grade crossing improvements. Additional information on the GCPF can be found at the [ICC website](#).

Improvement Type	GCPF (%) ⁽¹⁾	LPA (%) ⁽²⁾	Railroad Company (%)
Signal Installation	85	10	5
Bridge Replacement (no Federal funds)	60	30-40	0-10 ⁽⁴⁾
Bridge (with Federal funds)	Up to 60	Remainder ⁽³⁾	0 -10 (Lump Sum) ⁽⁵⁾
New At-Grade Crossings with Signals	50	50	0
New At-Grade Crossing with Surface	0	100	0

Notes:

- (1) Typically, all GCPF portions are not to exceed a lump-sum amount, with another party being apportioned any remaining costs over and above the estimated cost.
- (2) The LPA contribution may be waived in exchange for a crossing closure at a second location.
- (3) This portion may be funded under the Illinois STP-Bridge Program, the Surface Transportation Program (STP), Township Bridge Program (TBP), and/or other federal, State, or local funds.
- (4) The railroad company's contribution is dependent upon its existing bridge maintenance responsibilities.
- (5) The railroad company's contribution is voluntary unless the new bridge replaces a grade crossing protected by active warning devices. A minimum 5% contribution from the railroad is required for these projects.

These cost distributions are typical; ICC will determine the actual cost distributions.

GRADE CROSSING PROTECTION FUND ALLOCATIONS

Figure 4-2A

4-2.05 Economic Development Program (EDP)

EDP funds provide State assistance for highway improvements that provide access to new or expanding industrial, distribution, or tourism developments. The primary intent is to make available State matching funds that will be a positive contribution in the location and selection process and to target those projects that will aid in expanding the State's existing job base and create new employment opportunities. EDP is designed to assist where the development of these facilities is imminent. Ineligible projects include those that only provide access to retail establishments, that only improve opportunities for future development, or that are speculative in nature. This Program is administered jointly by OPP and the CBLRS.

EDP provides up to 50% in State funds for costs to improve access to eligible sites. The remaining funds must be provided by local or private sources. The basic funding arrangement may be altered on a case-by-case basis for projects that include improvements on roads under State jurisdiction. When work is on a State highway, the State funds will pay up to 100% of eligible costs. However, if there are no local routes included in the overall project, the funding split is 75% state and 25% local. For a project to be eligible for EDP funds there must be some local funding included in the project.

Local matching funds may consist of local road and bridge tax funds, the LPA's MFT allocation, or other local revenues. Funds obtained from the Truck Access Route Program (TARP), Section 4-2.06, can also be applied to the local matching funds. Local matching funds cannot include grant funds received from other State agencies.

See IDOT's website for additional information on the [Economic Development Program \(EDP\)](#).

4-2.06 Truck Access Route Program (TARP)

TARP funds assist LPAs in constructing or upgrading highway systems to accommodate 80,000-pound (36,000-kg) trucks. Projects must connect to a designated truck route, municipality, or truck generator with another designated truck route or municipality (unless phase construction is approved). The LPA must pass a resolution designating the road as a Class II or Class III truck route and post signs with that designation at the completion of the project; see [Section 3-2](#).

TARP is designed to help pay the cost difference of constructing or upgrading local highways to meet additional weight and geometric requirements. The State provides up to \$45,000 per lane-mile and \$22,000 per qualifying intersection or up to 50% of the entire project cost, whichever is less. The State's share of the cost is not to exceed \$900,000 per project. TARP funds may be used on a route that is already a Designated Truck Route, so long as the route has not been upgraded to 80,000-pound requirements previously, and the proposed improvements are TARP eligible.

The CBLRS administers TARP. TARP funds may also be used in conjunction with the Economic Development Program (EDP) on eligible projects.

See IDOT's website for additional information on the [Truck Access Route Program \(TARP\)](#).

4-2.07 State Matching Assistance (SMA) Program

The SMA Program is designed to assist counties in matching federal funds when the county cannot derive sufficient matching funds from local taxation. Counties receive a Surface Transportation Program Rural (STR) allotment that may be used to fund up to 80% of eligible project costs. Counties can levy a Federal-aid matching tax to use for the local share. Although an 80/20 federal/local matching ratio is allowable for STR projects, a lower matching ratio is more equitable when determining the need for matching funds because the counties receive other Federal-aid funds (e.g., STP-Bridge) that require a local match. Some counties do not have a sufficient tax base to generate the local funds needed for the match. The SMA Program provides \$4 million per year addressing this problem.

The county is required to levy a Federal-aid matching tax of at least 0.045% to be eligible for assistance. To receive the maximum amount, the county is required to have a tax rate of 0.05%. If the rate is 0.045%, the allocation is 90% of the maximum. If the rate is between 0.045% and 0.05%, the assistance is prorated. If the rate falls below 0.045%, the county may retain its eligibility for assistance if a permanent transfer of funds from a non-highway fund to the Federal-aid matching tax fund is made to meet the equivalent of the minimum eligibility threshold.

The maximum assistance amount for each county is established as the difference between the amount required to match the county's STR allotment using a computer-generated Federal/local matching ratio and the funds generated by the county's Federal-aid matching tax. This matching ratio is variable each year and is generated to result in the use of the entire SMA amount. All counties with a short fall under this formula receive full funding of the shortfall.

The amount of funds received by each county varies from year-to-year. The variable amount of STR funds available each year and the local Equalized Assessed Valuation (EAV), as provided by the Department of Revenue, have a direct correlation on the amount of funds to be disbursed based on shortfall. As an example, when the STR allotment increases, the poorer counties will have a greater need for an additional match. Conversely, when the allotment decreases, the poorer counties will not have a need to match as much Federal funding and will require less SMA funds.

SMA funds may be used for any Federal-aid project. Two factors impact the implementation of the SMA Program:

1. Lump-Sum Use. Counties may use its accumulated SMA funds to defray any part or the entire non-federal portion of any local Federal-aid project, regardless of the federal matching percentage. However, the SMA must be committed as a lump-sum rather than a percentage of the project cost.
2. Anticipation. There can be no anticipation of SMA funds (e.g., no county can commit more SMA funds to a project than it has available at the time of letting). However, existing agreements for active projects may be amended with CBLRS advance approval to increase the amount of SMA when it becomes available.

4-2.08 County Consolidated Program

The County Consolidated Program provides \$21.8 million per year of State assistance for distribution to all counties except Cook County. The counties share equally \$8 million of the funds with the remaining portion distributed using the MFT formula, which is based on the amount of motor vehicle license fees. The funds must be deposited in the agency's MFT account and can be expended for any permissible MFT use. See Section 4-3 for more details on the Motor Fuel Tax.

4-2.09 Needy Townships

The Needy Townships Program provides \$10 million per year of State assistance for needy townships and road districts that levy at the maximum tax rate allowed without referendum, but do not generate enough revenue to meet a minimum level of funding per mile of roadway. The funds must be deposited in the MFT account and can be expended for any permissible MFT use. This program is available to areas with the lowest ability to generate revenue on a per-mile basis. The eligible townships and assistance levels are set based on the EAV, annual average MFT distribution per mile, and average maintenance cost per mile.

4-2.10 High-Growth Cities

The High-Growth Cities Program provides \$4 million of State assistance per year to municipalities with populations over 5,000 that are experiencing above-normal population growth. Any municipality having an increase in population of at least 5% either through the comparison of two consecutive decennial censuses or the comparison of a decennial census and a special census within a given decade is eligible for this program. Funding is allocated among eligible cities based on their current population and per capita increase compared to all eligible cities. The funds must be deposited in the LPA's MFT account and can be expended for any permissible MFT use.

4-2.11 County Engineer Salary Program

This program is designed to aid counties in paying a reasonable professional salary for their county engineers. In exchange for an equal amount of a county's federal Surface Transportation Program (STP) allotment, the state will provide state funds to pay up to one-half of a county engineer's salary.

Recommended salaries have been established for the 99 counties in Illinois that receive rural STP federal-aid highway funds. The recommended salaries are established by a ranking system considering five factors:

- county MFT allotment
- county lane mileage
- county population
- county assessed valuation
- county system vehicle miles of travel

The sum of the five individual ranks is used to determine an overall rank. The magnitude of the responsibilities for each ranked county has been related to comparable department civil engineer responsibilities and an equivalent recommended salary established for each county. The county rankings are computed each year using the latest available data, and the respective recommended salaries are adjusted annually in a like manner as the department's salary bracket for civil engineers.

A county must agree to pay the county engineer a salary, exclusive of normal expenses, of at least 95% of the recommended salary to be eligible for the program. The amount of the exchange shall be no more than one-half of the salary paid to the county engineer with no upper salary limit, recognizing that a county may pay more than the recommended salary.

The county and the department shall enter into an agreement covering the terms of the exchange. An agreement can be entered into at any time during the year.

A county who shares an engineer with another county will qualify for this program by paying at least 95% of either the following:

1. The salary of at least 60% of the current recommended salary, or
2. A salary that, when combined with the salary paid by the county sharing the engineer, totals 60% of the sum of the current recommended salaries of the two counties.

4-2.12 Funding for Jurisdictional Transfers

Funds may be provided by the State, based on the present worth of the highway or structure, to the LPA that agrees to assume jurisdiction for the facility. The present worth is determined using the life-cycle cost of keeping the highway in a serviceable condition.

4-2.13 Park Access Program

The Park Access Program provides funding for road projects that are located within or provide access to State parks and historic sites. The projects are selected jointly by IDOT, IDNR, and the State Historic Preservation Officer (SHPO). Applications should be sent to IDNR. Funding is allocated at 100% of the total project cost.

4-2.14 Noise Abatement Program

The Noise Abatement Program provides State funding for noise abatement projects along existing fully access-controlled State routes in urban areas. LPAs are required to provide 50% local matching funds. Federal funds can be used to supplement the project cost if the project is designed to meet federal criteria. Costs associated with preliminary engineering, construction, and construction engineering are eligible. Costs associated with right-of-way and utilities are not eligible. The sponsoring agency must document the traffic-generated noise levels prior to applying for funds, and it must also pass a zoning ordinance regarding land use. Contact OPP for more information.

4-3 MOTOR FUEL TAX (MFT)

4-3.01 Source

In 1929, the Illinois General Assembly adopted a law placing a tax (e.g., 19 cents/gallon and an additional 2.5 cents/gallon on diesel fuel) on the operation of a motor vehicle on public highways and of operation of recreational watercraft on the water based on the consumption of motor fuel. Proceeds from this tax are administered by IDOT, with a portion of these revenues being allotted to counties, townships, and municipalities. The collection and distribution of these funds are outlined in the Motor Fuel Tax Law, [35 ILCS 505/1 et seq.](#) and are referred to as MFT funds.

4-3.02 Distribution

4-3.02(a) **General**

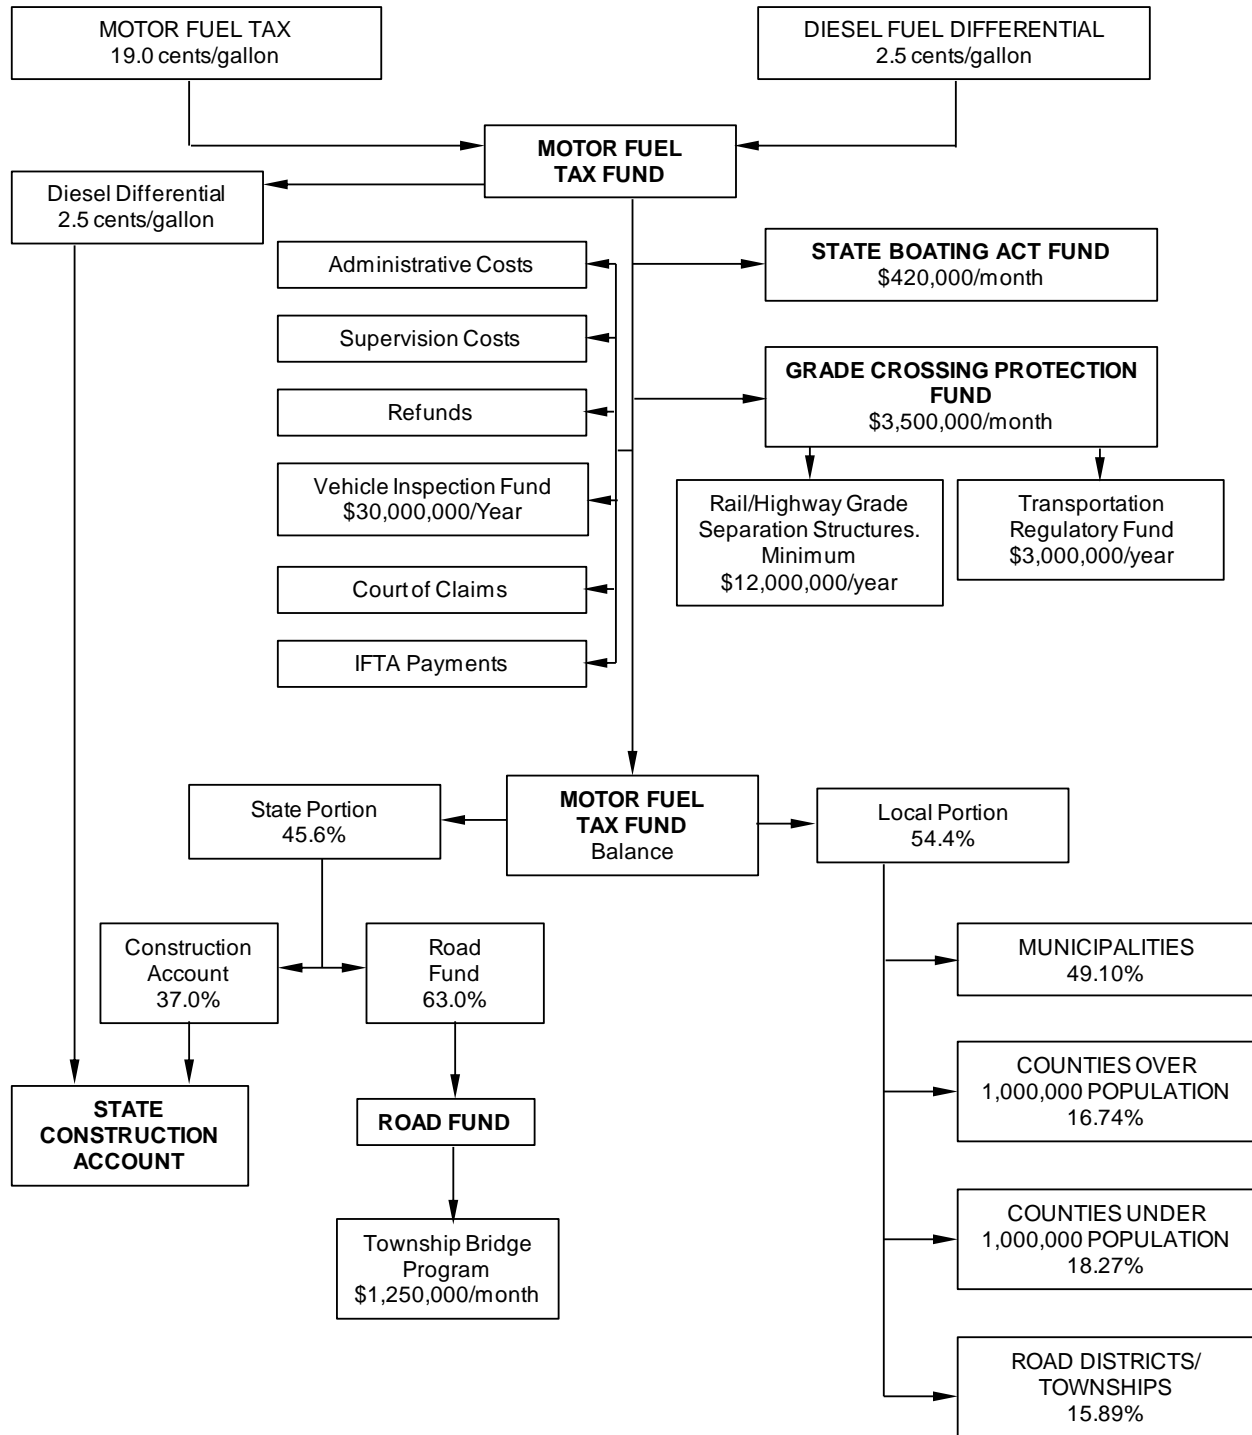

MFT funds are paid out to the units of local government in accordance with the MFT Fund, [35 ILCS 505/8](#) provisions. All money collected by the Department of Revenue is distributed after the first day of each month. No funds are held in escrow for retroactive changes in allocations. The amount of MFT collected is based on the previous month's sale of motor fuel statewide; therefore, allocations will vary from month to month.

Figure 4-3A illustrates the distribution of MFT funds. After deductions set by law, 54.4% of the remainder is distributed to LPAs. The following sections describe the allocation of the MFT funds to the counties, municipalities, and townships. See the IDOT publication, *MFT Funds: Source, Distribution and Uses by* ([Municipalities](#)) ([Counties](#)) ([Townships](#)) for more information.

4-3.02(b) **Municipalities**

A municipality's share of the total MFT municipal allocation is based on the ratio of that municipality's population to the total population of all incorporated areas in the State. The population figure is determined by the latest decennial census taken by the U.S. Bureau of Census. When the Illinois Secretary of State certifies the population count ([65 ILCS 5/1-7-2](#)), IDOT adjusts the municipal population figure on which the MFT allotment is based to agree with the certification ([35 ILCS 505/8](#)).

This municipal population figure for the purposes of determination of MFT allotments will remain in effect until the next decennial census, or if a change in population has been determined in accordance with the law. The following also applies to MFT allotments:

MOTOR FUEL TAX DISTRIBUTION

Figure 4-3A

BUREAU OF LOCAL ROADS & STREETS
LOCAL ROADS AND STREETS FUNDING

June 2018

4-3-3

1. MFT Allotments to New Municipalities. Before MFT allotments can be made to a newly incorporated municipality, articles of incorporation must be first filed with the Secretary of State. After the Secretary of State officially notifies IDOT that a Certificate of Incorporation has been issued, and after a census has been conducted, monthly MFT allotments will be made to the new municipality.

With respect to the census that must be made by the municipality, IDOT requires the submittal of:

- an ordinance adopted by the municipal board or council providing for the taking of the census;
- an affidavit executed by the municipal clerk and attached to the ordinance certifying to the passage of the ordinance; and
- an affidavit signed by the municipal clerk and president or mayor, and attested to by a notary public, giving the date of the census and the population of the municipality.

Forms [BLR 04310](#), [BLR 04311](#), and [BLR 04312](#) may be used.

If all required information is provided, the municipality will be notified of the date on which the first allotment will be made.

2. Change in Municipal MFT Allotments Due to Annexing of New Territory. If new territory has been annexed after the last federal census was taken, and the municipality desires to have its allotment increased because of this fact, it must take a census of the annexed territory. The municipality must provide IDOT with executed copies of the information listed above. If all required information is provided, IDOT will notify the municipality of the date when the first allotment, reflecting the new population, will be made.
3. Change in Municipal MFT Allotments Due to Special Census. To change the population figure upon which MFT allocations are based, a municipality must contact the Director of the Census, Department of Commerce, Washington, D.C. to determine the procedures to conduct a special census. No other census will be accepted. This census must be an actual count of all inhabitants residing within the corporate boundaries; estimates or a census taken of only selected areas within a municipality are not acceptable.

After the Census Bureau determines the census, the Director of the Census will furnish to the Office of the Secretary of State and the municipality a report of the results. The Office of the Secretary of State will then certify that it has received the results with a copy to the municipality and IDOT giving the new population of the municipality.

Upon receipt and review of the certification, IDOT will change the population figure upon which the municipality's MFT allocations are based and will notify the municipality of the date when the first allotment will be made due to the population change. MFT funds may not be used to pay for the cost of conducting any census.

HARD COPIES UNCONTROLLED

4-3.02(c) County

Counties that have 1,000,000 or more inhabitants receive a special designated allocation. Allocations to counties having less than 1,000,000 inhabitants receive allocations in proportion to the amount of motor vehicle license fees received from vehicles registered in each county during the preceding calendar year. On or before April 15 of each year, the Secretary of State submits a full report to IDOT detailing the amount of motor vehicle license fees received from vehicles registered in each county during the preceding calendar year, pursuant to [35 ILCS 505/8\(e\)](#).

4-3.02(d) Townships (Road Districts)

[35 ILCS 505/8](#) defines “road district” as any road district provided for by the Illinois Highway Code. Road districts also include park districts, forest preserve districts, and conservation districts organized under Illinois law. The term “township or district road” also includes roads maintained by park districts, forest preserve districts, and conservation districts.

The following applies to MFT funds for road districts:

1. **Road Districts.** MFT funds apportioned for use by road districts are allotted to the several counties in the State. These allotments are apportioned among the counties in the proportion which the total mileage of township or district roads in that county bears to the total mileage of all township or district roads within the State. Funds allotted to the counties for the use of its road districts must be apportioned among the eligible road districts in proportion to the eligible mileage of township or district road systems in each eligible road district.

Any park district, forest preserve district, or conservation district must comply with all statutes related to road districts with respect to receiving MFT allotments (Attorney General’s Opinion No. 85-024, dated December 2, 1985).

2. **Minimum Taxes.** To be eligible for MFT allocations, the road district must levy a tax or taxes for road and bridge purposes. To receive the maximum MFT allocation, the road district must levy a tax or taxes for road and bridge purposes at an extension rate of at least 0.08% of its assessed valuation. To meet this requirement, the road district may use both its regular road fund ([605 ILCS 5/6-501](#)) and permanent road fund ([605 ILCS 5/6-601](#)) either separately or in combination to equal the required percentage. If the road district does not levy a tax or taxes for road and bridge purposes at an extension rate of at least 0.08% of its assessed valuation, the road district’s MFT allocation shall be the percentage of the maximum allocation equal to the percentage obtained by dividing the rate extended by the road district for road and bridge purposes by 0.08%.

On or before July 1 of each year, the county clerk of each county will file a certificate with IDOT certifying the rate of road district tax levies in that county in accordance with the above formula. Certifications are date stamped when returned to the Department to ensure the certifications are filed before the deadline. If the county clerk fails to file this certificate, the allotment to the county for the road districts will not be made. However, if the county clerk later in the year does make a proper certification, the allocation will be made beginning with the first month’s allotment following the date of certification.

BUREAU OF LOCAL ROADS & STREETS
LOCAL ROADS AND STREETS FUNDING

June 2018

4-3-5

If the tax and/or taxes are not levied in accordance with the Motor Fuel Tax Law, the MFT allotments of the ineligible road district will be reallocated to the eligible road districts within the county. The ineligible road district, upon subsequent compliance with the MFT law, will once again be eligible; however, allotments will not be retroactive.

3. Property Tax Extension Limitation Law (PTELL). PTELL limits the increases in a taxing district's extensions. PTELL allows a taxing district to receive a limited inflationary increase in tax extensions on existing property. Increases in property tax extensions are limited to a lesser of 5% or the increase in the Consumer Price Index. This affects non-home-rule taxing districts in Cook County and in the collar counties (i.e., DuPage, Kane, Lake, McHenry, Will). PTELL allows the county board of other counties, by ordinance or resolution, to submit to the voters of the county, the question of whether to make all non-home rule-taxing districts that have all or a portion of their equalized assessed value situated in the county subject to PTELL ([35 ILCS 200/18-185 to 200/18-245](#)).

As a result of PTELL, some road districts are unable to levy the minimum 0.08% road and bridge tax, which would result in some road districts becoming ineligible to receive the maximum MFT funds. [35 ILCS 505/8](#) enables road districts under PTELL to receive the maximum MFT funds. To become eligible, the road district must have been levying the minimum 0.08% road and bridge tax prior to PTELL and continue to tax at the maximum allowable amounts allowed by PTELL or, in DuPage County, an amount equal to or greater than \$12,000 per mile of road under the jurisdiction of the road district, whichever is less.

4. Eligible Roads. According to [35 ILCS 505/8](#), IDOT is required to determine the mileage of all township and road district highways within the State for the purpose of allotting and allocating Motor Fuel Tax funds for use in road districts. Generally, a portion of a highway improved, designed, or ordinarily used for vehicular travel, exclusive of the berm or shoulder, is referred to as the roadway and is included in the mileage total provided that the highway is a public way for vehicular travel. Previously unreported public highways must be 0.04 miles (0.06 km) or longer to be included in the inventory for mileage totals.

To be considered a public way for vehicular travel, a road must be both "open" and "passable." The roadway must be free of obstructions (e.g., no gates, chains, fences, fallen trees) that prevent the public from gaining access to the full length of the road. There cannot be any no-trespassing, road-closed, or other signs or markers that prohibit public travel. Roads leading up to a closed bridge or culvert are considered a public way for vehicular travel if the approaches are passable. Vehicular travel may be prohibited or restricted for no more than 90 days in any one calendar year, pursuant to [625 ILCS 5/15-316](#).

A road is "passable" if the road can be traversed in a four-wheel drive vehicle in dry conditions without having to leave the roadway. The following criteria are used by IDOT to determine passability:

- a. Ruts. The roadway must be free of excessive ruts or potholes. Ruts more than 9 in (225 mm) should not exist on the majority of the roadway unless a four-wheel drive vehicle can straddle the ruts and traverse the road with relative ease at a low rate of speed.

HARD COPIES UNCONTROLLED

- b. Delineation. For dirt roadways, delineation of the roadway must be readily identifiable, by either wheel paths or cross section recognition.
- c. Clearance. Vegetation and other obstructions lateral to the roadway should be adequately cleared to allow a standard size 4-wheel drive vehicle to pass without rubbing and scratching the vehicle.
- d. Drainage. Adequate drainage is provided to prevent ponding on the roadway or erosion of the roadway, except in instances of seasonal or prolonged flooding.

If the open and/or passable criteria have not been met, IDOT will notify the township road commissioner and the county engineer of the problem and allow 30 days to correct it. If the problem is not corrected within 30 days, the road will be removed from MFT eligibility.

Township roads will be re-inventoried within a cycle to be determined by the district to determine MFT eligibility and verify length. A 5-year cycle is desirable.

4-3.02(e) Engineering Studies

MFT funds may be used by counties and municipalities for engineering studies, as permitted by the Illinois Highway Code. These studies must be restricted to costs incurred in performing only countywide or municipal-wide highway surveys or investigations, where the costs or conditions are such that the work cannot be accomplished as part of one or more construction sections. These surveys and investigations must also be limited to those necessary for the planning of future construction, reconstruction, or rehabilitation of streets and highways including the necessary appurtenances. They should be based on present and future traffic volumes and types, drainage facilities, traffic needs due to future expansion, and factors that will affect the design and location of future improvements. Any reports prepared in connection with these surveys or investigations must be filed with IDOT - one copy with the district and one copy with CBLRS ([605 ILCS 5/5-701.6](#) and [605 ILCS 5/7-202.11](#)).

MFT funds may not be used for the hiring of planning engineers to make a comprehensive survey of the county or municipality that would lead only to the enactment of a new zoning ordinance.

Engineering studies that are designed to provide the highway authority with a report on the present condition and projected service life of specific highways or the entire highway network may be funded with MFT revenues. Pavement evaluation studies should be comprehensive reports that reflect the effects on present conditions produced by environmental factors, traffic volumes, and drainage characteristics. The approval of MFT funding for a pavement evaluation study will be subject to the following conditions:

1. Evaluations. The study should only include those evaluations that are necessary for the planning of future construction, reconstruction, rehabilitation, or maintenance of street and highway systems. Base the evaluations on present and future traffic volumes and types, drainage facilities, and traffic needs due to future expansion that would affect the maintenance or design of future improvements. Do not include any evaluation of streets or highways that obviously have no structural value (e.g., oiled earth).

2. Approval. Prior district approval is required for the individual roads and streets to be evaluated.
3. Treatment Recommendations. Based on the evaluations, provide various rehabilitation treatments for at least a 10-year projected service life. The district must approve the various treatments selected. When the evaluation indicates that none of the selected rehabilitation treatments are adequate, include in the study the needed information to indicate the adequate thickness of overlay to provide satisfactory performance. When an evaluation indicates that reconstruction is necessary, any information furnished in the evaluation is considered as information only. The new design must be based on IDOT's design procedures. See [Chapter 44](#) for information on pavement design.
4. Disclaimer. IDOT is not bound by the results of the evaluation. IDOT reserves the right to approve or disapprove any proposed rehabilitation treatment regardless of the evaluation.

4-3.02(f) Highway and Street Bond Issues

The Illinois Highway Code allows MFT funds to be used for the payment of principal and interest on approved bond issue improvements. Miscellaneous administrative expenses (e.g., legal fees, treasurer's fees, recording fees, and engineering fees) may also be included in the cost of the bond issue to retire the bonds. Election costs incurred in submitting the bond issue to referendum are not considered eligible MFT expenses ([605 ILCS 5/5-701.5](#), [605 ILCS 5/5-701.11](#), [605 ILCS 5/6-701.6](#), and [605 ILCS 5/7-202.18](#)). No more than 50% of the annual MFT allotment should be used to pay off bonds and their interests. This will allow funds to be available for maintenance and other needed improvements.

4-3.03 Uses of MFT Funds

4-3.03(a) General

This Section clarifies issues pertaining to [605 ILCS 5/5-701](#), [605 ILCS 5/6-701](#), and [605 ILCS 5/7-202](#), defines parameters for the use of MFT funds, and determines under what conditions MFT funds may or may not be used. Figures 4-3B through 4-3D summarize the permissible uses of MFT funds for each type of LPA, and reference either the applicable section of the statute or the applicable Section of the BLRS Manual that discusses the use. Also, consider the following:

1. Counties. If the county highway system is being maintained in an acceptable condition, a maximum of 30% of a county's MFT funds may, with IDOT approval, be used for county unit road district roads.
2. Municipalities. For municipalities with a population greater than 500,000, 25% of the MFT funds must be spent on non-arterial streets ([605 ILCS 5/7-202.1c and 202.22](#)). Any municipality can use MFT funds to match a Federal-aid project up to 50% of the cost of the project ([605 ILCS 5/7-202.10](#)).

BUREAU OF LOCAL ROADS & STREETS
LOCAL ROADS AND STREETS FUNDING

4-3-8

June 2018

3. Municipality Street Extensions. Municipalities may construct and maintain extensions of municipal streets outside the corporate limits of the municipality, including parts of such streets that extend into another municipality, if it is performed pursuant to an agreement between the municipalities, see [605 ILCS 5/7-202.3](#). Municipalities may construct and maintain extensions of municipal streets within the corporate limits of any park district whose territorial limits are coterminous with the territorial limits of the municipality, pursuant to [605 ILCS 5/7-202.4](#).
4. Employees. For employees of an agency who may be paid from the MFT fund under the foregoing instructions, the method of payment may be one of the following:
 - Where the compensation is on an hourly, daily, or monthly basis, the agency may pay the employee directly from the MFT fund for the particular MFT-eligible job on which the work is performed.
 - Where the compensation is on an hourly, daily, or monthly basis, the agency may pay the employee from the fund for which he is regularly paid. This fund may then be reimbursed from the MFT fund for the job on which the work was performed for the amount paid to the employee for the time spent on the MFT job.

Under both methods of payment, the agency must maintain complete records of the dates and times for the employees who are engaged in MFT funded work and the particular projects or sections.

Reimbursements from MFT will be made promptly and periodically, preferably each month.

Payments from MFT funds to other funds for reimbursement are made in the same manner as any other payment (e.g., a claim showing the date, project or section, the class of labor, and the rate of pay must be filed and a warrant drawn against the MFT fund in favor of the fund which is being reimbursed). It is not necessary that individual claims for each employee be filed, but a separate claim must be filed for each project or section and, if it is desired, all employees working on that project during the period covered by the claim may be shown on one claim and reimbursement made by one warrant.

4-3.03(b) Construction Items

Any item included as an integral part of an MFT roadway/construction project is eligible for MFT funding. This includes engineering and land acquisition. When selecting township roads for improvement, preference should be given to school bus and mail routes. See [Section 14-2](#) for guidance on using MFT funds for maintenance issues. The following discusses MFT eligibility for construction items:

1. Sidewalks and Curb Ramps. MFT funds may be used for the construction of sidewalks and related curb ramps providing the following requirements and those of [Sections 41-5 and 41-6](#) are met:
 - a. Municipalities are permitted to construct sidewalks and pedestrian paths within the right-of-way of any street. Also, municipalities are permitted to construct pedestrian subway and overhead crossings.

HARD COPIES UNCONTROLLED

- b. Counties and road districts may construct sidewalks provided:
- The amount of pedestrian use of the street or highway justifies the construction of the sidewalks.
 - The LPA agrees to assume the responsibility for sidewalk maintenance and repair.
 - The sidewalk is constructed as an integral part of, or subsequent to the completion of, a major paving project built by the State or by the county or road district under State supervision.
2. Proposed Street Lighting System. Municipalities may use MFT funds for the construction or reconstruction of a street lighting system on improved (e.g., a construction section) municipal streets, county highways, and State highways ([605 ILCS 5/7-202.6](#)). Counties and townships/road districts may also use MFT funds for roadway lighting ([605 ILCS 5/5-701.1](#) and [605 ILCS 5/6-701.1](#)).
- The system must meet the requirements of [Section 41-7](#) and provide the necessary illumination required by the current edition of American National Standard Practice for Roadway Lighting (ANSI/IESNA RP-8) published by the Illuminating Engineering Society of North America (IESNA).
3. Storm Sewers. MFT funds may be used for the construction of storm sewers and appurtenances, or combination storm and sanitary sewers and appurtenances, where legally authorized under the following conditions:
- a. Location. Storm sewers, except for outfalls, must be built entirely within the limits of the highway improvement under consideration.
 - b. Necessity. The storm sewers must be considered to be an integral and necessary part of a highway improvement. Resolutions proposing an improvement for the express purpose of justifying the construction of a storm sewer are not acceptable.
 - c. Staging. Storm sewers may be built at the first stage of a highway improvement, provided steps are taken for the complete improvement at the time of original approval, or storm sewers may be built coincident with or after a highway improvement has been completed by the State, or by the local highway authority under State supervision.
 - d. Capacity. MFT funds may be used to provide storm sewers and appurtenances of sufficient size to accommodate only the water that would naturally flow to the roadway. If the LPA chooses to provide excess capacity to accommodate sanitary flow or water from other locations, the excess capacity must be paid for with other funds.
 - e. Outfalls. MFT funds may be used to construct municipal storm sewer outfalls outside the corporate limits up to the nearest acceptable natural waterway or connection to an acceptable existing storm sewer.

BUREAU OF LOCAL ROADS & STREETS
LOCAL ROADS AND STREETS FUNDING

4-3-10

June 2018

- f. Basins. If required by local storm water management agencies, retention/detention basins may be constructed with MFT funds. The MFT participation in construction of these basins will be determined in accordance with the capacity restrictions noted in Item 3d.
 - g. Approval. Combination storm and sanitary sewers must be approved by the [Illinois Environmental Protection Agency \(IEPA\)](#), Bureau of Water.
 4. Parking Facilities. MFT funds may be used by LPAs to acquire right-of-way and construct parking lanes adjacent to the roadway. Municipalities may also use MFT funds for off-street parking facilities ([605 ILCS 5/7-202.17](#)). MFT funds used for parking facilities are subject to the following conditions:
 - a. Public Availability. All parking facilities must be generally available to the public and may not contain individually reserved parking spaces. However, parking facilities in commercial areas or adjacent to public buildings must contain spaces reserved for persons with disabilities.
 - b. Restricted Parking. Parking spaces or lanes restricted for use by “residents only” or other special restrictions will be considered on an individual basis. Requests, presenting the need for and the conditions of the restriction, require approval by CBLRS. Requests should be submitted through the Regional Engineer. Requests that provide for individually assigned parking spaces will not be approved.
 - c. Revenue-Producing Parking. MFT funds may be used for a revenue-producing, off-street parking area. The disposition of parking revenues must be in accordance with the provisions of [Chapter 9](#).
 - d. Resetting Parking Meters. MFT funds may be used for moving and/or resetting parking meters where the work is made necessary by the construction of an MFT improvement.
 5. Traffic Control Devices. MFT funds may be used for the installation and maintenance of all or any warranted traffic control devices. These traffic control devices may include, but are not limited to, traffic signals, beacons, signs, and pavement markings.
 6. Right-of-Way Expenses. MFT funds may be used to purchase any right-of-way that may be required to construct a highway improvement. Legal fees, appraisal fees, and survey fees associated with these purchases may also be paid with MFT funds provided that MFT funds are not used to reimburse any public official or to reimburse any other fund for the salary and expenses of the state attorney, municipal attorney, municipal engineer, or others who are officials of the LPA.

IDOT approval of MFT expenditures for right-of-way is contingent upon adequate documentation that legal requirements have been met, that property owners are being treated equitably, and that the purchase price is fair.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS
LOCAL ROADS AND STREETS FUNDING

June 2018

4-3-11

7. County Garages. Counties may use MFT funds for constructing or maintaining, or both, a county garage used for the servicing, maintenance, or storage of construction or maintenance vehicles or equipment used in the construction or maintenance of county or state highways ([605 ILCS 5/5-701.9](#)). MFT funds may not be used for office space except by counties with a population greater than 1,000,000. MFT funds may not, however, be used to purchase property for the construction of the garage (Attorney General's Opinion F-1968, May 22, 1968).
8. Construction and Maintenance of Salt Storage Facilities. MFT funds may be used for the construction, reconstruction, maintenance, and rental of structures for the storage of salt used for highway maintenance provided that:
 - MFT funds are not used to purchase the property for construction; and
 - MFT funds are not urgently needed for other improvements.
9. Bicycle Facilities. LPAs may use MFT funds to construct bicycle facilities under the following conditions:
 - a. Counties. Counties may use MFT funds for:
 - placing, erecting, and maintaining signs or surface markings to designate official bike routes along a county highway;
 - the construction and maintenance of bicycle routes along county highways or along State highways by agreement with IDOT in counties with a population over 500,000. Also, the Bikeway Act contains provisions that allow the expenditure of MFT funds in counties of over 500,000 population for construction and maintenance of bikeways along public utility or railroad right-of-way ([605 ILCS 30/2](#)); and
 - paying the county's share for bicycle facilities constructed as part of a federally eligible transportation project on, adjacent to, or intended to serve any county highway ([605 ILCS 5/5-701.7](#)).
 - b. Municipalities. Municipalities may use MFT funds for the construction and maintenance of bicycle paths, lanes, or bicycle parking facilities, as well as signing and marking bicycle routes along streets within the municipality ([605 ILCS 5/7-202.20](#)).
 - c. Townships/Road Districts. Township and road districts can use MFT funds for signing and marking bicycle routes along township roads ([605 ILCS 5/6-701.7](#)).
10. Railroad Crossings. Public railroad crossing upgrades are eligible for MFT funds.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS
LOCAL ROADS AND STREETS FUNDING

4-3-12

June 2018

11. Utilities. The cost of moving or removing existing publicly owned utilities, made necessary by road and street improvements, may be paid with MFT funds, with the exception of municipally owned utilities lying outside the corporate limits. The cost of moving or removing existing privately-owned utilities, made necessary by road or street improvements, may be paid with MFT funds if the existing facilities are located on private right-of-way. If the existing utilities are located on public right-of-way, the cost of moving or removing them must be borne by the utility company. Utility agreements are necessary when an improvement requires relocation or adjustment of utility appurtenances except when existing permits provide for moving or removing a utility. [Section 5-7](#) provides guidance on the preparation of a utility agreement.
12. Equipment Operations. Equipment operation costs are eligible for MFT funds. However, the purchase and repair of this equipment are not eligible. [Section 12-1](#) provides additional guidance.
13. Cattle Passes. The costs of constructing cattle passes on improvements involving the use of MFT funds must meet the following:
 - a. Property Owners. Where the improvement is on an existing road or street, the property owner is responsible for the entire cost of the cattle pass, except where the crossing is made on any waterway or natural channel for water and where a culvert or bridge is maintained as required for road purposes. In these cases, the owners or occupants are not required to pay for or construct any more of the crossing than the additional cost in excess of the necessary cost of a suitable culvert or bridge for road purposes.
 - b. Local Governments. In special cases, the local governmental agency may participate in the cost of constructing cattle passes to the extent that the highway or traveling public is benefited by having the livestock pass under the highway, rather than at grade and, where new or additional right-of-way is being obtained, the value of the right-of-way can be considered as an offset on all or part of the cost of the livestock pass.
 - c. Submission. Before the authorization of the expenditure of MFT funds can be made for the construction of livestock passes, the LPA must submit the following information for consideration:
 - the estimated cost of the livestock pass;
 - the estimated value of land taken from the property owner plus damages to land not taken, if any;
 - the amount paid the landowner for the land, either in cash or other consideration; and
 - the estimated value to the traveling public because the livestock crossing will be underneath the roadway rather than at grade.

4-3.03(c) Salary and Expenses

The following applies to MFT eligibility for salaries and expenses:

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS
LOCAL ROADS AND STREETS FUNDING

June 2018

4-3-13

1. Counties. The county engineer's salary and expenses may be paid out of general or highway funds of the county ([605 ILCS 5/5-202](#)). MFT funds allocated to the county for highway purposes may be used to pay the salary and expenses related to the county engineer's duties required by the Illinois Highway Code ([605 ILCS 5](#)) or the Department. However, MFT funds allocated to counties to be used by road districts may not be used to pay any portion of a county engineer's salary or expense (Attorney General's Opinion No. 457, August 21, 1933).
2. Road Districts. A highway commissioner is an elected public official and an officer of the township or road district. The commissioner's salary may not be paid with MFT funds allotted to the counties for use by the road district (Attorney General's Opinion No. 928, March 14, 1927). Road district treasurer fees may not be reimbursed with MFT funds.
3. Municipalities. If the corporate authorities of a municipality appoint an individual to a position within the Public Works Department or Engineering Department, the municipality must first provide for the individual's compensation for all of the duties of the officer by ordinance. The municipality shall not pay any portion of the salary of the appointed position from the MFT funds allotted to the municipality (Attorney General's Opinion No. 315, April 29, 1952).
4. Employee Salaries and Fringe Benefits. The following applies:
 - a. Wages or Salaries. Other public employees who are not classified as elected public officials or officers of the LPA (e.g., other engineers, technical staff, foreman, laborers) may be paid from the MFT fund for the time actually engaged in MFT funded construction or maintenance projects. They must receive the same rate of pay as they would normally receive from the agency while engaged in other work of a similar classification.
 - b. Holidays, Vacation, and Sick Leave. Payment of a prorated portion of holidays, vacation, and sick leave may be made with MFT funds for costs incurred by the agency while working on MFT funded maintenance and construction projects.
 - c. Health, Hospitalization, and Life Insurance. Payment of a prorated portion of health, hospitalization, and life insurance premiums may be made with MFT funds for costs incurred on MFT funded maintenance and construction projects.
 - d. Workers' Compensation Insurance Premiums. Worker's compensation premiums covering county, road district, and municipal employees are eligible for payment with MFT funds. These premiums may be paid with MFT funds in the prorated share of the employees' salary that is paid from MFT revenues.

HARD COPIES UNCONTROLLED

- e. Retirement and Social Security. Counties, municipalities, and road districts whose employees are covered under the provisions of the Illinois Municipal Retirement Fund, [40 ILCS 5/7-101 et seq.](#), may use MFT funds to pay their contributions to the Municipal Retirement Fund. The term “municipality” in the Illinois Municipal Retirement Fund includes not only municipalities, but also other political subdivisions, including counties and townships. The provision provides that the political subdivisions’ contribution will be paid from the same funds from which the employee’s compensation is paid, and provides that the political subdivision may levy a tax to reimburse the fund from which the contribution was made. If a tax is levied for that purpose, the MFT account must be reimbursed as the taxes are collected, and the amount of the reimbursement shown on the statement accompanying the request for expenditure of MFT funds for the next period.

Counties, municipalities, and road districts whose employees are covered under the provisions of the Social Security Enabling Act, [40 ILCS 5/21-101 et seq.](#), of the State may also use MFT funds to pay their contributions to the Social Security fund for work that is part of construction or maintenance of an MFT project.

5. Legal Fees. The following applies:

- a. County. Because the Office of State’s Attorney is statutory and the duties, salary, and expenses of the Office are provided for by the State law, MFT funds cannot be used to pay the Office of State’s Attorney expenses ([55 ILCS 5/3-9001 et seq.](#)).
- b. Municipal. The city attorney is an appointed municipal official, and the salary and duties are prescribed by the governing body of the municipality. MFT funds cannot be used to pay for legal work performed by a city attorney on MFT funded projects. However, because the city attorney’s duties are not prescribed by law, the compensation of other persons, whom the governing body of the municipality might elect to hire to perform legal work in connection with the acquisition of right-of-way for MFT construction improvements, may be paid with MFT funds.
- c. Road Districts. Payment of attorney’s fees and legal costs in connection with the procurement of right-of-way may be paid with MFT funds, providing:
- the right-of-way is in the name of the road district;
 - the right-of-way pertains to an MFT road district construction project; and
 - no fees for legal work are paid to any county, township, or road district official (State’s Attorneys’ fees are not eligible).

4-3.03(d) Non-Dedicated Subdivision Roads Established Prior to July 23, 1959

Counties ([605 ILCS 5/5-701.15](#)), Road Districts ([605 ILCS 5/6-701.8](#)), and Municipalities ([605 ILCS 5/7-202.21a](#)) may use MFT funds for eligible maintenance or construction projects on non-dedicated subdivision roads established prior to July 23, 1959 if property owners in the subdivision where such road is situated provide proportional matching contributions, whether in cash, kind, services or otherwise.

Non-dedicated subdivision road refers only to those roads which were denoted as such on a subdivision plat filed prior to July 23, 1959, which have not been dedicated to the public (Illinois Attorney General's Opinion 96-008). If cash contributions are provided by property owners the cash shall be deposited in the appropriate MFT account. Any in kind, services, or otherwise contribution shall be used on or for the road and shall be documented with auditable paperwork supporting contribution's value. If labor is provided as a matching contribution, the prevailing hourly wage rate published by the Illinois Department of Labor for the type of labor and location of work shall be used. If materials are provided as a matching contribution, materials shall comply with all IDOT policies, specifications, and certifications.

Non-dedicated subdivision roads improved with County or Road District MFT funds to meet standards established by the County, become part of the road district system. Non-dedicated subdivision roads improved with Municipal MFT funds to meet standards as established by the Municipality, become part of the municipal street system.

4-3.03(e) Investments and Deposits

The use of MFT funds involves cash flow planning to determine when MFT funds are available to expend. Generally speaking, MFT funds must be highly liquid to meet the anticipated costs for highway construction projects and/or maintenance projects. If the MFT cash flow analysis shows that funds are available to earn an investment return, MFT funds may then be invested or deposited in financial instruments that have no tolerance for risk of principal. The LPA must comply with the Public Funds Investment Act ([30 ILCS 235](#)). In addition, the Investment of Municipal Funds Act ([50 ILCS 340](#)) provides additional investment options.

The LPA may use MFT funds to purchase:

- tax anticipation warrants that shall bear interest not to exceed four percent;
- municipal bonds;
- bonds and other interest-bearing obligations of:
 - the United States;
 - the State of Illinois;
 - any other state; or
 - any political subdivision or agency of the State of Illinois or of any other state;
- savings certificate of deposits of any State or National Bank if such certificates are fully insured by the Federal Deposit Insurance Corporation; or
- treasury notes and other securities issued by agencies of the United States.

In addition, the LPA may use MFT funds to make deposits in:

- savings accounts of any State or National Bank if such accounts are fully insured by the Federal Deposit Insurance Corporation; or

- withdrawable capital accounts or deposits of State or federal chartered savings and loan associations which are fully insured by the Federal Savings and Loan Insurance Corporation.

No bank or savings and loan association shall receive public funds unless it has complied with [30 ILCS 235/6](#).

A copy of the debt instrument shall be provided to the Department. Any financial instrument that results in a loss of principal shall be considered an ineligible use of MFT funds. Any loss of principal of MFT funds shall be reimbursed with other local funds. Any interest earned less any fees from investments and deposits shall be credited back to the MFT funds according to [Section 9-1](#).

4-3.04 Using MFT in Conjunction with Other Funds

The following applies:

1. County Bridge Funds. MFT funds may be used in conjunction with the County Bridge Fund to construct or repair any bridge, culvert, drainage structure, or grade separation, including approaches thereto, on, across or along any public road provided that the improvement is designed and constructed as an MFT project. The county's commitments to aid road districts and municipalities must comply with [605 ILCS 5/5-501](#). Road districts and municipalities may also use MFT funds to pay their share of the cost of joint bridge improvements with the county.
2. Township Bridge Funds. MFT funds may be used for the local share in conjunction with a bridge constructed under the Township Bridge Program, see Section 4-2.02.
3. Federal Funds. For counties and municipalities, MFT funds may be used to match federal funds. For municipalities, the participation in the cost of the improvement is limited to 50%. In addition, any LPA may use its MFT funds for any eligible MFT item included in a federally funded project.
4. Other Funds. MFT funds may be used for any phase of a project in conjunction with other funds provided that the entire improvement is designed according to MFT policies and constructed under the supervision of IDOT.

4-3.05 Joint Improvements - Written Contracts and Construction or Maintenance Agreements

Any highway authority may enter into a written contract with any other highway authority for the jurisdiction, maintenance, administration, engineering, or improvement of any highway or portion thereof subject to the approval of IDOT ([605 ILCS 5/4-409](#)). MFT funds may be used for any eligible portion of the joint project provided that the entire project is accomplished under the supervision of IDOT.

Any municipality may negotiate an agreement with the Department whereby the municipality may use such funds as are available to it for that purpose for the construction or maintenance of a State highway within its boundaries, or with the corporate authority of a county or road district for the construction or maintenance of a highway on the county highway system or township or district road system outside of its municipal boundaries ([605 ILCS 5/9-101](#)).

The county board may negotiate an agreement with the Department whereby the county may use such funds as are available to it for that purpose for the construction or maintenance of a highway on the State highway system, or with a municipality for the construction or maintenance of streets on the municipal street system of such municipality ([605 ILCS 5/9-101](#)).

4-3.06 Asset Management

4-3.06(a) General

LPAs may use MFT funds for asset management, if the assets are eligible to be constructed or maintained with MFT funds. This includes the following categories:

- Pavements
- Structures
- Culverts/Storm Sewers
- Pavement Markings
- Highway Signs

Asset management may be completed by consulting engineers or LPA staff. See [Section 5-5](#) for preliminary engineering agreements. Employee salaries may be compensated according to Section 4-3.03(c). See [Chapter 6](#) for requirements on structures.

4-3.06(b) Pavement Management Studies

Pavement management involves procedures (e.g., pavement condition rating provided by the pavement evaluation study) that are more comprehensive than the procedures used in the pavement evaluation. Using the values assigned for the existing pavement condition and the present and projected traffic, the Pavement Management Report should provide the following information:

- a projected average pavement condition index using a specified level of funding for a specified period;
- a projected level of funding necessary to provide a specified average pavement index after a specified period; and
- a recommended schedule of pavement improvement strategies and timetable for improvements that will meet the selected parameters.

Projects of this nature will be evaluated and approved by CBLRS on a case-by-case basis. When the LPA requests to use MFT funding, CBLRS, in cooperation with the district, will establish monitoring procedures to evaluate the effectiveness of the Pavement Management Program.

4-3.06(c) Inventories

Inventories are vital to asset management. Each asset class will have a variety of unique inventory categories; however, at a minimum, all inventories should have the following fields:

- ID Number – It is a unique identifier code that allows the asset to be tracked, and may be a sequential or alpha-numeric code, or any other system.
- Description – It is an explanation of the asset that may require numerous fields, including height, width, thickness, material type, etc.
- Condition Rating – It is an evaluation of a current condition of the asset, which should be used to determine future maintenance or rehabilitation.
- Location – It is an identifier that establishes the geographic position of the asset.
- Date(s) – It is the day when an event occurred; it should include installation/construction date, inspection/rating date, maintenance date, and replacement date.

4-3.06(d) Inspections

The asset owner must have a systematic strategy for conducting field inspections and reporting its findings. It must be clear to the inspection team which elements and attributes to investigate. The inspection report should accurately and clearly record all findings and may include photographs representing the condition of the asset and/or any significant defects.

4-3.06(e) Software/Hardware

The asset owner may purchase or develop asset management software to assist with the inventory and inspection management. Annual software license fees and maintenance costs are eligible MFT expense. Hardware may be purchased only if it is a mobile, is an integral part of the asset management system, and is used exclusively for eligible highway assets.

PERMISSIBLE USES OF MFT FUNDS
(By Townships and Road Districts)

Figure 4-3D

4-4 LOCAL FUNDING

4-4.01 Local Road and Bridge Taxes

County and road districts can impose taxes to provide local funding for roadway and bridge projects. These funds are typically used solely for costs associated with these roadway and bridge projects.

4-4.02 Bonds

Any LPA may finance a highway improvement project with the proceeds of a bond issue and request that the use of MFT funds for the payment of principal and interest when retiring the bonds. If MFT funds will be used to pay any portion of the project cost or LPA indebtedness, the entire improvement must be accomplished under the general supervision of IDOT. Any portion of the improvement that is ineligible for MFT funding may not be included in the cost of the indebtedness to be repaid with MFT funds.

There are generally two types of bond issues for which a LPA may commit future MFT allotment; these are discussed in the following subsections.

4-4.02(a) **General Obligation Bonds**

Any LPA may issue General Obligation Bonds for constructing a highway improvement. The LPA issuing the bonds establishes a general tax levy that is pledged toward retiring the bonds. When MFT funds are used to retire the bonds, the tax levy must be cancelled. Except as otherwise permitted by law, the question of issuing the bonds must be submitted by referendum to the voters of the taxing district ([605 ILCS 5/5-605](#), [605 ILCS 5/6-510](#), [605 ILCS 5/6-513](#), and [65 ILCS 5/8-4-1](#)).

4-4.02(b) **MFT Fund Bonds**

Counties, road districts, and municipalities are authorized to issue bonds to construct highway improvements and to repay the principal and interest with MFT funds, pursuant to [30 ILCS 385/1 - 385/4](#). These are identified as “Motor Fuel Tax Fund Bonds” and must be administered in a manner similar to General Obligation Bonds. Because the bond issue is not secured by a property tax levy, it will not be necessary to provide a “certification of cancellation of tax levy.”

4-4.03 Special Assessments

Article 9 of the Illinois Municipal Code, [65 ILCS 5/9-1-1 et seq.](#) provides legislative authority for municipalities to construct local improvements that will be paid for by assessments against the properties affected. When a municipality undertakes a highway or street improvement using special assessment financing, the public benefit portion assessed against the agency may be paid with MFT funds, providing that the project itself is eligible for MFT funding. The project must be constructed under the general supervision and approval of IDOT. The procedures for initiating a special assessment project are similar to those used for a bond issue project, see [65 ILCS 5/9-1-1, et seq.](#), [605 ILCS 5/7-202.13](#).

A municipality may use a special assessment to finance the local share of a project constructed with Federal-aid funds, pursuant to [65 ILCS 5/9-2-113](#).

4-4.04 Road Impact Fees

LPAs have the authority to adopt and implement road improvement impact fee ordinances and resolutions. Road improvement impact fee means any charge or fee levied or imposed by a unit of local government as a condition to the issuance of a building permit or a certificate of occupancy in connection with a new development, when any portion of the revenues collected is intended to be used to fund any portion of the costs of road improvements ([605 ILCS 5/5-901, et seq.](#)).

4-4.05 Local General Funds

Local general funds refer to all funds that are received by the LPA through property taxes, income taxes, sales taxes, and other taxes assessed by the LPA. A portion of these funds may be allocated to roadway and bridge projects at the discretion of the LPA.

4-5 ACRONYMS

This is a summary of the acronyms used within this chapter.

ADT	Average Daily Traffic
BBS	Bureau of Bridges and Structures
BLRS	Bureau of Local Roads and Streets
CBLRS	Central Bureau of Local Roads and Streets

Chapter 5 AGREEMENTS

5-1 AGREEMENTS OF UNDERSTANDING

5-1.01 Statutory Background

Generally, highway construction by local highway authorities that is funded in whole or in part with federal funds, State funds, and Motor Fuel Tax (MFT) funds, requires Illinois Department of Transportation (IDOT) supervision and approval. However, [605 ILCS 5/5-402](#) and [605 ILCS 5/7-203.2](#) provide that counties and municipalities may enter into Agreements of Understanding (AOU) with IDOT to construct and/or maintain highways or streets using MFT funds, or other State funds administered under MFT policies and procedures, without the approval and supervision of IDOT. The local public agency (LPA), however, must show that it is adequately organized, staffed, equipped, and financed to discharge satisfactorily such statutory requirements and duties. LPAs must have an appointed full-time engineer. The district will determine if the LPA has met these requirements.

Road construction projects that are funded entirely by a county (e.g., do not receive any State or federal financing) may be performed under the supervision and approval of IDOT at the option of the county.

5-1.02 Agreement Content

An AOU between IDOT and an LPA are typically used for maintenance and construction, or maintenance only. Counties may include work done by road districts under the supervision of the county engineer. IDOT and the LPA must prepare the terms of the agreement to ensure that funds are expended consistent with the intent of the law. The following stipulations should be included in the agreement:

- The responsibilities of the LPA and IDOT must be listed.
- In the event that a vacancy occurs in the LPA's position responsible for overseeing expenditure of MFT funds (e.g., county engineer, city/public engineer), the AOU is terminated and a new AOU would need to be sought by the LPA once the vacancy is filled.
- IDOT may make periodic inspection of the jobsite and project files, as it deems necessary, to satisfy itself that the work is being done in compliance with the plans, specifications, and IDOT policies and procedures.
- The agreement must state what work is covered by the agreement.
- The provisions of the agreement do not apply to any federal or State funded projects that are not administered under the MFT policies and procedures.
- The agreement can be terminated at the discretion of either party.
- The use of MFT funds, other than specified in the agreement, will require approval by IDOT.

BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS

5-1-2

June 2017

- The provisions of the agreement may be tailored to the LPA.

5-1.03 LPA Responsibilities

The LPA is responsible for the following items and any other items that are pertinent to providing a clear understanding between the parties in the agreement:

1. To maintain an adequate, fully staffed organization and to keep IDOT advised of the organization and key staff changes.
2. To follow the procedures set forth by [605 ILCS 5/5-403](#) and [605 ILCS 5/6-701.3](#) for counties, and [605 ILCS 5/7-203](#) for municipalities for maintenance and construction of any highway or street.
3. To use the design criteria and to follow the policies and procedures adopted by the Bureau of Local Roads and Streets (BLRS). Modifications and deviations must be approved by IDOT.
4. For construction projects, to ensure all plans and specifications are prepared by an Illinois licensed professional engineer or by individuals under the direct supervision of an Illinois licensed professional engineer. All plans are required to have an engineer's professional and/or structural seal and signature, as applicable.
5. For LPAs to obtain the Bureau of Bridges and Structures (BBS) approval for all preliminary bridge design and hydraulic reports and all final bridge plans for bridges and culverts of NBIS length or greater and other structures identified in [Section 10-2](#).
6. To obtain all necessary environmental clearances and construction permits before advertising a project for letting or constructing the project with its own forces.
7. Securing all right-of-way (ROW) prior to advertising a project for letting, unless prior approval by IDOT has been secured.
8. To obtain IDOT's approval of plans and specifications for improvements or connections to State highways and/or appurtenances prior to advertising for bids. The LPA is responsible for withholding the final payment to the contractor until written certification is received by IDOT that the project has been completed according to the plans and specifications and the work is acceptable to IDOT.
9. To advertise for bids using IDOT's Notice to Contractor Bulletin and to let contracts for maintenance or construction to the lowest responsible bidder, or to do the work itself through its officers, agents, or employees.
10. To perform, or have someone else perform, construction and material inspections required for its construction and maintenance projects using procedures in accordance with the IDOT's [Project Procedure Guide \(PPG\)](#).
11. To make available, upon request, all records for review and/or audit by IDOT. These documents must be retained for a minimum of five years after the work has been completed. LPAs operating under AOU are required to supply IDOT, if applicable to the project, with one copy of the various documents for record purposes as specified in AOU.
12. To obtain IDOT approval prior to any use of MFT funds, other than those specified in the agreement. For approvals by the LPA, the approval must be prior to any use of MFT funds.
13. To request IDOT's authorization of MFT funds on a timely basis.
14. To submit an annual report to the district listing the projects undertaken, the funds expended, and the projects' status.

HARD COPIES UNCONTROLLED

15. To furnish the district all documents required by AOU.

5-1.04 District Responsibilities

The district is responsible for the following items and any other items that are pertinent to providing a clear understanding between the parties in the agreement:

- to authorize MFT funds when requested by the LPA,
- to provide a general review of the LPA's operation under the AOU, and
- to perform a documentation review of MFT projects.

5-1.05 Processing Agreements of Understanding

A LPA desiring to operate under AOU or desiring additional information about AOU should contact the district. Sample agreements are available from the district. If the district determines that a LPA is qualified to operate under AOU, the agreement must be executed by the LPA and Central Bureau of Local Roads and Streets (CBLRS).

5-2 JURISDICTIONAL TRANSFERS

5-2.01 Jurisdictional Responsibility

Jurisdiction is the authority and obligation to administer, control, construct, maintain, and operate a highway subject to the provisions of the Illinois Highway Code. A highway is defined as any public way for vehicular travel which has been established by statute, dedication, or prescription. The term highway includes rights of way, bridges, drainage structures, signs, guardrails, and all other appurtenances necessary for vehicular travel. A highway in a rural area may be called a road. A highway in a municipality may be referred to as a street ([605 ILCS 5/2-202](#)). See [Chapter 3](#) for a discussion on jurisdiction responsibilities.

When a highway authority has jurisdiction of a highway, it has various obligations that include reconstruction, signing, maintenance, etc. All of these obligations remain with the highway authority until the jurisdiction is transferred to another highway authority. Transfer of the maintenance or any other portion of jurisdiction is not allowed. For example, a county can enter into an agreement to have another highway authority perform maintenance on a section of highway; however, this does not relieve the county from the ultimate obligation of ensuring that the maintenance is performed. The agreement for the performance of services is not an agreement for the transfer of jurisdiction. In other words, a maintenance agreement does not transfer jurisdiction.

A jurisdictional transfer will occur because it is either mandated by statute or agreed to by written contract. A municipality that annexes territory that includes a township/road district road within the annexed territory or adjacent to a township road is mandated to assume jurisdiction of the township road within the annexed area ([65 ILCS 5/7-1-1 et seq](#) and [605 ILCS 5/6-203](#)). Agreed-to jurisdictional transfers occur because of the logical need to transfer authority to another highway system. For example, relocating an existing State highway may result in decreased traffic occurring on the old State highway. Therefore, the old State highway may be better served under the jurisdiction of a county, municipality, or township/district road system.

It should also be noted a jurisdictional transfer agreement in itself does not automatically include the transfer of land rights associated with the highway. A separate process involving transfer of land rights must be performed; see Section 5-2.04.

A highway authority may provide MFT or other local funds based on the present worth of the highway or structure to the highway authority that agrees to assume jurisdiction for the facility. The present worth is determined using the life-cycle cost of keeping the highway in a serviceable condition. The highway authority assuming jurisdiction of the roadway must deposit all present worth funds, regardless of source, into their MFT account and must be expended in accordance with MFT standards, policies, and procedures.

The CBLRS should be notified of all jurisdictional transfers (both mandatory and agreed-to) for review, comment, and recordkeeping purposes. The District and/or the LPA is responsible for notifying the CBLRS of proposed and completed jurisdictional transfers, and ensuring the proper documentation is submitted to IDOT for processing and recordkeeping. See Section 5-2.03 for documentation and procedures required for agreed-to jurisdictional transfers.

5-2.02 Jurisdictional Transfers - IDOT Responsibilities

[605 ILCS 5/4-409](#) authorizes IDOT to enter into a written contract with any other highway authority for the jurisdiction of any highway or section of highway. IDOT may also, upon application of any highway authority, authorize the highway authority to enter into a written contract with any other highway authority for the jurisdiction of any highway or section of highway. IDOT is therefore required to be a party to all agreements involving the transfer of jurisdiction of a highway from one highway authority to another. If the transfer involves the State highway system, IDOT is one of the executors of the agreement. If the transfer is between two highway authorities, IDOT approval of the jurisdictional transfer agreement is required. The Director of Planning and Programming approves all jurisdictional transfers between two local highway authorities and shall be coordinated through the District BLRS office.

Jurisdictional transfers involving marked or unmarked state highways may require additional review by Office of Planning and Programming, Bureau of Operations, and the IDOT Route Marking and Signing Committee prior to execution of the agreement by IDOT. If the changes involve a U.S. Route, then IDOT must seek federal approval from the AASHTO Special Committee on U.S. Route Numbering. The department will review LPA proposals for jurisdictional transfers of state highways on a case-by-case basis. Jurisdictional transfers mandated by the Illinois Compiled Statutes (ILCS) do not require IDOT approval. However, a municipality is required to notify a township regarding an annexed township road that automatically becomes the municipality's jurisdiction ([65 ILCS 5/7-1-1](#)). The municipality should also notify IDOT and the county engineer. Agreed-to jurisdictional transfers between two highway authorities will require IDOT approval.

The CBLRS is responsible for maintaining records of jurisdictional transfers (electronic and microfilm/microfiche). The original hard copies of jurisdictional transfer agreements are retained at the Illinois State Archives. To improve communication and maintain a complete record of jurisdiction changes for a given key route, any joint agreements, state contracts, or other documents submitted to or prepared by the District affecting the jurisdiction of a highway shall be transmitted to and coordinated with CBLRS for recordkeeping. The CBLRS will be responsible for coordinating jurisdiction changes to IRIS through the Office of Planning and Programming Highway Data Manager.

The Highway Systems Manager in the CBLRS serves as the clearinghouse for jurisdictional matters. In this capacity, the Highway Systems Manager reviews documents requiring IDOT approval, maintains records/documentation of highway jurisdiction, and review of jurisdictional matters requiring clarification. Records involving annexation and land rights shall be maintained and managed by the District. To streamline and improve these records, the District may at their discretion, utilize electronic records such as county GIS where available. For further guidance on annexation requirements and documentation, contact the District office.

5-2.03 Jurisdictional Transfers - Procedures and Documentation

Transfers of jurisdiction shall be accomplished in accordance with the BLRS publication, [Highway Jurisdiction Guidelines for Highway and Street Systems](#). Although these guidelines shall be used as a general guide to develop documentation, each proposed transfer shall be evaluated on a

BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS

January 2019

5-2-3

case-by-case basis. The Highway Systems Manager of the CBLRS is responsible for reviewing documents involving jurisdictional transfers. To avoid delays in the review and execution of jurisdictional transfer agreements, it is strongly recommended that draft agreements for all proposed jurisdictional transfers be submitted to the CBLRS for review prior to execution.

Any jurisdictional transfer agreement involving a local highway authority will require documentation by a written jurisdictional transfer agreement. The district staff or LPA developing the agreement should use the standard jurisdictional transfer agreements developed by the department in order to provide compliance with the Illinois Compiled Statutes, to maintain records of all jurisdictional transfers, and to approve those transfers requiring departmental approval. These transfer documents are maintained by the department and are considered official legal documents for establishing jurisdiction.

One of the two Bureau of Local Roads (BLR) forms listed below shall be used for agreed-to jurisdictional transfers. The first one is for jurisdictional transfers between the state and a local highway authority. The second form is for jurisdictional transfers between two local highway authorities only. Each form lists the additional documents required for jurisdictional transfers involving municipalities, counties, or townships. The BLR forms shall not be altered.

The following standard agreement forms are provided by CBLRS:

- Form [BLR 05210](#) – Local Public Agency - State Jurisdictional Transfer
Applicability: State and Local Highway Authority Transfers with Improvement or when a Present Worth transfer involves the exchange of MFT funds.
- Form [BLR 05212](#) – Local Public Agency Agreement for Jurisdictional Transfer
Applicability: Local to Local Highway Authority Transfers only

At a minimum, the jurisdictional transfer agreements should contain the following items and any other items pertinent (intergovernmental agreements, plans, plats, letters of intent, correspondence, present worth, etc.) to providing a clear understanding and legal representation between the parties in the transfer:

1. Conveyor/Recipient. The document should clearly indicate the highway authority conveying and the highway authority receiving the segment of highway involved.
2. Termini Description. Provide a clear description of the highway and the beginning and ending points involved in the transfer. Use route numbers and local highway names. Include federal route numbers when available.
3. Length. Accurately measure the length of highway to be transferred to the nearest hundredth of a mile (hundredth of a kilometer).
4. Key Route. The inventoried key route number for the highway shall be provide. Highways may have multiple key route segments. IDOT prefers one form per key route segment be provided.
5. Structures. Indicate and identify all National Bridge Inspection Standards (NBIS) structures to either be included or excluded in the transfer by their structure number(s). Any structure(s) not excluded is considered a part of the jurisdictional transfer.
6. Illinois Statutes. The jurisdictional transfer should identify the State law that authorizes the legality of the transfer.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS

5-2-4

January 2019

7. Other Information. Include any additional information that may assist in identifying the transfer. Jurisdictional transfers involving an improvement should include the applicable project number, State section number, LPA section number, contract number, etc. Plan sheets, location maps, and plats may be necessary if the highway improvement is not yet constructed.
8. Location Map. Include a map (minimum 8½" x 11") to provide the location of the affected highway involved. The map should be legible (reproducible by photocopy) and indicate the limits of the portion of highway to be transferred. This map shall clearly label and indicate all termini and show the jurisdiction of major highways adjacent to the jurisdictional transfer.
9. Resolutions and Ordinances. The State law requires that a resolution from the county and an ordinance from the municipality be executed for an agreed-to jurisdictional transfer. Examples are contained in the [Highway Jurisdiction Guidelines for Highway and Street Systems](#).
10. Effective Date of Jurisdictional Transfer. Clearly define the date and method by which a jurisdictional transfer will take place. Jurisdictional Transfers between two local highway authorities will normally be effective upon the IDOT's approval. If a construction improvement is tied to the transfer, these will normally become effective 21 days after final inspection and acceptance of the improvement.

It is strongly recommended that a draft agreement be submitted for review. Submit a minimum of three original signed and sealed documents of the final agreement to the district for final review and execution by the department.

5-2.04 Transfer of Land Rights

[605 ILCS 5/4-508](#) allows for the conveyance of any real estate interest from the State to another highway authority in conjunction with a past or present transfer of jurisdiction. The conveyance of any real estate interest from the State to another highway authority is not mandatory and must be mutually agreeable to both parties. Therefore, the State can transfer jurisdiction to another highway authority without the conveyance of any real estate interest. This conveyance can be part of the jurisdictional master agreement. For conveyance of land associated with a highway in which the jurisdiction has been previously transferred, a Letter of Intent between IDOT and the LPA is prepared to initiate the transfer; see Section 5-4. After concurrence of the concerned parties, a plat and legal description of the property to be transferred is prepared. If the transfer material is acceptable, the LPA must pass and execute the appropriate ordinances/resolutions to accept the transfer and submit five certified copies to the district. The transfer is then approved by the Secretary of Transportation.

No part of the transferred land can be vacated or disposed of without the approval of IDOT that may require compensation for non-public use. For additional guidance on real estate transfers, see the Section 6 of the IDOT [Land Acquisition Policies and Procedures Manual](#).

HARD COPIES UNCONTROLLED

5-3 JOINT AGREEMENTS

Certain state and federal funds are required to follow [30 ILCS 708/](#), the Grant Accountability and Transparency Act (GATA). Additional information and requirements of state agencies and/or grantees (LPAs and others) may be found at the State of Illinois website for grants.

GATA will provide a uniform, effective, and efficient method of providing notice of funding opportunities, selection of recipients, and monitoring of funds provided. For projects using funds covered by GATA additional requirements and procedures may be required in addition to those in Section 5-3.

Website: <https://grants.illinois.gov>

Procedures and policies for other projects not required to follow GATA procedures are discussed in this Section.

5-3.01 Joint Agreements Between State and LPAs

5-3.01(a) Requirements for a Joint Agreement

IDOT may enter into a joint agreement for maintenance, engineering, administration, or improvement of a highway with any other highway agency. A local-State agreement is required when LPAs are involved in projects financed in part with State and/or federal funds. A joint agreement is required for a project when one or more of the following conditions apply:

- The project involves planned improvements on the local highway system for which construction, engineering, utility relocation, and/or ROW acquisition will be paid totally, or in part, with State or federal funds.
- The project involves planned improvements on the State highway system for which the LPA is participating in the cost and/or any subsequent maintenance thereof on any phase of the improvement or in energy and/or maintenance costs of traffic signals or street lighting. If a highway is constructed to a greater width or of a different type than is required by IDOT, the LPA will be responsible for the excess cost ([605 ILCS 5/4-404](#)).
- The project involves planned improvements on the State or local highway system involving a jurisdictional transfer between the State and the LPA.

5-3.01(b) Agreement Content

For most LPA projects involving Federal-aid and/or State funds, standard agreement forms ([BLR 05310](#) or [BLR 05311](#)) should be used. These forms cannot be used if there are three or more parties to the agreement. Multiple parties may be included on standard agreements if one agency is designated as the lead agency. All transactions with IDOT will be with the lead agency. A separate Intergovernmental Agreement (IGA) should be prepared to specify payment and other responsibilities between the lead and additional LPAs, this is not required to be submitted to IDOT.

If an individual joint agreement is required to be written, the agreement must clearly identify the responsibilities of each party. The agreement should incorporate the following items and any other items pertinent to providing a clear understanding between the parties relative to the project:

BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS

5-3-2

June 2017

- Include the LPA name, MFT section number for each agency that is a party to the agreement, federal project number (for Federal-aid projects), and State job number.
- Provide a description of the work to be accomplished.
- Include a location description and location map.
- Identify who is responsible for the surveys, plan preparation, letting and awarding of the contract, and construction supervision of the work.
- Specify the method of construction (e.g., State-let contract, local-let contract, LPA day-labor forces).
- Note if a separate concurrence in the award of the contract is required.
- Separate the division of cost by showing the funding responsibilities and the type of funds being used. Clearly identify any limiting amounts. Attach any supporting documentation (e.g., resolutions).
- Identify the method of payment and/or reimbursement by each party.
- Identify the specific Disadvantaged Business Enterprise (DBE) program being followed by the LPA.
- Identify who is responsible for any utility adjustments and disposition of encroachments.
- Note any parking restriction applicable to the project.
- Specify jurisdiction of the facility, both before and after construction.
- Specify who is responsible for maintenance after the project is completed.
- Specify who is responsible for maintenance and energy costs for traffic signals and/or street lighting.
- If a transfer of jurisdiction is involved, identify limits of the roadway included in the jurisdictional transfer and attach all necessary transfer documents in accordance with the BLRS publication, [Highway Jurisdiction Guidelines for Highway and Street Systems](#).
- Identify who is responsible for record retention during and after the project completion.
- Note the agreement expiration date and any other special conditions.

When the LPA desires to use one or more lump-sum amounts before the federal percentage is calculated, specify the order in which it should be used and the “not to exceed” amount. The following provides an example of the wording that should be used on Form [BLR 05310](#) with regards to State Match Assistance (SMA) or other funds:

- Lump-sum \$60,000 TARP funds not to exceed 50% of final cost of project credited to the project to be utilized first.
- Lump-sum to be utilized second not to exceed \$20,000 EDP funds.
- Lump-sum to be utilized third not to exceed \$40,000 SMA funds.

These specified amounts will be used in sequence, with the federal and local percentages calculated after they are deducted.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS

June 2017

5-3-3

When the LPA desires to use a percent “not to exceed” commitment, the federal and State funds will be used concurrently at the specified percentages up to the “not to exceed” amount (e.g., 20% not to exceed \$40,000 SMA Funds).

Be advised that the “not to exceed” amount specified under a percentage commitment will be tied up and unavailable for programming until the project is closed out and a documentation review has been complete by IDOT or the Federal Highway Administration (FHWA), if required.

5-3.01(c) Draft Agreement

Draft joint agreements should be prepared for all projects. They will be reviewed by both the district and CBLRS for those projects involving special funding or conditions that are not adequately addressed in the standard agreement format. The purpose of this review is to ensure that the improvement is compatible with the State highway system, the work is included in the State’s Annual Construction Program and ROW and other provisions in the proposed agreement are adequate to permit federal and/or State participation in the project. Comments and recommendations on the draft agreement will be provided for incorporation into the final agreement.

5-3.01(d) Final Agreement

A minimum of three original agreements by the appropriate LPA official(s) must be furnished to the district. Provide one additional original agreement for each LPA that is a party to the agreement.

If the improvement is on the State highway system, the joint agreement will be processed through Bureau of Design & Environment (BDE) unless the project is being funded with Federal-aid funds allocated for improvements selected by LPAs. Agreements for these projects, as well as improvements on the local highway system, will be processed through BLRS.

There may be special cases where these procedures will need to be modified. Contact the appropriate bureau office for guidance.

The agreements should be signed by the chairman of the county board, mayor, or village president. If the agreement is signed by an appointed local official, the local official signing the agreement must be authorized to do so by resolution of the local governing body. This resolution should also be on file in the district office. See [Section 2-3.05\(b\)](#) on signature requirements.

Since the highway commissioner has jurisdiction of its highways, the highway commissioner must also approve the expenditure of township road district funds, and the construction, repair, and maintenance of township roads within the road district.

A copy of the executed agreement is furnished to the LPA upon execution by IDOT. Copies are also sent to the district and all bureaus and agencies affected by the project.

5-3.01(e) Amendment to Federal-Aid Agreement

If a revision to the Division of Cost of the original joint agreement (Form [BLR 05310](#)) or any subsequent amendments is required, the LPA should use Form [BLR 05311](#). Form [BLR 05310](#) was not designed to function as an amendatory document.

All requirements of Section 5-3.01(c) and 5-3.01(d) should be addressed.

5-3.02 Agreement for County Engineer's Salary

When a county elects to transfer part of its Surface Transportation Program (STP) funds to IDOT in return for State funds to be used to pay a portion of its county engineer's salary, a joint agreement is needed. Form [BLR 09220](#) can be used for this type of agreement.

This agreement will remain in force and effect for a period of six years from the date of execution unless terminated by either party upon 30 days written notification by either party. The agreement will be temporarily suspended during any period for which the county does not have sufficient STP funds available to be transferred.

5-3.03 Joint Agreements Between LPAs

[605 ILCS 5/4-409](#) allows IDOT to authorize a highway authority to enter into a contract with another highway authority for the jurisdiction, maintenance, administration, engineering, or improvement of any highway.

5-3.03(a) Guidelines for an Agreement

When two LPAs are jointly constructing a highway improvement, a joint agreement between the LPAs is always advisable. In some circumstances, IDOT requires this joint agreement to be submitted for approval. In all other cases, one copy of an executed joint agreement should be submitted to IDOT for informational purposes. A joint agreement is required for a project when any of the following conditions apply:

- A municipality proposes to improve a municipal street extension that extends into another municipality ([605 ILCS 5/7-202.3](#)).
- A county proposes to improve a street (not a county highway) within a municipality with a population exceeding 500 persons to connect or complete a county highway within a municipality ([605 ILCS 5/5-408](#)).
- A municipality and a township propose a joint improvement ([65 ILCS 5/11-85](#)).
- A county elects to surrender its jurisdiction over the ROW and improvement of a county highway ([65 ILCS 5/11-91.2](#) and [605 ILCS 5/5-410.1](#)).
- When a county(ies) deems it necessary to make improvements of county line roads ([605 ILCS 5/5-405](#)) or to make improvements with adjacent counties ([605 ILCS 5/5-406](#) and [407](#)).
- LPAs in adjacent States.
- When a municipality maintains a county highway within a municipality ([605 ILCS 5/5-410](#)).

5-3.03(b) Format

Clearly identify the responsibilities of each party. Address in the agreement any applicable items listed in Section 5-3.01(b). Also, address in the agreement any additional items that might be pertinent to ensure a clear understanding between the agencies executing the agreement.

5-3.03(c) Draft Agreement

Furnish a draft copy of the joint agreement to the district for review and comment if IDOT approval of the agreement is required. The purpose of this review is to ensure the agreement is compatible with statutory requirements.

5-3.03(d) Signatures

The agreement should be signed by the chairman of the county board, mayor or village president, or highway commissioner, as appropriate. If an appointed local official signs the agreement, then the official must be authorized to do so by resolution of the local governing body. This resolution should also be on file in the district. See [Section 2-3.05\(b\)](#) on signature requirements.

5-3.03(e) Distribution

When IDOT approval of the joint agreement is required, a minimum of four original agreements by the appropriate LPA official(s) must be furnished to the district. Provide additional original agreement if more than two LPAs are a party to the agreement.

A copy of the executed agreement is furnished to each LPA upon approval by IDOT. Copies are also furnished to the CBLRS and all agencies affected by the project. When IDOT requires copies of the agreement for informational purposes only one copy of the executed agreement needs to be provided to the district.

5-3.04 Interagency Cooperative Agreements

The *Intergovernmental Agency Act*, [5 ILCS 220](#) allows any power, privilege, function, or authority that may be exercised by a public agency to be exercised, combined, transferred, or exercised jointly with another public agency. These contracts must be approved by the governing bodies of each participating agency. These agreements should reflect a sustaining working relationship between the agencies. It should emphasize the mutual benefits and costs and should not focus on one particular project. When the agreement involves functions that affect roads and streets, the agreement should be sent to IDOT for review.

5-4 LETTERS OF INTENT / LETTERS OF UNDERSTANDING

Jurisdictional transfers are usually initiated by IDOT or a LPA that identifies a need for an improvement of a specific roadway or structure on a State unmarked route; however, certain transfers of jurisdiction can occur without an improvement. Negotiations for a jurisdictional transfer of State unmarked routes should begin when an improvement is being formulated and should be documented with a letter of intent (LOI) (accepting or refusing the jurisdictional transfer) and signed by the LPA. Subsequently, a Joint Agreement with all affected agencies (State, county, and/or municipality) must be executed before the jurisdictional transfer occurs. Section 5-2 discusses jurisdictional transfers.

State improvements that do not involve local financial participation may at times be covered by Letters of Understanding (LOU). The LOU can also cover local improvements with no State or federal participation. A LOU may be used to delineate maintenance responsibilities (e.g., parking lanes, curbs and gutter flags, sidewalks, manholes, catch basins, storm sewers, traffic signals, utilities, appurtenances). Many of the provisions typically included in a Joint Agreement of Understanding should also be included in a LOU (e.g., ordinances for sewer, parking, and encroachments; provisions for curb ramps and plan approval).

The district will prepare the LOU. A brief description of the proposed project and description of the responsibilities of both parties must be included in the LOU. The LOU will be signed by the Regional Engineer, and transmitted to the LPA for the local official's signature.

5-5 ENGINEERING AGREEMENTS

5-5.01 General

If a LPA elects to use a consultant for engineering services, the LPA shall enter into an agreement with a consultant meeting the requirements of [225 ILCS 325/23](#) to provide engineering services financed in whole or in part with Federal, State, Motor Fuel Tax (MFT), or Township Bridge Program (TBP) funds.

Funds will be limited to the amount of compensation called for in the agreement. These funds cannot be expended for payment of engineering services until an agreement has been submitted to, and approved by, the IDOT.

The term consultant refers to a professional design firm (private firm) or sole proprietorship (individual) for engineering services. Services provided for land surveying or architectural design meeting the requirements of [225 ILCS 330](#), [225 ILCS 305](#), or [225 ILCS 315](#); respectively, will be referred as professional services, when they are not included with the engineering services agreement.

5-5.02 Types of Services

1. Project Specific. A contract between the LPA for the performance of services and defined scope of work related to a specific project.
2. Multiphase. A project-specific contract where the defined scope of work is divided into phases which may be negotiated and authorized individually as the project progresses.
3. Master Task Order. A contract for the performance of services On Call or Indefinite Delivery/Indefinite Quantity (IDIQ) under task or work orders issued on an as-needed or on-call basis, for an established contract period. The solicitation and contract provisions shall:
 - Specify a reasonable maximum length of contract period, including the number and period of any allowable contract extensions.
 - Specify a maximum total contract dollar amount which may be awarded under contract;
 - Include a statement of work, requirements, specifications, or other description to define the general scope, complexity, and professional nature of the services.
 - Individual task orders or work orders shall be assigned to the Master Task Order. Once assigned, the LPA should negotiate with the consultant according to Section 5-5.06(c). If negotiations are unsuccessful, the LPA may use a different Master Task Order or may follow the Qualifications Based Selection (QBS) procedures for selecting a different consultant.

5-5.03 Length of Services

The maximum term including extensions of the engineering services contract may not exceed 10 years for contracts using non-federal funds or for project specific using federal funds. If federal funds are used for an IDIQ the maximum term length is five years and all work orders must be issued during the term of the contract. The total time from execution of an IDIQ contract to the completion of all work orders issued cannot exceed 10 years. However, the length of the contract should be determined based on the scope of work. The LPA shall comply with any established Illinois statutory or local ordinance that further limits the length of a contract.

5-5.04 Conflict of Interests

It is important to understand that conflicts of interest may be direct or indirect when securing engineering services (e.g., as result of a personal or business relationship). Additionally, the appearance of a conflict of interest should be avoided, as an apparent conflict may undermine public trust if not sufficiently mitigated.

Conflict of interest requirements include but are not limited to the following:

1. The requirement that no LPA elected official, officer, or employee who participates in the procurement, management, or administration of engineering services contracts or subcontracts shall have, directly or indirectly, any financial or other interest in connection with such engineering contracts or subcontracts. For instance, a county may not enter into a contract with a professional design firm if the county engineer is also a member of that professional design firm.
2. The requirement that no person or entity performing services for a LPA shall have, directly or indirectly, any financial or other interest in any real property acquired for the project.
3. The person or entity performing services for a LPA may perform design and construction engineering/management and/or inspection on the same project provided the LPA has established the necessary controls and provides sufficient oversight to ensure that a conflict of interest does not exist, or has approved procedures to mitigate any conflict or potential for a conflict. Prior to allowing a person or entity to provide engineering services on multiple phases of a project, the LPA shall evaluate that their policies, procedures, and practices associated with the procurement, management, and administration of engineering consultant services comply with Federal and State laws and FHWA requirements.

A person or entity performing construction engineering/management and/or inspection services on the same project on which the person or entity also performed design services provides the person or entity an opportunity to influence or affect project decisions on scope changes, design changes, construction revisions, contract change orders, and other related issues. This may result in project delivery efficiencies, as the person or entity that designed the project is well-suited to verify that the project is being constructed in accordance with the design and may resolve issues related to the design on behalf of the contracting agency. However, procuring a different person or entity other than the consultant to provide the necessary construction engineering/management and/or inspection services provides another level of review and reduces the potential for a conflict of interest.

4. IDOT employees shall not participate in the procurement, management, and administration of engineering and design related consultant services on behalf of the LPA.

5-5.05 Retainage

The LPA may withhold retainage on state, MFT, or TBP funded engineering services agreements. However, withholding retainage provides no substantial benefits to the LPA. The LPA shall not withhold retainage on federally funded engineering agreements.

5-5.06 Qualifications Based Selection for Engineering and Professional Services

5-5.06(a) Introduction

The principal objective of the QBS procedures is to allow a LPA to locate a qualified consultant to undertake the project; then, through negotiations, engage the consultant to provide the creative and technical work required at a fair and reasonable cost. The area and magnitude of responsibility in the process can vary widely according to project type.

5-5.06(b) Applicability

The value of \$40,000 used throughout Section 5-5 is based on [50 ILCS 510/8](#) and will be adjusted annually by a BLRS Circular Letter, typically issued in February. The procurement procedures outlined in Section 5-5.06(c) and (e) apply to the selection of all engineering and professional services based on the following funding type parameters:

1. State, MFT or TBP Funded Engineering and Professional Services. QBS procedures for public notice, evaluation, selection, and contract negotiations shall be used whenever a project requiring architectural, engineering, or land surveying services is proposed for a LPA of fewer than 3,000,000 inhabitants, except home rule units, unless the LPA has a satisfactory relationship for services with one or more firms ([50 ILCS 510](#)).

A LPA may also waive the requirements of public notice, evaluation and selection if the LPA determines, by resolution, that an emergency situation exists and a consultant must be selected in an emergency manner, or if the total cost of services from a consultant is estimated to be less than \$40,000 ([50 ILCS 510/8](#)). If the LPA estimates the total cost of services within the contract will be less than \$40,000, IDOT will not approve any agreement or supplemental that exceeds the \$40,000 threshold; unless the LPA followed state statutes.

2. Federally Funded Engineering Services. LPAs shall use QBS in accordance with The Brooks Act, (40 USC 11) and the FHWA's requirements for Procurement, Management, and Administration of Engineering and Design related Services (23 CFR 172) to promote open competition by advertising, ranking, selecting, and negotiating contracts based on demonstrated competence and qualifications for the type of engineering and design related services being procured, and at a fair and reasonable price.

BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS

5-5-4

January 2019

If a consultant is selected to work on multiple phases of a project, the dollar limits apply to the total combined cost of all included phases. If the LPA included an option to perform one or more other phases as part of the original solicitation, the LPA is then not required to conduct another QBS unless the LPA elects to select a different consultant for subsequent phases.

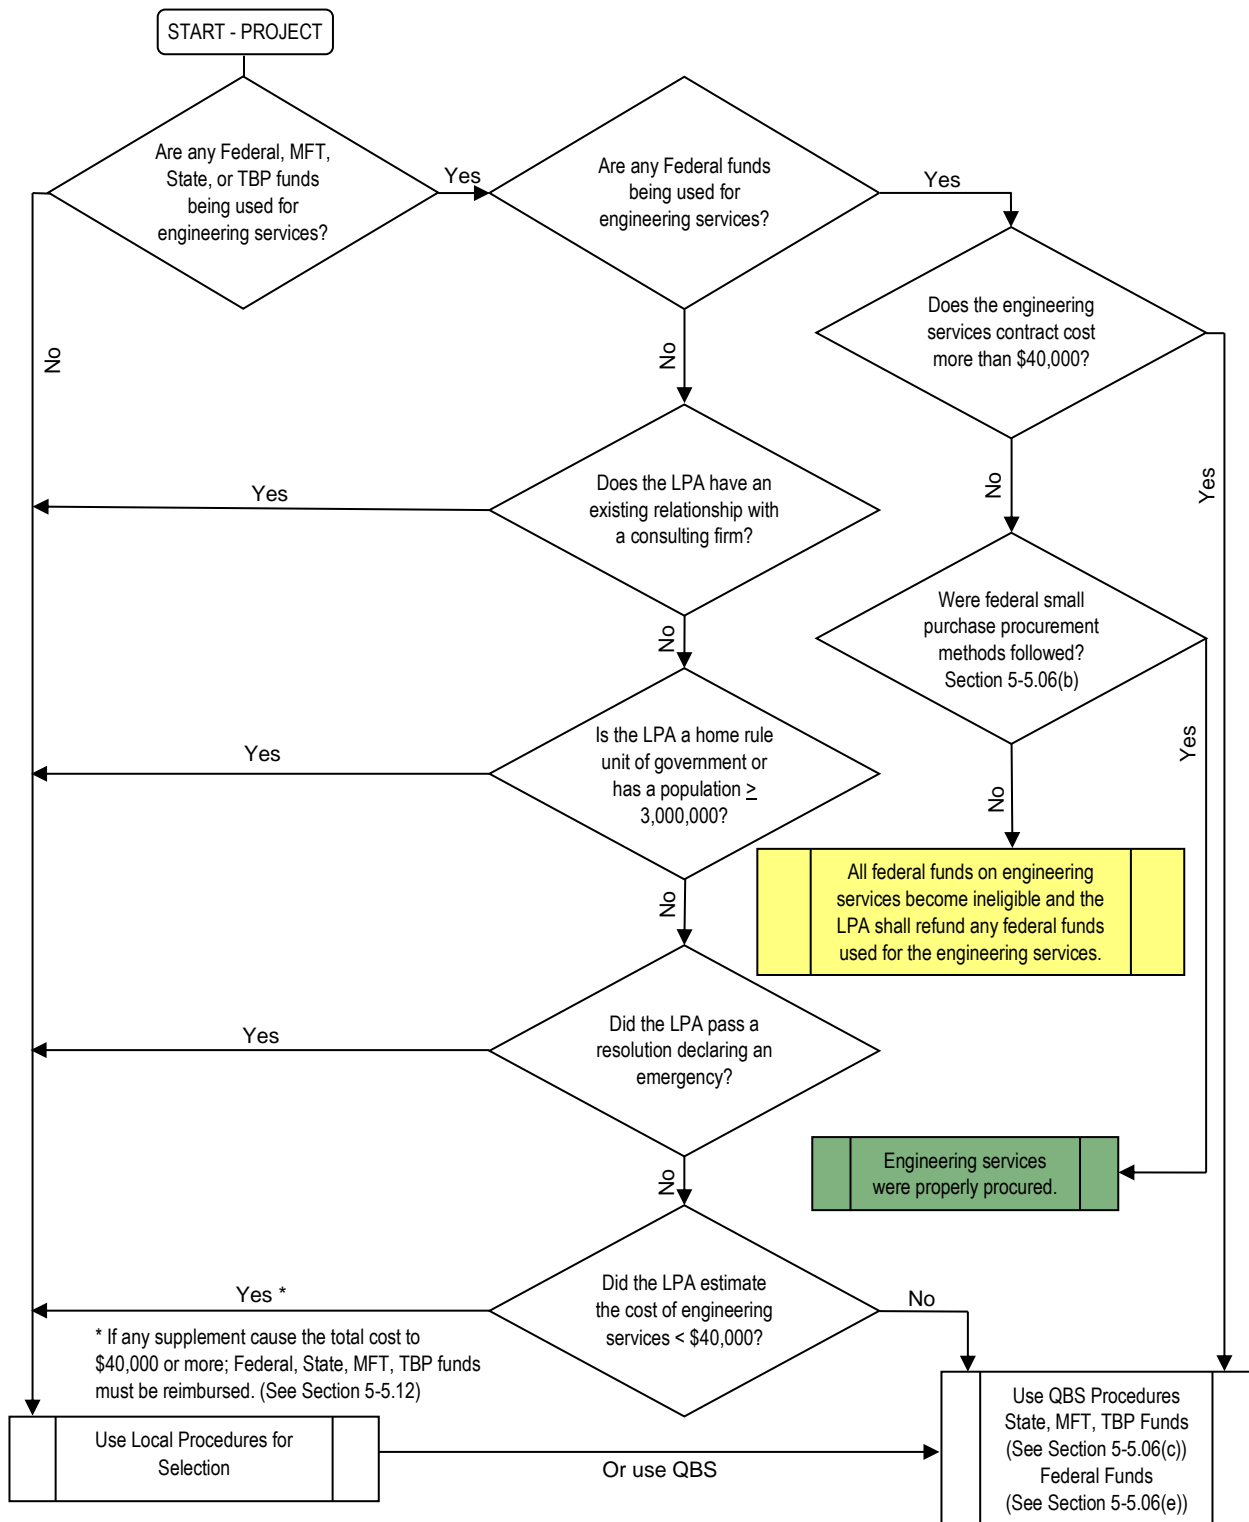

3. Small Purchases for Federally Funded Engineering Services. If the cost of any individual contract for engineering services (Phase I, II, III, etc.) will be less than \$40,000, then the small purchase procurement method may be used (23 CFR 172.7(a)(2)). The following additional requirements shall apply to the small purchase procurement method:
 - a. The scope of work, within one project phase shall not be broken down into smaller components merely to permit the use of small purchase procedures.
 - b. A minimum of three consultants are required to satisfy the adequate number of qualified sources reviewed. In instances where less than three qualified consultants respond to the solicitation, the LPA shall contact the District LR&S office for verification of the LPA's solicitation to determine the solicitation did not contain conditions or requirements which arbitrarily limited competition.
 - c. Contract costs may be negotiated in accordance with State small purchase procedures; however, the allowability of costs shall be determined in accordance with the Federal cost principles.
 - d. If the cost of any supplemental changes to the contract for the engineering services exceeds \$40,000 and federal QBS procedures were not followed, federal funds become ineligible above the \$40,000 on engineering services.
4. Locally Funded Engineering Services. IDOT does not have oversight over contracts for engineering services funded entirely with local funds. However, the LPA is still required to comply with [50 ILCS 510](#).

The procurement method used for selection of engineering services will not impact funding for the construction of a project.

**BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS**

January 2019

5-5-5

REQUIREMENTS FOR QBS

Figure 5-5A

5-5.06(c) State Required QBS Procedures using State, MFT or TBP Funds

The procedure for State required QBS procurement consists of the following five basic steps:

1. Define the Project. Clearly define the scope of the services desired. Depending on the amount of data, this may be on one or more pages. This information should include the following:
 - describe in general terms the need, purpose, and objective of the project;
 - identify the various project components;
 - establish the desired timetable for the effort;
 - identify any expected problems; and
 - determine the total project budget.

A comprehensive evaluation of the problem or need that resulted in the project is essential to the procurement process. The solution, approach, and eventual design for the project will evolve out of the expertise offered by the consultant responding to the request for technical proposals. To ensure that the respondents address the project properly and effectively, clearly articulate all known parameters of the project.

The LPA may skip to Step 5 when both of the following criteria are met.

- The LPA elects to select a consultant that has a satisfactory working relationship with the LPA; and
 - The engineering services contract is not being paid for using federal funds.
2. Public Notice. Whenever a project requiring engineering services is proposed, the LPA shall post a public notice requesting a statement of interest along with the qualifications and performance data from consultants. This may be accomplished through an advertisement in a local newspaper, posting on the LPA's website, or through various trade magazines or websites.

Consider the following sources when preparing a list of potential firms:

- identification of consultants from the LPA's or IDOT's prequalification list;
 - a directory or source list identifying small, minority, and women owned businesses with capabilities relevant to the project;
 - discussions with other persons or agencies who have accomplished similar work;
 - lists of consultants secured from professional societies; and/or
 - lists of consultants secured from the agency's own experience of consultants.
3. Evaluation. The LPA shall evaluate the consultant submitting letters of interest, taking into account qualifications, ability of professional personnel, past record and experience, performance data on file, willingness to meet time requirements, location, workload of the consultant, and such other qualifications-based factors.

The first objective of evaluation is the elimination of all respondents who are not qualified or who do not have the experience for the required work. The LPA may conduct discussions with and require presentations by consultants deemed to be the most qualified based on their qualifications, approach to the project, and ability to furnish the required services. When conducted, interviews shall occur separately with a minimum of three consultants, or all qualified consultants if less than three qualified consultants respond. If the LPA decides to conduct discussions with and/or require presentations by consultants deemed to be the most qualified, this should be included in the public notice.

In no case shall the LPA, prior to selecting a consultant for negotiation, seek formal or informal submission of verbal, written, or sealed estimates of costs or proposals in terms of dollars, hours required, percentage of construction cost, or any other measure of compensation.

4. Selection. On the basis of evaluations, discussions and presentations, the LPA shall select no less than three consultants which it determines to be the most qualified to provide services for the project and rank them in order of qualifications to provide services regarding the specific project. The LPA shall then contact the consultant ranked most preferred and attempt to negotiate a contract at a fair and reasonable compensation, taking into account the estimated value, scope, complexity, and professional nature of the services to be rendered. Typical criteria for evaluating and ranking consultants are included in Figure 5-5B. If fewer than three qualified consultants submit letters of interest and the LPA determines that one or both are so qualified, the LPA may proceed to negotiate a contract.
5. Contract Negotiation. The LPA shall prepare a written description of the scope of the proposed services to be used as a basis for negotiations and shall negotiate a contract with the highest qualified consultant at compensation that the LPA determines in writing to be fair and reasonable. In making this decision, the LPA shall take into account the estimated value, scope, complexity, and professional nature of the services to be rendered.

An important objective of the negotiation process is to reach a complete and mutual understanding of the scope of professional services to be provided and the degree of performance desired. The general scope of professional services developed in the procurement process should be broad in order to serve as the basis for negotiation. The negotiation process offers the opportunity for refinement, amendment, and complete definition of the services to be rendered, as well as the areas of responsibility and liability for those services. Mutual understanding on these points at the negotiation stage can minimize the possibility of misunderstanding as the project progresses.

Special elements of the engineering portion of the project to be established during negotiation include:

- project schedule,
- manpower requirement and timing,
- level of engineering effort,
- avenues of research, and
- areas of responsibility/liability.

Any percentage fee contract should be fully supported by an acceptable estimate of man-hours, anticipated hourly payroll rates by classification of employee for the project, and applicable overhead and burden rates. These rates should be evaluated and, if determined to be acceptable, the percentage fee may be approved by the district.

The consultant's method of dividing the project into work units and calculating related time units are to be such that the estimate can be readily reviewed. The consultant will use its own estimates of man-hours, rates of pay, overhead, profit, and itemized non-salary costs based on the consultant's work force and past job experience.

When the prime consultant requires the services of another consultant to provide expertise, advice, or information to the prime consultant, the prime consultant will complete an analysis of fee for engineering services (including a breakdown of direct salary and direct non-salary costs) or supply specific rate for services (e.g. testing). The prime consultant is responsible for ensuring that Disadvantage Business Enterprises (DBEs) will have an equitable opportunity to compete for subcontracts. See [Chapters 8](#) and [24](#) for information on DBEs for LPAs.

Contracts between LPAs and consultants must be set forth in fully executed agreements. If there is an agreement with the consultant, and if the fee is within range of the budget, then proceed to finalize an agreement. If problems arise with the scope of the project or the fee, further discussion and clarification may be required.

Selection of a consultant by qualification provides no guarantee that the LPA and the consultant will come to an agreeable fee. For that reason, the ranking process provides, in addition to the first preference, at least two alternative qualified consultant. If agreement cannot be reached on the scope and fee, the LPA may drop negotiations with the top-ranked consultant and continue the process with the second ranked consultant at Step 5.

6. Summary. Ranking and negotiations involve a considerable amount of subjective judgment. Engineering projects involve a large expenditure of public funds, accountability for decisions, and value judgments is most important. To ensure adequate accountability:
 - involve more than one knowledgeable person in the evaluation process,
 - be consistent in reviewing each applicant,
 - keep accurate and complete records of all correspondence, memoranda, evaluations, and decisions.

The primary purpose of undertaking the QBS process is to locate the most qualified consultant to do the work and negotiate a fair and equitable agreement. Federal and Illinois law prohibits selecting consultants based on cost for any project exceeding \$40,000. The selection shall be based on the consultant's experience and expertise in projects of the same type as proposed.

5-5.06(d) Development of Selection Criteria and Weighting

These criteria and weightings are suggested for all projects regardless of funding. The criteria "must assess the demonstrated competence and qualifications for the type of professional services solicited". LPAs must determine and publish selection criteria and weightings for projects requiring federal QBS. The total of all weights must equal 100%. Factors may include but are not limited to the following and Figure 5-5B:

- Technical Approach (10 - 30%)

BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS

January 2019

5-5-9

- e.g., project understanding,
- innovative concepts,
- quality control procedures, or
- other items
- Firm Experience (10 - 30%)
- Specialized Expertise (10 - 30%)
- Staff Capabilities (Prime/Sub) (10 - 30%)
- Work Load Capacity (10 - 30%)
- Past performance (10 - 30%)

In addition, there are two nominal non-qualifications-based criteria for evaluation. They are limited to a combined weight of 10% or less*:

- *In-State or Local Presence
 - not based on political or jurisdictional boundaries and may be applied on a project by project basis,
 - used where a need to provide a local presence has been established, a local presence will add value to quality and efficiency of the contract and application of the criteria results in an appropriate number of qualified consultants, and/or
 - if the consultant indicates in the proposal that a local project office will be established the criteria is satisfied.
- *Participation of Qualified and Certified DBE Sub-consultants

The following shall not be used as a factor in the evaluation, ranking and selection:

- All price and cost related items.
 - This includes: cost proposals, direct salaries/wage rates; indirect costs (overhead), and other direct costs.
- In-State or Local Preference (other than as explained above).

HARD COPIES UNCONTROLLED

**BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS**

5-5-10

January 2019

The weight given to each evaluation criterion in the ranking process may vary from project to project, with more weight towards the criteria that are critical to the success of the project. Typical technical criteria for both evaluating and ranking entities should include but not be limited to the following:

- (1) The education, experience, and expertise of the entity's principals and key employees.
- (2) The entity's general experience, stability, and history of performance on projects similar to the one under consideration.
- (3) Availability of adequate personnel, equipment, and facilities to do the required work expeditiously.
- (4) The name, or names, of individuals in the entity who will be assigned key project responsibilities, with particular attention to their qualification, competence, and past performance.
- (5) The entity's approach to the planning, organizing, and management of a project effort, including communication procedures, approach to problem solving, data gathering methods, evaluation techniques, and similar factors.
- (6) Facilities and equipment owned by the entity, including computer capability, reproduction and communication equipment, laboratory and testing equipment, or other specialized equipment applicable to the project under consideration.
- (7) Present workload with attention to current and future commitments of available personnel, particularly those key persons expected to be assigned to your project.
- (8) Financial stability, with particular attention to avoiding a situation in which the entity is solely dependent on income from the project at hand for its existence.
- (9) Recommendations and opinions of each entity's previous clients as to its ability to meet deadlines and remain within budget. Prior clients may also be able to advise you as to each entity's sense of responsibility; attitudes of key personnel; concern for economy, efficiency, and environment; and quality of service.
- (10) If practical, observation of each entity's facility and the sites of current and/or completed projects.
- (11) The reputation and integrity of the engineering entity within the professional field and the community.
- (12) Awards received by the entity and technical papers authored by employees.
- (13) Special considerations for some projects might include staff conversant in foreign languages.

Non-technical criteria may not exceed 10% of the total evaluation and rank weighting. Typical non-technical criteria for both evaluating and ranking entities may include but not be limited to the following:

1. Proximity of the engineering entity to the proposed project site and/or the agency's office.
2. Qualified minority representation.
3. How DBE goals are addressed.

CONSULTANT RANKING CRITERIA

Figure 5-5B

5-5.06(e) Federal QBS Requirements

For engineering agreements \$40,000 or greater which include federal funds, LPAs are required to use QBS which is fully compliant with Federal requirements of 23 CFR 172 and the Brooks Act. As sub-grantees, LPAs must use competitive negotiation supported by qualification based selection procedures. This is the primary method of procurement for engineering and design related services using federal funding. See Figure 5-5C for specific requirements.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS

January 2019

5-5-11

The procedure for federal QBS procurement consists of the following steps. Section 5-5.07 provides an example of a LPA's QBS policies and procedures.

A box (similar to this) will indicate minimum requirements to be addressed for each step. If the LPA's QBS policies and procedures will match the existing language in any step from Section 5-5, their QBS cannot reference the *BLRS Manual* but must include the language.

1. Initial Administration. LPAs shall develop and sustain organizational capacity and provide the resources necessary for the procurement, management, and administration of engineering and design related consultant services.

The LPA must include in their QBS procedures the organizational structure for the procurement, management, and administration for consultant services.

2. Written Policies and Procedures. The LPA shall prepare and maintain written policies and procedures for the procurement, management, and administration of engineering and design related consultant services. All LPAs must have their own QBS procedures. If it follows the policies and procedures as outlined in Section 5-5 and specifically Section 5-5.06(e), further approval may not be required. However; if the LPA's QBS procedures has significant differences then IDOT approval is required, see Section 5-5.06(g).

An example of a significant difference would be a multi-step selection process, which would require submission to IDOT for approval.

LPAs who decide their procedures will result in significant differences from that shown in Section 5-5.06(e) must submit their QBS procedures for review and approval by IDOT.

3. Define the Project. Clearly define the scope of the services desired. Depending on the amount of data, this may be on one or more pages. This information should include the following items:
 - describe in general terms the need, purpose, and objective of the project;
 - identify the various project components;
 - establish the desired timetable for the effort;
 - identify any expected problems; and
 - determine the total project budget.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS

5-5-12

January 2019

A comprehensive evaluation of the purpose and need that resulted in the project is essential to the procurement process. The solution, approach, and eventual design for the project will evolve out of the expertise offered by the consultant responding to the request for technical proposals. To ensure that the respondents address the project properly and effectively, clearly articulate all known parameters of the project. This may be the appropriate time to prepare an independent in-house estimate of engineering costs as discussed in Step 9.

The LPA must include at a minimum the five (5) items outlined above in their QBS procedures to define the scope and services desired for the project.

4. **Public Notice.** Whenever a project requiring engineering services is proposed, the LPA shall post a public notice for a Request for Proposal (RFP) along with the qualifications and performance data expected of consultants. This may be accomplished through an advertisement in a local newspaper, posting on the LPA's website, or through various trade magazines or websites. The notice shall provide no less than 14 calendar days from the last date of acceptance of proposals.

As a minimum, the following must be included in the LPA's QBS procedures:

- if an interview will or will not be required;
- where the public notice will be published;
- the time periods the public notice will be published.

Consider the following sources when preparing a list of potential firms:

- identification of consultants from the LPA's or IDOT's file;
- a directory or source list identifying small, minority, and women owned businesses with capabilities relevant to the project;
- discussions with other persons or agencies who have accomplished similar work;
- lists of consultants secured from professional societies; and/or
- lists of consultants secured from the agency's own experience of consultants.

If the LPA plans to use a multi-step process to minimize the efforts of the LPA in narrowing the list of qualified and interested consultants, this must be described in their QBS procedures and submitted to IDOT for approval. The process must also be described in the initial public notice.

As a minimum, the following must be included in the LPA's QBS procedures:

- if an interview will or will not be required;
- where the public notice will be published;
- the time periods the public notice will be published.

5. Conflicts of Interest. See Section 5-5.04.

As a minimum, the LPA must include Section 5-5.04, when determining a conflict of interest for engineering services. The LPA may also require the consultants to submit a disclosure statement with their SOI or RFP. IDOT uses the [BDE DISC 2 Template](#), which provides an example of a consultant's disclosure statement. A copy of the LPA's consultant's disclosure statement shall be included in their QBS procedures, if required by their QBS procedures.

6. Suspension and Debarment. Verify any suspension or debarment actions and eligibility of consultants as specified in 2 CFR Part 1200 and 2 CFR Part 180. This may be accomplished by checking the System for Award Management Exclusions (SAM Exclusions); obtaining a disclosure statement; or adding a clause or condition to the covered transaction with the consultant. A LPA may want to also verify by checking the [Chief Procurement Office's \(IDOT\) \(CPO\) website](#), including the other three associated CPOs (Capital Development Board, General Services, and Higher Education), the Illinois Department of Labor and the Illinois Department of Human Rights. Hyperlinks to these other websites can be found on the [CPO IDOT website](#).

As a minimum, the LPA must include the procedure to verify consultant suspension or debarment. The LPA may also require the consultants to submit a disclosure statement with their SOI or RFP. IDOT uses the [BDE DISC 2 Template](#), which provides an example of a consultant's disclosure statement. A copy of the LPA's consultant's disclosure statement shall be included in their QBS procedures, if required by their QBS procedures.

7. Evaluation. The LPA shall evaluate the consultant submitting letters of interest, taking into account qualifications, ability of professional personnel, past record and experience, performance data on file, willingness to meet time requirements, workload of the consultant, and other qualifications-based factors.

The first objective of evaluation is the elimination of all respondents who are not qualified or who do not have the experience for the required work. The LPA may conduct discussions with and require presentations by consultants deemed to be the most qualified based on their qualifications, approach to the project, and ability to furnish the required services. When conducted, interviews shall occur separately with a minimum of three consultants, or all qualified consultants if less than three qualified consultants respond. If the LPA decides to conduct discussions with and/or require presentations by consultants deemed to be the most qualified, this must be included in the public notice.

Criterion and weighting for the evaluation is discussed further in Section 5-5.06(d) and Figure 5-5B.

In no case shall the LPA, prior to selecting a consultant for negotiation, seek formal or informal submission of verbal, written, or sealed estimates of costs or proposals in terms of dollars, hours required, percentage of construction cost, or any other measure of compensation.

BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS

5-5-14

January 2019

If the LPA plans to use a multi-step process to minimize the efforts of the LPA in narrowing the list of qualified and interested consultants, this must be described in their QBS procedures. This is discussed in Step 4 – Public Notice above.

The criterion and weighting for evaluation and selection is discussed in Section 5-5.06(d) and Figure 5-5B. If there is a possibility of additional discussions or presentations being required, this must be described in their QBS procedures. The criterion and weighting need to be included in all RFPs.

If a form will be used during the evaluation, a copy of a typical form must be included in their QBS procedures.

8. Selection. The selection committee is typically composed of individuals, who have some knowledge of the project and procedures. This could be the county / city engineer, public works director, LPA staff, an elected official, municipal manager, private citizen, etc. On the basis of evaluations (Step 7), discussions and presentations, the LPA shall select no less than three consultants which it determines to be the most qualified to provide services for the project and rank them in order of qualifications to provide services regarding the specific project. The LPA shall contact the consultant ranked most preferred and attempt to negotiate a contract at a fair and reasonable compensation, taking into account the estimated value, scope, complexity, and professional nature of the services to be rendered.

If fewer than three qualified consultants submit letters of interest and the LPA determines that one or both are so qualified, IDOT approval is required. After IDOT approval is received, the LPA may proceed to negotiate a contract.

The LPA must include who (titles) will serve on the selection committee. Procedures for selecting must also be described, an example of IDOT's selection procedures may be found in [Section 8-2.05](#) of the *BDE Manual*.

9. Estimate of Cost for Engineering. The LPA must prepare an independent in-house estimate for the cost of engineering prior to the start of negotiations. This will be used during the contract negotiation process.

The LPA must prepare an independent in-house estimate for the cost of engineering prior to the start of negotiations. This should be prepared early in the process, but must be completed before starting contract negotiations.

10. Contract Negotiation. The LPA shall prepare a written description of the scope of the proposed services to be used as a basis for negotiations. The LPA shall negotiate a contract with the highest qualified consultant at compensation that the LPA determines in writing to be fair and reasonable. In making this decision, the LPA shall take into account the estimated value, scope, complexity and professional nature of the services to be rendered.

HARD COPIES UNCONTROLLED

An important objective of the negotiation process is to reach a complete and mutual understanding of the scope of professional services to be provided and the degree of performance desired. The general scope of professional services developed in the procurement process should be broad in order to serve as the basis for negotiation. The negotiation process offers the opportunity for refinement, amendment, and complete definition of the services to be rendered, as well as the areas of responsibility and liability for those services. Mutual understanding on these points at the negotiation stage can minimize the possibility of misunderstanding as the project progresses.

Special elements of the engineering portion of the project to be established during negotiation include:

- project schedule,
- manpower requirement and timing,
- level of engineering effort,
- avenues of research, and
- areas of responsibility/liability.

Any percentage fee contract should be fully supported by an acceptable estimate of man-hours, anticipated hourly payroll rates by classification of employee for the project, and applicable overhead and burden rates. These rates should be evaluated and, if determined to be acceptable, the percentage fee may be approved by the district.

The consultant's method of dividing the project into work units and calculating related time units are to be such that the estimate can be readily reviewed. The consultant will use its own estimates of man-hours, rates of pay, overhead, profit, and itemized non-salary costs based on the consultant's work force and past job experience.

When the prime consultant requires the services of another consultant to provide expertise, advice, or information to the prime consultant, the prime consultant will complete an analysis of fee for engineering services (including a breakdown of direct salary and direct non-salary costs) or supply specific rate for services (e.g. testing). The consultant is responsible for ensuring that DBEs will have an equitable opportunity to compete for subcontracts. See [Chapters 8](#) and [24](#) for information on DBEs for LPAs.

Contracts between LPAs and consultants must be set forth in fully executed agreements. See Section 5-5.08 for the BLR forms, which must be used for the agreement between the LPA and the consultant when federal funds are used for professional services. If there is an agreement with the consultant, and if the fee is within range of the budget, proceed to finalize an agreement. If problems arise with the scope of the project or the fee, further discussion and clarification may be required.

Selection of a consultant by qualification provides no guarantee that the LPA and the consultant will come to an agreeable fee. For that reason, the ranking process provides at least two alternative qualified consultants, in addition to the first preference. If agreement cannot be reached on the scope and fee, the LPA may drop negotiations with the top-ranked consultant and continue the process with the second ranked consultant at Step 9. The LPA shall develop procedures for proper disposal of concealed cost proposals of unsuccessful bidders.

The LPA must describe their procedures for contract negotiations, including procedures if a contract cannot be negotiated with the selected consultant along with the proper disposal of sealed cost proposals.

BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS

5-5-16

January 2019

11. Acceptable Costs. IDOT will review and approve the engineering agreement to verify elements of contract costs, acceptable indirect cost rate(s) for application to contracts and assuring consultant compliance with the Federal cost principles.

The LPA must describe their process for review, if one exists; before forwarding the engineering agreement to IDOT for further review and approval.

12. Invoice Processing. See Section 5-10.

The LPA must describe their process for review and approving for payment; before forwarding the request for reimbursement to IDOT for further review and approval.

13. Ongoing and Finalizing Administration. The following are ongoing and finalizing requirements:

- Monitoring the consultant's work and compliance with the terms, conditions, and specifications of the contract;
- Preparing a consultant's performance evaluation when services are completed and using such performance data in future evaluation and ranking of consultant to provide similar services;
- Closing-out a contract;
- Retaining supporting programmatic and contract records;
- Determining the extent to which the consultant, who is responsible for the professional quality, technical accuracy, and coordination of services, may be reasonably liable for costs resulting from errors and omissions in the work furnished under its contract;
- Assessing administrative, contractual, or legal remedies in instances where consultants violate or breach contract terms and conditions, and providing for such sanctions and penalties as may be appropriate; and
- Resolving disputes in the procurement, management, and administration of engineering and design related consultant services.

This is a compilation of items 12 through 18 as shown in Figure 5-5C and further discussed in Sections 5-5.13 and 5-5.14. The LPA must describe their process for these items.

In summary, the ranking and negotiations involve a considerable amount of subjective judgment. Because engineering projects involve a large expenditure of public funds, accountability for decisions and value judgments is most important. To ensure adequate accountability:

- involve more than one knowledgeable person in the evaluation process,
- be consistent in reviewing each applicant,
- keep accurate and complete records of all correspondence, memoranda, evaluations, and decisions.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS

January 2019

5-5-17

The primary purpose of undertaking the QBS process is to locate the most qualified consultant to do the work and negotiate a fair and equitable agreement. Current federal regulations limit contracts in the amount to the lesser of \$150,000 or the state limits ([50 ILCS 510/8](#)), which is currently less than \$40,000 contracts without following federal QBS requirements in the selection of a consultant (see Section 5-5.06(b) Item 3). The selection shall be based on the consultant's experience and expertise in projects of the same type as being solicited.

Per 23 CFR 172.5 - Program management and oversight.

- (a) **STA responsibilities.** STAs or other recipients ... (i.e. STA State Transportation Agency – IDOT)
- (b) **Subrecipient responsibilities.** Subrecipients shall develop and sustain organizational capacity and provide the resources necessary for the procurement, management, and administration of engineering and design related consultant services, reimbursed in whole or in part with FAHP funding as specified in 23 U.S.C. 106(g)(4)(A). Responsibilities shall include the following:
 - (1) Adopting written policies and procedures prescribed by the awarding STA or other recipient for the procurement, management, and administration of engineering and design related consultant services in accordance with applicable Federal and State laws and regulations; or when not prescribed, shall include:
 - (i) Preparing and maintaining its own written policies and procedures in accordance with paragraph (c) of this section; or
 - (ii) Submitting documentation associated with each procurement and subsequent contract to the awarding STA or other grantee for review to assess compliance with applicable Federal and State laws, regulations, and the requirements of this part;
 - (2) Procuring, managing, and administering engineering and design related consultant services in accordance with applicable Federal and State laws, regulations, and approved policies and procedures, as specified in 23 CFR 1.9(a).
- (c) **Written policies and procedures.** The contracting agency shall prepare and maintain written policies and procedures for the procurement, management, and administration of engineering and design related consultant services. The FHWA shall approve the written policies and procedures, including all revisions to such policies and procedures, of the STA or recipient to assess compliance with applicable requirements. The STA or other recipient shall approve the written policies and procedures, including all revisions to such policies and procedures, of a subrecipient to assess compliance with applicable requirements. These policies and procedures shall address, as appropriate for each method of procurement a contracting agency proposes to use, the following items to ensure compliance with Federal and State laws, regulations, and the requirements of this part:
 - 1. Preparing a scope of work and evaluation factors for the ranking/selection of a consultant;
 - 2. Soliciting interests, qualifications, or proposals from prospective consultants;

FEDERAL QBS REQUIREMENTS

Figure 5-5C

(Sheet 1 of 2)

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS

5-5-18

January 2019

3. Preventing, identifying, and mitigating conflicts of interest for employees of both the contracting agency and consultants and promptly disclosing in writing any potential conflict to the STA and FHWA, as specified in 2 CFR 200.112 and 23 CFR 1.33, and the requirements of this part.
4. Verifying suspension and debarment actions and eligibility of consultants, as specified in 2 CFR part 1200 and 2 CFR part 180;
5. Evaluating interests, qualifications, or proposals and the ranking/selection of a consultant;
6. Determining, based upon State procedures and the size and complexity of a project, the need for additional discussions following RFP submission and evaluation;
7. Preparing an independent agency estimate for use in negotiation with the selected consultant;
8. Selecting appropriate contract type, payment method, and terms and incorporating required contract provisions, assurances, and certifications in accordance with § 172.9;
9. Negotiating a contract with the selected consultant including instructions for proper disposal of concealed cost proposals of unsuccessful bidders;
10. Establishing elements of contract costs, accepting indirect cost rate(s) for application to contracts, and assuring consultant compliance with the Federal cost principles in accordance with § 172.11;
11. Ensuring consultant costs billed are allowable in accordance with the Federal cost principles and consistent with the contract terms as well as the acceptability and progress of the consultant's work;
12. Monitoring the consultant's work and compliance with the terms, conditions, and specifications of the contract;
13. Preparing a consultant's performance evaluation when services are completed and using such performance data in future evaluation and ranking of consultant to provide similar services;
14. Closing-out a contract;
15. Retaining supporting programmatic and contract records, as specified in 2 CFR 200.333 and the requirements of this part;
16. Determining the extent to which the consultant, which is responsible for the professional quality, technical accuracy, and coordination of services, may be reasonably liable for costs resulting from errors and omissions in the work furnished under its contract;
17. Assessing administrative, contractual, or legal remedies in instances where consultants violate or breach contract terms and conditions, and providing for such sanctions and penalties as may be appropriate; and
18. Resolving disputes in the procurement, management, and administration of engineering and design related consultant services.

FEDERAL QBS REQUIREMENTS

Figure 5-5C

(Sheet 2 of 2)

HARD COPIES UNCONTROLLED

5-5.06(f) Major Differences between Federal and State Requirements

The major differences between federal and state requirements are:

- The existing relationship and home rule requirements permitted with state, MFT, and TBP QBS are not allowed for federal QBS.
- IDIQ contracts are limited to a maximum term length of five years for federal QBS and ten years for non-federal.
- A maximum of 10% of the evaluation criteria can be assigned to local presence and DBE participation for federal QBS.
- Notification must be provided to responding applicants of the final ranking of the three most highly qualified applicants for federal QBS.
- Preparing a consultant's performance evaluation when services are completed and using such performance data and ranking of the consultant with regard to providing similar services in the future is required for federal QBS.
- Additional work which was not included in the scope of services and evaluation criteria may not be allowed to be added to contracts for federal QBS.
- If non-competitive procurement (sole source, emergency, or less than three consultants) is used; it must be approved by IDOT in advance for federal QBS.
- LPAs are responsible for ensuring a consultant's costs billed are allowable in accordance with the federal cost principles and consistent with the contract terms for federal QBS.

5-5.06(g) Approval of LPA's Federal QBS Procedures

When federal funds are used to fund a portion of engineering and design related services, LPAs must have their own QBS procedures. If it follows the policies and procedures as outlined in Section 5-5 and specifically Section 5-5.06(e), further approval may not be required. However; if the LPA's QBS procedures has significant differences then IDOT approval is required.

An example of a significant difference would be a multi-step selection process, which would require submission to IDOT for approval.

The LPA's QBS procedures should address items discussed in Section 5-5.06, along with:

- Purpose and applicability.
- Definitions.
- Program management and oversight.
- Procurement methods and procedures.
- Contracts and administration.
- Allowable costs and oversight.

The above topics are expanded in 23 CFR 172 – *Procurement, Management, And Administration of Engineering and Design Related Services*.

5-5.07 Federal QBS Examples

In order to assist LPAs in implementing Federal QBS requirements two examples are provided with a) written policies and procedures and b) project specific information. Either example can be modified by LPAs to meet their individual organization structures and needs or project specific details. Contact the appropriate District LR&S office for further questions or a QBS requiring IDOT approval.

5-5.07(a) Written Policies and Procedures Example

[LPA Name] receives federal funds, which may be used to fund the engineering and design related consultants' services. Our written policies and procedures as describe herein for QBS will meet the requirements of 23 CFR 172 and the Brooks Act.

1. Initial Administration – [LPA Name] QBS policy and procedures assigns responsibilities to the following [**describe the titles and/or other departments**] within [LPA Name] organization for the procurement, management, and administration for consultant services.
2. Written Policies and Procedures – [LPA Name] believes their adopted QBS written policies and procedures substantially follows Section 5-5 of the *BLRS Manual* and specifically Section 5-5.06(e), therefore; approval from IDOT is not required.
3. Project Description – [LPA Name] will use the following five items when developing the project description and may include additional items when unique circumstances exist.
 - Describe in general terms the need, purpose, and objective of the project;
 - Identify the various project components;
 - Establish the desired timetable for the effort;
 - Identify any expected problems
 - Determine the total project budget.
4. Public Notice – [LPA Name] will post an announcement on our website [**website address**] and/or publish an ad in a newspaper with appropriate circulation. The item will be advertised for at least 14 days prior to the acceptance of proposals, and at least twice in the newspaper and/or on continuous display on our website.
5. Conflict of Interest – [LPA Name] require consultants to submit a disclosure statement with their procedures. [LPA Name] require the use of the IDOT BDE DISC 2 Template as their conflict of interest form.
6. Suspension and Debarment – [LPA Name] will use of SAM Exclusions, IDOT's CPO's website and the three other state CPO's websites to verify suspensions and debarments actions to ensure the eligibility of firms short listed and selected for projects.
7. Evaluation Factors – [LPA Name] allows the following [**specify title**] to set the evaluation factors for each project but must include a minimum of [**number**] criterion and stay within the established weighting range. The maximum of DBE and local presence combined will not be more that 10% on projects where federal funds are used. Project specific

BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS

January 2019

5-5-21

evaluation factors will be included at a minimum in the Request for Proposals. **[List the criterion and weighting range]**.

8. Selection – **[LPA Name]** require a **[number]** person selection committee. Typically the selection committee members include **[specify title 1, title 2 ..., title x]**. The selection committee members must certify that they do not have a conflict of interest. Selection committee members are chosen by the **[specify title]** for **[each project or a specific period of time]**. **[LPA Name]** require each member of the selection committee to provide an independent score for each proposal using the form below prior to the selection committee meeting.

<i>Criteria</i>	<i>Weighting</i>	<i>Points</i>	<i>Firm 1</i>	<i>Firm 2 ...</i>	<i>Firm x</i>
<i>Criterion 1</i>					
<i>Criterion 2 ...</i>					
<i>Criterion x</i>					
<i>Total</i>	<i>100%</i>				

The selection committee members' scores are averaged for a committee score which is used to establish a short list of three firms. The committee score is adjusted by the committee based on group discussion and information gained from presentations and interviews to develop a final ranking. If there are other firms within **[xx%]** of the minimum score, the **[specify title]** may choose to expand the short list to include more than three firms.

9. Independent Estimate – **[LPA Name]** will prepare an independent in-house estimate for the project prior to contract negotiation. The estimate is used in the negotiation.
10. Contract Negotiation – **[LPA Name]** require a **[number]** person team to negotiate with firms. The team consists of **[specify title 1, title 2 ..., title x]**. Members of the negotiation team **[may / may not]** delegate this responsibility to staff members.
11. Acceptable Costs – **[LPA Name]** require the **[specify title]** to review the contract costs and the indirect cost rates to assure they are compliant with Federal cost principles prior to submission to IDOT.
12. Invoice Processing – **[LPA Name]** require the **[specify title]** assigned to any project using federal funds to review and approve all invoices prior to payment and submission to IDOT for reimbursement.
13. Project Administration – **[LPA Name]** require the assigned **[specify title]** to monitor work on the project in accordance with the contract and to file reports with the **[specify title]**. The **[LPA Name]** procedures require an evaluation of the consultant's work at the end of each project. These reports are maintained in **[LPA Name]** consultant information database. **[LPA Name]** follows IDOT's requirements and the required submission of Form [BLR 05613](#) to the IDOT district at contract close-out along with the final invoice.

5-5.07(b) Project Specific Information Example

The City of Giant Springs plans to reconstruct Main Street and improve their sidewalks along the street to comply with ADA requirements. In order to proceed with Phase I and II engineering, the city decided to hire an engineering consultant to handle the design. The city has federal funds available to help fund the design of the project and realizes the total engineering costs will exceed \$40,000. The city knew they were required to use written QBS procedures which complied with state and federal guidelines. Their QBS procedures and example forms are included along with discussion in this example.

City of Giant Springs Qualification Based Selection Procedure (*Project Specific Information is italicized*)

1. Initial Administration – Giant Springs has a City Engineer. The City Engineer’s office has two junior engineers and a technician and an administrative assistant, who will handle the day-today management and administration. The City Engineer’s office will work with the City Purchasing office in procurement.
2. Written Policies and Procedures – Giant Springs believes their written procedures substantially follows Section 5-5 of the *BLRS Manual* and specifically Section 5-5.06(e), therefore; approval from FHWA is not required.
3. Project Description – Giant Springs will use the following five items when developing the project description and may include additional items under unique circumstances.
 - Describe in general terms the need, purpose, and objective of the project;
 - Identify the various project components;
 - Establish the desired timetable for the effort;
 - Identify any expected problems
 - Determine the total project budget.

Project Description:

The scope of services desired is to have Phase I and II engineering provided for the reconstruction of Main Street between Price Street and Oak Street. Main Street is the primary transportation corridor through the city. This reconstruction is necessary because the existing street and sidewalks are older and in poor condition. The major components of the design are roadway and pavement design, parking and traffic control, sidewalks, and drainage. Phase I is expected to last 18 months and Phase II is expected to last another 12 months. Providing detours for both vehicular traffic and pedestrians will be challenging because there are both businesses and the elementary school located along this section of Main Street. Minimizing impacts to both the school and businesses is an important consideration in the design of this project. Because both a school and part of the city’s business district are located within the limits of the project compliance with ADA requirements is also critical. The total budget for this project \$1,540,000.

4. Public Notice – Giant Spring’s procedures requires the city to post an announcement on the city’s website (www.giantsprings.com) and publish an ad in the Big City Telegraph, a newspaper with appropriate circulation. The item will be advertised at least 14 days prior

BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS

January 2019

5-5-23

to the acceptance of proposals and at least twice in the newspaper and will be on continuous display on the city's website for.

The ad for this project was placed on the city's website and in the newspaper on two consecutive Mondays. Here is the example advertisement.

"Giant Springs is accepting proposals from consultants for Phase I and Phase II engineering design of Main Street between Price and Oak Street. The evaluation criteria and weighting for this project is as follows: technical approach - 30%, firm experience - 20%, staff capabilities - 20%, work load capacity - 20%, and local presence - 10%.

Consultants should request a proposal packet from the city. The packet contains a detailed description of the project, conflict of interest forms, and specific requirements for the format and content of their submission.

Proposal responses are due October 18th, 2017 at 2:00 pm at City Hall, 205 W. Main Street, Room 205, Giant Springs, IL 62764. The technical proposal must not contain any cost information. All proposals shall include a conflict of interest form.

Proposals will be evaluated and at least three consultants will be selected to interview for this project. Interviews of consultants for this project will be held the week of November 1, 2017."

5. Conflict of Interest – Giant Spring's procedures require consultants to submit a disclosure statement with their procedures. The city uses the IDOT BDE DISC 2 Template as their conflict of interest form.

All three firms included a disclosure statement with their submittal; no conflicts of interest were discovered.

6. Suspension and Debarment – Giant Spring's procedures require verification of suspension and debarment actions to ensure the eligibility of firms short listed and selected for projects. The city uses the SAM Exclusions, IDOT's CPO's website and the three other state CPO's websites to verify suspensions and debarments.

All three firms were checked and verified not to be suspended or debarred.

7. Evaluation Factors – Giant Spring's procedures for QBS allow the City Engineer to set the evaluation factors for each project but will include a minimum of five criterion and stay within the established range. The maximum of DBE and local presence requirements combined cannot be more that 10% on projects where federal funds are being used. Project specific evaluation factors will be included at a minimum in the Request for Proposals.

Criteria and weighting per the city's QBS procedures

- Technical Approach (10 - 30%)
- Firm Experience (10 - 30%)
- Specialized Expertise (10 - 30%)
- Staff Capabilities (Prime/Sub) (10 - 30%)

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS

5-5-24

January 2019

Work Load Capacity (10 - 30%)
Past Performance (10 - 30%)
In-State or Local Presence*
Participation of Qualified and Certified DBE Sub-consultants*
(* The combined total of these two items cannot exceed 10%)

For this project the City Engineer set the following selection criteria and weighting.

<i>Technical Approach</i>	<i>30%</i>
<i>Firm Experience</i>	<i>20%</i>
<i>Staff Capabilities</i>	<i>20%</i>
<i>Work Load Capacity</i>	<i>20%</i>
<i>Local Presence</i>	<i>10%</i>

The city is requiring interviews with the top three firms. The interviews will be used to adjust the preliminary scores selection committee members individually develop based on the proposal.

8. Selection – Giant Spring’s procedures require a five-person selection committee. Typically, the selection committee members include the director of public works, the city engineer, and at least one of the other public works staff members. Usually the city has at least one member, but not more than two members from outside the public works department. These outside members may be public works directors or engineers from nearby communities, their county engineer, council members, or members of the community. The selection committee members will certify that they do not have a conflict of interest. Selection committee members are chosen by the director of public works for each project. The selection committee members individually review and score each proposal prior to the selection committee meeting. Their scores are averaged for a committee score which is used to establish a short list of three firms. If there are other firms within 10% of the minimum score, the public works director may choose to expand the short list to include more than three firms. The committee score is adjusted by the committee based on group discussion and information gained from presentations and interviews to develop a final ranking.

For this project the city’s selection committee was composed of the public works director, the city engineer, two staff engineers from the public works department and their county engineer.

The city’s procedure requires the use of this basic form to score the submissions. Each member of the selection committee is to provide an independent score for each proposal using the form below prior to the selection committee meeting.

Their scores are averaged for a committee score which is used to establish a short list of three firms. The committee score is adjusted by the committee based on group discussion and information gained from presentations and interviews to develop a final ranking. If there are other firms within [10%] of the minimum score, the public works director may choose to expand the short list to include more than three firms.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS

January 2019

5-5-25

Criteria	Weighting	Points	Firm 1	Firm 2	Firm 3
<i>Technical Approach</i>	<i>30%</i>	<i>30</i>			
<i>Firm Experience</i>	<i>20%</i>	<i>20</i>			
<i>Staff Capabilities</i>	<i>20%</i>	<i>20</i>			
<i>Work Load Capacity</i>	<i>20%</i>	<i>20</i>			
<i>Local Presence</i>	<i>10%</i>	<i>10</i>			
<i>Total</i>	<i>100%</i>	<i>100</i>			

9. Independent Estimate – Giant Spring’s staff will prepare an independent in-house estimate for the project prior to contract negotiation. The estimate is to be used in the negotiation.

The City Engineer prepared a detailed estimate for the Phase I and II engineering for this project. His estimate was \$231,000.

10. Contract Negotiation – Giant Spring’s procedures require a two-person team to negotiate with firms. The team consists of the public works director and the city’s manager. When necessary either the public works director or the city manager may delegate this responsibility to staff members.

For this project, the city engineer and city manager began negotiations with the highest ranked firm. The firm’s cost exceeded the engineer’s estimate by 40% and the firm did not believe they could adjust their scope or staffing in any way to reduce costs. The team moved to negotiation with the second ranked firm. The costs were slightly below the city’s estimate and their project scope covered all the city’s requirements. Negotiations with the second ranked firm were successful. A sealed cost proposal from the third ranked firm was returned to the firm unopened. The proposal from the first ranked firm was disposed of by shredding.

11. Acceptable Costs – Giant Spring’s procedures require the city manager to review the contract costs and the indirect cost rates to assure they are compliant with Federal cost principles prior to submission to IDOT.

For this project, the city manager reviewed the costs and found no issues and forwarded to IDOT for final review and approval.

12. Invoice Processing – Giant Spring’s procedures require the project manager assigned to any project using federal funds to review and approve all invoices prior to payment and submission to IDOT for reimbursement.

13. Project Administration – Giant Spring’s procedures require the assigned project manager to monitor work on the project in accordance with the contract and to file reports with the public works director. The city’s procedures require an evaluation of the consultant’s work at the end of each project. These reports are maintained in the city’s consultant information database. The city follows IDOT’s requirements and they require submission of Form [BLR 05613](#) to the IDOT district at contract close-out along with the final invoice.

When submitting Form [BLR 05510](#), the completion of Exhibit C (Figure 5-5D) is required. See Section 5-5.08 for information concerning the BLR forms for engineering agreements.

EXHIBIT C – FORM BLR 05510 (EXAMPLE)

Figure 5-5D

5-5.08 Standard Engineering Services Agreements

While use of standard engineering agreement forms is not required, the LPA should use the standard engineering agreements developed by the department in order to ensure compliance with all federal and state requirements. If a standard engineering agreement form is modified, the department logo, form number, and any other department identifier shall be removed. Separate engineering agreements are required for preliminary and construction engineering services.

The following standard agreement forms are provided by CBLRS:

- Form [BLR 05510](#) – Engineering Services Agreement
- Form [BLR 05520](#) – Maintenance Engineering to Be Performed by a Consulting Engineer
- Form [BLR 05530](#) – Request for Engineering Services Performed by Local Forces

5-5.08(a) Form [BLR 05510](#)

Form [BLR 05510](#) provides a standard agreement form for preliminary engineering and construction engineering using federal, state, MFT, or TBP funds. Form [BLR 05510](#) is used to compensate the consultant for all work based on methods of payment outlined in Section 5-5.10. The agreement must contain a maximum amount payable, which cannot be exceeded without modification of the agreement.

1. Preliminary Engineering. Preliminary engineering is divided into two phases. Phase I includes preparation of the environment documents, project development or design report, bridge condition reports, and preliminary bridge design and hydraulic report (with Type, Size, & Location (TS&L) as required). Phase II includes preparation of the plans, specifications, and estimates. The work covered by Phase II shall not begin until Phase I has been completed and design approval has been given by IDOT.

For federally funded preliminary engineering services agreements, the LPA shall award a construction contract or acquire ROW within 10 years of the federal authorization date of the preliminary engineering services agreement unless an extension has been granted by FHWA. The IDOT Bureau responsible for individual federal program categories may have more stringent requirements; therefore, the LPA should review all program requirements when requesting funds.

2. Construction Engineering. Construction engineering by the consultant may include the duties of the Resident Construction Supervisor and/or construction inspection. The LPA shall remain in responsible charge. Requirements for construction supervision and in responsible charge are contained in [Section 13-2.01](#) and [Section 25-1.02](#).

5-5.08(b) Form [BLR 05520](#)

LPAs may enter into an agreement with a consultant to provide engineering services for maintenance work funded in whole or in part with MFT funds. Formal agreements may include preliminary engineering and/or engineering inspection.

Typically, the consultant is responsible for the following duties during preliminary engineering:

- investigation of the condition of the streets and/or structures;

BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS

5-5-28

January 2019

- determination, in consultation with the local officials, of the maintenance operations to be included in the maintenance program;
- preparation of the maintenance resolution, estimate, and proposal;
- attendance at meetings of the governing body as may reasonably be required;
- attendance at the public letting and preparation of the contract or acceptance of proposal forms; and
- preparation of the maintenance expenditure statement.

For engineering inspection projects, the consultant is usually responsible for the following:

- furnishing the engineering field supervision of maintenance operations requiring professional on-site inspection;
- checking materials invoices for payment; and/or
- preparing the payment estimate for contract maintenance, including any necessary changes-in-plans, and providing a final estimate of the contract maintenance cost.

Form [BLR 05520](#) may be used for maintenance preliminary engineering and/or engineering inspection agreements. The agreement requires the signature and seal of the licensed professional engineer, or structural engineer as applicable, and the signature and title of the local official. Attach the formal agreement to the maintenance documents submitted to the district for approval showing the estimated cost of maintenance and the operations requiring engineering inspection.

5-5.08(c) Form [BLR 05530](#)

If federal funds will be requested to pay for engineering services provided by the LPA, CBLRS approval is required. The department is required to pre-audit all projects receiving federal funding in accordance with applicable federal regulations. Any services performed prior to the approval from the department may jeopardize the eligibility of federal funding reimbursement. Any invoices submitted for reimbursement for services performed by a LPA will not be processed for payment until a request for a pre-audit and approval is submitted to the CBLRS.

5-5.09 Other Engineering Services Agreements

5-5.09(a) Road District Engineering and Administration

[605 ILCS 5/6-701.3](#) allows a County to be paid administrative and engineering costs for road district MFT construction and maintenance. Engineering and administrative work may be performed on either an actual cost or a fixed-percentage basis, or a combination of these methods. The following will apply:

1. Work Force. This work may be done by one, or an approved combination, of the following:
 - a. by the county with its own forces, with payments to be made directly from MFT funds on an actual cost basis;
 - b. by the county with its own forces, with payments to be made on a percentage basis, as determined and agreed on by and between the county and the road district and approved by IDOT; and/or

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS

January 2019

5-5-29

- c. by a consulting engineer under agreement with the county and approved by IDOT.
2. Resolution. The county board will adopt a resolution informing IDOT of the method or methods it proposes to use. The resolution must include the following:
 - a. Identify the method or methods of performing the work and the program(s) to which it is applicable (e.g., MFT Construction, MFT Maintenance, Township Bridge Program);
 - b. if method 1(b) above is used, include the rate of compensation to be applied to each application;
 - c. provide the effective date of the resolution; and/or
 - d. note the supersedes of any preceding resolution.
3. Approval. Submit two originals of the resolution to the Regional Engineer for approval.
4. Renewal. Annual formal agreements are required for road district maintenance where the county is not performing the engineering services with its own forces; see Section 5-5.08(b).

5-5.09(b) Inspection and Testing Services

LPAs may enter into an agreement with a consultant, or a testing company authorized to do business in the State of Illinois as a "Testing Laboratory" to provide inspection services for projects financed in whole or in part with MFT funds provided the costs will be assigned to the MFT project for which the testing is being done. The consultant or a testing company shall have the appropriate prequalification and training.

Formal agreements may include the following:

1. Scope of Services. This may include:
 - a. obtaining samples for inspection;
 - b. material testing;
 - c. reporting results;
 - d. obtaining material certification; and/or
 - e. providing proof that the materials concerned meet the requirements of the appropriate specifications.

This work should be performed in accordance with IDOT's [PPG](#) and with IDOT's Quality Control/Quality Assurance (QC/QA) Program, where applicable.

2. Method of Measurement. The method of measurement will be based on the services to be performed. Methods of measurement will be in accordance with standard test methods, IDOT's [Manual of Test Procedures for Materials](#), and good engineering practices. Pay rates may be based on units of measurement. The following are some units that may be used:
 - a. plant proportioning control, ton or yd³ (metric ton or m³);
 - b. in-place density determination, hourly rate;
 - c. flexural strength tests, each;
 - d. Marshall tests, each;
 - e. mix design, each;
 - f. core drilling, ft (m);

HARD COPIES UNCONTROLLED

- g. soil reports, per hour laboratory time;
- h. structural steel shop inspection and testing, hourly rate.

5-5.09(c) Non-Standard Engineering Services Agreement Required Clauses

The following clauses shall be included in all non-standard engineering services agreement for preliminary and/or construction engineering:

1. Services. Define the services to be performed.
2. Contract Length. Identify the section or time period covered by the agreement.
3. Compensation. Include the amount and type of compensation to be paid to the consultant. Where the major portion of services is to be provided on a cost-plus basis, provide a list of personnel by occupational title or professional class and the rate of pay for each. If the principal engineer or other consultant's employee perform routine services (e.g., field material inspection, detailed inspection, standard design, drafting work) that could be performed by lesser salaried personnel, the wage rate billed directly for these services cannot exceed those rates paid to the consultant's salaried personnel performing the same or similar work.
4. Payment. Identify the time schedule at which payments are to be made.
5. Non-discrimination. Include the standard clauses for non-discrimination and fair employment practices.

For federally funded engineering services agreements, all required clauses contained in 23 CFR Part 172 shall be included.

5-5.09(d) Municipal Engineer

If a municipality decides to use a consultant to perform the duties of the municipal engineer; using MFT funds, the municipality shall use the State QBS according to Section 5-5.06. However, if the original scope of work does not include all the work needed to be performed by the municipal engineer, the municipality shall perform another selection while avoiding any direct, indirect, or appearance of conflict of interests.

For example, a municipality hires the consultant as their municipal engineer using MFT funds. Since the municipality has a satisfactory relationship with the consultant and state funds are being used, the municipality is not required to provide public notice, evaluate multiple firms, and select highest rated firm. The scope of work includes providing preliminary and construction engineering for the municipality's annual MFT maintenance program and street resurfacing program; and to apply for federal funding through the metropolitan planning organization (MPO) and special department programs.

- If the municipality decides to replace a bridge and plans to use MFT funds for the engineering, the municipality would need to perform another State QBS to complete this engineering work, since it was not included in the original scope of work of the municipal engineer.
- The consultant, who is acting as the municipal engineer, applies for and the municipality receives federal funds for a complete reconstruction of Main Street through the downtown business district. The federal funding includes preliminary engineering, construction, and

construction engineering. The estimated engineering cost for the project is \$75,000. The municipality would need to perform a federal QBS to complete this engineering work. Since the estimated cost is \$40,000 or greater and the engineering contains federal funds, the existing satisfactory relationship process is not allowed.

5-5.10 Method of Payment

5-5.10(a) Compensation Formulas

The following costs are used in one or more of the compensation formulas:

- Direct Labor - the consultant's direct salary cost, which is the salary expense for professional and technical personnel and principals for time that they are productively engaged in work necessary to fulfill the terms of the agreement;
- In-House Direct Costs - the consultant's non-labor costs identified with a particular project. Form [BDE 436](#) shall be used to submit eligible items;
- Overhead - The consultant's actual overhead factor (including payroll additives) or a negotiated overhead factor;
Note(s):
 1. A negotiated overhead factor may only be used on MFT, state, and TBP funded projects. The maximum negotiated overhead factor is 1.4.
 2. Field Rates shall be used for construction engineering projects expected to exceed one year in duration or if the construction engineering contract exceeds \$1,000,000.00 for any duration.
- Outside Direct Costs – the consultant's outside project costs performed by vendors (i.e. outside printing costs, etc.)
- Service By Others – the consultant's services performed by a sub-consultant (i.e. another engineering firm, lab testing firm, landscape architect, etc.)

The engineering agreement will be negotiated based on one of the following methods of compensation. The compensation method selected for the prime consultant shall be used by any sub-consultant, with the exception of construction engineering agreements, when a specific rate is allowed for testing services.

1. Lump-Sum. Lump-sum compensation may be used for engineering services contracts less than \$20,000. For federally funded engineering services agreement, the lump sum shall be developed using CPFF formula (see Item 3 below).
2. Specific Rate. Specific rate compensation may be used only for small engineering services contracts less than \$40,000 and where the work can be clearly defined (e.g., testing). The rate includes payroll, overhead, and profit.
3. Cost-Plus-a-Fixed-Fee Amount (CPFF). CPFF compensation is used when the estimate of the work, labor, and other expenses required for its execution cannot be accurately estimated by LPA's personnel in advance.

The fixed fee allows for the consultant's profit and other miscellaneous amounts. The fixed fee is based on the initial contract estimate.

Note: The fixed fee may be renegotiated when significant changes in the scope, complexity, character, or duration of work are warranted.

BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS

5-5-32

January 2019

One of the following fixed fee formulas shall be used:

$$FF = 0.145[DL + R(DL) + OH(DL) + IHDC]$$

$$FF = 0.145[DL + R(DL) + 1.4(DL) + IHDC]$$

$$FF = 0.145[(2.3 + R)DL + IHDC]$$

Where:

DL = Direct Labor
IHDC = In-House Direct Costs
OH = Overhead
R = Complexity Factor

The total compensation of the consultant shall use the following formula:

$$CPFF = DL + IHDC + OH(DL) + FF + ODC + SBO$$

Where:

DL = Direct Labor
IHDC = In-House Direct Costs
OH = Overhead
FF = Fixed Fee
ODC = Outside Direct Costs
SBO = Service by Others

Lump Sum, Specific Rate, CPFF or the following compensation formulas may also be used for State, MFT, or TBP funded engineering services contracts:

1. Direct Labor Multiplier (DLM). The DLM method of compensation allows every consultant a different percentage of profit depending on the level of a firm's overhead. The DLM formula is:

$$DLM = [(2.80 + R) \times DL] + IHDC$$

See CPFF for definitions of DLM pay factors.

2. Actual Costs. The actual costs of services plus a specified percentage for overhead.

For MFT funded engineering service contracts on LPA maintenance projects, the compensation may be as shown in Figure 5-5E.

Note: If Lump Sum or Actual Costs is used, the total engineering cost cannot exceed the amount determined under Base Fee.

Preliminary engineering fees for MFT maintenance projects are applied to the total approved estimated cost of each MFT maintenance operation included in the MFT maintenance estimate except MFT maintenance engineering. The MFT engineering inspection fee is applied to the final cost of those MFT maintenance operations inspected by the engineer. If retainage is used on MFT maintenance engineering, 10% of the total fee is withheld until the final cost of inspected items is known and the final payment estimate and/or final documents and the MFT maintenance expenditure statement have been submitted.

HARD COPIES UNCONTROLLED

**BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS**

January 2019

5-5-33

BASE FEE		
Value of Program ≤ \$20,000		Negotiated (\$1,250 Maximum)
Value of Program > \$20,000		\$1,250
PLUS		
Engineering Categories*	Preliminary Engineering (Maximum Fee (%))	Engineering Inspection (Maximum Fee (%))
I	N/A	N/A
II-A	2%	1%**
II-B	3%	3%
III	4%	4%
IV	5%	6%

* *Engineering Category Definitions:*

Category I. Services purchased without a proposal such as electrical energy or materials purchased from Central Management Services' Joint Purchasing Program (www.purchase.state.il.us) or another joint purchasing program that has been approved by the District BLRS or CBLRS.

Category II-A. Maintenance items that are not included in Category I or do not require competitive sealed bids according to [Section 12-1.02\(a\)](#) or a local ordinance/resolution.

Category II-B. Routine maintenance items that require competitive sealed bids according to [Section 12-1.02\(a\)](#) or a local ordinance/ resolution. Routine maintenance includes all items in the following work categories: snow removal, street sweeping, lighting and traffic signal maintenance, cleaning ditches or drainage structures, tree trimming or removal, mowing, crack sealing, pavement marking, shoulder maintenance, limited amounts of concrete curb and gutter repair, scour mitigation, pavement patching, and minor drainage repairs.

Category III. Maintenance items that are not covered by Category IIB and require competitive bidding with a material proposal or a deliver and install proposal.

Category IV. Maintenance items that are not covered by Category IIB and require competitive bidding with a contract proposal.

** *An Engineering Inspection Fee for Category IIA is only allowed for items that require inspection and/or acceptance testing.*

FEE FOR MAINTENANCE ENGINEERING

Figure 5-5E

5-5.10(b) Efficiency Factor

The consultant may also opt to include an efficiency factor. When provided in an agreement, the consultant has the opportunity to share in any direct labor cost savings achieved by the efficiencies of the consultant from the original direct labor estimate. Upon submission and approval of the final bill, when the negotiated direct labor cost upper limit is not reached, the consultant will be entitled to 1% of the remaining funds.

An efficiency factor may also be applied to those contracts using the cost plus fixed fee method. When the contract's direct labor cost upper limit is not reached, the consultant will receive 1% of the difference between negotiated and actual direct labor plus overhead.

5-5.10(c) Complexity Factor

Figure 5-5F presents a description for the various levels on the complexity of work.

R Value	Complexity of Work
CPFF = 0.0 DLM = 0.0	Low complexity projects that involve such work as project surveys, routine drafting functions, minor simple span bridges, small rural projects, project reports, and simple environmental assessments.
CPFF = 0.035 DLM = 0.003	Complex jobs that involve such work as small urban projects, freeway interchanges, projects on new alignment, freeways, multi-span continuous bridges, complex environmental assessments, and design reports.
CPFF = 0.070 DLM = 0.008	Very complex work that involves such work as multi-level interchanges, movable bridges, complex major bridges, major urban freeways, complex design reports, environmental impact statements, and major engineering studies requiring special expertise.

COMPLEXITY FACTOR

Figure 5-5F

5-5.11 Agreement Processing

Once the LPA and the consultant have agreed on scope, terms, and compensation, the engineering agreement shall be submitted to the District BLRS for review.

1. MFT, State, and TBP Funded Engineering Services Agreements. The District BLRS will provide approval to the LPA.

BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS

January 2019

5-5-35

2. Federally Funded Engineering Services Agreements. The District BLRS will provide an initial review and then submit to the CBLRS for processing.

CBLRS will conduct a financial review of the agreement to ensure acceptability.

For construction engineering services agreements, the Form [BC 775](#) (and Form [BC 776](#) if required) shall be completed by the LPA and approved by the IDOT District prior to pre-construction meeting. Failure to attach these forms to the federally funded construction engineering services agreements may result in delay in IDOT approval.

After all internal IDOT sign offs have been received, the CBLRS will request federal authorization. Once federal authorization is received, the CBLRS will issue a notice to proceed. If the LPA allows the consultant to perform any work and/or costs to be incurred prior to federal authorization and approval by the IDOT, the work and/or costs will not be eligible for federal reimbursement and will not be allowed as a match to the federal funds. The LPA proceeds at their own risk with the understanding that if the IDOT approval is not obtained, federal, State, MFT, and/or TBP funds will not be allowed for the engineering services contract.

5-5.12 Supplements to the Agreements

When the consultant is requested to complete work outside the scope of the original agreement, or other material contract changes (i.e. the addition or substitution of a sub-consultant); the LPA must provide a written supplement to the original agreement. This may be done by a letter supplement. Where applicable, the LPA should:

- Review the original agreement prior to negotiation of any proposed supplemental agreement.
- Provide a statement to the district explaining the reasons that the original agreement will be supplemented to add/change/amend conditions.
- Describe the scope of work in sufficient detail to clearly outline the additional work that the consultant is to do. The scope of work must meet the definition of the project (see Sections 5-5.06(c) or 5-5.06(e)).

Example: If it is discovered on a proposed resurfacing project, work off of the ROW is needed and the supplemental is to provide environmental and plat work; this would be eligible. However, if under this same proposed project, it is discovered the bridge must be replaced; this would not be eligible and a new selection for engineering services would be required.

- Include the mode of payment (e.g., cost plus a fixed fee, specified hourly rate, daily rate, any indirect cost). This mode of payment must be the same as the original agreement. Always include a maximum amount payable.
- Specify a time for beginning and completion of the contract. Be specific (e.g., calendar days, specified day of the year).
- Specify if subletting is authorized; if so, specify to whom, for what, and the amount payable.

HARD COPIES UNCONTROLLED

- Attach, as exhibits, a finance summary of estimated costs of the supplement(s). Include only the costs to be incurred by the additional scope of work.

Provide spaces for the consultant and the LPA to sign the letter supplement. Ensure that both parties to the agreement have the authority to act and the supplement does not exceed any dollar threshold contained in Section 5-5.06(b). The supplement will require IDOT approval.

5-5.13 Administration of the Agreement

5-5.13(a) Project Administrator

The LPA is responsible for assigning one of its personnel as project administrator to work with the consultant. The project administrator will conduct the following:

- Prepare supplements and letter supplements to existing consultant agreements for additional services or services beyond the scope of the work of the original agreement and include the LPA's estimate of the costs for the work involved.
- Perform as liaison between the LPA and the consultant to ensure compliance with the terms of the agreement and with regard to the work performed by the consultant.
- Monitor the consultant's progress reports to ensure that problem areas are reported, and corrective action is taken.
- Establish controls to monitor time for completion of each agreement to ensure that the time limitations are not exceeded.
- Ensure the accuracy of bills presented by the consultant and submit the bills to the district for reimbursement.
- Maintain cumulative cost records for each agreement.
- Establish controls to prevent payment in excess of contract limitations.
- Monitor the consultant to ensure compliance with any and all Equal Employment Opportunity provisions of the agreement.

5-5.13(b) Final Check

Upon completion of the work under the engineering agreement, the LPA will ensure that all terms and conditions of the agreement have been complied with and that all services to be performed under the agreement have been completed prior to final release of the consultant.

The agreement will be terminated in writing by the LPA. A copy of any termination should be sent to the district.

5-5.13(c) Project Closeout

The LPA is responsible for ensuring that all terms and conditions of the engineering agreement have been fulfilled and that all services to be performed under the agreement have been completed. For state let projects with construction engineering services contracts, all project closeout documentation required by the Bureau of Construction Procedure Memorandum 12-79 shall be submitted to the District Bureau of Construction prior to the construction engineering services contract being closed out by the District.

Documentation (e.g., itemized cost lists, time cards, payroll ledgers, related bills, cancelled checks) to support invoiced engineering costs shall be included in all invoice submissions. The LPA shall comply with all required retention schedules established for LPAs by the Secretary of State. For department auditing purposes, copies (electronic copies are suitable) of all invoices and supporting documentation shall be retained for a period of 3 years after payment of the final voucher. The following applies:

1. MFT and TBP Funded Engineering Services. The LPA shall submit Form [BLR 13510](#) upon completion of the project if MFT or TBP funds are used to fund any portion of the engineering services.
2. State Funded Engineering Services. The LPA shall submit to IDOT a final invoice for the agreed compensation incurred, in accordance with the approved agreement and any supplements. Submit this invoice within 90 days following IDOT approval of the plans, specifications, and estimates (PS&E).

Upon receipt of the final invoice, the District will prepare the Form [PRO 336](#) to notify the appropriate office of the project completion.

3. Federally Funded Engineering Services. The requirements for state funded engineering services apply. IDOT will audit invoices in accordance with FHWA approved auditing procedures (see Section 5-10.04). Upon completion of the audit and resolution of any findings, IDOT will close out the Contract Obligation Document (COD) and submit a final voucher to FHWA.

The prime consultant shall complete Form [BLR 05613](#) and submit to the district at the conclusion of the contract. The district will submit this form to the CBLRS along with the final invoice.

5-5.14 Evaluation

The LPA's project administrator is responsible for evaluating the consultant's performance. Upon completion of the evaluation place a copy in the LPA's file for consideration when a consultant is to be hired for future work. If federal funds are used, then a copy of the evaluation is to be sent to IDOT.

5-6 RAILROAD AGREEMENTS

As changes take place on the railroads and local highway systems, there will be a need for crossing improvements, structure replacements, or the elimination of a crossing. Before these actions can take place, an agreement must be in place that describes the scope of work, the responsibilities of the parties involved, and the method(s) of payment.

For both upgrades to existing crossings and the construction of new crossings, contact the railroad early in the process of planning and design. Long approval times are typical for any work within railroad ROW.

5-6.01 Requirements for a Railroad Agreement

A railroad agreement is required where:

- there are proposed joint improvements between railroad(s) and LPAs involving changes in a railroad grade separation structure or grade crossing, including changes in protection that will be paid totally or in part with MFT, State, or federal funds,
- there are improvements on the local highway system that require a relocation or removal of the railroad facilities, and/or
- if there is a change in circuitry and/or traffic signal preemption.

A separate railroad agreement is not normally required when the Illinois Commerce Commission (ICC) issues an order or develops a stipulated agreement. See Section 5-6.06 covering the improvements listed above. A supplemental agreement will be required if the ICC order does not cover all of the federal requirements or fund types.

5-6.02 Agreement Format

In the agreement, specify the responsibilities of each party. The agreement should contain the following items plus any additional items applicable to the project:

1. Identify the railroad name, LPA name, and MFT section number, if applicable. For Federal-aid projects, also identify the project and job number.
2. Include a description of the work to be done.
3. Provide a location description and location map. Include the AAR DOT number and the railroad milepost.
4. For projects with federal funds, include a statement that the project is subject to FHWA requirements.
5. Identify who is responsible for the surveys, plan preparation, specifications, and estimates.
6. Include the responsibilities for special signal and pavement markings at railroad crossings.
7. Identify which agency is responsible for letting and awarding the contract and who will provide construction supervision of the work.
8. Identify the selected method of construction (e.g., State or local let contract, railroad or local forces).

BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS

5-6-2

June 2017

9. Note if concurrence in the award of the contract is required.
10. Provide a division of cost showing funding responsibilities and the type of funds being used.
11. Identify the method of payment and/or reimbursement by each party.
12. Note the LPA appropriation for their share of the cost.
13. For federally funded projects, include any statements regarding DBEs. Note the DBE program being followed by the LPA if it is a locally let contract.
14. Identify who is responsible for railroad adjustments and the salvage of old equipment.
15. Identify who is responsible for maintenance of the completed work (e.g., crossing surfaces, warning signals, power lines, roadway approaches).
16. If protection work is involved, the agreement must stipulate that the work conforms to the ICC Requirements for Railroad-Highway Grade Crossing Protection and to the [Illinois Manual on Uniform Traffic Control Devices \(ILMUTCD\)](#).
17. Note who is responsible for the retention of records for inspections, audits, etc. As a minimum, railroads must retain records for three years after completion of the project.
18. Identify the proposed completion date of the project.
19. Provide provisions in the agreement to allow termination of the project.
20. Include a statement that IDOT audits railroad bills for work performed by railroad forces in accordance with FHWA requirements on all projects involving the use of State or federal funds.

5-6.03 Preparation and Execution

Typically, the LPA or the LPA's consultant will prepare the railroad and LPA agreement. At the request of a LPA, the CBLRS can provide assistance to the LPA during the agreement preparation process. The draft agreement is circulated among the affected parties and is sent to the district, the LPA, the railroad, and the CBLRS for corrections/comments. Once corrected, the agreement is executed by all parties.

Upon review of the draft agreement by IDOT, the LPA arranges with the railroad to have an estimate of cost and plans submitted to the district for approval prior to execution of the agreement.

A minimum of three original agreements should be provided by the appropriate parties. Additional original agreements should be included, if more than one LPA and/or railroad is a party to the agreement.

The agreement should be signed by the authorized LPA and company representative. Usually, the LPA representative is the chairman of the county board, highway commissioner, mayor, or village president. In the case of a county or municipality, if another local official signs the agreement, the official must be authorized to do so by resolution of the county board, city council, or village board. See [Section 2-3.05\(b\)](#) on signature requirements. The railroad representative who signs the agreement is usually the company president, general manager, or chief engineer. IDOT approval of the executed agreement must be secured prior to authorizing the railroad company to proceed with the work.

Railroad agreements involving MFT funds require the approval of the district.

For guidance on coordinating with railroads, see [Section 10-2.01](#).

5-6.04 Procedure for Joint State-LPA Railroad Agreements

For joint State and LPA improvements involving railroad crossing work where the construction contract will be awarded by the State, negotiations with the railroad may be handled by IDOT or the LPA as provided in the joint agreement. If the joint agreement makes no provisions for railroad negotiations, the development of agreements and negotiations with railroad companies will be handled by the LPA. For railroad work to be performed in conjunction with a Federal-aid highway improvement, FHWA requirements and/or the provisions of [Chapter 7](#) of the *BDE Manual* will apply. When the plans are prepared by the LPA, a plan and profile of the highway adjacent to the railroad crossing is submitted to IDOT by the LPA before negotiations are started. When the LPA will award the contract for joint improvements, all negotiations with the railroad are handled by the LPA and the required documents are secured by the LPA.

5-6.05 Compensation

Compensation for railroad work is usually based on an actual cost basis.

5-6.06 Illinois Commerce Commission (ICC)

5-6.06(a) ICC Jurisdiction

Rail carriers (railroads) are corporations engaged in the transportation of passengers and/or goods for hire in the State of Illinois, as defined in [625 ILCS 5/18c](#), and come under the jurisdiction of the ICC. The State law states, in part:

No public road, highway, or street shall hereafter be constructed across the track of any rail carrier at grade, nor shall the track of any rail carrier be constructed across a public road, highway, or street at grade, without having first secured the permission of the Commission;

The Commission's rules, regulations, and requirements cover the construction, maintenance, division of cost, marking, and signaling of highway and railroad crossings in the State of Illinois.

5-6.06(b) General Procedures

When ICC is involved in a highway-railroad improvement, ICC will either approve a stipulated agreement with the railroad and LPA, then issue an ICC order, or issue an order after a petition has been filed, and a public hearing has been held.

Section 5-6.06(c) defines when a petition is required and when a stipulated agreement may be used. Petition and stipulated agreement procedures are discussed in Sections 5-6.06(d) and 5-6.06(e) respectively.

5-6.06(c) Petition and Stipulated Agreements Guidance

1. Petition. In certain instances, a petition followed by a hearing with ICC is required. The following are cases in which a petition is required:
 - the establishment of a new public at-grade railroad crossing,
 - the elimination of any existing public at-grade crossing or grade-separated structure,
 - new construction of any grade-separated structure with a cost greater than \$1,000,000,
 - the installation of automatic warning devices at a crossing with less than two trains per day, and
 - where a crossing does not meet the minimum stipulated agreement criteria for signal improvements or one of the parties involved is unwilling to execute a stipulated agreement.
2. Stipulated Agreements. Stipulated agreements are generally used under the following conditions:
 - a. Automatic Flashing Light Signals (AFLS) with Gates. AFLS with gates may be recommended by the stipulated agreement procedure when any of the following conditions are met or exceeded unless a diagnostic team finds automatic flashing lights signals and gates are not warranted and recommends the installation of an alternative active/passive warning device:
 - the product of the seasonally adjusted average daily traffic count and the average daily train movements exceeds 3,000 for the mainline or branch line tracks having two or more train movements daily,
 - the clearing sight or stopping sight distances for normal highway conditions, for actual rail and vehicular traffic speeds are restricted and the product of trains per day times vehicles per day exceeds 1,000,
 - there is an unusual highway or track geometric or vehicle/train operation that creates a hazardous condition that cannot be reasonably improved by other means, or
 - a diagnostic team recommends the improvement.
 - b. Other. The stipulated agreement procedure may also be used for the following conditions:
 - reconstruction or minor relocation of existing grade separation structures,
 - construction of new grade separations costing less than \$1,000,000,
 - upgrading control circuitry,
 - installation of cantilevered signals due to the widening of the roadway,

BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS

June 2017

5-6-5

- the construction of connector roads where crossing closures are involved,
- improvement, reconstruction, relocation, or realignment of the highway approaches at any existing public grade crossing, and/or
- improvement, reconstruction, relocation, or removal of track structures and railroad appurtenances that may be in the interest of public safety at an existing public grade crossing.

In any condition where the party desiring the crossing improvements is unsure which procedure to use, contact the ICC for a determination.

5-6.06(d) Petition Procedures

If the LPA can reach agreement with the railroad concerning the type of warning device needed and the division of cost for an existing crossing, it may not be necessary to hold a formal hearing before ICC. If the LPA cannot reach an agreement with the railroad, a formal hearing must be held before ICC. Either the LPA or the railroad may submit a petition requesting a hearing to ICC. Application forms are available from ICC. The petition should state the location of the crossing(s) involved, the improvements desired (including the reasons why the improvements are necessary), and that amount of financial assistance requested, if applicable. When filing a petition with ICC, also provide a copy of the petition to the railroad or LPA and IDOT.

Upon receipt and review of the petition, ICC will send out a notice of the date, time, and place of the hearing to all parties involved. The hearings are conducted in a manner similar to that of a court trial, but on a more informal basis. During the hearing, each party will have the opportunity to express their concerns regarding the proposed safety improvement.

The petitioner should present all pertinent information relative to the physical characteristics of the highway and approaches near the crossing and surrounding area. Data should be presented depicting existing and projected vehicular traffic on the crossing. The petitioner should present evidence showing why the improvements are needed. Information regarding the roadway work should be presented if there will be a highway project in connection with the crossing improvement.

Typically, the railroad company involved will have a representative present who can testify with regard to train traffic and the estimated cost of warning devices and/or crossing surface work. However, it is advised that the LPA have some knowledge of this information prior to the hearing. While it is not required, the parties may choose to have an attorney present to provide assistance at the hearing.

ICC issues an order based on findings made from evidence presented at the hearing. The order includes a description of the work to be performed, the parties responsible for ensuring that the work is performed, the division of cost between affected parties, and the date by which all work should be completed.

In contested cases, ICC issues a proposed order where all affected parties are given an opportunity to comment within a specified time frame, usually two weeks, before the final order is issued.

HARD COPIES UNCONTROLLED

5-6.06(e) Stipulated Agreement Procedures

Generally, the LPA initiates the stipulated agreement procedure by contacting ICC in writing or by phone and requesting that a meeting be scheduled. However, a railroad or IDOT may also request a meeting. Because the nature of the proposed crossing improvements may vary considerably, ICC contacts each affected party regarding the necessary preparation prior to the meeting.

On the date and time mutually agreed upon, all affected parties meet at the site and discuss the crossing needs and possible solutions. Should it be determined at the meeting that the project meets the minimum warrants under the ICC's stipulated agreement procedures and all parties are in agreement with the improvements and division of cost, ICC will prepare a stipulated agreement for signature by all parties; see Section 5-6.06(c). Prior to the circulation of a stipulated agreement, all necessary cost estimates (e.g., signals, surfaces, approaches, bridge construction) must be submitted to ICC. After all parties execute the stipulated agreement, ICC will issue an order for completion of work.

If the proposed project does not satisfy the requirements for a stipulated agreement or there is disagreement among the parties regarding the proposed work or division of cost, any affected party (e.g., LPA, railroad, IDOT) may petition ICC for a hearing; see [Section 10-2.01](#).

5-7 UTILITY AGREEMENTS

5-7.01 Requirements for Utility Agreements

A utility agreement is required when a proposed highway improvement requires relocation or adjustment of an existing utility and existing permits do not provide for moving the utility. Typically, these are projects that affect utilities located outside the existing highway ROW.

5-7.02 Agreement Format

When a project requires a utility agreement, the LPA is normally responsible for its preparation and execution in consultation with the district. Each utility agreement must specify the responsibilities of each party and contain the following items plus any additional items applicable to the project:

1. Identify the utility name, LPA name, and MFT section number, if applicable. For Federal-aid projects, also identify the project and job number.
2. Include a description of the work to be done.
3. Provide a location description and location map.
4. For projects with federal funds, include a statement that the project is subject to FHWA requirements.
5. Identify who is responsible for the surveys, plan preparation, specifications, and estimates.
6. Identify which agency is responsible for letting and awarding the contract and who will provide construction supervision of the work.
7. Identify the selected method of construction (e.g., State- or local-let contract, utility forces, or contract by utility company).
8. Note if concurrence in the award of the contract is required.
9. Provide a division of cost showing funding responsibilities and the type of funds being used.
10. Identify the method of payment and/or reimbursement by each party.
11. Note the LPA appropriation for their share of the cost.
12. For federally funded projects, include any statements regarding DBEs. Note the DBE program being followed by the LPA, if it is a locally let contract.
13. Note who is responsible for the retention of records for inspections, audits, etc. As a minimum, the utility company must retain records for three years following completion of work.
14. Identify the proposed completion date of the project.
15. Provide provisions in the agreement to allow termination of the project.
16. Include a statement that IDOT will audit utility bills for work performed by utility forces in accordance with FHWA requirements on all projects involving the use of State or federal funds.

5-7.03 Preparation and Execution

The draft agreement is circulated among the affected parties, including the district, for corrections/comments. Once corrected, the agreement is executed by the LPA and the utility company.

Upon review of the draft agreement by the district, the LPA arranges with the utility company to have an estimate of cost and plans submitted to the district for approval prior to execution of the agreement.

The agreement is signed by the authorized LPA and utility company representative. Usually, the LPA representative is the chairman of the county board, highway commissioner, mayor, or village president. In the case of a county or municipality, if another local official signs the agreement, the official must be authorized to do so by resolution of the county board, city council, or village board. See [Section 2-3.05\(b\)](#) on signature requirements. The utility representative who signs the agreement is usually the company president, general manager, or chief engineer. The agreement must be approved by the district.

Federal participation in the relocation or removal cost of a utility, required by a highway project, may be secured by following the federal procedures for project authorization/obligation of funds and obtaining the district's approval of the agreement and PS&E prior to the beginning of utility work. If the utilities are located on the public ROW, the associated cost for relocation or removal must be borne by the utility company.

For additional guidance on coordinating with utility companies, see [Section 10-4](#).

5-8 MAINTENANCE AGREEMENTS FOR STATE HIGHWAYS

5-8.01 Traffic Signal Master Agreements

For most traffic signals on State highways, the districts will select local contractors to provide maintenance. However, in some cases, municipalities may perform the signal maintenance work that is the State's responsibility under the terms of a master agreement. LPAs are reimbursed by the State for maintenance and/or energy costs associated with the signals.

The Traffic Signal Master Agreement is prepared by the district Bureau of Operations. The agreement should:

- Identify the location of each traffic signal.
- Indicate the level of maintenance that should be provided.
- Identify the party that will be responsible for the maintenance costs and energy costs. If the cost is shared between the parties, indicate the portion of the cost for which each agency is responsible.
- Indicate whether the LPA will maintain the traffic signal through the use of its own forces or through an ongoing contractual agreement with a local contractor.

The agreement is signed by the LPA and IDOT.

For additional guidance on master agreements, contact the appropriate IDOT district office.

5-8.02 Municipal-State Maintenance Agreements

IDOT is authorized to enter into contracts with any municipal corporation to maintain any State highway located within the municipal corporation ([605 ILCS 5/4-406](#)). The agreement will provide for a minimum level of maintenance, a discussion of the route included, and the amount of reimbursement for the LPA.

5-9 TIERED APPROACH TO CORRECTIVE ACTION OBJECTIVES AGREEMENTS

Illinois environmental law requires the Illinois Pollution Control Board to consider land use controls in determining risk to human health from contamination in soil and groundwater. This approach is known as the Tiered Approach to Corrective Action Objectives (TACO). As a result of IDOT's effort, IDOT has developed [Highway Authority Agreements](#) (HAA), which is the land use controls recognized in TACO; see the [HAA](#) for TACO agreements. In the agreement, IDOT or a local highway authority is responsible, depending on who signs the agreement, for the following commitments:

- The agency will not allow drinking water wells to tap groundwater in the area of the ROW that may be contaminated.
- If soil in the ROW that may be contaminated is excavated, human health and the environment will be protected.

For a highway authority willing to make these commitments, there are a number of significant benefits. These include:

- (1) Notification. A company is required to notify the agency that it has contaminated the ROW and will take responsibility. These agreements could cover nearly any type of pollutant.

Release. The company gives the agency a legal release from liability and indemnifies the agency for claims that may be made.

Reimbursement. Should the LPA excavate through contaminated soil in the ROW (e.g., release of petroleum), the company will reimburse the LPA's costs of dealing with the contamination (e.g., cost of disposing of the contaminated soil in a landfill).

A company that has contaminated the ROW has two choices:

- it can clean up the ROW, or
- it can negotiate a [Highway Authority Agreement](#) that is acceptable to the LPA.

The first choice is expensive and an unnecessary drain on the Leaking Underground Storage Tank (LUST) Fund. This fund reimburses owners for their cleanup costs of those tanks. Money for this fund comes from tax on motor fuel sold at the pump, similar to the Motor Fuel Tax. Clean up of the ROW is typically unnecessary because the cleanup is not needed to protect human health and the environment. However, the LPA still must meet its commitments made in the [Highway Authority Agreement](#).

5-10 INVOICE PROCESSING

5-10.01 General

According to the terms of the joint agreement, a LPAs may invoice IDOT for reimbursement of State and federal funds.

5-10.02 Supporting Documentation

To process an invoice, BLRS requires copies of documentation verifying LPA payments. Two copies of the invoice and supporting documentation shall be submitted to the District LRS office. Supporting documentation must include, but not limited to, the following:

- Copies of all cancelled checks paid for the project,
- Letter from recipient that payment was made if cancelled check(s) is/are not available,
- List and itemization of all direct costs and unit rates for each direct cost item,
- List of employees by classification, time spent by each employee on the project for the Invoice service period (Note: ensure the time charges are for the service dates shown on the Invoice and that they are within the period for the obligated funds.), and the hourly rate of each employee. Verify that the computations for total employee labor costs are correct.
- Low bid amount and award date, if applicable.

Proper preparation of the invoice in accordance with the above guidelines is essential to avoid delays in processing. The district shall use Form [BLR 05620](#) to forward to the proper bureau for final processing.

LPAs shall retain all invoice documentation for a minimum of three years after the project is completed to allow for State and/or LPA audits.

5-10.03 Payment Status

Once invoice payments have been processed by the BLRS, payment status may be checked on the official Illinois State Comptroller's website. Click on "Vendor Payments" and follow the instructions. A Tax Identification Number is required to access the system.

5-10.04 LPA Single Audit Requirement

If a LPA receives a significant amount of federal funding (currently \$500,000 a year or more), a single audit must be submitted to IDOT. This requirement is set forth by the U.S. Office of Management and Budget, Circular No. A-133 (2007). If an audit is required, the LPA shall identify federal funds received through IDOT. The Catalog of Federal Domestic Assistance (CFDA) number for the Federal-Aid Highway Program is 20.205 – Highway Planning and Construction.

BUREAU OF LOCAL ROADS & STREETS
AGREEMENTS

5-10-2

June 2017

5-10.05 Obligation Time Limit

Final invoices shall be submitted to BLRS within one year of the completion of the project. If a final invoice is not received within one year of completion of the project, the last invoice received will be considered the final and the contract obligation will be closed. If this deadline is not met, an extension of time may be requested. An extension of time request shall include justification for the delay and an estimated final invoice date.

Chapter 6

BRIDGE INVENTORY AND INSPECTIONS

6-1 NATIONAL BRIDGE INSPECTION STANDARDS (NBIS)

6-1.01 General

The NBIS is the Federal regulation that establishes the requirements for a bridge inspection organization, inspection procedures, frequency of inspections, qualifications of personnel, and preparation and maintenance of a state bridge inventory. The NBIS applies to all structures defined as bridges carrying a roadway and open to the public. The bridge inspection program resulting from the NBIS is intended to detect structural and functional deficiencies in order to minimize the probability of structural failure and improve bridge traffic safety. The Federal Highway Administration (FHWA) has promulgated regulations to establish the applicable criteria that each state transportation department must meet, see 23 CFR, Part 650, Subpart C.

To properly implement the NBIS program requirements for local public agencies (LPAs) in Illinois, the Department relies on the LPA to perform the NBIS requirements for structures under its jurisdiction. All LPAs with jurisdiction of a structure eligible for inclusion in the National Bridge Inventory (NBI) must designate a Program Manager to ensure compliance with the NBIS and provide guidance and management of their bridge inventory. The designated Program Manager must meet the qualifications as described in Section 3 of the [Structural Services Manual](#), maintained by the Bureau of Bridges and Structures (BBS). Statewide oversight of the LPA bridge inspection program is provided by the Statewide Program Manager in the Bridge Management Unit (BMU) of the BBS.

IDOT policies and procedures for Bridge Inspection are located in the BBS' [Structural Services Manual](#).

6-1.02 Definitions

The following definitions apply to the NBIS and its implementation:

1. Bridge. A structure, including supports, erected over a depression or an obstruction, such as water, highway, or railway, and having a track or passageway for carrying traffic or other moving loads, and having an opening, measured along the center of the roadway of more than 20.0 ft (6.1 m) between undercopings of abutments or spring lines of arches, or extreme ends of openings for multiple boxes; it may also include multiple pipes, where the clear distance between openings is less than half of the smaller contiguous opening. See Figure 6-1A for examples of various bridge openings.

Abutment Supported
Bridges

$S \geq 20.0'$ (6.1 m): Bridge

Concrete Box Culvert
at Grade or Under Fill
(Single or Multi-Span)

$X + Y + X... \geq 20.0'$ (6.1 m): Bridge
Where $Y < \frac{X}{2}$

Metal Pipe Under Fill
(Single or Multi-Span)

$X + Y + Z... \geq 20.0'$ (6.1 m): Bridge
Where $Y < \frac{A}{2}$, where A
is the Smaller of X or Z

**DETERMINATION OF BRIDGE LENGTH FOR
THE PURPOSE OF DEFINITION OF A BRIDGE**

Figure 6-1A

2. National Bridge Inspection Standards (NBIS). The Federal regulations establishing requirements for a bridge inspection organization, for inspection procedures, frequency of inspections, qualifications of personnel, and preparation and maintenance of a state bridge inventory. The NBIS applies to all structures defined as bridges carrying roads open to the public.
3. National Bridge Inventory (NBI). The aggregation of structure inventory and appraisal data collected to fulfill the requirements of the NBIS, which require that each state prepare and maintain an inventory of all bridges subject to the NBIS.
4. NBI Record. Data that has been coded according to the *Recording and Coding Guide for the Structure Inventory and Appraisal of the Nation's Bridges (Guide)* for each structure carrying highway traffic or each inventory route which passes beneath a structure.

-
5. Master Structure Report. The representation of the data recorded and stored for each NBI record in accordance with the *Guide*.
 6. Sufficiency Rating. A numerical value from 0.0 to 100.0 which indicates a bridge's overall sufficiency to remain in service. The rating is calculated from the Structure Inventory and Appraisal (SI&A) data and reflects the following factors:
 - structural adequacy and safety,
 - serviceability and functional obsolescence,
 - essentiality for public use, and
 - any special considerations.

6-2 BRIDGE INVENTORY

6-2.01 National Bridge Inventory (NBI)

The NBI is a national program that requires each state to prepare and maintain an inventory of all bridges on public roads that are subject to the NBIS. The purpose is to maintain a national database of structures and applicable structural analyses data. This information is used by the FHWA to develop reports to submit to Congress on the status of the nation's bridges, and by states in managing their bridge maintenance, rehabilitation, and replacement programs.

6-2.02 Illinois Structure Information System (ISIS)

IDOT maintains a computerized bridge inventory system, designated as the Illinois Structure Information System (ISIS). This is part of the Illinois Highway Information System (IHIS). The ISIS database system contains information required by the NBIS, including inspection data.

The ISIS data is available from the Structure Information Management System (SIMS). LPAs may obtain the database file of local bridges for each county from IDOT's website and use the SIMS with the Microsoft Access database application program.

6-2.03 Inventory Requirements

The bridge inventory must include the following:

- all structures carrying public roads meeting the definition of a bridge, and
- all other structures where an opening length (measured along the centerline of the roadway) of less than or equal to 20.0 ft. (6.1 m) and involving a highway. These may be accepted into the system if prior approval is given by the Central Office of Planning and Programming – Data Collection Unit.

Structure numbers (SN) should be assigned and the inventory should be completed for non-highway, railroad and pedestrian structures over roads open to the public. This establishes the structure in the ISIS for inventorying its location, and vertical and horizontal clearances. NBIS inspections are not required for pedestrian structures. However, regular maintenance inspections are encouraged.

The responsibility for reporting the required information for the ISIS rests with the agency having jurisdiction of the road leading to and from the bridge. If there is no public road on the structure, the reporting responsibility rests with the agency having jurisdiction of the road under the structure.

6-2.04 Structure Number (SN)

Each structure is identified by a 7 digit SN composed of a 3 digit county number and a 4 digit structure sequence number. The county number can be found as Item 3 in the [Structure Information and Procedure \(SIP\) Manual](#). The [SIP Manual](#) also provides additional information on the sequence number. The SN is assigned by the district or the maintaining agency from a block of numbers reserved for each agency. The SN is to be assigned prior to submittal of the

Preliminary Bridge Design and Hydraulic Report (PBDHR) or Type, Size & Location (TS&L) plans, as applicable, and shall be included in the ISIS to avoid possible duplicate use of the SN.

Data for deleted structures is retained in the ISIS and the SN shall never be used again. Similarly, a bridge constructed using any portion of the original substructure may keep its same SN. Completely new bridges erected at the same location on the same or new alignment that does not use any part of the old bridge will be assigned a new SN. Structures moved to a new location should receive a new SN. New structures may be assigned SNs using the next available SN by district scheme. There is no official statewide scheme for the assignment of SNs according to jurisdiction.

Once the maintaining agency and IDOT have agreed on a SN for a bridge, that SN is permanent and will not be changed for any reason even if there is a change in maintenance responsibility. This avoids confusion in record retrieval and retention. To make the bridge numbering system effective in the field, one SN tag should be painted or installed on each end of the bridge.

6-2.05 ISIS Structure Reports

Figure 6-2A presents the Structure Reports necessary to communicate information for entry into ISIS. The forms for the initial recording of inventory, route, and inspection information may be available from the district, copied from the [SIP Manual](#), or printed from the Structure Information Management System ([SIMS - County](#)), which can be downloaded from the IDOT website. Forms for reporting changes and information on existing structures can be obtained directly from [SIMS - County](#) or from the IDOT website. Ensure the most recent [SIMS – County](#) files are downloaded prior to printing these reports.

6-2.06 Sufficiency Rating (SR)

Based on the inventory, traffic, inspection, and load-rating data submitted to ISIS, the Department calculates a SR for each structure. The SR is between 0.0 and 100.0, with the lower numbers implying a higher priority of need for improvement.

BUREAU OF LOCAL ROADS & STREETS
BRIDGE INVENTORY AND INSPECTIONS

June 2018

6-2-3

Report	Usage of Report
Inventory/Status Initial Report (R105-I) (SIMS)	Reporting inventory and bridge status information to ISIS on new-to-system bridges.
Inventory Turnaround Report (S105) (SIMS)	Reporting revisions of inventory data to ISIS. The inspector should have this form or Forms S114 and S111 at each NBIS inspection.
Inspector's Inventory Report (S114) (SIMS)	Form S114 is for reporting revisions of inventory data to ISIS. The inspector should have this form or Form S105 and Form S111 at each NBIS inspection.
Key Route/Construction Initial Report (R111-I) (SIMS)	Reporting route information to ISIS on new-to-system bridges.
Key Route Turnaround Report (S111) (SIMS)	Reporting revisions of key route data to ISIS. The inspector should have this form and Form S114 or S105 at each NBIS inspection.
Master Structure Report (S107) (SIMS)	Reports most information contained in ISIS for each bridge. This form is not for reporting revisions to the System. The inspector should have this form at each NBIS inspection.
Routine Bridge Inspection Report (BBS-BIR)	The BBS-BIR form is used for recording specific inspection notes and ratings for each bridge. The BBS-BIR is used for a single inspection and contains current ratings information. The inspector should have this form at each NBIS inspection, and the signed original copy must be in the bridge file kept by the owner of the bridge.
Fracture Critical Inspection Form (BBS-BIR-FC1)	Form BBS-BIR-FC1 is used for recording results of Fracture Critical (FC) inspections. The inspector should have this form at each FC inspection.
Fracture Critical Member Inventory Form (BBS-BIR-FC2)	Form BBS-BIR-FC2 is used to record the FC Type, number of spans, and number of members in each FC bridge. The inspector should consult this form before each FC inspection, and the signed original must be in the bridge file kept by the owner of the bridge.
Underwater Bridge Inspection Report (BBS-BIR-UW1)	Form BBS-BIR-UW1 is used for recording results of Underwater (UW) inspections. The inspector should have this form at each UW inspection.
Special Inspection Report (BBS-SI-1)	Form BBS-SI-1 is used to record the Special Inspection Type Code and Condition Status for all bridges requiring a Special Inspection. The inspector should consult this form before each Special Inspection, and the signed original must be in the bridge file kept by the owner of the bridge.
Scour Critical Evaluation Coding Report (BBS SCE)	Form BBS SCE is used for reporting coding recommendations for Scour Critical Evaluations (ISIS Item 113).
Scour Critical Bridge Plan of Action (BBS 2680)	Form BBS 2680 is used to record actions to be taken to monitor scour critical or scour susceptible bridges during and after major storm events. The inspector should consult this form before each Routine Inspection and when a major storm event occurs. The form should be updated to reflect current field conditions and the signed original must be in the bridge file kept by the owner of the bridge.
Bridge Posting / Closure Review (BBS PCR)	Form BBS PCR is used for recording results of each Bridge Posting / Closure review inspection. The inspector should have this form at each review.
Bridge File Checklist (BBS BFC)	Form BBS BFC is used to document the contents of each official Bridge File and the location of required information that may be stored separately or electronically. The inspector should consult this form before each inspection, and the original copy must be in the bridge file kept by the owner of the bridge.

Note: All forms listed are available from [SIMS - County](#) or from the [IDOT website](#). BBS and BIR forms may be found on the [IDOT website](#).

STRUCTURE REPORTS

Figure 6-2A

HARD COPIES UNCONTROLLED

6-2.07 Inventory Updates

IDOT is required to maintain and report on the accurate operational status of all bridges in the NBI. New bridges or any conditions that require revision of existing structure information must be reported to the district promptly. The district must include the revision in ISIS within 90 days after the change in status for LPA structures. The 90 days start when the structure is opened or reopened to unrestricted traffic or when other events occur that result in changes to inventory or inspection data for a structure.

Refer to the [SIP Manual](#) Item 41 for appropriate Bridge Status codes. NBIS requirements state that changes in Bridge Status must be entered in ISIS within 90 days of that change. When a LPA bridge is load posted (ISIS Codes 2-6), under staged construction (ISIS Code 7), closed for construction (ISIS Code A), or closed but anticipated to be rehabilitated or replaced within 5 years (ISIS Code B), the owner should report that change in Bridge Status to the district.

Structures with Bridge Status B for more than 5 years will be considered permanently closed and the Bridge Status will be changed to E or may be deleted. When structures are coded with Bridge Status 5 or 6 (Temporary Measures) for more than 5 years, the temporary measures become permanent for the structure. Condition Ratings, Load Ratings, and Bridge Status will be based on these measures. In addition, all inventory information should be updated as necessary.

6-3 BRIDGE INSPECTIONS

The bridge owner (LPA) must have a systematic strategy for conducting field inspections and reporting the findings. The inspection team must be led by a qualified Team Leader. The bridge inspection report should accurately and clearly record all findings and should include photographs of the overall structure and of any significant defects.

Per the NBIS, the owner of a bridge should have an individual bridge file for each structure. Counties may hold files on behalf of townships or other LPAs for which they provide services. In addition, the LPA, as the owner of the structure, must have a systematic means of entering, storing, and retrieving all bridge inspection data. The file should contain a full history of the structure.

A Bridge File Checklist (Form [BBS BFC](#)) must be maintained with each Bridge File. This form may be found on the [IDOT website](#) or by contacting the appropriate district office.

6-3.01 LPA Responsibility

6-3.01(a) Publicly Owned Structures

In order to satisfy the requirements of the NBIS, the LPA is responsible for inspections of all structures on roads open to public travel that meet the definition of a bridge, see Section 3.1.2 in the [Structural Services Manual](#) for facilities under its jurisdictional responsibility. In addition, all closed structures are required to be inspected for proper closure by the LPA.

Though not required by the NBIS, for structures under their jurisdiction and responsibility that do not meet the definition of a bridge or are not carrying highway traffic, LPAs are strongly encouraged to perform regular inspections to ensure public safety.

The responsible LPA may perform the inspection with qualified in-house personnel or retain the services of a qualified inspector proficient in the performance of NBIS inspections. See Section 3.9.2 in the [Structural Services Manual](#) for Personnel Qualifications.

6-3.01(b) Privately Owned Structures

Privately owned structures, and those owned by government agencies that are not highway agencies, carrying public roadways, are subject to inspection and inclusion in ISIS; see Section 6-2.02. Therefore, it is the responsibility of the owners of these structures to have timely inspections performed according to the provisions of the NBIS. The BBS BMU and the Local Bridge Unit (LBU) will work with the owner to:

- ensure the owner is aware when the NBI inspection is due, and
- obtain copies of the inspection forms to keep on file and for submission to the district for inclusion in ISIS.

In general, a LPA has a responsibility to post and warn the public of any hazards on a public highway carried by a structure. When it becomes apparent that the private owner (e.g., railroad, drainage or sanitary district, developer) of a bridge carrying a public highway will not or cannot

perform the safety inspections required by the NBIS, the LPA having jurisdiction over the public highway leading to the bridge is responsible for performing the necessary inspection. If the private owner also has jurisdiction of the road leading to the bridge (e.g., private business that allows customers to use the road), the LPA may need to consider closing the public road leading to the private road until an inspection is performed and the bridge is considered safe. The NBIS requirements are not directly applicable to privately owned structures, but owners are strongly encouraged to follow the requirements of the NBIS.

6-3.02 Reporting Requirements

This Section discusses the process for entering field inspection results into the ISIS. See Figure 6-2A for a list of inspection report forms.

6-3.02(a) New Structure, or Initial Inspection of Old Structure not in ISIS

The following applies:

1. Complete the Inventory / Status Initial Report (R105-I) and the Key Route / Construction Initial Report (R111-I) and submit copies to the district. If a bridge has been replaced, then also indicate in the submittal the SN of the replaced structure so the replaced bridge can be marked for deletion.
2. Complete the Bridge Inspection Report (Form [BBS-BIR](#)). The signed original of Form [BBS-BIR](#) is retained in the individual bridge file kept by the owner of the bridge. The Bridge Inspection Report (Form [BBS-BIR](#)) should be completed and a copy submitted to the district.
3. The Scour Critical Evaluation Coding Report ([BBS SCE](#)), if applicable, must be filled out and submitted at the same time as the other two initial reports if it has not been submitted previously.
4. The LPA should submit all reports within 90 days of opening the bridge to traffic to allow the district proper time to enter the data within the required timeframe.

6-3.02(b) Re-inspection of Structures on File in ISIS

The following applies:

1. Complete the Bridge Inspection Report (Form [BBS-BIR](#)).
2. Submit copies of Reports [BBS-BIR](#) and S105, and S114 if required, to the district. The LPA should submit the inspection report within 90 days of the inspection to allow the district proper time to enter the data within the required time frame.

6-3.02(c) Reconstruction of an Existing Structure

Any reconstruction, rehabilitation, or major repair of an existing bridge currently in ISIS should be recorded in the ISIS within 90 days of reopening the bridge to unrestricted traffic. Work that changes the inventory data of a bridge open to traffic must also be recorded within 90 days of the completion of the work. A bridge reconstructed using the same abutments or piers may

keep the same SN so long as the geometry, span lengths, etc. have not significantly changed. The following applies:

1. Complete Form [BBS-BIR](#).
2. Revise and submit copies of Reports [BBS-BIR](#) and S105, and S114 if required, as described in Section 6-3.02(b).

6-4 LOAD RATING AND POSTING

6-4.01 Requirements

All bridges must be load rated to determine their load-carrying capacity. This includes the Inventory Rating Factor, Operating Rating Factor, and the ratings for the Illinois Legal Loads as defined in the *Illinois Vehicle Code* ([625 ILCS 5/15-111](#)). These ratings provide an indication of the bridge's capacity to safely resist the loads it is likely to be subjected to. This information assists in the determination of necessary load posting, the issuance of special overload permits, and the scheduling for rehabilitation or replacement. These ratings must be performed by IDOT or receive IDOT's concurrence, in accordance with [625 ILCS 5/15-317\(b\)](#).

According to IDOT's load rating policy, as described in Section 3.3.9 of the [Structural Services Manual](#), re-evaluation of the load-carrying capacity must be performed when significant deterioration in structurally critical areas has occurred since the last rating. Such deterioration is typically indicated when the ISIS Superstructure (Item 59), Substructure (Item 60), or Culvert (Item 62) is reduced to a "4" or less, or when the Condition Rating of Deck (Item 58) falls to "3" or less.

In addition, load rating is performed at a maximum 10-year interval for bridges meeting any of the following criteria:

- a Condition Rating of "4" or less for Items 59, 60, or 62;
- a Condition Rating of "3" or less for Item 58; or

Load rating of bridges not meeting the above criteria, although not specifically required, may be requested by the LPA.

6-4.02 Responsibilities

All bridges must be rated for load capacity by IDOT, or by a qualified Illinois Licensed Structural Engineer with IDOT's concurrence. Generally, existing structures do not need to be load rated unless they have deteriorated, have been repaired or modified, have a modification to the wearing surface or meet the requirements in Section 6-4.01.

6-4.02(a) Load Rating by IDOT

IDOT will rate bridges at the request of the LPA or upon its own initiative. A request for rating should state any unusual or notable conditions. The LPA should provide a copy of the "as-built" construction plans or, if plans are not available, a dimensioned sketch of the bridge and its significant structural members. Representative photographs showing the overall condition and specific problem areas should also be included.

Rating requests may be made in writing through the district using Form [BLR 06510](#). A representative of the BBS will schedule a field investigation of each structure to determine actual conditions of the bridge which affect the load-carrying capacity.

6-4.02(b) Load Rating by Others

Structure ratings performed by others must receive the concurrence of IDOT (BBS). A summary report for all bridges rated should detail the procedures, findings, inventory and operating ratings, and posting recommendations based on a field inspection and analysis performed by an Illinois Licensed Structural Engineer in accordance with provisions of the current AASHTO *Manual for Bridge Evaluation (MBE)*. The structural engineer's seal must be affixed to the Structure Load Rating Summary (Form [BBS 2795](#)) along with computations and analysis model. Excerpts from detailed inspection reports or other similar submittals will not be accepted.

6-4.02(c) Reporting

The LPA should submit the summary report, original Form [BBS 2795](#) and other attachments to the district for forwarding to the BBS. The LPA should accept the consultant's findings prior to submittal of the report.

6-4.03 Bridge Closure and Weight Limit Posting

When a structure cannot carry legal loads, as defined in the Illinois Vehicle Code [625 ILCS 5/15-317](#), IDOT is required to ensure suitable signs are erected and maintained to inform the public of the maximum weight limit. The agency having jurisdiction over the roadway is responsible for the posting of signs, regardless of structure ownership or maintenance responsibility.

When IDOT determines a structure carrying traffic on a public road is not capable of carrying the legal loads as defined in [625 ILCS 5/15-111](#), it will inform the LPA. Upon notification from IDOT of a required load posting, the LPA shall erect signs as soon as possible and notify IDOT within 30 days that signs are in place, or within 14 days for closures.

Per [625 ILCS 5/15-317](#), the load posting signs must match the load posting requirements determined by the Department. Posting at a lower or higher level is not permitted. Likewise, a single posting level is not permitted when a combination posting level is required. The LBU should be contacted for re-evaluation if a combination posting level is required but the LPA believes a single posting level would be more appropriate for the structure location. See Figure 6-4A for bridge weight limit posting traffic control.

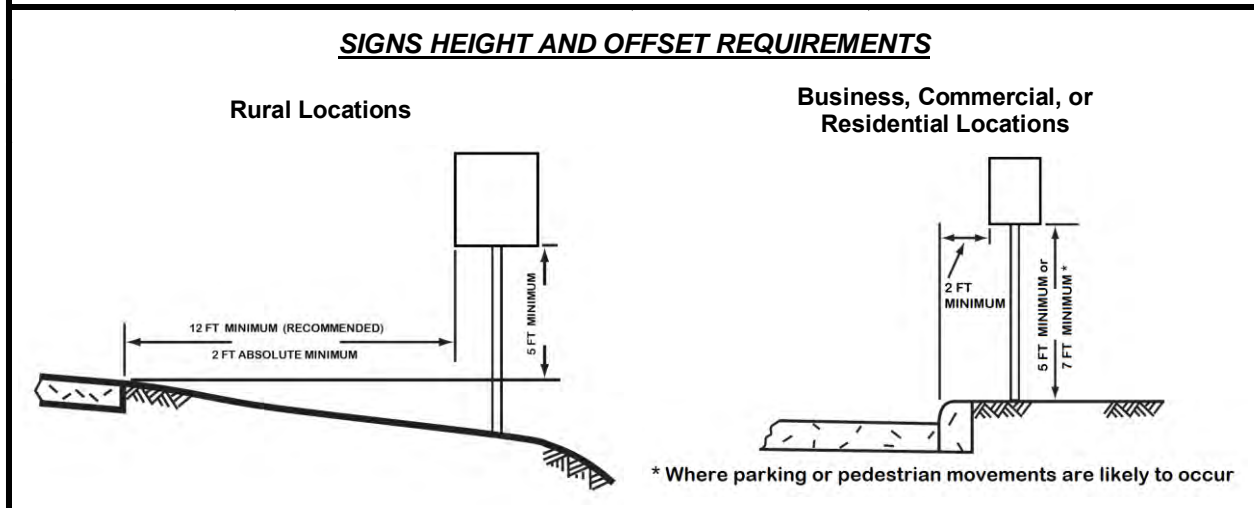

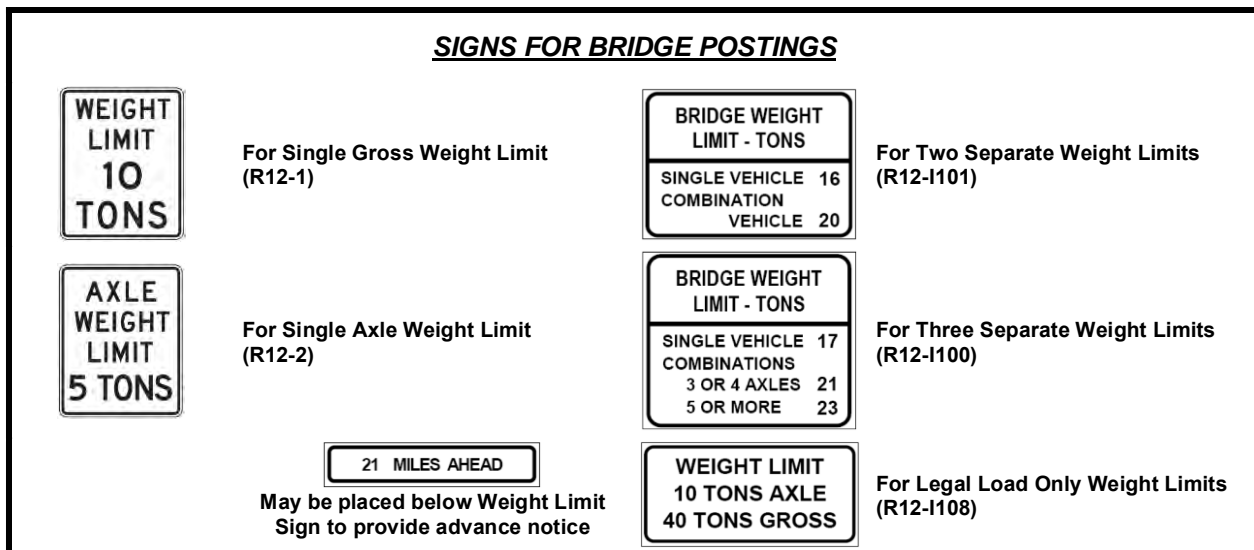

When a structure is to be closed, the LPA should immediately erect barricades that will prohibit traffic access to the structure. Those barricades are to remain in place until permanent closure measures can be installed. See Figure 6-4B for the proper permanent bridge closure traffic control. Additional information may also be found in the [Illinois Supplement to the Manual of Uniform Traffic Control Devices \(IL MUTCD\)](#).

6-4.04 Bridge Closure and Weight Limit Posting Review

In accordance with the Illinois Vehicle Code, [625 ILCS 5/15-317](#), the districts annually monitor local bridges that are listed in the ISIS as requiring load postings or closure. The district will

notify the appropriate LPA when a bridge is not properly posted or closed by sending a letter (see Figure 6-4C for example) with a copy of the Bridge Posting / Closure Review (Form BBS PCR) by certified mail.

The LPA shall correct any signing in accordance with the [ILMUTCD](#) or other deficiencies in a timely manner and notify the district within 30 days (see Figure 6-4D for example). All notifications to the district will include a signed copy of the BBS PCR form with photographs, preferably digital, certifying the deficiency at the bridge has been corrected. If the LPA is unable to complete the required corrections within 30 calendar days, they must provide the district with an estimated compliance date with justification. Failure of a LPA to comply may result in the withholding of Motor Fuel Tax (MFT) allotments and the district not approving current MFT expenditures, or other actions determined by the Department.

- SIGNS HEIGHT AND OFFSET REQUIREMENTS**
- 'Single Weight Limit' signs shall be located immediately in advance of the bridge.
 - 'Multiple Weight Limit' signs shall be located within 500 feet in advance of the bridge.
 - Additional weight limit signs may be installed in advance of the restriction with an 'XX MILES AHEAD' plaque to provide advance notice. Advanced signs should be installed near junctions where a driver could choose an alternate route with a minimum of inconvenience.
 - 'Legal Load Only' signs shall be located immediately in advance of the bridge.

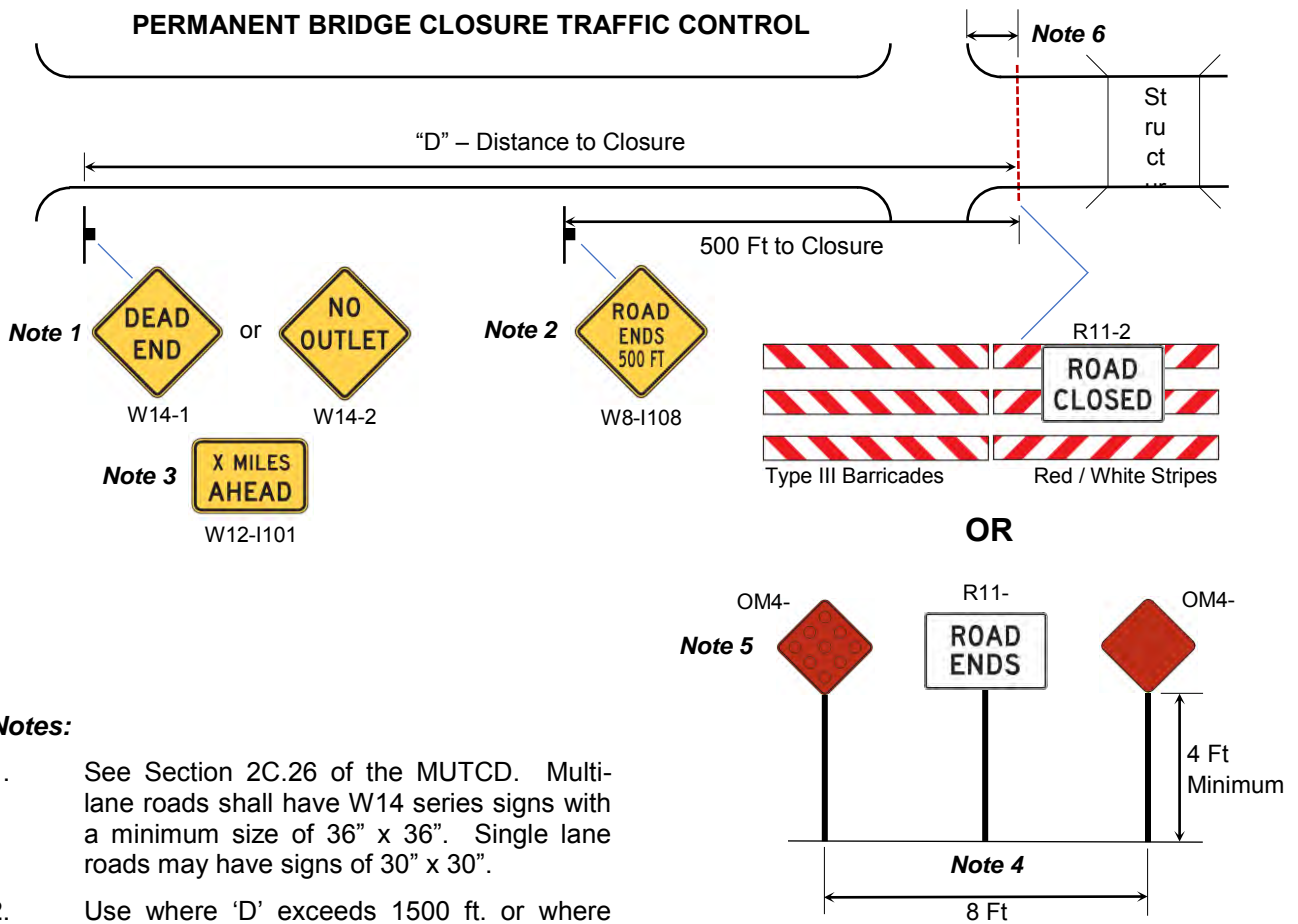

BRIDGE POSTING TRAFFIC CONTROL

Figure 6-4A

**BUREAU OF LOCAL ROADS & STREETS
BRIDGE INVENTORY AND INSPECTIONS**

June 2018

6-4-5

Notes:

1. See Section 2C.26 of the MUTCD. Multi-lane roads shall have W14 series signs with a minimum size of 36" x 36". Single lane roads may have signs of 30" x 30".
2. Use where 'D' exceeds 1500 ft. or where sight distance to the closure is less than 500 ft.
3. Where the point of closure is over 1 mile from the last cross road, an "X MILES AHEAD" plaque (W12-1101) may be used.
4. Type III Barricades with a "ROAD CLOSED" sign (R11-2) or a "ROAD ENDS" sign (R11-100) with red object markers (OM4-1 or OM4-3) shall be used at the point of closure. Guardrail may be used in conjunction with barricades or "ROAD ENDS" sign (R11-100). If used, barricades shall be retro-reflectorized red/white and permanently installed into the pavement. Any barriers used shall extend beyond the edge of shoulder. If practical, old pavement should be removed beyond the closure point or covered with dirt/rocks to minimize the illusion of the road continuing. Barricades or "ROAD ENDS" sign (R11-100) should be installed at least 100 ft. In advance of broken pavement or dirt/rocks.
5. Object markers (OM4-1 or OM4-3) used in conjunction with a "ROAD ENDS" sign (R11-100) shall be red and conform with Section 2C.66 of the MUTCD.
6. If a cross road or entrance is located near the road closure, the closure devices shall be outside the clear zone of the cross road or entrance.
7. If the bridge is under active construction, traffic control shall be in accordance with Part 6 of the MUTCD.

[LPA Contact Information]

RE: Bridge Posting & Closure

Dear _____:

In accordance with the *Illinois Vehicle Code* ([625 ILCS 5/15-317](#)), an inspection of all structures within your jurisdiction that are load posted or closed was recently conducted by this office. This inspection was done to ensure that all load posted structures are properly signed and closed structures are properly signed and barricaded. The following deficiencies of structures under your jurisdiction were noted during this inspection:

<u>Structure Number</u>	<u>Structure Status</u>	<u>Deficiency</u>	<u>Corrective Action to be Taken</u>
-------------------------	-------------------------	-------------------	--------------------------------------

Please correct the deficiencies in a timely manner and notify this office in writing by completing and returning the attached Notice of Compliance form with digital photos within 30 calendar days from the date of this letter. If you are unable to complete the required corrections within the 30 calendar days, please provide this office with an estimated compliance date. Do not return the attached Notice of Compliance until the deficiencies have been corrected.

All signage must be in accordance with the [Illinois Supplement to the Manual of Uniform Traffic Control Devices \(IL MUTCD\)](#). The [ILMUTCD](#) may be accessed using the IDOT website. When performing your regular maintenance procedures during warmer weather, please ensure that all signing is clearly visible and not blocked by the growth of foliage.

If you have any questions regarding this issue, please contact **[Name]** at **[Contact Information]**.

Sincerely,

[Regional Engineer]

By: **[Local Roads and Streets Engineer]**

Chapter 7

PERMITS

7-1 GENERAL

Many activities performed by local public agencies (LPAs) affect the environment, navigation, public land, or private land. Depending upon the nature of the impact, the activity may require the LPA to obtain a permit or certification. Unless otherwise noted, the LPA coordinates with the applicable Federal or State agencies to process the permit application. Some of these permits/certifications are obtained during the planning phase of project development, and others are obtained during the design or construction phase. Any necessary permit authorizations/certifications should be obtained before commencement of work requiring the permit/certification. Personnel involved in project development should be aware of the requirements for these permits/certifications to ensure that necessary authorizations and clearances are obtained in a timely manner to allow the work requiring the permit/certification to proceed as scheduled. The permit authorization/certification should be obtained as close as practical to the start date for the work to optimize the time frame available for accomplishing the work before the authorization expires. LPAs must carefully monitor expiration dates for permit authorizations to ensure that any necessary extension or renewal request is processed in a timely manner. The need to receive one or more permits or approvals can significantly affect the project schedule.

Chapter 7 briefly documents information related to the permits/certifications that may be required for a project. Figure 7-1A identifies the address for each agency from whom a permit or certification may be required. Figure 7-1B identifies the regulatory jurisdictional boundaries for the USACE within the State of Illinois.

A joint application form (NCR Form 426) that has been developed by the United States Army Corp of Engineers (USACE), Illinois Environmental Protection Agency (IEPA), and Illinois Department of Natural Resources Office of Water Resources (OWR), which is used to apply for Section 10 and Section 404 permits from the USACE and for obtaining the related Section 401 Water Quality Certification from the IEPA. The form is also used for obtaining permits from the OWR for Construction in Floodways of Rivers, Lakes, and Streams and for work affecting public waters. The current version of the joint application form is available on the websites for the Chicago, Rock Island (lead Corps District for Illinois) and St. Louis Corps Districts. The LPAs should contact the USACE, IEPA, or OWR to obtain the current version of the joint application form. The form is also available on the [IDNR website](#).

7-1-3

REGULATORY JURISDICTIONAL BOUNDARIES

Figure 7-1B

HARD COPIES UNCONTROLLED

7-2 IDNR OFFICE OF WATER RESOURCES PERMITS**7-2.01 Permit Programs**

Construction activities in and along the rivers, lakes, and streams of the State, including Lake Michigan, in and along public bodies of water, and for the construction and maintenance of dams may require coordination and/or permits administered by OWR, pursuant to the *Rivers, Lakes, and Streams Act*, [615 ILCS 5](#). LPA improvement projects would most likely involve the following three IDNR regulatory permit programs.

- Part 3700 – Construction in Floodways of Rivers, Lakes, and Streams Permit. The permit requirements are applicable to all rivers, lakes, and streams under the jurisdiction of OWR, except those in the counties of Cook, Will, DuPage, Kane, Lake, and McHenry for which floodway limits have been defined pursuant to 17 *Illinois Administrative Code* 3708.
- Part 3704 – Regulation of Public Waters Permit. The permit requirements are applicable to those lakes, rivers, streams, and waterways that are considered public waters, as listed in 17 *Illinois Administrative Code*, Part 3704, Appendix A.
- Part 3708 – Floodway Construction in Northeastern Illinois Permit. The purpose of this permit is to regulate construction and backfill in the regulatory floodway of rivers, lakes, and streams of Cook, DuPage, Lake, McHenry, and Will Counties, excluding the City of Chicago. A permit is required for construction, including replacement structures, roadway widening, etc., within the designated area listed above.

More detailed information may be obtained from the IDNR website. The IDNR “Sustainability Act” ([Public Act 97-1136](#)) became law in December 2012 and provides new revenue sources and reduces dependency on General Revenue funding. Among other provisions, this new act added language to the Rivers, Lakes and Streams Act ([615 ILCS 5/35](#)) that allows IDNR to collect a fee per application for permits issued under the Rivers, Lakes and Streams Act to help defray a portion of the ordinary and contingent expenses of the IDNR.

7-2.01(a) Part 3700 – Construction in Floodways of Rivers, Lakes, and Streams Permit

Legal Reference: This permit is authorized by [615 ILCS 5/23](#), 29a, 30 and 35; Implementing Rules are in 17 *Illinois Administrative Code*, Part 3700.

Purpose of Permit: To protect the rights, safety, and welfare of private and public landowners by the regulation of floodway development.

Applicability: The permit requirements are applicable to all rivers, lakes, and streams under the jurisdiction of the OWR, except those in the counties of Cook, Will, DuPage, Kane, Lake, and McHenry for which floodway limits have been defined pursuant to 17 *Illinois Administrative Code* 3708. A permit is required for construction in the floodway of streams serving a tributary area of one square mile (640 acres) or more in an urban area or in the floodway of a stream serving a tributary area of 10 square miles (6,400 acres) or more in a rural area.

Permit Criteria for Bridges and Culverts Crossings:

1. **New Bridges and Culverts.** The following applies to new bridges and culverts that would not result in flood damages or potential flood damages outside the project right-of-way due to increases in flood heights or velocities. Absent contrary evidence, this standard will be considered met if, for the worst-case analysis, the application shows that:
 - (a) any water surface profile increase would be contained within the channel banks (or within existing vertical extensions of the channel banks such as within the design protection grade of existing levees or floodwalls) or flood easements; or
 - (b) in urban areas, the water surface profile increase would not exceed 0.5 ft (150 mm) at the structure, nor 0.1 ft (30 mm) at a point 1,000 ft (300 m) upstream of the structure; or
 - (c) in rural areas, the water surface profile increase would not exceed 1.0 ft (300 mm) at the structure, nor 0.5 ft (150 mm) at a point 1,000 ft (300 m) upstream of the structure; and
 - (d) any increase in average channel velocity would not be beyond the scour velocity of the predominant soil type of the channel; or
 - (e) increased scour, erosion, and sedimentation would be prevented by the use of riprap or other design measures.
2. **Bridge and Culvert Crossing Reconstruction.** A bridge or culvert crossing reconstruction project that meets the following provisions will be permissible. A reconstruction project that does not meet these provisions must comply with the general standards for new bridges and culverts described above.
 - (a) For any flood event up to and including the 1%-annual-chance event, reconstructed crossing shall be no more restrictive to normal and flood flows than the existing bridge or culvert crossing; and
 - (b) Documentation must be provided that the existing crossing has not caused demonstrable flood damage. In the case of public projects, certification by a Regional Engineer of the IDOT Office of Highways Project Implementation, a county engineer (if an Illinois Licensed Professional Engineer), or a municipal engineer (if an Illinois Licensed Professional Engineer) that the existing crossing has not caused demonstrable flood damage will be adequate documentation.

7-2.01(b) Part 3704 – Regulation of Public Waters Permit

Legal Reference: This permit is authorized by [615 ILCS 5](#); Implementing Rules are in 17 *Illinois Administrative Code*, Part 3704.

Purpose: To protect the public's interest, rights, safety, and welfare in the State's public bodies of water by preventing construction that would:

- obstruct or interfere with the navigability of any public body of water;
- encroach on any public body of water; or

BUREAU OF LOCAL ROADS & STREETS

June 2018

PERMITS

7-2-3

- impair the rights, interests, or uses of the public in any public body of water or in the natural resources thereof.

Applicability: The permit requirements are applicable to those lakes, rivers, streams, and waterways that are considered public waters, as listed in 17 *Illinois Administrative Code*, Part 3704, Appendix A.

Permit Standards: The following apply to the Public Waters Permit:

1. **Navigability.** No activity may result in an obstruction to, or interference with, the navigability of any public body of water.
2. **Bank/Shoreline Instability.** No activity may result in bank or shoreline instability on other properties.
3. **Encroachment.** If it is determined that an activity would result in a long-term or permanent encroachment on a public body of water or impairment of any rights, interests, or uses of the public, it must be demonstrated that:
 - the project has been designed and will be constructed and operated in a way that will minimize and mitigate to the fullest practicable extent its encroachment on the body of water and its impairment of the rights, interests, and uses of the public; and
 - there will be a public benefit resulting from the activity that would offset the encroachment and/or impairment.

7-2.01(c) Part 3708 – Floodway Construction in Northeastern Illinois Permit

Legal Reference: This permit is authorized by [615 ILCS 5/18g](#) and 35; Implementing Rules are in 17 *Illinois Administrative Code*, Part 3708.

Purpose: The purpose of this permit is to regulate construction and backfill in the regulatory floodway of rivers, lakes, and streams of Cook, DuPage, Lake, McHenry, and Will Counties, excluding the City of Chicago, so that periodic inundation will not:

- pose a danger to the general health and welfare of the user;
- require the expenditure of public funds;
- require the provision of public resources or disaster relief services; and
- result singularly or cumulatively in greater flood damages or potential flood damages due to increases in flood stage or velocities or loss of flood storage.

Applicability: A permit is required for construction, including replacement structures, roadway widening, etc., within the designated area listed above. To receive a permit for work in the regulatory floodway, the proposed construction shall be an appropriate use of the regulatory floodway (see Part 3708 for appropriate uses), and the proposed construction shall not reduce the regulatory floodway storage or conveyance and shall not increase regulatory floodway velocities.

HARD COPIES UNCONTROLLED

Permit Criteria for Bridge, Culvert, and Roadway Approaches:

1. Bridges and Culverts. The construction of an appropriate use below the 100-year frequency flood elevation will be considered permissible provided the proposed project meets the following criteria and is so stated in writing with supporting plans, calculations and data by an Illinois Licensed Professional Engineer:
 - (a) In the case of the construction of a new bridge or culvert crossing and roadway approach, the proposed structure shall not result in an increase of upstream flood stages greater than 0.1 ft (32 mm) when compared to existing conditions for all flood events up to and including the 100-year frequency event; or the upstream flood stage increases will be contained within the channel banks (or within existing vertical extensions of the channel banks) such as within the design protection grade of existing levees or flood walls or within recorded flood easements; or a flood control project is built to mitigate the increased backwater due to the structure.
 - (b) In the case of bridge and culvert reconstruction or modification, the bridge or culvert and roadway approach reconstruction or modification shall be constructed with no more than 0.1 ft increase in backwater over the existing flood profile for all flood frequencies up to and including the 100-year event, if the existing structure is not a source of flood damage. The proposed construction shall meet the following criteria:
 - 1) The proposed structure, including approach roads, does not result in an increase in upstream stages for normal and flood flows when compared to the existing structure.
 - 2) On publicly navigated waterways, the proposed structure is not an obstruction to navigation.
 - 3) The determination as to whether the existing structure is a source of flood damage shall be made according to the following method:
 - a. Determine the increase in upstream flood profile due to the existing bridge or culvert by calculation or from the flood study used to delineate the regulatory floodway for all reported flood profiles up to and including the 100-year flood.
 - b. Determine if there are any buildings or structures located in the 100-year flood plain upstream of the existing bridge or culvert that may be subjected to flooding. The upstream flood plain shall be checked for the length of stream required for the backwater impacts due to the existing bridge or culvert to be reduced to 0.1 ft or less.
 - c. Collect the low opening elevations or lowest damageable elevations of the upstream buildings and structures as identified in subsection shown above. Determine if any buildings or structures are subject to inundation by the 100-year frequency flood event.

- (c) The compensatory storage shall be provided for any regulatory floodway storage lost due to the proposed work from the volume of fill or structures placed and the impact of any related flood control projects. Artificially created storage lost due to a reduction in head loss behind a bridge shall not be required to be replaced. The compensatory regulatory floodway storage must be placed between the proposed normal water elevation and the proposed 100-year flood elevation. All regulatory floodway storage lost below the existing 10-year flood elevation must be replaced below the proposed 10-year flood elevation. All regulatory floodway storage lost above the existing 10-year flood elevation must be replaced above the proposed 10-year flood elevation. If the compensatory storage will not be placed at the location of the proposed construction, the applicant's engineer must demonstrate to the Department through a determination of flood discharges and water surface elevations that the compensatory storage is hydraulically equivalent.
- (d) When excavation is proposed in the design of the bridge and culvert openings, including the modifications to and replacement of existing bridge and culvert structures, or to compensate for lost conveyance for other appropriate uses, transition sections must be provided for the excavation. The following expansion and contraction ratios shall be used unless an applicant's engineer can prove to the Department through engineering calculations and model tests that more abrupt transitions may be used with the same efficiency:
- 1) When water is flowing from a narrow section to a wider section, the water should be assumed to expand no faster than at a rate of 1 ft horizontal for every 4 ft of the flooded stream's length;
 - 2) When water is flowing from a wide section to a narrow section, the water should be assumed to contract no faster than at a rate of 1 ft horizontal for every 1 ft of the flooded stream's length; and
 - 3) When expanding or contracting flows in a vertical direction, a minimum of 1 ft vertical transition for every 10 ft of stream length shall be used.
- (e) If the 100-year regulatory floodway elevation at the site of the proposed construction is affected by backwater from a downstream receiving stream with a larger drainage area, the proposed construction shall be shown to meet the requirements of this section for the 100-year frequency flood elevations of the regulatory floodway conditions and conditions with the receiving stream at normal water elevations. However, for bridge and culvert construction or reconstruction, a smaller bridge or culvert may be built if it can be demonstrated to the Department that the proposed structure would meet the requirements of this section for the 100-year frequency flood elevation of the regulatory floodway flood study profile and would not be a source of flood damage as determined according to the method described previously to any existing upstream building or structure when analyzed as follows:

The proposed bridge or culvert shall be analyzed for a 100-year flood frequency flow on the tributary stream and for all tailwater elevations on the receiving stream between and including the normal water elevation and the 10-year flood frequency elevation.

- (f) If an applicant learns from the Department, local government or a private owner that a downstream restrictive bridge or culvert is scheduled to be removed, reconstructed, modified, or a public flood control project is scheduled to be built within the next five years, the proposed construction shall be analyzed and shown to meet the requirements of this Section for both the existing conditions and the expected flood profile conditions when the bridge, culvert or flood control project is built.
- (g) If the appropriate use would result in a change in the regulatory floodway location or the 100-year frequency flood elevation, the applicant shall submit to the Department and to FEMA all the information, calculations and documents necessary to be issued a conditional regulatory floodway map revision and receive from the Department a conditional approval of the regulatory floodway change before a permit is issued. However, the final regulatory floodway map will not be changed by the Department until as-built plans are submitted and accepted by FEMA and the Department. In the case of non-government projects, the municipality in incorporated areas and the county in unincorporated areas must concur with the proposed conditional regulatory floodway map revision before Department approval can be given.
- (h) All engineering analyses shall be performed by or under the supervision of an Illinois Licensed Professional Engineer, except in the case of a federal project.

7-2.02 Types of Permits

Generally, OWR issues an Individual Permit to applicants to demonstrate compliance with the rules for construction within a floodway. OWR has issued statewide and regional permits for specific activities which have insignificant impact on those factors under the jurisdiction of OWR. After the issuance of a statewide/regional permit, no application or further authorization will be required by OWR for activities meeting the terms and conditions of the statewide/regional permit. OWR may also issue General permits for more expeditious and less costly permit applications. Individual applications must still be submitted but authorizations will be granted for activities meeting all the terms and conditions of the general permit without notice or interagency coordination.

If a LPA project requires an Individual Permit coordination shall be with the OWR. Approval of the preliminary bridge design will be contingent on the hydraulics being approved by the OWR. If changes are required to the proposed structure, re-submittal to the LBU is required. For additional guidance on PBDHR submittal requirements, see [Chapter 10](#).

7-2.02(a) Statewide Permits

Figure 7-2A provides a list of all active OWR Statewide Permits (SWP).

BUREAU OF LOCAL ROADS & STREETS

Permit Number	Permit Title
SWP 2	Construction of Bridge and Culvert Crossings of Streams in Rural Areas
SWP 3	Authorizing Mooring Facilities Used Exclusively for Barge Fleeting Purposes
SWP 4	Aerial Utility Crossings
SWP 5	Minor Boat Docks
SWP 6	Minor, Non-obstructive Floodway Construction Activities
SWP 7	Outfalls
SWP 8	Underground Pipeline and Utility Crossings
SWP 9	Minor Shoreline, Stream Bank, and Channel Protection Activities
SWP 10	Accessory Structures and Additions to Existing Residential Buildings
SWP 11	Minor Maintenance Dredging Activities
SWP 12	Bridge and Culvert Replacement Structures and Bridge Widening
SWP 13	Temporary Construction Activities
SWP 14	Special Uses of Public Waters

ACTIVE OWR STATEWIDE PERMITS**Figure 7-2A**

The following discusses the criteria for the Statewide Permits typically used for improvement projects by LPAs:

Statewide Permit No. 2 ([SWP 2](#)) – Construction of Bridge and Culvert Crossings of Streams in Rural Areas. SWP 2 applies to the construction of new and replacement bridges over streams in rural areas with drainage areas 10 mi² or greater when it is determined that the structure will not cause significant increases in potential flood damage. Rural areas are areas where residential, commercial, or industrial development does not exist and is not expected to occur within a 10-year period. If the area is unclear, the OWR shall be consulted for determination on whether the location is Rural or Urban. This decision should be documented.

SWP 2 does not apply to:

- 1) the areas in Lake, McHenry, Cook, DuPage, Kane, and Will Counties for which regulatory floodways have been designated pursuant to 17 *Illinois Administrative Code*, Part 3708
- 2) the public waters of the State (see the Department's Part 3704 "Regulation of Public Waters" rules for a listing of the public waters), and

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

7-2-8

PERMITS

June 2018

- 3) replacement of any bridge or culvert that has been the source of demonstrable flood damage.

SWP 2 only approves the hydraulic design of qualifying bridges; additional approvals may be required. The PBDHR must be submitted through the district to the LBU for applicable structures. To be authorized by SWP 2, bridge and culvert structures must meet the following conditions:

Special Conditions of the Statewide Permit No. 2

1. For a new culvert or bridge crossing:
 - (a) The crossing shall be designed such that it will not result in an increase in water surface profile elevation more than 1.0 ft (300 mm) over the natural condition for any frequency flow up to and including the 100-year frequency flood; and
 - (b) The crossing shall be designed such that it will not result in an increase in water surface profile elevation more than 0.5 ft (150 mm) over the natural condition at a point 1,000 ft (300 m) upstream of the proposed structure (as determined by the horizontal projection of the maximum created head and the slope of the hydraulic grade line) for any frequency flood up to and including the 100-year frequency flood; and
 - (c) There are no buildings or structures in the area impacted by the increases in water surface profile.
2. For a replacement culvert or bridge crossing:
 - (a) The crossing shall be designed so that there will be no increase in backwater over the existing conditions, or
 - (b) The crossing shall be designed so that it complies with the water surface profile increases listed in Special Condition 1; and
 - (c) An Illinois Licensed Professional Engineer shall determine and document that the existing structure has not been the cause of demonstrable flood damage. Such documentation shall include, at a minimum, confirmation that:
 - 1) No buildings or structures have been impacted by the backwater induced by the existing crossing; and
 - 2) There is no record of complaints of flood damages associated with the existing crossing.
3. The proposed bridge or culvert crossing, whether new or replacement, must not involve the straightening, enlargement or relocation of the existing channel of the river or stream. The excavation of the channel and/or overbank necessary for the effective hydraulic performance of the culvert or bridge or removal of debris from the river or stream is not considered straightening, enlargement or relocation. Any excavation of the overbank incorporated into the design of the bridge or culvert crossing to meet the terms of Special Condition 1 or 2, must include appropriate vertical and horizontal transitions. Furthermore, the bottom elevation of the overbank excavation must not be below one-

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

half the channel depth of the stream. This depth shall be calculated at an existing cross-section of the stream within the general vicinity of the culvert or bridge which has been unaffected by man-made obstructions.

- 4. The design must be certified by an Illinois Licensed Professional Engineer to have been designed by standard hydrologic and hydraulic engineering methods and to be in compliance with the terms and conditions of this Permit and the applicable rules of the Department; and
- 5. The design must be certified by a second Illinois Licensed Professional Engineer to have been reviewed and found to be in compliance with the terms and conditions of this Permit.
- 6. The permittee shall maintain, for each project authorized by this permit, the records necessary to document compliance with the above conditions.

Certification Statements – SWP 2

To satisfy the requirements of SWP 2, for a **new bridge or a replacement** bridge or culvert crossings, the PBDHR that is submitted for the project must contain certification statements as noted above. The PBDHR is to be submitted through the district to the LBU; see [Section 10-2](#). The certification statements should contain, at a minimum, the information provided in the following samples:

I hereby certify that the waterway opening for the proposed structure has been designed by standard hydrologic and hydraulic engineering methods and is in compliance with the terms and conditions of Statewide Permit No. 2 and the applicable rules of the Department.	
_____	_____

PE Seal (with date of expiration)	

BUREAU OF LOCAL ROADS & STREETS

7-2-10

PERMITS

June 2018

I hereby certify that I have reviewed the design for the waterway opening of the proposed structure and I have found it to be in compliance with the terms and conditions of Statewide Permit No. 2 and the applicable rules of the Department.

(Signature of an Illinois Licensed Professional Engineer)

(Date)

PE Seal (with date of expiration)

For a **replacement** bridge or culvert crossing, the PBDHR that is submitted for the project must contain an **additional** certification statement. The certification statement should contain, at a minimum, the information provided as following:

I hereby certify that the existing structure has not been the cause of demonstrable flood damage and that:

- a) no buildings or structures have been impacted by the backwater induced by the existing structure; and
- b) there is no record of complaints of flood damage associated with the existing structure.

(Signature of an Illinois Licensed Professional Engineer)

(Date)

PE Seal (with date of expiration)

The required certifications must be included with the PBDHR. Based on review of the PBDHR, the LBU will concur that the conditions of SWP 2 have been met.

Statewide Permit No. 6 (SWP 6) – Minor Non-Obstructive Floodway Construction. SWP 6 authorizes the construction of minor floodway activities that are determined to have an insignificant impact on the factors under the jurisdiction of OWR. This permit does not apply to the areas in Lake, McHenry, Cook, DuPage, Kane, and Will Counties for which regulatory floodways have been designated pursuant to 17 *Illinois Administrative Code*, Part 3708. Some of the activities not involving fill or positive change in grade include the construction of light poles, sign posts, and similar structures and the construction of sidewalks and driveways built at grade. Other minor construction activities, including those involving fill or positive change in grade, may be authorized by this permit based on a determination by OWR after their review of submitted plans. Additional information is available on the IDNR website.

Statewide Permit No. 7 (SWP 7) – Outfalls. SWP 7 authorizes all outfall structures and drainage ditch outlets meeting the conditions of the permit, except those on Lake Michigan and

BUREAU OF LOCAL ROADS & STREETS

June 2018

PERMITS

7-2-11

those in Lake, McHenry, Cook, DuPage, Kane, and Will Counties for which regulatory floodways have been designated pursuant to 17 *Illinois Administrative Code*, Part 3708. Additional information is available on the IDNR website.

Statewide Permit No. 9 (SWP 9) – Minor Shoreline, Stream Bank, and Channel Protection Activities. SWP 9 authorizes minor protection activities for shorelines, stream banks, and channels experiencing active erosion, except those in Lake, McHenry, Cook, DuPage, Kane, and Will Counties for which regulatory floodways have been designated pursuant to 17 *Illinois Administrative Code*, Part 3708. The length protected must not exceed, either singularly or cumulatively, 1,000 ft (300 m). In public waters, only the placement of protection materials on an eroded bank is authorized by SWP 9. Additional information is available on the IDNR website.

Statewide Permit No. 11 (SWP 11) – Minor Maintenance Dredging Activities. SWP 11 authorizes minor dredging activities except for those in Lake, McHenry, Cook, DuPage, Kane, and Will Counties for which regulatory floodways have been designated pursuant to 17 *Illinois Administrative Code*, Part 3708. The affected length must not exceed, either singularly or cumulatively, 1,000 ft (300 m). Additional information is available on the IDNR website.

Statewide Permit No.12 (SWP 12) – Bridge and Culvert Replacement Structures and Bridge Widening. SWP 12 authorizes the replacement of bridge and culvert structures and the widening of specified existing bridges on rivers, lakes, and streams under IDNR's jurisdiction draining 10 mi² (26 km²) or more in rural areas and 1 mi² (2.59 km²) or more in urban areas. SWP 12 does not apply to the State's public bodies of water, nor those in Lake, McHenry, Cook, DuPage, Kane, and Will Counties for which regulatory floodways have been designated pursuant to 17 *Illinois Administrative Code*, Part 3708. A list of Illinois "public bodies of water" can be viewed at the IDNR website.

For a project to be authorized by SWP 12, bridge and culvert structures must meet the following conditions:

Special Conditions of the Statewide Permit No. 12

1. An Illinois Licensed Professional Engineer shall determine and document that the existing structure has not been the cause of demonstrable flood damage. Such documentation shall include, at a minimum, confirmation that:
 - a) no buildings or structures have been impacted by the backwater induced by the existing structure, and
 - b) there is no record of complaints of flood damages associated with the existing structure.
2. An Illinois Licensed Professional Engineer shall determine that the new structure will provide the same or greater effective waterway opening as the existing structure. For bridge widening projects, the existing piers and the proposed pier extensions must be in line with the direction of the approaching flow upstream of the bridge.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

7-2-12

PERMITS

June 2018

3. The project does not include any appreciable raising of the roadway approaches. This condition does not apply if all points on the approaches exist at an elevation equal to or higher than the 100-year frequency flood headwater elevation as determined by a Federal Emergency Management Agency flood insurance study, or a study completed or approved by IDNR/OWR.
4. The project shall not involve the straightening, enlargement, or relocation of the existing channel of the river or stream, except as permitted by IDNR Statewide Permit No. 9, (Minor Shoreline, Channel, and Stream Bank Protection Activities) or by Statewide Permit No. 11, (Minor Maintenance Dredging Activities).
5. The permittee shall maintain records of projects authorized by this permit necessary to document compliance with the above conditions.

The certification statements should contain, at a minimum, the information provided in the following samples:

I hereby certify that the existing structure has not been the cause of demonstrable flood damage and that:

- a) no buildings or structures have been impacted by the backwater induced by the existing structure; and
- b) there is no record of complaints of flood damage associated with the existing structure.

(Signature of an Illinois Licensed Professional Engineer)

(Date)

PE Seal (with date of expiration)

I hereby certify that I have determined that the new structure will provide an effective waterway opening equal to or greater than that provided by the existing structure.

(Signature of an Illinois Licensed Professional Engineer)

(Date)

PE Seal (with date of expiration)

The required determination and documentation, along with the certifications, should be submitted with the PBDHR through the district to the LBU; see [Section 10-2](#).

Based on review of the PBDHR, the LBU will concur that the conditions of SWP 12 have been met.

BUREAU OF LOCAL ROADS & STREETS

June 2018

PERMITS

7-2-13

Statewide Permit No. 13 (SWP 13) – Temporary Construction Activities. SWP 13 applies to temporary construction activities in floodways. SWP 13 does not apply to the State's public bodies of water and those in Lake, McHenry, Cook, DuPage, Kane, and Will Counties for which regulatory floodways have been designated pursuant to 17 *Illinois Administrative Code*, Part 3708. Additional information is available on the IDNR website.

7-2.02(b) Regional Permits

Regional Permits are permits authorizing specific types of projects meeting certain criteria within regulatory floodways of Cook, DuPage, Kane, Lake, McHenry, and Will Counties in Northeastern Illinois without coordination with OWR.

The following describes the Regional Permits and their requirements:

1. Regional Permit 1 – Authorizing Bridge and Culvert Reconstruction and Modification Projects That Are Not a Source of Flood Damage. IDOT's District 1 administers Regional Permit 1. IDOT operates, without coordination with OWR, under the Memorandum of Understanding between the IDOT and IDNR.

Bridge and culvert reconstruction and modifications that are certified by the Regional Engineer as meeting the following criteria are considered authorized by OWR under Regional Permit 1:

- (a) Flow Restriction. The proposed structure, including the approach roads, is no more restrictive to normal and flood flow than the existing structure.
- (b) Channel Modification. No channel modification is proposed other than that required for transitions by the rules for Floodway Construction in Northeastern Illinois (17 *Illinois Administrative Code*, Part 3708).
- (c) Navigable Waterways. On publicly navigated waterways, the proposed work is not an obstruction to navigation.
- (d) Headwater Increase. The maximum headwater increase due to the proposed modification is no greater than 0.1 ft (30 mm) increase in backwater over the existing flood profile for all flood frequencies up to and including the 100-year event.
- (e) Flood Damage. The existing crossing is not a source of flood damage. To show the proposed structure is not a source of flood damage, the IDOT Regional Engineer must adhere to the following procedure:
 - Determine the head loss due to the existing bridge or culvert by calculation, or from the flood study used to delineate the regulatory floodway for all reported flood profiles up to and including the 100-year flood.
 - Determine if there are any buildings or structures located in the 100-year flood plain upstream of the existing bridge or culvert that may be subjected to flooding. The upstream flood plain should be checked for

HARD COPIES UNCONTROLLED

the length of stream required for the backwater impacts due to the existing bridge or culvert to be reduced to 0.1 ft (30 mm) or less.

- Collect the low-opening elevations or lowest damageable elevations of the upstream buildings and structures. Determine if any buildings or structures are subject to flood damage.

If the existing structure is determined to be a source of flood damage to buildings or structures in the upstream flood plain, Regional Permit 1 does not authorize the proposed structure.

- (f) Compensatory Storage. Effective compensatory storage will be provided for any additional loss of floodway storage due to the proposed work. This means that if flood storage will be lost below the existing 10-year flood elevation, it must be replaced below the 10-year flood elevation and, if flood storage is lost above the existing 10-year flood elevation, it is replaced above the proposed 10-year flood elevation. All effective compensatory storage must be placed above the normal water elevation and below the 100-year elevation.

Compensatory storage for up to 200 yd³ (150 m³) of fill material may be placed at a location outside of the project reach without demonstrating hydraulic equivalence and without applying for a floodway map change.

Relief from the compensatory storage requirement may be granted with OWR concurrence when extreme hardship is demonstrated, and an engineering analysis shows that no increase in flood stage will result. Relief will not be granted for compensatory storage greater than 200 yd³ (150 m³).

- (g) Transition Sections. Transition sections must be used in the calculation and design of effective bridge and culvert openings and in the design and construction of effective excavations. Use the following expansion and contraction ratios:

- when water is flowing from a narrow section to a wider section, the water should be assumed to expand no faster than at a rate of 1 ft (300 mm) horizontal for every 4 ft (1.2 m) of the flood stream's length;
- when water is flowing from a wide section to a narrow section, the water should be assumed to contract no faster than at a rate of 1 ft (300 mm) horizontal for every 1 ft (300 mm) of the flooded stream's length; and
- when expanding or contracting flows in a vertical direction, use a minimum of 1 ft (300 mm) vertical transition for every 10 ft (3 m) of stream length.

- (h) Downstream Backwater. If the 100-year floodway elevation at the site of the proposed construction is impacted by backwater from a downstream receiving stream with a larger drainage area, document that it meets the requirements of 17 *Illinois Administrative Code*, Part 3708, for the flood study profile conditions and conditions with the receiving stream at normal water elevations. However, for bridge and culvert construction or reconstruction, a smaller bridge or culvert

BUREAU OF LOCAL ROADS & STREETS

June 2018

PERMITS

7-2-15

may be built if it can be demonstrated that the proposed structure would meet the requirements for the flood study profile and would not be a source of flood damage to any existing upstream building or structures when analyzed as follows:

- Analyze for a 100-year flood frequency flow on the tributary stream for all tailwater elevations on the receiving stream between and including the normal water elevation and the 10-year flood frequency elevation.
- If, within the next 5 years, a downstream restrictive bridge or culvert is scheduled to be removed, reconstructed, modified, or a government sponsored regional flood control project is scheduled to be built, analyze and document the proposed construction to ensure that it meets the preceding criteria for both the existing conditions and the expected flood profile conditions when the bridge, culvert, or flood control project is built.
- If the bridge or culvert reconstruction or modification would result in a change in the regulatory floodway location or the 100-year frequency flood elevation, submit to the OWR and to the Federal Emergency Management Agency all the information, calculations, and documents necessary to revise the floodway map. The Office of Water Resources Management will issue a conditional approval of the floodway change before authorization is granted.
- All engineering analyses must be performed by or under the supervision of an Illinois Licensed Professional Engineer.

A permit summary form (form [D1_PD0024](#)) has been prepared to aid in the design and review of floodway projects and to ensure that designed projects can be permitted according to the rules of the Regional Permit. The summary form identifies the key permit conditions that must be addressed and serves as a check sheet for the reviewer. The Illinois Licensed Professional Engineer who performed or supervised the hydraulic design in accordance with the permit rules must sign the form. This form must be completed by the LPA and included with the submittal to District 1 of the PBDHR (see [Chapter 10](#)) for all projects utilizing Regional Permit 1.

2. Regional Permit 2 – Authorizing Bridge and Culvert Modification. IDOT District 1 administers Regional Permit 2. IDOT operates, without coordination with OWR, under the Memorandum of Understanding between IDOT and IDNR. Bridge and culvert modifications that are certified by the Regional Engineer as meeting the following criteria are considered authorized by OWR under Regional Permit 2:
 - (a) Culvert Length/Bridge Width. The total amount of proposed culvert lengthening or bridge widening does not exceed 12 ft (3.6 m).
 - (b) Flow Restriction. The proposed modification, including the approach roadway, is no more restrictive to normal and flood flows than the existing structure.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

7-2-16

PERMITS

June 2018

- (c) Channel Modification. No channel modification is proposed other than that required for transitions under the rules for “Floodway Construction in Northeastern Illinois” (17 *Illinois Administrative Code*, Part 3708).
- (d) Navigable Waterway. On publicly navigated waterways, the proposed modification is not an obstruction to navigation.
- (e) Compensatory Storage. Effective compensatory storage will be provided for any additional loss of floodway storage due to the proposed work. This means, for example, that if flood storage is lost below the existing 10-year flood elevation, it must be replaced below the proposed 10-year flood elevation and if flood storage is lost above the existing 10-year flood elevation, it must be replaced above the proposed 10-year flood elevation. All effective compensatory storage must be placed above the normal water elevation and below the 100-year flood elevation.

Compensatory storage for up to 200 yd³ (150 m³) of fill material may be placed at a location outside of the project reach without demonstrating hydraulic equivalence and without applying for a floodway map change.

Relief from the compensatory storage requirement may be granted with the OWR Management concurrence when extreme hardship is demonstrated, and an engineering analysis shows that no increase in flood stage will result. Relief will not be granted for compensatory storage greater than 200 yd³ (150 m³).

A permit summary form (form [D1 PD0024](#)) must be completed by the LPA and submitted to District 1 with the PBDHR (see [Chapter 10](#)), if applicable, for all projects utilizing Regional Permit 2.

3. Regional Permit No. 3 – Authorizing Construction of Minor Projects in Northeastern Illinois Floodways. Regional Permit 3 applies to the construction of certain minor projects within floodways in Northeastern Illinois including the following project types:
 - storm sewer outfalls and outlet channels,
 - sidewalks, and
 - shoreline and streambank protection.

Each of these types of projects must meet specified criteria like the criteria in SWP’s 6, 7, and 9 to be permitted under Regional Permit 3. See the IDNR website for additional information on Regional Permit 3.

7-2.02(c) General Permits

General Permits are like Statewide Permits but require an application submittal to OWR. They cover specific type of projects and are limited in scope.

HARD COPIES UNCONTROLLED

7-2.02(d) Individual Permits

Applicability: If an OWR Construction Permit is needed, and the project is not covered by a Statewide, Regional, or General Permit, an Individual Permit is required from OWR. It is suggested that OWR be consulted about rural/urban determinations. Individual permits to construct drainage structures and channel changes must be secured from the OWR for:

- structures that drain an area 10 mi² or greater in a rural area, or
- structures that drain an area 1 mi² or greater in an urban area, or
- channel changes affecting a drainage area of 10 mi² or more in a rural area and 1 mi² in an urban area; or
- projects affecting public waterways (see 17 *Illinois Administrative Code*, Part 3704, Appendix A for a list of these public waterways).

Permit Information Needs: The Joint Application Form (NCR Form 426), with appropriate supporting data, is used as the application for an Individual Permit. Supporting data includes:

- hydraulic report (use PBDHR when required; see [Section 10-2](#));
- hydraulic analysis data files (electronic);
- waterway sketch
- floodplain cross sections;
- road profiles; and
- channel change sketch, if applicable, (see Figure 7-2B for a sample channel change sketch). See Section 5-700 in the IDOT [Drainage Manual](#) for guidance on channel modification.

For replacement structures with no appreciable raising of grade, the LPA may use a certification statement signed by the county engineer or municipal engineer in place of the hydraulic analysis data. The county engineer or municipal engineer must be an Illinois Licensed Professional Engineer. This certification statement should be like the certification statement for SWP 12 (see Section 7-2.02). The statement should state that the existing structure has not been the cause of demonstrable flood damage and that the proposed replacement structure will not increase flood damage potential. When making this certification statement, the engineer is acknowledging that the design risk assessment process as described in the IDOT [Drainage Manual](#) has been performed.

If a LPA project requires an Individual Permit coordination shall be with the OWR. Approval of the preliminary bridge design will be contingent on the hydraulics being approved by the OWR. If changes are required to the proposed structure, re-submittal to the LBU is required. For additional guidance on PBDHR submittal requirements, see [Chapter 10](#).

7-2.02(e) Maintenance/Rehabilitation Exceptions

The following activities are exempted from an OWR Floodway Construction Permit:

BUREAU OF LOCAL ROADS & STREETS

7-2-18

PERMITS

June 2018

1. Maintenance and repair of existing bridge and culvert structures, including dredging to restore the waterway opening to the original design cross section, and superstructure replacement which would not reduce the waterway opening below the 1% annual chance of exceedance (100-year frequency) water surface elevation. (Maintenance does not include increasing the height of an existing roadway). (Note: although exempt from this Part, superstructure replacement involving replacing the girders of bridges over public bodies of water will require authorization under 17 *Illinois Administrative Code* 3704 Regulation of Public Waters);
2. Widening of bridge decks which would not reduce the bridge waterway opening below the 1% annual chance of exceedance (100-year frequency) water surface elevation nor involve the horizontal extension of piers;
3. Culvert extensions of up to 100% of the original length, but not exceeding 40 ft in length, provided the extension involves no change in alignment or reduction in size from the original culvert;
4. Removal of structures provided the materials would be removed from the floodway or placed in a way which would not obstruct normal or flood flows;

Projects calling for the total removal of an existing superstructure and the construction of a new superstructure on the existing substructure units, and culvert extensions as noted above, require hydraulic submittals. The hydraulic submittals shall include the existing and proposed design and 100-year hydraulic openings and elevations and shall be sufficient to evaluate the impact of scour on the existing substructure to remain (for bridges). The supporting data should be included, and a certification statement included that the existing structure has not been the cause of “demonstrable flood damage”. Use a certification statement like that provided for Statewide Permit 12 provided in Section 7-2.02(a).

7-2.02(f) No Construction Permit required

For projects not requiring an OWR construction permit, LPAs should continue to submit all PBDHR to the district for projects that require IDOT approval prior to preparation of design plans (see [Section 10-2](#)). Coordination with the OWR is not required. OWR construction permits are not required for rural structures with a drainage area of less than 10 square miles or for urban structures with a drainage area of less than one square mile. IDOT will review and approve the PBDHR for such projects.

The certification statements included with PBDHR submitted to IDOT should reference the IDOT [Drainage Manual](#) as the publication providing the policies and procedures for determining hydraulic adequacy.

Hydraulic Certification statements should contain, at a minimum, the information provided in the following sample certification statements:

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

June 2018

PERMITS

7-2-19

1. Drainage Areas Not Requiring a Permit:

I hereby certify that the waterway opening for the proposed structure has been designed using hydrologic and hydraulic engineering methods in accordance with the policies and procedures presented in the *Drainage Manual* or the Illinois Department of Transportation.

(Signature of an Illinois Licensed Professional Engineer)

(Date)

PE Seal (with date of expiration)

2. Rehabilitation Projects Not Requiring a Permit:

The PBDHR information submitted to the LBU for superstructure replacement projects should contain a certification statement that the existing structure has not been the cause of “demonstrable flood damage” (similar to the certification statement for Statewide Permit No. 12).

If the certification statement for flood damage cannot be provided by the county engineer, a complete hydrologic and hydraulic analysis is required to verify the hydraulic adequacy of the existing waterway opening and the following certification statement should be included with the hydraulic report:

I hereby certify that the waterway opening for the existing/proposed structure has been analyzed and evaluated using hydrologic and hydraulic engineering methods in accordance with the policies and procedures presented in the *Drainage Manual* of the Illinois Department of Transportation.

(Signature of an Illinois Licensed Professional Engineer)

(Date)

PE Seal (with date of expiration)

When making this certification, the engineer is acknowledging that the “design risk assessment process” has been performed as described in Section 1-303.01 of the IDOT [Drainage Manual](#).

BUREAU OF LOCAL ROADS & STREETS
PERMITS

7-2-20

June 2018

Note: This sketch is applicable when the following major channel changes occur:

1. The new channel is 250 ft (75 m) or longer.
2. The abandoned portion of the old channel is 750 ft (225 m) or longer.
3. The channel change at a bridge results in a stream alignment that would cause bank erosion because of a short radius bend.
4. The stream change is unusual and needs special attention.

SAMPLE CHANNEL CHANGE SKETCH

Figure 7-2B

7-3 IEPA PERMITS**7-3.01 Permit for Burning of Landscape Waste****7-3.01(a) Background**

Legal Reference: [415 ILCS 5/9\(c\)](#), 10, and 27; Implementing rules in 35 *Illinois Administrative Code* Part 237.

Responsible Agency: Illinois Environmental Protection Agency (IEPA) and the Illinois Pollution Control Board.

Purpose: To ensure that open burning if necessary, will be conducted in a time, place, and manner as to minimize the emission of air contaminants, and will have no serious detrimental effect upon adjacent properties or the occupants thereof.

No person shall cause or allow the open burning of refuse, conduct any salvage operation by open burning, or cause or allow the burning of any refuse in any chamber not specifically designed for the purpose and approved by the IEPA; except that the Illinois Pollution Control Board may adopt regulations permitting open burning of refuse in certain cases.

Applicability: For the burning of landscape waste in any area of the State, if open burning is conducted with the aid of an air curtain destructor or comparable device to reduce emissions substantially and does not occur within 1,000 ft (300 m) of any residential or other populated area.

7-3.01(b) General Permit

Permit Name: General Permit for Open Burning of Landscape Waste Generated by Land Clearing Activities Necessitated by Road Construction Projects Included in the “Annual Program” and “Service Bulletins” of IDOT.

Applicability: This General Permit can be used for any LPA project constructed with Federal funds or let by the State.

Permit Information Needs: A completed Notice of Open Burn form must be sent to the IEPA Air Permit Section not less than 7 working days prior to each open burn. The Notice of Open Burn form must provide the following information:

- name and address of the contractor proposing the open burn;
- the site location of the proposed open burn including address, county, township, sketch of the immediate vicinity of the proposed open burn site, and a printed map of the general area showing the site and nearby features marked, with distances to the features (e.g., structures, residences, populated areas, roadways, airports, lakes, waterways, hospitals, nursing homes, schools);
- schedule of the open burning activity including estimated duration and dates;

BUREAU OF LOCAL ROADS & STREETS

7-3-2

PERMITS

June 2018

- estimated quantity of material to be burned;
- IDOT construction contract number; and
- authorized signature of person responsible for the open burn activity.

7-3.01(c) Individual Permit

Applicability: The open burning of landscape waste on local-let projects not constructed with Federal funds will require an Individual Permit from the IEPA Bureau of Air. It will normally be the responsibility of the contractor to apply for this permit.

Permit Information Needs: A completed application must be sent to the IEPA Bureau of Air. See the IEPA website for the current open burning guidance and application forms required. The application must provide the following information:

- name and address of the contractor proposing the open burn;
- the site location of the proposed open burn including address, county, township, sketch of the immediate vicinity of the proposed open burn site, and a printed map of the general area showing the site and nearby features marked, with distances to the features (e.g., structures, residences, populated areas, roadways, airports, lakes, waterways, hospitals, nursing homes, schools);
- schedule of the open burning activity including estimated duration and dates;
- exact quantity and type of material to be burned;
- project identification;
- exact nature and exact quantities of air contaminant emissions;
- methods or actions that will be taken to reduce the emission of air contaminants;
- reasons why burning is necessary to the public interest; and
- authorized signature of person responsible for the open burn activity.

7-3.02 General Storm Water NPDES Permit for Construction Site Activities

See Section 7-4.01 for information on the General Storm Water NPDES Permit for construction activities issued by IEPA.

7-3.03 Section 401 Water Quality Certification

See Section 7-4.03 for a discussion of Section 401 Water Quality Certification issued by IEPA and required by the *Clean Water Act* for Federal authorization by the USACE under Section 404.

7-3.04 Permit Fees

Applicants for certain IEPA permits and certifications require the payment of a fee. These include NPDES Permits and Water Quality Certifications. Permit fees do not apply to the State

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

June 2018

PERMITS

7-3-3

or any department or agency of the State, nor to any school district; however, this exemption from permit fees does not apply to LPAs even though they may receive some assistance from the State.

Permit fees must be included with all permit applications. Permit holders should be aware that failure to pay fees could result in a referral to the Attorney General's Office and potential penalties, pursuant to Statute. For additional information on permit fees, see the IEPA website.

7-4 FEDERAL PERMITS / CERTIFICATIONS

LPAs are responsible for obtaining several Federal permits or certifications when required on individual projects. This Section briefly discusses the identification, applicability, and information needs of each permit or certification. The Federal permits are:

1. Section 402 NPDES Permit for Storm Water Discharge. This permit is administered by the IEPA and applies to projects that will involve clearing, grading, and excavation activities that result in the disturbance of one acre or more of total land area.
2. Section 404 Permit for the Discharge of Dredged or Fill Material. This permit is obtained from the USACE for the discharge of dredge or fill material into waters of the United States, including wetlands.
3. Section 401 Water Quality Certification. This certification is obtained from the IEPA and is required in conjunction with a Section 404 permit (i.e., the IEPA must either approve or waive the water quality certification as a condition for issuance of an individual Section 404 permit or for use of a nationwide or regional Section 404 permit).
4. Section 9 Permit for the Construction of Bridges in Navigable Waters. This permit is obtained from the US Coast Guard (USCG) for construction of bridges in navigable waters of the United States.
5. Section 10 Permit for Structures and Work in Navigable Waters. This permit is obtained from the USACE for structures or work (other than bridges and causeways) affecting the navigable water of the United States.

7-4.01 National Pollutant Discharge Elimination System (NPDES) Permits

Permit Name: General NPDES Permit No. ILR10 – General NPDES Permit for Storm Water Discharges from Construction Site Activities. A copy is available on the IEPA website.

Legal Reference: Section 402 of the *Federal Water Pollution Control Act* (1972), as amended by the *Clean Water Act* (1977 & 1987): 33 USC 1251-1376, DOT Order 5660.1A; 23 CFR 650, Subpart B; 40 CFR 121-125, 129-131, 133, 135-136.

Responsible Agency: United States Environmental Protection Agency through the IEPA.

Purpose: To restore and maintain the chemical, physical, and biological integrity of the nation's waters through prevention, reduction, and elimination of pollution.

Applicability: Required for construction activities involving clearing, grading, and excavation activities that disturb 1 acre or more of land area.

Permit Authorization: For storm water discharges from construction sites to be authorized under this General Permit, a Notice of Intent (NOI) must be submitted to IEPA at least 30 days prior to the commencement of construction:

Notice of Intent (NOI): The NOI requires the following information:

BUREAU OF LOCAL ROADS & STREETS

7-4-2

PERMITS

June 2018

- mailing address and location of construction site or, if not available, latitude and longitude of the approximate center of the site;
- the owner's name, address, telephone number, and status as Federal, State, private, public, or other entity;
- the name, address, and telephone number of the general contractor that has been identified at the time of the NOI submittal;
- the name of the receiving water or, if the discharge is through a municipal separate storm sewer, the name of the municipal operator of the storm sewer, and the ultimate receiving water;
- the number of any NPDES permit for any discharge, including non-storm water discharges, from the site that is currently authorized by an NPDES permit;
- a yes or no indication of whether the owner or operator has existing quantitative data that describes the concentration of pollutants in storm water discharges;
- a brief description of the project;
- estimated timetable for major activities;
- estimate of the number of acres of the site on which soil will be disturbed; and
- a certification that a Storm Water Pollution Prevention Plan (SWPPP) has been or will be prepared for the facility prior to the start of construction.

The NOI form is available on the IEPA website.

Notice of Termination (NOT): Submit a NOT to the IEPA after construction activities are complete. The NOT indicates that the site has been finally stabilized using permanent stabilization methods and that all storm water discharges from the construction site are eliminated. The NOT must include the following information:

- mailing address and location of construction site or, if not available, latitude and longitude of the approximate center of the site;
- the owner's name, address, telephone number, and status as Federal, State, private, public, or other entity;
- the name, address, and telephone number of the general contractor; and
- a certification that all storm water discharges associated with construction has been eliminated.

The NOT form is available on the IEPA website.

Storm Water Pollution Prevention Plan (SWPPP): A SWPPP must be developed for each construction site covered by this permit and completed prior to the start of construction. The SWPPP should include a site description (e.g., map, nature of construction activity, area disturbed), erosion and sediment controls, storm water management plan, maintenance of site, inspection schedule, reports, and identification of the contractors/sub-contractors. Unless

HARD COPIES UNCONTROLLED

otherwise specified in the IEPA's *Illinois Urban Manual*, the SWPPP must be designed for a 24-hour rainfall event for a 25-year storm frequency. It is required that the SWPPP be kept on site during construction activities.

7-4.02 Section 404 Permits – Dredged or Filled Material

7-4.02(a) General

Section 404 permits, issued by the USACE are required for activities that involve the discharge of dredged or fill material into waters of the United States, including wetlands. An FHWA publication (FHWA-RE-88-028) titled *Applying the Section 404 Permit Process to Federal-aid Highway Projects* provides useful information for improving interagency coordination. In addition, the publication helps integrate the *National Environmental Policy Act* (NEPA) and the Section 404 requirements.

Legal Reference: Section 404 of the *Federal Water Pollution Control Act* (1972), as amended by the *Clean Water Act* (1977 & 1987): 33 USC 1251-1376, DOT Order 5660.1A; 23 CFR 650, Subpart B; 33 CFR 209, 320-323, 325, 328, 330; 40 CFR 121-125, 129-131, 135-136, and 230-231.

Purpose: To restore and maintain the chemical, physical, and biological integrity of the Nation's waters through prevention, reduction, and elimination of pollution.

Applicability: Permit required for any discharge of dredged or fill material into waters of the United States, including wetlands.

7-4.02(b) General Permits

Certain discharges into waters of the United States may be authorized by a USACE General Permit. A General Permit covers certain activities that the USACE has identified as being substantially similar in nature and causing only minimal individual and cumulative environmental impacts. These activities may be authorized on a nationwide basis or may cover activities in a limited geographic (regional) area. The information needs, applicability provisions, processing procedures, and conditions applicable to Regional and Nationwide Permits vary according to the specific permit involved. Some USACE districts require submittal of essentially the same information for Nationwide or Regional Permits as for Individual Permits. For actions that would involve discharges covered by more than one Nationwide or Regional Permit, the permit that is the least burdensome procedurally should be used.

The USACE Chicago District has issued a Regional Permit (RP) Program to replace the Nationwide Permit (NWP) Program. The NWPs typically expire every five years. The following is a discussion of the NWP and RP most commonly used for highway projects in Illinois:

NWP 3 – Maintenance.

- (a) The repair, rehabilitation, or replacement of a previously authorized, currently serviceable, structure or fill provided that the structure or fill is not to be put to uses

BUREAU OF LOCAL ROADS & STREETS

7-4-4

PERMITS

June 2018

differing from those uses specified or contemplated for it in the original permit or the most recently authorized modification.

- (b) NWP 3 also authorizes the removal of accumulated sediments and debris in the vicinity of and within existing structures and the placement of new or additional riprap to protect the structure.
- (c) NWP 3 also authorizes temporary structures, fills, and work necessary to conduct the maintenance activity.

NWP 7 – Outfall Structures and Associated Intake Structures. Activities related to the construction or modification of outfall structures and associated intake structures, where the effluent from the outfall is authorized, conditionally authorized, or specifically exempted by, or that are otherwise in compliance with regulations issued under the National Pollutant Discharge Elimination System Program.

NWP 13 – Bank Stabilization. Bank stabilization activities necessary for erosion prevention, provided the activity meets all the following criteria:

- (a) No material is placed more than the minimum needed for erosion protection;
- (b) The activity is no more than 500 ft in length along the bank, unless this criterion is waived in writing by the district engineer;
- (c) The activity will not exceed an average of one cubic yard per running foot placed along the bank below the plane of the ordinary high-water mark or the high tide line, unless this criterion is waived in writing by the district engineer;
- (d) The activity does not involve discharges of dredged or fill material into special aquatic sites, unless this criterion is waived in writing by the district engineer;
- (e) No material is of the type, or is placed in any location, or in any manner, to impair surface water flow into or out of any water of the United States;
- (f) No material is placed in a manner that will be eroded by normal or expected high flows; and,
- (g) The activity is not a stream channelization activity.

NWP 14 – Linear Transportation Projects. Activities required for the construction, expansion, modification, or improvement of linear transportation projects (e.g., roads, highways, railways, trails, airport runways, and taxiways) in waters of the United States., provided the discharge does not cause the loss of greater than 0.5 acre of waters of the United States. For NWP 14, which addresses linear transportation crossings, the description of the project provided to USACE should include information on temporary stream crossings, work pads, temporary bypass channels, cofferdams, etc., that will be involved in the construction work, to the extent that this information is known or can be anticipated at the time of the permit submittal. To the extent that this information adequately covers the temporary work features that the contractor ultimately proposes, it will eliminate the need for having the contractor obtain a separate permit authorization for the temporary work and will avoid the associated potential for delays in project implementation.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

June 2018

PERMITS

7-4-5

NWP 23 – Approved Categorical Exclusion. Federally funded projects that are classified as categorical exclusions may be eligible for authorization under NWP 23. The Federal Highway Administration (FHWA) and the USACE have an agreement for processing NWP 23.

Categorical Exclusion (CE) projects that will not involve more than minor water quality impacts and are such that the applicable permit conditions can be met, are potentially eligible for processing under the CE Nationwide Permit. Such projects should be discussed at district coordination meetings and approval should be requested from FHWA for use of NWP 23. Form [BLR 19100](#) or [BLR 22210](#) should be used to document this authorization.

If the FHWA grants approval for use of NWP 23, the appropriate USACE district should be provided with:

- documentation of the FHWA's approval;
- a sketch and brief description of the work requiring a 404 Permit;
- an indication of the type and approximate quantity of fill involved; and
- a copy of the biological information received in response to the environmental survey request for the action.

If the USACE district does not provide notification that it intends to seek assertion of the USACE Division Engineer's discretionary authority to require an Individual Permit for the action within 20 calendar days from the date it receives the above information, the project may proceed under NPW 23.

NWP 25 – Structural Discharges. Discharges of material such as concrete, sand, rock, etc., into tightly sealed forms or cells where the material will be used as a structural member for standard pile supported structures, such as bridges, including the excavation of bottom material from within the form.

NWP 33 – Temporary Construction Access and Dewatering. Temporary structures, work, and discharges, including cofferdams, necessary for construction activities or access fills or dewatering of construction sites, provided that the associated primary activity is authorized by the USACE or the USCG. It should be recognized that time will be required to obtain separate permit authorization for the additional temporary work items.

Chicago RP3 – Transportation Projects. RP3 authorizes the construction of transportation projects that affect waters of the United States not to exceed 0.25 acres for a single crossing with a cumulative impact not to exceed 1.0 acres for a transportation project involving multiple crossings. Temporary construction activities are not authorized by RP3.

Chicago RP4 – Minor Discharges and Minor Dredging. RP4 authorizes the discharge of up to 25 yd³ of dredged or fill material, including the discharge of materials such as concrete, sand, rock or stone into tightly sealed cells, where such cells will be used as a structural member for a pile-supported structure,

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

7-4-6

PERMITS

June 2018

Chicago RP7 – Temporary Construction Activities. RP7 authorizes temporary structures and discharges necessary for construction activities, access fills, and dewatering of construction sites.

Chicago RP9 – Maintenance. RP9 authorizes:

- (a) Repair or rehabilitation of any previously authorized, currently serviceable, structure or fill, provided that the structure or fill is not to be put to uses differing from those uses specified or contemplated for it in the original permit or the most recently authorized modification.
- (b) Maintenance of existing flood control facilities, retention/detention basins, and channels that were constructed by the USACE and transferred to a local sponsor for operation and maintenance.

Chicago RP10 – Bank Stabilization. RP10 authorizes bank stabilization activities in all waters of the U.S., except Lake Michigan, subject to the following, which shall be addressed in writing and submitted with the notification:

- (a) Projects that involve the use of vegetative and biotechnical practices will be processed under Category I and are not subject to length restrictions.
- (b) Projects that involve the use of structural bank stabilization practices, such as riprap, gabions, lunker boxes, steel sheet piling, or fabric-formed concrete will be processed under Category I and shall not exceed a total length of 500 ft.

Chicago RP12 – Bridge Scour Protection. RP12 authorizes the construction and installation of protective armoring at existing bridge foundations, abutments, and/or bridge piers of Scour Critical bridges.

Other Nationwide and Regional Permits. A complete listing of USACE nationwide and regional permits is available on the website for the appropriate USACE District Office.

These permits are subject to certain notification procedures and restrictions and must meet the NWP general conditions and any applicable special conditions. This information is available on the appropriate USACE District Office website. The use of any of these permits requires Section 401 Water Quality Certification from IEPA. See Section 7-4.03 for a discussion of the certification process.

For work covered by NWP or RP, the LPA must notify the appropriate USACE District Office via letter in advance of undertaking the action. When the permit has specific requirements for notification, the notification must conform to the stipulated requirements. For use of permits that are not subject to specific notification requirements, the notification must be provided via a letter or other correspondence to the appropriate USACE District Office informing them of the action and indicating the proposed permit category.

A statement concerning the use of any applicable Nationwide or Regional Permit should be included in the contract proposal. The special provisions must include applicable Section 404 Permit requirements identifying the contractor's responsibilities and the conditions applicable to

HARD COPIES UNCONTROLLED

the project. The contractor should clearly be made responsible for securing permits for construction activities not included in the specific permit documents.

7-4.02(c) Individual Permits

If an activity involves the discharge of dredged or filled material into waters of the United States and is not covered by a Nationwide or Regional Permit, an individual Section 404 Permit will be required. Each application for an Individual Section 404 Permit must be submitted to the appropriate USACE District Office. The joint application form (NCR Form 426) should be used for the application. A copy of the application should also be sent to the IEPA for Section 401 Water Quality Certification. This is discussed in Section 7-4.03.

Permit Information Needs: The list below indicates the typical items of information required for a Section 404 Permit:

- Name and address of permit applicant.
- Complete, detailed description of the proposed activity, its purpose, intended use, and drainage area of the watershed to the downstream limit of the project. The description should include information on temporary stream crossings, work pads, temporary bypass channels, cofferdams, etc., that will be involved in the construction work requiring a Section 404 Permit. For dredging and fill activities, describe the location, type, composition, and quantity of material to be dredged/filled, method of dredging/filling, and method of transportation to disposal/fill site. Also, describe the disposal/fill site by including the location, quantity of material it will hold, composition of receiving soil, and method of containment. Identify any practical alternatives that would fulfill the objectives of the proposed project and explain why the final proposal was selected.
- Location of the proposed activity, including legal description.
- If applicable, name, address, and title of authorized agent.
- Names, addresses, and telephone numbers of all adjoining and potentially affected property owners, including the property involved with the permit action, if different from the applicant.
- Date activity is proposed to commence.
- Estimated time of construction.
- Indication of whether any portion of the activity for which authorization is sought is complete.
- List of all approvals or certifications required by other Federal, Interstate, State, or LPAs for any structures, construction, discharges, deposits, or other activities described in the application.
- Indication of whether any agency has denied approval for the activity described in the application or for any activity directly related to the activity described.
- Engineering details (e.g., limit of fill activity, amount of fill, area taken, linear feet [meters] of disturbance, erosion control plan, disposal of waste material).

BUREAU OF LOCAL ROADS & STREETS

7-4-8

PERMITS

June 2018

- Copy of Environmental Impact Study (EIS) or Environmental Assessment (EA), if prepared, describing environmental impacts (e.g., soils, water quality, groundwater, wetlands, fish, wildlife, floodplains). If EIS or EA not prepared, copy of Wetland Determination Report, Wetland Impact Evaluation form, and Natural Resource Review Tool (NRRT) report or Ecological Compliance Assessment Tool (EcoCAT) report.
- Copy of the mitigation plan.
- Project drawings (8½ inches x 11 inches), including a vicinity map, plan view of the project and a cross section view of the project.
- Environmental signoffs.
- Some USACE districts may require additional items of information such as photographs of the project site, quantity calculations for fill activities, and documentation of coordination with Soil and Water Conservation Districts regarding proposed erosion and sediment control measures.

7-4.03 Section 401 Water Quality Certification

Responsible Agency: Illinois Environmental Protection Agency (IEPA).

Legal Reference: Section 401 of the *Federal Water Pollution Control Act* (1972), as amended by the *Clean Water Act* (1977 & 1987): 33 USC 1251-1376, DOT Order 5660.1A; 23 CFR 650, Subpart B; 33 CFR 209, 320-323, 325, 328, 329; 40 CFR 121-125, 129-131, 133, 135-136, and 230-231.

Purpose: To restore and maintain the chemical, physical, and biological integrity of the Nation's waters through prevention, reduction, and elimination of pollution.

Applicability: State certification is required in conjunction with the authorization by USACE of any activity that may result in any discharge into waters of the United States requiring a Section 404 Permit. Water Quality Certification is also required for Section 9 Permits.

Processing: The IEPA has issued Section 401 water quality certification for certain Nationwide Permits subject to general conditions. For certain other Nationwide Permits and for Regional Permits, water quality certification has been issued subject to general and regional conditions. Section 401 water quality certification was denied for the other Nationwide Permits. For a listing of 401 water quality certifications and denials see the Rock Island District USACE website.

For projects requiring an individual Section 404 Permit or a Nationwide Permit for which generic water quality certification was denied or the conditions required by the generic certification cannot be met, individual certification must be requested from the IEPA. The joint application form (NCR Form 426) along with the IEPA application fee should be sent to the IEPA. The USACE will not issue an individual Section 404 Permit until certification is received. Any Nationwide Permit authorization is subject to obtaining certification from the IEPA.

HARD COPIES UNCONTROLLED

7-4.04 Section 9 – Coast Guard Bridge Permit

This permit is for the construction of bridges or causeways over navigable waters of the United States required by Section 9 of the *Rivers and Harbors Act of 1899*. Permits for the construction of dams and dikes required by Section 9 are under the authority of the USACE.

Responsible Agency: United States Coast Guard (USCG).

Legal Reference: Section 9 of the *Rivers and Harbors Act of 1899*; 33 USC 401, et seq, as amended and supplemented; 23 CFR part 650, Subpart H; and 33 CFR 114-115.

Purpose: To ensure that there will be no interference to navigation on the navigable waterways of the United States.

Applicability: A permit is required for the construction, modification, replacement, or removal of bridges or causeways over a navigable waterway, except for the following:

1. A permit is not required for any bridge or causeway over waters which are not subject to the ebb and flow of the tide and which are not used and are not susceptible to use in their natural condition or by reasonable improvement to transport interstate or foreign commerce, whether or not such waters were used or were susceptible to use, at some previous time, to transport commerce (historic use).
2. Removal of an existing bridge without replacing it with another bridge also does not require a permit.
3. Repairs to a bridge which do not alter the clearances, type of structure, or any integral part of the substructure or superstructure or navigation conditions, but which consist only in the replacement of worn or obsolete parts may be made as routine maintenance without a formal permit action from the U.S. Coast Guard.

Permit Information Needs: The permit application can be in a letter form. See [Section 28-2](#) of the *Bureau of Design and Environment (BDE) Manual* or the USCG website for a discussion of the required information.

7-4.05 Section 10 – Structures and Work in Navigable Waters**7-4.05(a) General**

Section 10 Permits are required for structures (excluding dikes, dams, bridges, or causeways) and other work in or affecting the navigable capacity of the water body (i.e., course, location, condition). Section 10 Permits are obtained simultaneously with Section 404 Permits (i.e., share a joint application) and are normally valid for one year with possibility for extension.

Responsible Agency: United States Army Corps of Engineers (USACE).

Legal Reference: Section 10 of the *Rivers and Harbors Act of 1899*; 33 USC 403, et seq, as amended and supplemented; 23 CFR part 650, Subpart H; 33 CFR 320, 322, 323, 325, 326, 327, 329, and 330.

BUREAU OF LOCAL ROADS & STREETS

7-4-10

PERMITS

June 2018

Purpose: To protect and preserve the navigable waterways of the United States against any obstruction to navigation.

Applicability: Permit required for structures (other than bridges or causeways) or certain types of work in or affecting a navigable waterway. Examples of work include dredging, channelization, filling, and construction of pier protection cells.

7-4.05(b) General Permits

Some work in navigable water requiring a Section 10 Permit may be authorized by a General, Nationwide, or Regional Permit. Examples of Section 10 Nationwide Permits are NWP 7, 13, 23, 27, and 33. Details of these NWP's are in Section 7-4.02.

7-4.05(c) Individual Permits

If the work in navigable waters does not qualify for a General Permit, an application for an Individual Permit must be submitted to the appropriate USACE Regional Engineer. The joint application (NCR Form 426) should be used. Information like what is required for a Section 404 Permit should be provided to the USACE.

7-5 SPECIAL WASTE PERMITS

When a special waste is known to exist within the limits of a LPA improvement as determined by the results of a preliminary site investigation (PSI), then the exposure and disposal of that substance is regulated by state law. See [Section 20-12](#) for discussion of special waste and special waste studies. When applicable, it may be necessary to obtain the following permits for the proposed scope of work:

Supplemental Waste Stream Permit. This permit is applicable to all projects that will involve the disposal of a special waste. The permit application is prepared by the disposal facility on behalf of the environmental firm handling special waste disposal working for the prime construction contractor. This permit will allow the disposal facility to accept generated special waste.

Resource Conservation and Recovery Act (RCRA) Permit. This permit is applicable to all projects in which the contractor will conduct remediation activities that require the storage of hazardous waste for more than 90 days. This permit will be prepared by the environmental firm working for the prime construction contractor. This permit's purpose is to apply the appropriate conditions and restrictions for the operation of hazardous waste storage, hazardous waste treatment, or hazardous waste disposal.

Underground Storage Tank (UST) Permit. This permit is applicable to all projects in which the contractor is required to remove an underground storage tank. (Note: Permits for removing an UST can only be obtained by licensed UST removal contractors). This permit is necessary to ensure that tank removal meets acceptable closure standards.

For permit application requirements see [Section 28-3](#) of the *BDE Manual*,

Chapter Eight

PUBLIC RIGHT-OF-WAY ACCESSIBILITY TRANSITION PLAN

8-1 PUBLIC RIGHT-OF-WAY ACCESSIBILITY TRANSITION PLAN

The Americans with Disabilities Act (ADA) is a civil rights statute that protects qualified individuals with disabilities from discrimination on the basis of disability. Title II of the ADA prohibits discrimination in all services, programs, and activities provided to persons with disabilities by State and local governments, including public transportation. The ADA applies to all facilities built before and after 1990. Local public agencies (LPA) are required to perform self-evaluations of their current facilities, relative to the accessibility requirements of the ADA. LPAs are required to correct any deficiencies identified through the self-evaluation. Only LPAs with more than 50 employees (including both full and part-time employees) are required to have a public right-of-way (PROW) accessibility transition plan detailing how and the deficiencies will be corrected is recommended. However, a public right-of-way (PROW) accessibility transition plan is recommended for all LPAs.

8-1.01 Self-Evaluation

8-1.01(a) General

A site must contain at least one pedestrian access route within the boundary of the site from public transportation stops, accessible parking, accessible passenger loading zones, and public streets or sidewalks, to the pedestrian access route for the building they serve. However, LPAs are not required to install pedestrian facilities on the PROW as a requirement under the ADA. Once a pedestrian facility is constructed, the LPA shall provide an accessible pedestrian access route within the pedestrian facility. On sidewalks, a pedestrian access route should not alternate between one side of a highway and the other unless caused by temporary pedestrian re-routing due to construction of sidewalks and/or curbs and gutters.

8-1.01(b) Inventory

LPAs shall conduct an inventory of existing pedestrian facilities owned, maintained, or operated by the LPA. Inventory approaches are on-ground surveys, windshield surveys, aerial photo studies, or drawing reviews. Inventories are eligible for Federal, State, and MFT funding (See Section 4-3.06).

8-1.01(c) Barrier Identification

Barriers on pedestrian access routes should be identified in the self-evaluation. This also may require coordinating with local disability organizations and the public. When prioritizing the corrective actions, consider the following:

BUREAU OF LOCAL ROADS & STREETS

TRANSITION PLAN

8(2)

Oct 2013

- location of pedestrian generators, particularly those in high-priority areas that would be likely serve individuals with disabilities (e.g., medical facilities, high-rise buildings, housing for the elderly, nursing homes, libraries, and commercial or government buildings),
- location of existing pedestrian access routes,
- location of existing utilities, signs, poles, or other features (e.g., steps) that would need to be removed to provide full accessibility,
- existing ground contours that would affect the longitudinal and transverse slope of sidewalks and ramps,
- location of marked crosswalks, and
- presence of drainage features (e.g., inlets, manholes).

Figure 8-1A provides some possible barriers for facilities on the public rights-of-way.

Issue	Possible Barriers
Sidewalk and Pathway Clear Width	Narrow, Obstructions (see below), Protruding Objects
Sidewalk and Pathway Cross Slope	Steepness, Irregularity, Variability, Warping, Settlement
Landings Along Sidewalks and Pathways	Less Than 4 feet by 4 feet
Sidewalk and Pathway Grade	Steepness, Angle Points
Materials and Finishes	Deterioration of Surfaces, Deterioration of Markings, Appropriateness of Material (ex. Cobblestones)
Gratings	Grating Type, Grate Opening Orientation
Discontinuities	Missing Sections, Gaps, Drops, Steps
Detectable Warning System	Missing, Inappropriate Materials, Inadequate Size, Wrong Location
Obstructions	Signs, Mail Boxes, Fire Hydrants, Benches, Telephones, Traffic Signal Poles, Traffic Signal Controller Boxes, Newspaper Boxes, Drainage Structures, Trees, Grates, Pole Mounted Objects, Standing Water, Snow or Ice
Traffic Signal Systems	Lack of Provision for the Visually Impaired such as APS, Inadequate Time Allowed, Inoperable Buttons, Inaccessible Buttons
Curb Ramp	Missing, Doesn't Fall within Marked Crosswalk, Doesn't Conform to Guidelines
Curb Ramp Flares	Missing Where Required, Too Steep

PUBLIC RIGHTS-OF-WAY FACILITIES POTENTIAL ACCESSIBILITY BARRIERS

Figure 8-1A

8-1.02 Public Right-of-way Accessibility Transition Plan Components

8-1.02(a) Designate ADA Coordinator

LPAs must designate at least one responsible employee to coordinate ADA compliance for public rights-of-way (PROW). This may be the ADA Coordinator required by 55 ILCS 5/5-1131, 60 ILCS 1/85-60, or 65 ILCS 5/1-1-12, or may be an employee within the highway department. This position must be familiar with the LPAs operation, be properly trained in ADA PROW requirements, and be able to effectively communicate with governmental agencies, advocacy groups, and the public.

8-1.02(b) Public Notice

LPAs must provide the public an opportunity to provide input on the PROW accessibility transition plan prior to adoption. The target audience should include public transit users and disability advocacy groups as well as the general public. LPAs should determine the most effective way to provide notice. If notice is provided via a website, the website must in itself be accessible.

8-1.02(c) Grievance Procedure

LPAs must adopt and publish procedures for resolving grievances arising under Title II of the ADA. The procedures are intended to set out a system for resolving complaints of disability discrimination in a prompt and fair manner. The grievance procedure provides an opportunity to resolve a local issue at the local level. However, the use of LPAs grievance procedure is not a prerequisite to filing a complaint with either a federal agency or a court.

8-1.02(d) Design Standards, Specifications, and Details

LPAs must adopt technical guidelines that comply with ADA Standards. LPAs may adopt nationally accepted technical guidelines (i.e. PROWAG) or develop their own. LPAs may use Section 41-6 of the BLRS Manual to meet this requirement.

8-1.02(e) Self-Evaluation

LPAs shall include the self-evaluation as part of the PROW accessibility transition plan.

8-1.02(f) Schedule and Budget for Improvements

LPAs must include a schedule of improvements to upgrade accessibility annually in accordance with the PROW accessibility transition plan. Upgrades may be performed as individual projects or as part of regularly scheduled maintenance or construction projects. Any alteration of existing facilities or construction of new facilities must comply with ADA. Federal, State, and Motor Fuels Tax funds may be used to comply with ADA.

Generally, priority should be given to transportation facilities, public places, and places of employment. Other factors to consider when prioritizing improvements may include:

BUREAU OF LOCAL ROADS & STREETS
TRANSITION PLAN

8(4)

Oct 2013

- Severity of non-compliance,
- Citizen requests or complaints regarding inaccessible locations,
- Pedestrian level of service,
- Population density,
- Presence of a disabled population, and/or
- Cost

8-1.02(g) Monitor Progress

In order to be effective, the PROW accessibility transition plan needs to be utilized in planning and funding decisions. LPAs must update the PROW accessibility transition plan regularly to reflect changes in real world conditions and to address any possible new areas of noncompliance. Regular updates to the plan will also result in monitoring compliance and the effectiveness of priorities set in the plan itself.

Chapter 9

FINANCIAL PLANNING – MFT and State Funds

[Chapter 4](#) discusses the sources of funding available to the local public agencies (LPAs) within Illinois for transportation projects. Chapter 9 discusses the necessary local financial planning for the various non-Federal sources of funding (i.e., Motor Fuel Tax (MFT), Township Bridge Program (TBP), and other State funded programs).

9-1 MFT FINANCING

9-1.01 Unobligated Balance

The Illinois Department of Transportation (IDOT) maintains an account balance, known as the unobligated balance, for the MFT account of each county, road district, and municipality. These are MFT funds that have been allotted to the LPA, but for which IDOT has not authorized expenditure. The unobligated balance is increased when:

- the monthly allotments are distributed;
- projects are completed, and unexpended funds are credited from an obligated account;
- interest earned on MFT funds is credited to the unobligated account; or
- the LPA deposits other funds into the MFT account (e.g., State funds for special local programs, jurisdictional transfers, etc.).

MFT funds are obligated and subtracted from the unobligated balance by authorization of the IDOT Regional Engineer when a project has reached a stage in which a LPA has a financial obligation (e.g., an approved engineering agreement or construction contract). The LPA may review their monthly statement that lists all transactions that affect this unobligated balance on [IDOT's website for MFT Monthly Distribution](#).

9-1.02 Monthly Allotment

Checks for the LPA MFT allotments are sent each month to the municipal treasurer for the municipal allotments and to the county treasurer for the county and road district allotments. Rather than receiving a monthly check, the LPA may request that the State Treasurer invest the money directly as part of the Treasurer's Investment Pool. LPAs can also have their warrants directly deposited into a local bank. Arrangements for this can be made by contacting the Office of the Comptroller, Electronic Commerce Division.

BUREAU OF LOCAL ROADS & STREETS

9-1-2

FINANCIAL PLANNING – MFT and State Funds

December 2018

The LPA may review their monthly letter informing the LPA of the amount of its monthly MFT allotment on [IDOT's website for MFT Monthly Distribution](#). This letter also contains a list of all transactions affecting its MFT account during the preceding month. Transactions affecting the LPA's MFT account will be one of three types: Authorization to Expend Funds (Section 9-1.07(a)), Credit to Unobligated Balance (Section 9-1.08(g)), or Payments to State (Section 9-1.08(h)).

9-1.03 Appropriation of MFT Funds

9-1.03(a) General

Counties and municipalities initiate an MFT project by passing an ordinance or resolution (Forms [BLR 09110](#) or [BLR 14220](#) for counties and municipalities) establishing the scope of a project and appropriating MFT funds for the project. A road district accomplishes the same objective by submitting Form [BLR 09120](#) "Statement of Proposed Road Improvement", Form [BLR 14221](#) "Estimate of Maintenance Cost/Maintenance Expenditure Statement", or Form [BLR 09150](#) "Request for Expenditure".

When a LPA submits a resolution for approval for an improvement or maintenance program, IDOT will evaluate the LPA's current unobligated balance plus anticipated allotments during the life of the project or maintenance period to determine whether adequate funding is available before approving the resolution.

A separate MFT appropriation resolution will not be required, provided that the LPA budget ordinance contains the necessary project information required by the resolution and identifies that MFT funds will be used as discussed in Section 9-1.03(c).

When a LPA appropriates MFT funds for a project, the appropriation should cover, as practical, all anticipated costs. This may exceed their current unobligated balance, because authorizations are not made at the appropriation stage. Prior to advertisement for letting, the LPA must ensure sufficient funds are available, including its current unobligated balance plus anticipated MFT allotments through the estimated completion date, to cover the total cost of the contract. If estimated MFT revenues are not adequate to cover this cost, other sources of financing will be required. This is accomplished using other local funds to pay a portion of the direct costs in conjunction with MFT funds, or a loan may be made to the MFT fund, the principal to be repaid to the source of the loan.

9-1.03(b) Resolutions Procedures

The procedures to be followed when projects are constructed under IDOT approval and inspection can be found in [605 ILCS 5/5-403](#), [5/6-701.1](#), and [5/7-203](#). The first action in the initiation of a project by a county or municipality is normally the adoption of an ordinance or resolution declaring the intent and appropriating funds. Form [BLR 09110](#) “Resolution for Improvement Resolution” is the resolution form provided by IDOT. If a bond issue or special assessment will finance a project, a Resolution of Intent as indicated in Form [BLR 09112](#) “Local Agency Resolution of Intent MFT / General Obligation Bond” or the Form [BLR 09113](#) “Municipal Resolution of Intent for Special Assessment”, as appropriate, must be the first action. IDOT also provides Form [BLR 09120](#) “Statement of Proposed Road Improvement”, which addresses the improvement of the road district road involving the expenditure of funds requiring IDOT approval.

9-1.03(c) Resolution Contents (Counties and Municipalities)

The following applies:

1. Section Designation. See [Section 2-4](#) for Section Designation criteria.
2. Location. Provide a description of the project’s beginning and ending points in the resolution or Road Improvement Statement. With each copy, submit a map showing the proposed improvement location.
3. Proposed Project Description. Include a description of the project in general terms. Avoid specifying a span length, type of bridge, and a thickness or type of bituminous surface because they are subject to change during the design stage. This eliminates the need for an amending resolution when the plans provide for a different type of improvement than documented in the original resolution. Municipalities are required to include the length and width of the proposed improvement in the resolution.
4. Type of Construction. Indicate whether the project will be constructed by contract or by day labor.
5. Financial Commitment. State the amount of MFT funds appropriated by the governing body and MFT funds committed to the project. If the project is partially funded with other funds, include a statement committing the other funds with or in the resolution.
6. Certification. County and municipal resolutions must be attested to and sealed by the county or municipal clerk.

9-1.03(d) Statement of Proposed Road Improvement (Road Districts)

Form [BLR 09120](#) “Statement of Proposed Road Improvement” for a road district project must state the amount of MFT funds committed by the highway commissioner for the project. If the road district project is partially funded with other funds, the Statement of Proposed Road Improvement must also state the source and amount of other funds committed to the project. The highway commissioner and the county engineer must sign Form [BLR 09120](#).

BUREAU OF LOCAL ROADS & STREETS

9-1-4

FINANCIAL PLANNING – MFT and State Funds

December 2018

When the records are available in the road district establishing one LPA as having jurisdiction and responsibility for the maintenance of boundary line roads, the signatures of the adjoining road district highway commissioners and adjoining county engineers, in the case of county line road district roads, will not be required.

9-1.04 Anticipating Unallotted MFT Funds

9-1.04(a) General

Unless IDOT is advised to the contrary, it will finance all LPA MFT projects on a cash basis. If sufficient MFT funds are not available, IDOT will require assurance from the LPA that funds will be available from other sources to pay all bills within 90 days of the estimated completion of the project.

9-1.04(b) Counties and Municipalities

A county or a municipality may borrow funds from other sources to complete an MFT improvement. The loan may be repaid from future MFT allotments provided that no charges are made for interest by a county (payment of interest charges is permissible for municipalities). The anticipation of MFT allotments should not cover an excessive period. It is generally not advisable to commit future allotments for more than two years beyond the estimated completion date. In special circumstances, the district, in consultation with the Central Bureau of Local Roads and Streets (CBLRS), may authorize repayment periods exceeding two years. If a county or a municipality proposes to borrow local funds and later requests reimbursement with MFT funds, it must state its intent by formal resolution of the governing board or council; see Section 9-1.03. IDOT must approve the proposed payback time and repayment schedule.

MFT funds may be used to reimburse the loan, including interest (municipalities only), provided that MFT funds are not anticipated for an excessive period. An “excessive period of time” is defined as a period that exceeds the incumbent administration’s term of office. The LPA should have some reserve funds to accommodate routine maintenance and unforeseen emergencies to its transportation system.

9-1.04(c) Road Districts

The county must pay the costs incurred in the construction of road district MFT projects from the MFT account. A road district is not allowed to pay these costs directly from its road and bridge fund or other local funds and later be reimbursed with MFT funds.

A road district may, however, deposit local funds into the county treasury to pay project costs with the intention of later requesting reimbursement with MFT funds. Reimbursement requires prior IDOT approval of the arrangement. MFT policy and procedures must be used in the design and construction of the project.

9-1.05 MFT Reimbursement for Bond Issues

The information concerning a LPA's use of bonds (e.g., General Obligation Bonds (GOB), MFT Fund Bonds) to finance highway improvements has been relocated to [Section 15-3](#).

9-1.06 Special Assessment Procedures

The information of when a municipality proposes to finance a project by special assessment and later requests MFT funds to retire the indebtedness has been relocated to [Section 15-4](#).

9-1.07 Expenditures

IDOT approval of an appropriating resolution or Statement of Proposed Road Improvement does not authorize the LPA to begin disbursing MFT funds for the project. The LPA will be authorized to disburse MFT funds at various stages throughout a project.

9-1.07(a) Authorization to Expend Funds

At the request of the LPA (e.g., when a project has reached a stage where the LPA must disburse MFT funds and the required documents have been submitted and approved/concurred by IDOT), IDOT will authorize an expenditure of MFT funds. The actual authorization is an IDOT accounting procedure where the funds authorized are deducted from the LPA's unobligated balance and committed to the specific project as obligated funds. Each authorization transaction is printed on the LPA's monthly allotment notification letter; see Section 9-1.02.

A list of accounts to which MFT funds are authorized by the District BLRS are provided in Figure 9-1A.

Several of a project's required authorization steps are accomplished automatically in the District BLRS while others must be initiated by the LPA.

9-1.07(b) Automatic Authorization

IDOT will automatically authorize the following items upon approval of the appropriate paperwork up to the amount appropriated by resolution:

1. Funds for Contracts. When IDOT approves the executed contract for construction, the awarded value of the contract is authorized. When IDOT approves a Request for Approval of Change in Plans (Form [BLR 13210](#)) the amount of the adjusted/final contract is authorized, provided sufficient appropriation by the LPA has been passed.
2. State Contracts with LPA Participation (MFT). When IDOT executes a State contract, the LPA participation utilizing MFT funds, the funds will be authorized for the amount shown in the State-Local Agreement for MFT eligible scope of work and /or items.

BUREAU OF LOCAL ROADS & STREETS

3. Day Labor Costs. Maintenance operations are authorized when IDOT approves the LPA's resolution, see [Section 14-2](#). For maintenance operations required to seek competitive sealed bids (see [Section 12-1](#)), contract maintenance, or construction additional documents may be required including plans, specifications, estimates, and/or material proposals prior to actual expenditure of funds.
4. Maintenance Engineering. When IDOT approves the LPA's resolution maintenance engineering is authorized, see [Section 14-1](#) for additional information.
5. Obligation Retirement. Retirement of obligations will be authorized for expenditure upon approval of the appropriate obligation retirement resolution. See Sections 9-1.05 for GOB/MFT Bonds and Section 9-1.06 for Special Assessments.
6. Railroad and Utility Work. When a railroad and/or utility company, in accordance with an agreement, performs work, the expenditure of MFT funds will be authorized upon receipt and approval by the LPA of the company's bill and detailed statement of expenses. Amounts authorized will be sufficient to permit payments to be made according to the terms of the agreement. The LPA shall submit a copy of their approval to IDOT upon the LPA's approval.

Notes

1. Itemize and detail requests for Expenditure of MFT Funds (Form [BLR 09150](#)) for right-of-way expenditure(s) on the reverse side of Form [BLR 09150](#).

AUTHORIZED MFT ACCOUNTS

Figure 9-1A

9-1.07(c) Requests for Authorization

When it is necessary to disburse MFT funds for any other purpose, the LPA must submit Form [BLR 09150](#) "Request for Expenditure" to IDOT. Indicate the amount and purpose of the request. It should be accompanied by appropriate documentation (e.g., engineering bills, invoices for joint participation). Upon receipt of a properly documented request for expenditure, IDOT will authorize the necessary funds, up to the maximum amount that has been appropriated.

The expenditure of MFT funds for letting advertising costs will be authorized as an engineering charge.

A regularly appointed or elected municipal official must sign requests for expenditure of MFT funds for municipal MFT work. This official may be the clerk, board president, mayor, or a regularly appointed engineer whose office is established by ordinance and who is appointed to the office in an official manner. Requests for expenditure of MFT funds signed by anyone else cannot be accepted.

9-1.07(d) Salary and Expenses

[Section 4-3](#) describes the use of MFT funds for salaries and other fringe benefits. The following procedures apply when MFT funds are used for these expenditures:

1. Wages or Salaries. For employees of a LPA who may be paid from the MFT fund, the method of payment may be one of the following:
 - Where the compensation is on an hourly, daily, or monthly basis, the LPA may pay the employee directly from the MFT fund for the particular section or maintenance operation on which the work is done.
 - Where the compensation is on an hourly, daily, or monthly basis, the LPA may pay the employee from the fund for which the employee is regularly paid. This fund may then be reimbursed from the MFT fund for the section or maintenance operation on which the work was performed for the amount paid to the employee for the time spent on the MFT section or maintenance operation.

Under the first method of payment, the LPA will make payments in the same manner as other payments on the section or maintenance operation are made.

Under the second method, the LPA must maintain complete records of the dates and time for the employees who are engaged on MFT work and the section or maintenance operation. Reimbursements from MFT will be made promptly and periodically, preferably each month.

BUREAU OF LOCAL ROADS & STREETS

9-1-8

FINANCIAL PLANNING – MFT and State Funds

December 2018

Payments from MFT funds to other funds for reimbursement are made in the same manner as any other payment (e.g., a claim showing the date, section or maintenance operation, the class of labor, the rate of pay must be filed, and a warrant drawn against the MFT fund in favor of the fund which is being reimbursed). It is not necessary that individual claims for each employee be filed, but a separate claim must be filed for each section or maintenance operation and, if it is desired, all employees working on that section or maintenance operation during the period covered by the claim may be shown on one claim and reimbursement made by one warrant.

2. Holidays, Vacation, and Sick Leave. Whenever an MFT payroll is made by the LPA, a payment may also be made to the county highway tax fund or other fund involved for a definite percentage of the payroll cost as a payment for the benefits involved. Calculate the percentage by dividing the cost of the benefits in previous years by the total payroll cost. Determine this percentage from records over a period of three or more consecutive years and compute the percentage to the nearest whole number. No payment will be made until the District BLRS has approved the established percentage.
3. Health, Hospitalization, and Life Insurance. Payment of a prorated portion of Health, Hospitalization, and Life Insurance premiums may be made with MFT funds for costs incurred on MFT maintenance and construction projects.

The prorated portion shall be determined in the same manner provided for "Holidays, Vacation, and Sick Leave".

4. Worker's Compensation Insurance Premiums. The LPA may make pro-rata payments from their MFT account directly to the insurance company for these premiums, or they may use MFT funds to reimburse another fund from which the premiums were paid.
5. Retirement and Social Security. Requests for expenditure of MFT funds for the LPA's contributions to these two accounts will be honored based on actual amounts owed or will be honored in advance, provided that the amount requested is substantiated by an accompanying estimate statement. In the estimate statement, show which sections will be built, what maintenance operation will be performed, and what salaries (e.g., the county engineer) will be paid with MFT funds. Also show in the statement, in connection with the municipal retirement fund, the percentage of contribution as determined by the retirement board for the period covered by the request for funds. If the LPA has levied a tax for payment of either or both accounts, the MFT account must be reimbursed as the taxes are collected. The amount of the reimbursement shall be shown on the statement accompanying the request for expenditure of MFT funds for the next period.

The expenditure of MFT funds will be authorized to the LPA for one account entitled "(LPA's name) Contribution to Illinois Municipal Retirement Fund or to Social Security." The expenditure of MFT funds will not be authorized to each section and to maintenance separately. Keep this account separate from other accounts. Payments from this account to the employees' retirement and/or social security fund should be made periodically. The claim against the account, payable to the retirement or social security fund, should identify the payrolls that are covered by the claim.

HARD COPIES UNCONTROLLED

It is not necessary for the LPA to report the amount of its contribution in connection with final papers for construction sections or expenditure statements for maintenance. Instead, the LPA should prepare a statement of receipts and expenditures for submission with the request for expenditure of MFT funds for the next period.

It is not necessary for LPA to appropriate funds, by resolution, covering MFT expenditures for retirement and social security contributions.

9-1.08 Reimbursement of Funds to MFT Accounts

9-1.08(a) General

When MFT funds are expended for construction or maintenance related work and then reimbursed by property owners, corporate fund, State or federal funds, or any other source, the reimbursement is credited to the MFT section account from which the payment was made. Likewise, any payment not eligible for MFT participation will be reimbursed to the MFT account.

Final acceptance of construction projects will be withheld until the final reimbursement has been made or until other arrangements have been approved. In special cases (e.g., where the reimbursement will be made over a long period of time), the CBLRS may close out the sections upon approval. In these cases, the subsequent reimbursements are credited to the MFT unobligated balance, with a description of the purpose of the reimbursements.

9-1.08(b) Off-Street Parking Revenues

Municipalities may use MFT funds for off-street parking facilities in accordance with [605 ILCS 5/7-202.17](#).

The LPA must assign a section number to track this revenue. The following procedures will apply:

1. Separate Accounts. When a LPA chooses to maintain accounts for each parking facility constructed, close the construction section and determine the final MFT participation. To account for revenues, establish new MFT sections as in the following example:

Account for revenue reimbursements for a parking lot built as Section 02-00076-00-PK as using Section 79-R0076-00-PK. The original MFT participation for the project will be entered into the database as “the amount appropriated.” The receipts will be credited to the unobligated account annually, and the total accumulation of these credits will be maintained in the far-right column on Form [BLR 15106s](#). Once the amount appropriated has been achieved, the section will be closed.

2. Single Account. When the LPA has several revenue-generating parking facilities and maintains only one parking revenue account, close the original construction section(s) and determine the total MFT participation of all projects. To account for revenues, establish a new section number as (year of 1st reimbursement)–R0000-00-PK. Enter the total participation of all sections in the database as the amount appropriated. If additional parking projects are built, add the MFT participation to the appropriation amount. Treat annual credits for parking receipts as those in separate accounts.

BUREAU OF LOCAL ROADS & STREETS

9-1-10

FINANCIAL PLANNING – MFT and State Funds

December 2018

3. Maintenance. Generated revenues are to be used first to maintain the parking area before MFT funds are used for maintenance.
4. Surplus Revenues. Surplus revenues not needed for maintenance may be used to acquire land and construct additional off-street parking areas.

Return surplus revenues not needed for maintenance or construction of additional parking areas to the LPA's MFT account until the amount of MFT funds originally paid out have been refunded. When the total amount reimbursed is equal to the MFT funds used for construction, all other surplus revenues become the property of the LPA.

5. Compliance Review. Ensure the LPA's parking revenue account is made available to IDOT for compliance review purposes.

9-1.08(c) Crediting Reimbursement for a Specific Section

The following will apply:

1. Active or Open Sections. The authorization or reimbursement is credited to the section account as identified in the compliance review.
2. Closed Sections (in MFT Database). If the section is closed, it will be reopened to include the disbursement or receipt, as indicated by the compliance review, including comments (e.g. source and purpose). Final paperwork shall be corrected. Once this action is completed, the section must be closed again.
3. Closed Sections Purged from MFT Database. If the section is closed and purged from the database, the disbursement or receipt of funds is entered as category "other" and in the memo area the original section designation is entered. The source and purpose shall be identified of the reimbursement.

9-1.08(d) Crediting Reimbursement Not Identified by a Section

Any other reimbursement that cannot be assigned to an existing section must be entered as category type "other" and identified with an explanation in the memo field. The source and purpose of the reimbursement plus the compliance review report number shall be identified.

9-1.08(e) Crediting Earned Interest

Any earned interest (and only earned interest) on the LPA's fund must be accounted for in the compliance review under a section titled "Interest" with a line designated for each year's interest. Each annual total of earned interest will be credited as category "interest" in the MFT database and in the memo field the compliance review report number shall be identified along with year in which the interest was earned. See [Section 15-1](#) for additional information.

BUREAU OF LOCAL ROADS & STREETS

December 2018

FINANCIAL PLANNING – MFT and State Funds

9-1-11

9-1.08(f) Income from Property Purchased with MFT Funds

Any revenues from the rental of property purchased with MFT funds are credited to the MFT fund account. If right-of-way is purchased with MFT funds, which then becomes unnecessary and is later sold, credit the revenue received to the MFT fund account up to the original purchase price.

9-1.08(g) Credit to Unobligated Balance

When a project has been completed and all bills have been paid, it is possible that all funds authorized for a specific purpose were not required. When IDOT approves Form [BLR 13510](#) for the project, these unexpended funds are transferred from the project's obligated account and returned (credited) to the LPA's unobligated balance. The same is true for when IDOT approves Form [BLR 14221](#) (as a Maintenance Expenditure Statement) for maintenance. This credit is accomplished automatically by IDOT and will appear on the LPA's monthly allotment notification letter.

9-1.08(h) Payments to State

IDOT has established procedure whereby regular payments on a debt owed to the State by a LPA may be deducted directly from the LPA's monthly MFT allotments upon request by the LPA. The CBLRS, in cooperation with the District BLRSs, will determine these arrangements.

9-2 STATE FUNDS FINANCING**9-2.01 Township Bridge Program (TBP) Funding****9-2.01(a) Annual Allotment**

Each year IDOT apportions \$15 million to the counties to be used by the road districts for the construction of bridges. See [Section 4-2](#) for additional information. For rehabilitation of bridges contact the District BLRS for guidance on eligibility. The District BLRS will set up a Contract Obligation Document (COD) for each county's allotment.

9-2.01(b) Annual Program

Each county is required to submit an annual program detailing the projects that are proposed for funding through TBP. Submit the annual program to the District BLRS on or before September 1 each year. Projects in the annual program must be listed in order of priority. Complete Form [BLR 09210](#) and submit it to the District BLRS.

9-2.01(c) Obligation of Funds

TBP funds apportioned to the counties are not automatically paid to the county treasurer when the allotments are distributed. The funds are held in the State treasury until they are obligated for payment to the county treasurer. TBP funds are considered obligated upon award of the contract by the county, signed engineering agreement, or acquisition of right-of-way, and have been approved by the District BLRS. These funds, once in the county treasurer's account, cannot be expended until the necessary payment estimates have been processed. Payout will be accomplished by the submittal of an invoice (Form C-13) by the District BLRS to the District Administration – Financial Services with a copy to CBLRS. Any funds apportioned to a county that are not obligated within 48 months of the date when the apportionment is made will revert to the Road Fund ([605 ILCS 5/6-906](#)) and will be distributed through the TBP Lapse Pool Program.

9-2.01(d) TBP Account Balance

Each county must maintain an account that will identify TBP funds separately from all other funds. Because the funds are paid to the county prior to the actual need, the county must maintain these funds in an account. If the TBP funds are invested prior to being disbursed, any interest earned will be used as TBP funds and applied to already approved TBP projects. Interest earned on any TBP money belongs to the TBP fund and cannot be considered as part of the local match. Funds released from a project by change order may be applied to overruns in current projects or future TBP projects.

When TBP funds are expended for construction-related work and then reimbursed by property owners, corporate fund, State or Federal funds, or any other source, the reimbursement is credited to the TBP account for the section from which the payment was made. Likewise, any expenditure not eligible for TBP participation will be reimbursed to the TBP account.

9-2.01(e) Anticipation of Allotments

With the approval of the District BLRS, a road district may finance a project from other sources and pledge their future TBP allotments toward repayment of the indebtedness. Any project financed in such a manner must be constructed using the same procedures as if TBP funds were paid directly for construction. The following applies:

1. Bonded Indebtedness. A road district may issue bonds to construct a bridge selected in accordance with [605 ILCS 5/6-510](#). For bond issuing financing, see Section 9-1.05. Future allotments of the road district's TBP funds may be pledged toward repayment of the bond issue ([605 ILCS 5/6-903](#)).
2. Resolution of Indebtedness. In cooperation with the county, a road district may use any other source of county or road district funds available to finance a project. The county board may pass a resolution (Form [BLR 09215](#)) declaring indebtedness to the county, which will be repaid with future allotments of the road district's TBP funds.

9-2.01(f) Suspension of Allocation

If any county, after having been provided reasonable notice by IDOT, fails to expend funds in a satisfactory manner, IDOT will not authorize further payments to the county until it corrects its unsatisfactory use of funds.

9-2.01(g) Contract Additions and Deletions

Payout for the net amount of the contract additions on each of the county's projects will be scheduled upon approval by IDOT and debited to the county's allotment. If the combination of additions and deletions for the entire project extends the obligation beyond the currently available funds, the overrun amount may be paid from the following year's allocation ([605 ILCS 5/6-903](#)). Funds released from a project by change order may be applied to current projects or used for future projects. These released funds must be covered by approved contracts before the next date when funds are subject to lapse.

9-2.01(h) Use of TBP Funds

[Section 4-2](#) provides details on the eligible uses of TBP funds.

9-2.02 TBP Lapse Pool

Funds allocated to the counties under TBP will lapse or revert to the Road Fund if they are not obligated within four years of the allotment. IDOT has established an administrative program for these types of funds where road districts having special needs may use them. This program is referred to as the TBP Lapse Pool.

BUREAU OF LOCAL ROADS & STREETS

December 2018

FINANCIAL PLANNING – MFT and State Funds

9-2-3

Lapse Pool funding will contribute a maximum of 80% of the construction and construction engineering costs. At the time a project is selected, the maximum allocation of funds is established. Any cost increases more than the maximum amount established are the responsibility of the LPA. Cost decreases resulting in balances in Lapse Pool funds must be returned to IDOT for deposit in the Lapse Pool Fund.

Available funds in the Lapse Pool are limited and therefore are not redistributed through the allotment process. To redistribute and use the funds completely, IDOT has established the following criteria for the selection of Lapse Pool projects:

- When sufficient funds become available to warrant a solicitation of TBP Lapse Pool projects, the department will contact the county engineers for candidate projects.
- The county engineer is required to provide written justification for the project to the District BLRS.
- All bridges constructed with Lapse Pool funds are selected by the CBLRS from a list of projects submitted by the District BLRSs.
- The regular MFT engineering criteria, procedures and policies must be followed.
- A State/LPA Joint Agreement is required for each project; see [Section 5-3](#). The agreement will designate the method of payment to the county.

9-2.03 Grade Crossing Protection Fund (GCPF)

The types of projects eligible for funding under the GCPF are discussed in [Section 4-2](#). The Illinois Commerce Commission (ICC) is responsible for managing the GCPF. The following procedures are applicable to the GCPF:

1. Application. Application for use of the GCPF should be in the form of a formal petition on behalf of the local highway authority (or any other interested party) to ICC. Application forms are available from ICC. The petition should state the location of the crossing(s) involved, the improvements desired (including the reasons why the improvements are necessary), and that amount of financial assistance requested from the GCPF.
2. Hearing. ICC requires a formal hearing for most, if not all, of the cases involving the GCPF. See [Section 10-5](#) for further discussion.
3. Selection. ICC selects the projects and adds them to their multiyear program. Funding is committed when ICC issues an order for the completion of the work.
4. Implementation. Once ICC approves funding, the development of the project follows the procedures established for regular MFT crossing improvements, except that an ICC order (with a division of cost) is used instead of a formal agreement. Submit all bills to the District BLRS, which will forward them to CBLRS for processing and payment.

9-2.04 Economic Development Program (EDP)

The LPA will apply to the Office of Planning and Programming (OPP) for these funds. Submit the following information with the EDP application:

- name of company, type of product, and total company site investment;
- location (e.g., include a map showing the location of the site) and general description of improvement;
- estimate of the number of primary jobs created or retained;
- anticipated time for the development to occur;
- projected visitors at tourist attraction, if a tourism project;
- letter of commitment from the company to expand or locate;
- engineer's cost estimate of the improvement; and
- extent of the local participation and source of local matching funds.

If IDOT commits to funding, a joint agreement is necessary. The project is developed using MFT policies and procedures. If federal funds are used, the project is developed using federal policy and procedures. EDP funds may be used as part of the LPA's match to the federal funds. Additional information can be found on [IDOT's website](#).

9-2.05 Truck Access Route Program (TARP)

The CBLRS will make an annual solicitation of candidate projects for the upcoming fiscal year. Applicants should include any information pertaining to prior commitments by IDOT, a description of industries or truck generators served, projected growth, and number of trucks using the route. Provide information pertaining to phase construction that completes a truck route or is part of a multistage construction. Geographical diversity is also considered. Once the District BLRS submits potential projects to the CBLRS, the CBLRS will determine a district priority along with justification.

Approved projects will require a joint agreement and a resolution establishing an 80,000 lb (36,000 kg) truck route, see [Section 5-3](#). If the TARP funding is included within a federally funded project, the same joint agreement is used for both funds. TARP projects which include federal funds are developed using federal policy and procedures. TARP funds may be used as part of the LPA's match to the federal funds. Other projects will use MFT policies and procedures. Additional information can be found on [IDOT's website](#).

9-2.06 State Matching Assistance (SMA) Program

Counties wanting to use SMA should include the request in the joint agreement for federally funded projects. IDOT deducts the amount from the county balance as it makes payment on the contract.

A county may use its accumulated SMA funds to defray any part or the entire non-federal portion on any local Federal-aid project regardless of the federal matching percentage. The SMA may be committed as a lump-sum amount or as a percentage of the project cost not to exceed the current available SMA balance for the county.

9-2.07 County Consolidated, Needy Townships, and High Growth Cities

Each year a check is sent to each eligible LPA for deposit in their MFT account. The LPA's unobligated MFT balance is increased to include this amount. These funds are considered MFT funds.

9-2.08 County Engineer's Salary Program

A county may decide to participate in this program at any time. The details of the program are sent out annually in a letter to the Illinois Association of County Engineers (IACE). The county and the State will enter into a six-year agreement for the county engineer's salary program. This agreement will have a termination date of six years or less. The county must pass an annual resolution appropriating county funds for the salary and approving the transfer of the county's Surface Transportation Program (STP) funds to the State. When the resolution is approved and sent to the District BLRS, IDOT will send a check for the State funds to be exchanged for the STP funds and deduct that amount from the county's STP balance. The check must be deposited into the county's MFT account, unless the agreement with IDOT states otherwise.

9-2.09 Present Worth Jurisdictional Transfers

When IDOT transfers a highway to a LPA and includes a present worth for the highway, a funding agreement will be required in addition to Form [BLR 05210](#); see [Section 5-3](#). This funding agreement should designate an effective date for the transfer which matches the date on the Form [BLR 05210](#). If the effective date is a specified number of days after execution of the agreement, the funds will be automatically distributed to the LPA. If the effective date of the transfer is not linked to the date of the agreement execution, the LPA will be responsible to bill IDOT to receive payment. The procedure for the present worth payment should be clearly stated in the agreement. All funds transferred to a LPA as part of a present worth jurisdictional transfer shall be deposited into the LPA's MFT account.

9-2.10 Park Access Program

The LPA will submit applications for the Park Access Program to the Illinois Department of Natural Resources (IDNR). When a project is included in the program, a joint agreement is required. The project is developed using MFT policies and procedures. If federal funds are used, the project is developed using federal policy and procedures. Park Access Program funds may be used as part of the LPA's match to the federal funds.

9-2.11 Noise Abatement Program

The LPA will need to apply to OPP. A joint agreement is required. The project is developed using MFT policies and procedures. If federal funds are used, the project is developed using federal policy and procedures. Noise Abatement Program funds may be used as part of the LPA's match to the federal funds.

Chapter 10

PROJECT DEVELOPMENT – MFT and State Funds

10-1 ENVIRONMENTAL ISSUES

10-1.01 General

During project development, it is important for the designer to identify, understand, and avoid where possible or practical any of the environmental impacts caused by the project. Environmental surveys and coordination can be a significant portion of project development and project schedules can be affected significantly. This section has a general application to all local public agency (LPA) projects that are not federally funded when addressing environmental impacts. This includes, but is not limited to, environmental documentation, coordination, and general environmental guidance procedures for the types of projects listed below.

For additional information on special environmental surveys and procedures, see [Chapter 20](#).

10-1.01(a) Federal Action

A LPA project, funded with MFT, TBP, State, or local funds may include a federal action. A federal action may occur when an improvement requires approval or permit through a federal agency. The following items are defined as a federal action, when the proposed improvement:

- has been determined to have an adverse effect on historic properties pursuant to Section 106 of the *National Historic Preservation Act*,
- requires the use of properties protected by Section 4(f) of the *Department of Transportation Act* (49 U.S.C. 303) that cannot be documented with an FHWA de minimis determination, or a programmatic Section 4(f) evaluation other than the programmatic evaluation for the use of historic bridges,
- requires the acquisition of lands under the protection of Section 6(f) of the *Land and Water Conservation Act* of 1965, the *Federal Aid in Fish Restoration Act*, the *Federal Aid in Wildlife Restoration Act*, or other unique areas or special lands that were acquired in fee or easement with public-use money and have deed restrictions or covenants on the property,
- requires an individual U.S. Army Corps of Engineers Section 404 permit (the improvement does not meet the conditions for a Nationwide Permit or a General Permit),
- requires an individual Illinois Environmental Protection Agency Section 401 Water Quality Certification (the improvement does not meet the conditions established by ILEPA),

BUREAU OF LOCAL ROADS & STREETS

10-1-2

PROJECT DEVELOPMENT – MFT and State Funds

December 2018

- requires work encroaching on a regulatory floodway or work adversely affecting the base floodplain (100-year flood) elevations of a water course or lake, pursuant to Executive Order 11988 and 23 CFR §650 subpart A, or
- may affect, and is likely to adversely affect federally listed species, or designated critical habitat, or projects with impacts subject to the conditions of the *Bald and Golden Eagle Protection Act*.

10-1.01(b) Non-Federal Certification / Project Status

Form [BLR 10100](#) is required to be submitted to the District BLRS prior to the advertisement in IDOT's Notice to Contractors Bulletin. The District BLRS will acknowledge receipt of Form [BLR 10100](#). A copy will be placed in the project file except for locally funded projects with no federal action. For these projects, Form [BLR 10100](#) may be used to document environmental review. However, this form will not be required to be submitted to the District BLRS prior to advertisement.

10-1.01(c) Locally Funded Projects with No Federal Action

Locally funded projects not requiring IDOT's review or approval or not requiring federal action are highly encouraged to follow IDOT's policies and procedures as set forth in this chapter. The LPA with jurisdiction within the project limits is still required to fulfill their obligations under state law, and to obtain signoffs from any pertinent local or state agency given oversight of an environmental resource in the project vicinity. A LPA or their consultant may request IDOT's assistance in the project development to conduct environmental surveys and identify impacts to these environmental resources.

If a LPA decides not to seek IDOT's assistance with an environmental survey, the LPA or consultant should clearly label all correspondence to other agencies to clarify that the project is locally funded and will not be processed by IDOT. A copy of the cover letter should be sent to the District BLRS.

10-1.01(d) Locally Funded Projects Requiring IDOT Review / Approval or Require Federal Action

Locally funded projects with items requiring IDOT's review / approval or require federal action must follow IDOT policies and procedures for those items as set forth in this chapter and [Chapter 20](#). All other aspects of the project will follow Section 10-1.01(c).

10-1.01(e) MFT, TBP, and State Funded Projects

LPA projects funded with Motor Fuel Tax (MFT), Township Bridge Program (TBP), or State funds are required to follow IDOT policies and procedures as set forth in this chapter.

10-1.01(f) Federally Funded Projects or Requiring Federal Action

LPA projects funded with federal funds or requiring a federal action are required to follow IDOT policies and procedures as set forth in this chapter and [Chapter 20](#).

10-1.02 Environmental Survey Requests (ESR)

10-1.02(a) General

Environmental Survey Requests (ESR) for cultural, biological, wetland and special waste resources are required for all MFT, TBP, and State funded projects.

See [Section 20-2](#) for Environmental Survey Requests.

10-1.02(b) Ecological Compliance Assessment Tool (EcoCAT)

For locally funded projects without the Illinois Department of Transportation’s (IDOT) review and approval, the LPA shall use EcoCAT and pay any fee established by the Illinois Department of Natural Resources (IDNR) to comply with the *Illinois Endangered Species Protection Act* ([520 ILCS 10/11\(b\)](#)), the *Illinois Natural Areas Preservation Act* ([525 ILCS 30/17](#)), and the *Interagency Wetland Policy Act of 1989* ([20 ILCS 830/1 et seq.](#)).

Copies of the consultation termination letter or consultation closed report from EcoCAT shall be submitted to the District BLRS.

10-1.03 Section 6(f) Land Conversion Request

See Section [20-4](#) for Section 6(f) Lands.

10-1.04 OSLAD Land Conversion Request

10-1.04(a) Legal Authority

The Open Space Lands Acquisition and Development (OSLAD) grant program is a State funded grant program authorized by the *Open Space Lands Acquisition and Development Act*, ([525 ILCS 35/1 et seq.](#)). The compliance procedures for the OSLAD grant program are in the *Open Space Lands Acquisition and Development Grant Program*, 17 Illinois Administrative Code (IL Admin Code) 3025.

10-1.04(b) Applicability

Compliance procedures for proposed conversion of OSLAD assisted lands are applicable to all projects proposing conversion regardless of project type or funding source.

BUREAU OF LOCAL ROADS & STREETS

10-1-4

PROJECT DEVELOPMENT – MFT and State Funds

December 2018

10-1.04(c) Procedures

17 IL Admin Code 3025 incorporates by reference essentially the same compliance procedures as required for the Land and Water Conservation Fund (LAWCON) grant program. However, because the OSLAD grant program is State funded, concurrence of the National Park Service (NPS) is not required for proposed conversion of OSLAD assisted lands. Special procedures are required when lands that have OSLAD grant program funds involved in their purchase or development and will be converted to uses other than public outdoor recreational use. The following procedures apply:

1. Coordination. Early and ongoing coordination with the official having jurisdiction over the OSLAD assisted land and the IDNR should be diligently pursued.
2. Report Requirements. When a project proposes the use of land in which OSLAD funds have been involved in its purchase or development, the Director of IDNR must approve conversion of the land to other than public outdoor recreational use; however, a special report is not required.
3. Conversion Request. Requests to convert OSLAD assisted properties in whole or in part to other than public outdoor recreational uses must be submitted to IDNR in writing. IDNR will approve conversions only upon the substitution of replacement property having equal fair market value and comparable outdoor recreational usefulness, quality, and location. LPAs should submit a request for OSLAD land conversion approval to the IDNR Division of Grant Administration, as applicable. Formal review periods for conversion requests are not specified in the OSLAD regulation.

IDNR regulations do not specify information requirements for conversion requests. However, the information specified in the Section 6(f) requirements to support fair market value and comparable outdoor recreational usefulness, quality, and location should serve as a guide for the items to address in preparing OSLAD conversion requests; see [Section 20-4](#).

10-1.05 Wetland Compliance Procedures

10-1.05(a) Legal Authority

The *Interagency Wetland Policy Act of 1989*, ([20 ILCS 830/1](#) et seq.) and the *Implementation Procedures for the Interagency Wetland Policy Act*, (17 IL Admin Code 1090) address the State policy for wetlands. IDOT and IDNR have adopted a Wetlands Action Plan to establish compliance with the goals of the *Interagency Wetland Policy Act of 1989* and the *IL Admin Code*. (See [Appendix C](#) of the *Bureau of Design and Environment (BDE) Manual*).

10-1.05(b) Applicability

The *Interagency Wetland Policy Act* and the *IL Admin Code* apply to all State and IDOT pass-through funded projects involving possible wetland impacts.

See [Section 20-8](#) for wetland procedures.

HARD COPIES UNCONTROLLED

10-1.06 Historic Preservation Compliance**10-1.06(a) Legal Authority**

The following legal authority regulates or influences the policies and procedures for historic preservation compliance documentation:

- *The Illinois Historic Preservation Act* ([20 ILCS 3410/1](#) et seq.),
- *The Illinois State Agency Historic Resources Preservation Act* ([20 ILCS 3420/1](#) et seq.), and
- *The Rules for Review of State Agency Undertakings* (17 IL Admin Code 4180).

10-1.06(b) Applicability

This Section applies to all MFT, TBP, and State funded projects that do not involve federal funds or are not regulated by a federal agency must comply with these *Acts* and the *IL Admin Code*.

If a federal funds are used or a federal action is required, see [Section 20-5](#) for historic preservation compliance.

10-1.06(c) Definitions

The following definitions apply to historic preservation:

1. **Adverse Effect**. The destruction or alteration of all or part of an historic resource; isolation or alteration of the surrounding environment of an historic resource; introduction of visual, audible, or atmospheric elements that are out of character with a historic resource or which alter its setting; neglect or improper utilization of an historic resource that results in its deterioration or destruction; or transfer or sale of an historic resource to any public or private entity without the inclusion of adequate conditions or restrictions regarding preservation, maintenance, or use.
2. **Area of Potential Effects**. The geographic area or areas within which an undertaking may cause changes in the character or use of historic properties, if these properties exist.
3. **Comment**. The written finding by the Director of the effect of a State undertaking on an historic resource.
4. **Committee**. The Historic Preservation Mediation Committee.
5. **Director**. The Director of the Illinois Department of Natural Resources (IDNR) or their designee, who serves as the State Historic Preservation Officer (SHPO).
6. **Historic Resource**. Any property that is either publicly or privately held and which:
 - is listed in the National Register of Historic Places (National Register),

BUREAU OF LOCAL ROADS & STREETS

10-1-6

PROJECT DEVELOPMENT – MFT and State Funds

December 2018

- has been formally determined by the Director to be eligible for listing in the National Register as defined in 16 U.S.C. 470(f),
 - has been nominated by the Director and the Illinois Historic Sites Advisory Council for listing in the National Register,
 - meets one or more criteria for listing in the National Register, as determined by the Director, or
 - is listed in the Illinois Register of Historic Places.
7. Illinois State Archaeological Survey (ISAS). The entity that conducts all archaeological investigations for IDOT projects, in accordance with an intergovernmental agreement between IDOT and the University of Illinois at Urbana-Champaign.
8. State Historic Preservation Officer (SHPO). The official appointed or designated pursuant to Section 101(b)(1) of the *National Historic Preservation Act* to administer the State historic preservation program or a representative designated to act for the SHPO. The SHPO for Illinois is thru the [State Historic Preservation Office](#) within IDNR.
9. Undertaking. Any project, activity, or program that can result in changes in the character or use of historic properties, if any historic property is located in the area of potential effects. The project, activity, or program must be under the direct or indirect jurisdiction of a State agency or licensed or assisted by a State agency. An undertaking includes, but is not limited to, an action that is:
- directly undertaken by a State agency,
 - supported in whole or in part through State contracts, grants, subsidies, loan guarantees, or any other form of direct funding assistance, or
 - carried out pursuant to a State lease, permit, license, certificate, approval, or other form of entitlement or permission.

10-1.06(d) Development

The following procedures will apply:

1. Resource Identification. As early as practical in the development of a proposed highway project, actions will be initiated by the LPA, in cooperation with the District BLRS and BDE, to identify historic resources within the area that the project may affect. These resources may be identified through a variety of sources (e.g., listings of the National Register properties, eligible properties published by the Keeper of the National Register, local inventories of historic sites, coordination with SHPO or local historical groups, field investigations).

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

December 2018

PROJECT DEVELOPMENT – MFT and State Funds

10-1-7

An agreement, currently in effect with SHPO, allows BDE to issue an “in-house” clearance on historic properties for certain project types without the need for field surveys or project-specific coordination with SHPO. For these projects, the dated “Cleared for Letting” box on the Project Monitoring Application (PMA) Cultural Resources screen constitutes the necessary documentation of compliance with the State historic preservation requirements. For project types not covered by SHPO agreement, compliance must be established in accordance with the paragraphs that follow in this Section.

Structures at the time of construction, which are 50 years or older must be submitted for further review for historic significance. LPAs are encouraged to submit structures 40 years or older at time of design to avoid potential delays.

2. Documentation. Upon completion of the actions for identification of historic resources, BDE will forward documentation of the results to SHPO. The documentation will include a brief description of the proposed project, a map, a description of the project location, current photographs of above ground structures more than 50 years old, and, as appropriate, results of historic surveys and archaeological surveys and testing. The transmittal will indicate that the documentation is being submitted pursuant to the *Illinois State Agency Historic Resources Preservation Act* and Rules for Review of State Agency Undertakings, 17 IL Admin Code 4180.
3. Documentation Review. SHPO will review the documentation submitted and will advise BDE if additional information is needed. In accordance with 17 IL Admin Code 4180.250(d), the project may proceed if SHPO fails to provide a response within 45 calendar days after the date of completed documentation (i.e., sufficient documentation to enable SHPO to apply the National Register eligibility criteria to any historic properties identified in the project area).
4. No Historic Resources Present. If SHPO determines that no historic resources exist within the area of potential effects, it may provide a response to that effect within 30 calendar days of the receipt of complete documentation for the project. Upon receipt of a written response from SHPO indicating that no historic resources exist in the area of potential effects, the LPA will be deemed to have met its compliance responsibilities for the project under the *Illinois State Agency Historic Resources Preservation Act*.
5. Findings on Effect. If SHPO determines that historic resources do exist within the area of potential effects, it may issue one of the following findings: no effect, no adverse effect, no adverse effect with conditions, or adverse effect. SHPO should issue its finding within 30 days of the receipt of complete documentation.
6. No Effect or No Adverse Effect. If SHPO issues a finding that the project will have no effect or no adverse effect on historic resources, upon receipt of the written finding, the LPA will be deemed to have fulfilled its compliance responsibilities for the project under the *Illinois State Agency Historic Resources Preservation Act*.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

10-1-8

PROJECT DEVELOPMENT – MFT and State Funds

December 2018

7. No Adverse Effect with Conditions. If SHPO issues a no adverse effect finding with conditions, the LPA will be deemed to have fulfilled its compliance responsibilities for the project under the *Illinois State Agency Historic Resources Preservation Act* once it has met the stipulated conditions and has provided written notification to that effect to the District BLRS. The District BLRS will forward the compliance notification to SHPO through the Central BLRS (CBLRS) and BDE.
8. Adverse Effect. If SHPO issues an adverse effect finding, or if the conditions stipulated for a finding of no adverse effect cannot be met, the LPA and IDOT will initiate consultation with SHPO to examine and discuss alternatives to avoid, minimize, or mitigate the identified adverse effects. (If any of the historic resources involved are listed in the Illinois Register of Historic Places, the requirements of the *Illinois Historic Preservation Act* will apply. Any specific actions necessary for compliance with that Act will be identified and addressed through the consultation with SHPO.) In addition to the LPA, IDOT, and SHPO, parties to the consultation may include other State agencies, local governments, local not-for-profit groups, and other parties of interest, as agreed to by the LPA, IDOT, and SHPO. As a part of the consultation process, the LPA, IDOT, and SHPO may agree to call a public information meeting to obtain comments concerning the project and its effects on historic resources. If it is agreed that a public information meeting will be held for the project, the LPA must provide notice of the meeting at least 30 calendar days before the scheduled meeting date. The notice will be placed in a newspaper of general circulation in the project area and include the following information:
 - date, time, and place of meeting,
 - purpose of the meeting,
 - description of the project,
 - description of the historic resource involved, and
 - the procedure for offering written or oral testimony.

The LPA will designate an officer to conduct the public meeting and who will be responsible for recording the proceedings and providing a written transcript to SHPO within 7 calendar days after the public meeting. See Section [20-3](#) for Section 4(f) and Section [20-5](#) for Section 106 coordination procedures.

9. Elimination of Adverse Effect. After consideration of the information collected during the consultation process, if the LPA, IDOT, and SHPO agree upon a feasible and prudent alternative that eliminates the adverse effect, SHPO will provide written notification indicating that implementation of the agreed alternative will result in no adverse effect on historic resources. Upon receipt of the written confirmation of the agreed alternative from SHPO, the LPA will be deemed to have met its compliance responsibilities for the project under the *Illinois State Agency Historic Resources Preservation Act*. If the LPA subsequently determines that changes are necessary in the agreed alternative which could result in adverse effects on historic resources, consultation with SHPO must be reopened.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

December 2018

PROJECT DEVELOPMENT – MFT and State Funds

10-1-9

10. Memorandum of Agreement for Adverse Effect. After consideration of the information collected during the consultation process, if the LPA, IDOT, and SHPO agree on a feasible and prudent alternative that minimizes or mitigates adverse effects, or if they agree that there are no feasible and prudent alternatives to reduce the adverse effects, SHPO will prepare a Memorandum of Agreement (MOA) describing the alternative or stating the finding. IDOT and SHPO will be the principal signatories to MOA. Other consulting parties will have the opportunity to concur with MOA if they are responsible for carrying out any of the terms of the agreement. Upon execution of MOA and fulfillment of its terms, the LPA will be deemed to have met its compliance responsibilities for the project under the *Illinois State Agency Historic Resources Preservation Act*.
11. Failure to Execute MOA. If the LPA, IDOT, and SHPO fail to agree upon the existence of a feasible and prudent alternative and cannot execute the MOA, see [Section 26-5](#) of the *BDE Manual* for guidance.

10-1.07 Threatened and Endangered Species/Natural Areas Review

10-1.07(a) Legal Authority

The *Illinois Natural Areas Preservation Act* ([525 ILCS 30/17](#)), *Illinois Endangered Species Protection Act* ([520 ILCS 10/11\(b\)](#)), and the Consultation Procedures for Assessing Impacts of Agency Actions on Endangered and Threatened Species and Natural Areas (17 IL Admin Code 1075) require consultation with IDNR.

10-1.07(b) Applicability

The above *Acts* and the *Administrative Code* apply to all actions funded, authorized, or performed by the State and LPAs.

See [Section 20-9](#) for Threatened and Endangered Species/Natural Areas Review

10-1.08 Evaluation of Farmland Conversion Impacts

10-1.08(a) Legal Authority

The following legal authority regulates or influences the procedures on farmland conversions:

- *The Farmland Preservation Act* ([505 ILCS 75/1 et seq.](#)), and
- *The Farmland Preservation Act* (8 IL Admin Code 700).

The following documents also influence the procedures on farmland conversions:

- IDOT's Agriculture Land Preservation Policy (see [Appendix A](#) of the *BDE Manual*), and
- Cooperative Working Agreement between the Illinois Department of Agriculture (IDOA) and IDOT regarding Farmland Preservation (see [Appendix A](#) of the *BDE Manual*).

BUREAU OF LOCAL ROADS & STREETS

10-1-10

PROJECT DEVELOPMENT – MFT and State Funds

December 2018

10-1.08(b) Definitions

The following definitions apply:

1. Agricultural Land or Farmland. All land in farms including cropland, hayland, pastureland, forestland, corrals, gardens, and orchards; land used for farmsteads, buildings, barns, and machinery sheds; adjacent yards or corrals, pens, waste lagoons, feedlots, farmstead or feedlot windbreaks, grain bins, lanes for farm residences and fields, field windbreaks, ponds, commercial feedlots, greenhouses, nurseries, broiler facilities, and farm landing strips.
2. Agricultural Land Conversion. The taking of land directly out of agricultural production or displacing it by another use and not returning it to production.
3. Land Class. One of eight classes of land in the Land Capability Classification System (Handbook 210, issued September 1961, and approved for reprinting January, 1973) as developed by the Natural Resource Conservation Service (NRCS), United States Department of Agriculture. Incorporation by reference does not include any future editions or amendments. The land capability classification shows, in a general way, the suitability of soils for most kinds of field crops. The soils are grouped according to their limitations for field crops, the risk of damage to the soil if they are used for crops, and the way they respond to management.
4. Modern Soil Survey. A document published after 1965 by NRCS containing a description of county's soils, maps showing their distribution, and discussions concerning their behavior and adaptability.

10-1.08(c) Applicability

Coordination with IDOA is required for highway and bridge projects funded in whole or in part with MFT, TBP, State funds and Federal-aid projects, and which require additional right-of-way, unless any of the following apply:

- The project is located within the boundaries of an incorporated municipality,
- The project is nonlinear (e.g., bridge or intersection improvements) and requires acquisition of no more than 10 acres (4 hectares) of land. When the areas of right-of-way for the project approaches the 10 acres (4 hectare) threshold for coordination and the project will likely involve additional acquisition for borrow or mitigation, the project should be coordinated with IDOA. Anticipated sites for borrow and mitigation should be indicated if known, or
- The project is linear; requires acquisition of no more than 3 acres of land per project mile (0.75 ha per project kilometer), (area acquisition divided by project length); and does not involve alternative alignment(s) in which the right-of-way diverges from, and is not contiguous to, the existing right-of-way. When the amount of right-of-way for the project approaches the threshold for coordination and the project will likely involve additional acquisition for borrow or mitigation, the project should be coordinated with IDOA.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

December 2018

PROJECT DEVELOPMENT – MFT and State Funds

10-1-11

If individual coordination is not needed because of the above exemptions, appropriate documentation should be including in the project file. In addition, the following statement should be included in the project report or environmental documentation:

“The impact of this project on farmland conversion has been evaluated in accordance with the September 4, 1984 letter from the U.S. Soil Conservation Service (SCS). Since the project will convert less than three acres per mile and the conversion will not result in more than minor impacts, further coordination with SCS will not be necessary.”

10-1.08(d) Procedures

The following procedures will apply:

1. General. IDOA is especially interested in projects that consider more than one alignment, each of which has different agricultural impacts and different amounts of farmland conversion. Projects with multiple alignments can be as localized as those developed to eliminate offset intersections or as widespread as those for a new freeway connecting distant cities. In all cases, however, only that information which is likely to influence a choice among alternatives should be gathered and considered. For 3R/spot improvements with multiple alignments, soils information should be included when modern soil surveys are available. If modern soil surveys are not available, the remaining coordination information should be forwarded to IDOA. If it is determined that soils information is necessary, IDOA will normally acquire this information.

Where a proposed project will convert farmland to non-farm use, consider measures that could mitigate the scope and impacts of the conversion. In cases where coordination with IDOA is required, this coordination will assist in the identification and evaluation of possible mitigation measures. In all other instances, the LPA should ensure that measures to minimize farmland conversion impacts are appropriately identified and considered.

The LPA will send the project information to the IDOA for review should be addressed as follows:

Illinois Department of Agriculture
Bureau of Land and Water Resources
PO Box 19281
State Fairgrounds
Springfield, IL 62794-9281

BUREAU OF LOCAL ROADS & STREETS

10-1-12

PROJECT DEVELOPMENT – MFT and State Funds

December 2018

When IDOA has completed its review, it will respond in writing to the agency that submitted the information. Early and complete submittals will generally result in a timely response. Should IDOA response contain substantive comments or raise controversial issues, these comments and issues should be addressed to the extent that the information is available, and a response forwarded expeditiously to IDOA. Remaining comments should then be addressed as soon as the necessary information becomes available. Additional follow-up coordination may be required to determine if mutually satisfactory solutions exist prior to assuming an IDOT position at a hearing or in draft and final environmental documents.

The discussions below identify specific procedures for projects involving new construction or reconstruction, and for 3R projects. If coordination with IDOA is necessary and it is unclear whether the project is 3R or reconstruction, the information required for a 3R project should be provided to IDOA as early in project development as practical. When offered an early opportunity to review project information, IDOA can make an initial determination of its degree of interest and request follow-up information, if appropriate, without delaying the project unduly.

2. New Construction or Reconstruction Projects. When coordination with IDOA is required, the timing of the coordination and the information provided is important. When new construction or reconstruction is involved, it is appropriate, shortly after the location study has been initiated, to notify IDOA that a project is being studied and that more detailed information will follow as it is developed. On major projects, it is desirable to maintain contact with IDOA so that potential problems can be identified early to minimize any delays.

On new construction and reconstruction projects, provide IDOA with the description, purpose, and scope of each proposed project together with the following information for each alternative:

- the location, including proposed right-of-way lines if the scale permits, on all the following maps:
 - a general county highway map,
 - a plat map, and
 - a modern soil survey map (if available).
- total land area in acres (hectares) required for additional right-of-way, including frontage and access roads,
- the number of acres (hectares) of each USDA Land Capability Classification (Land Classes I - VIII) and Soil Type (including index number) proposed for acquisition, if applicable,
- identification of all soil types occurring within the proposed right-of-way and the number of acres (hectares) of each soil type, if applicable. Note: Land Class and soil type are obtainable from a county's modern soil survey which may be obtained from a local NRCS field office,

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

December 2018

PROJECT DEVELOPMENT – MFT and State Funds

10-1-13

- indication of each alternative's conformance with the appropriate zoning ordinance and comprehensive land-use plan (i.e., regional, county, city) regulating the project area, if applicable,
 - identification of the following impacts that may be associated with the implementation of the project, as applicable:
 - number of farm units and owners affected,
 - number of farm parcels severed,
 - number of farm unit operations severed,
 - number of landlocked parcels created,
 - miles (kilometers) of adverse travel created for each affected farm unit,
 - effects of the proposal upon existing farm drainage systems (surface and subsurface),
 - acres (hectares) of farmland required for borrow and location of the borrow site (depicted on a soil survey and plat map), if available, and
 - erosion control techniques to be used on the disturbed area during and after project construction,
 - a brief discussion of all measures included to mitigate any adverse impacts identified above, and
 - indication that farmland conversion has been minimized and other appropriate mitigation included for the selected alternative consistent with the operational and safety requirements applicable to the project.
3. 3R Projects. When coordination is necessary, and the proposed improvement primarily involves 3R work on existing alignment, it is appropriate, shortly after location and/or environmental studies have been initiated, to notify IDOA that a project is being studied and to provide the following information:
- description, purpose, and scope of the proposed project,
 - map depicting the location of the project, a county highway map is acceptable,
 - total land area in acres (hectares) required for additional right-of-way and a brief description of its nature (e.g., a 10 ft (3 m) strip on north side, a 3 acre (1 hectare) parcel to flatten curve at location noted on map), and
 - indication that farmland conversion has been minimized and other appropriate mitigation included for the selected alternative consistent with the operational and safety requirements applicable to the project.

10-1.09 Special Waste

Special waste screening is required for MFT, TBP, and State funded projects. The procedure is discussed in the [Section 20-12](#).

HARD COPIES UNCONTROLLED

10-1.10 Groundwater**10-1.10(a) Introduction**

The *Illinois Environmental Protection Act* ([415 ILCS 5/1 et seq.](#)), the *Illinois Groundwater Protection Act* ([415 ILCS 55/1 et seq.](#)), and parts of the *IL Admin Code* impose requirements for protection of the State's groundwater resources to ensure their availability for beneficial purposes.

In the development of proposed LPA highway projects, potential impacts to groundwater resources consideration should be given to implementing practical measures for avoiding, minimizing, and mitigating adverse project impacts to those resources, see [Section 26-22](#) of the *BDE Manual*.

10-1.10(b) Sole Source Aquifers (SSA)

On March 11, 2015 the U.S. Environmental Protection Agency (USEPA) designated a portion of the Mahomet Aquifer system as a sole source aquifer (SSA) for Illinois. The *Safe Drinking Water Act* of 1974 gives the USEPA authority to designate all or part of an aquifer as a "sole source" if contamination of the aquifer would create a significant hazard to public health and there are no physically available or economically feasible alternative sources of drinking water to serve the population that relies on the aquifer. A significant hazard to public health is defined as the level of contaminants in an aquifer would exceed National Primary Drinking Water Standards or exceed Federal, Tribal or state public health advisory levels for currently unregulated contaminants, or violate the intent of EO 12088, "Federal Compliance with Pollution Control Standards." This designation authorizes USEPA review of federally funded projects to assess potential for contamination of the aquifer system.

LPA projects which do not include federal funds or federal action do not require any coordination with the USEPA. However, LPA's are encouraged to coordinate with the USEPA; if their project would have a potential impact to the Mahomet Aquifer. Further information may be found in [Section 26-22](#) of the *BDE Manual*.

LPA projects which do include federal funds or federal action, see [Section 20-13](#).

10-2 PROJECT STUDIES/REPORTS

Section 10-2 provides guidance on the preparation of various project studies and reports for LPA MFT, TBP, and State funded projects.

10-2.01 Information Sources

Engineering investigations must determine if the proposed highway improvement satisfies the need for safe, economical, and efficient transportation and provides other relevant benefits (e.g., traffic benefits, public services, reduction of crashes, pedestrian facilities, transit considerations). The following sections identify informational sources that are important in establishing the need for the highway improvement.

10-2.01(a) Functional Classification

[Section 27-3](#) discusses the application of the functional classification system in Illinois for geometric design applications. All highway improvements must be compatible with the functional classification of the highway under design. A highway's functional classification and highway type are important factors in determining which design policies and criteria to use and for establishing programming priorities for new construction, reconstruction, or 3R-type improvements. [Five Year Classification Maps](#) are available from the IDOT Office of Planning and Programming (OPP).

10-2.01(b) Highway Data Bank

OPP is responsible for maintaining the Illinois Highway Information System (IHIS), which includes the [Roadway Information and Procedure Manual](#) (IRIS) and [Structure Information and Procedure Manual](#) (SIP). The LPA may obtain computer generated route log listings for the State routes and local roads and streets from OPP. The available data is dependent on the highway system. The following major items may be available:

- administrative classification,
- physical dimensions,
- roadway characteristics,
- traffic data,
- geometric data,
- pavement cross sections, surface type, drainage, and shoulder conditions, and
- bridge inspection and appraisal data.

A complete listing of items is shown in the indices of the *Illinois Highway Information System - Roadway Information and Procedure Manual* and the *Structure Information and Procedure Manual*.

10-2.01(c) Current and Projected Traffic Volumes

Under the general guidance of OPP, the districts count and classify existing traffic volumes on the State highway system and some local roads and streets. OPP also maintains data used to project future traffic volumes (e.g., annual traffic growth factors). The following traffic data may be available from the District:

- current hourly and daily traffic volumes,
- current turning movement volumes,
- traffic projections and assignments for new facilities, and
- traffic projections for future design years on existing facilities.

Similar data, developed in conjunction with the Urban Transportation Planning Process, also may be available from Metropolitan Planning Organizations (MPOs). Because the design of a project is dependent upon the projected design hourly volumes, these figures must be carefully examined and questioned before using for design purposes. Improper traffic projections can result in the construction of unnecessary or inadequate highway improvements.

10-2.01(d) Crash and Skid Reduction Analyses

During the preliminary study, identify areas on the Five-Percent Report and computer-generated listings that report supplemental data for high-crash spots and roadway sections, statewide average crash rates, and all crash patterns (e.g., fixed objects) at various sites throughout the project. The Bureau of Safety Programs and Engineering (BSPE) regularly provides crash information upon request. The following is a partial listing of available crash information:

- Five-Percent Report and computer-generated listings that report supplemental data for high-crash spots and roadway sections,
- county crash summaries,
- municipal crash summaries,
- reports which can be generated for individual locations, selected geometric feature, or type of crash:
 - Five-Percent Report,
 - Intersection Profile,
 - Segment Profile,
 - Location Summary,
 - Crash – One-Line Listing,
 - Intersection Summary,
 - Cross Tab
 - Time of Day by Severity,
 - Crash Type by Severity,

BUREAU OF LOCAL ROADS & STREETS

December 2018

PROJECT DEVELOPMENT – MFT and State Funds

10-2-3

- Conditions by Severity,
- Time of Day by Day of Week,
- Roadway Description,
- Roadway Summary, and
- Animal/Vehicle Collisions.
- statewide average crash rates (distributed annually for comparison with existing project crash rates for proposed improvement justification),
- collision diagram printouts for roads and streets on the local system when the LPA is part of the Local Accident Reference System (LARS) and for intersections with State highways. Collision diagram computer plots also may be requested for intersections,
- individual crash reports for above locations, upon request from a microfilm or imaging retrieval system,
- summaries of Motor Vehicle Traffic Crashes and statewide average percentages by type of collision, light condition, and road surface. These percentages may be compared with project percentages from collision diagram summary sheets to help identify over-represented crash patterns.

10-2.01(e) Airport Coordination

Highway and bridge improvements within 2 miles (3.2 km) of publicly owned airports, within 1 mile (1.6 km) of privately-owned airports open to the public, and within 0.5 miles (0.8 km) of restricted-landing areas require coordination with the IDOT's Office of Intermodal Project Implementation, Bureau of Aeronautics. These coordination requirements concerning distance to an airport are in conjunction with height obstructions of 15 ft (4.6 m) or more above the roadway. In addition, the LPA must coordinate with the Bureau of Aeronautics for all realignments and construction improvements on new location regardless of the height of obstruction.

For those airports that are publicly owned, coordination with the Federal Aviation Administration (FAA) is required. Contact the Bureau of Aeronautics prior to communicating with FAA.

Airport clearance requirements could affect the controlling elevations and locations of pavements and structures. Discuss the necessary construction equipment (e.g., cranes, pile drivers) and highway appurtenances (e.g., signs, lighting, traffic signals, utility poles) that might affect airspace clearances. During the project's development, also contact the local airport authorities to ascertain that any proposed airport expansion plans will not cause the highway improvement to conflict with future airspace clearances. Any required vertical clearance permits must be obtained prior to plans, specifications, & estimates (PS&E) approval. Airspace clearances are defined in the Aviation Safety (92 IL Admin Code 16).

HARD COPIES UNCONTROLLED

10-2.01(f) Railroad Coordination

When a project is involved with a railroad grade crossing or separation, coordination with the affected railroad should take place at an early stage to determine if any improvement is necessary to the railroad facility and to determine funding responsibilities for the improvement. Before the railroad work can begin, it will be necessary to prepare a railroad agreement or to obtain the approval of the Illinois Commerce Commission (ICC).

[Section 5-6](#) discusses when a railroad agreement is required, agreement format, and procedures for preparing and executing the agreement. Additionally, [Section 5-6](#) provides guidance on petitions before ICC and ICC Stipulated Agreements.

During preliminary engineering, the following will occur:

1. **General.** In most instances, the LPA is responsible for the preparation of the plans for new construction, modernization, or reconstruction of highway structures, drainage facilities, and the approaches. Occasionally, the railroad will prepare plans for a structure carrying the railroad over a local highway.

All plans, specifications, and special provisions prepared by either the LPA or the railroad are subject to approval by the other party, and no changes will be allowed by either party without the consent in writing of the other party.

2. **Railroad Structures Designed By or For the Railroad.** This applies to a railroad structure over a local highway or street. When the railroad elects not to perform the structure design with its own forces and the LPA does not have the forces available to perform the design within the required schedule, a consultant may be employed to perform the design. Typically, the LPA will select a suitable consultant from a list of consultants approved by the railroad, but must follow the requirements in [Section 5-5](#). The design work is then performed by agreement between the LPA and the consultant with the railroad's approval.

In certain cases, where justified, the railroad will select a consultant to design the structure and enter into an agreement with the consultant for the design. The selection of the consultant and the terms, including fee, is subject to the LPA's approval.

In those projects where Federal-aid funds are anticipated for reimbursing the railroad's consultant for the cost of preparing the plans for a structure, the preliminary engineering cost must be programmed before IDOT can authorize the preparation of such plans.

3. **Preliminary Engineering Portion of Railroad Force Account Work.** The railroad will generally perform the preliminary engineering with its own forces for the railroad force account work covered by construction agreements between the LPA and the railroad.

In special instances (particularly warning device system design), the railroad may use the services of a consultant retained by the railroad to perform the preliminary engineering.

10-2.02 Intersection Design Studies**10-2.02(a) General**

An Intersection Design Study (IDS) is a graphic representation of a proposed treatment for the development or improvement of an intersection facility. It is based on an analysis of traffic needs and an evaluation of physical and economic elements at the intersection site. [Chapter 34](#) provides the design criteria for intersections.

The LPA will be required to prepare an IDS for intersections if any of the following conditions apply:

- in a rural area when both roads have a current 30th maximum design hourly volume (DHV) of 300 vehicles or more,
- in a rural area when a local road with a current DHV of 300 or more intersects a State marked route,
- in an urban area when both streets have a current DHV of 400 vehicles or more,
- in an urban area when a local street with a current DHV of 400 or more intersects a State marked route,
- when additional lanes and/or channelization is proposed on one or both routes, or
- any intersection designed as a roundabout.

The above conditions apply to all intersections including the terminus of a project.

[Chapter 14](#) of the *BDE Manual* provides guidelines for the preparation of an IDS and the data that is required to be documented. The designer should also consider the following:

- if an existing intersection would normally require an IDS, but it is found to be adequate for the design year traffic, a capacity analysis is considered adequate,
- for any intersection where additional turning lanes or channelization are proposed, and traffic volumes are less than those shown above, a capacity analysis will not normally be required,
- for warrants on traffic signals, see [Chapter 39](#).

10-2.02(b) Processing

All IDSs and major geometric changes for MFT, TBP, and State funded projects should be reviewed by the District geometrics unit, as a best practice

10-2.03 NBIS Length / Bridge Condition / Hydraulic Report**10-2.03(a) NBIS Length**

Based on the definition of a bridge by the American Association of State Highway and Transportation Officials (AASHTO) and as given in the National Bridge Inspection Standards (NBIS), the NBIS length is 20.0 ft (6.1 m).

10-2.03(b) Bridge Condition Report

The Bridge Condition Report (BCR) summarizes the findings of the investigation of a bridge and its components. It is used to establish the scope of work on the extent of repair, replacement (partial or total), and widening or other improvements. The BCR allows the LPA and IDOT to determine the most cost-effective method of correcting the reported structural, geometric, or hydraulic deficiencies and for restoring a bridge to a structurally adequate and functionally serviceable condition.

A BCR is not required for total structure replacement for projects using non-federal funding.

A BCR is required for all repair projects affecting the load carrying capacity of the structure (an abbreviated BCR will be allowed), rehabilitation and widening projects or for which a Preliminary Bridge Design and Hydraulic Report (PBDHR) must be submitted for IDOT approval. This includes not only projects using MFT, TBP, or State funds, but also bridges of NBIS length or greater, also see Sections 10-1.01(c) and (d). All rehabilitation and widening projects require an in-depth report and is to include color photos. The following items are necessary for an in-depth report:

1. Introduction. The introduction should provide the reason for the report.
2. Administrative and Geographical Information. The report should include detailed administrative and geographical information (e.g., facility carried, feature crossed, age of bridge).
3. Inspection Information. Include what type of inspection was performed (e.g., visual, testing type, equipment), results of inspection, degree of impairment to structure, and any structural deficiencies. Precast prestressed deck beams should be sounded and scaled as part of the inspection.
4. Description. The report should include a description of the physical condition of the bridge and the deficiencies that require correction.
5. Verification. The ability and capacity of the existing structure for reuse should be verified and documented. This should include at a minimum, a statement that the structure is adequate for the required and stated design load. In addition, for structures to remain over waterways, the BCR should verify the adequacy of the structure for scour.
6. Recommendations. Note all recommended repairs and any methods of repair.
7. Justification. Provide justification for any proposed work.

BUREAU OF LOCAL ROADS & STREETS

December 2018

PROJECT DEVELOPMENT – MFT and State Funds

10-2-7

8. Photos. Include color photos of deficient areas.
9. Asbestos Determination (Form BLR 10220). Form [BLR 10220](#) is required when the scope of work disturbs the bridge deck or wearing surface, if not previously submitted.
10. Master Structure Report (S-107). This report is output from the [Structure Information Management System](#) (SIMS). The current S-107 should also be included with the PBDHR submittal.

For structures on 3R and resurfacing only projects not requiring any rehabilitation and where change in surface thickness is 0 in. or greater, provide color photos and a description of the structures as described in the Master Structure Report, as well as Form [BLR 10220](#). These structures should preferably be in good condition (structure condition rating of 5 or greater). A formal BCR will then not be required for these structures. However, a load rating analysis, with submittal of Form [BBS 2795](#) and Form [BLR 06510](#), will be required, as well as other materials described in Section 4.2 of the [Structural Service Manual](#).

When the scope of the anticipated rehabilitation work is limited to bridge deck and minor structural repairs (without need for a widening or replacement), only the preparation of a Bridge Condition Report for Deck Repair is required. Because the geometrics of the structure will not be altered, this type of work normally will not require a Type, Size, and Location (TS&L) submittal as discussed in Section 10-2.03(b). However, a load rating analysis, with submittal of Form [BBS 2795](#) and Form [BLR 06510](#) will be required, as well as other materials described in Section 4.2 the [Structural Service Manual](#).

Submit the required number of copies of the BCR to the District BLRS. The District BLRS will forward the BCR to the Local Bridge Unit (LBU) in the Bureau of Bridges and Structures (BBS) for review and approval. The BCR must be approved prior to or with the approval of the PBDHR.

10-2.03(c) Preliminary Bridge Design and Hydraulic Report (PBDHR)

The PBDHR contains the necessary information for use by IDOT personnel to review the preliminary bridge design and hydraulics for LPA bridge and culvert construction projects, and for obtaining construction permits from the IDNR Office of Water Resources (OWR). For further information on permits, see [Chapter 7](#). Submittal of PBDHR to IDOT is required for all structures of NBIS length or greater, as well as when a permit is to be issued except for:

- structures having a clear span of 10 ft (3 m) or less, or a waterway opening of 100 ft² (9 m²) or less (including over-the-road flow) for the design flood.

In addition, submittal is not required for structures for which the preliminary design has been prepared by IDOT.

Prior to the submittal of the PBDHR to the BBS, the proposed structure number (SN) must be assigned and entered into IHIS by the District (see [Section 6-2](#)).

BUREAU OF LOCAL ROADS & STREETS

10-2-8

PROJECT DEVELOPMENT – MFT and State Funds

December 2018

For most projects where the structure is a rural stream crossings, a completed Form [BLR 10210](#) with attachments, including the plan and profile sheet, hydraulic/hydrologic analysis and calculations, foundation borings/soil report (see Section 10-2.05), Asbestos Determination Certification (Form [BLR 10220](#)), Scour Critical Evaluation Coding Report (Form [BBS-SCE](#)), hydraulic certification statement, or joint application form as applicable, should provide sufficient information for IDOT to review and approve proposed projects.

Detailed TS&L drawings must be prepared and submitted as part of PBDHR for projects that have at least one of the conditions listed below:

- structures carrying or crossing an Interstate highway,
- a roadway under the jurisdiction of the State of Illinois,
- structures over roadways or railroads,
- urban structures,
- structures having a clear span of 100 ft (30 m) or greater,
- projects funded with Illinois Major Bridge funds,
- unusual or complex structures,
- structures designed by IDOT,
- retaining walls,
- multi-use structures, or
- boardwalks.

Simple structures, such as rural precast concrete deck beam structures on pile bent spill thru abutments and piers, or simple culverts, typically do not require TS&L drawings, as Form [BLR 10210](#) and plan and profile sheet are sufficient to describe the proposed structure. In addition, for pile supported substructures, the pile encasement type should be provided on Form [BLR 10210](#). For similar locations using superstructures such as steel wide flange beams (or plate girders, concrete I-beams, etc.), the PBDHR submittal must include a cross section thru the superstructure. The additional structure information is provided for IDOT personnel to review and approve the preliminary bridge design.

The following information and/or forms should be included with the PBDHR as applicable:

1. Stream Crossings. For most rural stream crossings, a completed Form [BLR 10210](#) with attachments should provide sufficient information for IDOT personnel to review and approve preliminary bridge designs.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

2. Borings/Structural Geotechnical Reports (SGR). Foundation borings are required following the procedures in the [IDOT Geotechnical Manual](#) (see Section 10-2.05). Record the boring data for all structures on the Soil Boring Log (Form [BBS 137](#)), or similar form. Include this data as part of the Form [BLR 10210](#) submission. When appropriate, borings are required to be submitted with the PBDHR. This assists the BBS in review of the preliminary foundation design and for determination of scour (SIP Item 113). There may be occasions when borings are to be taken “Before Final Design”, such as:

- a. some culverts, and
- b. single span pile bent spill thru bridges where SIP Item 113 is coded “8B” for scour, and the only decision is pile type.

Boring information is highly recommended at an early stage and before the PBDHR submittal. The waiving by the BBS of the boring/SGR requirement with the submittal is not automatic. PBDHRs submitted without this required information for approval of the PBDHR may be returned as incomplete.

3. Pile Encasement Type. For pile supported substructures, the pile encasement type should be provided on Form [BLR 10210](#).

4. Superstructure Cross Section. For locations using superstructures such as steel wide flange beams (or plate girders, concrete I-beams, etc.), the PBDHR submittal must include a cross section thru the superstructure.

5. Type, Size, and Location (TS&L) Plans. TS&L drawings are detailed bridge configuration plans that are used as the basis for the development of construction plans.

4. Certification Statements. The certification statements included with the Hydraulic Reports submitted to IDOT should reference the [IDOT Drainage Manual](#) as the publication providing the policies and procedures for determining hydraulic adequacy. See [Section 7-2](#) for permitting and certification requirements for those structures requiring an OWR permit.

The information below is provided for approval requirements for those structures not requiring an IDNR construction permit:

- a. Structures for Drainage Areas Not Requiring a Permit. This is applicable for structures in rural areas with drainage areas less than 10 mi² (26 km²) and for structures in urban areas with drainage areas less than 1 mi² (2.6 km²). The following certification statement should be included with the PBDHR submittal:

<p>I hereby certify that the waterway opening for the proposed structure has been designed using hydrologic and hydraulic engineering methods in accordance with the policies and procedures presented in the Drainage Manual of the Illinois Department of Transportation.</p>	
P.E. Seal	(Signature): _____
(with date of expiration)	Date: _____

BUREAU OF LOCAL ROADS & STREETS

10-2-10

PROJECT DEVELOPMENT – MFT and State Funds

December 2018

- b. Superstructure Replacements Not Requiring a Permit. A PBDHR submitted to BBS for a superstructure replacement project should contain a certification statement that the existing structure has not been the cause of “demonstrable flood damage,” similar to the certification statement for the Statewide Permit 12 provided in [Section 7-2](#). When using this certification, the engineer should consider the structural and hydraulic adequacy of the structure to remain, including scour.

If the municipal or county engineer cannot provide the certification statement for flood damage, a complete hydrologic and hydraulic analysis is required to verify the hydraulic adequacy of the existing waterway opening, and the following certification statement should be included with the report.

I hereby certify that the waterway opening for the existing/proposed structure has been analyzed and evaluated using hydrologic and hydraulic engineering methods in accordance with the policies and procedures presented in the Drainage Manual of the Illinois Department of Transportation.

P.E. Seal (with date of expiration) (Signature): _____ Date: _____

When making this certification, the engineer is acknowledging that the “design risk assessment process” has been performed as described in the [IDOT Drainage Manual](#).

- c. Maintenance/Rehabilitation Exceptions. The current policy of IDNR OWR does not require a construction permit for projects considered to be maintenance. Maintenance includes repair or replacement of the superstructure, widening or resurfacing, minor dredging to restore the waterway opening to the original cross section design, and culvert extensions of up to 100%, but not exceeding 40 ft (12 m) in length (i.e., culvert extension of up to 40 ft (12 m) on an existing 40 ft (12 m) culvert).

However, IDOT requires the hydraulic adequacy of the existing waterway opening be investigated to approve PBDHR for certain projects. Such includes projects that involve the use of federal or State funds, or locally funded projects when the clear span is NBIS length or greater.

Projects involving the total removal of an existing superstructure and the construction of a new superstructure on the existing substructure units, and culvert extensions as noted above, require hydraulic submittals.

The hydraulic submittal should include the existing and proposed design and 100-year hydraulic openings and elevations and must be sufficient to evaluate the impacts of scour on the existing substructure to remain (for bridges). Note that approval of the BCR requires verification of scour adequacy, which may require hydraulic evaluation for scour during that phase. The supporting data should be included, and a certification statement included that the existing structure has not been the cause of “demonstrable flood damage”. Use a certification statement similar to that provided for Statewide Permit 12 provided in [Section 7-2](#).

5. Review. Submit the required number of copies of the PBDHR to the District BLRS for transmittal to BBS for review and approval.
6. Proposed Structure Number (SN). The proposed SN, when required, should be assigned and entered in the IHIS prior to submittal, and must be entered before approval of the PBDHR.
7. Design Exceptions. The PBDHR is to include justification for any design exceptions necessary for the structure (i.e. the clearance above design highwater elevation).

The LPA is responsible for obtaining all other permits including IDNR OWR (individual permits) when necessary. Approval of the PBDHR by IDOT will be contingent on the hydraulic approval and permit by IDNR OWR. For additional guidance on permits, see [Chapter 7](#).

10-2.04 Drainage Studies

The roadway alignment is dependent on the interrelationships of several variables. High-water elevations and the depth of roadway ditch flow for surface drainage directly influence the gradeline. Hydraulic structure sizes and storm sewer systems may significantly affect project cost estimates. For these and other reasons associated with drainage controls, a drainage study containing preliminary hydrologic and hydraulic analyses should be prepared where highway drainage and/or structures will significantly affect the design or cost of a project. A drainage study is an investigation of the existing and proposed drainage patterns that affect a section of roadway. Drainage studies are discussed in more detail in the [IDOT Drainage Manual](#). See [Chapter 38](#) for drainage design guidelines.

The district may request that a drainage study be submitted for review when a concern about the adequacy of a drainage feature is identified during review of the plans.

10-2.05 Geotechnical Studies and Reports

10-2.05(a) Geotechnical Report

The purpose for a Geotechnical Report is to provide insight into area geology, pedology, and other engineering factors to be used by the designer. If soil stability problems are anticipated, a preliminary Geotechnical Report should be prepared during the preliminary study phase. Information on the geotechnical reports can be found in the [IDOT Geotechnical Manual](#).

While a final pavement design is usually not needed until plan preparation, a determination of pavement type and approximate thickness may be needed during the preliminary study phase. [Chapter 44](#) discusses pavement design procedures and when a Geotechnical Report is required.

10-2.05(b) Structure Geotechnical Report (SGR)

A SGR is necessary for projects involving bridges, culverts, retaining walls, or other structures. However, for many LPA structures, such as those on low volume roads with little change in grade, it may be possible the SGR consists only of soil borings with foundation recommendations.

The design engineer must ensure foundation information provided is sufficient. All soil borings must be tied to the vertical and horizontal project datum.

The SGR shall be included with the PBDHR submittal to the BBS. For additional requirements for PBDHR submittals see Section 10-2.03(c).

10-2.06 Commitments

A commitment is a documented obligation or promise made by a properly authorized representative of the LPA for carrying out a specific action or actions affecting the planning, design, land acquisition, construction, or operation of a highway project that involves special consideration and action. A commitment file must be kept for all State funded local projects and is recommended for MFT projects. [Section 22-2](#) provides additional information concerning the recording of commitments. When applicable, note the commitments in the project agreements and contract documents. The commitment list is to be included with the plan submittal to the District BLRS. If the LPA is under an MFT Memorandum of Understanding, the LPA is responsible for providing the District BLRS with a copy of their commitment file at the same time as the rest of the project file is submitted.

10-2.07 Design Criteria

10-2.07(a) General

Design criteria for MFT and State funded projects can be found in [Part IV](#) of the *BLRS Manual*. Use Form [BLR 22120](#) to document the adherence of the proposed project to the BLRS design criteria. For those agencies without a licensed professional engineer (PE) on staff, the entire form must be fully completed and submitted to the District BLRS prior to submittal of the plans.

10-2.07(b) Design Exceptions

In general, the designer is responsible for making a reasonable effort to meet the design criteria presented in this *Manual*. However, recognizing that this will not always be practical or cost effective, [Section 27-7](#) discusses the evaluation of design exceptions to the geometric design criteria.

BUREAU OF LOCAL ROADS & STREETS

December 2018

PROJECT DEVELOPMENT – MFT and State Funds

10-2-13

Form [BLR 22120](#) is also used to document the justification and approval of design exceptions that are necessary for the completion of the project. The form must be fully completed by those LPAs without a licensed professional engineer on staff. LPAs with a licensed PE on staff will only need to complete page one of the form and those portions of the form where a design variance from a specific design criterion is being requested.

Requests for design exceptions should be submitted in writing to the District BLRS. A written response will then be sent to the LPA.

LPAs operating under an Agreement of Understanding will be allowed to determine the acceptability of Level Two design exceptions without District BLRS approval. A copy of the form should be kept in the LPA's project file.

10-2.08 Work Zone Transportation Management Plans for Impact on State Highways

For MFT or state funded projects that impact a State highway, the LPA shall follow procedures contained in Section [22-2](#) except the LPA should coordinate directly with the District rather than taking to a FHWA/IDOT coordination meeting.

10-2.09 Complete Streets for State-Maintained Routes

10-2.09(a) General

[605 ILCS 5/4-220](#) requires that bicycle and pedestrian ways shall be given full consideration in the planning and development of transportation facilities, including the incorporation of such ways into State plans and programs. Therefore, when a LPA project follows or intersects a State highway, and there is any type of work (including the addition of turn lanes) to the State highway, [Chapter 17](#) of the *BDE Manual* will apply to the State highway.

10-2.09(b) Application

For all LPA projects that impact a State highway in or within one mile of an urban area, bicycle and pedestrian ways shall be established for State highways in conjunction with the construction, reconstruction, or other change of any State transportation facility except:

1. In pavement resurfacing projects that do not widen the existing travel way or do not provide stabilized shoulders; or
2. Where approved by the Secretary of Transportation based upon documented safety issues, excessive cost, or absence of need.

The location of the State highway in a non-urban area is in and of itself insufficient to automatically exclude it from consideration of the Complete Streets law. Other factors to consider include bicycle accommodations on either side of the project, bicycle generators in the project vicinity, bicycle travel along State highways, and safety concerns.

BUREAU OF LOCAL ROADS & STREETS

10-2-14

PROJECT DEVELOPMENT – MFT and State Funds

December 2018

The District or CBLRS may direct questions regarding the applicability of the law to the Statewide Bicycle and Pedestrian Coordinator.

10-2.09(c) Construction Options for Bicycle Travel

Each project must be evaluated on an individual basis. Some of the options in accommodating bicyclists on a State-maintained route include:

1. The installation of a 10-foot wide shared use path;
2. Paved shoulders in accordance with policy guidelines in the *BDE Manual*; or
3. In urban areas, a wider travel way.

Appropriate bicycle accommodations at roadway intersections along the State highway are required (curb cuts, ADA ramps, etc.).

10-2.09(d) Exceptions to the Complete Streets Law

The Secretary of Transportation must specifically approve accommodation exceptions in or within one mile of urban areas covered in the law based on documented safety issues, excessive cost (as determined by the *BDE Manual*), or absence of need. The LPA shall submit their request of exception to the District. Signed documentation of the Secretary's concurrence shall be included in the project files.

10-2.09(e) Funding for Complete Streets

The LPA will be responsible for the cost of any work along a State highway required by the bicycle and pedestrian accommodations.

10-3 RIGHT-OF-WAY

The procedures for the acquisition of right-of-way by a LPA are flexible but should adequately address all significant concerns based on the specific situation. [605 ILCS 5/5-801 thru 803](#), [605 ILCS 5/6-801 thru 805](#), and [65 ILCS 5/11-76, 76.1, and 76.2](#), also govern the acquisition of right-of-way. This Section presents a general overview of right-of-way issues for LPAs. The [IDOT Land Acquisition Policies and Procedures Manual](#) provides additional guidance and potential requirements in the acquisition of right-of-way.

Additional coordination through the District Bureau of Land Acquisitions is required when:

- federal funds are used in any phase of the project (see [Section 22-3](#));
- right of way is to be acquired in the name of the State (see Section 10-3.03); or
- coordination is a requirement of the state funds. Additional coordination is typically not required when using state funds such as Economic Development Program (EDP), Truck Access Route Program (TARP), or listed under [Section 4-2](#).

10-3.01 Interest to be Acquired

10-3.01(a) Fee Title

LPAs may expend MFT funds to acquire fee title to any land, rights, or other property necessary for highway purposes by purchase or through eminent domain. It is recommended that fee title to be acquired for all right-of-way within the proposed right-of-way line, except when it is considered feasible to acquire a dedication or permanent easement. Ensure deeds or court orders are recorded in the county in which the property is located.

10-3.01(b) Dedication

Dedications are when a property owner of private property allows the land to be used for public use, and the acceptance by the proper public authority. This is commonly done when a developer of a subdivision dedicates the right-of-way for the roadways which are to be accepted by the LPA.

10-3.01(c) Permanent Easement

Permanent easements for highways purposes, are acquired for the perpetual right to construct and maintain a public highway and incidental facilities over and across the surface of lands. Examples would be construction and/or installation of appurtenant highway facilities such as outfall storm sewers, riprapping of stream channels, or channel changes are examples that may require future entry for maintenance, or future improvements. Ensure permanent easements are recorded in the county in which the property is located.

10-3.01(d) Temporary Easement

Temporary easements are grants of an estate or interest in the land and are irrevocable. Ensure that the easements are recorded. They are transferred with the sale of the land. Acquisition of temporary easements should be accomplished in the same manner as the acquisition of a fee acquisition or a permanent easement. Obtain temporary easements where the specified use is essential to the completion of a project and future entry is not necessary. Examples when a temporary easement may be necessary are detour roads; borrow pits (owned or furnished by the LPA), removal of the remainder of buildings located partially on acquired right-of-way, or channel changes requiring no future maintenance by the LPA. Ensure temporary easements are recorded in the county in which the property is located.

10-3.01(e) Temporary Use Permit and Right-of-Entry

Occasionally once construction has begun, an unknown issue may arise requiring work off the right-of-way. In this case, a temporary use permit and right-of-entry may be appropriate and are the terms used to describe a license giving permission to a LPA to do a particular act or series of acts on the land of another without possessing any estate or interest in that land.

A license with respect to real property does not usually continue with the sale of the land and may be terminated in various ways. Consequently, the acquisition of temporary use permits should be confined to particular areas of construction (e.g., sloping of lawns, extending back slope beyond the right-of-way lines, reconstruction of driveways) where a nominal amount of money is involved, the probability of termination is minimal, and the effect of termination would not jeopardize completion of the project.

10-3.01(f) Right-of-Way Donations

Right-of-way for MFT projects may be secured through right-of-way donations. Ensure the landowner has been informed of their right to receive just compensation. However, in case of donations, it is not necessary to appraise the property or to offer compensation. It is recommended the LPA follow Section 4.1.12 of the [IDOT Land Acquisition Policies and Procedures Manual](#) including the various forms.

10-3.01(g) Acquisition of Railroad Property

When the LPA requires property interest from a railroad to complete a highway improvement, sufficient lead time to acquire these interests is essential. Once it is determined that a project will require the acquisition of property owned or under the control of a railroad, it is critical that the CBLRS be informed. The following will apply:

1. Acquisition of Railroad Non-Operating Property. The acquisition of non-operating railroad property is accomplished in the same manner as any other acquisition of property for a highway improvement.

2. Acquisition of Railroad Operating Property. Where a proposed highway improvement will cross or longitudinally use a railroad's operating property, the LPA generally will acquire a permanent easement to construct and maintain the improvement. There will be instances when a highway project will require only the temporary use of railroad property. When this situation occurs, permission to do work of a temporary nature on railroad right-of-way will be included in the construction and maintenance agreements between the LPA and the railroad.

The railroad is responsible for executing the necessary documents to cover the rights or interests required for the highway project, regardless of whether it owns the fee title or easement. Section 3.6.16 of the [IDOT Land Acquisition Policies and Procedures Manual](#) provides information on the compensation of railroad right-of-way. If condemnation is necessary, consult with the District BLRS and Land Acquisition. However, note that permission of the ICC is a prerequisite to the filing of the complaint for condemnation and motion for the right of immediate possession and the time required must be considered when scheduling the project.

10-3.02 Right-of-Way Statement

LPA projects built under the supervision of IDOT should not be advertised for letting until the necessary right-of-way has been secured. Material awards for day labor projects should not be made until the necessary right-of-way for construction has been secured. Authorization for the expenditure of MFT funds for day labor materials or work will not be given to the LPA until the right-of-way is clear. As soon as the right-of-way has been secured, the appropriate LPA official (e.g., county engineer, highway commissioner, city engineer, municipal official) is responsible for submitting a statement to that effect to the District BLRS.

10-3.03 Right-of-Way for a State Highway

If the right-of-way will be acquired for work on a State highway, the LPA must follow IDOT's procedures for land acquisition. If the acquired right-of-way is to be added to the state's highway system, full compliance with Title II and III of the *Uniform Relocation Assistance and Real Property Acquisition Act of 1970* is mandatory. Contact the District's Bureau of Land Acquisition to coordinate before proceeding.

10-3.04 Right-of-Way Procedures Versus Funding Type

If there is a possibility that a MFT funded project may be changed to a federally funded project, ensure that the federal procedures for land acquisition are followed; see [Section 22-3](#). If proper procedures were not followed, the project may not be eligible for federal funding.

10-3.05 Right-of-Way Markers

Right-of-way markers are required on all county improvements; their use is optional on township and municipal improvements.

10-4 UTILITY COORDINATION

10-4.01 Definition

A utility is defined as a privately, publicly, or cooperatively owned line, facility, or system for producing, transmitting, or distributing communications, cable television, power, electricity, light, heat, gas, oil, crude products, water, steam, waste, storm water not connected with highway drainage, or any other similar commodity. This includes any fire or police signal system or street lighting system, which directly or indirectly serves the public. The term utility also applies to a utility company inclusive of any wholly owned or controlled subsidiary. The term utility includes those facilities used solely by the utility that are a part of its operating plant.

10-4.02 Plan Preparation and Field Location of Utilities

Generally, it will be the responsibility of the planner and designer to attempt to locate, identify, and, to the maximum extent practical, avoid disturbance, or to provide for the relocation of all existing identified utilities. Send a copy of the preliminary plans to all affected utility companies in the early stages of the project.

In the design plans, show the type and nature of all utility facilities (mains and services) located within the limits of the right-of-way and indicate all owners, their addresses, and list the Joint Utility Locating Information for Contractors (JULIE) phone number (800-892-0123) or 811.

Show the utilities with the appropriate symbols. For guidance, see the [IDOT Highway Standards](#) and [IDOT CADD, Modeling and Deliverables Manual](#). The vertical and horizontal location of utilities, to be relocated or adjusted by their owners, need not be exact. However, if the utility were to remain in place or were relocated or adjusted by the contractor, vertical and horizontal dimensions must be shown to the accuracy provided by the utility owner.

When a utility owner fails or refuses to stake the utility or provide a written statement to the contractor, the Engineer will authorize the contractor to locate the facility with payment made in accordance with the [IDOT Standard Specifications](#). If a utility is located on right-of-way by permit, the cost of locating the utility should be at the utility owner's expense.

10-4.03 Estimates and Final Bills for Moving or Removing Utilities

Utility agreements are necessary when an improvement requires relocation or adjustment of utility appurtenances, except when existing permits provide for moving or removing a utility. [Section 5-7](#) provides guidance on a preparation of the utility agreement.

In preparing the cost estimate, consider the following:

1. District Review. The District must review and approve the cost estimate for the work before the work is started. When only MFT funds are involved and the total cost of the utility adjustment is less than \$5,000, neither an estimate of cost nor an audit of the final bill will be required.

BUREAU OF LOCAL ROADS & STREETS

10-4-2

PROJECT DEVELOPMENT – MFT and State Funds

December 2018

2. Additional Information. Indicate the age of the existing facility on the cost estimate. Include a staking diagram that shows the existing and proposed right-of-way lines.
3. Cost Details. Include the applicable items from the following list in the cost estimate:
 - a. cost of labor for moving or removing existing utility,
 - b. equipment expense for moving or removing existing utility,
 - c. cost of labor for installation,
 - d. equipment expense for installation,
 - e. cost of new material necessary for installation,
 - f. credit for extended service life,
 - g. engineering and overhead costs,
 - h. credit for betterments not required by road construction, and/or
 - i. material salvage from existing utility.

Provide a detailed estimate for Items 3a through 3e, 3h, and 3i showing the number of hours, rate, kind of equipment, items of material, etc. For Items 3f and 3g, provide detailed computations.

4. Labor Rates and Equipment Rental Rates. Indicate the labor rates and equipment rental rates used to determine the cost estimate.
5. Extended Service Life. Calculate the credit for extended service life (Item 3f.) as follows:

$$\text{Credit} = \frac{\text{Expired Service Life of Replaced Facility}}{\text{Total Estimated Service Life of Replaced Facility}} \times \text{Original Cost}$$

Where:

Expired Service Life of Replaced Facility = the number of years that the particular facility has been in service.

Total Estimated Service Life of Replaced Facility = the sum of the period of actual use plus the period of expectant remaining life.

Original Cost = the original cost of the facility being replaced.

6. Depreciation. If the facility is still in operation but has been fully depreciated by the utility company, the interested parties, by mutual agreement, need to reestablish the expectant remaining life of the replaced facility.
7. Public/Private Property. If portions of a facility to be adjusted are on both private and public right-of-way, proportion of the final cost between that on private property and that on public property in the same relations that the dollar values for each bear to the approved estimate.

BUREAU OF LOCAL ROADS & STREETS

December 2018

PROJECT DEVELOPMENT – MFT and State Funds

10-4-3

Where the utility company elects to construct an entirely new facility and retire (remove) the existing utility, include Items 3c, 3d, 3e, 3f, 3g, and 3h in the estimate. If only a portion of the existing facility will be removed, use Items 3a, 3b, 3g, and 3i for that portion of the work. Item 3f may be omitted if the facility involves only a utility line crossing of the highway, or a segment of a utility line that is less than 1 mile (1.6 km) in length, provided the replacement facility for the segment is not of greater functional capacity or capability than the one it replaces, and includes no betterments.

If the utility company elects to move the existing facility and replacement material is unfit for reuse, include Items 3b, 3e, 3g, and 3i in the estimate.

If desired, reimbursement to the utility company may be made on an agreed lump-sum basis, for adjustment work estimated to cost less than \$25,000. Also, a detailed final bill will not be required. If the reimbursement is a lump sum, include with the estimate of cost, a statement signed by the proper utility official indicating concurrence in the estimated cost as the figure for which the reimbursement will be made.

The expenditure of MFT funds may be authorized by the LPA for the full amount of the utility adjustment estimates at the time the estimates are approved. To facilitate payment, the LPA should submit a Request for Expenditure (Form [BLR 09150](#)) with the estimate to the District BLRS.

In approving the estimate of cost and reviewing of the final bill, IDOT will be governed by the policies set forth by FHWA and [Chapter 15](#).

Chapter Eleven

PLAN DEVELOPMENT – MFT and State Funds

11-1 PLAN PREPARATION

The local agency is usually responsible for preparing plans for local agency projects. Section 11-1 discusses the preparation of these plans for MFT and State funded projects.

11-1.01 Initiation

The designer is responsible for preparing the plans so that they can be accurately constructed in the field. To properly prepare the plans, the designer must have a well-defined scope of work. Form BLR 22120 can be used to define the design criteria for the project. Additionally, at the beginning of plan development, the designer should review the project commitment file when applicable. This file should contain all commitments made to IDOT, other agencies, and the public during the development of the project.

The local agency is responsible for the design of structures in its projects. The work is generally performed by either in-house staff or by consultants. However, under some circumstances, the Bureau of Bridges and Structures (BBS) may prepare structure plans for a county.

605 ILCS 5/4-101.4 provides that IDOT must prepare bridge design plans and specifications for a county when requested to do so by the county engineer. However, scheduling is critical and sufficient lead-time must be allowed to perform this work. The use of qualified consultants is encouraged for all design projects, particularly for those projects on expedited schedules. The following guidelines are provided for making requests to BBS for IDOT design assistance:

1. Request. The county should send a letter to BBS indicating the proposed scope and schedule and requesting the services of BBS. The Local Bridge Unit of BBS will review the request and advise the county if the services can be provided within the requested time frame.
2. Timing. The lead time required will vary according to the complexity of the structure and availability of BBS staff. The request notification should be made no later than at the submission of the Preliminary Bridge Design and Hydraulic Report (PBDHR), and significantly earlier for non-routine type structures. This should allow sufficient time for the county to procure a consultant to prepare the design if BBS cannot provide the requested services within the time period specified by the county.

11-1.02 Plan Types

Plans types may consist of one or more of the following:

1. Contract Plans. Contract Plans are typically prepared on 34 in x 22 in (D size) (864 mm x 559 mm) sheets that are considered full size plan sheets. Each sheet includes a borderline with a 2 in (51 mm) left-binding margin, 0.5 (13 mm) in right margin, and 1 (25 mm) in top and bottom margins. This provides a working area of 31.5 in x 20 in (800 mm x 500 mm).

Contract plans may also be prepared on 11 in x 17 in (B size) sheets. Each sheet includes a border line with a 1 in left-binding margin and 0.5 in right, top, and bottom margins. This provides a working area of 15.5 in by 10 in (394 mm x 254 mm).

2. Abbreviated Contract Plans. This type of plan is adaptable to special types of projects (e.g., minor emergency repairs, safety improvements, resurfacing, restoration, rehabilitation, pavement marking). Abbreviated Plans may be included in the contract proposal when prepared on 8.5 in x 11 in (A size) (216 mm x 279 mm) sheets. They typically consist of only the information needed to describe the scope and type of work.
3. Structure Plans. Structure Plans are Contract Plans for highway traffic and drainage structures that require the seal of a structural engineer. Where appropriate, Standard Plans for precast prestressed concrete deck beam bridges may be used as an alternative to a custom design. These plans must be used without a modification of the standard design, unless the modified plans are sealed by an Illinois licensed structural engineer.
4. Lighting Plans. These plans are part of the Contract Plans and include details of any proposed lighting construction. See Section 41-7 for design guidelines.
5. Traffic Signal Plans. These plans are part of the Contract Plans and include details of any proposed traffic signal construction. See Section 39-4 for design guidelines.
6. Right-of-Way Plans. These plans are the basic engineering documents for the acquisition of right-of-way and are developed to define the areas necessary to be acquired to construct and to maintain the highway improvement. They are drawn using the same size, type of sheets, and scale as the Contract Plans.
7. Utility/Railroad Plans. The utility and railroad companies use these plans to conduct the necessary relocations and/or improvements to their facilities. Typically, they are not included with the Contract Plans. When they are included, it is for information purposes only unless the work is to be performed by the contractor. If they are included in the Contract Plans, the drawings are the same size, type of sheets, and scale as the Contract Plans.

11-1.03 Plan Content

The designer should prepare the contract plans as simply as practical. Avoid the use of duplicated data and unnecessary cross-references. A description of the various plan sheets follows.

11-1.03(a) Contract Plans

Contract Plans should contain the following information:

1. Cover Sheet. A cover sheet is required for all plans. It identifies the project type, project location, type of funding, and other pertinent project information, and it provides a place for signature and seal of a licensed professional engineer, and for plan approval. It may also contain an index of sheets if an index is not included as a separate sheet.
2. Summary of Quantities. The Summary of Quantities should be placed on the Cover Sheet if space allows, otherwise, place it on a separate sheet following the Cover Sheet. The Summary of Quantities should show the appropriate quantity breakdowns based on the construction and safety work type, project location, funding sources, etc. Ensure that the wording of the pay items agree with the *IDOT Standard Specifications and Special Provisions*.
3. Typical Section Sheet. The following applies to the Typical Section Sheets:
 - Ensure that all applicable typical sections are provided. Note the title of the typical section and applicable stations directly below the typical section.
 - Include all General Notes applicable to the typical sections.
 - Note all applicable pay items on the typical section.
 - Include the structural pavement design information.
4. Plan/Profile Sheets. Include Plan and Profile Sheets prior to the Detail Sheets.
5. Traffic Control Plan. Provide for the handling of traffic through and/or around the work area. Where necessary, provide plan sheets showing lane closures and constrictions, construction staging, and detours.
6. Erosion and Sediment Control Plan. Graphically illustrate the locations of all temporary and permanent erosion and sediment control devices, including when they should be applied in relation to the sequence of construction operations.

7. Detail Sheets. Where necessary, details may be included. The following are typical examples of detail sheets:

- where the project involves a complex intersection,
- drainage details that are not covered in the *IDOT Highway Standards* or on the Plan and Profile Sheets,
- where there is a change in the roadway surface or base course width,
- Signing Plans, where applicable, and/or
- environmental mitigation plans (e.g., wetland plans), where required.

8. Traffic Signal Plans. Traffic Signal Plans should contain the following information:

- detail sheet showing the intersection layout and stationing,
- traffic volumes for all legs of the intersection,
- approaching and exiting travel lanes, turning lanes, shoulder, and median widths,
- proposed phasing diagrams,
- all roadway features that may affect the stationing or setback of poles (e.g., guardrail, barrier median, barrier curb, signs exceeding 50 ft² (4.5 m²), driveways, culverts, railroads, pipelines),
- the approximate height of any power and telephone lines over the roadway,
- the location of all lighting poles and luminaries,
- the proposed location for the controller cabinet and signal posts,
- electrical distribution and control system designs, include wiring diagrams, and
- drawings of equipment, foundations, and electrical details.

9. Lighting Plans. Lighting plans should contain the following information:

- stationing at appropriate intervals,
- travel way, shoulder, and median widths at frequent intervals,
- all roadway features that may affect the stationing or setback of poles (e.g., guardrail, barrier median, barrier curb, signs exceeding 50 ft² (4.5 m²), driveways, culverts, railroads, pipelines);
- the approximate height of any power and telephone lines over the roadway,
- the location of power poles from which service may be obtained,
- if traffic signals are present or proposed, the location of the power pole and control cabinet,

- the location of all poles and luminaries,
 - electrical distribution and control system designs, include wiring diagrams (e.g., control circuit diagram), and
 - drawings of equipment, foundations, and electrical details,
 - type of pavement,
 - indicate either residential or commercial,
 - all conduit and cable runs, including the size of the cable and conduit at each location, and
 - the calculated footcandles at the pavement surface.
10. Structure Plans. Structural plans should follow the requirements in the *BBS Bridge Manual*. Include the county engineer's certification and professional engineer seal or structural engineer's seal as appropriate.
11. Cross Sections. The following information should be included on the cross sections:
- Provide the proposed centerline pavement surface elevation on each cross section.
 - Label the side slope on the first and last cross section of each sheet and where there are changes in the slope. Show the side slope using a vertical to horizontal ratio (e.g., 1V:3H).
 - Show the cut and fill areas, in square feet (square meters), above or beside each cross section.
 - Provide a full section for each crossing culvert pipe with elevations.
 - Include guardrail requirement, where applicable.
12. Highway Standards. See Section 11-4 for a discussion on *IDOT's Highway Standards*.

11-1.03(b) Utility Plans

Utility Plans should include the following details:

- the type and nature of all existing utility facilities (e.g., mains and services) located within the limits of the right-of-way,
- all owners and their addresses,
- existing and proposed right-of-way lines,
- any temporary adjustments,
- the location of the final utility facility and cross sections for all buried utilities, and

- the sequence and schedule of adjustments, relative to other construction activities.

11-1.03(c) Railroad Plans

Include the following information to the railroad plans:

1. At-Grade Crossings. For at-grade crossings, include the following:

- the number of mainline and subsidiary tracks,
- the type and width of crossing,
- the angle of crossing,
- the general condition of the existing crossing,
- the existing and proposed warning devices,
- the number and speeds of passenger and freight trains,
- the anticipated construction date,
- the current highway ADT for existing crossing,
- the 10 year projected highway ADT for proposed crossing,
- the type of proposed rail to be used in the project,
- the distance between existing and proposed crossings, and
- any abandoned crossing.

2. Grade Separations. For grade separations, include the following:

- the vertical clearance between the highway or railroad rails and bottom of the superstructure,
- a plan and profile of the track and of the proposed highway improvement for 500 ft (150 m) each way from the intersection of the highway and railroad centerlines,
- the flow line and cross section of existing and proposed drainage structures involved,
- typical highway and track cross sections,
- all railroad and highway right-of-way lines,
- the distance to a railroad Mile Post,
- the location and height of wire lines on the railroad right-of-way,
- all details for any track adjustments or runaround tracks proposed,
- detour road-crossing details and proposed temporary warning devices, including a plat and description of temporary easement, if required,

- detailed plans of the structure, and
- all other construction data pertinent to the project.

11-1.03(d) Right-of-Way Plans

See the *IDOT Bureau of Land Acquisition Manual* for information concerning the preparation of Right-of-Way Plans.

11-1.04 Drafting Guidelines

Project drafting is typically performed using CADD. The *IDOT CADD Roadway Drafting Reference Guide* (CADD Guide) provides information on the use of CADD. However, manual drafting is still being used on some projects, especially small, simple projects. Section 63-3 of the *BDE Manual* provides general information on the drafting criteria for preparing plans, including:

- dimensioning guidelines for plan sheets,
- guidelines for using abbreviations,
- use of symbols on the plan sheets and cell libraries,
- guidelines for capitalization (e.g., use upper case for all text shown in the plans);
- stationing guidelines,
- guidelines for showing superelevation rates, grades, angles, etc., on the plans,
- guidelines for sheet numbering,
- recommended drawing scales,
- sheets sizes,
- sheet organization, and
- data plotting (CADD or manual drafting).

11-2 PLAN REVIEW**11-2.01 Preliminary Plan Review****11-2.01(a) General Review**

The purpose of the preliminary plan review is to ensure the plans are in conformance with the design criteria presented in this *Manual* and other IDOT documents and is appropriate for the site. The preliminary plan review will occur after the designer has essentially completed the plans including the cover sheet, plan and profile sheets, detail sheets, cross section sheets, determination of pay items, special provisions, etc. During this stage, the designer should address any utility conflicts and determine if adjustments and/or agreements are necessary. This also may include a plan-in-hand field review, if deemed necessary. This is the best design stage for IDOT and other agencies that may have a role in the project to conduct a major review of the plans. All major content comments must be made during this review period. All plan commitments of record should be incorporated into the preliminary plans. IDOT and agencies that have made commitments on the project should review the preliminary plans to ensure that the plans comply with their commitments.

For major projects, more than one plan review may be necessary to avoid having to make substantial changes late in the plan preparation process.

11-2.01(b) Bridge Plans

The Local Bridge Unit within the Bureau of Bridges and Structures (BBS) will be responsible for advising, reviewing, and/or approval of the local agency bridge plans.

For certified bridge/box culvert plans, a preliminary review is not required. For complex and unusual designs, a preliminary submittal should be made for review. The stage in the plan development for this review should be determined after the review of PBDHR. For more complex projects, additional reviews may be necessary. Contact the Local Bridge Unit of BBS to discuss the need for preliminary reviews.

11-2.01(c) Lighting Projects

1. Impact on State Highway. The local agency shall submit pre-final plans and specifications that involve lighting improvements along a State highway or lighting improvements that impact a State highway (i.e. State/local intersection, overpasses/underpasses, frontage road, etc.) to the district. See Chapter 56 of the BDE Manual as guidance for highway lighting and design.

Except in Region 1, District 1, the district will submit pre-final plans and specifications for highway lighting improvements to the Central BLRS. Central BLRS will forward the pre-final plans and specifications to the Electrical and Mechanical Unit of BDE for their

review and approval. Central BLRS will forward the comments from the BDE review to the district.

Final Plans, Specifications & Estimate will be forwarded to the Electrical and Mechanical Unit of BDE for a final review prior to letting the project.

Region 1, District 1 will review and approve plans and specifications for highway lighting improvements for local agencies with Region 1, District 1.

2. No Impact on State Highway. Highway lighting improvements along non-State highways that do not impact a State highway may be reviewed by the Department if requested by the local agency; however, the local agency must comply with any recommended changes as a result of the requested review. The procedures for review of lighting plans that impact state highways shall be followed.

11-2.01(d) Traffic Signal Plans

The local agency is required to submit plans and specifications that involve traffic signal improvements at intersections with State highways. Except in Region 1 District 1, the district will then forward the plans and specifications to the Central BLRS for review by the Central Bureau of Operations. Projects that involve traffic signal improvements at intersections with non-State highways will be sent for review by the Central Bureau of Operations when PS&E is submitted to the Central BLRS for letting. The Central Bureau of Operations will review the plans and specifications for compliance with the ILMUTCD and IDOT traffic signal requirements.

11-2.02 Pre-final Plan Review

Pre-final plans are essentially the same as the final plans. If there are only minor review comments on the preliminary plans, these plans can then be finalized and forwarded to the district for approval before the project is scheduled for letting. Prior to this review, the designer should incorporate and/or address all comments made during the preliminary plan review.

The district will review the pre-final plans to ensure that:

- its comments from the preliminary plan review have been incorporated into the plans or addressed satisfactorily in the transmittal correspondence,
- the changes from the preliminary plans do not conflict with any commitments, and
- the plans still conform to the design criteria.

11-2.03 Final Plan Review

The purpose of the final plan review is to ensure that reviewer comments from the pre-final plan review have been addressed. Revisions or changes should not be necessary.

11-2.04 Final Plan Approval and Release

All plans must be approved by the appropriate local highway department or departments and released for bidding by the IDOT District Office. Figure 11-2A shows the signature block that should be used on all local highway plan cover sheets.

AGENCY RESPONSIBLE FOR LETTING	
Approved	<div style="text-align: right;">_____ (DATE)</div> <hr style="border: 0; border-top: 1px solid black;"/> <div style="text-align: right;">_____ (SIGNATURE)</div> <hr style="border: 0; border-top: 1px solid black;"/> <div style="text-align: right; font-size: small;">Local Agency, Position</div>
Passed	<div style="text-align: right;">_____ (DATE)</div> <hr style="border: 0; border-top: 1px solid black;"/> <div style="text-align: right;">_____ (SIGNATURE)</div> <hr style="border: 0; border-top: 1px solid black;"/> <div style="text-align: right; font-size: small;">District # Engineer of Local Roads & Streets</div>
Releasing for Bid Based on Limited Review	<div style="text-align: right;">_____ (DATE)</div> <hr style="border: 0; border-top: 1px solid black;"/> <div style="text-align: right;">_____ (SIGNATURE)</div> <hr style="border: 0; border-top: 1px solid black;"/> <div style="text-align: right; font-size: small;">Deputy Director of Highways, Region # Engineer</div>

Note: If multiple local agencies are involved in a project, each local highway department must approve the plans. An additional approved section needs to be added.

PLAN APPROVAL AND RELEASE SIGNATURE BLOCK

11-3 SPECIFICATIONS AND SPECIAL PROVISIONS

11-3.01 General

The IDOT publications *Standard Specifications for Road and Bridge Construction (IDOT Standard Specifications)*, the *Supplemental Specifications and Recurring Special Provisions*, contract special provisions, and plans all are essential parts of the contract. They should complement each other and provide complete instructions for the work to be accomplished. If a discrepancy exists among these documents, the relationships as described in the *IDOT Standard Specifications* will apply.

11-3.02 Specifications

11-3.02(a) *IDOT Standard Specifications*

The *IDOT Standard Specifications* outline the general requirements and covenants applicable to all highway construction improvements as well as provisions relating to materials, equipment, and construction requirements for individual items of work on road and bridge construction projects awarded by IDOT. The *IDOT Standard Specifications* are intended for general and repetitive use. They provide IDOT criteria for:

- the scope of work,
- control of work,
- control of materials,
- legal regulations and responsibilities to the public,
- contract execution and progress, and
- measurement and payment of contract items.

The *IDOT Standard Specifications* are published in book form and are updated every 3 to 4 years. They are approved by the Specifications Committee, which acts in an advisory capacity to the Director of Highways. The Specifications Committee includes permanent representatives from the Bureaus of Bridges and Structures, Design and Environment, Construction, Materials and Physical Research, Operations, Local Roads and Streets, District One, FHWA, and the Illinois State Toll Highway Authority. The other eight downstate districts hold three seats on a 3-year rotating basis. The Director of Highways chooses the chairperson for a 4-year term. The Standards and Specifications Engineer in the Bureau of Design and Environment is the recording secretary.

Suggested changes to the *IDOT Standard Specifications* initiated by local highway authorities or the district should be submitted to the Central BLRS Policy and Procedures Unit for consideration by the Specification Committee.

Use of the *IDOT Standard Specifications* is required for local agency projects administered by IDOT. They may also be used for other local agency projects and private work.

11-3.02(b) Supplemental Specifications

Supplemental Specifications are additions, deletions, and/or revisions to the *IDOT Standard Specifications* that have been adopted by IDOT since the last printing of the *IDOT Standard Specifications*. They require the approval of the Specification Committee. They are automatically considered a part of the *IDOT Standard Specifications*. Supplemental Specifications are contained in the *Supplemental Specifications and Recurring Special Provisions* that is revised and printed in book form each year.

11-3.03 Special Provisions

11-3.03(a) General

Special provisions are additions or revisions to the *IDOT Standard Specifications* documenting conditions and requirements for special situations. A special provision should not modify another special provision.

11-3.03(b) Recurring Special Provisions

Recurring Special Provisions are special provisions that are commonly used on many projects. Unlike the *IDOT Standard Specifications* and the Supplemental Specifications, Recurring Special Provisions do not require the approval of the Specifications Committee. Recurring Special Provisions are printed annually in the *Supplemental Specifications and Recurring Special Provisions* and are included in a bidding document and contract by referencing their applicability through the use of a check sheet. The designer is responsible for checking the appropriate Recurring Special Provisions for the project and including the check sheet with the bidding documents.

11-3.03(c) Contract Special Provisions

Contract Special Provisions are the special provisions that the designer includes with the proposal that is submitted with the plans to the district. They may include one or more of the following:

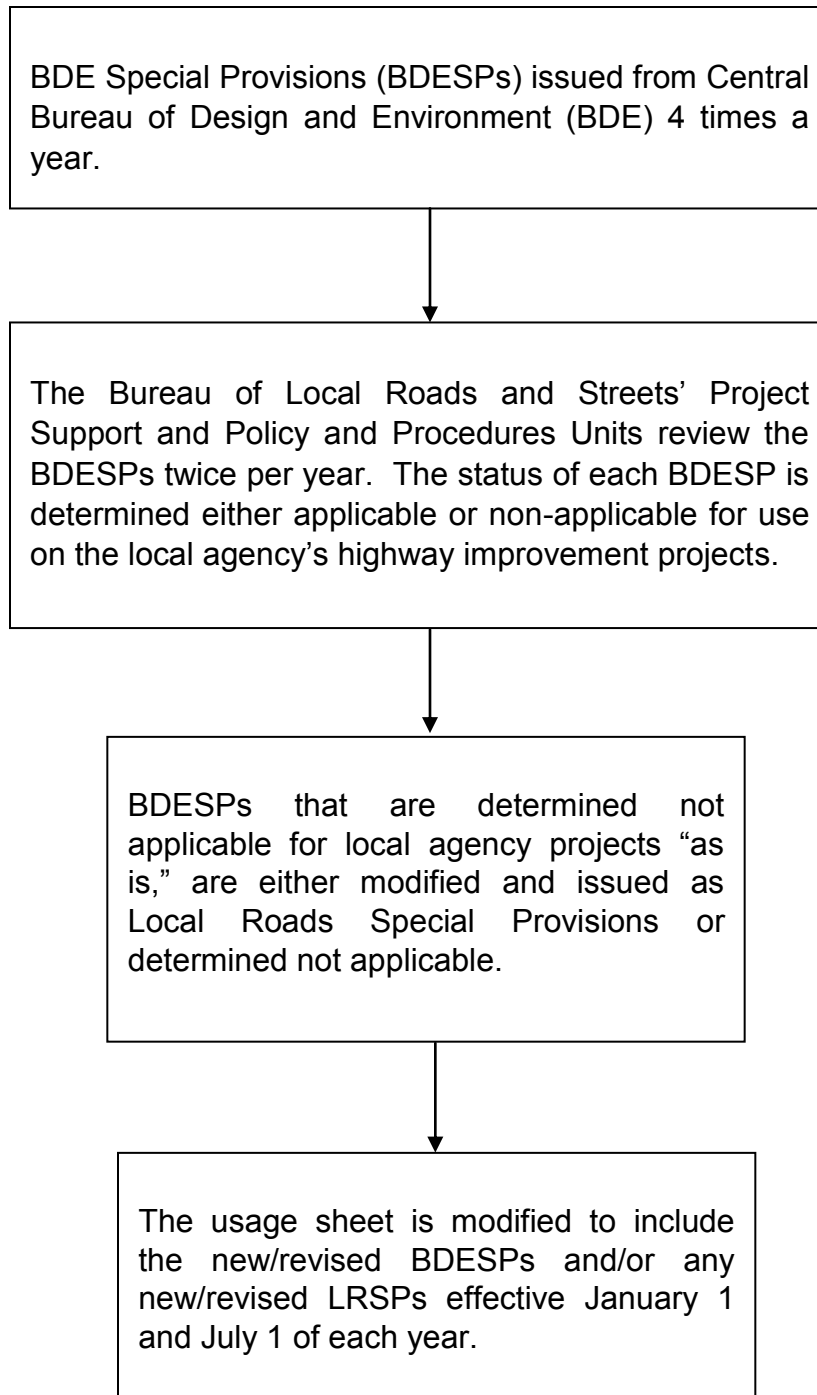

1. Bureau of Design and Environment Special Provisions (BDESPs). These special provisions are contract special provisions issued quarterly by BDE for statewide use. They are issued through BDE effective beginning with a specific letting. The Central BLRS reviews a list of BDESPs and the usage guide semi-annually to local agencies and consultants. The full packet is available for download from IDOT's website. The

designer is responsible for including the appropriate BDESPs into the proposal for each project.

Figure 11-3A presents the procedure for distributing special provisions from BDE to the Central BLRS.

2. Guide Bridge Special Provisions (GBSPs). Guide Bridge Special Provisions are contract special provisions issued by the Bureau of Bridges and Structures that may have changes from letting to letting. The designer is responsible for including the appropriate GBSPs into the proposal for each project. These special provisions are available on the IDOT website.
3. Local Roads Special Provisions (LRs). Local Roads Special Provisions are contract special provisions issued for statewide local agency use. These special provisions are written to cover the needs of local agencies when they differ from those of the State and are designated with an "LR" followed by a number which references the section of the *IDOT Standard Specifications* that the LR Special Provision revises (e.g., LR 302 revises Section 302 of the *IDOT Standard Specifications*). LR Special Provisions are available for downloading from the IDOT website. The designer is responsible for including the appropriate LR Special Provisions into the proposal for each project.
4. District Special Provisions. District Special Provisions are contract special provisions addressing concerns unique to a district (e.g., material shortages, labor agreements). Prior to general insertion into contract proposals, the district approves these special provisions. They may be obtained from the district office. The designer is responsible for including the appropriate District Special Provisions into the proposal for each project. The district may also recommend these special provisions for consideration as BDE Special Provisions or Local Roads Special Provisions.
5. Project Specific Special Provisions. Project specific special provisions are contract special provisions written by the designer to address a unique situation on a project. These special provisions should not be used in more than one project. Project specific special provisions are required wherever a project contains work, material, unique sequence of operations, or any other requirements that are necessary for the completion of the project but are not included in the *IDOT Standard Specifications*, *Supplemental Specifications* and Recurring Special Provisions, BDE Special Provisions, Guide Bridge Special Provisions, Local Roads Special Provisions, or District Special Provisions. These special provisions should not be prepared to personalize the work to the ideas of the designer or to place emphasis on certain aspects of a project. The practice of emphasizing particular procedures and requirements already stated in the *IDOT Standard Specifications* is more properly accomplished at the preconstruction conference. The designer is responsible for writing and including the appropriate Project Specific Special Provisions into the proposal for each project.

The district may consider these special provisions for District Special Provisions or recommend them for LR Special Provisions or BDE Special Provisions.

DISTRIBUTION OF SPECIAL PROVISIONS

Figure 11-3A

The *IDOT Standard Specifications* and Supplemental Specifications are included in the contract documents by referencing the applicable editions in the first paragraph of the special provision portion of the bidding document and contract. Recurring Special Provisions are included through the use of a check sheet. Contract Special Provisions are included in the documents provided to the contractor.

11-3.04 Special Provisions Preparation

11-3.04(a) Preparation Steps

The designer should use the following steps when preparing a special provision:

1. **Determine Need.** The designer should review the existing specifications, standards, details, special provisions, and plans to ensure that there is a need for the special provision. If the topic is not adequately covered in one of the other documents, only then should a special provision be prepared. The purpose of the special provision should be clear. Some examples are:
 - changes or clarifications to the general requirements or covenants of the construction contract,
 - changes or clarifications to the material or equipment requirement,
 - changes or clarifications to a construction procedure,
 - establishing or modifying a pay item, and/or
 - describing a new or experimental procedure or product.

If an existing standard specification includes the information necessary for a project, but is not clear, do not rewrite the specification into a special provision. Send a detailed recommendation to the district for clarification. Additionally, if it is required to only revise or add new information to an existing standard specification, do not rewrite it. Use one of the following suggestions in wording this type of special provision:

- “Work shall be in accordance to Section _____ except for _____” or
 - “Revise the second sentence of Article _____ to read _____”.
2. **Research.** The designer should research the topic so that complete and detailed information is available before writing the special provision. If the designer determines this special provision will be applicable in more than one project, submit the special provision to the district and/or Central BLRS for consideration as a District Special Provision, Local Roads Special Provision, or Inserted Special Provision.
 3. **Format.** Prepare special provisions in the same manner as the *IDOT Standard Specifications*. Section 11-3.04(b) presents the format that should be used.

4. Writing the Special Provision. Once all the research has been completed, the first draft can then be prepared. The designer may want to review existing special provisions for guidance. The following are several grammatical recommendations for preparing special provisions:
 - a. Wording. Write in the passive voice.
 - b. Sentences. Prepare the special provision using simple language and words. Keep words and sentences short (i.e., 20 words or less), unless complexity is unavoidable.
 - c. Paragraphs. Limit paragraphs to three or four sentences.
 - d. Terminology. Words used should be consistent with their exact meaning. Use the same word throughout; do not use synonyms. Avoid any words that have a dual meaning. Section 11-3.04(d) presents the recommended terminology that should be used. Omit the use of extraneous words and phrases.
 - e. Pronouns. Avoid the use of pronouns, even if this results in frequent repetition of nouns.
 - f. Punctuation. Carefully consider the punctuation using the minimum number of punctuation marks consistent with the precise meaning of the language. Ensure that the meaning of any sentence is not in doubt.
 - g. Parentheses. Avoid the use of parentheses (). Instead, use commas or rewrite the sentence.
 - h. Numbers. It is unnecessary to write numbers both in words and figures. Write all numbers associated with abbreviated units numerically (e.g., 2 m, 8 mph, 32 kPa). Write fractions as decimals. Decimals less than one and greater than -1 should be preceded by a zero. Numbers within charts and tables are always written as numbers.

For numbers not associated with an abbreviated unit, use the following:

- numbers from zero to ten will be spelled out (e.g., ten hours, two-way radio, seven tires);
- numbers greater than ten will always be written as numbers (e.g., 12 hours, 50 cycles, 11 percent); and
- numbers less than one will be written as decimal numbers except inches will be written as fractions (e.g., 0.2 acre, 300 mm, 3/4 in).

- i. Dates and Times. Use numbers for time, day, and year. Use the full name of the month.
5. Reviewing. The designer should review the previously completed paragraphs as succeeding ones develop. Where necessary, redraft preceding paragraphs to reflect later thoughts.
6. Submissions. The designer should prepare and distribute the preliminary draft of the special provisions to the district for review and comment as soon as practical. The designer will be responsible for incorporating the reviewers' comments into the final draft.

11-3.04(b) Format

Prepare special provisions in the same format as the *IDOT Standard Specifications*. The sections of the special provision that should be addressed, when needed, include:

1. Description. Provide a brief narration of the work to be performed with references to specifications, plans, or other special provisions that further define the work. The description usually begins with "This work shall consist of..." Only mention the major aspects of the work.
2. Materials. Designate the materials to be used in the work and establish their requirements. Delineate complete specifications of the properties of each material and the test method. References may be made to AASHTO, ASTM, or other recognized standards/procedures. Where a material is already specified in the *IDOT Standard Specifications*, reference the appropriate article or section with any necessary changes stated. Do not reproduce a standard specification in its entirety to revise one or two elements.

The use of proprietary specifications is generally prohibited by the Illinois Compiled Statutes. However, the statutes do allow, under certain conditions, proprietary items to be used. Where the designer has a need for a proprietary specification, see Section 11-3.05(d) or contact the district for guidance.

3. Equipment. Designate the equipment to be used in the work and establish its requirements. Where a piece of equipment is already specified in the *IDOT Standard Specifications*, reference the appropriate article or section with any necessary changes stated. Do not reproduce a standard specification in its entirety to revise one or two requirements.
4. Construction Requirements. Describe the sequence of construction operations or the desired end product. Only use the presentation for the sequence of construction operations if it is critical to achieve the desired result.

5. Method of Measurement. Describe the units of measurement for each pay item and where the item will be measured (e.g., in place, in truck, at plant). Designate any modifying factors and other requirements needed to establish a definite measured unit.
6. Basis of Payment. Describe the units and the pay item name for which payment will be made. Note the entire pay item name in upper-case letters. Do not include a listing of all elements of the work.

11-3.04(c) Guidelines

In addition to the above sections, the following presents several guidelines the designer should consider when developing special provisions:

1. Completeness. The designer should ensure that the essentials have been included, each requirement is definitive and complete, and the *IDOT Standard Specifications* have not been duplicated. The special provision should not be vague.
2. Clarity. To ensure clarity, the designer should:
 - clearly delineate the method of measurement and basis of payment,
 - make a clear, concise analysis of the job requirements for general conditions, types of construction, and quality of workmanship. Do not leave the contractor in doubt on what they will be required to do,
 - give directions, never suggestions,
 - never assume the contractor knows what is meant,
 - avoid conflicting or ambiguous requirements. Every specification should have only one meaning, and
 - never conceal difficulties or hazards from the contractor. This avoids conflict during the project.
3. Conciseness. Each special provision should be as concise as practical. When reviewing the special provision, the designer should consider the following suggestions:
 - where practical, refer to an existing specification and delineate only the portion changed,
 - avoid duplications between different special provisions and any related contract documents,
 - do not give reasons for a specification requirement,
 - do not provide additional information that is unnecessary for the preparation of bids and the accomplishment of the work,
 - once stated, do not repeat any instruction, requirement, direction, or information,

- use cross-references, wherever practical,
 - write the specification in the positive form (e.g., use “will” instead of “will not”), and
 - do not include instructions to the local agency or IDOT in the specification.
4. Correctness. To ensure that the special provision is written correctly, the designer should review the following:
- do not include items that cannot be required or enforced,
 - ensure that the specification does not punish the contractor or supplier,
 - ensure that the specification does not unintentionally exclude an acceptable product, construction method, or any equipment,
 - ensure that the provision does not change the basic design of the item,
 - minimize the inclusion of work incidental to a pay item,
 - do not specify impossibilities (The practical limits of workers and materials must be known and recognized),
 - specify standard sizes and patterns wherever practical,
 - use best available technology,
 - ensure that the contractor will not be held responsible for the possible inaccuracy of information furnished by the local agency and/or IDOT,
 - ensure sufficient attention has been provided to assessing the durability or reliability of the material or procedure discussed. The use of recognized standards should be referenced to ensure that the specified performance or characteristics are achieved. If not, define the testing criteria completely and accurately,
 - make a careful, critical examination of manufacturers’ or trade associations’ recommendations and require supporting evidence,
 - requirements should be stringent (A strong requirement can be relaxed more economically, when the need arises. Weak specifications cannot be strengthened without increasing cost and generating claims),
 - ensure that the provision gives directions that are consistent with the standard practice currently used by IDOT or the local agency, and
 - ensure that the special provision only modifies the *IDOT Standard Specifications* and not other special provisions.

11-3.04(d) Terminology

Phraseology and terminology used in the *IDOT Standard Specifications* also should be used in the special provisions. In addition, the designer should consider the following:

1. Abbreviations. Generally, avoid abbreviations. However, they may be used if they are defined and the definitions are consistent with the accepted meanings. Always use the abbreviations for the terms listed in the *IDOT Standard Specifications*.
2. Amount, quantity. Use “amount” when writing about money only. When writing about measures of volume, use “quantity.”
3. Any, all. The word “any” implies a choice and may cause confusion. In place of “any,” the term “all” should be used.
4. Article. Capitalize “Article” when referring to an article of the *IDOT Standard Specifications*.
5. As per. Do not use “as per”; instead, use “according to.”
6. As shown on the plans. Use “as shown on the plans” instead of “as shown in the plans,” “as detailed on the plans,” “as shown on the detail sheets,” “as shown on the highway standards,” or “as shown on sheet (*number*) of the plans.”
7. Contractor. Use the word “Contractor” in place of the word “bidder” when writing special provisions for construction. “Bidder” should only be used for proposals. Contractor should always be capitalized.
8. Course. Use “course” for layers, not for “lifts.”
9. Day. Define the type of day to be used (e.g., calendar day, working day).
10. Department. Use “Department” in place of “Illinois Department of Transportation.” Department should always be capitalized. Do not use the IDOT acronym in the contract documents.
11. Included In. Use “included in the cost” instead of “incidental to.” The price of all work will be factored somewhere into the contract. Bid prices are generally lower when the contractor knows where to include costs.
12. Pay Item. Use “pay item” instead of “bid item.”
13. Proposal. Do not use the word “proposal” when the word “contract” is intended. The term “proposal” only should be used to describe requirements during the bidding process.
14. Said. Do not use “said pipe,” “said aggregates” but, instead, use “the pipe,” “the specified aggregates.”

15. Same. Do not use “same” to replace a pronoun like “it” or “them” standing alone, such as “connected to same,” “specified for same,” or “same will be given consideration.” The sentence should be rewritten to clearly describe what is meant.
16. Section. Capitalize “Section” when referring to a section in the *IDOT Standard Specifications*.
17. Shall, will. Use the word “shall” when specifying the responsibilities of the contractor. Use the word “will” when specifying the responsibilities of IDOT (“we will,” “they shall”).
18. State. The term “State” is preferred over the “State of Illinois” or “Illinois.”
19. Such. Do not end a sentence with the word “such.” “Such” usually means “of this or that kind,” or similar to something stated. Instead, state that which is actually meant, or name the work to be completed or rephrase the sentence.
20. The. Do not eliminate “the” for brevity.
21. Unless Otherwise Specified. Do not use the term “unless otherwise specified.” In special provisions, the designer should know if something will be “otherwise specified.” In the *IDOT Standard Specifications* everything can be “otherwise specified” in the plans or through Contract Special Provisions.
22. Unit Price. Use “contract unit price” instead of “contract unit price bid.”

11-3.04(e) Unit Abbreviations

The *IDOT Standard Specifications* and the Supplemental Specifications provides a list of unit abbreviations adopted for the *Standard Specifications* and the *Supplement Specifications and Recurring Special Provisions*.

11-3.05 Specifying Materials

11-3.05(a) Specifying Aggregates for Surfaces and Bases

The local agency may specify in a special provision a surface or base course that provides for the use of either crushed or uncrushed aggregate. It is permissible to also allow local materials in addition to the materials specified in the *IDOT Standard Specifications* for a particular surface or base.

11-3.05(b) Specifying Seal Coat or Blotter Aggregate

Special provisions for seal coats and blotter treatments may provide for a specific type of aggregate (e.g., gravel, crushed stone). Either material, or one material to the exclusion of the

other, may be specified. If one material will be specified to the exclusion of the other, provide a special provision to define the type and gradation of the desired aggregate material. It is permissible to allow an approved local gradation in addition to those specified in the *IDOT Standard Specifications* for a particular surface treatment.

11-3.05(c) Specifying Bituminous Materials

It is permissible, where the *IDOT Standard Specifications* permits the use of two or more types of bituminous materials, to specify one type to the exclusion of the others, or separate bids may be taken on two or more types. In the latter case, the special provision may specify that the awarding agency reserves the right to make the award to the lowest responsible bidder for any type.

11-3.05(d) Patented or Proprietary Items

Proprietary items may be included in a contract if:

- standard items are also included and the contractor has the option to select either the standard or the proprietary method of construction or maintenance (605 ILCS 5/9-110), or
- where they are essential to ensure compatibility with an existing system.

Document the reason for specifying the product in the project files patented and/or proprietary items shall be approved by IDOT's Bureau of Materials and Physical Research's Products Evaluation Unit. The Products Evaluation Circular is available on IDOT's website.

11-3.05(e) Guaranty/Warranty Clauses

Except as noted below, guaranty or warranty clauses that require the contractor to guarantee or warrant materials and workmanship will not be approved. This restriction is not intended to prevent local agencies from benefiting under any guaranty or warranty given as a customary trade practice for any material or product purchased. Exceptions to this restriction are as follows:

5. Electrical or Mechanical Equipment. Contracts that involve furnishing and/or installing electrical or mechanical equipment may include contract clauses that require:
 - Manufacturers' warranties or guarantees on all electrical and mechanical equipment, consistent with those provided as customary practice.
 - Contractors' warranties or guarantees providing for satisfactory in-service operation of the electrical and mechanical equipment and related components for a period not to exceed 6 months following project acceptance.

6. Separate Non-Participating Pay Items. Guaranty/warranty clauses that are incorporated into the contract as separate non-participating pay items.

11-3.06 Experimental Projects or Features

An experimental feature may be a material, equipment item, process, method, traffic operational device, or other feature that has not been sufficiently tested under actual conditions to merit acceptance without reservation in normal highway construction or which has been accepted, but needs to be compared with alternative acceptable features to determine relative merits and cost effectiveness. The *Products Evaluation Circular*, which is a useful document for determining the status of new product proposals in Illinois, can be found on IDOT's website.

For an experimental feature to be authorized or approved for inclusion in a project, an Experimental Features Work Plan must be prepared for approval by the Bureau of Materials and Physical Research (BMPR). The work plan must be prepared and submitted through the district, prior to submission of PS&E. This work plan should contain or reflect the following items:

- A project location map.
- The experimental feature and the method of construction, as well as the materials, process, technique, and/or equipment necessary that is a departure from normal procedures.
- The objective of the experiment in terms of the purpose, how the results might be used, and the benefits (e.g., savings in time, money, and lives).
- A suggested evaluation process including the frequency of inspection. A control section should be provided unless the nature of the experiment is such that a control section would serve no purpose.
- The estimated difference in cost. Note that higher costs are normally anticipated; however, the experimental feature should not be excluded for this reason.
- Plan drawings and any special provisions pertaining to the experimental feature that would be beneficial.
- The estimated time or duration necessary for evaluation.
- Reference to any research on the subject.

Upon receipt of the work plan, the district will forward the work plan with a recommended action to the Central BLRS. Upon receipt by the Central BLRS, the appropriate Project Development Engineer will review the proposal. After review, the proposal will be discussed with the Bureau of Materials and Physical Research (BMPR). If BMPR accepts the project, the Project Development Engineer will inform the district of approval by memorandum. The district will notify the local agency of the approval.

BUREAU OF LOCAL ROADS & STREETS
PLAN DEVELOPMENT - MFT and State Funds

11-3(14)

Nov 2007

If BMPR recommends the project but does not have the manpower to evaluate it, the project may still be approved if the local agency, the district, or some other acceptable party agrees to evaluate the project and maintain the records. If approved in this manner, the Project Development Engineer will notify the district by memorandum as detailed above. The local agency will be responsible for submitting annual and final reports to BMPR through the district. Assistance in the preparation of work plans, evaluation records, and final reports is available from the Central BLRS Policy and Procedures Unit.

HARD COPIES UNCONTROLLED

11-4 HIGHWAY STANDARDS

The *IDOT Highways Standards* are developed by the Bureau of Design and Environment (BDE) in collaboration with other bureaus and are approved by BDE for general use. Districts and local agencies may submit ideas and details for the *IDOT Highways Standards* to BDE.

The *IDOT Highways Standards* provide details on various design elements that are consistent from project-to-project. They provide information on how to construct the various design elements. Design data and/or specifications are not included on the highways standards. The designer is responsible for providing a copy of the standard in the proposal for local-let projects.

11-5 QUANTITY ESTIMATES

In addition to preparing clear and concise plans, as described in Section 11-1, the designer needs to compile an accurate summary of the project quantities. This information leads directly to the Engineer's Estimate, which combines the computed quantities of work and the estimated unit bid prices. An accurate summary of quantities is critical to prospective contractors interested in submitting a bid on the project. Chapter 64 of the *BDE Manual* presents guidelines on calculating quantities for highway construction projects.

11-5.01 Guidelines for Preparing Quantity Computations

When preparing quantity computations, the designer should consider the following guidelines:

1. Specifications. Cross check all items against *the IDOT Standard Specifications* and the *Supplemental Specifications and Recurring Special Provisions* to ensure that the appropriate pay items, methods of measurement, and basis of payment are used. If an item is not covered in the *IDOT Standard Specifications* or *Supplemental Specifications and Recurring Special Provisions*, a special provision, plan note, or detail must be included in the contract documents to cover the item. Only the official name and description should be used in the contract documents, special provisions, and summary of quantities.
2. Rounding. The quantity of any item provided in the plans should check exactly with the figure on the computation sheets. Indicate any rounding of the raw estimated figures on the computation sheets. Unless stated otherwise, no rounding of the calculations should be done until the value is incorporated into the summary of quantities sheet.
3. Significant Digits. When calculating quantities, carefully consider the implied correspondence between the accuracy of the data and the given number of digits.
4. Cost Estimate. Only use the total values from the summary of quantities sheets to develop the cost estimate. Show all items described in the plans that will be included in the cost estimate on the plan sheets. Section 11-6 provides the criteria for preparing construction cost estimates. These quantities are used to determine the final Engineer's Estimate.
5. Estimating Forms/Computation Worksheets. Blank copies of the estimating forms and computation worksheets are available from BDE.

11-5.02 Computer Estimates

For most projects, the computer can be used to develop some of the quantity estimates. For small projects, it may be more efficient to manually calculate the quantities for all elements, including earthwork. Each software package (e.g., GEOPAK) uses different procedures for

determining how and which quantities can be estimated. The designer should give special consideration to how the plans are prepared on the computer (e.g., cell names, levels, processing procedures) to allow the software to determine the quantities.

11-5.03 Computation Records

In preparing the project quantities, prepare computation sheets for each item used on the project. Combine these sheets and bind them with a cover sheet. The preparer should sign or initial and date each sheet. The checker should also sign or initial and date each sheet. Number the sheets and indicate the total number of pages on each sheet (e.g., Sheet x of y).

Check all values obtained through computations or use of standardized tables, preferably on an independent basis. For those pay items where agreements may be reached to make payment on the basis of planned quantities, an independent check should be performed and noted. Note the resolution of any differences between original and check computations. Where the computer performs computations, an independent check is not required. However, make spot checks of the input and review the computation output sheet for obvious mistakes. Additionally, sign and date the computer output similarly to hand computation sheets.

Retain the quantity computations within the project file.

11-5.04 Units of Measurement

Estimate the quantities for all contract bid items using the terms and units of measurement presented in the *IDOT Standard Specifications*. Show the values determined from the computations on the summary of quantities sheet, and elsewhere in the plans. Section 64-1 of the *BDE Manual* illustrates typical rounding criteria that should be used on the summary of quantities sheet and in the plans; note that certain elements are rounded based on standard manufacturer sizes.

11-5.05 Construction Time Estimates

Exercise care when estimating the contract time. Contract time, working days, and calendar days are defined in the *IDOT Standard Specifications*. Unreasonable time limitations will unnecessarily increase bid prices and the potential for claims, which is especially important if the proposal includes provisions for liquidated damages. The procedures and factors to consider when estimating the contract time are discussed in Section 66-2 of the *BDE Manual*.

11-5.06 Non-Defined Work**11-5.06(a) Lump-Sum Items**

Use lump-sum bid items only where the scope of work for the item is clearly defined, and the amount of work has a minimal chance of changing during construction. The *IDOT Standard Specifications* defines which quantities may be estimated as lump sum. Wherever practical, list the quantities for the separate items that will be included within the lump-sum item. The list should note that the separate “quantities are for estimating purposes only.” Where there is a significant chance of quantity changes, the work must be bid by the unit and not lump sum. Where lump-sum items are used, the total quantity for the project will always equal one.

11-5.06(b) Items Included in Other Work

No item should be shown as incidental to another pay item or the contract. If any item will be included as part of another item, it must be addressed by the specifications or with a special provision. The designer should only include an item of work in another pay item where the scope of work for both is clearly defined and the probability of the quantity of either item changing is minimal. Generally, minimize the use of items included in other pay items. It is difficult for bidders to prepare an accurate estimate for a project that contains incidental items for which quantities or the scope of work is indeterminable.

Generally, use the applicable pay item for those items that are normally covered in the *IDOT Standard Specifications*. Where the quantities or scope of work items are indeterminate at the time of bidding, these items should be paid for on a force account basis as described in the *IDOT Standard Specifications*.

11-6 COST ESTIMATES

An estimate is the predicted project cost at the time of receipt of bids developed from a knowledge of cost of labor, materials, equipment, overhead, profit, and incidental items. The following apply to local let projects. For additional guidance on cost estimates, see Chapter 65 of the *BDE Manual*.

11-6.01 Project Estimates

A local agency is required to submit a project cost estimate for all work administered by IDOT. Estimators should evaluate the following:

1. Labor Costs. Labor costs are variable throughout the State. The estimator must determine not only what types of crafts, but also the most efficient number of workers in each craft that will be required to complete construction of the improvement. Additionally, the estimator must take into consideration the efficiency of the local labor, their working agreement, welfare and fringe benefits, guarantees of minimum working hours per week, show-up time clauses, and non-working conditions due to mechanical breakdowns or bad weather in determining a unit cost for labor. Social security, compensation, and liability insurance costs must also be added to the labor costs as it pertains to the items involved.
2. Material Costs. Material prices should be obtained from area suppliers. Note that these prices are probably higher than those obtainable by a contractor. Therefore, the estimator should use judgment based on past experience.
3. Equipment Costs. Equipment costs include:
 - ownership expense for depreciation,
 - repairs,
 - taxes, and
 - storage, when equipment is idle.

Operating expenses are kept separate and include fuel, oil, and grease.

4. Overhead Costs. Overhead costs may include bonds, moving equipment, incidental materials, general supervision, and field cost accounting.
5. Profit. Profit may range from 10% (over \$100,000) to 20% (\$5,000 or less).
6. Incidental Costs. Incidental costs may occur for:
 - work that is incidental to the contract,

- stage construction,
- tight completion dates,
- excessive hand work, and
- congested work area.

11-6.02 Estimating Forms

Form BLR 11510 is available for use by local agencies in preparing cost estimates for construction projects.

11-7 PLANS, SPECIFICATIONS, AND ESTIMATES (PS&E) PROCESSING**11-7.01 PS&E Submittal**

The local agency will submit PS&E for all improvements, except Group II-A or Group II-B maintenance items (see Section 14-2.04), to the district for review and approval. All highway plans must be sealed by an Illinois licensed professional engineer, which includes the licensee's written signature, date of signing, and expiration date of the license. The plans must also be signed by an appropriate local agency official. After approval, the project can be scheduled for a letting.

11-7.02 Bond Issue and Special Assessment Improvements

A local agency may propose a bond issue or special assessment improvement with the intention of either using MFT funds in conjunction with or, at a later time, requesting the expenditure of MFT funds to retire the bonds or the public benefit assessment portion of the improvement. Submit PS&E for these projects in the same manner as required for typical MFT projects. For special assessment work, submit PS&E to the district for approval before initiating the court proceedings.

11-7.03 Approval of Bridge Plans

Bridge plans that are included in PS&E will be approved as follows:

1. Structural Engineer's Seal, Signature, and Certification. The following applies to the requirements for a structural engineer's seal, signature, and certification:
 - a. Plans Prepared by a Structural Engineer. For plans prepared by an Illinois licensed structural engineer, the seal of the structural engineer responsible for the design must be affixed to the plans. The plans must include the licensee's written signature, date of signing, and expiration date of the license. The seal of a licensed professional engineer is not an acceptable substitute to the structural engineer's seal.
 - b. Plans Prepared by the County Engineer (Non-Standard). The Engineer of Bridges and Structures will seal structure plans for counties, provided that a county engineer, who is an Illinois licensed professional engineer, has prepared the plans. Sufficient time must be allowed for the review by the Bureau of Bridges and Structures (BBS). The county engineer will place the following statement on the General Plan and Elevation Sheet of the structure plans:

These plans were prepared by me or by a full-time member of my staff working under my personal supervision.

(P.E. Seal) Date: _____

Date of License
Expiration: _____

County Engineer
Illinois Licensed Professional Engineer #

If the design is found to be structurally adequate, the structural engineer's seal of the Engineer of Bridges and Structures will then be affixed to the plans.

- c. Certified Bridge/Box Culvert Plans. Local agency simple span bridges, continuous span bridges, and multiple box culverts are considered structurally adequate by IDOT when the plans are appropriately certified by an Illinois licensed structural engineer. These certified structures should follow the design, standard details, and guidelines shown in the *IDOT Bridge Manual* and other Manuals maintained by the Bureau of Bridges and Structures. Review by BBS for structural adequacy and economical design will still be required for structures of unusual or complicated design.

Place the following certification on the first sheet of the bridge plans:

I certify that to the best of knowledge, information and belief, this bridge/box culvert design is structurally adequate for the design loading shown on the plans. The design is an economical one for the style of structure and complies with requirements of the current AASHTO Standard Specifications for Highway Bridges.

The designer's Illinois structural engineer seal, as well as the written signature, date of signing, and expiration date of the license must accompany the above certification. This certification does not limit the responsibilities of the designer under 225 ILCS 325.

- d. IDOT's Standard Bridge Plans. IDOT's Standard Bridge Plans have been accepted as structurally adequate and do not normally require a structural engineer's seal or certification. However, when the Standard Plans have been altered (e.g., modification of the substructure for use with a standard superstructure plan), a structural engineer's seal and certification must be affixed to the individual plan sheets of the special design. The licensee's written signature, date of signing, and expiration date of the license must also be included.

A foundation review by BBS Foundations Unit is required for all structures using IDOT's Standard Bridge Plans, unless the local agency elects to have an Illinois

licensed structural engineer perform this review. In order to facilitate this review, submission of foundation borings must be included with the Preliminary Bridge Design and Hydraulic Report (Form BLR 10210).

2. Hydraulic Responsibility. The responsibility for hydraulic and hydrological analyses and the geometrics of a bridge/box culvert lies with a professional engineer. Therefore, all structure plans (including certified and Standard Bridge Plans) require a professional engineer's seal, signature, date of signing, and expiration date of the license. The local agency and the designer are responsible for ensuring that PS&E conform to the Division of Water Resources construction permit and the approved Preliminary Bridge Design and Hydraulic Report.

Additionally, if MFT funds are used to construct municipal storm sewer outfalls outside the corporate limits, ensure that the plans that are submitted to the district are accompanied by copies of the following:

- an ordinance prohibiting connection by other than a government agency to the outfall system outside the corporate limits; and
- maintenance agreements.

3. IDOT Review for MFT and TBP Projects. The district will approve all plans MFT and TBP funded structures after any structural review has been completed by BBS.

4. IDOT Review of County and Road District Bridges. The plans for bridges and culverts section, 605 ILCS 5/5-205.1 requires that plans, specifications, and estimates for all bridges and culverts with a clear span length of more than 30 ft (9 m) to be built by the county, or by one or more road districts, be submitted to IDOT for review and approval, irrespective of funding.

For bridges and culverts that will be constructed with funds that IDOT does not supervise, submit two sets of plans directly to BBS and forward a copy of the transmittal letter to the district. BBS will retain one set of plans and return the other set to the county engineer.

5. Preliminary Bridge Design and Hydraulic Report (Form BLR 10210) Approval. After IDOT approval of form BLR 10210, the local agency will not be required to submit the design plans for structural review except for the following situations:

- when the plans are to be signed and sealed by the Engineer of Bureau of Bridges and Structures (for local agencies who have prepared the plans using a non-structural engineer),
- for complex, unique, or major bridges, and/or
- for streets over State highways.

11-7.04 Approval of Lighting Plans

For all lighting plans, the seal of the professional engineer responsible for the lighting design must be affixed to the plans. The plans must include the licensee's written signature, date of signing, and expiration date of the license.

11-7.05 Release of Contract Plans

The district will review and release for letting the plans, special provisions, and the local agency's estimate for all projects, excluding railroad crossing signal related improvements.

Chapter 12

LETTING AND CONTRACT AWARD

– MFT and State Funds

12-1 PROCUREMENT PROCEDURES

The Illinois Department of Transportation (IDOT) will apply the following procedures when exercising the approval responsibility given to it by the Illinois Highway Code for the letting of local public agency (LPA) contracts or approval of day labor work.

The procurement procedures described herein apply to work that can be performed either by a contractor or by day labor. Day labor work typically requires the purchase of materials to be incorporated into work performed by LPA employees using LPA equipment. The following Sections discuss the common types of procurement and day labor procedures.

12-1.01 Types of Contracts

12-1.01(a) Formal Contracts

A formal contract is a written agreement between a LPA and a contractor setting forth the obligation of the parties including, but not limited to, the performance of the work, the furnishing of labor and materials, and the basis of payment based on an engineering design.

12-1.01(b) Material Proposals

A material proposal is a form of contract used to purchase materials for day labor operations. Within the material proposal there may be various bid groups. These bid groups may be created to:

- group similar items together to be supplied by one vendor,
- group items within a maintenance operation to be completed by one vendor, or
- based on specific locations to be completed by one vendor.

Each bid group is considered as a separate contract. Material is typically furnished to the job site, stockpile, or other location. Furnishing may include tailgating and distributing by the material supplier. The LPA may also pick up the material at the material supplier facility using LPA equipment and employees, this is typically considered freight on board (FOB).

BUREAU OF LOCAL ROADS & STREETS
LETTING AND CONTRACT AWARD

12-1-2

- MFT and State Funds

November 2018

12-1.01(c) Deliver & Install Proposals

A deliver & install proposal is a form of contract like a material proposal in that the cost and delivery of material for the work operation is the substantial or principal cost of the contract. Within the deliver & install proposal there may be various bid groups, as discussed for material proposals. However, this proposal requires site work such as broom and roll aggregate for seal coat or performing a small amount of base patching or repair. A deliver & install proposal may be used for the following work operations that are based on limited engineering design, review, and oversight:

- bituminous surface treatments including base preparation,
- pavement striping including paint, thermoplastic, and preformed pavement marking,
- landscape planting,
- removing and re-erecting guardrail and terminals, and
- intermittent resurfacing.

12-1.01(d) Quotations

A quotation is a contract commitment from a material supplier for a specified period, with the understanding that the LPA will obtain the material at the lowest on-the-road cost. A quotation may be used in lieu of a material proposal for the purchase of material, including the placement in stockpiles or storage tanks or the pouring of ready-mixed concrete. It may not be used if the supplier is to incorporate the material into the roadway. Quotations are useful when the material may be needed at various locations and times, the quantity of material may not be known, or the same supplier may not always have the material available.

12-1.02 Methods of Procurement

Formal contract, material proposals, deliver & install proposals, and quotations that use Motor Fuel Tax (MFT) and other State funds are subject to the following methods of contract procurement. The following Sections discuss common types of procurement and provide guidance in determining when a formal bid is required.

12-1.02(a) Competitive Sealed Bids

Competitive sealed bids involve the preparation of an invitation for bids for a formal contract, a material proposal, a deliver & install proposal, or a request for quotations; see Section 12-2.01. The bids must be advertised and a public letting held, see Section 12-3. Consider the following when assessing the need for competitive sealed bids:

1. Formal Contracts. Bids are required for all projects, which will exceed the dollar limits shown in Figure 12-1A.

BUREAU OF LOCAL ROADS & STREETS
LETTING AND CONTRACT AWARD

November 2018

- MFT and State Funds

12-1-3

2. Material Proposals and Deliver & Install Proposals. Bids are required for the purchase of materials (excluding material already bid) during the duration of a day labor construction project for either of the following:
- the purchase of similar type of material (e.g. all grades of aggregates, all sizes pipe culverts, all grades of bituminous materials) will exceed the dollar limits shown in Figure 12-1A; or
 - the purchase of all materials furnished from any one vendor, including any cost for placement or incorporation of the materials into the work by that vendor, will exceed the dollar limits shown in Figure 12-1A .
3. Quotations. The requirement for bids is the same as for material proposals. All bidders may revise the quotation monthly by sending the LPA a registered letter at least five days before the end of any month. The new quotation will go into effect on the first day of the month following proper notification. Purchases are permitted from only those suppliers that submitted acceptable quotations at the public letting.

LPA Type	Population	Dollar Limit	Statute
County	Less than 2,000,000	Greater than \$30,000	55 ILCS 5-1022
County	2,000,000 or greater	Greater than \$5,000	Cook County's Ordinances Section 34 - Article IV - Procurement Code
Township/Road District	N/A	Greater than \$20,000	60 ILCS 1/85-30
Municipality (Commission Form)	N/A	\$25,000 or more	65 ILCS 5/4-5-11
Municipality	Less than 500,000	\$25,000 or more	65 ILCS 5/8-9-1
Municipality	500,000 or greater	Greater than \$10,000	65 ILCS 5/8-10-3

DOLLAR LIMITS REQUIRING COMPETITIVE SEALED BIDS

Figure 12-1A

12-1.02(b) Sole Source Suppliers

Occasionally, a LPA may require a material for which there is only one available supplier (e.g. ready-mix concrete delivered to a job site where there is only one producer within the allowable time-of-haul distance) and the cost exceeds the dollar limits shown in Figure 12-1A. If the LPA can demonstrate to the district that a single supplier is the only practical source, MFT funds may be used for a negotiated price material purchase. The LPA is responsible for obtaining district approval.

BUREAU OF LOCAL ROADS & STREETS

LETTING AND CONTRACT AWARD

12-1-4

- MFT and State Funds

November 2018

12-1.02(c) Emergency Purchases

Bids are not required for an emergency purchase, unless time permits. Emergencies are situations that are, or may become, a detriment to public health, safety, service, or property (e.g. a situation requiring immediate repair to prevent further damage to public property or serious disruption in public service). It is desirable to first obtain district approval by telephone or written correspondence. The nature of the situation, however, may dictate otherwise, which must be assessed on a case-by-case basis. Within 10 days of the emergency purchase, provide the district with written notification of the emergency condition, the name of the vendor or contractor involved, and the amount expended. The amount is not limited, but the emergency must be validated and shown to exist.

12-1.02(d) Centralized Joint Purchasing

LPAs may purchase materials for public projects jointly with the State. These purchases must be conducted in accordance with the policies set forth by the Department of Central Management Services (CMS). These policies and the publication "Joint Purchasing Manual, Government Units Reducing Through Centralized Procurement" are available from the Procurement Services Division of CMS or from the [CMS website](#).

LPAs may also use MFT funds for cooperative joint purchases of materials among two or more agencies. If another agency is the lead agency using other funds, the requirements within Chapter 12 must be met. The district will assist these agencies in assembling the bidding specifications and proposals, advertising for bids, and evaluating the bids. Subsequent to receiving bids, each separate agency will be financially responsible for their respective share of the joint material purchase.

12-1.03 Use of "Alternative" and "Type" Bids

"Alternative" bids and "Type" bids are used when a LPA desires to receive bids for two or more different types or classes of work for a particular work item. When used, the proposal and plans must differentiate the types or classes of work by using the prefix word "Alternative" or "Type" followed by a differentiating number or letter (e.g. Alternative I, Alternative II, Type A, Type B).

12-1.03(a) Alternative Bids

Use alternative bids where the types or classes of work are comparable (equal and competitive). Do not use alternatives where identical pay items can be used to define the scope of all types or classes of work. Rather, provide bidders the option of selecting the type or class of work. When this method is used, it is not mandatory that the contractors bid on all alternatives, but the award must be made to the lowest responsible bidder regardless of which alternative bid is lowest. The following is a sample statement for alternative bids:

BUREAU OF LOCAL ROADS & STREETS
LETTING AND CONTRACT AWARD

November 2018

- MFT and State Funds

12-1-5

The plans and proposal contain designs for concrete and bituminous pavements with equivalent pavement design life. [LPA] has no preference for the one to be constructed. The award is made to the lowest responsible bidder regardless of which alternative has the low bid.

12-1.03(b) Type Bids

Type bids should be used sparingly but may be used when the types or classes of work are not directly comparable (equal or competitive). This method is typically used where little information exists on the relative cost of the types or classes of work, or when a LPA may want to select a higher type construction if the additional cost for a higher type is acceptable to the LPA. Type bids may also be used if a LPA has a limited amount of funds available but wants to maximize the construction based on the funds available. In this case, each type would be a different project length. The awarding agency may make the award to the lowest responsible bidder for any type. The proposed criteria to be used in determining the lowest bidder should be developed by the awarding agency before bids are requested. The following is a sample for type bids:

The plans and proposal contain designs for concrete and bituminous pavements. The pavement design life for one pavement may be different than the other. Base the decision on which type of pavement to award on the difference of cost between the two types. The award is made to the lowest responsible bidder of either type.

12-1.03(c) Alternative Deliveries

Material proposals requesting bids for materials via two or more alternative delivery methods must include the unit price cost differential for the purpose of determining the lowest bid favorable to the awarding authority. For example, bids are solicited for furnishing gravel or crushed stone (FOB) a truck at the plant and for furnishing and hauling the material to the job. It is necessary to add the cost of delivery to the FOB plant bid to determine the bid which is most advantageous to the awarding authority. The cost of delivery includes the cost per mile (km) of hauling the material to the job site and the cost for unloading the material at the job site. These costs shall be predetermined and stipulated in the material proposal on a unit price basis. These unit prices, although estimated, should be as accurate as practical based on the best available cost information.

12-1.03(d) Combination Bids

A combination bid is a total bid received for two or more proposals on the same letting. This bid may be less than the total of the individual bids on each proposal. Any allowable combination must be specifically established by the LPA and included in the letting advertisement. To submit a combination bid, the contractor must also submit a separate bid with unit prices for each pay item for each proposal of the combination. A contractor is not required to submit a combination bid or a bid on each proposal of the combination. The LPA has the right to make awards to the low bidder for the combination or to the low bidder for each separate proposal.

November 2018

12-1.04 Proposal Guaranty

Bidders are required to furnish a Proposal Guaranty with their bid as evidence of good faith. The Proposal Guaranty may be a bid bond, bank cashier's check, or a certified check for not less than 5% of the amount bid or for the amount specified in the special provisions. All bids for MFT or State funded contracts and material proposals must be accompanied by a Proposal Guaranty in accordance with the special provisions.

12-1.04(a) Elimination of Proposal Bid Bond

A LPA may deny the use of a bid bond as a Proposal Guaranty, but may not further restrict the Proposal Guaranty.

12-1.04(b) Special Assessment Projects

If a municipality intends to use MFT funds for the public benefit portion of a project constructed under the Local Improvement Act, the provisions of [65 ILCS 5/9-2-103](#) are applicable to the furnishing of a Proposal Guaranty. All bids submitted must be accompanied by cash or a certified check, payable to the President of the Board of Local Improvements, for not less than 10% of the total amount. This will require the insertion of a special provision into the proposal.

12-1.04(c) Illinois Department of Corrections

The Illinois Department of Corrections industries will frequently request bidding proposals to furnish materials that they manufacture. They are exempt from the requirements to furnish a Proposal Guaranty with bids to furnish materials for MFT and State funded projects.

12-1.05 Day Labor Procedures

12-1.05(a) Approval of Day Labor Forces

[605 ILCS 5/5-403](#), [5/6-701.1](#), and [5/7-203.1](#) provide with IDOT approval, a LPA may perform work with its own forces. The LPA is required to obtain approval in writing from the district prior to initiating this type of work, and include the following information in the written request:

- type of work to be performed,
- approximate quantity of work,
- equipment owned or available,
- previous experience with the type of work, and
- past performance on conducting similar work.

Upon receipt, the district will review and approve the request as follows:

1. Equipment. Equipment may be used by the LPA for day labor work as follows:

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS
LETTING AND CONTRACT AWARD

November 2018

- MFT and State Funds

12-1-7

- a. Owned and On-Hand Equipment. Equipment that is owned and on hand by the LPA may be used for day labor work. All asphalt plants require approval from the Bureau of Materials.
 - b. Leased/Rental Equipment. Long-term lease or rental purchase equipment must be on hand and the terms of the lease or rental purchase available.
 - c. Specialized Equipment. For municipalities and counties, specialized equipment may be leased or rented when the majority of equipment required for the work is owned by the LPA. This exception requires prior district approval.
 - d. Road Districts. Day labor forces using only county or road district equipment may perform road district work. Road district equipment may include the following:
 - equipment that is owned by the road district (road districts may not lease or rent equipment). The only exception is for road districts with a population of less than 15,000 may lease up to \$2,000 in a fiscal year ([605 ILCS 5/6-411](#)).
 - equipment that is being acquired under contracts providing for installment payments over a period of not more than 10 years, with interest on unpaid balance not to exceed 9% ([605 ILCS 5/6-201.17](#)), or
 - equipment that may be used or acquired through an agreement with other highway commissioners, corporate authorities of any municipality in the same or adjoining counties, or with the county board in the same or adjoining counties for the lease or exchange of idle equipment ([605 ILCS 5/6-201.10](#)).
2. Previous Experience. This review will involve the amount of day labor work performed by the LPA and a review of the experience of the supervisory personnel.
 3. Past Performance. This review will involve the review of correspondence relative to progress, performance, and record of meeting obligations on previous day labor projects.
 4. Previously Approved Day Labor Forces. A LPA that has been approved for a specific type of work may be reapproved, if performance has been satisfactory.
 5. Types of Work. A LPA must be approved for each type of work it is requesting to be performed by day labor forces. For example, approval for bituminous surface treatments will not qualify a LPA to construct a plant mix surface.

12-1.05(b) Equipment Ownership Expenses

The equipment usage cost eligible for MFT or State funds for a day labor project is based on the actual time the equipment is in operation during the duration of a day labor project.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

LETTING AND CONTRACT AWARD

12-1-8

- MFT and State Funds

November 2018

The usage rate to be paid for publicly or privately owned equipment must not exceed the rates in the [Schedule of Average Annual Equipment Ownership Expense](#), as adjusted for the Producer Price Index for Construction Machinery Manufacturing (this is sent out by Circular Letter typically in February), or the Equipment Watch Blue Book. Note that the rate in the schedule includes the standard operating cost for servicing and repair, fuel, lubricants, filters, tires, etc. No additional compensation for ordinary operating expenses will be allowed. For equipment rates that are not listed in the schedule, complete and send the Equipment Expense Rate Data (Form [BC 2370](#)) to the District Bureau of Local Roads and Streets (BLRS) for forwarding to the Central BLRS (CBLRS). Ensure that any supplemental information that can be used in determining the rates is attached to the form.

The LPA is responsible for listing all equipment to be used, the rate to be reimbursed for each piece of equipment, and system used to calculate the rate on Form [BLR 12110](#). Forward the completed form to the District BLRS for approval.

Expendable equipment (e.g. equipment completely consumed or used up on a project) costing \$1,000 or less, including small tools, can be purchased with MFT funds for use on a day labor improvement.

12-1.05(c) Agreed Unit Prices

Agreed unit prices may be used in place of actual labor and equipment usage costs when the LPA will perform the work with its own work force and equipment. Ensure that the agreed unit price includes all the labor and equipment necessary to complete the item of work as specified. An agreed unit price is pay item specific. Do not include in the agreed unit price for one pay item the labor and equipment cost associated with another pay item. If the material cost is known (e.g., material furnished from a publicly owned source such as a general stockpile) it may be included in the agreed unit price.

The request for agreed unit prices must be submitted with the estimate of cost to the district for approval. Include the following statement:

***[LPA]** hereby agrees to complete the preceding schedule of work at the unit prices as shown.*

The above statement is signed by the following individuals:

- the county engineer for work to be performed by the county,
- the highway commissioner and county engineer for work to be performed by the road district, and
- an appropriate municipal officer having duties in connection with the work for municipalities.

12-2-1

12-2 INVITATION FOR BIDS - LOCAL-LET PROJECTS

Most MFT and State funded projects have a local letting. If a project is scheduled for a State letting, see [Section 24-1](#).

An invitation for bids refers to the compilation of pertinent bidding information relative to the project assembled into a single booklet for issuance to bidders. The bidders make a written offer to perform the proposed work. Except for Maintenance Group II-A and II-B items, the LPA is responsible for preparing and submitting all proposals to the district for review and approval, along with the status of the utility adjustments and right-of-way acquisition.

12-2.01 Invitation for Bid Contents

12-2.01(a) Formal Contract Proposals

Include the following in the formal contract proposal that is submitted to the district:

- LPA Formal Contract Proposal (Form [BLR 12200](#) and Form [BLR 12200a](#)),
- Proposal Bid Bond (Form [BLR 12230](#)), if allowed by the LPA,
- Affidavit of Availability (Form [BC 57](#)), if prequalification is required,
- Certified Apprenticeship and Training Program (Form [BLR 12325](#)),
- Affidavit of Illinois Business Office (Form [BLR 12326](#)),
- Check Sheet for Supplemental Specifications and Recurring Special Provisions, with applicable items marked,
- Contract Special Provisions, including Form [BLR 11310](#),
- applicable [Bureau of Design and Environment \(BDE\) Special Provisions](#),
- applicable [Bureau of Local Road and Streets Special Provisions](#),
- applicable Guide Bridge Special Provisions,
- applicable [Material Specifications](#),
- applicable District Special Provisions,
- applicable LPA Special Provisions,
- applicable LPA Ordinances/Resolutions,
- when plans are prepared on reduced size sheets, plan sheets may be included in the proposal,
- applicable IDOT [Highway Standards](#), if not included in the plans,
- permit documents including, but not limited to:
 - U.S. Army Corps of Engineers permits, letters of authorization, and attachments,

November 2018

- IDNR Office of Water Resources permits,
- U.S. Coast Guard permits, and
- IEPA permits
- foundation borings; include in the plans or proposal the location and log data documenting the results of any subsurface explorations for each foundation sounding or boring,
- Storm Water Pollution Prevention Plan, Contractor Certification Statement, and Erosion Control Plan, if required, and
- Prevailing Wage Rates or provide a special provision with a reference to [Illinois Department of Labor \(IDOL\) website](#) for prevailing wage rates.

Submit the following to the district with the formal contract invitation to bid. However, this information shall not be provided to bidders:

- Estimate of Time
- Estimate of Cost (Form [BLR 11510](#))

12-2.01(b) Material Proposals and Deliver & Install Proposals

Include the following in the material proposal or deliver & install proposal invitation for bid that is submitted to the district:

- Local Public Agency Material Proposal or Deliver & Install Proposal (Form [BLR 12240](#)),
- Proposal Bid Bond (Form [BLR 12230](#)), if allowed by the LPA,
- Affidavit of Availability (Form [BC 57](#)), if prequalification is required,
- Material Schedule of Prices (Form [BLR 12241](#)); the pay item wording must be in accordance with the IDOT Standard Specifications for Road and Bridge Construction and the Special Provisions. All items in a bid group must be listed together under a single bid group number,
- Apprenticeship or Training Program Certification (Form [BLR 12325](#)), required for all deliver & install proposals and any deliver & install bid group in a material proposal,
- Affidavit of Illinois Business Office (Form [BLR 12326](#)), required only when Form [BLR 12325](#) is inserted,
- Check Sheet for Supplemental Specifications and Recurring Special Provisions, with applicable items marked,
- Contract Special Provisions, including Form [BLR 11310](#),
- applicable [BDE Special Provisions](#),
- applicable [Local Roads Special Provisions](#),
- applicable LPA Ordinances/Resolutions,

- applicable Guide Bridge Special Provisions,
- applicable [Material Specifications](#),
- applicable District Special Provisions,
- applicable LPA Special Provisions,
- applicable IDOT [Highway Standards](#), and
- Prevailing Wage Rates or provide a special provision with a reference to [IDOL website](#) for prevailing wage rates, required for all deliver & install proposals and any deliver & install group in a material proposal.

Submit the following to the district with the material proposal or deliver & install proposal invitation to bid. However, this information shall not be provided to bidders:

- Estimate of Cost (Form [BLR 11510](#))

12-2.01(c) Request for Quotations

Include the following information with the Request for Quotations (Form [BLR 12250](#)):

- Contract Special Provisions, including Form [BLR 11310](#),
- applicable Inserted Special Provisions,
- applicable [Local Road Special Provisions](#),
- applicable Guide Bridge Special Provisions,
- applicable [Material Specifications](#), and
- applicable District Special Provisions.

12-2.01(d) Bid Bonds

If the LPA allows a bid bond as a Proposal Guaranty, include Form [BLR 12230](#) in the proposal. If an electronic bid bond will be allowed in lieu of a traditional bid bond, the LPA is responsible for checking the designated box at the bottom of Form [BLR 12230](#) prior to the proposal being distributed to interested bidders. Bidders will be required to supply an electronic bid bond identification number from an IDOT approved surety company. Special software is not required for implementation; however, the LPA will need internet access to verify the status of the electronic bid bond.

BUREAU OF LOCAL ROADS & STREETS

LETTING AND CONTRACT AWARD

12-2-4

- MFT and State Funds

November 2018

12-2.01(e) Wage Rates

Wage rates, as determined by the LPA or the IDOL, must be included in all formal contracts and deliver & install proposals containing bid items to be directly incorporated in the work by other than LPA forces (e.g. roadway components bid in place). The applicability of these wage rates in material proposals for bid items not directly incorporated in the work is governed by [820 ILCS 130/3](#). IDOL interprets the current law to exempt hauling of materials by suppliers to stockpile locations. All questions of applicability of the Prevailing Wage Act are governed by the determinations of IDOL. Prevailing wage rates may be obtained from [IDOL's website](#).

The Contractor and each subcontractor shall submit monthly, in person, by mail, or electronically, a certified payroll to the LPA or their designee in charge of the project. The certified payroll shall consist of records of all laborers, mechanics, and other workers employed by them on the project. The records shall include each worker's name, address, telephone number when available, classification or classifications, the gross and net wages paid in each period, the number of hours worked each day, and the starting and ending times of work each day. Any Contractor or subcontractor, who remits contributions to a fringe benefit fund that is not jointly maintained and jointly governed by one or more employers and one or more labor organizations in accordance with the federal Labor Management Relations Act, shall also include the worker's hourly wage rate, hourly fringe benefit rates, the name and address of each fringe benefit fund, the plan sponsor of each fringe benefit, if applicable, and the plan administrator of each fringe benefit, if applicable, in the certified payroll record.

The worker's full social security number and home address shall not be included on weekly transmittals. Instead the payrolls shall include an identification number for each worker (e.g., the last four digits of the worker's social security number). The certified payroll shall be accompanied by a statement signed by the contractor or subcontractor which avers that:

- such records are true and accurate;
- the hourly rate paid to each worker is not less than the general prevailing rate of hourly wages required; and
- the contractor or subcontractor is aware that filing a certified payroll that he or she knows to be false is a Class B misdemeanor.

The LPA is required to keep the certification records submitted for a period of not less than five years. Furthermore, these records, except an employee's address, telephone number, and social security number, shall be made available in accordance with the Freedom of Information Act.

BUREAU OF LOCAL ROADS & STREETS
LETTING AND CONTRACT AWARD

November 2018

- MFT and State Funds

12-2-5

12-2.01(f) Incentive/Disincentive Provisions

Incentive/disincentive provisions are typically used in formal contracts to motivate contractors to complete a critical project ahead of schedule. The incentive clause will compensate the contractor for each day that work is completed ahead of schedule and the disincentive clause will assess a deduction for each day the schedule is overrun. Use of these provisions should be restricted to critical projects (e.g. projects where it is highly desirable to minimize traffic delay and inconvenience) and must be approved by the CBLRS. See [Section 66-2](#) of the *BDE Manual* for additional information on incentive/disincentive provisions.

12-2.01(g) LPA Ordinances/Resolutions

The LPA may include contract language that requires the bidder to comply with local regulations established by ordinances or resolutions. By including this contract language, the LPA accepts responsibility for administering this contract language. Furthermore, if this contract language is determined to conflict with federal or state regulations or MFT policies, the State and/or MFT funding used for the project may be jeopardized.

12-2.02 Review and Approval

Except for Maintenance Group II-A and II-B items, the LPA will submit all proposals to the district for review and approval. This review may be done concurrently with or subsequent to the review of the plans, specifications, and estimates (PS&E). The project cannot be scheduled for letting until the proposal has been reviewed and approved by the district.

BUREAU OF LOCAL ROADS & STREETS
LETTING AND CONTRACT AWARD

November 2018

- MFT and State Funds

12-3-1

12-3 LETTING AND AWARD PROCEDURES

12-3.01 Prequalification of Bidders

12-3.01(a) General

The LPA shall ensure that the prequalification requirement is advertised in the Notice to Contractor's Bulletin. Furthermore, on Form [BLR 12200](#), the Prequalification box shall be marked if prequalification is required by Section 12-3.01(b) or the LPA elects to require prequalification.

12-3.01(b) Prequalification Required

All prospective bidders on formal contracts estimated to cost more than \$50,000 must be prequalified unless the formal contract is part of the LPA's maintenance program (See [Section 14-2](#) for requirements). The following criteria apply:

1. Highway Projects. IDOT prequalification is required for highway related projects.
2. Non-Highway Projects. For non-highway projects (e.g., independent bikeways, sidewalks, landscaping), the LPA may request approval from the district to use local contractor qualification procedures.
3. Building Projects. Capital Development Board (CDB) prequalification is required for building construction projects. Obtain a list of prequalified contractors from the CDB one week prior to issuing any proposals. Contractors are required to provide a copy of their CDB prequalification letter prior to receiving bidding documents.

12-3.01(c) Prequalification Optional

For formal contracts estimated to cost less than \$50,000 and formal contracts that are part of the LPA's maintenance program, the awarding agency has the option of using prequalification requirements. Prequalification of bidders is optional for all material proposals and deliver & install proposals regardless of the estimated cost.

12-3.02 Advertising to Receive Bids

12-3.02(a) Notice of Letting

Upon determination that a public letting is required for work to be performed by formal contract, material proposal, deliver & install proposal, or quotation, a Notice of Letting must be advertised to inform all potential bidders of the scheduled letting. Ensure that the Notice of Letting includes the following information:

- the location where the plans and proposals are available for distribution,
- the location, date, and time of the bid opening,
- a brief description of the project,
- major pay item quantities, and

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

LETTING AND CONTRACT AWARD

12-3-2

- MFT and State Funds

November 2018

- any prequalification requirements.

This information is necessary to inform potential bidders of the size and nature of the projects. Prior to advertising for bids for MFT and State funded local work, the district must have approved the PS&E and proposal, and a statement that the right-of-way has been acquired must be on file in the district.

12-3.02(b) Contractors Bulletin

LPA's MFT and State funded projects with local lettings are advertised in IDOT's Notice to Contractors Bulletin. The bulletin is published on a weekly basis and is issued each Thursday. The bulletin is also available on IDOT's website. Each advertisement must appear in the bulletin not less than 11 days before the date on which bids are to be received. This enables the advertisement to appear in at least two issues of the bulletin.

All LPA let projects financed with MFT or State funds must be advertised for letting in the bulletin. IDOT requires no additional public notice; however, this does not relieve the LPA from complying with the State law concerning these advertisements.

As a service to LPAs, projects financed with other funds may also be advertised in the bulletin. Project identification and major quantities should be provided to the district to be included in the advertisements for these projects.

Each district is responsible for inputting their respective advertisements into IDOT's information processing system. Once the entries have been verified and corrected, the district will transmit the advertisements to the CBLRS and notify the Bureau bulletin manager. The entries and notification must be received in the CBLRS prior to noon on Tuesday for a project to be advertised in the bulletin issued on Thursday of the same week. The district must be given adequate advance notice of a scheduled letting in order to input the advertisement by the bulletin deadline. Contact the appropriate district office for district deadlines and when [BLR 12310](#) "Computer Data for Contractors Bulletin" must be submitted by the LPA.

12-3.03 Issuing Bid Proposals

12-3.03(a) General

The advertisement and Notice of Letting indicate where bidding proposals are available. It is the contractor's responsibility to request a proposal if the contractor is interested in bidding on a project.

Denying a proposal to a contractor who is otherwise qualified to bid should be the result of a resolution enacted by the LPA governing board or council. For any letting, a LPA may refuse to issue authorization to bid to a prospective bidder for any of the following reasons:

- uncompleted work, which in the judgment of the LPA, might hinder or prevent the prompt completion of additional work awarded,

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS
LETTING AND CONTRACT AWARD

November 2018

- MFT and State Funds

12-3-3

- false information provided on a bidder's Affidavit of Availability,
- failure to pay, or satisfactorily settle, all bills due for labor and material on contracts in force at the time of issuance of proposal forms,
- failure to comply with any prequalification regulations of IDOT,
- default under previous contracts,
- unsatisfactory performance record as shown by past work for the LPA, judged from the standpoint of workmanship and progress,
- when the contractor is suspended from eligibility to bid at a public letting where the contract requires approval of IDOT,
- when any agent, servant, or employee of the prospective bidder currently serves as a member, employee, or agent of a governmental body that is financially involved in the proposal work, or
- when any agent, servant, or employee of the prospective bidder has participated in the preparation of plans or specifications for the proposed work.

A LPA may not, however, use unsatisfactory performance on work for another agency as a basis to deny the bidder a proposal. Since proposals are issued to contractors with the intent of soliciting bids, eligibility for bidding is generally assumed unless communicated otherwise. If the contractor is a responsible bidder meeting the acceptance criteria in Section 12-3.04, the award will be made to the contractor with the lowest bid once bids are opened. It is therefore important to ensure that each contractor is eligible for award prior to issuing proposals.

12-3.03(b) Prequalification Requirements

The following applies before the letting when prequalification is required:

1. Certificate of Eligibility. The LPA official who issues proposals to prospective bidders must make the proposals available only to contractors who furnish a certified or photostatic copy of their currently dated Certificate of Eligibility. The following conditions apply:
 - the total financial rating stated on the Certificate of Eligibility must equal or exceed the total estimated value of the project, and
 - the Certificate of Eligibility must show that the contractor has work ratings for the types of work on the project covering at least 50% of the estimated cost of the project.

This form must be kept on file by the LPA. If an IDOT representative is present at the letting, the form must be made available to the representative.

2. Affidavit of Availability. At the option of the LPA, bidders may be required to furnish Form [BC 57](#) "Affidavit of Availability" before the proposal is issued to the bidder. With this option, a special provision shall be inserted in the proposal to be used in place of Check Sheet Item LRS 6 or LRS 7.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

LETTING AND CONTRACT AWARD

12-3-4

- MFT and State Funds

November 2018

3. Not For Bidding Proposals. The LPA may also issue proposals and plans to material suppliers or to other contractors wishing only to subcontract a part of the work, even though they are not prequalified. However, these proposals must be plainly stamped or marked, "NOT FOR BIDDING."
4. Bidding on Multiple Projects. If more than one project is scheduled at a letting, contractors may bid on all sections for which they are prequalified.
5. Joint Ventures. Prequalified contractors may combine their available bidding capacity and bid as a joint venture. The joint venture is limited to a maximum of three prequalified contractors. The contractors must notify the LPA of their intent to bid as a joint venture at the time of request for a proposal. Each contractor must provide a copy of his/her Certificate of Eligibility. A joint venture is not acceptable for projects estimated at less than \$1,000,000 if more than one of the proposed joint venture partners has an individual prequalification rating and bid capacity to bid the item without a joint venture. Contractors whose financial ratings are based upon unaudited financial statements will not be permitted to joint venture with each other to bid on contracts that are estimated to exceed \$500,000.

12-3.04 Lettings

12-3.04(a) **General**

If the contractor is a responsible bidder meeting the acceptance criteria of the LPA and IDOT, the award will be made to the contractor with the lowest bid once the bids are opened. This is known as award to the lowest responsive and responsible bidder. In addition to prequalification, if required, the low bidder for all formal contract proposals, all deliver & install proposals, or any deliver & install group in a material proposal must comply with the following:

1. The bidder must comply with all applicable laws concerning the bidder's entitlement to conduct business in Illinois.
2. The bidder must comply with all applicable provisions of the Prevailing Wage Act.
3. The bidder must comply with Subchapter VI ("Equal Employment Opportunities") of Chapter 21 of Title 42 of the United States Code (42 U.S.C. 2000e and following) and with Federal Executive Order No. 11246 as amended by Executive Order No. 11375.
4. The bidder must have a valid Federal Employer Identification Number or, if an individual, a valid Social Security Number.
5. The bidder must have a valid certificate of insurance showing the following coverage: general liability, professional liability, product liability, workers' compensation, completed operations, hazardous occupation, and automobile.

LETTING AND CONTRACT AWARD

November 2018

- MFT and State Funds

12-3-5

6. The bidder and all bidder's subcontractors must participate in applicable apprenticeship or training programs approved by and registered with the United States Department of Labor's Bureau of Apprenticeship and Training. For any bidder or subcontractor that shall perform all or part of the work of the contract or deliver & install proposal solely by individual owners, partners, or members and not by employees to whom the payment of prevailing wages would be required, this certification is not required. All bidders must complete the appropriate section of Form [BLR 12325](#) "Apprenticeship or Training Program Certification" included in the bid documents.
7. The bidder must submit a signed Form [BLR 12326](#) "Affidavit of Illinois Business Office" stating that the bidder will maintain an Illinois office as the primary place of employment for persons employed in the construction authorized by the contract. This form is not required for material proposals, and only required for deliver & install proposals or any deliver & install group in a material proposal, if Form [BLR 12325](#) is required.

If a bidder does not comply with these requirements or fails to submit proper certification, the bidder is considered not responsible and ineligible for award. If the bid is awarded, MFT or State funding will not be allowed on the project.

12-3.04(b) Prequalification Requirements

When prequalification is required, the following applies:

1. Certificates of Eligibility. Prior to opening a contractor's bid, the LPA representative must reexamine all Certificates of Eligibility, in accordance with Item 1 in Section 12-3.03(b). Concurrence of the contractor's eligibility must also be obtained from the IDOT representative, if present at the letting, prior to opening the bid.
2. Ineligible Contractors. The LPA is not required to read a bid from a contractor that does not meet prequalification and responsibility requirements.

12-3.04(c) Opening Bids

At the time and place specified in the Notice of Letting, all bids received from bidders will be opened and read, except for any bid from a contractor that is not qualified as noted previously. Any bid received after the designated time shall be returned unopened to the bidder. The person reading the bid should state the name of the bidder, describe the Proposal Guaranty, and read the total bid amount for each contract or material group and all discounts, if applicable. Individual unit prices and extensions may be read at the option of the LPA.

BUREAU OF LOCAL ROADS & STREETS
LETTING AND CONTRACT AWARD

12-3-6

- MFT and State Funds

November 2018

12-3.05 Determination of Lowest Responsible Bidder

12-3.05(a) Extension of Unit Bid Prices

After proposals are opened and read, the extension of the unit bid prices are to be checked along with the summation of those extensions. If a total price is not shown or there is a discrepancy between the product of the unit price multiplied by the quantity, the unit price will govern. Where a contractor's bid proposal does not contain a unit price for a pay item, but does contain a total price for the same item, the total price will govern and be considered in determining the contract bid price. The unit price for these items will be calculated by dividing the total price quoted by the number of units listed. The calculated unit price will be considered the unit price that the contractor intended to bid if the project is awarded. The calculated unit price will govern the payment for that item of work.

If the contract proposal contains neither a unit price nor a total price for a pay item, the proposal must be rejected.

For material proposals and deliver & install proposals, there must be either a unit price or a total price for all items in a bid group or the bid for that group must be rejected.

12-3.05(b) Affidavit of Availability

On projects requiring prequalification of bidders, the two lowest bidders are to file an Form [BC 57](#) "Affidavit of Availability" with the awarding agency within 24 hours of the letting. The Affidavit must:

- be notarized and dated currently,
- include the amount of all uncompleted work (e.g., either as principal or subcontractor),
- be based on the most recent engineer or owner's estimate,
- include the location and the name of the agency under which jurisdiction the work is to be performed,
- include the commitment of equipment and personnel on payroll or rental basis even though no formal contract exists,
- include a list of all work for which the contractor is low bidder that has not yet been awarded or rejected, and
- include a list of all subcontractors and the value of work sublet.

The data contained in the Affidavit is of a confidential nature and should not be discussed publicly at any time.

12-3.05(c) Bidding Capacity

Consider the following when analyzing a contractor's bidding capacity:

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS
LETTING AND CONTRACT AWARD

November 2018

- MFT and State Funds

12-3-7

1. Available Financial Rating. The contractor's Available Financial Rating is computed by taking the combined value of uncompleted work the contractor has to perform with its own forces (Form [BC 57](#), Part II) and deducting this amount from the contractor's financial rating as shown on the Certificate of Eligibility. The net result is the contractor's Available Financial Rating, which must equal or exceed the estimated value of the project.
2. Available Work Rating. The contractor's Available Work Rating is computed by first deducting from the individual work ratings on the Certificate of Eligibility, the value of all similar type of uncompleted work to be completed by the contractor's own forces as a prime or subcontractor included on Part II of Form [BC 57](#). To determine the total Available Work Rating for a specific project, add the computed balance of the individual work rating for all work items applicable to the project; however, in this process, use the lesser of the balance of the individual work ratings or the estimated value for the work item in the project. The total Available Work Rating must equal or exceed 50% of the estimated value of the project, less any specialty items for the contractor to be awarded the contract.

When the proposed work requires more than one construction season (e.g., 8 months or 168 working days) to complete, the work ratings on the Certificate of Eligibility are multiplied by the number of construction seasons for completion. Any work underway on other projects is divided by the number of seasons to complete that project. The Available Work Rating is then determined using these adjustments.

3. Multiple Awards. If a contractor is the low bidder on two or more contracts on the same letting, the sum of the bids must not exceed the available bidding capacity of the contractor, as determined above. The contract(s) awarded in this situation will be the choice of the LPA and not the contractor.

12-3.05(d) Return of Proposal Guaranty

After all bids have been checked, tabulated, and the relationship between the proposals has been established, the Proposal Guaranty checks of all but the two lowest responsible bidders for each contract or material group must be returned promptly. Bid bonds will not be returned.

After three working days from the date of opening proposals, the LPA may permit the two lowest bidders to substitute bid bonds on Form [BLR 12230](#), executed by corporate surety companies satisfactory to IDOT, for the bank cashier's checks or certified checks submitted with their proposals as Proposal Guaranties.

12-3.06 Award or Rejection

The awarding agency has the right to award the contract, to reject any or all proposals, to waive technicalities, to advertise for new proposals, or to proceed with the work if, in its judgment, the best interests of the awarding agency will be served.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

LETTING AND CONTRACT AWARD

12-3-8

- MFT and State Funds

November 2018

12-3.06(a) Conflict of Interest

It is important to understand that a conflict of interest may be direct or indirect (e.g., as result of a personal or business relationship). Additionally, the appearance of a conflict of interest should be avoided, as an apparent conflict may undermine public trust if not sufficiently mitigated.

The Public Officer Prohibited Activities Act ([50 ILCS 105/3](#)) regarding conflict of interest states in part, *"No person holding any office, either by election or appointment under the laws or Constitution of this State, may be in any manner financially interested directly in his own name or indirectly in the name of any other person, association, trust, or corporation, in any contract or the performance of any work in the making or letting of which such officer may be called upon to act or vote..."*. The act provides for certain exemptions to the prohibition. However, those exemptions are very restrictive and should be carefully reviewed.

12-3.06(b) Award of Formal Contracts, Material Proposals and Deliver & Install Proposals

The county board, in the case of county or road district projects, or the city council or president and board of trustees, in the case of municipal projects, must make all awards. Committees of the governing body (e.g. road and bridge or public works committees) may not make awards.

The LPA may award a contract or accept a material proposal or quotation in the following circumstances:

1. Low Bid Below Estimate. If a contractor is the lowest bidder at or below the estimate and is recognized as responsible and eligible to bid, and all other factors are considered acceptable by the LPA and IDOT, the contract must be awarded to that contractor. In this case, MFT and/or State funds to the extent agreed upon will be authorized to the full extent of the contract costs.
2. Bid Over the Original Estimate. IDOT will not approve an award made for materials or contract construction that exceeds the estimate unless just cause for making the award is provided by the LPA. In these cases, IDOT will make an analysis of the justification for making the award and, if deemed necessary, the LPA will be asked to submit a revised estimate of the cost to justify its action.
3. Award with Two Low Bidders. If two bidders submit equal bids, the LPA shall consult with the District BLRS on how to proceed with the award. Acceptable practices for breaking the tie may include flipping a coin, drawing cards, rolling dice, or another random practice agreed upon by the District BLRS and the LPA. The two bidders shall be given the opportunity to be present when the LPA breaks the tie.

BUREAU OF LOCAL ROADS & STREETS
LETTING AND CONTRACT AWARD

November 2018

- MFT and State Funds

12-3-9

4. Award under Unusual Circumstances. If actions are taken that do not fall into the above options, IDOT will require a letter signed by the chairman of the county board, mayor, or president of the municipality, setting forth the reasons for the actions. When a road district(s) is involved, the highway commissioner(s) must also sign the letter or submit a supplementary letter. IDOT will review the reasons. If they are not satisfactory, IDOT may decline to approve the action.
5. Award to Other Than Low Bidder. If the LPA makes an award to a bidder other than the lowest responsible bidder, the following applies:
 - a. the LPA may rescind its action and award the contract to the lowest responsible bidder, in which MFT funds and/or State funds to the extent agreed upon may be used to the full extent of the contract cost, or
 - b. MFT and State funds will not be approved or authorized to finance any portion of the contract cost or material purchase should the LPA enter into a contract with other than the lowest responsible bidder.
6. Material Proposals and Deliver & Install Proposals. The following applies:
 - a. Bid Group. All items in a bid group must be awarded to the same bidder. The award is made based on the total bid for all items in the group.
 - b. Materials Furnished to a Specific Location. When bids are solicited for the purchase of materials that are to be delivered to a specified location, including materials spread or installed on the road, the lowest responsible bidder will be awarded the contract to furnish the materials.
 - c. Materials to be Picked Up at Source. A LPA may take bids to purchase materials that are to be picked up at the source of supply. The determination of the successful bidder for these materials may depend upon a transportation cost in addition to the unit price bid for the material. The LPA must specify in the proposal how the transportation cost is to be calculated. This transportation cost is usually computed on a predetermined charge per mile (km) from the bidder's source to the job site or to a centrally located point(s) within the LPA's jurisdiction. After the bids are opened, the distance in miles (km) from the designated point(s) to each bidder's source of supply is determined. The lowest bidder for these materials is that bidder whose unit price bid plus the transportation represents the lowest on-the-road cost to the purchasing agency. In cases where there are multiple locations, it could entail awarding more than one bidder.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

LETTING AND CONTRACT AWARD

12-3-10

- MFT and State Funds

November 2018

7. Quotations. When a LPA has solicited quotations rather than a material proposal for the purchase of materials, the LPA is responsible for providing copies of the Form [BLR 12250](#) "Request for Quotations" submitted by the material supplier to the district for approval. After approval, the LPA should return an approved copy to the supplier and retain one copy in their file. The quotations from all responsible bidders may be accepted. Where material is needed for a particular project or location, the supplier, whose quoted price plus transportation cost represents the lowest on-the-road cost to the LPA, will be asked to furnish the material for that work location. If a supplier, whose quoted price represents the lowest cost, is unable to furnish the material when requested, the LPA may purchase the material from the supplier whose quoted price is the next lowest. Documentation of these incidents must be kept on file for audit purposes. If a supplier is continually unable to furnish materials when requested, the LPA should consider that supplier non-responsible, document the details, and refuse to issue the supplier quotation requests for future work.
8. Time Frames. A LPA shall award all MFT and State funded formal contracts, material proposals, or deliver & install proposals within 45 calendar days of the opening of proposals to the lowest responsible and qualified bidder whose proposal complies with all requirements prescribed. The LPA will notify the successful bidder by letter of intent that the bid has been accepted, and subject to the following conditions, that bidder will be the contractor.

If a formal contract, material proposal, or deliver & install proposal is not awarded within 45 days after the opening of proposals, bidders may file a written request with the awarding authority for the withdrawal of their bid, and the LPA must permit the withdrawal.
9. No Bids Received. If after properly advertising for bids and no bids are received; the LPA shall consult the District BLRS office to discuss. A formal letter will be required from the LPA to provide justification on the option chosen. The district will need to concur.
 - a. Review and revise original bid proposal for possible errors or ambiguous information, which may have caused bidders to be cautious to place a bid. If the original bid proposal is revised and is required to be let; a new letting date must be advertised with the revised bid proposal.
 - b. If the original bid proposal does not need revised and time is not a factor, the LPA is encouraged to re-let and possibly send the proposal to other potential bidders.
 - c. If the original bid proposal does not need to be revised, but time is a factor, the LPA may take quotations as discussed earlier. This is based on the LPA did attempt to seek the lowest bid as discussed earlier.

12-3.06(c) Rejection of Bids

Rejection of bids should be based on the following considerations:

1. All Bids Over Estimate. All bids are over the estimate, where no justification is provided for the higher bid, and the LPA is of the opinion that a lower bid can be obtained through re-advertising.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

LETTING AND CONTRACT AWARD

November 2018

- MFT and State Funds

12-3-11

2. Contractor Overextended. Due to overextension of the contractor's Maximum Available Work Rating or the contractor's Available Financial Rating, as determined in Section 12-3.05(c), a contractor with the low bid below the estimate is declared as not being a responsible bidder by the LPA and/or IDOT.
3. Irregularities. Reasons for rejection of bids based on irregularities include one or more of the conditions discussed in Section 12-3.03(a) or any of the following reasons:
 - more than one proposal for the same work from an individual, firm, partnership, or corporation under the same name or different names,
 - evidence of collusion is found among bidders,
 - unbalanced proposals in which the bid prices for some items are, in the judgment of the LPA and IDOT, out of proportion to the bid prices for other items,
 - if the proposal does not contain a unit price or a total price for a pay item listed, except in the case of authorized alternative pay items or lump sum pay items,
 - if the proposal is other than that furnished by the LPA, or if the proposal is altered or any part thereof is detached,
 - if there are omissions, erasures, alterations, unauthorized additions, conditional or alternative bids, or irregularities of any kind which may tend to make the proposal incomplete, indefinite, or ambiguous as to its meaning,
 - if the bidder adds any provision reserving the right to accept or reject an award, or to enter into a contract pursuant to an award,
 - if the proposal is not accompanied by the proper Proposal Guaranty, or
 - if the proposal is prepared with other than ink or typewriter, not properly signed, or otherwise fails to meet the requirements of the requirements of the special provisions.

If the lowest responsible bid is below the estimate and IDOT concurs with the LPA's reason for rejection, the project may be re-advertised. IDOT may consider the low responsible bid that was submitted at the original letting as an established price for comparison purposes against the bid prices received at any subsequent letting for the same work. If considerable time has elapsed between the original and subsequent letting, the estimate of the cost may be adjusted due to inflation factors with the approval of IDOT.

12-3.07 Contract Bond for Formal Contracts and Deliver & Install Proposals

The LPA shall require every Contractor to supply and deliver a performance and payment bond to the LPA with good and sufficient sureties for formal contracts, for deliver & install proposals, and deliver & install groups within a material proposal costing over \$50,000. The amount of the bond shall be fixed by the LPA, and the bond, among other conditions, shall be conditioned for the completion of the contract, for the payment of material used in the work, and for all labor performed in the work, whether by subcontractor or otherwise. The surety shall be acceptable to the LPA, shall waive notice of any changes and extensions of time, and shall submit its bond on the form furnished by the LPA. If the contract is for emergency repairs, proof of payment for all

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

LETTING AND CONTRACT AWARD

12-3-12

- MFT and State Funds

November 2018

labor, materials, apparatus, fixtures, and machinery may be furnished in lieu of the bond. ([30 ILCS 550/1](#))

12-3.08 Execution of Formal Contracts, Material Proposals, and Deliver & Install Proposals

12-3.08(a) Formal Contracts

An executed contract is required before a LPA is bound. An award may be cancelled at any time by the awarding agency prior to the execution to protect the public interest and integrity of the bidding process or for any other reason if, in the judgment of the LPA and IDOT, the best interests of the LPA will be promoted thereby. Once a contract has been awarded, it is in the best interest of all parties concerned to ensure that the contract is executed without delay.

When the LPA notifies the contractor of the LPA's intent to award the contract, they will also send the contractor copies of the contract and contract bond form, where applicable Form [BLR 12321](#), for execution by the contractor.

The contract shall be executed by the successful bidder and returned, together with the contract bond, when applicable, within 15 days after the contract has been mailed to the bidder. Failure of the successful bidder to execute the contract and file acceptable bonds, where applicable, within 15 days after the contract has been mailed to the bidder will be just cause for the cancellation of the award and the forfeiture of the Proposal Guaranty, which will become the property of the LPA, not as penalty, but in liquidation of damages sustained. Award may then be made to the next lowest responsible bidder, or the work may be re-advertised and constructed under contract or otherwise, as the LPA and IDOT may decide.

If the bidder to whom the award is made is a corporation organized under the laws of a State other than Illinois, the bidder must furnish the LPA a copy of the corporation's Certificate of Authority to do business in the State of Illinois with the return of the executed contract and bond, where applicable. Failure to furnish the Certificate of Authority within the time required will be considered as just cause for the annulment of the award and the forfeiture of the Proposal Guaranty to the LPA, not as penalty, but in payment of liquidated damages sustained as a result of this failure.

The execution of contracts by the chairman of the county board, or any duly designated contracting officer, attested to by the county clerk, is considered by IDOT as sufficient evidence that the contracts have been legally awarded by action of the county board for county and road district projects.

The execution of contracts by the mayor, president of a village board, or president of a town board, or any duly designated contracting officer, attested to by the city clerk, village clerk, or town clerk, is considered by IDOT as sufficient evidence that the contracts have been legally awarded by action of the city council, village board, or town board for municipal projects.

BUREAU OF LOCAL ROADS & STREETS
LETTING AND CONTRACT AWARD

November 2018

- MFT and State Funds

12-3-13

The Proposal Guaranty checks of the two low bidders should be returned as soon as the contract and contract bond, where applicable, of the successful bidder have been executed and approved.

12-3.08(b) Material Proposals and Deliver & Install Proposals

The Form [BLR 12330](#) "Acceptance of Proposal to Furnish Material and Approval of Award" is to be used for the award of material proposals and deliver & install proposals. This form is the only documentation required for the district to approve the award, and together with the proposal booklet, constitutes a material purchase contract or deliver & install contract. Form [BLR 12330](#) should contain all the information regarding the type of material, estimated quantities, unit price bid, and total amount, plus point of delivery or shipping instructions. This form is to be signed by an appropriate local official and submitted to the district for approval. Approved copies of the form will be returned to the LPA. The LPA is required to return a copy to the successful bidder. The LPA at their option may follow the requirements of Section 12-3.08(a), instead of submitting Form [BLR 12330](#).

If a contract bond is not required, the LPA has the option of permitting a successful bidder to furnish a contract bond for the full amount of the award or of retaining the bidder's proposal check in lieu of the contract bond until completion of the purchase. If a bid bond was provided for the Proposal Guaranty, a contract bond will be required. When a contract bond is required or furnished, the LPA will return the Proposal Guaranty check of the successful bidder upon receipt and approval of the contract bond. The LPA will indicate their desires relative to the Proposal Guaranty and contract bond by filling in the proper spaces on the Notice of Letting portion of Form [BLR 12240](#).

The Proposal Guaranty of the second low bidder will be returned after the award of the material proposal or deliver & install proposal to the low bidder.

LETTING AND CONTRACT AWARD

November 2018

- MFT and State Funds

12-4-1

12-4 LOCAL LETTING COMPLAINTS OR PROTESTS

12-4.01 General

On LPA let procurements, a bid complaint, that concerns compliance of a bidder with the Apprenticeship and Training Certification, may be filed with IDOT. IDOT will resolve bid complaints according to Section 12-4.02.

On LPA let procurements, a bid protest, that concerns fraud, corruption or illegal acts undermining the objectives and integrity of the procurement process may be filed with the LPA. The LPA will resolve bid protests according to Section 12-4.03.

12-4.02 Apprenticeship and Training Certification

12-4.02(a) Complaints

The Office of Chief Counsel (OCC) will administer all complaints regarding Section 12-3.04(a)6.

1. In order for a complaint to be valid, all complaints must be submitted in writing and filed with OCC within seven calendar days of the bid opening. The entity filing a complaint should also send a copy of the complaint letter to the LPA. Complaints filed after seven calendar days will not be considered. The complaint shall contain the name of the LPA, contract section number, name of the apparent low bidder, and the reason for the complaint. The complaint shall also include the name, address, e-mail address (if available), telephone number, and facsimile number of the entity filing the complaint.
2. To allow for the timely submittal of a complaint, IDOT will not concur with the award of any contract until the eighth calendar day following the letting. Therefore, the LPA shall not proceed with the award for eight calendar days following the letting.

For LPAs under an agreement of understanding with IDOT, the LPA shall wait eight calendar days before awarding the project.
3. When a complaint has been timely filed with OCC, the District Local Roads Engineer will be contacted. The District Local Roads Engineer will contact the LPA. IDOT will not concur with the award of the contract until the complaint has been resolved.

For LPAs under an agreement of understanding with IDOT, the LPA shall not award the contract until the complaint has been resolved.
4. Under the direction of the OCC and/or District Local Roads Engineer, the LPA and/or the bidder will gather the documents necessary to resolve the complaint. The bidder shall cooperate by promptly providing the requested information. Failure of the bidder to cooperate shall result in the bidder being deemed non-responsible.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

LETTING AND CONTRACT AWARD

12-4-2

- MFT and State Funds

November 2018

5. The Director of Highways Project Implementation, based on OCC's advice and recommendation, will make the final decision regarding the disposition of the complaint. IDOT will attempt to resolve a complaint within the 45-day award period. However, if the complaint resolution is expected to take more than 45 days, IDOT will coordinate with the LPA.
6. Once a complaint is resolved, the Director of Highways Project Implementation will send a letter to the entity filing a complaint, with a copy also sent to the District Local Roads Engineer. The District Local Roads Engineer will notify the LPA of the decision and proper course of action.
7. If a complaint is sustained, the remedies available are limited to an award to the next lowest responsible bidder, cancellation of the solicitation, or re-advertisement of the solicitation. If the LPA proceeds with an award on a sustained complaint, IDOT will deem the project as non-participatory for MFT or other State funds administered by IDOT.
8. Nothing in this Section shall preclude IDOT from investigating or further considering a bidder's or Contractor's compliance with the Apprenticeship and Training Certification requirements after award or project completion.

12-4.02(b) Certification Determination

Upon receiving a complaint, OCC will request and review documents to determine whether satisfactory evidence exists that the apparent low bidder participates in a U.S. Department of Labor (USDOL) approved apprenticeship and training program(s) applicable to the crafts listed in the bid documents. If IDOT determines that satisfactory evidence exists, the complaint will be denied. IDOT will neither determine the types of crafts needed to complete the work nor otherwise rule on any other issue except for if a bidder participates in apprenticeship and training program(s) applicable to the crafts listed in the bid documents.

12-4.03 Bid Protests

All bid protests shall be resolved based on the LPA's procurement procedures. The LPA shall consult with the District BLRS before any decision is finalized to ensure that IDOT will not deem the project as non-participatory for MFT or other State funds administered by IDOT.

BLRS Special Provision "Protests on Local Lettings" may be inserted into the contract or material proposal to establish bid protest guidelines on LPA lettings.

12-5 CONTRACTOR OR SUBCONTRACTOR SUSPENSION

12-5.01 General

To protect the public interest in the solicitation, execution, and performance of contracts or subcontracts administered by IDOT, it is the policy of IDOT to conduct business only with contractors or subcontractors of responsible business integrity and honesty. Suspension is a discretionary action imposed in accordance with Subpart I of Title 44 Subtitle A Chapter III Part 6 of the Illinois Administrative Code. It may be imposed only for the causes and in accordance with the procedures set forth in Subpart I.

The Chief Procurement Officer (CPO) of IDOT may suspend a contractor or subcontractor from participation on any contract or subcontract awarded by or requiring approval or concurrence of IDOT upon a determination by the CPO based upon adequate evidence that the contractor or subcontractor has engaged in conduct proscribed by Section 6.520 of Subpart I. Further information on suspension may be found at the [CPO website](#).

12-5.02 Impact to LPA Projects

12-5.02(a) Advertisements and Lettings

For projects that have been advertised by the LPA, the LPA should refuse to issue proposal documents to the suspended contractor and should not open bids, submitted by the suspended contractor.

For projects that have been let by the LPA and the suspended contractor is the apparent low bidder, the LPA should reject the low bid and return the suspended contractor's proposal guarantee. The LPA may award to the next lowest responsible bidder or the LPA may re-let the project.

For projects require pre-qualification, the LPA should ensure that a suspended contractor is not listed as a subcontractor on Form [BC 57](#) "Affidavit of Availability".

12-5.02(b) Continuation of Executory Contracts

Interim suspension, voluntary exclusion, or suspension pursuant to this Subpart I shall not relieve a contractor or subcontractor or its surety of any obligation to be performed in accordance with the terms of any executory contract or bond that remains in full force and effect. Executory contracts are voidable by IDOT or LPA without penalty or further payment, except payment for completed and accepted work, if the facts and circumstances giving rise to the suspension are of such a nature as to require action to safeguard the public interest.

If the contractor is suspended by IDOT prior to the completion of the work, the LPA may:

- cancel the contract with the suspended contractor,
- continue the contract with an alternative source of funds, or

BUREAU OF LOCAL ROADS & STREETS

LETTING AND CONTRACT AWARD

- MFT and State Funds

12-5-2

November 2018

- submit a request to the District BLRS to continue the contract with the suspended contractor using federal, state, or MFT funds. The LPA shall provide documentation to the District BLRS validating that it is in the best interest of the public for the suspended contractor to complete the work. The District BLRS will submit the request to the CPO for a determination.

Chapter Thirteen

PROJECT IMPLEMENTATION - MFT AND STATE FUNDS

13-1 PRECONSTRUCTION CONSULTATION

Some form of preconstruction consultation is advisable for any project that is accomplished by contract. The consultation may be formal or informal, depending upon the complexity of the project.

When a day labor project involves furnishing and spreading materials, it is advisable to discuss project specifics with the material supplier prior to commencing work. The supplier and the local agency should agree upon scheduling of the work, method of handling traffic control, and method of payment for materials delivered. To avoid future conflicts, document these agreements in the project file.

13-1.01 Formal Preconstruction Consultation

Formal preconstruction conferences are typically held for complex contract projects. The purpose of the preconstruction conference is to arrive at acceptable solutions to potential conflicts by discussing the plans and specifications, any unusual conditions, the method and schedule of operations, mobilization of equipment, labor requirements, traffic control, and any applicable federal, State, or local requirements. As soon as practical after award, the local agency should arrange a conference with the contractor and district prior to commencing the work. On very large and complex projects, it may be desirable to hold additional separate conferences for individual operations (e.g., paving, roadside planting, electrical work). The following sections describe the procedures for conducting the preconstruction conference.

13-1.01(a) Preparation

Consider the following when preparing for the preconstruction conference:

5. Progress Schedule. The contractor should prepare a schedule that details the proposed work sequence to complete the contract work items within the allotted time (e.g., number of working days, completion date). The contractor will submit the schedule to the local agency, which will use it as a basis for checking construction progress. The contractor should include the production rates to complete each sequence of work in the progress schedule. Form BC-255 may be used for the progress schedule.

BUREAU OF LOCAL ROADS & STREETS

13-1(2)

PROJECT IMPLEMENTATION - MFT and State Funds

Jan 2006

6. Conference Attendance. Determine who should attend the conference. Typically, the following individuals are invited to attend the meeting:
- local agency representatives,
 - district local roads personnel,
 - resident engineer designated for the project,
 - contractor,
 - subcontractors and agents, as approved,
 - utility/railroad representatives, where these facilities are affected, and
 - other interested parties.

13-1.01(b) Discussion

Figure 13-1A illustrates a typical preconstruction conference agenda, which may be customized for individual projects. During the meeting, special emphasis should be placed on the following items:

1. Traffic Control. The Traffic Control Plan (TCP) should be a primary topic of discussion. The contractor will furnish the name of the individual in his direct employment who is to be responsible for the installation and maintenance of the traffic control for the project. Remind the contractor of the obligation to provide certified flaggers who have been instructed in the fundamentals of correct flagging procedures.
2. Commitments. Regardless of the fund type used, any commitments made during the planning, design, or right-of-way acquisition stages must be carried through to completion of the project. Review any commitment list, compiled prior to award of the contract, to determine if there are any commitments not included in the contract that must still be considered. Retain a copy of the commitment list to ensure satisfactory completion of all contract requirements.
3. Erosion Control Measures. At the meeting, if applicable, include a discussion of:
 - plan provision for temporary and permanent erosion and sediment control with pay items,
 - relationship of the temporary and permanent erosion and sediment control measures to the sequence of construction operation,
 - need for the contractor to supplement information in the Storm Water Pollution Prevention Plan (SWPPP) on the specific sequence of construction operations proposed for the project,
 - any project-specific concerns, problem areas, or commitments, and
 - arrangements for a field review for erosion and sediment control aspects.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

Jan 2006

PROJECT IMPLEMENTATION - MFT and State Funds

13-1(3)

These discussions should be reflected in the meeting minutes.

Section 13-4.05 provides further guidance on the necessary measures required for erosion and sediment control.

4. Permits Required. Provide a list of the applicable permits that are required for the projects. The following applies:
 - U.S. Army Corps of Engineers (USACE) – Section 404 Permit,
 - Illinois Environmental Protection Agency (IEPA) – NPDES permit, and
 - other permits.
5. Material Suppliers and Inspection Requirements. The contractor should present a list of the material suppliers. Any special testing requirements including quality control/quality assurance requirements and procedures should be discussed. Borrow pit locations and their environmental review should be discussed.

13-1.01(c) Documentation

Include written minutes of the preconstruction conference in the permanent project file. Provide copies of the minutes to the district, the contractor, and to each individual or agency represented. The project personnel involved should also initial the minutes involving instructions to the contractor. Include these instructions in the project file.

13-1.02 Informal Preconstruction Consultation

When a formal preconstruction conference is not held, the representative for the local agency and the contractor should confer and agree upon the scheduling of the work, method of handling traffic, sources of materials, public access, and method of payment for work accomplished. Document any agreements in the project file for future reference.

HARD COPIES UNCONTROLLED

13-2 CONSTRUCTION PROCEDURES

13-2.01 Project Supervision

Every local agency, when using MFT or State funds for a project, has an obligation to ensure that the project is completed according to the approved plans and specifications. The local agency should provide a resident engineer/technician that is responsible for the administration of the contract. The local agency is responsible for providing survey control points to guide the contractor in its operations. It is also the agency's duty to perform any required compaction tests, thickness measurements, area or volume measurements, and other tests to determine compliance with the plans and specifications. If the local agency does not have qualified personnel on its staff to accomplish the project supervision, it should employ a consulting engineer to provide the necessary supervision. The agency, in consultation with IDOT, should determine the level of supervision required and arrange to provide the necessary personnel.

IDOT, through the Central BLRS, provides an annual program of training classes for local agencies and consultant personnel. The program provides training in a variety of skills that relate to project supervision and inspection. Information on these classes is available on IDOT's website.

13-2.02 Project Documentation

Every project undertaken by a local agency has the potential to become the subject of controversy and, possibly, litigation, regardless of the source of funding for the project. The manner in which project records are maintained may have a significant impact upon the outcome of these confrontations.

IDOT does not prescribe a specific method of project documentation for MFT or State funded local projects. However, the documentation required must be kept in the project file and be available to IDOT upon request. IDOT's *Construction Manual* can be used as a guide. This *Manual* provides a method of documentation for projects where IDOT is the awarding authority. The level of documentation is primarily determined by the complexity of the work. A routine seal coat operation would most likely require only traffic control documentation and collection of weight tickets. For a major new construction or reconstruction project, IDOT's method, or a similar procedure, is recommended to provide an acceptable level of confidence. Material inspection documentation must follow IDOT's *Project Procedures Guide*; see Section 13-3.

13-2.03 Contract Changes

13-2.03(a) **Changed Conditions, Alterations, or Cancellation of Contracts**

Subsequent to the award of a contract or a proposal to furnish materials, the local agency or contractor may become aware of circumstances that substantially affect the performance of the work. Any alterations of contracts or agreements to cancel contracts must be accomplished

BUREAU OF LOCAL ROADS & STREETS

13-2(2)

PROJECT IMPLEMENTATION - MFT and State Funds

Nov 2008

according to the provisions of the *IDOT Standard Specifications*. The inability to produce or purchase necessary materials meeting the contract specifications is not sufficient cause to cancel a contract by mutual agreement.

13-2.03(b) Changes in Specifications

After the contract or material proposal has been awarded, any major change (e.g., a change that will affect the performance, life expectancy, lower the design strength of a product) to the specifications or any change to the material specifications will require approval of IDOT. If it is deemed necessary that a change in specifications is required, the local agency may submit a request to the district providing one or more of the following conditions is met:

- the project cannot reasonably be constructed or maintained as specified,
- a substantially equal product can be obtained at a savings to the project, or
- a vastly superior product can be obtained at the original contract price.

Furnish any supporting data to substantiate the requested change. If approved, the district will advise the local agency to submit Change in Plans according to Section 13-2.03(c).

13-2.03(c) Change in Plans

1. In accordance with the Change Orders section of the Criminal Code of 1961, 720 ILCS 5/33E-9, it is the responsibility of the local agency official signing the change order to provide a written determination for all change orders or series of change orders that authorize a net increase or decrease in the cost of a local agency contract by a total of \$10,000 or more, or an increase or decrease in the time of completion by 30 days or more. Written determinations of the change order must contain one of the following depending upon the circumstances of the change:

- The undersigned has determined that the circumstances that necessitate this change were not reasonably foreseeable at the time the contract was signed.
- The undersigned has determined that the circumstances that necessitate are germane to the original contract.
- The undersigned has determined that this change is in the best interest of the local agency and is authorized by law.

IDOT will not approve contract changes unless the written determination required by the Criminal Code is in place. It is important to note that compliance with the prior written determination mandated by the Criminal Code is separate from the Change in Plans approved by IDOT. The approval outlined in the Criminal Code must be done regardless of approval of Change in Plans by IDOT.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

Nov 2008

PROJECT IMPLEMENTATION - MFT and State Funds

13-2(3)

2. For any contract project or day labor construction project, IDOT requires the submission of a Change in Plans form BLR 13210 to document any plan changes.
- a. Types of Changes. Changes in plans may be classified as major or minor:
- Major Change. A major change applies to extra work or a quantity change that:
 - modifies the approved design geometrics or changes the typical section above the subgrade,
 - alters the intent or scope of the contract or character of work (e.g., extending or shortening contract length, adding work that is not required to complete the contract as awarded),
 - alters specifications, special provisions, or other contract requirements, see Section 13-2.03(b), or
 - results in added quantities, agreed unit prices, or an agreement to perform work by force account methods that exceed the contract award or approved estimate amount by 10% or \$20,000, whichever is less.
 - Minor Change. A minor change applies to extra work or a quantity change that is:
 - an authorization that adjusts small changes in plan quantities to final as-built quantities, except where the change in plans alters the contract to include work locations not in the original proposal or denies the competitive bidding process,
 - work accomplished at unit prices, agreed unit prices, or on a force account basis that does not classify as major and does not exceed the contract award or approved estimate amount by 10% or \$20,000, whichever is less, or
 - an adjustment in unit prices of the item specifically covered by the *IDOT Standard Specifications* or Special Provisions (e.g., timber piling length adjustment).
- b. Submission Requirements. The following applies with respect to the submission of major and minor changes:
- Major Change in Plans. Transmit all major changes to the plans to the district for approval prior to performing the work. Include revised plans, if necessary, for the work. If changes in plans involve a variance from policy or criteria, the procedures for variances in Section 27-7 will apply. Variances must be approved prior to the approval of the change in plans.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

13-2(4)

PROJECT IMPLEMENTATION - MFT and State Funds

Nov 2008

- Minor Change in Plans. The district can verbally approve minor changes in plans not involving quantities prior to performance of the work. Minor changes in quantities will be approved by the county engineer for county or road district work and by the municipal engineer for municipal work. Minor changes in quantities for municipalities without a municipal engineer will require district verbal approval.

Subsequently, submit the Change in Plans form (BLR 13210) and any customary bills, plans, and pertinent data to the district for formal approval of changes in quantities and changes in plans.

- Day Labor. On day labor construction projects, document these differences on form BLR 13210 using unit prices taken from the approved engineer's estimate. Calculate the increase or decrease of the quantities of work according to the *IDOT Standard Specifications*. Additions and deductions may be combined on the same form and submitted to the district when construction is complete. Design modifications and changes in length (either addition or deduction) and applicable quantities must be submitted on separate forms from other quantity changes.

Local agencies should incorporate written determinations as required in Section 13-2.03(c)(1) into, or attach to, the appropriate document making the change (e.g., form BLR 13210, amendments, resolution).

- c. Signature Requirement. The following applies with respect to signature requirements for approval of changes in plans:

- Municipal Change in Plans. A regularly appointed or elected municipal officer will sign changes in plans for municipal work. This officer may be the president of the board, mayor, clerk, or regularly appointed engineer whose office is established by ordinance and who is appointed to the office in an official manner. Changes in plans forms signed by others cannot be accepted.
- County Change in Plans. The county engineer will sign changes in plans for county work.
- Road District Change in Plans. The county engineer (superintendent of highways in Cook County) as well as the highway commissioner will sign changes in plans for road district work. In those cases where the highway commissioner has given the county engineer authority to approve all plans, only the county engineer will need to sign the change in plans. A copy of this written permission must be on file with IDOT.

HARD COPIES UNCONTROLLED

13-2.03(d) Thickness Report for PCC or Bituminous Pavements

It is the intent that all PCC and bituminous pavements be constructed to the thickness shown on the plans. Pavement thickness will be determined according to the *IDOT Standard Specifications* (e.g., cores and/or edge measurements). The following applies to pavements:

1. Core Drills. In order to prevent any delays in checking the thickness of pavement and shoulder times, coring should be accomplished as soon as the item is complete and equipment can be safely placed in the area. Coring will only be conducted under this policy when other contract provisions for coring do not apply. Contracts requiring at least 1000 yd² (800 m²) of pavement will require coring to confirm adequate thickness.

The local agency will determine the location of the cores using a random system. The local agency should use the procedures discussed in the Construction Memorandum No. 42, "Contractor Coring of Square Measurement Pavement and Shoulder Pay Items," as a guide. The core locations will be laid out by the resident engineer/technician. The contractor will complete all work necessary to perform the coring operation. The local agency will have a representative present while the contractor is coring the pavement. All costs necessary in completing the coring operations are paid in accordance with the standard specification for extra work unless otherwise provided in the contract.

2. Penalties for Thin Pavement and Surface Irregularities. Penalties assessed against a contractor for thin pavement or surface irregularities according to the *IDOT Standard Specifications* will be computed and shown as a deduction from the contract cost. Document these penalties as a separate line item on form BLR 13210. Penalties may not be calculated as pay item quantities and deducted from the contract in that fashion.

13-2.03(e) Extra Work

All extra work must comply with the requirements of the *IDOT Standard Specifications*. It is not permissible to convert extra work not covered by pay items in the contract into contract pay items to facilitate payment of the cost of the extra work.

Frequently, it is possible to negotiate an agreed price, either lump sum or unit price, to perform work that is necessary but was not included in the awarded contract. Documentation for agreed prices should include a letter from the contractor agreeing to do the work at the stipulated price, and a statement from the local agency accepting the contractor's proposal. Attach copies of the agreed price letter and local agency acceptance to form BLR 13210. Other extra work will be done on a force account basis. Approval of IDOT is required in accordance with the change in plan approval procedure.

13-2.03(f) Extension of Contract Time

The *IDOT Standard Specifications* provides the methods to be used when it is necessary to grant an extension of time to a contractor. The contractor of the local agency may request a

time extension. Submit all time extensions along with the supporting documentation to IDOT for approval.

13-2.03(g) Liquidated Damages

When a contractor fails to complete a project within the specified working days or by the specified completion date, or within the extended time as may have been allowed, liquidated damages will be assessed according to the *IDOT Standard Specifications*. The liquidated damages will be computed as a deduction from the contract and documented as a separate line on form BLR 13210.

13-2.04 Payments to Contractors

13-2.04(a) Pay Estimates

The local agency is responsible for preparing a pay estimate at least once a month and submitting to the district for the value of the work performed. Any retainage required by the project specifications is deducted from the pay estimate before payment is made to the contractor. IDOT does not require documentation of partial payment made by the local agency during the life of the project. However, it is always advisable to maintain some type of record in support of payments made to the contractor or material supplier. Use of the Engineer's Pay Estimate (Form BLR 13230) is recommended for partial payments.

13-2.04(b) Maximum Payment

Throughout the *IDOT Standard Specifications*, there are numerous references to pay items on which payment cannot be made for more than a specified percentage of the amount specified by the engineer. The purpose of the maximum pay percentages is to allow the contractor latitude in application rates as well as to discourage sloppy applications. These percentages generally apply to only those pay items that are paid for on the basis of volume or weight.

It is desirable to run daily yield checks on these items so that the contractor can be notified when production has exceeded the maximum specified quantity. The final payment is based on the plan quantity plus or minus any adjustment times the above maximum pay percentage.

13-2.04(c) Final Payment Estimate

The Engineer's Final Payment Estimate (Form BLR 13231) is required for all day labor construction and all contract projects. When preparing the final payment estimate, show the awarded quantities and costs for comparison with completed quantities and cost. Any increase or decrease in quantities must have been documented by an approved Request for Approval of Change in Plans (Form BLR 13210).

BUREAU OF LOCAL ROADS & STREETS

Nov 2008

PROJECT IMPLEMENTATION - MFT and State Funds

13-2(7)

When preparing the final payment estimate for a day labor construction project, the awarded cost information will be the same as that shown on the approved estimate. The completed cost information will be either the actual unit cost or the agreed unit cost plus the awarded unit price for the materials portion of each pay item. If the approved estimate shows the breakdown for each pay item into labor, equipment rentals, and material costs, show the same breakdown on the final payment estimate.

List additions to or deductions from the project that do not involve awarded pay items in the sections of the form set aside for "miscellaneous additions and extras" and for "miscellaneous debits", respectively. List all agreed price items, extra work items, and early completion incentives under the miscellaneous extras and additions section of the form. The miscellaneous debit section of the form should contain items such as thin pavement penalties, surface irregularity penalties, and liquidated damages. Also, show debits to the contract for uninspected materials or non-standard construction items that have been permitted to remain in place in this portion of the form.

Prior to submitting the final payment estimate to the district for approval, the local agency should ensure that their file contains the following documentation:

- release of Liens and Waivers of Claims from all subcontractors, material suppliers, and equipment suppliers for the project,
- certification by the contractor that all laborers and mechanics have been paid fair compensation,
- evidence that all pay quantities have been properly measured and final quantities agreed to by the contractor,
- evidence of materials inspection for all materials delivered to the project, and
- time and equipment rental records for a day labor project.

If federal funds are not involved, the local agency will retain a portion of the amount due to the contractor until an approved copy of the final payment estimate is returned (605 ILCS 5/5-409 and Check Sheet # LRS15 Partial Payments). For county or road district projects, the county engineer should sign the final payment estimate. For municipal projects, the signature should be that of a regularly appointed or elected municipal officer.

13-2.04(d) Contractor Claims

If a contractor claims that additional payment is due and the local agency has not agreed that payment is due, the contractor must file a written claim with the local agency. A final decision must be rendered by the local agency within 90 days of receipt of the claim. If a contractor seeks relief of this decision, the contractor must file a claim for adjudication at the Court of Claims within 60 days after the date of the written decision of the local agency.

HARD COPIES UNCONTROLLED

13-2.05 Equipment**13-2.05(a) Inspection**

The local agency is responsible for ensuring that the equipment used on MFT and State funded projects meets all requirements of the *IDOT Standard Specifications* and Special Provisions of the contract. The equipment must be of sufficient size and mechanical condition to provide satisfactory quality of work without causing injury to the roadway, structures, adjacent property, or other highways when being moved or used. The use of unsatisfactory equipment is not permitted. The *IDOT Standard Specifications* or Special Provisions may prescribe specific equipment for a particular phase of work and define the requirements and performance of that equipment. If equipment is not prescribed, the contractor is free to use any equipment, provided it is satisfactory to the local agency and meets the project requirements. The District Bureau of Project Implementation may inspect batch plants, pavers, and mixers upon request prior to the start of construction.

Many pieces of equipment carry a rating plate or operating manual from the manufacturer indicating capacity, volume, or operating features. Operation of the equipment outside these limits will generally produce an inferior product. Make a careful review of the project documents and related operating manual requirements prior to using the equipment on a project. The *IDOT Construction Manual* provides inspection checklists for construction equipment.

13-2.05(b) Substitution

If the contract specifies the use of equipment of a particular size or type, the contractor may request, in writing, permission to use alternative equipment. In these cases, the contractor will be responsible for furnishing evidence, satisfactory to the local agency, that the proposed equipment is capable of producing equal work. If the substitution is agreeable to the local agency, the agency will forward a copy of the request and any supporting documentation to the district for approval. The approval may be withdrawn at any time if results are found to be unsatisfactory. No additional compensation will be allowed the contractor for any delays or additional costs incurred as a result of using alternative equipment.

13-3 INSPECTION AND TESTING OF MATERIALS

13-3.01 General

13-3.01(a) Local Agency Responsibilities

All materials incorporated into a project, financed in full or in part with MFT or State funds, must be inspected and tested for compliance with the requirements of the *IDOT Standard Specifications*, Supplemental Specifications, Recurring Special Provisions, contract special provisions, and the *Project Procedures Guide* (PPG). The local agency is responsible for this inspection and testing before any material is incorporated into the project.

The guidelines in PPG apply to the testing and inspection of materials for all local agency projects. Exceptions to these guidelines have been developed to accommodate local agency needs. A Qualified Local Agency Representative (QLAR) must submit certain certifications for exceptions discussed in the following Sections. QLAR is defined as a county engineer, a public works director, or a municipal engineer. The public works director or municipal engineer must be a licensed Professional Engineer in the State of Illinois and a public employee.

It is important that local agency personnel receive adequate training and have access to well-maintained and properly calibrated equipment to carry out their responsibilities. Based upon the QLAR's professional judgment, they may certify their employees as qualified personnel based on prior training and related work experience. The QLAR must also certify that adequate equipment is available for the specified test. A Certification of Local Agency Material Test Procedures (Form BLR 13310) must be submitted to the district for each employee certified. This form will need to be submitted one time and only resubmitted if any of the certified conditions have changed. The local agency lab should be treated as a district lab as defined in PPG for those tests specified on form BLR 13310.

13-3.01(b) Department Assistance

Under certain circumstances, the local agency may request IDOT to take responsibility for obtaining samples of materials, making field inspections, and conducting material tests. The districts may provide some or all of these services to the local agency provided personnel are available and the work can be performed without additional expense to IDOT. Otherwise, the local agency will be required to perform these tasks with its own engineering forces and/or private testing laboratories. In all cases, the sampling, inspections, and testing will be conducted according to the *IDOT Standard Specifications* and PPG. The local agency, through its contractor, will provide any facilities as required by IDOT for collecting and forwarding samples, and making inspection.

The contractor or local agency must not use or incorporate into the work the materials represented by the samples until tests have been made and the material found to be in accordance with the *IDOT Standard Specifications*. Failing samples will be handled in accordance with PPG.

13-3.01(c) Consultants and Private Laboratories

When the local agency employs consulting engineers and/or private testing laboratories to handle the material inspection and testing, there must be an understanding with the district as to what materials will be inspected and what tests will be performed by each. The consulting engineers and/or private testing laboratories will furnish the local agencies with copies of the material inspection reports. It is the responsibility of the local agency to administrate the materials acceptance process for the contract. Trained technicians and qualified laboratories are required by PPG.

13-3.01(d) Contractors and Material Suppliers

Although the local agency has the primary responsibility for materials inspection, the contractor and material supplier also have certain obligations. It is the duty of the contractor to inform all of its suppliers of the inspection requirements and to provide the project identification data to them. When suppliers are notified of the requirements for materials inspection, they have an obligation to ensure that all materials shipped to the project are taken from stock that has been approved by the inspectors and to provide the contractor with satisfactory evidence that the materials have been approved.

13-3.01(e) Mixture Designs

IDOT may assist a local agency with mixture designs and verifications for:

- portland cement concrete (PCC) mixtures,
- hot-mix asphalt (HMA) mixtures,
- concrete aggregate mixtures and pozzolanic aggregate mixtures,
- modified soil stabilized base and subbase, and
- soil cement mixtures.

All PCC and HMA mixtures must be furnished from plants that have been approved for use by IDOT. Contact the District Materials Section for PCC and HMA plant approval.

13-3.01(f) Sampling

Acceptance sampling will be the joint responsibility of the local agency and IDOT as noted in PPG. It is the responsibility of the local agency to arrange for plant testing when the mixtures discussed in Section 13-3.01(e) are used on the project. Depending upon availability of personnel, the District Bureau of Project Implementation may be able to provide plant testing for local agency projects. If IDOT personnel are not available, the local agency must provide for plant testing either with its own personnel or through a contract with a consulting engineer.

Applicable procedures to be used and the frequency of sampling for the various mixtures are contained in the following IDOT publications:

- *Manual of Test Procedures for Materials*, and
- *Project Procedures Guide* (PPG).

13-3.02 Aggregate Gradation Control System

The Aggregate Gradation Control System (AGCS) is a program whereby any aggregate supplied to projects let under the jurisdiction of IDOT must be shipped from a certified source. The certified source maintains its own Gradation Control Program. Aggregate shipped must be certified that it meets the quality and gradation requirements in the *IDOT Standard Specifications*. Only certified sources shall ship material to local projects under the review of IDOT. No other inspection or testing is required by the local agency. The Bureau of Materials and Physical Research (BMPR) maintains an Approved Aggregate Source List.

13-3.03 Asphalt Acceptance Procedures

The procedures documented in this section apply to all local agency projects, regardless of fund type, for all grades of:

- cutback asphalts (i.e., rapid curing, medium curing, slow curing),
- road oil,
- asphalt binder, and
- emulsified asphalt.

The materials will be accepted according to the Bureau of Materials and Physical Research Policy Memoranda:

- "Performance Graded Asphalt Binder Acceptance Procedure,"
- "Emulsified Asphalt Acceptance Procedure," and
- "Cut Back Asphalt and Road Oil Acceptance Procedure."

The following procedures also apply:

1. Ordering. When ordering asphalt materials, the local agency or contractor will state that certified asphalt is required by IDOT, supplying the MFT section numbers and the name of the county or municipality.

BUREAU OF LOCAL ROADS & STREETS

13-3(4)

PROJECT IMPLEMENTATION - MFT and State Funds

Jan 2006

2. Bill of Lading. The carrier or contractor must submit a copy of the bill of lading to the county, road district, or municipal representative upon delivery. The producer's bill of lading must contain the following information:

- tank number(s) from which material was drawn,
- sequence number, identifying the tank test report,
- location where used (e.g., section, county, contract number),
- consignee and destination,
- bill of lading number,
- date of shipment,
- type of material,
- name and location of source,
- specific gravity at 60°F (15.6°C) for asphalt binder, cutback asphalts, and road oils or weight per gallon (liter) at 60°F (15.6°C) for emulsified asphalts,
- gross, tare, and net weights, and
- type of material last transported.

In addition to the above, bills of lading representing blended loads shall show the gallons (liters) or percentage of each component material.

3. Inspection upon Delivery. The local agency resident engineer will be responsible for checking and accepting the material on the project site. Material will be identified by the bill of lading accompanying the shipments. The resident engineer will check the bill of lading of each shipment to determine its type and source. This information will then be compared with data on the current list of certified sources to determine the certification status of the material. One of the following three judgments must be made regarding the acceptability of the material:

- when the bill of lading shows a source location and qualified product that are on the list of certified sources, the material will be accepted for use,
- when the bill of lading shows a source location or product that is not on the list of certified sources, but the bill of lading does contain the MISTIC test identification approval number, the material will be accepted and used, or
- when the bill of lading shows a source location or product that is not on the list of certified sources, and the bill of lading does not contain the MISTIC test identification approval number, the material will not be accepted for use.

4. Quantities. The local agency resident engineer will verify and document the quantities of accepted materials. For each project, the resident engineer will report the total quantities of accepted material used, by source and type, to the district on form BLR 13311 at the same time form BLR 13231 is submitted. The district will enter the

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

Jan 2006

PROJECT IMPLEMENTATION - MFT and State Funds

13-3(5)

quantities of certified materials into the MISTIC reporting system. Maintain copies of the bills of lading in the project file. Do not include the bill of lading with form BLR 13311 when it is sent to the district. The district will not approve final pay estimates without the completion of form BLR 13311.

5. Payment. All certified materials may be paid for after the local agency resident engineer has accepted the material and the material has been used.
6. Certified Source List. The Bureau of Materials and Physical Research will supply the certified source list to IDOT's central bureaus and district offices. A list of certified sources is also available on IDOT's website. The district will immediately notify local agencies receiving material from a source that becomes decertified. The IDOT website will also contain information regarding decertified sources.

13-3.04 Hot Mix Asphalt (HMA)

13-3.04(a) **Quality Control/ Quality Assurance (QC/QA) Program**

The HMA QC/QA Program is a process by which the daily quality control of the production and placement of the asphalt mixture is the responsibility of the contractor/vendor, while the owner/user is responsible for periodic quality assurance testing and final acceptance of the product.

1. Procedures. IDOT and industry related agencies/firms have developed QC/QA specifications through a partnering and consensus decision making process. This partnering effort between IDOT and the industry continues through annual reviews of the QC/QA specifications. The benefits of a QC/QA program are as follows:
 - a more uniform product is provided,
 - responsibility for the quality of the product is shifted to the contractor,
 - quality assurance testing by the local agency is reduced compared to the testing required by method specifications, and
 - corrective action is required to be taken promptly during construction, thereby improving the overall quality of the product.

The HMA QC/QA Program should be used on all projects, regardless of size. The Program will use the current IDOT specifications for HMA QC/QA. If a local agency does not use the QC/QA program, it will be responsible for all testing and inspection as discussed in Section 13-3.04(b).

2. Terminology. The following terms and definitions describe some of the various items and personnel involved in the HMA QC/QA process:

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

13-3(6)

PROJECT IMPLEMENTATION - MFT and State Funds

Jan 2006

- a. QC/QA Specification. An IDOT *Standard Specification* or Special Provision that applies to the construction contract. The QC/QA specification, along with its referenced documents, governs the contractor's QC requirements. These documents also specify the QA responsibilities of the engineer and local agency.
 - b. QA Manager. The person or entity employed by the local agency responsible for the quality assurance and acceptance requirements described in the specification.
 - c. QC Manager. The individual employed by the contractor and who has the responsibility for compliance with the QC provisions of the contract. The QC Manager must have training as established in the contract.
 - d. Trained Technician. An individual that has successfully completed the prerequisites established by IDOT for QC and/or QA testing, mix design, or contract administration. Training requirements are detailed in the *PPG*.
 - e. Qualified Laboratories. A laboratory qualified to perform materials acceptance testing on project produced materials as specified in the *PPG*.
3. Quality Control (QC) Responsibilities. The quality control aspect of the QC/QA program is the responsibility of the contractor. The contractor is responsible for providing a qualified laboratory and trained technicians to administer the QC portion of the contract both at the plant and in the field.
 4. Quality Assurance (QA) Responsibilities. Administration of the QA portion of the program is the responsibility of the local agency QA Manager. The expertise to perform the QA Manager duties should be available through the local agency staff, a private source, or furnished by the district as available. Depending on the circumstances, an individual may serve as both QA Manager and resident engineer. These responsibilities include monitoring QC and QA test results and ensuring investigations and corrective actions are performed. Provide the name of the individual who will perform the duties of QA Manager at the project preconstruction conference.
 5. Training. All personnel assigned to provide QA services must possess the level of training specified below. IDOT will identify sources for obtaining the required technical training. Required levels of training are as follows:
 - a. QA Manager. If a local agency employee is designated as the QA Manager, this individual must have completed the QA Manager training course. The training course is optional for local agency licensed Professional Engineers. Professional Engineers are responsible for determining if they possess the knowledge and/or experience necessary to perform the QA Manager duties. All local agency Professional Engineers are strongly encouraged to complete the training course.
 - b. Consultants. Consultants acting on behalf of a local agency must have successfully completed the HMA Level II training course.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

Jan 2006

PROJECT IMPLEMENTATION - MFT and State Funds

13-3(7)

- c. Mix Design/Mix Verification. Individuals must have successfully completed the HMA Level III training course or be certified by QLAR to perform mix design and mix verification. QLAR may only certify local agency employees.
- d. Assurance Testing for Gradation, Voids, & AC Content. Individuals must have successfully completed the HMA Level I training course or be certified by the QLAR to perform this quality assurance testing. QLAR may only certify local agency employees.
- e. Assurance Testing for Density. Individuals must have successfully completed the HMA Density Training or be certified by QLAR to perform assurance testing for density. QLAR may only certify local agency personnel.

Additional information on training can be found in the PPG.

6. Prior to Construction. Prior to construction, the QA Manager is responsible for the following:
 - a. Laboratories. Verify and document that all laboratories used for mix design, mix design verification, quality control testing, or quality assurance testing have been inspected and approved according to IDOT criteria. The District Materials Section can verify this information.
 - b. QC Personnel. Verify and document that the contractor's QC personnel have received the appropriate QC/QA training and are listed in the IDOT trained technician database. Ensure names, social security numbers, and levels of training are provided. The District Materials Section can verify this information.
 - c. Small Quantities and Pay Items. Review the contractor's plan for QC of small quantity production, when allowed by the QC/QA Specification.
 - d. Quality Control Plan. Confirm and document that an approved annual QC plan is on file with the district. Review and approve the QC plan addendum for the project.
 - e. Mix Design. The contractor shall be responsible for all mix designs. IDOT will verify all new mix designs, or contract for same. The QA Manager will document that a verified mix design is being used.
7. During Construction. During the construction phase, the following activities will occur:
 - a. Start of Production. The QA Manager/resident engineer will:
 - verify and document that initial target values and Job Mix Formula adjustments are according to the contract,
 - witness and document the contractor's placement of the test strip and nuclear density gauge/core correlation, if applicable,

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

13-3(8)

PROJECT IMPLEMENTATION - MFT and State Funds

Jan 2006

- witness and document the contractor's development of growth curves, and
 - observe and approve the contractor's proposed rolling pattern and density targets.
- b. QA Plant Testing. The local agency will perform tests on mix sampled at the plant (e.g., QA plant tests). The district may provide some or all of these services to the local agency provided personnel are available and the work can be performed without additional expense to IDOT. A consultant/independent lab may be used for the QA plant testing requirements, provided the duties are performed by a Level I HMA trained individual and the lab has been approved by IDOT. This individual will:
- conduct independent assurance tests on split samples taken by the contractor for quality control tests at the frequency specified in the specifications for aggregate gradation and volumetric properties,
 - witness the contractor's sampling and splitting of samples, and
 - witness scale checks at least once a week. Note that only diary documentation is required if IDOT is regularly conducting scale checks for the plant.
- c. QA Field Tests. The local agency or its designated representative is responsible for the quality assurance density testing as required by the *Standard Specifications*. The following methods may be used provided the person has successfully passed the required density training:
- Local agency inspectors may perform density testing.
 - A consultant may be retained to perform density testing for the local agency.
 - Where density is to be established by coring, the associated laboratory testing is the responsibility of the local agency. QA cores will generally be split samples cored by the contractor and witnessed by the local agency or their agent.
- d. Investigations. The QA Manager will:
- be available for consultation when the QC plan or specification requires an investigation by the contractor,
 - investigate when the contractor's required test results deviate from the specified control limits, and
 - as appropriate, perform additional split sample tests and review the contractor's technician performance and testing procedures.

HARD COPIES UNCONTROLLED

- e. Documentation. The resident engineer/QA Manager will:
- provide written test results to the contractor for all required plant and density QA tests,
 - maintain a diary detailing all corrective action taken by the contractor,
 - include all activities and observations relating to production and tests in the diary, and
 - maintain records to validate the specified acceptance criteria, including validation of the contractor's QC by the assurance process, the contractor's process control and actions, and assurance testing for voids and density.

13-3.04(b) Method Specification Work

Under method specification work, the local agency is responsible for the daily quality control of the production and placement of HMA as well as periodic quality assurance testing and final acceptance of the product. The District Bureau of Project Implementation may provide some or all of these services to the local agency provided personnel are available and the work can be performed without additional expense to IDOT. Otherwise, the local agency will be required to perform these tasks with its own engineering forces and/or private testing laboratories. In all cases, sampling, inspection, and testing, both at the plant and in the field, will be conducted according to the sampling and testing frequencies found in PPG.

13-3.05 Portland Cement Concrete (PCC) Quality Control/Quality Acceptance Procedures**13-3.05(a) QC/QA Program**

This Section is reserved.

13-3.05(b) Method Specification Work

Under method specification work, the local agency is responsible for the daily quality control of the production and placement of PCC as well as periodic quality assurance testing and final acceptance of the product. The District Bureau of Project Implementation may provide some or all of these services to the local agency, provided personnel are available and the work can be performed without additional expense to IDOT. Otherwise, the local agency will be required to perform these tasks with its own engineering forces and/or private testing laboratories. In all cases, sampling, inspection, and testing, both at the plant and in the field, will be conducted according to the sampling and testing frequencies found in PPG.

13-3.06 Miscellaneous Materials

All materials delivered to the jobsite for incorporation into the project must be in compliance with the *IDOT Standard Specifications* or contract Special Provisions. Method of acceptance refers to the means of determining whether the materials supplied are in compliance with the *Standard Specifications*. There are various methods of acceptance for supplied material; manufacturer's certification, approved materials lists, quality control/quality assurance, certified source, testing program, and visual acceptance. PPG contains detailed information on the various methods of acceptance.

Under the testing program method of acceptance, materials are sampled at the source or jobsite by IDOT personnel or their representatives and tested at the jobsite or in laboratories to verify specification compliance. Additional information on the testing program method of acceptance is given below:

1. Inspection at the Source. IDOT has inspectors who regularly visit most of the material suppliers within the State that furnish materials for IDOT projects. Additionally, IDOT has agreements with other States and contracts with commercial testing laboratories to accomplish source inspection at out-of-State suppliers and fabricators who are frequent suppliers for Illinois projects. IDOT will issue inspection reports for local projects providing the contractor has requested materials and furnished the supplier with proper project identification.

If a material supplier does not regularly produce materials for State projects, IDOT will assist the local agency in deciding upon the methods to be used in sampling the materials and whether or not the tests can be performed at IDOT laboratories. If IDOT is unable to perform the testing, it will be the responsibility of the local agency to arrange for sampling and testing.

2. Fabrication Inspection. Certain items (e.g., structural steel, reinforcing steel, precast and prestressed concrete beams) require some measure of fabrication prior to delivery to a job site. If the item requires shop drawings, it is the contractor's obligation to provide the fabricator's shop drawings to the local agency for review and approval. A copy of the approved shop drawings must be furnished to the district. It is the fabricator's responsibility to ensure that all raw materials used have been inspected. The inspector at the fabrication plant should document the raw materials inspection when the report on the fabricated product is issued.
3. Inspection at the Job Site. If arrangements cannot be made for source inspection or if materials are delivered that have not been inspected for some reason, the local agency should insist that the materials be stockpiled until samples have been taken and tests have been made. Under no circumstances should materials that have not been inspected be incorporated into the work. It is the contractor's and supplier's responsibility to furnish the necessary samples or assist in obtaining the samples. It is the local agency's responsibility to arrange to have the samples tested.

BUREAU OF LOCAL ROADS & STREETS

Jan 2006

PROJECT IMPLEMENTATION - MFT and State Funds

13-3(11)

IDOT requirements for the inspection and testing of materials do not preclude the use of non-participating items in a MFT or State funded project. However, clearly indicate the non-participating items on the plans, specifications, and estimate. These non-participating materials must meet the requirements of the *IDOT Standard Specifications* or contract Special Provisions in an MFT or TBP project paid with local funds.

HARD COPIES UNCONTROLLED

13-4 MISCELLANEOUS CONSIDERATIONS**13-4.01 Shop Drawings****13-4.01(a) Structure Drawings**

The *IDOT Standard Specifications* require the contractor to submit shop drawings for approval for most structures and/or for shop fabrication inspections. These reviews can be conducted either by the local agency or by IDOT. The following will apply:

- a. Local Agency Review: The local agency may conduct the review or inspection if it has qualified, engineering personnel available or if it hires a qualified consultant to conduct the review and/or inspection. Local agencies are encouraged to conduct their own reviews for the following elements:
 - simple span, precast, prestressed box beam bridges, and any of the structure's appurtenances (e.g., elastomeric bearings, special-design expansion joints);
 - simple span, steel, wide flange beam, and precast prestressed box-beam structures developed from standard plans and any appurtenances;
 - continuous, multi-span precast, prestressed I-beam structures; and
 - continuous, multi-span steel structures, and simple span structures not listed above.

- b. IDOT Review. The local agency may request that IDOT perform the shop drawing review and/or fabrication inspection. IDOT's agreement to perform the work will depend on the availability and workload of the Bureau of Bridges and Structures (e.g., shop drawing review, steel fabrication inspection) and the Bureau of Materials and Physical Research (e.g., precast and/or prestressed concrete, inspection, elastomeric bearing fabrication inspection, approval of paint and high-stress bolts). To obtain IDOT's services, the local agency should provide a written request to the district as soon as the project information is available. The district will forward this request to the appropriate Bureau(s). This is especially important for steel fabrication inspection services. Figure 13-4A provides the distribution lists for various elements requiring an IDOT review or inspection. The request should also include the following information:
 - job information (e.g., structure number; route; section; county; IDOT contract number, if applicable, contract number),
 - point of contact for questions and the name of the individual to send reports to a job completion including name, contact number, and location for fabricator and prime contractor, and
 - the approximate start date and duration, if known.

Notes:

1. *Where erection is located.*
2. *Only if the Bureau of Bridges and Structures will provide shop fabrication inspection.*
3. *Contact the district for the latest inspection district.*

SHOP DRAWING REVIEW

Figure 13-4A

This request will authorize IDOT's reviewer and/or inspector to act as the local agency's representative.

- c. Inspector. The inspector will need an approved copy of the shop drawings and/or fabrication inspection. If the drawings or inspections were not conducted by IDOT, provide a second copy to the district. This will allow IDOT to assist the inspector with any technical or interpretative questions. IDOT also requires a copy of any Special Provisions or project-specific specifications applicable to fabrication that are different from the *IDOT Standard Specifications*.
- d. Items Requiring Review. Generally, shop drawings or a fabrication inspection will be required for all structural steel elements, prestressed concrete beams, elastomeric bearings, and expansion joints. However, not all structural items will require shop drawings and/or fabrication inspection. The contractor and resident engineer/technician should check with the district for the latest list of items not requiring a review or inspection. Special or non-standard items generally will require the contractor to prepare set of shop plans and/or have a fabrication inspection.

13-4.01(b) Precast Box Culverts

Shop drawings are required for all precast box culvert projects (including standard and non-standard box sections) as well as for manholes, junction chamber, extensions, and end sections. Shop drawing approval by IDOT is not required for standard precast concrete box culverts that comply with:

- the *IDOT Standard Specifications*,
- the *AASHTO Specifications*, and
- the specific producer's quality control/quality assurance (QC/QA) plan approved by IDOT.

In addition to the following guidance, the local agency should review the Bureau of Bridges and Structures' (BBS) latest approval policy for precast box culverts:

1. General. The following will apply:
 - a. Design. The designer should clearly indicate in the contract plans the design fill height, the span x rise, and the proper AASHTO designation (and whether Interstate loading is required) for every precast box culvert, including all extensions and end sections. The producer will be required to mark this information on the precast concrete box. To determine the design fill height, calculate the maximum and minimum fill heights between the extreme edges of the shoulders. For further design guidance, review BBS' design criteria for precast and cast-in-place concrete box culverts.
 - b. Contract Documents. It is recommended that the construction documents specify that the culverts be in accordance with the latest BMPR "QC/QA for Precast Concrete Products Policy." See the IDOT's website for the latest copy of this policy.
 - c. Producers. For precast concrete box culverts, the producer will be required to provide the producer's mark, AASHTO/ASTM designation, date of manufacture, and the span, rise, and design cover for the culvert.
2. Standard Designs. IDOT's "No Review or Approval Policy" only applies to standard precast culvert sizes. The producer should submit the shop drawings to the contractor, who will forward them to the local agency. In review of these drawings, the local agency may do one of the following:
 - a. The local agency may, at their discretion, accept the producer's shop drawings by following the procedures in the BBS' memorandum of March 1, 2002 pertaining to the review and approval of shop drawings for precast box culverts and by specifying that the culverts must meet the BMPR Policy Memorandum 02-02 "QC/QA for Precast Concrete Products Policy."

BUREAU OF LOCAL ROADS & STREETS

13-4(4)

PROJECT IMPLEMENTATION - MFT and State Funds

Jan 2006

- b. The local agency may review and approve the shop drawings by using an Illinois Licensed Structural Engineer or an Illinois Licensed Professional Engineer, either employed by the local agency or by a qualified consultant engineer.
- c. The local agency may require, by Special Provision, that an Illinois Licensed Structural Engineer or an Illinois Licensed Profession Engineer approve the shop drawings provided by the contractor/producer. The local agency may require the producer to provide a certifying statement. The following certification statement is recommended:

I certify that the details shown in the precast concrete box culvert shop drawings for this project comply with the current applicable AASHTO design specifications and contract requirements. The shop drawings will satisfy the reinforcement and dimensional requirements of the contract.

Signature: _____ License No.: _____ Date: _____

Printed Name: _____ Company: _____

- 3. Non-Standard Designs. Cast-in-place end sections and special sections detailed in the contract plans are understood to be structurally adequate and do not require additional shop drawings. Where the precast culvert is not an option, the plans should include the note "Precast culvert alternative is not allowed." Note this next to the culvert on the Plan and Elevation Sheet of the Roadway Plans and in the General Notes of the Structural Plans. For non-standard precast concrete box culverts following the procedures of the March 1, 2002 BBS memorandum, shop drawings may be submitted for review and approval to the BBS through the district. The following submittal of shop drawings will apply:

- a. Producer/Contractor. The precast producer should submit the shop drawings to the contractor. The contractor will submit the drawings to the local agency for review and approval. If found acceptable, the shop drawings should be submitted to the IDOT District Office for forwarding to BBS. Accompanying the shop drawings should be the appropriate design plan sheets that indicate the design fill height, span x rise, AASHTO designation, etc. The shop drawings should be no larger than 11 in x 17 in (280 mm x 430 mm). See Figure 13-4A (structural steel) for the number of sets that should be submitted.
- b. Local Agency. If the shop drawings are found to be acceptable, the local agency will submit the shop drawings to district. The local agency may accept the drawings based on the seal and structural certification of an Illinois Licensed Structural Engineer. This will expedite the approval process. A special provision specifying this requirement will need to be included in the project specifications. The following certification statement is recommended:

I certify that to the best of my knowledge, information, and belief, that this precast box culvert design is structurally adequate for the design fill height, span x rise,

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

Jan 2006

PROJECT IMPLEMENTATION - MFT and State Funds

13-4(5)

and AASHTO designation shown on the plans. The design is an economical one for the style of structure and complies with the requirements of the current AASHTO Standard Specifications for Highway Bridges.

13-4.02 Borrow, Use, and Waste Areas

13-4.02(a) Environmental Review

Proposed borrow areas, use areas (including temporary access roads and runarounds, plant sites, and staging and storage areas), and waste areas must be designated by the contractor and approved prior to their use. These sites will be reviewed for archaeological resources, threatened or endangered species, or their essential habitat, wetlands, prairies, and savannahs at no cost to the contractor. For additional guidance, see Section 10-1.

The following procedures apply to waste areas:

1. Form BDE-2289. Upon award, the local agency's contractor will submit form BDE-2289 to the local agency. A copy of form BDE-2289 can be obtained from the IDOT website for submittal to the district. Provide a location map showing the size and boundaries of the area and ground level photos, preferably from each direction, with form BDE-2289. If not used as the location map, also include a copy of the most recent plat book page showing the respective township.
2. Landowner Agreement. The local agency should obtain written permission from the property owner to conduct reconnaissance surveys of the areas. Submit the written permission to the district.
3. Evaluation. BDE will review the site information to identify cultural and/or biological or wetland conflicts. IDOT will advise the local agency of the expected time to complete the required surveys and will allow the contractor the opportunity to choose another site prior to survey initiation. The contractor is responsible for paying any additional testing, for mitigation, and for obtaining any permits.

13-4.02(b) Waste Disposal

Following approval of waste areas by IDOT, disposal of waste material must not create an unsightly or objectionable appearance or detract from the natural topographic features, nor be placed at an elevation higher than that of the adjacent roadway without permission from the engineer (415 ILCS 5/3-160).

See the *IDOT Standard Specifications* for additional information on the disposition of clean construction and demolition debris with respect to fill and waste areas.

HARD COPIES UNCONTROLLED

13-4.03 Traffic Control in Work Zones

Traffic control in work zones will be provided according to the project Traffic Control Plan (TCP) and *ILMUTCD*. The *IDOT Highway Standards* contain typical highway standards for traffic control in work zones that are approved for use on local agency projects. Additional guidance can be found in Section 39-5.

13-4.03(a) Marked Detours

The signing of a detour route is not required for non-marked routes. However, it is advisable to use signing, especially for arterials and collectors, when there is an alternative route in the immediate vicinity of the project. The signing must be coordinated with other agencies having jurisdiction of the alternate route. Avoid the use of low-volume residential streets.

13-4.03(b) Existing Pavement Markings

Obliterate conflicting pavement markings through the work zone area to prevent confusion to vehicle operators. Painting or taping over existing markings is not acceptable.

13-4.03(c) Temporary Pavement Markings and No Passing Signs

Except for low-volume roads, provide temporary pavement markings and no passing signs on all high-type surfaces (e.g., hot-mix asphalt, concrete), in accordance with the following:

1. **Lane Markings**. At the end of each day's work, install appropriate temporary pavement markings between all lanes that are open to traffic. Temporary markings consist of stripes 4 ft (1.2 m) in length at a maximum spacing of 40 ft (12 m) along the centerline of two-lane highways, and the lane lines on multilane highways. Centerlines on two lane highways will be yellow and lane lines separating two or more lanes of traffic moving in the same direction will be white. Remove all temporary markings on the final wearing surface within 5 days after the permanent markings are installed unless otherwise noted in the plans, or requested by the engineer.
2. **Edge Markings on Multilane Highways**. Where edge lines on multilane highways are obliterated due to resurfacing and operational problems are anticipated or are occurring due to the roadway geometrics, traffic volumes, ambient lighting, or narrow bridges, place temporary diagonal lines on the shoulders beginning at the edge of the travel lanes or auxiliary lanes at intervals of 50 ft (15 m) on ramps or 200 ft (60 m) on main lines. The markings will be a minimum of 4 in (100 mm) wide and 2 ft (0.6 m) long and angled away from the direction of traffic at approximately 45°. The color of the diagonal lines will match the color of the pavement edge lines.
3. **Permanent Pavement Markings**. Replace temporary pavement markings with standard markings as soon as practical. Usually, it should not be necessary to leave temporary

markings in place for more than 2 weeks after completion of any intermediate or final surface. The time restrictions for installation of permanent pavement markings begin at the completion of each intermediate lift or final lift on the resurfacing project. If the markings are obliterated by cold-milling, the time restriction begins when the entire surface has been milled. These restrictions may be delayed by the local agency whenever the contractor cannot apply marking due to unanticipated inclement weather other than a winter shutdown on the project, strike activities, or other circumstances beyond the contractor's control. Install the permanent markings as soon as practical after construction activities are resumed. Prior to winter, standard edge lines, lane lines, centerlines, and no-passing zone markings must be installed, at a minimum, on any intermediate or final surface that will remain open to traffic during winter shutdown periods.

4. No Passing Signs. No passing zones on two and three lane roads may be identified by using either the pennant NO PASSING ZONE warning sign or the DO NOT PASS, PASS WITH CARE regulatory sign in place of pavement markings for periods of time up to 3 calendar days after an intermediate or final lift is completed. Signs may also be used in lieu of pavement markings on low-volume roads until it is practical to install the final full standard markings.

13-4.03(d) Traffic Control for Roads Closed to Through Traffic

Whenever a local authority determines that a bridge or highway construction site requires the closing of a road to through traffic, the contract documents must specify alternative procedures for flagging and controlling traffic, provided the procedures have been approved by IDOT (430 ILCS 105/2). The alternative procedures acceptable for use to reduce traffic control for roads closed to through traffic are based on the following ADT ranges through the construction zone, excluding construction vehicles:

- less than 100 ADT,
- 100 to 400 ADT, and
- over 400 ADT.

The designer is responsible for estimating the ADT through the construction zone and documenting this information in the Traffic Control Plan (TCP) on the plans. Special Provisions and/or special details relating to reduced traffic control other than flaggers must be developed and included in the TCP on a project-by-project basis. The estimated ADT may vary at different locations within the construction zone or during separate construction phases. In these cases, document locations and phases for the varying ADT criteria, so that the contractor could adjust traffic control accordingly. If no action is taken by the designer with respect to determining reduced levels of traffic control, the contractor will be required to provide the same level of traffic control within the section of road closed to through traffic as would be required for open highway conditions. The traffic control can be adjusted as follows:

BUREAU OF LOCAL ROADS & STREETS

13-4(8)

PROJECT IMPLEMENTATION - MFT and State Funds

Jan 2006

1. Flaggers. The *IDOT Standard Specifications* contain provisions for reducing the number of flaggers required where the road is closed to through traffic, but only if the expected ADT, shown on the plans or in the Special Provisions, is less than 400. The *IDOT Standard Specifications* allow the contractor to use only one flagger when the ADT is between 100 and 400 and does not require a flagger when the ADT is below 100, unless the contractor's operation encroaches on the open travel lane.
2. Traffic Control Devices. Signing within the section closed to through traffic may also be reduced from that shown on the applicable *Traffic Control Standards* when the designer has determined that reduced traffic control is appropriate. Where the estimated ADT will be less than 400, only one advance warning sign will usually be necessary. This sign should display a specific message (e.g., RIGHT LANE CLOSED AHEAD) versus a general message (e.g., MEN WORKING). Flashing lights may be omitted from the advance sign(s). Where the estimated ADT will be 400 or more, signing should be provided to full open highway requirements, except the advance signing may be reduced by omitting the first sign in the normal series (e.g., ROAD CONSTRUCTION AHEAD). Barricades, cones, and other traffic control devices should normally comply with full open highway requirements except when the operating speed of the traffic within the section closed to through traffic will be less than 45 mph (70 km/h). In these cases, the following taper rates will apply:
 - 40 mph (60 km/h) – 25:1,
 - 35 mph (55 km/h) – 20:1, or
 - 30 mph (50 km/h) – 15:1.

13-4.04 Temporary Sidewalks During Construction

The designer is responsible for assessing the need to include temporary sidewalks in the plans where existing sidewalks will be reconstructed as part of the project. The *IDOT Standard Specifications* allow the resident engineer to direct the contractor to provide an aggregate surface. In some cases, it may be advantageous to provide temporary sidewalk quantities in PS&E. Provisions for temporary sidewalks should be included under any of the following conditions:

- where a known generator (e.g., school, neighborhood, shopping center) or individuals with disabilities are known to exist (e.g., nursing home, hospitals),
- if the principal access for pedestrian traffic to a business is by an existing paved surface and that surface will be removed, or
- when the construction sequence will include the removal of existing sidewalks and the new sidewalks will not be constructed prior to a winter shutdown.

Temporary sidewalks will be a minimum of 3 ft (1 m) wide. Consider the use of wider sidewalks in areas where high pedestrian or individuals with disabilities are known to exist. If the

HARD COPIES UNCONTROLLED

temporary sidewalk is to remain in place for more than 4 weeks, construct it with a minimum of either 2 in (50 mm) of Portland cement or bituminous concrete or a minimum 3 in (75 mm) compacted depth of aggregate (e.g., CA 10, CA 12, Type B) or other similar locally available aggregate as approved by the engineer. The pay item should be Temporary Sidewalk, measured in square feet (square meters) and should include removal after the permanent sidewalks are placed.

13-4.05 Erosion and Sediment Control

Temporary measures will be used to control erosion and sedimentation while a project is under construction, prior to establishment of permanent measures. Temporary measures for construction activities are presented in the *IDOT Standard Specifications*, which includes a continual system of seeding erodible/bare areas every seven days to minimize the amount of exposed surface area within contract limits. Permanent measures are part of the completed project and will be used to prevent erosion and sedimentation after completion of the construction project. The erosion and sediment control information in the plans should clearly specify what types of measures or, if known, what specific measures are to be implemented in relation to each component of construction operations that will expose areas of earth or stockpiles of material to possible erosion from storm events.

The resident engineer/technician is responsible for maintaining a project erosion and sediment control file at the construction site. The file will contain:

- the Stormwater Pollution and Prevention Plan (SWPPP) including signed Contractor's Certification Statement or an Erosion Control Plan, if SWPPP is not required,
- plan sheets showing existing and planned erosion and sediment control measures,
- a copy of each Erosion Control Inspection Report,
- a copy of the Notice of Intent (NOI), when applicable,
- a copy of each Incident of Non-Compliance (ION), when applicable, and
- a copy of the Notice of Termination (NOT), when applicable.

The local agency will submit NOI to IEPA advising of the intent to use the NPDES statewide general storm water permit. Submittal of NOI 30 days before commencing disturbances of land for project construction will authorize the discharge of storm water from the construction site under the terms and conditions of the permit. NOI must be posted at the job site.

For all projects involving erosion and sediment control measures, the resident engineer/technician is responsible for conducting a field review for erosion and sediment control with the prime contractor and any subcontractors that will be involved in implementation of the practices. Ensure the review is conducted before any earth work or clearing operations begin. The purpose of the field review is to finalize the proper timing and placement of erosion and sediment control measures. Additional field reviews will be required as work progresses. The resident engineer/technician is responsible for recording the date of each field review in the

BUREAU OF LOCAL ROADS & STREETS

13-4(10)

PROJECT IMPLEMENTATION - MFT and State Funds

Jan 2006

project diary. Document the subjects discussed in the field review, and the names and position titles of individuals in attendance, in a memorandum to the erosion control file. Have the contractor complete and sign the Contractor's Certification Statement indicating that the contractor understands the terms of the permit.

Consider the following principles in the general approach to erosion and sediment control:

- a. Construction Limits. Define construction limits to keep soil disturbance to a minimum, leaving as much existing vegetation in place as practical.
- b. Sensitive Areas. Protect sensitive areas prior to any earth moving activity. The permit requires that perimeter controls must be in place prior to earth disturbance activities.
- c. Erosion and Sediment Control Plan. Maintain an Erosion and Sediment Control Plan for each construction phase.
- d. Divert Water. Divert "clear" water flowing through the construction site away from disturbed areas.
- e. Contain Silt. Intercept and contain silt close to its source.
- f. Contain Sediment. Contain all project-related sediment at the project site.

Additionally, the following procedures should be used for field reviews at the project's work site:

- Inspect all disturbed areas, existing erosion control measures, vehicle access sites, and all other areas subject to erosion at least once every 7 days and within 24 hours of the end of each 0.5 in (13 mm) or greater rainfall or equivalent snowfall.
- Document the findings of these inspections using the Erosion Control Inspection Report. By copy of the form, the contractor will be directed to perform any repairs, maintenance, or implementation of additional measures determined necessary.
- Note the dates of corrective action taken by the contractor in response to the inspection report on the form.
- If a local agency at any time observes a failure of any of the erosion and sediment control measure, the resident engineer/technician will complete and submit to IEPA an Incident of Non-Compliance (ION) within 5 days of the time the violation was identified. The information on the form must describe the cause of non-compliance, actions taken to prevent any further non-compliance, environmental impact resulting from the non-compliance, and actions taken to reduce the environmental impact resulting from the non-compliance.
- The contractor must complete permanent erosion control measures as soon as practical after the completion of grading. Temporary measures must be installed and maintained until permanent measures are established. The intent is to provide quick coverage to exposed areas to prevent erosion problems before they occur.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

Jan 2006

PROJECT IMPLEMENTATION - MFT and State Funds

13-4(11)

- When all permanent erosion control measures are in place with 70% establishment rate of vegetation, the local agency will complete and send the Notice of Termination (NOT) to IEPA.

The information required to satisfy the erosion control requirements is summarized in Figure 13-4B.

13-4.06 Mobilization

Mobilization is a payment made at the beginning of a project to compensate contractors and subcontractors for work done in preparation of the contract work. The Bureau of Construction requires that all state let contracts pay the prime contractor mobilization according to the Standard Specifications for Road and Bridge Construction. Furthermore, all prime contractors receiving a mobilization payment are required to pay their subcontractors mobilization. Mobilization payments are optional on local let projects.

BUREAU OF LOCAL ROADS & STREETS

PROJECT IMPLEMENTATION - MFT and State Funds

Jan 2006

FORM	RESPONSIBILITY	WHEN	WHERE TO SEND
Storm Water Pollution Prevention Plan (SWPPP) or Erosion Control Plan (on ALL projects)	Designer/Resident ⁽¹⁾	During Design/ Construction	Submit with plans or Special Provisions. Keep in Project Erosion Control File.
Contractor Certification Statement ⁽²⁾	Contractor and all subcontractors involved in Erosion Control	At Preconstruction Meeting	Submit with plans or Special Provisions. Keep in Project Erosion Control File.
Notice of Intent (NOI) (WPC 623) ⁽³⁾	Resident ⁽⁴⁾	30 days before construction begins	Post at Job site. Send original by certified mail to IEPA. Include copy in Project Erosion Control File.
NPDES/Erosion Control Inspection Report (BC 2259) (REQUIRED on ALL projects)	Resident/Inspector	Weekly and after more than 0.5 in. (13 mm) rainfall	Keep in Project Erosion File. Provide copy to Contractor.
Incidence of Non-Compliance (WPC 624) ⁽³⁾	Resident ⁽⁴⁾	Within 5 days	Original by certified mail to IEPA. Project Erosion Control File.
Notice of Termination (NOT) (WPC 621) ⁽³⁾	Resident ⁽⁴⁾	Final Stabilization ⁽⁵⁾	Send original by certified mail to IEPA. Include copy in Project Erosion Control File.

Notes:

- (1) *This form must be signed by the local agency representative.*
- (2) *Resident portion of the Report should be completed before the actual construction starts.*
- (3) *Can be found in the IDOT Construction Manual.*
- (4) *Contractor should be given a copy of the NPDES Permit.*
- (5) *Final stabilization is defined at 70% viable vegetative growth.*

EROSION AND SEDIMENT CONTROL REQUIREMENTS

Figure 13-4B

HARD COPIES UNCONTROLLED

13-5 FINAL ACCEPTANCE AND PROJECT CLOSEOUT

13-5.01 Construction

13-5.01(a) Certification of Materials

When an MFT or State funded construction project is completed, the district is required to certify that all materials incorporated into the contract work were in close conformity with the approved plans and specifications. Material certification requirements are discussed in PPG.

The following is a brief overview of the key steps involved in the materials acceptance process:

- a. Inspection of Materials. Physical testing or visual inspection of the materials for compliance with the specifications.
- b. Evidence of Materials Inspection. The minimum proof that Method of Acceptance sampling and testing has been performed.
- c. Documentation of Inspection. Documentation that the materials received on the job site were accompanied by adequate Evidence of Materials Inspection as described in step (b) above. Include this documentation as part of the project files.
- d. Input into MISTIC. Input of assigned material quantities into MISTIC by district.
- e. Project Materials Certification Review. The District Materials Section compares the quantities on the final payment estimate with the inspection reports on file with IDOT.
- f. Project Acceptance. Upon completion of the materials certification review, the district proceeds with all actions necessary to accept the project.

Material certification (Steps 4 through 6) is not required for MFT special maintenance projects.

Additional information is found in PPG.

13-5.01(b) Final Inspection

Upon completion of all project work, the local agency should contact IDOT to schedule a final inspection of the project. A final inspection is required for day labor construction and contract construction projects and is recommended for contract maintenance projects. Representatives of the local agency and the contractor will conduct an inspection. IDOT will do a final inspection after the Engineer's Final Pay Estimate is received.

The purpose of a final inspection is to ensure IDOT that the project was constructed essentially according to the approved plans and that all restoration and cleanup required has been satisfactorily completed. During the final inspection, the contractor will note any visible

BUREAU OF LOCAL ROADS & STREETS

13-5(2)

PROJECT IMPLEMENTATION - MFT and State Funds

Jan 2006

deficiencies or irregularities for correction. The final inspection is also an opportunity for all parties to discuss any problems that may have occurred and to mediate any outstanding disagreements between the contractor and the local agency.

Any outstanding deficiencies noted during the final inspection must be corrected prior to final acceptance. Once these deficiencies have been corrected, IDOT will formally notify the local agency that the project has been inspected and found to be acceptable.

13-5.01(c) Final Acceptance

IDOT will issue final acceptance, providing the following conditions have been met:

- a. Final Inspection. Representatives of the local agency, contractor, and the district will perform the final inspection of the project. Deficiencies found will be corrected to the satisfaction of the local agency and the district before final payment is made to the contractor.
- b. Pay Items and Quantities. The different items of work have been measured and requests for change in plans (Form BLR 13210), making final adjustments in quantities, and as-built plans, have been submitted and approved by IDOT; see Section 13-2.03(c).
- c. Affidavits and Releases. The contractor has furnished all the affidavits and releases showing that bills for major items of work have been paid; see Section 13-2.04(c).
- d. Material Certification. Inspection reports indicating all materials incorporated in the improvement were inspected and found to comply with the specifications and are on file with the local agency.
- e. Engineer's Final Payment Estimate. The district has approved the Engineer's Final Payment Estimate (Form BLR 13231).
- f. Final Report. Form BLR 13510 has been submitted to close out the MFT or State funded portion of the project.

13-5.01(d) Project Closeout

When an MFT or State funded project has been completed according to the approved plans and specifications, including any approved changes, the local agency will notify the district. Each MFT or State funded project or section must be closed out, and have a final accounting of all funds authorized for expenditure. This final accounting will call attention to either the need for additional authorization of funds, or the need for a credit of excess funds to the unobligated balance. After the necessary steps have been completed, the project can be closed out. The following steps are required to close out the project:

- final inspection and initial acceptance by the local agency and IDOT,

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

Jan 2006

PROJECT IMPLEMENTATION - MFT and State Funds

13-5(3)

- Final Payment Estimate (Form BLR 13231) submitted by the local agency and approved by IDOT,
- Final Report (Form BLR 13510) submitted by the local agency and approved by IDOT, and
- credits of any balances to MFT Unobligated Balance or TBP Balance.

If a construction project is abandoned prior to the construction phase, form BLR 13510 will be submitted to account for any MFT and/or State funds authorized to the project. For MFT and TBP projects, any unused funds will be credited to the MFT Unobligated Balance or TBP Balance.

13-5.02 Preliminary and Construction Engineering

Funds authorized and expended for preliminary and construction engineering by local agency forces or consulting engineers are to be accounted for on form BLR 13510 upon completion of the project. If the engineering has been performed by a consulting engineer, the local agency should ensure that all terms and conditions of the engineering agreement have been fulfilled and that all services to be performed under the agreement have been completed and a satisfactory final report has been submitted to the district before making final payment.

13-5.03 Right of Way

Funds authorized and expended for land acquisition and associated costs are to be accounted for on the Final Report (Form BLR 13510) upon completion of the project.

13-5.04 Utilities

When utility adjustments or relocations have been completed, the local agency should ensure that all of the work has been accomplished according to the approved agreement, plans, and estimate. All deficiencies should be corrected and the work accepted by the local agency prior to submitting the final bill to the district for approval. A detailed final bill is not required if payment is to be made on an agreed lump sum basis and is under \$25,000. Funds authorized and expended for utility work will be accounted for on the Final Report (Form BLR 13510) upon completion of the project.

13-5.05 Railroads

When the railroad work has been completed, the local agency should ensure that all of the work has been accomplished according to the approved agreement, plans, and estimate. All deficiencies should be corrected and the work accepted by the local agency prior to submitting

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

13-5(4)

PROJECT IMPLEMENTATION - MFT and State Funds

Jan 2006

the final bill to the district for approval. Funds authorized and expended for railroad work will be accounted for on the Final Report (Form BLR 13510). If the project consists of railroad work only, submit form BLR 13510 after the final payment to the railroad to close out the project.

When Grade Crossing Projection Funds are involved in the railroad work, the railroad will notify the Central BLRS upon completion of its work. The Central BLRS will then request the district to inspect the site. After receiving this notification, the district will schedule a final inspection of the crossing surface, approaches, signal, and circuitry work with representatives of the local agency.

When Grade Crossing Protection Funds are involved, the railroad will send its final bill to the Central BLRS. The Central BLRS will review the final bill, arrange for the necessary audit, and advise the local agency when to pay its share of the railroad work.

13-5.06 Special Assessment and Bond Issue Projects

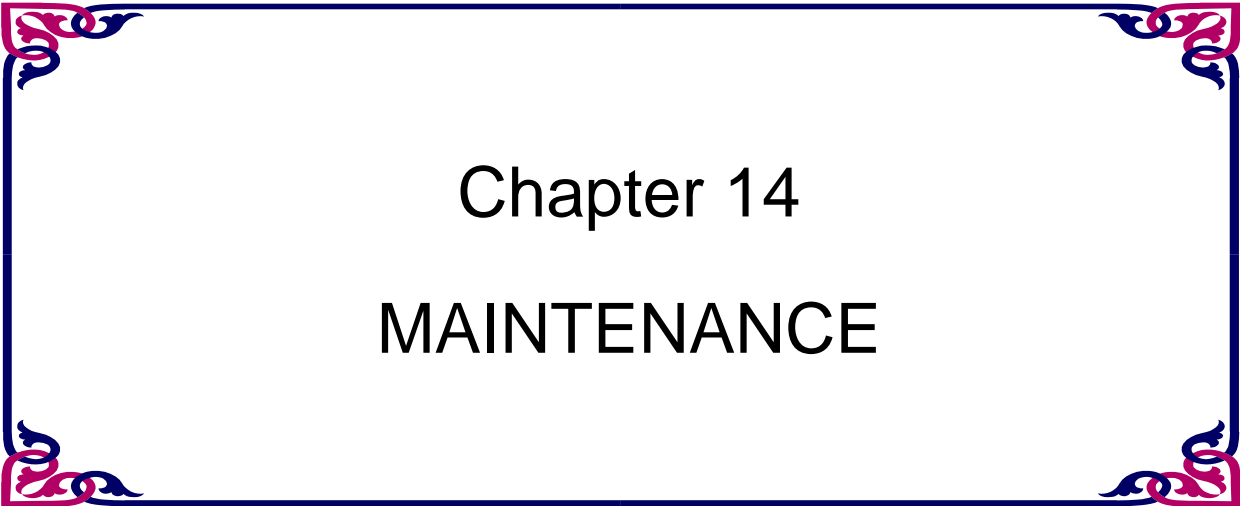

A local agency may use special assessment proceedings or bond issues to assist in the financing of a construction project. However, this does not alter the procedures for MFT projects. Final inspection is still required along with all the other items discussed in Section 13-5.01. Any necessary change in plans along with the Engineer's Final Payment Estimate should be processed and approved by the district. The Final Report (Form BLR 13510) shall be submitted as soon as practical after the final payment estimate has been paid. This applies even though no MFT funds may have been authorized for expenditure and disbursed for the project up to that time.

The financial statement portion of form BLR 13510 will show all MFT expenditures as of the date of its preparation. If there are MFT payments for construction, engineering, right of way, etc., they will be shown as authorized just like a regular MFT improvement. Likewise, those funds authorized for obligation retirement (e.g., public benefit assessments, bond issue payments) will be shown as authorized for obligation retirement and expended as such.

On special assessment projects only, if MFT funds have not been authorized at the time of submittal of form BLR 13510, a copy of form BLR 15410 should accompany the final documentation. This will expedite the approval of the subsequent obligation retirement resolutions.

13-6 CONTRACTOR'S PERFORMANCE REPORT

The local agency is responsible for keeping IDOT informed of any delay on the part of the contractor in starting the work, unsatisfactory work, or poor progress. This will permit IDOT to consider these issues when the contractor applies for a new work rating. Form BC-1777 is to be prepared annually at the end of each construction season for each project completed during the year. Send the completed form BC-1777 to the district by the first of each year with copies to the contractor. Although submittal of form BC-1777 is voluntary for the local agency, it is the agency's opportunity to formally apprise IDOT of the work performed. This form is available on IDOT's website.

Chapter 14

MAINTENANCE - MFT

14-1 MAINTENANCE OPERATIONS

The *Illinois Highway Code* defines maintenance as “the performance of all things necessary to keep a highway in serviceable condition for vehicular traffic” ([605 ILCS 5/2-214](#)). There are several sections of the *Illinois Highway Code* that permit the use of Motor Fuel Tax (MFT) funds for maintenance of the local highway system.

The phrase “to keep a highway” refers to an existing highway. If proposed work is to qualify as a maintenance operation, it must not involve upgrading the geometrics or the design characteristics of the roadway. Maintenance may involve the repair or restoration of the existing cross section of an existing highway item, facility, or appurtenance, but may not involve the complete replacement, widening, or expansion of any of these elements. Only work properly classified as maintenance may be included in the maintenance program for local public agencies (LPAs).

This Chapter discusses the general maintenance program.

14-1.01 Maintenance Administration

14-1.01(a) Publication of Notice of Letting

The cost to locally publish the notice of letting for maintenance work is an acceptable maintenance operation eligible for the use of MFT funds. When using MFT for advertising, it is included as part of maintenance engineering. The Illinois Department of Transportation (IDOT) publishes a free weekly Notice to Contractors Bulletin, see [Section 12-3](#) for more details.

14-1.01(b) Maintenance Engineering

Engineering services required for a LPA to complete its maintenance is an acceptable maintenance operation. This includes both preliminary engineering and engineering inspection. These services are to be performed by the LPA’s staff under the direction of a licensed professional engineer or by securing the services of a licensed professional engineer. It is also permissible to include certain limited engineering services not directly related to a construction project (e.g., bridge inspections, traffic counts) as part of maintenance engineering, see [Section 5-5](#) for more details.

14-1.01(c) Maintenance Supervision

Maintenance supervision is an eligible MFT maintenance operation. Maintenance supervision is defined as the services of one or more persons who act as foremen, have general charge of maintenance work, or provide technical assistance in preparing maintenance papers not requiring a licensed professional engineer. It may be considered as a separate maintenance operation or

BUREAU OF LOCAL ROADS & STREETS

14-1-2

MAINTENANCE - MFT

December 2018

included in the various day labor maintenance operations. The cost of these services must be based on the hourly rate of the employees providing the services.

14-1.01(d) Maintenance Operations

Figure 14-1A provides a summary of various maintenance operations eligible for MFT funds and Sections 14-1.02 thru 14-1.07 provides further explanation. If you are unsure of a maintenance operation not listed, contact your District Bureau of Local Roads and Streets (BLRS) office.

14-1.02 – Maintenance of Roadway Surface	(a) Pavement Patching and Joints (b) Aggregate Surfaces (c) Dust Palliative (d) Bituminous Surface Treatments (e) Slurry Seals (f) Micro-Surfacing (g) Hot In-Place Recycling (h) Cold In-Place Recycling (i) Bituminous Surface Plant Mix (j) Hot Mix Asphalt (HMA) or Warm Mix Asphalt (WMA)
14-1.03 – Maintenance of Drainage Features	(a) Bridges (b) Culverts (c) Curb and Gutter (d) Storm Sewers Miscellaneous – Bridge inspections, bridge deck patching, minor bridge repairs, debris removal, minor scour repair, end sections, riprap including bedding, minor scour protection, ditch cleaning, repair and replacement of inlets / manholes / catch basins, and repair structural failure of storm sewer.
14-1.04 – Maintenance of Traffic Control Devices	Pavement Markings, Signs, Traffic Signals, and Traffic Signal Software
14-1.05 – Maintenance of Transportation System Appurtenances	(a) Bicycle Paths (b) Existing Street Lighting System (c) Motor Vehicle Safety Inspection Lanes (d) Parking Facilities (Municipalities) (e) Sidewalks
14-1.06 – Maintenance of Safety Items	(a) Roadside Barriers (b) Snow and Ice Control (c) Tree Trimming
14-1.07 – Miscellaneous Maintenance	County garages, grade separations, mowing of roadway ROW, salt storage facilities, state highways, and hauling for MFT eligible maintenance operations.

MAINTENANCE OPERATIONS SUMMARY**Figure 14-1A****HARD COPIES UNCONTROLLED**

14-1.02 Maintenance of Pavements

The maintenance responsibility of street and side road approaches that intersect State highways is defined in the IDOT Bureau of Operations *Maintenance Policy Manual*.

14-1.02(a) Pavement Patching

Pavements may be patched and joints repaired as a maintenance operation.

14-1.02(b) Aggregate Surfaces

Aggregate surface material may be placed as a maintenance operation provided the material placed is limited to a maximum loose thickness of 8 in (200 mm). Approved placement methods are based on the aggregate type and are as follows:

1. Aggregate Surface Course, Type A. The IDOT [Standard Specifications for Road and Bridge Construction](#) (*Standard Specifications*) require aggregates used for surface courses to be placed by means of a spreader and to be compacted with a roller. Tailgate spreading is an unacceptable method for the placement of Aggregate Surface Course, Type A.
2. Aggregate Surface Course, Type B. Tailgate spreading of Aggregate Surface Course, Type B, is permitted if a Special Provision allowing tailgate spreading is included in the bid proposal or request for quotations.

14-1.02(c) Dust Palliative

Dust palliatives may be specified on an aggregate surface as a maintenance operation. Any liquid asphalt, road oil, or emulsified asphalt used for prime coats may be specified. The application of any approved dust palliative including salt, calcium chloride, or lignum sulfanate may be specified.

14-1.02(d) Bituminous Surface Treatments

Bituminous patching material may be used to fill potholes. Bituminous surface treatments may be applied on existing earth, aggregate, and bituminous surface treatments as a maintenance operation. The following conditions will apply:

- Scarifying and adding aggregate base material as necessary to replace existing aggregate bases is acceptable.
- Bituminous patching material may be placed to repair an existing base. This includes placement of hot mix asphalt (HMA) at intermittent locations.
- Bituminous materials must be placed in accordance with the [Standard Specifications](#). If a particular bituminous material is desired, it must be specified in a Special Provision.
- The LPA may specify the type of aggregate for bituminous surface treatments for cover and seal coat aggregate, and for blotter aggregates. A Special Provision is required specifying the type of aggregate for which bids will be received. If a specific gradation is desired, the gradation must be specified in a Special Provision.

- The application of Bituminous Surface Treatment Class A-1, A-2, or A-3 is permitted.
- Due to environmental concerns, the general use of cutback asphalts will not be permitted between May 1 and September 30. However, the use of SC-70, MC-30, MC-70, and RC-70 in prime coat applications will be allowed.
- The work may be done by contract, with day labor forces, or spread and applied by a materials supplier.

14-1.02(e) Slurry Seals

See [Section 45-6](#).

14-1.02(f) Micro-Surfacing

See [Section 45-6](#).

14-1.02(g) Hot In-Place Recycling

See [Section 46-6](#).

14-1.02(h) Cold In-Place Recycling

See [Section 46-6](#).

14-1.02(i) Bituminous Surface Mixture (Class B)

Bituminous Surface Plant Mix up to a thickness of 2 in (50 mm), plus material needed to fill depressions and to correct crown deficiencies may be placed as a maintenance operation. [LR 400-2](#) BITUMINOUS SURFACE MIXTURE (CLASS B) should be used.

14-1.02(j) Hot Mix Asphalt (HMA) or Warm Mix Asphalt (WMA)

A HMA/WMA surface course up to 2 in (50 mm), plus leveling binder to fill depressions and to correct crown deficiencies, may be placed over existing pavements as part of maintenance. The milling of a pavement to any depth and replacing this material with HMA/WMA up to the same thickness as milling plus up to 2 in (50 mm) HMA/WMA may also be classified as maintenance.

The following conditions apply:

1. The work shall be completed by contract or by day labor forces.
2. For work done by contract and estimated to cost \$50,000 or more, prequalification of bidders shall be required.
3. Resurfacing shall be a minimum of one lane in width. The length of a segment shall be at least 300 ft (91 m).
4. Curb ramps shall be installed and/or updated to comply with requirements in [Section 41-6](#) to the maximum extent practicable.

BUREAU OF LOCAL ROADS & STREETS

December 2018

MAINTENANCE - MFT

14-1-5

5. Minimum lift thickness shall be according to [Section 44-1](#).
6. The HMA/WMA resurfacing shall be no wider than the existing surface in order to avoid the breakup of the pavement edges by traffic.
7. There should not be evidence of extensive structural failure on the existing pavement. Subgrade/base failures shall be repaired prior to resurfacing. If more than ten percent of the total project pavement area will be patched, other rehabilitation techniques should be considered.
8. An area reflective crack treatment or a strip reflective crack control treatment may be included as part of the maintenance project.
9. Only drainage corrections to restore the road cross section or to correct drainage problems within the eligible segments shall be allowed. This includes replacement/repair of crossroad culverts beneath the roadway and into the foreslopes, damaged curb and gutter, inlets, catch basins, and manholes. Minimal ditch work at the crossroad pipe culverts will be allowed to ensure adequate drainage. Efforts should be made on curb and gutter sections to retain the flow line of the gutter and adequate curb height.
10. High crash locations are not intended to be addressed as a maintenance project. Highways on the state or local 5% Safety Report or other locations experiencing higher than expected fatal and serious injury crashes for the traffic volume, geometric characteristics, and/or posted speed limit should be improved according to [Chapter 32](#) or [33](#).

14-1.03 Maintenance of Drainage Features

14-1.03(a) Bridges

Routine bridge maintenance can be done as part of the general maintenance program. This includes such items as bridge inspection expenses, debris removal, minor scour repair, deck patching, and minor repairs. More extensive repairs, especially those requiring the review of the Bureau of Bridges and Structures (BBS), should be done as individual projects.

MFT funds may be used for the maintenance of movable bridges, but cannot be used for the wages of the operator or the cost of energy used in the operation of bridges.

14-1.03(b) Culverts

Culverts may be replaced as a maintenance operation. All installations should be adequately sized to efficiently accommodate the runoff and provide adequate protection to the highway and abutting property. Proper documentation of this sizing should be retained for installation of culverts with a diameter greater than 36 in (900 mm) or combined openings greater than 7 ft² (0.65 m²). The LPA is responsible for coordinating with the District BLRS office for completing environmental coordination, submitting a preliminary bridge design and hydraulic report, and obtaining permits, when applicable. Give consideration to clear zone requirements and planned future improvements to the roadway, especially for larger sized culverts. Rather than including the replacement of large culverts in the general maintenance program, it is recommended that

HARD COPIES UNCONTROLLED

these replacements be done as individual projects, especially for those being replaced by contract.

The initial installation of entrance culverts and the cleaning of existing culverts are also allowed as a maintenance operation.

14-1.03(c) Curb and Gutter

Intermittent deteriorated curb and gutter can be replaced as necessary as a maintenance operation. Complete curb and gutter replacement cannot be classified as maintenance.

14-1.03(d) Storm Sewers

Storm sewers along streets and highways can be maintained with MFT funds. This includes such items as cleaning sewer lines, inlets, manholes, and catch basins; repairing and replacing inlet, manhole, and catch basin frames, grates, and lids; and repairing structural failures between adjacent manholes. [605 ILCS 5/7-202.7](#) provides specific conditions for municipalities. For counties and road districts, this is an eligible expense provided the storm sewers are for roadway drainage.

14-1.04 Maintenance of Traffic Control Devices

MFT funds may be used for the maintenance and operation of warranted traffic control devices. These traffic control devices may include, but are not limited to, traffic signals, beacons, signs, and pavement markings. Traffic control devices can only be installed where the [Illinois Supplement to the Manual of Uniform Traffic Control Devices \(ILMUTCD\)](#) warrants have been met and where the devices are maintained in accordance with the provisions of the [ILMUTCD](#). This includes software necessary for traffic signal maintenance or programming.

14-1.05 Maintenance of Transportation System Appurtenances

14-1.05(a) Bicycle Paths

Municipalities may use MFT funds to maintain bicycle paths, bicycle parking facilities, and signs/markings within the municipality.

Counties over 500,000 population may use MFT funds to maintain bicycle path and signs/markings. Townships may only use MFT funds to maintain signs and markings on bicycle paths.

14-1.05(b) Existing Street Lighting System

Municipalities may use MFT funds for the maintenance and operation of existing lighting systems that meet the following conditions:

- the street lighting is on an improved municipal street, county highway, or State highway; and

- the system is in satisfactory condition.

This includes the payment of rental charges for facilities owned by a utility. The lighting must be for street purposes and provide relatively uniform lighting levels on the section of street on which MFT funds are being used.

14-1.05(c) Motor Vehicle Safety Inspection Lanes

Municipalities may maintain motor vehicle safety inspection lanes with MFT funds when the lanes are of a permanent nature and in operation on a regular basis throughout the year.

14-1.05(d) Parking Facilities (Municipalities)

MFT funds may be used for the maintenance of parking facilities provided MFT funds were used in their construction, see [Section 4-3](#). Any revenue obtained from the use of these facilities must be used for maintenance before MFT funds can be used.

14-1.05(e) Sidewalks

Road districts and counties can use MFT funds to maintain or repair existing sidewalks.

Municipalities may maintain and repair existing sidewalks with MFT funds ([605 ILCS 5/7-202.15](#)). Short gaps on existing sidewalk systems may also be filled in as part of a maintenance operation provided there are no problems with sidewalk grades or cross slopes and the work can be done within the existing right-of-way and meet the requirements of the *Americans with Disabilities Act* (ADA) or *Proposed Accessibility Guidelines for Pedestrian Facilities in the Public Right-of-Way* (PROWAG).

14-1.06 Maintenance of Safety Items

14-1.06(a) Roadside Barriers

See [Section 35-4](#).

14-1.06(b) Snow and Ice Control

MFT funds can be used for snowplowing and for snow and ice control materials. Establishment of material purchase prices will be permitted for the entire winter season, even if this extends over two maintenance periods. The estimate of maintenance cost for the 1st maintenance period may be used to cover the purchase during the 2nd maintenance period. This must be noted on the estimate of maintenance cost and on any proposal required per Section 14-2.07. The purchase is charged to the maintenance period in which the purchase took place. Using this procedure may result in material purchases reported on the maintenance expenditure statement as being paid at two different unit prices.

14-1.06(c) Tree Trimming and Removal

In general, it is not permissible to use MFT funds to pay for the cost of tree trimming or tree removal as a maintenance operation except for the following:

- the trimming of limbs or the removal of dead trees that are in imminent danger of falling, thereby endangering vehicular traffic;
- the removal of limbs or trees that have fallen onto streets or roads;
- the trimming or removal of trees that obscure traffic signals, street lights, or traffic signs; or
- the trimming or removal of trees to eliminate highway safety hazards.

An area wide tree treatment or removal project, involving the removal of trees on a wholesale basis, may not be paid with MFT funds except for the treatment or removal of Ash trees due to the Emerald Ash Borer (EAB) infestation. If removing Ash trees, or performing a cost effective EAB treatment for Ash trees the following criteria shall be met, if using MFT funds:

- the LPA is located in the EAB quarantined zone published by the Illinois Department of Agriculture;
- the Ash trees are located on the public right-of-way or are a potential hazard to vehicle travel; and
- the Ash trees to be treated or removed are shown in a detailed inventory; and
- MFT funds are not used to plant replacement trees.

14-1.07 Miscellaneous Maintenance

[Section 4-3](#) provides reference to both the Statutes and BLRS determinations on MFT eligibility. Items listed under this section is for only the maintenance of:

- county garages;
- grade separations;
- mowing of roadway ROW;
- salt storage facilities;
- state highways;
- hauling of MFT materials.

If the MFT eligibility of a maintenance operation is unknown, contact the District BLRS office.

14-2 MAINTENANCE INITIATION

14-2.01 Methods of Performing Maintenance

14-2.01(a) Day Labor Maintenance

Maintenance operations performed by LPA employees using publicly owned equipment is classified as day labor maintenance. The use of non-publicly owned equipment may be permitted, see [Section 12-1](#). When a LPA elects to do maintenance work by day labor, sufficient publicly owned equipment and personnel must be available to do the work. The LPA should also demonstrate, by past performance, that the work to be done by day labor will be satisfactory and cost effective. If these provisions cannot be met, day labor maintenance will not be permitted.

Furnishing and spreading materials on the road by a material supplier without specialized equipment may also be considered day labor maintenance. See [Section 12-1](#) for information for obtaining approval to perform this work using day labor for work which typically would fall under Contract Maintenance.

A material proposal, deliver and install proposal, or request for quotations is used for the taking of bids for materials necessary to perform day labor maintenance operations.

14-2.01(b) Contract Maintenance

Maintenance operations which will require a formal contract; if the bidder is requested to do more than furnish the material, spread it on the road or street, roll aggregates, or do a small amount of base repair, see [Section 12-1](#). Maintenance operations which require the bidder to provide specialized equipment and personnel to manipulate materials into a finished product must be done by contract. This includes the placement of bituminous plant mixture, except for intermittent resurfacing.

A contract proposal is used for the taking of bids for contract maintenance.

14-2.02 Maintenance Period

IDOT has designated 12 or 24 months as the accounting period for LPA MFT maintenance programs. This period starts January 1 and ends December 31. The LPA may use different starting and ending dates with IDOT approval, contact the District BLRS office for guidance.

14-2.03 Maintenance Resolution

A maintenance resolution is required for a county or municipality to appropriate MFT funds to be used for maintenance operations contemplated during the maintenance period. Form [BLR 14220](#) is provided for maintenance resolutions. The appropriation for all general maintenance work for the maintenance period may be included in one maintenance resolution. The resolution must be submitted to the district for approval prior to the incurring of any expenses to the MFT funds for the maintenance period covered by the resolution. Should the actual cost of maintenance exceed

BUREAU OF LOCAL ROADS & STREETS

the total amount of MFT funds appropriated, the LPA must adopt a supplement resolution appropriating the additional funds, if MFT funds are to be used for the overage.

Counties and municipalities have the option of submitting a copy of their approved budget with the corresponding resolution, instead of a MFT maintenance resolution. The submittal shall include the approved resolution for the budget and only the pages from the budget showing the MFT funds. The line item(s) for MFT shall indicate it as maintenance with the amount. If the budget year differs from the maintenance period, a minimum of two line items will be required.

Example:

If the budget year is May 1, 2018 thru April 30, 2019 and the maintenance period is January 1 to December 31, then the budget line items would appear similar to:

MFT Maintenance	\$48,000
May 1 to December 31 – 2018 MFT Maintenance	\$32,000
January 1 to April 30 – 2019 MFT Maintenance	\$16,000

Maintenance appropriations may not exceed the sum of a LPA’s current unobligated balance plus estimated MFT allotments for the remainder of the maintenance period. A LPA may not commit MFT allotments for any succeeding year to be used for payment of bills incurred during the current maintenance period. If a proposed maintenance program exceeds the amount of MFT funds estimated to be available, the source of the additional funds to be provided should be shown.

Road districts do not pass resolutions; therefore, to appropriate MFT funds for general maintenance; submit Form [BLR 14222](#) “Estimate of Maintenance Cost/Maintenance Expenditure Statement” or Form [BLR 09150](#) “Request for Expenditure/Authorization of Motor Fuel Tax Funds” to IDOT for approval. The forms shall be signed by the county engineer and township highway commissioner for each road district. Either of these are considered to be the appropriation of MFT funds for road district general maintenance.

MFT funds will not be authorized until a MFT maintenance resolution is submitted; for road districts either Form [BLR 14222](#) or Form [BLR 09150](#) must be submitted with signatures from the road commissioner and the county engineer. The amount of MFT funds authorized is limited to the lesser amount of either MFT funds appropriated in the maintenance resolution, Form [BLR 14222](#), Form [BLR 09150](#), or the amount of MFT funds estimated to be available during the maintenance period.

14-2.04 Section Designation

For general guidance on MFT section numbers, see [Section 2-4](#).

Use the following procedure to assign section numbers for general maintenance programs:

1. Year. Use the last two digits of the calendar year or LPA fiscal year of the program.
2. Agency Sequence. For counties and municipalities, use 00000. For road districts, the first two digits would be the road district code number followed by three zeros.

BUREAU OF LOCAL ROADS & STREETS

December 2018

MAINTENANCE - MFT

14-2-3

3. Subsection. All day labor maintenance work may be included under one subsection, usually 00. Each maintenance contract for the same maintenance period must be identified with a separate subsection. The appropriations for all work may be included in one resolution under one section number usually subsection 00.
4. Section Type. General Maintenance (GM) section type designations will be used for the annual maintenance program.

14-2.05 Maintenance Engineering Categories

All maintenance operations on Form [BLR 14222](#) for the estimate of maintenance costs, shall require one of the following maintenance engineering category designations. The maintenance category always falls to the lowest applicable category, see Figure 14-2A.

1. Category I. Services purchased without a proposal such as electrical energy or materials purchased from Central Management Services' Joint Purchasing Program (www.purchase.state.il.us) or another joint purchasing program that has been approved by the District BLRS office or Central BLRS (CBLRS).
2. Category II-A. Maintenance items that do not require competitive sealed bids according to [Section 12-1](#) or a local ordinance/resolution and do not fall into Category I.
3. Category II-B. Maintenance items that require competitive sealed bids according to [Section 12-1](#) or a local ordinance/ resolution. Routine maintenance includes all items in the following work categories: snow removal, street sweeping, lighting and traffic signal maintenance, cleaning ditches or drainage structures, tree trimming or removal, mowing, crack sealing, pavement marking, shoulder maintenance, limited amounts of Concrete Curb & Gutter (CC&G repair), scour mitigation, pavement patching, and minor drainage repairs.
4. Category III. Maintenance items that are not covered by Category IIB and require competitive bidding with a material proposal or a delivery and install proposal.
5. Category IV. Maintenance items that are not covered by Category IIB and require competitive bidding with a formal contract proposal.

14-2.06 Estimate of Maintenance Costs

Form [BLR 14222](#) is for use by all LPA types at the beginning of the maintenance period for the preparation of an estimate of maintenance cost and again at the end of the maintenance period for preparation of the maintenance expenditure statement, see Section 14-3.04. Form [BLR 14222](#) is designed to allow the estimate of maintenance cost to be updated with actual quantities used and costs, along with the addition of other maintenance operations as discussed below.

An estimate of maintenance cost must include all known maintenance operations to be funded with MFT funds. If other maintenance operations are added during the maintenance period which would require the operation to seek competitive sealed bids, see [Section 12-1](#); a revised estimate is required. Any other maintenance operations, not included on the estimate of maintenance costs or revised estimate, are required to be included individually on the maintenance expenditure statements. All estimate of maintenance costs must be submitted to the district for

HARD COPIES UNCONTROLLED

approval within 120 days after the start of the maintenance period or after the submittal of the resolution, whichever is later and prior to seeking competitive sealed bids for a maintenance operation, see [Section 12-1](#).

The estimate of maintenance costs must be signed by the named official on the form or other authorized individual. See [Section 2-3](#) for additional information.

14-2.06(a) Maintenance Engineering

The estimated cost of engineering services to be paid in connection with a LPA's MFT maintenance program must be set forth separately on the estimate of maintenance costs as "Maintenance Engineering." The amount counties may charge road districts is determined by resolution passed by the county board. A copy of the resolution must be submitted to the appropriate IDOT district.

List maintenance engineering as a separate item on the estimate. The fees paid for maintenance engineering should not exceed the schedule of maximum fees on Form [BLR 05520](#) "Maintenance Engineering to be performed by Consulting Engineers". The cost for other services (e.g. materials testing, advertising, bridge inspections) would be in addition to the normal maintenance engineering fees.

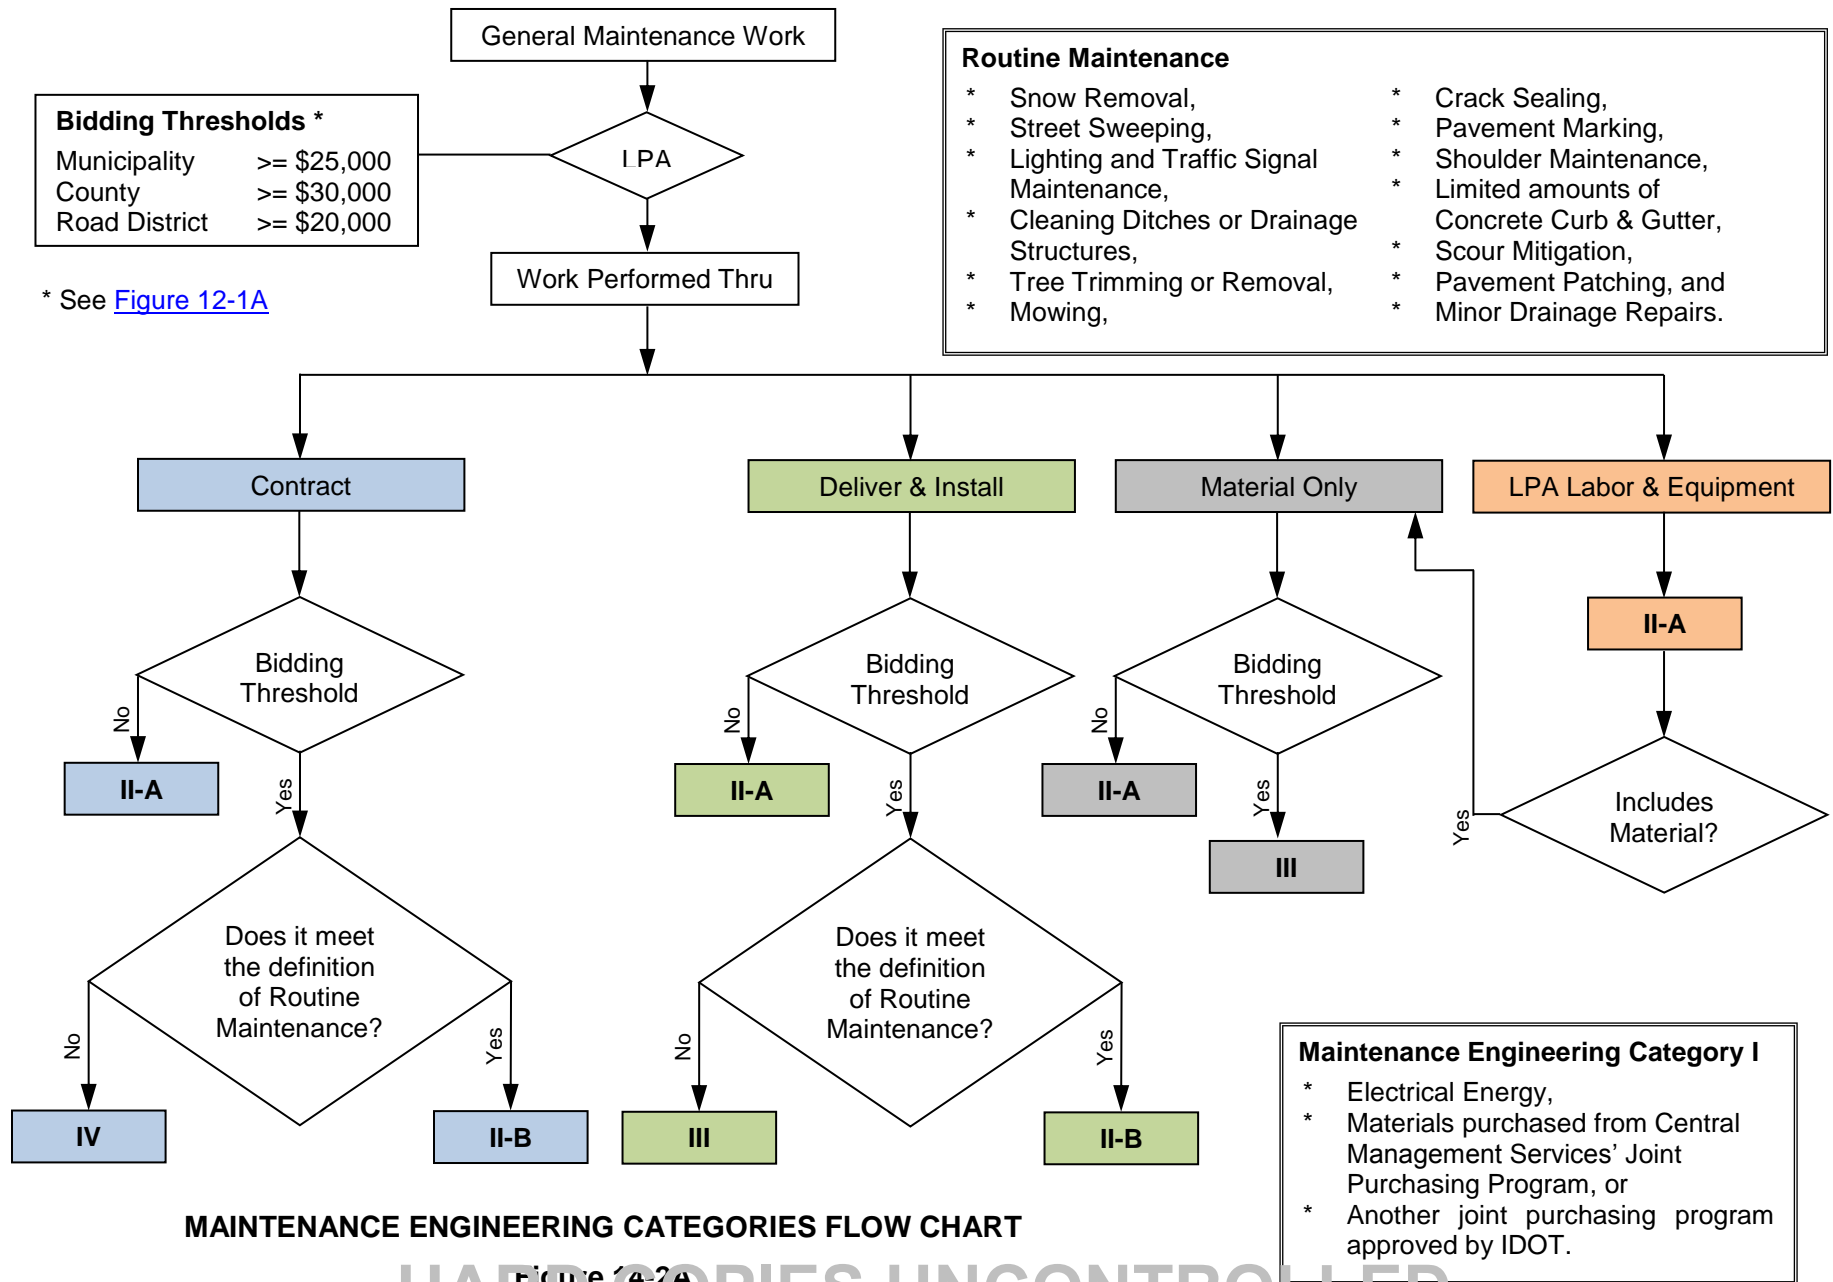

If additional maintenance operations are added during the maintenance period, but not included in the estimate of maintenance costs and additional engineering services are needed, the additional maintenance engineering costs will be listed separately on the maintenance expenditure statement.

MFT funds for "Maintenance Engineering" may be initially authorized under "Maintenance", however; "Maintenance Engineering" must be accounted separately by the LPA. When the maintenance expenditure statement is submitted, the district will make revisions as needed to show the final authorization for "Maintenance" and "Maintenance Engineering".

14-2.06(b) Listing of Material, Labor, and Equipment

LPAs should use Form [BLR 14222](#) to prepare an estimate of maintenance cost for both day labor and contract maintenance operations. For each day labor operation, estimate the cost of material categories (aggregate, bituminous material, culvert, etc.), along with the total estimated cost of material for each maintenance operation. LPAs may provide a total estimated LPA's labor cost and a total estimated of LPA's equipment cost for their their entire maintenance program or list the LPA's labor and LPA's equipment estimated costs for each maintenance operation. If a consultant is utilized, the LPA's labor and LPA's equipment costs fall under Maintenance Engineering Category II-A.

Each maintenance contract should be indicated as a separate maintenance operation listing the type of work in each contract and the total estimated cost of the contract.

MAINTENANCE ENGINEERING CATEGORIES FLOW CHART

Figure 14-2A
 HARD COPIES UNCONTROLLED

14-2.06(c) Equipment Ownership Expenses

LPA's planning to use MFT funds to reimburse locally owned equipment used for maintenance operations must meet the requirements discussed in [Sections 12-1](#) and [15-1](#). The submittal of the required documentation as discussed in [Section 12-1](#) must be submitted with the estimate of maintenance costs for approval.

14-2.06(d) Non-MFT Items

The LPA may include maintenance work not funded with MFT funds in their maintenance program; however, it should be identified as non-MFT on the maintenance estimate.

14-2.07 Maintenance Letting**14-2.07(a) Bidding Proposals**

Proposals for day labor maintenance and contract maintenance need to be prepared in the same manner as for construction projects. See [Section 12-2](#) for information on contract proposal, material proposal, delivery and install proposal, and request for quotations.

Prequalification of bidders is optional for maintenance contracts and material proposals except for bituminous resurfacing contracts greater than \$50,000 for which prequalification is required. If prequalification is required, it must be indicated in the letting advertisement.

The scope of a maintenance proposal should be identified so all work is completed or all material is delivered by the end of the maintenance period. It is imperative an award be made at an early date to allow this work to be completed by the end of the maintenance period. Include a Special Provision in the material proposal specifying that all materials must be furnished and spread by a designated termination date no later than the end of the maintenance period.

Material proposals for the purchase of salt or other ice control measures may be for an entire winter period even if it extends over two maintenance periods. If the purchase of salt or other ice control measures will occur in the 2nd maintenance period, a resolution will need to be submitted and approved. When appropriate, the LPAs may solicit quotes from material suppliers rather than taking formal bids. See [Section 12-1](#) for more information.

A maintenance contract must contain either a number of working days or a completion date no later than the end of the maintenance period. When working days are used, the allowable number of working days should typically not exceed the average number of working days remaining in the maintenance period. Approval of IDOT is required when a maintenance contract must continue beyond the end of the maintenance period.

It is permissible to award contracts for lighting, traffic signals, and other contracts only involving equipment and labor with minor replacement materials for a period not exceeding three years. This is allowed because it is not always feasible for a contractor to increase the work force to provide the necessary services for a short period. A separate subsection is set up for each contract for the first year of the contract; see Section 14-2.04. The cost for the remaining years

BUREAU OF LOCAL ROADS & STREETS

December 2018

MAINTENANCE - MFT

14-2-7

of the contract may be included in the same subsection as the day labor maintenance work (usually a 00 subsection) each year.

14-2.07(b) Letting and Award

The requirements for bidding and for advertising to receive bids are the same as for construction and can be found in [Section 12-3](#).

14-3 RECORD KEEPING

14-3.01 General

14-3.01(a) Expenditures

The expenditure of MFT funds for maintenance may not exceed the lesser of the approved appropriation resolutions or the amount authorized by IDOT. MFT funds may not be expended for items to be bid or quotations obtained, see [Section 12-1](#) until the estimate of maintenance costs and other documentation is approved, see Sections 14-2.03, 14-2.06 and 14-2.07.

MFT funds authorized for expenditure for a maintenance period must be accounted for in that period. Outstanding bills not paid by the end of the maintenance period will still be charged to the maintenance period in which the bills were incurred. All costs incurred as part of a maintenance contract will be charged to the maintenance period in which the contract that was awarded even if it was necessary to extend the contract beyond the end of the maintenance period. An exception is for multi-year contracts for lighting and traffic signal maintenance that extend beyond the maintenance period. The costs for these operations apply to the maintenance period in which they actually occur.

14-3.01(b) County Maintenance

Maintenance operations may be performed by counties either on a countywide basis or on a section basis or patrol basis. Resolutions appropriating MFT funds for the work may be lump sum, covering all sections or patrols, or may be in separate amounts with a separate appropriation for each section or patrol. Likewise, authorization for the expenditure of MFT funds for the work will be in one amount if the appropriation is a blanket one or in separate amounts if an appropriation is made for each section or patrol. Actual cost records must be kept accordingly (i.e., whichever way it is set up).

14-3.01(c) Road District Maintenance

Maintenance operations on township and road district roads may be performed either on a district-wide basis, section basis, or patrol basis. Authorization for the expenditure of MFT funds for this work may be lump sum or for each section and/or patrol, as requested by the county engineer.

14-3.01(d) Municipal Maintenance

Resolutions that appropriate MFT funds for municipal maintenance work and authorization of the expenditure of MFT funds may be lump sum for all streets to be maintained. Cost records, however, should be kept by maintenance operation as established on the estimate.

14-3.02 Overruns

14-3.02(a) Day Labor

For day labor maintenance operations, the following will apply if:

1. Additional maintenance operations not included in the approved estimate of maintenance costs will require the submission of a revised estimate of maintenance cost, when the operation is required to be bid or request for quotations obtained, see Section 14-2.06.
2. The total cost of overruns of a maintenance operation is \$10,000 or less, no additional IDOT approval is necessary. If the maintenance operation includes multiple bid groups, the \$10,000 or less will apply to the individual bid groups.
3. The total cost of overruns of a maintenance operation exceeds \$10,000 ([720 ILCS 5/33E-9](#)), a written request is required for IDOT's approval justifying the increase. If the maintenance operation includes multiple bid groups, the exceeds \$10,000 will apply to the individual bid groups. IDOT's approval of this request should be documented in the district's file.

14-3.02(b) Contract Maintenance

For contract maintenance operations, prepare Form [BLR 13210](#) "Request for Approval of Change in Plans" when required by the criteria presented in [Section 13-2](#). See [Section 9-1](#) for when MFT funds are authorized.

14-3.03 Material Inspection for Maintenance

Material inspection for maintenance consists of the following steps:

1. Inspection of Materials. Conduct physical testing or visual inspection of the materials to ensure compliance with the [Standard Specifications](#) in accordance with the [Project Procedures Guide \(PPG\)](#).
2. Evidence of Materials Inspection. Ensure there is proof that the required material sampling and testing has been performed in accordance with the [PPG](#).
3. Documentation of Inspection. Document the fact that the materials received on the job site were accompanied by adequate evidence of material inspection as described in Step 2 and include the documentation as part of the project files.

The LPA may request assistance from IDOT, as needed. The LPA will maintain the documentation of inspection for a minimum of three years after the completion of the contract for a possible review.

14-3.04 Maintenance Expenditure Statements (MES)

After the end of the maintenance period, the LPA shall submit the Maintenance Expenditure Statement (MES), Form [BLR 14222](#) to IDOT within three months after the end of the maintenance period. After this time, all outstanding bills should have been paid. Maintenance resolutions and

BUREAU OF LOCAL ROADS & STREETS

December 2018

MAINTENANCE - MFT

14-3-3

estimates of maintenance costs submitted for future maintenance periods after that date may not be processed until the delinquent MES has been submitted.

The MES should include lump sum costs for labor, equipment, and maintenance engineering costs. Material costs and maintenance contract costs should be shown for each day labor operations. LPAs may provide a total actual labor cost and a total actual equipment cost or list labor and equipment actual costs for each maintenance operation. The MES shall also include all other maintenance operations listed separately which were paid using MFT funds, but were not included in the estimate of maintenance costs, see Section 14-2.06.

After the receipt of a LPA's MES, IDOT will ensure adequate MFT funds have been appropriated and authorized and will credit any funds not expended to the LPA's unobligated balance.

IDOT's documentation review of MFT funds will determine if all maintenance expenditures were made in accordance with approved estimates of maintenance costs, approved contracts and award of materials, and the equipment rate schedule; see [Chapter 15](#).

Whenever IDOT determines MFT funds have been used to pay for maintenance operations not approved or otherwise has been improperly expended, the LPA will be given an opportunity to document the acceptability of the unapproved items or improper expenditure. If it is determined that the expenditure is not proper, the LPA will be required to refund the expenditure to their MFT account from a separate non-MFT account as a permanent transfer.

14-4 MAINTENANCE INSPECTION (COUNTIES AND ROAD DISTRICTS)

Roads constructed with Federal funds is discussed in [Section 25-2](#).

[605 ILCS 5/5-702](#) and [5/6-702](#) require that IDOT withhold MFT funds from individual counties, townships, and road districts when proper maintenance is not being performed on MFT funded construction projects.

The districts should review the quality of maintenance of MFT construction projects on county, township, and road district roads through their design life of 15 to 20 years. The method of accomplishment will be left to the districts. The districts should work closely with the county engineer to determine if township and road district roads are maintained in a manner satisfactory to IDOT and the county. However, all county, township, and road district projects should be observed at least once every five years. Efforts should be documented when problems are found, and again when they have been corrected.

14-4.01 Items of Inspection

The district should conduct maintenance inspections that include the following:

- name of county or county and road district;
- section number;
- date of inspection;
- surface type;
- condition of surface, shoulders, ditches, structures, traffic control, and guardrail;
- type of maintenance being performed during the year:
- routine (e.g., mowing, patching);
- extraordinary (e.g., placement or removal of large amounts of materials, seal coats); and
- recommended maintenance work to bring the section up to a serviceable condition for vehicular traffic.

14-4.02 Notification

The district will inform the county engineer of all needed maintenance corrections noted during the inspection. If a maintenance correction is essential to provide for safe operation of vehicular traffic, the district will advise the LPA immediately.

14-4.03 Bridge Inspection

LPAs are required to provide periodic inspections of bridges in accordance with the *National Bridge Inspection Standards (NBIS)* and report their findings to IDOT; see [Section 6-3](#).

14-5 ACRONYMS

This is a summary of the acronyms used within this chapter.

ADA	<i>Americans with Disabilities Act</i>
BBS	Bureau of Bridges and Structures
BLRS	Bureau of Local Roads and Streets
CBLRS	Central Bureau of Local Roads and Streets
CC&G	Concrete Curb & Gutter
EAB	Emerald Ash Borer
GM	General Maintenance
HMA	Hot Mix Asphalt

Chapter 15

DOCUMENTATION REVIEW, GENERAL OBLIGATION BONDS, & SPECIAL ASSESSMENTS

15-1 DOCUMENTATION REVIEWS

The local public agency (LPA) should be familiar with the various Illinois Department of Transportation (IDOT) policies, procedures, and instructions that have been set forth in this *Manual*. The LPA is responsible for tracking Motor Fuel Tax (MFT) funds, such as receipts, credits, authorizations for expenditures, and the expenditures. The LPA is responsible for submitting the required documents for review and/or approval by IDOT also contained in this *Manual*. If you have questions, please contact the District Bureau of Local Roads and Streets (BLRS) office.

The District BLRS office is responsible to periodically review each LPA's MFT account, which is accomplished by a MFT Documentation Reviewer (reviewer) of the District BLRS office. Reviews are conducted primarily as cash receipt and disbursement reviews of the LPA's MFT fund. Reviews are also performed to discover any improper or unapproved uses or expenditures not in accordance with Illinois law. The reviewer will review based on state law, IDOT policy, and approved document submittals.

LPA's may also be contacted by IDOT's Bureau of Investigations and Compliance (BIC) to perform an audit. This audit is performed in accordance with generally accepted government auditing standards (GAGAS) and is done completely autonomous from the BLRS.

15-1.01 Record of Receipts and Disbursements

The LPA should use a ledger as a master record to show monthly receipts of MFT funds and credits and authorizations of expenditures to individual section accounts as a best practice. The ledger should also be used as an individual accounting record for each of the authorized expenditure of MFT funds. BLRS has developed an MFT computer software package that may be used by the LPA for these purposes. This software package can be downloaded from the [IDOT website](#) under the "Databases" tab.

A complete record of the receipts and disbursements of MFT funds must be kept by the LPA in accordance with the requirements of the Illinois Local Records Acts ([50 ILCS 205](#)). When the LPA requests to destroy records with the Secretary of State (SOS), the LPA should notify the District BLRS. If there is a need by IDOT to place a hold on the destruction of certain records by the LPA, IDOT will need to file their request with the SOS prior to the destruction. IDOT should notify the LPA of this request. LPA officials should retain the following supporting information:

- all cancelled checks (or images – front & back sides), monthly bank statements,

BUREAU OF LOCAL ROADS & STREETS

15-1-2

DOCUMENTATION REVIEW / GOB / SA

December 2018

- electronic payments,
- records of investment of MFT funds,
- all necessary data to support payment for labor and equipment rental,
- vendor's invoices,
- payment estimates, and
- all other claims to support expenditures and receipts to/from this fund.

The LPA shall preserve all claims, warrants, records, and resolutions pertaining to the receipt and disbursement of MFT funds for review by IDOT. Records should be retained using the following procedures:

1. Unobligated Balance, Authorizations and Credits. IDOT publishes a monthly statement indicating the month's starting unobligated balance, allotment for the month as well as showing the authorizations and/or credits issued since the last statement, and the ending unobligated balance for the LPA. This statement can be found on the [IDOT website](#) under the "Distribution" tab. The unobligated balance is the funds that IDOT has not given the LPA permission to expend. The LPA is given an authorization by IDOT for the use of funds for the various projects. Once authorized these funds are now considered obligated. MFT funds that are authorized to an LPA for a specific purpose are not to be transferred and used for any other purpose. A credit is issued for surplus funds and for interest earned. Authorizations are subtracted from the unobligated balance and credits are added to the unobligated balance. An annual summary of all the LPA's transactions is available from the District BLRS office.

2. Deposits. All MFT funds received by the LPA from the State are recorded and must be deposited into a bank account. No warrants received from the State shall be endorsed and turned over to a contractor or anyone else.

When the LPA has a "dedicated" MFT account, all funds deposited into this account become MFT funds. When other funds are erroneously deposited into the MFT fund; the reviewer will report this in the Documentation Review comments.

If the LPA has a co-mingled account, other funds may be deposited into this account as long as accounting procedures provide for keeping a separate balance for the MFT funds and any interest earned on these funds. The LPA must note non-MFT deposits and withdrawals from this account.

3. Disbursements. MFT disbursements are evidenced by a series of claims and warrants. Each claim is sequentially numbered. The MFT section number should be included on each invoice and on each claim to which it is charged. Each claim should be signed by the party filing it.

4. Reimbursements to the MFT Account. When MFT funds are expended for construction or maintenance projects and then reimbursed by property owners, corporate funds, State funds, Federal funds, or any other source; the reimbursement shall be attributed to the MFT section account from which the payment was made. Any payments not eligible for MFT participation shall be reimbursed to the account from which they were paid.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

December 2018

DOCUMENTATION REVIEW / GOB / SA

15-1-3

5. Materials, Equipment, Labor Claims. Claims for materials or equipment in connection with day labor construction (see [Section 12-1](#)) or maintenance (see [Section 14-2](#)) should be documented. If the claim involves material purchased that is incorporated directly into a MFT project, a copy of the vendor's invoice shall be attached to the claim. For payments to contractors for contract construction or maintenance, a copy of the engineer's payment estimate shall be attached to each claim. When an LPA uses MFT funds to reimburse a corporate account for labor and/or equipment expenses, it shall maintain adequate records to substantiate the charges. For labor, the LPA shall base the accounting system on daily time records and identify the type of work involved on the daily time records along with the wage rates and hours. For equipment rental, the LPA shall show items of equipment; the hourly rates and numbers of hours used for each piece of equipment and identify the labor rates and hours, and MFT section number or location used.

The total costs accumulated from these daily records shall be transferred to payment bills and ultimately to the Final Report of Improvement Constructed under the Illinois Highway Code (Final Report – Form [BLR 13510](#)) or the Estimate of Maintenance Costs/Maintenance Expenditure Statement (MES) (Form [BLR 14222](#)). The LPA shall ensure that daily time records are available for IDOT's documentation review for verification of charges. The practice of assigning a percentage of the public works or highway department payroll as an MFT expense is not an acceptable method of documentation without having other documentation to support the percentage. If there is an intergovernmental agreement on how payment for work performed by one LPA is to be reimbursed by another LPA; the agreement needs to be made available. For payment of MFT eligible personnel in connection with day labor construction or maintenance, a properly documented payroll supported by daily time records will constitute a claim. Payment shall be made by a separate warrant for each individual shown on the payroll, except where a payroll clearing account is in use. When the compensation is on an LPA hourly, daily, or monthly basis, the LPA may pay the employee from the fund from which the employee is regularly paid. The LPA fund may be reimbursed from the MFT fund for the time spent on the MFT job. The LPA must keep complete records of the dates and times LPA employees are engaged on MFT work. Reimbursements in this manner from MFT funds should be made promptly and periodically. See [Section 4-3](#) for MFT eligibility for salaries and expenses.

6. Payments to Other LPAs. Payments from MFT funds to another LPA fund for reimbursement are made in the same manner as any other payment. A claim should show the date, project or section and the same documentation as listed above in Item 5 if payment is for labor and/or equipment. A warrant is then drawn against the MFT fund in favor of the fund that is being reimbursed. If desired, all employees working on that project/section during the period covered by the claim may be shown on one claim and reimbursement made by one warrant.

15-1.02 No Disbursement – Memorandum Documentation Review

A regular receipt and disbursement documentation review is not necessary for any calendar year in which a LPA receives MFT funds but makes no disbursements. In this case, the

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

15-1-4

DOCUMENTATION REVIEW / GOB / SA

December 2018

reviewer will prepare the appropriate portion of the documentation review package addressed to the District Local Roads Engineer (DLRE) stating no disbursements were made by the LPA during the period indicated, therefore; no regular MFT documentation review is necessary.

The reviewer will include in the package:

- the allotments and other funds, including interest received by the LPA;
- the previous documentation review balance;
- the total MFT funds invested or on deposit at the bank at the end of the calendar year; and
- supporting documentation of the MFT fund bank balances agreeing with the Memorandum Documentation Review.

The period covered by this type of review shall always be included in the regular receipt and disbursement documentation review of the first year following the LPA's disbursement of MFT funds.

15-1.03 Request for Records

When scheduling a documentation review, the reviewer will contact the LPA and may request the following records be made available:

- MFT fund ledger and/or account book;
- claim register, if any;
- cancelled checks or images (front and back of checks) and monthly bank statements;
- paid invoices, bills, vouchers, etc.;
- electronic payments;
- payroll and equipment usage records;
- section files including resolutions, contract and material awards, final reports, and maintenance expenditure statements;
- minutes of board or council meetings, where necessary;
- any other information relative to the time frame being reviewed (e.g., Certificates of Deposits, passbooks, money market statements);
- documentation to support expenditures of MFT funds; and
- documentation to support receipts to the MFT funds other than monthly allotments.

15-1.04 Detail of Disbursements

For small LPA's, the reviewer may find it convenient to review all disbursements. For large LPAs, the reviewer may use a sampling technique.

HARD COPIES UNCONTROLLED

15-1.05 Review of Warrants

The reviewer will determine if claims issued against the MFT fund have been approved by the LPA prior to issuance of the warrant. Cancelled warrants will also be examined for proper warrant date, number, payee, and amount and then compared to the monthly bank statements and the LPA's MFT fund ledger. Paid invoices, LPA bills, vouchers, and any other necessary documentation may also be examined. The extensions and amounts are compared with the amount disbursed.

The LPA officials will be asked to explain any disbursements questioned by the reviewer or any discrepancies found. The documentation review report will address these findings with appropriate comments, explaining the particular facts found and what action, if any, needs to be taken.

15-1.06 Formal Contracts Required to be Bid

When reviewing contract projects, the reviewer will check each payment against the Engineer's Payment Estimate (Form [BLR 13230](#)). The reviewer will verify the Engineer's Payment Estimate (Form [BLR 13230](#)), marked as "Final" has been approved by IDOT prior to final payment to the contractor unless the LPA is under agreements of understanding for the project.

15-1.07 Day Labor

Items of labor, material, equipment usage, and miscellaneous, whether they apply to a construction account or a maintenance account, must be examined and checked as follows:

1. Labor. MFT fund for labor expenses may be paid in the following manner:
 - a. Direct Payment. When the LPA pays the employee directly from the MFT fund, the LPA must keep adequate records of employment on the MFT funded project by the employee (e.g., hours, dates). Payment is made by an MFT warrant payable directly to the employee. See [Chapter 9](#) for guidance on payment of labor with MFT funds.
 - b. Local Funds. When the LPA pays the employee from the LPA fund from which the employee is regularly paid, the LPA fund may be reimbursed by an MFT warrant payable directly to the LPA fund. The LPA must keep adequate records on which the employee is engaged in MFT work (e.g., hours, dates, locations, sections). For maintenance, location and sections are not required. Payment from the MFT fund to another LPA fund for reimbursement of the above is made periodically, preferably each month, and must be made the same as any other MFT payment. It is not necessary to have individual claims for each employee for a section. All employees working on a particular section during the period covered by the claim may be covered by one warrant.
2. Materials. Payment for materials purchased directly with MFT funds should be substantiated by the vendor's invoice, which should be checked for proper unit prices, extensions, and totals. Materials taken from LPA stock cannot be charged at more than cost. Accurate records must be kept of the quantities and dates used.

3. Equipment Usage. When a LPA desires to claim MFT funds for the use of its own equipment for MFT work, the hourly rate claimed for each piece of equipment it desires to use cannot exceed the rate provided by IDOT's [Schedule of Average Annual Equipment Ownership Expense](#) (under the "LPA Resources" tab) including the index factor or Equipment Watch. Adequate records must be kept by the LPA (e.g., hours, dates, equipment, section numbers). The equipment must be listed on the Equipment Rental Schedule (Form [BLR 12110](#)) and approved by IDOT.

15-1.08 Miscellaneous Receipts and Disbursements

Occasionally, the reviewer will encounter situations that vary from the routine documentation review. In these cases, the reviewer will set up the necessary accounts to record the receipts and disbursements of the particular account. The reviewer will also make the necessary remarks in the documentation review comments to address the situation. Some of these situations are discussed in the following subsections.

When these types of funds are reimbursed to the MFT fund, they are identified in the documentation review report under the documentation review comments as "other receipts." The section number, source, purpose, and amount must be shown.

15-1.08(a) Authorizing Disbursements and Crediting Reimbursement for a Specific Section in the MFT System

The following will apply:

1. Active or Open Sections. The authorization or reimbursement is credited to the section account as identified in the documentation review.
2. Closed Sections (In the MFT System). If the section is closed, it is reopened to include the disbursement or receipt, as indicated by the documentation review, including comments (e.g., source, purpose). Final paperwork is corrected. Once this action is completed, the section must be closed again.
3. Closed Sections (Purged from the MFT System). If the section is closed and purged from the database, the disbursement or receipt of funds is entered as category "other" and in the memo area the original section designation is entered. The source and purpose shall be identified. The purging of data is no longer allowed.

15-1.08(b) Authorizing Disbursements and Crediting Reimbursement Not Identified by a Section

Any other reimbursement that cannot be assigned to an existing section must be entered as category type "other" and identified with an explanation in the memo field. The source and purpose of the reimbursement or disbursement plus the documentation review report number shall be identified.

15-1.08(c) Crediting Earned Interest

The Attorney General of the State of Illinois has set forth a ruling which, in general, states that interest must follow the fund. Any earned interest on the investment of the LPA's MFT funds must be accounted for in the documentation review. Upon receipt, these funds must be deposited in the LPA's bank account and credited to the "Unobligated Account."

The accounting of monies earned on the MFT fund investment is reviewed during the course of the documentation review made on the LPA.

Any earned interest (and only earned interest) on LPA's fund must be accounted for in the documentation review under a section titled "Interest" with a line designated for each year of interest. Each annual total of earned interest will be credited as category "interest" in the MFT system and in the memo field the documentation review report number shall be identified along with year in which the interest was earned.

15-1.08(d) Crediting Surplus Off-Street Parking Revenue Funds

When a municipality has used MFT funds to construct a revenue-producing off-street parking facility, its parking revenue account must be made available to IDOT for documentation review purposes. A section number to track this revenue must be assigned as follows:

1. Separate Accounts. When a LPA chooses to maintain accounts for each parking facility constructed, the construction section must be closed and the final MFT participation is determined. To account for revenues, new MFT sections must be established as in the following example:

Revenue reimbursements for a parking lot built as section 02-00076-00-PK is accounted for by using section 02-R0076-00-PK. The original MFT participation in the project is entered in the database as "the amount appropriated." The receipts are credited to the Unobligated Account annually, and the total credited accumulation is maintained in the far-right column on Form [BLR 15106s](#) of the documentation review. Once the amount appropriated has been achieved, the section is closed.

2. Single Account. When the LPA has several revenue-producing parking facilities but maintains one parking revenue account, the original construction sections are closed and the total MFT participation in all projects is determined.

The new section number is established as (year of 1st reimbursement)-R0000-00-PK. The total participation in all sections must be entered into the database as the amount appropriated. If additional parking projects are built, the MFT participation for those lots is added to the appropriation amount. Annual credits for parking receipts are treated as separate accounts.

15-2 TOWNSHIP BRIDGE PROGRAM DOCUMENTATION REVIEWS

The Township Bridge Program (TBP) account of each county is reviewed periodically by the MFT documentation reviewer of the District BLRS office. This documentation review usually takes place at the same time as the MFT documentation review.

15-2.01 Record of Receipts and Disbursements

The county shall preserve all claims, warrants, records, and resolutions pertaining to the receipt and disbursement of Township Bridge Program funds for review by IDOT. Warrants shall be deposited in a separate account to facilitate an efficient accounting during the documentation review.

The county must use a ledger to show receipts of TBP funds and expenditures from individual section accounts. BLRS has developed a TBP computer software package that can be downloaded from the [IDOT website](#) under the "Databases" tab.

A complete record of receipts and disbursements of TBP funds must be kept by the LPA similar to what is required for MFT funds; see Section 15-1.01. Procedures similar to those for MFT should be used. Additionally, the TBP funds received by the county from the State are recorded and deposited into a bank account, which will identify TBP funds and interest earned on these funds separately from other funds. Disbursements are made from the account when pay estimates are received from the contractor, or invoices from consultants are received for preliminary or construction engineering. Funds not needed for a project for which they were obligated must remain in the account until applied to a future project.

15-2.02 Request for Records

When scheduling a documentation review, the reviewer will contact the LPA and request records similar to those listed in Section 15-1.03 be made available.

15-2.03 Documentation Review

The reviewer will review all receipts and disbursements to and from the TBP account similar to the review of MFT funds discussed in Section 15-1. The reviewer will ensure that any funds paid to a county by the State for a TBP project but not needed to complete the project remain in the TBP account to be used on future projects and that interest earned on the TBP account is credited to the account. To balance completed projects, the reviewer will record any credits to or debits from the unobligated balance in the documentation review report. The reviewer will also check to ensure that only the allowable percentage of TBP funds is expended, with the remaining balance coming from the LPA's local funds and/or from MFT funds.

15-3 GENERAL OBLIGATION BOND AND DOCUMENTATION REVIEW

An LPA's may use MFT funds to reimburse bonds (e.g., General Obligation Bonds (GOB), MFT Fund Bonds) to finance highway improvements, but must follow the requirements of Section 15-3.01. Whenever MFT funds are used for the retirement of bonds by the LPA, it is necessary for IDOT to review the LPA books. The purpose is to determine the existence and amount of indebtedness that is eligible for MFT participation.

15-3.01 General Obligation Bond Procedures

15-3.01(a) MFT Reimbursement for Bond Issues Procedures

[Section 4-4](#) discusses an LPA's use of bonds (e.g., General Obligation Bonds (GOB), MFT Fund Bonds) to finance highway improvements. The following discusses procedures for initiating and processing a bond issue project, which is approximately the same for each type of bond when MFT funds will be used to pay all or part of the bond issue.

1. Resolution of Intent (Municipality and County). When an LPA proposes to finance a project with the proceeds of a bond issue and later requests MFT funds to retire the indebtedness, the LPA must submit a resolution stating its intent to IDOT. Assign a section number to the resolution for the project (see [Section 2-4](#)) and adequately describe the location, the proposed widths of the roadway, and type of the proposed improvement. For a GOB issue, the Resolution of Intent (Form [BLR 09112](#)) requires IDOT approval prior to submitting the proposition to the voters, if voters' approval is required.

When the entire cost of the project is paid with proceeds of the bond issue, there is no need to appropriate any MFT funds at the time the Resolution of Intent (Form [BLR 09112](#)) is passed. However, if the LPA wants to pay any eligible portion of the total project cost directly with MFT funds, a resolution (Form [BLR 09110](#)) to appropriate the necessary MFT funds must be submitted to IDOT for approval.

2. Direct Payment of Project Costs. Do not include any project costs that are paid directly with MFT or other funds in the bond issue. When the cost of engineering is not part of the bond issue and is paid with MFT funds, make payments from the MFT account directly to the persons performing the engineering work. Do not deposit MFT funds in, or disburse from, the bond issue account. MFT funds cannot be used to pay engineering costs on GOB issue projects until the bond issue has been passed by referendum.
3. Procedures for Road District Bond Issues. In general, the county engineer, acting in cooperation with or for the highway commissioner, will submit the general plan of improvement to IDOT for approval prior to the submission of the proposition to the voters, if voters' approval is required.

BUREAU OF LOCAL ROADS & STREETS

15-3-2

DOCUMENTATION REVIEW / GOB / SA

December 2018

4. Bond Ordinance — GOB Projects Only. Subsequent to the passage of the referendum, the LPA (e.g., county board or corporate authorities) must file an ordinance with the county clerk certifying the results of the vote and the issuance of the bonds ([605 ILCS 5/5-605](#), [5/6-513](#), and [65 ILCS 5/8-4-4](#)). The LPA should submit two certified originals of the bond ordinance to IDOT.

For road districts, a register of all issues of these bonds is filed with the county clerk by the road district clerk. Submit two originals to IDOT ([605 ILCS 5/6-510](#)).

5. Allowable Miscellaneous Expenses. Legitimate miscellaneous expenses incurred in connection with an approved road or street bond issue improvement (e.g., attorney fees (see [Section 4-3](#)), engineering costs) may be included as part of the improvement cost, and MFT funds may be used to retire the bonds. Voting costs in connection with issuance of bonds are not considered legitimate MFT expenses.

6. Obligation Retirement Resolution. To retire the obligation with MFT funds, submit to IDOT an Obligation Retirement Resolution (Form [BLR 15411](#)) appropriating the funds required each time an obligation becomes due. If a road district wants to retire the obligation with MFT funds, the county must submit a County Request for Road District Motor Fuel Tax Funds to be Used to Retire Indebtedness (Form [BLR 09130](#)) to IDOT indicating the outstanding amount needed for payment.

For GOB issue projects, the county clerk must sign Certification of Cancellation of Tax Levy (Form [BLR 15314](#)), if required. It certifies that the tax levy, which would have produced funds to pay the indebtedness, has been cancelled and not extended. This must accompany the Obligation Retirement Resolution (Form [BLR 15411](#)).

If the bond issue improvement includes work not eligible for MFT participation, the amount of MFT funds to retire the bonds and interest must reflect the percentage of the project that is eligible for MFT participation.

15-3.01(b) Records

Subsequent to passage of the referendum, two certified copies of the bond ordinance must be submitted to IDOT.

For road districts, two copies of a register of all issues of these bonds must be submitted to IDOT pursuant to the Illinois Highway Code, [605 ILCS 5/6-510](#).

As soon as the bonds have been sold, the proceeds must be deposited by the LPA's treasurer in a bond account(s) as directed by the bond ordinance, not the MFT account. Two forms should be completed by the clerk and submitted to the appropriate District BLRS office. These forms are:

1. Description, Ordinance, and Bond Issue:
 - Use Form [BLR 15310](#) if the bond issue is a general improvement bond issue.
 - Use Form [BLR 15312](#) if the bond issue is a refunding or refinancing bond issue.
2. Schedule of Tax Levies and Retirement Schedule:

HARD COPIES UNCONTROLLED

- Use Form [BLR 15311](#) for a general improvement bond issue.
- Use Form [BLR 15313](#) if it is a refunding or refinancing bond issue.

15-3.02 Documentation Review of General Obligation Bonds

15-3.02(a) Accounts

When it is anticipated that a bond issue will be repaid with MFT funds, whether in whole or in part, IDOT is required to conduct a documentation review of the bond issue accounts.

When the LPA receives the proceeds from the bond (Form [BLR 15310](#)) and retirement schedule (Form [BLR 15311](#)), both forms need to be submitted to the District BLRS. The District BLRS will schedule an initial documentation review at this time. The final documentation review is conducted upon completion and final acceptance of the project(s).

When IDOT has approved the Engineer's Payment Estimate (Form [BLR 13230](#)) marked as "Final" and all other bills for the project have been paid, the LPA will submit the Final Report – Notice of Completion and Acceptance (Form [BLR 13510](#)). The Final Report will contain a detailed summary of all costs associated with the project and an indication of whether these costs were paid from the bond fund or from another source. If there are several projects under the same bond issues, a Final Report will need to be completed for each project. After receiving the Final Report (Form [BLR 13510](#)), IDOT will perform the final documentation review. Any project costs that are not eligible for MFT participation will be determined during the final documentation review, and the MFT-eligible portion of the repayment schedule will be revised accordingly.

If the bond issue to be repaid with MFT funds is a refunding or refinancing bond issue, the initial documentation review and the final documentation review are the same.

15-3.02(b) LPA Records

The reviewer will request the various LPA records relative to the bond issue. A copy of the bond ordinance should be included with the documentation review report.

During preparing the documentation review report, the reviewer may need to examine the following LPA records:

- minutes of the LPA's meetings;
- special election data;
- LPA legal and construction files;
- LPA documents kept by the treasurer (e.g., bills, invoices, bank statements, electronic payments);
- bond ordinance;
- MFT fund; and

- other LPA funds.

15-3.02(c) Costs Over and Above the Amount of the Bond Issue

Typically, this type of documentation review arises when the LPA finds that the proceeds received from the sale of the bonds and earned interest are insufficient to cover all costs on the project being improved. The LPA requests the use of MFT funds to cover the costs over and above the amount of the bond issue. A documentation review is requested to determine the actual MFT funds necessary to complete final payment of all costs on the project.

This is essentially a final documentation review. The reviewer accounts for all monies received from the sale of the bonds, earned interest, and any MFT funds that may have already been authorized to the LPA. The reviewer takes into consideration all outstanding bills necessary to complete final payment of all costs on the section applicable to MFT funds.

15-3.02(d) Miscellaneous Information Regarding Bonds

A copy of the LPA resolution should be given to the reviewer. This resolution may contain the pertinent data relative to the issuance of the bonds and certain options for bond retirement the LPA may exercise. Whenever this occurs, the reviewer must cover the options in the documentation review comments and prepare any appropriate schedules as needed.

Whenever there is a partial abatement (cancellation) of taxes, the Cancellation of the Tax Levy Certificate (Form [BLR 15314](#)), which is certified by the county clerk, should show the actual amount of taxes that have been abated or cancelled. The amount shown as being extended and the amount shown as being cancelled should equal the tax levy for that particular year.

When a LPA sells a portion of the authorized bond issue and then finds it necessary to sell any or all of the remaining unissued bonds, the reviewer prepares a supplementary bond documentation review. For this supplementary sale of bonds, the reviewer prepares a regular bond documentation review following the general procedure already outlined. The reviewer accounts for only the proceeds from the sale of the supplementary sale of bonds. This is necessary because the issuance dates usually differ from that of the original partial offering, which affects the amount of accrued interest received by the LPA. The reviewer must obtain a copy of the supplementary ordinance for inclusion in the documentation review report.

The LPA will need to complete Form [BLR 15411](#) (Obligation Retirement Resolution) for repayments of bond and interest from the MFT account. The authorization and payments will show in the regular MFT documentation review.

15-4 SPECIAL ASSESSMENT AND DOCUMENTATION REVIEW

A municipality may use MFT funds to retire the indebtedness to finance a special assessment project and must follow the requirements of Section 15-4.01. When the municipality desires to retire the public benefit portion of a Special Assessment (SA) Project, IDOT must conduct a documentation review to determine that the work was eligible for the use of MFT funds and that the amount of MFT funds used did not exceed the public benefit portion.

15-4.01 Special Assessment Procedures

15-4.01(a) Resolution of Intent

When a municipality proposes to finance a project by special assessment and later requests MFT funds to retire the indebtedness, the corporate authorities are responsible for submitting a resolution (Form [BLR 09113](#)) to IDOT stating their intent. Assign a section number to the resolution for the project (see [Section 2-4](#)) and adequately describe the location and type of proposed improvement.

15-4.01(b) Direct Payment of Project Costs

Any portion of a project (e.g., right-of-way, engineering expenses) may be paid directly with MFT or other funds. If the municipality chooses to pay a portion of the project directly, exclude all costs related to that portion from the assessment. All project costs that will be paid directly should not be included in the final project cost that is submitted to the circuit court for the determination of the assessment. When MFT funds will be used for direct payment of eligible project costs, the Resolution of Intent may include the necessary appropriation of MFT funds.

The use of MFT funds to pay engineering costs directly on special assessment projects that have not been confirmed by the court is not allowed unless prior approval of resolutions of intent have been secured.

Payments from the MFT account must be made directly to the entities performing the engineering work. MFT funds shall not be deposited in and disburse from the local improvement account or bond issue account.

15-4.01(c) Obligation Retirement Resolution

If a municipality wants to retire the public benefit assessments with MFT funds, it should submit an Obligation Retirement Resolution (Form [BLR 15411](#)) to IDOT, appropriating the funds required each time an obligation comes due. The municipality may request MFT authorization to retire all, or any remaining installments, of the public benefit assessments at one time.

Pertinent information showing the total private and public benefit assessments and project costs should accompany the first Obligation Retirement Resolution. The project costs should be the latest costs available for all right-of-way, engineering, construction, legal fees, and court costs associated with the project. Estimated costs may be used if the final costs for a phase are not known when preparing the resolution. For the Board of Local Improvements to collect the assessments, both public and private, they are required to file a certificate of issuance of first voucher in the circuit clerk's office in which the assessment was confirmed. File this certificate within 30 days after issuance of the first voucher for construction and show the amount and date of the first voucher.

It is necessary to furnish all the preceding information to IDOT for documentation review purposes. Special Assessment (Description, Court, Legal, and Financial Data) (Form [BLR 15410](#)) and Public Benefit Retirement Schedule (Form [BLR 15312](#)) are available for this purpose and will be furnished upon request. After the construction contract has been awarded and approved, the Obligation Retirement Resolution will be approved by IDOT along with authorization to expend MFT funds.

Form [BLR 15312](#) is not required when the total public benefit will be returned in one lump sum.

15-4.01(d) Miscellaneous Information

The following provides additional information regarding special assessments.

1. Public Benefit Assessment Payments. An LPA may use MFT funds to pay the first installment or all ten installments of public benefit assessments, without interest, provided that all other court data is in order and the Court has confirmed the assessment roll.
2. Interest. The following apply to interest on special assessments:
 - a. Start Date. Interest begins to accrue 60 days from the issuance date of the first voucher for work, except where the taking and damaging of property is involved. In this case, interest begins to accrue 60 days from the date that the Warrant for Collection is delivered to the LPA by the Circuit Court. The taking and damaging of property occurs when condemnation proceedings for right-of-way are involved in the special assessment. Interest is always computed 60 days from the date the first voucher is issued and not from the date the first voucher is recorded in court.
 - b. Assessment. Interest is computed on the total amount of all public benefit assessments (10 installments). It is always computed 60 days from the issuance date of the first voucher or the date of the Warrant for Collection to January 2nd of the following year.
 - c. First Payment. If the first voucher has been issued and the LPA is requesting the use of MFT funds for payment of interest, the first voucher must be recorded in court before IDOT will authorize payment of interest with MFT funds.

BUREAU OF LOCAL ROADS & STREETS

December 2018

DOCUMENTATION REVIEWS / GOB / SA

15-4-3

- d. Corrections. When the interest dates and/or amounts are incorrectly shown on the LPA's Obligation Retirement Resolution, the interest should be correctly computed 60 days from the date of issuance of the first voucher or the date of the Warrant for Collection to January 2nd of the following year. Appropriate comments must be made when dates or amounts are incorrectly shown by the LPA.
3. Principal. The first installment of principal is due on January 2nd of the year following the issuance of the first voucher except when the acquisition or damaging of property is involved. In this case, the first installment immediately becomes due and payable upon delivery of the Warrant for Collection to the LPA.
4. Installments. The following will apply:
 - a. Request for Less than the Resolution. If the LPA requests less interest and/or principal on their Obligation Retirement Resolution than what is actually due, the LPA will only receive authorization for the lesser amount requested.
 - b. Request for More than the Resolution. If the LPA requests more interest and/or principal on their Obligation Retirement Resolution than is actually due, the LPA will only receive authorization for the actual amount due as shown by the schedule on Form [BLR 15411](#).
 - c. Payments. Special Assessment Bonds can only be issued against collections on any or all of installments two through ten. Special Assessment Bonds cannot be issued against collections of the first installment. The first installment is paid to the contractor by warrant only.
 - d. Other Funds. If the LPA pays a special assessment installment by borrowing from another LPA fund, with the intention of reimbursing the borrowed funds with certified MFT funds, a Notice of Interest must be passed by the LPA board and recorded in the minutes. Prior to payment of the special assessment installment with borrowed funds, the LPA must record their intent to repay the borrowed funds with MFT funds when authorization is received. Otherwise, there is no obligation due, and the LPA must not use any MFT funds for payment of this particular installment.
 - e. Interest. The second to tenth installments of principal bear interest from January 2nd to January 1st, inclusive, of the following year except where the acquisition or damaging of property is involved. In this case, it is recommended that the documentation reviewer review the statute for the applicable provision ([65 ILCS 5/9-2-48](#)).

15-4.01(e) Records

LPAs are required to furnish the District BLRS with the following:

1. Statement of Financing of Local Improvement Project. The LPA will complete Form [BLR 09140](#) and submit to the District BLRS.

HARD COPIES UNCONTROLLED

2. Municipal Resolution of Intent for Special Assessment. The LPA shall pass a resolution of their intent (Form [BLR 09113](#)) and submit to the District BLRS.
3. Preliminary Court Information. The LPA must submit Form [BLR 15410](#) (i.e., description, court, legal and financial data). Additionally, the following is required:
 - the court approval of the special assessment, both public and private;
 - the LPA's estimate used to determine the assessment; and
 - the date of the first voucher, if issued.
4. Schedule of Installments. The LPA must indicate the due dates, installment numbers, principal due, interest due, and the total amount of each installment on Form [BLR 15311](#).
5. Obligation Retirement Resolution. The LPA shall use Form [BLR 15411](#) as a formal request to use MFT funds for a particular debt. A description of the debt must be shown in sufficient detail to identify the public benefit assessment and the individual payment due.
6. Special Assessments (Public Benefit Retirement Schedule). The LPA shall submit Form [BLR 15411](#) when they retire the special assessment, unless it is paid in one lump sum.

15-4.02 Documentation Review of Special Assessments

15-4.02(a) Procedure

When final papers are submitted by the LPA, the District BLRS initiates a final documentation review. The reviewer should request that the various LPA records, relative to the special assessment, be made available for examination. The reviewer reviews Form [BLR 09113](#) and Form [BLR 15410](#) which are submitted by the LPA, by examining the Circuit Clerk's files. The reviewer should secure all court, legal, and financial data relative to the special assessment.

The reviewer reviews the following information on the assessment roll confirmed by the court:

- the total public and the total private assessments,
- the number of installments,
- amount of each installment,
- the breakdown between public and private assessments in each installment, and
- the assessment roll portion that covers the costs paid in the form of special assessments against private property owners and the LPA as public benefits.

After securing all the necessary information from the Circuit Clerk's files, the reviewer will review the District BLRS files and compare the information secured from the Circuit Clerk's file against the information originally submitted by the LPA. Any differences will be noted. The reviewer will also request an explanation from the LPA regarding any differences. This is necessary because, prior to the documentation review, any MFT funds already authorized for payment of obligations as part of this special assessment have been based on information furnished by the

LPA. If the assessments exceed the final cost, IDOT will prorate the excess public benefit assessment over the remaining installments or deduct it from the final installments, whichever the LPA requests. If all installments are paid, a refund to the MFT account for the excess amount is required.

The final documentation review should contain schedules listing all vouchers and/or bonds issued for payment of construction, engineering, legal, and court costs. These costs are considered the total actual costs of the improvement. These costs do not include any amount shown in the Statement of Financial Cost as “amount estimated to pay accruing interest on bonds and/or vouchers.”

The total of the above items is the “total actual cost” as shown in the Statement of Final Cost. This total should agree with the “total assessment” as shown on the assessment roll as confirmed by the court. Any differences should be noted by the appropriate comments.

After securing all relative information and after the finances have been balanced, the documentation review comments are prepared.

15-4.02(b) Costs Over and Above the Amount of the Special Assessment

Typically, this type of documentation review arises when the LPA underestimates the actual cost of the improvement and finds that collections on the special assessment are insufficient to pay the vouchers and/or bonds issued. The LPA requests authorization for MFT funds to cover the costs over and above the amount of the special assessment. A documentation review is requested to determine the actual amount of MFT funds needed by the LPA.

This is essentially a final documentation review. The documentation review accounts for the total actual cost as compared to the total assessment to provide the actual amount of MFT funds needed by the LPA to pay any costs over and above the amount of the special assessment.

15-5 POST DOCUMENTATION REVIEW PROCEDURES

15-5.01 Documentation Review Approval by the District

Upon the completion of the MFT documentation review of the LPA, the draft copy along with pertinent findings, comments, and/or recommendations are given to the DLRE for review, resolution, and approval. Upon receipt, the DLRE reviews the documentation review and the comments with respect to the following:

- documentation review completeness and consistency with established MFT format,
- agreement with the MES (Form [BLR 14222](#)) and/or the Final Report (Form [BLR 13510](#)), as appropriate,
- need for a LPA credit(s) and/or authorization(s),
- conformance with IDOT policy and State Statutes,
- validity of citations and noted irregularities, and
- the satisfactory disposition of all findings.

15-5.02 Potential Criminal Action

If the documentation review findings have the potential for criminal action, Central BLRS must be notified immediately. The matter is referred to BIC, if appropriate.

15-5.03 Disposition of Findings

Findings refer to the discovery of irregularities and/or issues during the documentation review. If there are findings to be resolved that require the cooperation of the LPA, the District BLRS must contact the appropriate LPA official and relate the documentation review findings to be resolved. The District BLRS must document the discussion with written correspondence to the appropriate LPA official and reiterate the actions required to resolve the finding(s) with a copy being sent to the CBLRS. The District BLRS should then approve the documentation review and release it for further processing. Written documentation to the appropriate LPA official may not be required if the necessary measures were taken immediately and do not require council or board action by the LPA.

The following presents the calendar day schedule for unresolved findings, at every stage the CBLRS will need to be informed:

1. 45 Days. Once written documentation is sent and 45 calendar days pass and neither corrective action nor a positive response has been received from the LPA, the District BLRS must contact the LPA by phone and follow up with written documentation restating the previous findings and IDOT's position. At this time, the District BLRS should request a meeting with the appropriate LPA official to offer assistance in overcoming any disagreement or misunderstanding surrounding the findings.

BUREAU OF LOCAL ROADS & STREETS

15-5-2

DOCUMENTATION REVIEWS / GOB / SA

December 2018

2. 75 Days. If the request for a meeting is rebuffed and 30 more calendar days pass without LPA action or response, the District BLRS must notify the LPA in writing that, effective immediately, approval of all MFT work will be withheld until all pending findings have been resolved in a manner satisfactory to IDOT.
3. 105 Days. If IDOT still does not receive written notification of LPA action and response within 30 more calendar days, the District BLRS must again notify the LPA in writing. The letter will state that unless all pending findings are immediately resolved in a manner satisfactory to IDOT, the Regional Engineer will recommend to the CBLRS and to the Director of Program Development further payment of MFT funds be withheld in accordance with [605 ILCS 5/5 - 702](#), [5/6 - 702](#), or [5/7-204](#), as appropriate.
4. 135 Days. If 30 more calendar days pass totaling 135 days without LPA action or written response, and all negotiation attempts by IDOT have been rebuffed, the CBLRS must notify the appropriate LPA official by registered mail. No further payment of MFT funds will be made as noted above until all findings are resolved. The CBLRS must coordinate this action with the Office of the Comptroller. The LPA must be notified each month that MFT payments will be resumed only when all MFT expenditures have been accounted for in a manner satisfactory to IDOT.

The District BLRS shall maintain a comprehensive listing of unresolved LPA documentation review findings which will allow close adherence to the above procedure.

15-5.04 Distribution

If no findings have been identified in the documentation review, the District BLRS approves the documentation review and releases it. The District BLRS retains IDOT's original of all documentation reviews. A copy of the documentation review is sent to the LPA.

15-6 ACRONYMS

This is a summary of the acronyms used within this chapter.

BIC	Bureau of Investigation and Compliance
BLRS	Bureau of Local Roads and Streets
CBLRS	Central Bureau of Local Roads and Streets
DLRE	District Local Roads Engineer
Final Report	Final Report of Improvement Constructed Under the Illinois Highway Code (Form BLR 13510)
GAGAS	Generally Accepted Government Auditing Standards
GOB	General Obligation Bonds
IDOT	Illinois Department of Transportation
ILCS	Illinois Compiled Statutes
LPA	Local Public Agency
MES	Maintenance Expenditure Statement
MFT	Motor Fuel Tax
Reviewer	MFT Documentation Reviewer
SA	Special Assessments
SOS	Secretary of State
TBP	Township Bridge Program

Chapter 17

PLANNING AND PROGRAMMING – Federal Funds

17-1 STATE PROPOSED HIGHWAY IMPROVEMENT PROGRAM

17-1.01 Multi-Year Highway Improvement Program

The Office of Planning and Programming (OPP) is responsible for development of the multi-year highway program. OPP works with the nine highway districts to develop priorities for specific improvement projects that meet Illinois Department of Transportation's (IDOT) overall accomplishment goals. This collective set of candidate projects from throughout the State is then analyzed further to develop multi-year programs within the fiscal limitations of projected revenues and which best meet IDOT's goals. Through these efforts a Multi-Year Highway Improvement Program is developed and published in April each year.

Federal funds are made available to local public agencies (LPA) through IDOT for use on various construction programs. Part of the Illinois apportionment is allocated to LPAs based on accepted distribution formulas. Included in the Multi-Year Highway Improvement Program are LPA Federally-funded projects scheduled for the first four years of the Multi-Year Program.

OPP works through the Central Bureau of Local Roads and Streets (CBLRS) to identify these projects. Each District BLRS office is given a program mark based on anticipated allocations of Federal funds. The District BLRS office then works with the LPAs to identify projects to be included in the program. During the early stage, the LPA should determine whether the project would be accomplished using one or several contracts. This decision is based on the complexity of the project, project costs, and the availability of Federal funds. Each LPA analyzes its priorities and available Federal funds plus the necessary matching funds. This enables the LPA to prepare its multi-year program. The LPA should check with the appropriate District BLRS office for the individual requirements on program submission. The District BLRS office categorizes and reviews all program requests to ensure that the total program costs fall within funding restraints. The District BLRS's program is then submitted to the CBLRS. The CBLRS reviews all programs for statewide funding restraints and then coordinates the District BLRSs' submittals with OPP.

17-1.02 Annual Highway Improvement Program

17-1.02(a) Development

Projects in the multi-year program that are scheduled within the current fiscal year become part of the Annual Highway Improvement Program. The Annual Program may include only a portion of the entire project (e.g., engineering, land acquisition, utility adjustments, and construction). When Federal funds are used for any of these items, the item is identified as a separate line item in the Annual Program. Any non-participating cost to be included in a State contract must be included in the program cost. The preliminary program for the upcoming fiscal year is

BUREAU OF LOCAL ROADS & STREETS

17-1-2

PLANNING AND PROGRAMMING - Federal Funds

December 2018

furnished to the State legislature in April. During the following month, the annual element of the multi-year program is finalized and is published in July each year.

17-1.02(b) Annual Program Revisions

A number of substantial increases in project cost estimates may have occurred on local projects between the time of their inclusion in the Annual Highway Improvement Program and the time of joint agreement development. These cost increases have an impact on the State appropriation available for accomplishment of the Annual Program.

In an effort to minimize the effect of cost increases on the Annual Program, the LPA should provide the District BLRS office with revised cost estimates as soon as practical in order to avoid delaying projects from letting. It is very important that the District BLRS office maintain the most current cost estimates. The District BLRS office should submit program revisions as soon as practical to the CBLRS for the following types of projects:

- projects less than \$200,000, programmed amount must be within \$10,000 of the funding agreement amount; or
- projects \$200,000 or greater than, programmed amount must be within 5% of the funding agreement amount.

The Program revision request should include program deletions to accommodate the cost increases. If the programming costs of other projects are being reduced to accommodate the increased program estimates, submit a brief explanation for the other project's changes so that the reduction in cost can be included. Requests should be submitted a minimum of thirteen weeks before the scheduled letting.

When it is determined that a project in the Annual Program will not be accomplished during the fiscal year, a request by the District BLRS office to substitute another project should be made as soon as practical.

17-2 FEDERAL PLANNING REQUIREMENTS

The planning process involves the development of projects, decisions on funding, and the determination of construction priorities. The CBLRS and District BLRS offices assist LPAs with project coordination.

17-2.01 Statewide Transportation Improvement Program (STIP)

The *Federal Transportation Funding Act* requires that a State establish a minimum four-year Statewide Transportation Improvement Program (STIP) for highway and transit projects that are federally funded or require Federal action. This program is updated every year. Projects that are not considered of significant scale for individual identification may be grouped by function, work type, and/or geographic area.

The first three annual elements of IDOT's Multi-Year Highway Improvement Program are used as a basis for the development of the highway portion of the STIP. The portion of the STIP for projects located in urbanized areas is developed in cooperation with the Metropolitan Planning Organizations (MPOs). Section 17-2.02 gives additional details of the MPO requirements. The State and the affected local officials select other projects. The responsible party for highway planning work at the local level is dependent on the type of area in which the project is located. The following presents the appropriate local official for each area type:

1. Rural. The chairman of the appropriate county board or designated representative, typically the county engineer, is responsible for the planning. The appropriate local official and the district formulate and establish the need and priority of construction projects.
2. Urban. A committee composed of county, city, and district representatives typically conducts planning for an urban area.

IDOT must provide citizens, affected agencies, and other interested parties a reasonable opportunity to comment on the proposed STIP. The STIP is published with reasonable notification of its availability. Upon completion of the public involvement review process, the STIP is submitted to the Federal Highway Administration (FHWA) and the Federal Transit Administration (FTA) for approval. Approval of the STIP allows IDOT to proceed with the authorization of Federal funds for highway and transit projects. Projects not included in the federally approved STIP will not be eligible for Federal funding.

Projects included in the STIP can be advanced to or deferred from the first annual element without additional action or approvals. Projects being added to or deleted from the STIP that are of significant scale for individual identification are considered amendments and will require an opportunity for public review and comment and approval by the FHWA and FTA. The implementing LPA will be responsible for public involvement on the STIP amendment.

17-2.02 Metropolitan Planning Organizations (MPOs)

23 USC 134 requires that an MPO be designated for each urbanized area and the metropolitan area has a continuing, cooperative, and comprehensive (3-C) transportation planning process

BUREAU OF LOCAL ROADS & STREETS

that results in plans and programs that consider all transportation modes and support metropolitan community development and social goals. Areas with populations over 200,000 are called transportation management areas (TMAs). The Governor has designated an MPO for each urbanized area. Figure 17-2A lists the MPO for each urbanized area. The MPO is responsible, along with IDOT, for administering the 3-C process. This type of planning results in transportation improvement plans and programs consistent with the planned development of the urbanized areas and assists in determining the transportation modal choice. For additional information, see OPP's publication [MPO Cooperative Operations Manual](#).

URBANIZED AREA (population 200,000 and under)	METROPOLITAN PLANNING ORGANIZATION (MPO)
Beloit	State Line Area Transportation Study (SLATS)
Bloomington / Normal	McLean County Regional Planning Commission (MCRPC)
Carbondale / Marion	Southern Illinois Metropolitan Planning Organization (SIMPO)
Cape Girardeau	Southeast Metropolitan Planning Organization (SEMPO)
Champaign / Urbana	Champaign / Urbana Urban Area Transportation Study (CUUATS)
Danville	Danville Area Transportation Study (DATS)
Decatur	Decatur Urbanized Area Transportation Study (DUATS)

Rockford	Rockford Metro Agency for Planning (RMAP)
St. Louis	East-West Gateway Council of Governments

**METROPOLITAN PLANNING ORGANIZATIONS AND
TRANSPORTATION MANAGEMENT AREAS**

Figure 17-2A

BUREAU OF LOCAL ROADS & STREETS

December 2018

PLANNING AND PROGRAMMING - Federal Funds

17-2-3

IDOT provides fund estimates (program marks) to the MPOs. These estimates can be used in developing the metropolitan Transportation Improvement Program (TIP) using the MPO's procedures for actions/approvals. The TIP must cover a period of not less than three years. The TIP may be modified at any time consistent with the procedures established for its development and approval. While the TIP does not need to be approved by the FHWA or FTA, copies of any new or amended TIP must be provided to both agencies. The TIP is included without modification into the STIP by reference.

The first year of the TIP constitutes an "agreed to" list of projects for project selection. No further project selection action is required to proceed with these projects. If a LPA wants to proceed with a project in the second or third year of the TIP, the project must be added to the annual element in accordance with the MPO's selection and amendment procedures.

17-2.03 Value Engineering (VE)

Value Engineering (VE) is the systematic application of recognized techniques by a multi-disciplinary team not directly involved with the planning and development phase of a project to identify the function of a product or service, establish a worth for that function, generate alternatives through the use of creative thinking, and provide the needed functions to accomplish the original purpose of the project, reliably and at the lowest life-cycle cost, without sacrificing safety, necessary quality, and environmental attributes of the project.

17-2.03(a) Applicability

VE is applicable to all highway projects on the National Highway System receiving Federal assistance with an estimated cost of \$50 million or more, all bridge projects on the National Highway System receiving Federal assistance with an estimated cost of \$40 million or more, and any project the FHWA determines to be appropriate.

17-2.03(b) Project Selection

Each district identifies applicable projects during the preparation of the multi-year program. Due to the complexity and scope of large projects, more than one VE study may be desirable. Other projects not meeting the definition may be selected for this program. The District shall notify the CBLRS and FHWA of the identified projects as part of the multi-year plan development.

17-2.03(c) Project Cost

Costs associated with environmental studies, preliminary engineering, final design, land acquisition and construction should be used in determining the selected project's cost. The project cost includes state, LPA, and federal-aid highway funds.

17-2.03(d) Scope of Studies

1. Initiation of VE Study. Local projects utilizing VE should be coordinated with the District VE Coordinator at the initiation of the project. Schedule VE studies in such a manner so as not to cause delay of the project. For a Phase I report with multiple construction contracts, develop a plan for conducting the VE study(s) based on the Phase I

HARD COPIES UNCONTROLLED

considerations and the nature and complexity of the work type, (e.g., one VE study may cover alike construction projects). A single VE study should cover as many construction contracts under the single Phase I report as practicable and beneficial. The VE study should be initiated as close to the completion of the Phase I report as possible. Initiate the VE study no later than the time the construction plans are 30% complete and to allow for the implementation of the recommendations without delaying the project. The VE study should be, at the least, scheduled when the Phase I report is completed.

2. Team Makeup. The VE team, selected by the district, consists of individuals not personally involved in the design of the project. The team leader should have attended the National Highway Institute (NHI) course on Value Engineering or have equivalent experience in the preparation of VE studies. When making up the team, take into account the following:

- Draw team members from either the district or central office;
- Consider individuals from specialty areas depending on the project scope;
- Assign personnel from construction, maintenance, and studies and plans (as applicable);
- Include representatives from environment, operations, and land acquisition as necessary;
- Include individuals from the public and other agencies when in the public interest;
- Participation by FHWA members is encouraged where feasible;
- Participation by the central office is encouraged; and
- Invitation of IDOT personnel from nearby districts should be considered.

Qualified consultants may be retained to conduct VE studies provided the consultant has not worked on the subject project or the consultant maintains an independent VE study team.

3. Process. To best accomplish the goals of Value Engineering, the districts have considerable latitude in determining the type, size, and complexity of a VE study. Value engineering studies should follow widely recognized problem solving principles.
4. Final Report. Each Study concludes with a formal VE report, which outlines the decisions and recommendations and is presented to the Deputy Director/Regional Engineer or his/her representative. FHWA should be invited to all VE closeout meetings. Each district establishes a procedure for prompt review and implementation of the approved recommendations. When any recommendation is a major change to an approved Design Report or is a design exception to policy, the recommended change is coordinated through the appropriate central bureau.
5. Monitoring. Each district appoints a VE coordinator who is knowledgeable in VE studies and trained in VE procedures. The VE coordinator's responsibilities include monitoring each VE study from initiation through the final report, reviewing the report, and assisting in the implementation of the findings. As there may be local projects meeting this threshold, the district VE coordinator will be responsible for coordinating both state and

BUREAU OF LOCAL ROADS & STREETS

December 2018

PLANNING AND PROGRAMMING - Federal Funds

17-2-5

local roads administered projects. During the month of October, each year, the district VE coordinator sends the Bureau of Design and Environment's (BDE) VE coordinator a list, which itemizes the total number of VE studies conducted over the past year and the estimated cost savings for each study. BDE will summarize the information and forward it to the FHWA. The BDE VE coordinator will compile an annual list of approved recommendations from all VE studies completed within that year.

17-2.03(e) Constructability Reviews

Constructability reviews are a useful tool for complex or unusual projects and are encouraged as a cost or time saving measure. These reviews may include the use of IDOT personnel, unassociated with the project, or consultant/contractor teams that would not be bidding on the project. These reviews would not typically be making complex design change recommendations as would be expected in a full VE study. The constructability review would focus upon staging issues, work staging areas, field expedient procedures or methods, and similar activities focused upon accelerating or enhancing the proposed design.

17-3 CLEARINGHOUSE COORDINATION**17-3.01 Policy**

Clearinghouse coordination was established after Federal Executive Order 12372 revoked the Office of Management and Budget's (OMB) Circular A-95. It offers States and LPAs the opportunity to initiate and establish their own review procedures and priorities. Under the Executive Order, States can decide which activities to review and how they should be reviewed. The Executive Order encourages States to establish a single point of contact, through which all reviews can be focused. In Illinois, the Illinois Department of Commerce and Economic Opportunity is the approval agency for the Regional Planning Commission Act ([50 ILCS 15/0.01 and 15/1](#)). The Regional Planning Commissions serve as the Substate Clearinghouses for regional reviews in all but four counties in the State. The FHWA is obligated to cooperate with the State-established process and must provide an explanation if State clearinghouse comments are not accommodated.

17-3.02 Substate Clearinghouses in Illinois

Because coordination with Substate Clearinghouses varies, this *Manual* does not discuss their coordination requirements. It is the LPA's responsibility to submit the request for Substate Clearinghouse review to the appropriate clearinghouse. The Substate Clearinghouse should be contacted to determine which projects require submittal.

Figure 17-3A lists the Substate Clearinghouses and corresponding counties currently recognized in Illinois.

Chapter 18

GENERAL ENVIRONMENTAL PROCEDURES - Federal Funds

All projects funded through the Illinois Department of Transportation (IDOT) must meet applicable Federal and State laws and regulations requiring identification and evaluation of the project's environmental impacts. In aggregate, Chapters 18 through [20](#) of the *Bureau of Local Roads and Streets (BLRS) Manual* describe the applicable environmental procedures for local public agency (LPA) Federally funded projects. Chapter 18 presents information that has a general application to all LPA Federally funded projects. This includes environmental documentation, coordination, and general National Environmental Policy Act (NEPA) compliance procedures. The subsequent Chapters discuss more specific applications of the environmental procedures (e.g., Categorical Exclusions). See [Section 10-1](#) for environmental requirements for other LPA projects.

Chapters 18 through [20](#) have been developed based on Part III, "Environmental Procedures," of the *Bureau of Design and Environment (BDE) Manual*. The procedures in the *BDE Manual* are applicable to IDOT's program of projects on the State highway system, which are typically more complex than LPA projects; therefore, the *BLRS Manual* has been modified as appropriate. For a more in-depth discussion on environmental procedures, see the *BDE Manual*. Chapters 18 through [20](#) provide references to several Federal documents that have a special prominence in the implementation of environmental procedures (e.g., *Council on Environmental Quality (CEQ) Regulations*, 23 CFR 771). See [Appendix A](#) of Part III of the *BDE Manual* for a copy of these documents. For a quick reference to environmental coordination see Figure 18-1A.

18-1 DEFINITIONS

[Appendix B](#) of the *BDE Manual* presents an extensive list of definitions typically used for environmental procedures. The following presents the definitions of the more common terms used in this Chapter:

1. *National Environmental Policy Act (NEPA)*. The NEPA of 1969, as amended, is a Federal environmental statute that requires the consideration of environmental factors through a systematic, interdisciplinary approach before committing to a course of action. Procedures for the course of action or actions set forth in the CEQ regulations and 23 CFR Part 771.
2. *Council on Environmental Quality (CEQ)*. The CEQ is composed of three members appointed by the President. It maintains a quality awareness of the nation's environmental resources. The CEQ oversees the implementation of NEPA by issuing regulations (i.e., 40 CFR Parts 1500-1508) to guide all Federal agencies.
3. *23 CFR 771 (Environmental Impact and Related Procedures)*. This regulation is contained in the *Code of Federal Regulations (CFR)*, and prescribes the policies and

BUREAU OF LOCAL ROADS & STREETS

18-1-2

GENERAL ENVIRONMENTAL PROCEDURES - Federal Funds

June 2018

procedures of the Federal Highway Administration (FHWA) and the Federal Transit Administration (FTA) for implementing NEPA, as amended, and the regulations of the CEQ (i.e., 40 CFR Parts 1500 – 1508). This regulation sets forth all FHWA, FTA, and Department of Transportation (DOT) requirements under NEPA for the processing of highway and urban mass transportation projects.

1. Action. For purposes of 23 CFR 771, an “action” is a highway project proposed for FHWA funding. It also includes activities such as joint and multiple-use permits, changes in access control, etc., which may or may not involve a commitment of Federal funds. For Federal flood plain regulations, “action” is any highway construction, reconstruction, rehabilitation, repair, or improvement undertaken for Federally funded/regulated projects.
2. Categorical Exclusion (CE). (For purposes of 40 CFR 1500, *CEQ Regulations*.) A category of actions that do not individually or cumulatively have a significant effect on the human environment and for which, therefore, neither an Environmental Assessment (EA) nor an Environmental Impact Statement (EIS) is required.
3. Class of Action. There are three classes of action that prescribe the level of documentation required in the NEPA process. These actions are:
 - Categorical Exclusion (CE),
 - Environmental Assessment (EA), and
 - Environmental Impact Statement (EIS).
4. Cooperating Agency. Any Federal agency, other than a lead agency, that has jurisdiction by law or special expertise with respect to any environmental impact involved in a proposal (or a reasonable alternative) for legislation or other major Federal action significantly affecting the quality of the human environment. A State or LPA of similar qualifications may, by agreement with the lead agency, become a cooperating agency.
5. Environmental Assessment (EA). A concise public document for which a Federal agency is responsible that serves to briefly provide sufficient evidence and analysis for determining whether to prepare an EIS or a Finding of No Significant Impact (FONSI).
6. Environmental Impact Statement (EIS). A detailed written statement, prepared for major Federal actions significantly affecting the quality of the human environment. The EIS must discuss the environmental impact of the proposed action, any adverse environmental effects that cannot be avoided should the proposal be implemented, alternatives to the proposed action, the relationship between local short-term uses of man’s environment and the maintenance and enhancement of long-term productivity, and any irreversible and irretrievable commitments of resources that would be involved in the proposed action should it be implemented.
7. Finding of No Significant Impact (FONSI). A document by a Federal agency briefly presenting the reasons why an action, not otherwise excluded, will not have a significant impact on the human environment, and for which an EIS, therefore, will not be prepared.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

June 2018

GENERAL ENVIRONMENTAL PROCEDURES - Federal Funds

18-1-3

8. Lead Agency. The agency or agencies preparing or having assumed primary responsibility for preparing the environmental document.
9. Record of Decision (ROD). A FHWA document, prepared after the publication of the Final EIS, which presents the following conclusions:
 - basis for the decision (i.e., the selected alternative);
 - mitigation measures that will be incorporated into the project; and
 - documents any required Section 4(f) approval.
10. Scoping. An early and open process for determining the scope of issues to be addressed in EISs or EAs and for identifying potentially significant issues related to the proposed action. Scoping is intended to focus the study effort on issues that are significant and avoid the collection of needless detailed information on insignificant issues.

18-2 GENERAL NEPA REQUIREMENTS

This Section discusses general requirements that Federal-aid projects must follow to satisfy NEPA.

18-2.01 Purpose/Policy

The CEQ established regulations governing the effects of highway transportation projects on human health and the environment. 40 CFR 1500.1 defines the purpose of NEPA. The following excerpts highlight some of its key provisions:

- *NEPA establishes policy, sets goals, and provides means for carrying out the policy.*
- *NEPA procedures must ensure that environmental information is available to public officials and citizens before decisions are made and before actions are taken.*
- *NEPA documents must concentrate on the issues that are truly significant to the action in question, rather than amassing needless detail.*
- *The NEPA process is intended to help public officials make decisions that are based on understanding of environmental consequences, and take actions that protect, restore, and enhance the environment.*

40 CFR 1500-1508 sets forth the policy for compliance with NEPA. The policy provides that Federal agencies shall to the fullest extent possible:

- *Implement procedures to make the NEPA process more useful to decision makers and the public; to reduce paperwork and the accumulation of extraneous background data; and to emphasize real environmental issues and alternatives.*
- *Use the NEPA process to identify and assess the reasonable alternatives to proposed actions that will avoid or minimize adverse effects of these actions on the quality of the human environment.*
- *Encourage and facilitate public involvement in decisions that affect the quality of the human environment.*
- *Use all practicable means ... to restore and enhance the quality of the human environment and avoid or minimize any possible adverse effects of their actions upon the quality of the human environment.*

For FHWA transportation projects, compliance procedures are found in 23 CFR 771 *Environmental Impact and Related Procedures*.

18-2.02 Application

The FHWA will be the lead agency for most Federally funded LPA transportation projects subject to the NEPA process. IDOT and the LPA normally serve as joint lead agencies with the

BUREAU OF LOCAL ROADS & STREETS

18-2-2

GENERAL ENVIRONMENTAL PROCEDURES - Federal Funds

June 2018

FHWA. Other agencies with jurisdiction by law or with special expertise may serve as cooperating agencies.

NEPA procedures apply to all Federally regulated projects, including Motor Fuel Tax (MFT) or other State funded projects that require an individual Section 404 permit and an environmental report to comply with NEPA for the Federal action granting the permit. In this example, the FHWA is not involved in the project; therefore, the flow of information and activities would be processed through the US Army Corps of Engineers (USACE), which would serve as the lead agency.

18-2.03 Purpose and Need

[Section 22-6](#) of the *BDE Manual* provides guidance for the “Purpose and Need” section of environmental documents. This guidance was prepared by the FHWA’s Washington Office of Environmental Policy and was issued on September 18, 1990. The guidance emphasizes the importance of the “Purpose and Need” discussion in establishing a sound basis for evaluating alternatives and environmental impacts. The LPA should consider this guidance when preparing environmental documents for its highway projects.

18-2.04 Alternatives

The LPA must document and clearly discuss reasonable alternatives under consideration and those other alternatives that were eliminated from the detailed study as part of the preliminary design process. The following provides a range of alternatives to consider when determining the reasonable alternatives:

1. “No-Action” Alternative. The “no-action” alternative normally includes short-term minor restoration types of activities (e.g., safety, maintenance improvements) that maintain continuing operation of the existing roadway.
2. Transportation System Management (TSM) Alternative. The TSM alternative includes those activities that maximize the efficiency of the present system. Possible subject areas to include in this alternative are fringe parking, ridesharing, high-occupancy vehicle (HOV) lanes on existing roadways, and traffic signal timing optimization. This limited construction alternative is usually relevant only for major projects proposed in urbanized areas over 200,000 in population.
3. Mass Transit. This alternative includes those reasonable and feasible transit options (e.g., bus systems, rail) even though they may not be within the existing FHWA funding authority. It should be considered on all proposed major highway projects in urbanized areas over 200,000 in population. Consideration of this alternative may be accomplished by reference to the regional or area transportation plan where that plan considers mass transit or by an independent analysis during early project development.
4. Build Alternatives. Both improvement of existing highways and alternatives on new location should be evaluated. A representative number of reasonable alternatives must be presented and evaluated in detail in the draft EIS (40 CFR 1502.14(a)). For most major projects, there is a potential for a large number of reasonable alternatives. Where

HARD COPIES UNCONTROLLED

there are a large number of alternatives, only a representative number of the most reasonable examples, covering the full range of alternatives, must be presented. The determination of the number of reasonable alternatives in the draft EIS, therefore, depends on the particular project and the facts and circumstances in each case.

Each alternative should be briefly described using maps or other visual aids (e.g., photographs, drawings, sketches) to help explain the various alternatives. The material should provide a clear understanding of each alternative's termini, location, costs, and the project concept (e.g., number of lanes, right-of-way requirements, median width, access control). Where land has been or will be reserved or dedicated by LPAs, donated by individuals, or acquired through advanced or hardship acquisition for use as highway right-of-way for any alternative under consideration, the draft EIS should identify the status and extent of this property and the alternatives involved. Where these lands are reserved, the EIS should state that the reserved lands will not influence the alternative to be selected.

18-2.05 Proposed Action

The LPA must properly define the proposed action to ensure a meaningful evaluation of the reasonable alternatives and to avoid commitments to transportation improvements before they are fully evaluated.

The proposed action may include complete and/or incomplete portions of a highway section and one or more future highway projects. Avoid segmenting a proposed improvement into separate environmental reports. The proposed action should include the total length of highway between logical termini, even if only a short length is proposed for construction within the multi-year and long-range program. Section 18-2.06 briefly summarizes the principles of logical termini. See [Section 22-6](#) of the *BDE Manual* for a more complete discussion. The environmental report should clearly identify the length of the proposed action and furnish any available information on long-range possibilities of future improvements for the proposed action.

18-2.06 Logical Termini

[Section 22-6](#) of the *BDE Manual* provides guidance in determining logical project termini for proposed actions. This guidance provides several working examples to illustrate the factors involved in choosing termini. These factors are then applied to issues such as project purpose and need, environmental impacts, and avoidance of segmentation.

18-2.06(a) Introduction

In developing a project concept that can be advanced through the stages of planning, environment, design, and construction, the project sponsor must consider a "whole" or integrated project. This project should satisfy an identified need (e.g., safety rehabilitation, economic development, capacity improvements) and should be considered in the context of the local area socioeconomic and topography, the future travel demand, and other infrastructure improvements in the area. Without framing a project in this way, proposed improvements may miss the mark by only peripherally satisfying the need or by causing unexpected side effects

BUREAU OF LOCAL ROADS & STREETS

18-2-4

GENERAL ENVIRONMENTAL PROCEDURES - Federal Funds

June 2018

that require additional corrective action. A problem of “segmentation” may also occur where a transportation need extends throughout an entire corridor, but environmental issues and transportation needs are inappropriately discussed for only a segment of the corridor.

The FHWA regulations outline three general principles in 23 CFR 771.111(f) that are used to frame a highway project:

- (1) *Connect logical termini and ensure they are of sufficient length to address environmental matters on a broad scope;*
- (2) *Have independent utility or independent significance (i.e., be usable and be a reasonable expenditure even if no additional transportation improvements in the area are made); and*
- (3) *Do not restrict consideration of alternatives for other reasonably foreseeable transportation improvements.*

The aim of this guidance is to discuss criteria that can be used to select logical termini for the development of a project.

18-2.06(b) A Definition of Logical Termini

Logical termini for project development are defined as (1) rational end points for a transportation improvement, and (2) rational end points for a review of the environmental impacts. The environmental impact review frequently covers a broader geographic area than the strict limits of the transportation improvements. In the past, the most common termini have been points of major traffic generation, especially intersecting roadways. This is due to the fact that in most cases traffic generators determine the size and type of facility being proposed. However, there are also cases where the project improvement is not primarily related to congestion due to traffic generators, and the choice of termini based on these generators may not be appropriate.

Choosing a corridor of sufficient length to look at all impacts need not preclude staged construction. Therefore, related improvements within a transportation facility should be evaluated as one project, rather than selecting termini based on what is programmed as short-range improvements. Construction may then be “staged” or programmed for shorter sections or discrete construction elements as funding permits.

It is important to obtain the concurrence of the FHWA in the logical termini for a project early in the project development.

18-2.07 Scoping

Scoping is an early and open process for determining the scope of issues to be addressed in EISs or EAs and for identifying potentially significant issues related to the proposed action. Scoping is intended to focus the study effort on issues that are significant and avoid the collection of needless detailed information on insignificant issues.

BUREAU OF LOCAL ROADS & STREETS

June 2018

GENERAL ENVIRONMENTAL PROCEDURES - Federal Funds

18-2-5

For an environment review, a scoping process may or may not be necessary. This depends, in part, on the number and magnitude of issues potentially involved and the probability that the proposed action may involve significant issues. Part 1501.7 of the *CEQ Regulations* further discusses the scoping process.

18-2.08 Significance of Environmental Impacts

In evaluating the significance of environmental impacts, the LPA must consider the nature of the changes that may be caused by the action and the magnitude and importance of those changes. It is important to contact agencies that have special expertise or jurisdiction by law and individuals and/or organizations directly affected by the proposal to fully assess project impacts. Documentation of these contacts and those concerning the resolution of identified problems must be included in the appropriate environmental document.

18-2.09 Ensuring Validity of Environmental and Design Documents

LPAs and the BLRS have a primary responsibility to ensure that singular or cumulative changes in projects under development or the affected environment do not impair the validity of environmental and design documents and mitigation commitments. This responsibility is operative at all times, irrespective of the stage of environmental and engineering documents, through construction and maintenance. If circumstances arise that may affect the validity of project documents and commitments, the Central Bureau of Local Roads and Streets (CBLRS) should be contacted for specific guidance.

18-3 ENVIRONMENTAL DOCUMENTATION

18-3.01 Introduction

The primary purpose of environmental documentation is to ensure that the policies and goals defined in NEPA are incorporated into the ongoing programs and actions of IDOT and the LPAs. Environmental documentation is intended to accomplish more than mere disclosure; it will be used in conjunction with other relevant material to plan actions and to make decisions.

18-3.02 Classes of Action and the Selection of the Environmental Document

On Federal-aid projects, the appropriate environmental documentation is determined by the project's potential to have significant environmental impacts. The class of action is one of the following three types:

1. Categorical Exclusion (CE). Projects that are Federally funded and qualify for a CE will document the appropriate environmental documentation in the Project Development Report (PDR). See [Chapter 19](#) for additional guidance.
2. Environmental Assessment (EA). Projects that are Federally funded and for which the significance of the environmental impact is unclear require the preparation of an EA. Based on the EA's finding, one of the following will occur:
 - No Significant Impact. Projects that are Federally funded and are found to have no significant impact to human health and the environment are documented with a FONSI. See [Chapter 24](#) of the *BDE Manual*.
 - Significant Impact. Projects that are Federally funded and are found to have significant impact to human health and the environment require an EIS.
3. Environmental Impact Statement (EIS). An EIS is required for all Federally funded highway projects determined to likely cause significant impacts to human health and the environment. A ROD is prepared to document the basis for the decision. See [Chapter 25](#) of the *BDE Manual*.

18-3.03 Special Environmental Studies

Environmental studies provide the technical data and information necessary to identify and evaluate the nature and extent of environmental impacts of a proposed action, and associated mitigation measures that may be appropriate.

The environmental studies are typically conducted in conjunction with actions for which an EIS will be prepared. They also will be performed for actions processed as an EA or a CE, if necessary, to address specific substantive issues. The environmental studies will be used for the following situations:

- to determine the type of environmental processing (i.e., EIS, EA, CE) to be prepared for a specific project;
- as the basis for scoping decisions;

BUREAU OF LOCAL ROADS & STREETS

18-3-2

GENERAL ENVIRONMENTAL PROCEDURES - Federal Funds

June 2018

- to determine the significance of project impacts; and
- as the basis for discussions in reports.

[Chapter 20](#) discusses procedural aspects of the environmental studies.

18-4 CONCURRENT NEPA/404 PROCESSES**18-4.01 Background**

A [Statewide Implementation Agreement](#) (SIA) is in effect for Federal-aid highway projects in Illinois and provides for concurrent NEPA and Section 404 processes. The purpose of the SIA is to ensure appropriate consideration of the concerns of the USACE, the US Environmental Protection Agency (USEPA), and the US Fish and Wildlife Service (USFWS), especially regarding compliance with the Section 404(b)(1) Guidelines, as early as practical in highway project development. The intent is also to involve these agencies, and the US Coast Guard (USCG), the Illinois Environmental Protection Agency (IEPA), and the IDNR, at key decision points early in project development to minimize the potential for unforeseen issues during the Section 404 permit review. A copy of the [SIA](#) is included in [Appendix A](#) of the *BDE Manual*.

18-4.02 Applicability

All Federally funded LPA projects (through BLRS) needing FHWA action under NEPA (e.g., projects requiring an EIS or an EA) and a standard Individual Permit from the USACE under Section 404 of the *Clean Water Act* are eligible for processing under the NEPA/404 SIA. Decisions on whether to process specific eligible projects under the concurrent NEPA/404 procedures will be made in accordance with Part III of the SIA. The procedures that follow apply to all projects processed under the concurrent NEPA/404 process described in the SIA.

18-4.03 Procedures

See [Section 22-4](#) of the *BDE Manual* for the procedures to comply with this process.

18-5 COORDINATION

The primary objective of coordination is to emphasize cooperative consultations among agencies, organizations, and the general public before the final environmental report (or discussion) is prepared. This is intended to avoid the submission of adverse comments on a completed document. This Section discusses policies and practices on coordination for all Federally funded LPA highway projects. The necessary coordination for a CE project is discussed in [Chapter 19](#). The coordination required for an EA or EIS project is discussed in [Chapters 24](#) and [25](#) of the *BDE Manual*, respectively.

18-5.01 General

18-5.01(a) Policy

Every reasonable effort should be made in project development to inform and solicit the aid of agencies, organizations, and those who have an interest in the project, or who have information or expertise on environmental factors relevant to the project. Special efforts should be made to begin coordination as early as practical in project development and to use procedures that will encourage and allow public participation in constructing the value judgments necessary to select wisely among project alternatives.

18-5.01(b) Coordination Activities

The following describes various forms of coordination to be used:

1. District Coordination Meetings. Agencies, organizations, and those who have special expertise or jurisdiction by law for any environmental impact of a proposed project should be invited to attend the regularly scheduled coordination meetings held by the involved district. This will allow these entities to receive early notification and firsthand information and knowledge on relevant environmental issues. Other coordination-type meetings should be scheduled and undertaken, as needed, to resolve potential environmental problems as early as practical in project development. Information provided and received at all meetings should be documented for potential use in decision-making and in environmental reports or PDRs.
2. Scoping Meetings. If practical, the regularly scheduled coordination meetings discussed in Item 1 should also serve as scoping meetings, where appropriate. Where scoping occurs, either at the regular coordination meetings or in a specially convened meeting, these should be especially well documented, including who participated, what information was provided and received, what decisions were made, and who agreed and who dissented with specific determinations.
3. Public Involvement. [Chapter 21](#) discusses public involvement in detail.
4. Correspondence. Correspondence is a key element in coordination activities. Correspondence received on an environmental issue should be acknowledged. If the correspondence is in response to a request for comments on a public involvement activity or an environmental document, the correspondence should be acknowledged as

BUREAU OF LOCAL ROADS & STREETS

18-5-2

GENERAL ENVIRONMENTAL PROCEDURES - Federal Funds

June 2018

described in the procedures for public involvement discussed in [Chapter 21](#). For other correspondence on environmental matters, the appropriate form of written acknowledgment may be an individual response letter. Substantive comments should be addressed in sufficient detail to allow the commentor to obtain a clear understanding of the status of the issue and its disposition.

18-5.01(c) Commitments

Coordination activities often result in commitments. For example, once a project undergoes proper coordination activities, IDOT and the LPAs may be committed to provide measures to mitigate the adverse impact of a project. A highway agency's ability to interact effectively with other entities is based on its record and credibility for fulfilling its past commitments. Past performance may affect negotiations, approvals, and processing for many other projects.

As commitments are made throughout the different phases (e.g., design, construction, maintenance) of the project, add them to a cumulative commitment list. Document commitments made during the earlier phases in the Environmental Survey Request (ESR), PDR, and/or environmental document. When applicable, flag the commitments in the project agreements and contract documents, and document those commitments on the commitment list, which should be included in the plan submittal. The LPA should maintain a commitment file for each project that includes all the appropriate documentation. If the LPA is under an MFT Agreement of Understanding (AOU), they must provide the district with a copy of their commitment file along with the rest of the project file.

On Federal projects, when a coordination meeting with the FHWA is held, any known commitments should be discussed to ensure that all affected parties are aware of the nature and scope. When a preconstruction conference is held, commitments should be discussed to ensure awareness and understanding of any special considerations affecting construction and to emphasize the importance of follow-through as construction proceeds. Other parties affected by the commitments may be invited to the preconstruction conference.

If at any point in the project development, implementation, or maintenance operation, a previous commitment will be impacted by subsequent project decisions or commitments, the affected parties will be contacted prior to making a final decision on the previous commitment. Update the commitment list and provide documentation of coordination with the affected parties and ultimate decision on the proposed changes to previous commitments in the commitment file.

Include documentation in the commitment file for each commitment that has been fulfilled.

At the final inspection after the project is completed, provide the district with a copy of the Commitment List. The district will forward a copy of the finalized Commitment List to CBLRS.

18-5.02 Projects Involving Federal Lands (USFWS Coordination)**18-5.02(a) Background**

USFWS has requested early notification in planning for projects with any involvement of Federal lands, primarily those areas in the Shawnee National Forest. The purpose of the notification is to provide USFWS an early opportunity to evaluate potential uses of and impacts on such land, which may or may not be subject to Section 4(f); see [Chapter 20](#). This notification is in addition to coordination with the USFWS that otherwise may be required (e.g., because of involvement with Federally listed threatened and endangered species).

18-5.02(b) Applicability

The following procedures are applicable to Federally funded LPA projects processed through the CBLRS that involve any Federal lands.

18-5.02(c) Procedures

As part of early project planning studies, the LPA should evaluate whether projects may involve the use of any Federal lands. If yes, contact the appropriate office of the USFWS. The preferred method of notification is to mention the potential involvement in the agenda for a regularly scheduled district coordination meeting; see Section 18-5. USFWS personnel will determine whether to attend the coordination meeting or request additional information to address concerns on the potential involvement. The information included in the agenda should identify the Federal lands involved and, as practical, should briefly describe the nature and extent of the potential involvement.

The district and LPAs must ensure that the appropriate office of the USFWS is provided coordination meeting agendas and associated meeting minutes when projects involving Federal lands are addressed.

18-5.03 Coordination with US Army Corps of Engineers (USACE)

IDOT and USACE have developed special coordination procedures to provide the USACE with the proper opportunity to participate in the project development process.

18-5.03(a) Project Meetings

USACE offices should be afforded advance notice of meetings at which their attendance would be necessary or desirable. For concurrence point meetings associated with the concurrent NEPA and Section 404 procedures, the notification will be as described in the procedures; see [Chapter 22](#) of the *BDE Manual*. For other meetings, the district or LPA should provide the following information to the appropriate USACE office and should send an informational copy to the CBLRS:

- proposed location and date for meeting,

BUREAU OF LOCAL ROADS & STREETS

18-5-4

GENERAL ENVIRONMENTAL PROCEDURES - Federal Funds

June 2018

- purpose of the meeting,
- explanation of the reason for USACE involvement, and
- sufficient information on the details of the project or issues involved to enable USACE representatives to prepare for the meeting.

18-5.03(b) USACE As Cooperating Agency

When it is determined that USACE should be a cooperating agency for a specific project, the request to USACE should be made by the district or LPA as early as practical in project development, preferably before preparation of the draft environmental document. Note that USACE does not need to be a cooperating agency for projects in which only nationwide permits are necessary. The notice should include the best available information on the proposed undertaking (e.g., project scope, alternatives, and any pertinent issues that have been identified).

18-5.03(c) Environmental Reports and Section 404 Permits

Section 18-4 discusses environmental documentation and coordination with the USACE on the concurrent NEPA/404 process. [Chapter 7](#) provides additional guidance on Section 404 permits.

18-5.04 Coordination with US Department of the Interior (USDOI)

18-5.04(a) Background

USDOI has provided guidance concerning contacts for environmental and other project document reviews and requests for early coordination and consultation in project planning. This Section implements the USDOI guidance for applicable LPA projects.

18-5.04(b) Applicability

The following procedures are applicable to Federally funded LPA projects processed through the CBLRS that involve lands under the jurisdiction of USDOI.

18-5.04(c) Procedures

All project-related contacts with USDOI should be directed to the appropriate USDOI field level bureau. This includes contacts for early coordination and scoping requests.

USDOI encourages agencies to establish direct working relationships with its field offices. These relationships are important for early identification of issues and concerns and also for early resolution of environmental problems that would otherwise surface during formal reviews of environmental documents.

USDOI bureaus and offices with jurisdiction by law or special expertise on environmental quality issues are listed in [Appendix C](#) of Part III of the *BDE Manual*. LPAs should use [Appendix C](#) to

HARD COPIES UNCONTROLLED

determine appropriate USDOT contacts for coordination during early planning, NEPA scoping, and other preliminary activities.

18-5.05 Coordination with the Illinois Department of Natural Resource (IDNR)

18-5.05(a) Interagency Memorandum of Understanding (MOU)

The MOU by and between IDOT and IDNR governs coordination with IDNR for highway projects. The MOU establishes a framework for early coordination on natural resource issues and for follow-up coordination as necessary for compliance with statutory and regulatory requirements under the jurisdiction of IDNR.

The following Sections discuss the key provisions of the IDOT/IDNR MOU as it applies to Federally funded LPA projects.

18-5.05(b) General Principles of Coordination

Coordination with IDNR is initiated through the ESR. See [Chapter 20](#) for more detail for non-federal funded projects see [Chapter 10](#). The ESRs will be the mechanism for BDE to initiate the evaluation of potential natural resource impacts and for coordination with IDNR as appropriate.

The IDNR Division of Ecosystems and Environment (E&E) is the primary contact for coordination of highway project information by BDE. The IDNR E&E is responsible for ensuring that appropriate offices within IDNR receive highway project information for review in response to identified resource involvements. The IDNR E&E is also responsible for notifying BDE of any additional information needed for IDNR to complete its review. The BDE contact is responsible for supplying IDNR with the information necessary to complete the review of a project, including the initial information for threatened and endangered species, and additional information for projects required to be submitted for a more thorough review. The LPA may be requested to provide some of this information.

All official comments, recommendations, and responses by either IDNR or BDE will be in writing, except verbal responses may be allowed for urgent situations, with a written response due within five days following the action taken.

IDNR's review process must include an examination of the potential impacts to natural resources in general and to ensure compliance with the *Interagency Wetland Policy Act of 1989*, the *Endangered Species Protection Act*, and the *Illinois Natural Areas Preservation Act*. Upon completion of the review for a project, IDNR will provide documentation to confirm compliance with these State laws. The review conducted by IDNR is valid for three years from the date upon which BDE and IDNR conclude formal coordination necessary to address resources covered by the IDOT/IDNR MOU. If the project has not commenced (i.e., been advertised for bid letting) in that time, it must be resubmitted for IDNR review.

The natural resources that may be impacted include the following:

- wetlands;

BUREAU OF LOCAL ROADS & STREETS

18-5-6

GENERAL ENVIRONMENTAL PROCEDURES - Federal Funds

June 2018

- streams;
- the bisecting of a forest or the removal of a significant number of trees;
- prairie/savanna areas;
- IDNR properties;
- nature preserves/natural area inventory sites;
- sites on the Register or Land and Water Reserves; and
- threatened and endangered species, including previously documented occurrences of which BDE is aware and the occurrences identified through the Natural Heritage Database.

For forests and trees resources, the project will be submitted to IDNR for completion of the natural resource review process, if any of the following apply:

- a project on new alignment involving impacts to a block of trees equal to or greater than 20 acres (8 ha);
- the removal of trees that would bisect or fragment a 20 acre (8 ha) or greater block of trees not associated with a stream corridor; or
- within a stream corridor:
 - + a project on new alignment on any stream segment, or
 - + a project on existing alignment.

Work involving the removal of dead and diseased trees for safety reasons need not be coordinated with IDNR for review.

18-5.05(c) Review Process

The LPAs should use the following steps for the review process:

1. Determining Need for IDNR Review. BDE will review proposed projects using maps, aerial photos, the Natural Heritage Database, and field surveys to determine if they potentially involve any of the resource issues discussed in Section 18-5.05(b).

If BDE determines based on its review that a project does not involve any issues of interest to IDNR, project submittal to IDNR is not required for review.

If IDNR recommends surveys during the pre-screening process, BDE will provide copies of the survey results to IDNR. If the surveys were not conducted as recommended, BDE will provide documentation to support this decision. When any of the resources in Section 18-5.05(b) are determined to occur in the area the proposed project may affect, BDE will determine whether the resources are covered by a MOU between IDOT and IDNR for avoidance and mitigation of impacts. If the resources are covered by this type

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

June 2018

GENERAL ENVIRONMENTAL PROCEDURES - Federal Funds

18-5-7

of MOU and the project will comply with the agreed terms, no further coordination with IDNR is necessary.

2. Coordinating with IDNR for Project Review. If identified resources involved with a project are not covered by a MOU, or if BDE is unable to comply with the terms of this MOU, BDE will prepare and submit to the IDNR E&E a Biological Resources Review (BRR). The BRR shall indicate the results of fieldwork conducted and shall describe efforts made to avoid or minimize adverse impacts to the identified resources. If the translocation of a listed species is proposed, BDE will provide sufficient information in the BRR to enable IDNR to evaluate the likelihood of success.

The IDNR E&E will review the BRR and supporting documentation and will coordinate with appropriate staff to determine whether further analysis or recommendations are required. After the review and within 90 days of receipt of the BRR, IDNR will submit one of the following responses to BDE:

- a. Acceptance. IDNR accepts the conclusions/proposals contained in IDOT's BRR and provides a form indicating successful closure of the threatened and endangered species consultation process and compliance with the *Interagency Wetland Policy Act*. If it appears that the proposed project may result in the killing or injuring of an Illinois-listed animal species, IDNR may include a recommendation that IDOT should obtain an incidental taking authorization prior to proceeding with project construction. In this case, IDNR will close consultation upon receipt of an acknowledgement from IDOT indicating that it will apply for an incidental taking authorization prior to commencing any construction that would result in the killing or injuring of a listed animal species. The sign-off is valid for 3 years from the date of the Agency Action Report (AAR) or from the date of resource issue resolution, if other resources are involved.
- b. Non-Acceptance. IDNR does not accept the conclusions/proposals contained in IDOT's BRR and makes recommendations on how impacts might be avoided or further minimized. Both agencies have 45 days to resolve any differences that may remain upon which time IDNR shall provide IDOT a sign-off indicating compliance with both State Acts. If it appears that the proposed project may result in the killing or injuring of an Illinois-listed animal species, IDNR may include a recommendation that IDOT should obtain an incidental taking authorization prior to proceeding with project construction. In this case, IDNR will close consultation upon receipt of an acknowledgement from IDOT indicating that it will apply for an incidental taking authorization prior to commencing any construction that would result in the killing or injuring of a listed animal species. If resolution is not reached within the 45 day period, the process ends and is classified as having failed or partially failed to protect the resource involved; a decision is made to elevate the issue within each agency; or, upon mutual agreement by both parties, negotiations may continue.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

18-5-8

GENERAL ENVIRONMENTAL PROCEDURES - Federal Funds

June 2018

3. Follow-up Coordination and Reporting. The LPA is responsible for implementing the project and mitigation as agreed. Submit any reports required by the MOU to the IDNR E&E for review and coordination with other appropriate IDNR staff.

If, during development of a project, new information is obtained or the scope of the project changes to the extent that IDNR would have been involved initially, the LPA shall contact the district to discuss the need for further coordination. Also, if IDNR is concerned with a resource issue not reflected in Section 18-5.05(b) or if new information becomes available after the project review has been completed, IDNR may request that BDE submit the project for review.

On projects subject to coordination with IDNR pursuant to the IDOT/IDNR MOU, districts and LPAs must carefully monitor the progress of the project in relation to the timeframe for the validity of the original IDNR signature on the AAR (for pre-screening) or the IDNR response on resource issue resolution (if resource issues are involved). A valid IDNR response must be in place at key points in the project development and implementation process as described below.

For projects processed as CEs, a valid IDNR response on pre-screening against the Natural Heritage Database and, as applicable, on final resource issue resolution, must be in place when the project is submitted for CE approval and when the project is advertised for bid letting.

For adverse wetland impacts that are subject to coordination with IDNR as "Standard Review Actions" under the IDOT Wetlands Action Plan, IDNR approval of a conceptual wetland compensation plan will qualify as the "resource issue resolution" response on the wetlands aspect for purposes of the project environmental documentation. IDNR approval of a detailed wetland compensation plan will be required for "final resource issues resolution" prior to advertising "Standard Review Actions" for letting.

For impacts to State-listed endangered or threatened species, the Biological Opinion provided by IDNR in response to a Detailed Action Report will be the "resource issue resolution" response on the endangered species aspects for purposes of the project environmental documentation. If the project will involve an incidental taking of a State-listed species, an incidental taking authorization from IDNR will be required for "final resource issue resolution" prior to awarding the project.

When it becomes necessary to resubmit a project to IDNR to provide a valid response at the aforementioned processing points, the LPA should accomplish the submittal by sending a copy of the original AAR to the IDNR E&E with a request for renewal of the IDNR response.

Chapter 19

CATEGORICAL EXCLUSIONS - Federal Funds

19-1 GENERAL

Chapter 19 discusses local public agency (LPA) projects that may be classified as Categorical Exclusions (CE). Figure 19-1A is a pictorial representation of the decision making process to determine if a project meets the definition of a CE. The Code of Federal Regulations (CFR) in 23 CFR 771 defines “action” as any highway or transit project proposed for Federal Highway Administration (FHWA) funding, joint and multiple use permits, changes in access control, etc., which may or may not involve a commitment of federal funds.

A Programmatic Agreement (PA), herein referred to as “Programmatic Agreement”, has been developed in conformance with 23 CFR 771.117 to address the development and approval of CEs in a streamlined and efficient manner.

19-1.01 Definition

References: 40 CFR 1508.4 Categorical Exclusion Definition
23 CFR 771.115 Classes of Actions
23 CFR 771.117 Categorical Exclusions
Section 1 of FHWA Technical Advisory T6640.8a Categorical Exclusion

The FHWA environmental regulations (23 CFR 771) define “categorical exclusions” (CEs) as “Class II” actions which meet the definition as contained in 40 CFR 1508.4, and based on past experience with similar actions, do not involve significant environmental impacts. They are actions which:

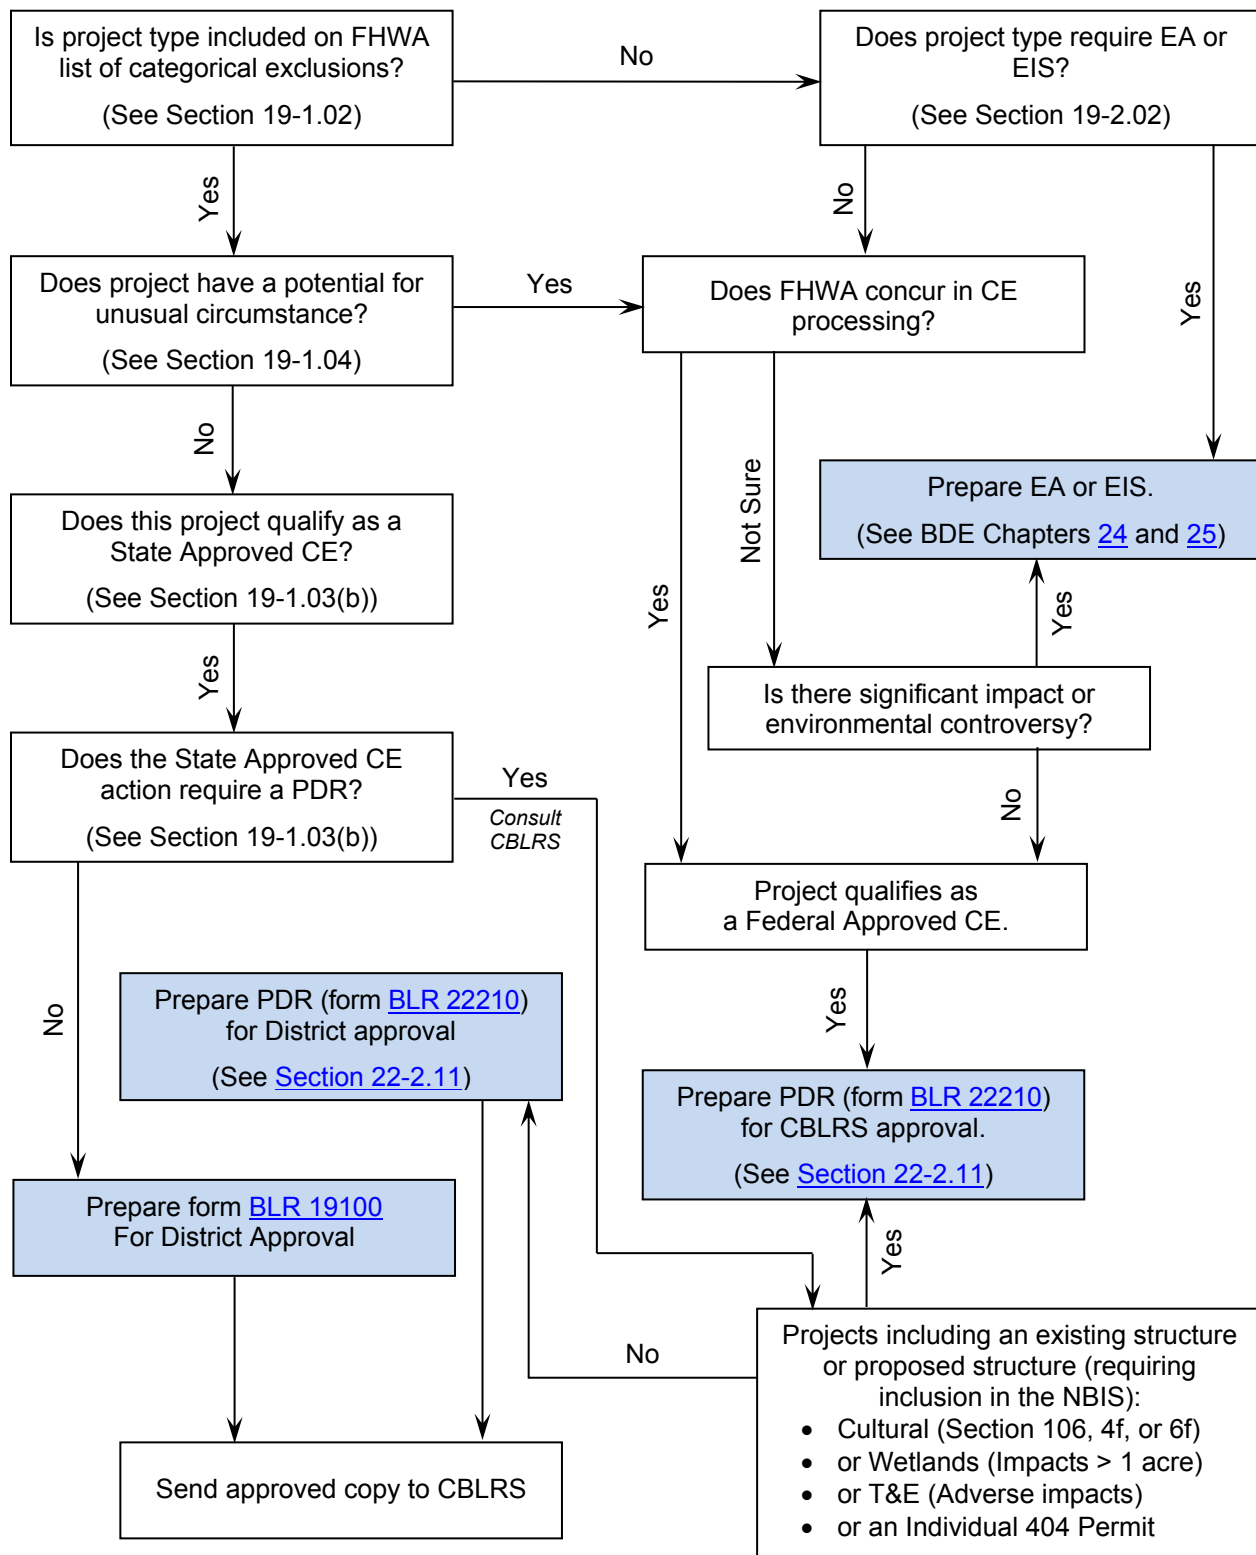

- do not induce significant impacts to planned growth or land use for the area;
- do not require the relocation of significant numbers of people;
- do not have a significant impact on any natural, cultural, recreational, historic, or other resource;
- do not involve significant air, noise, or water quality impacts;
- do not have significant impacts on travel patterns;
- do not otherwise, either individually or cumulatively, have any significant environmental impacts

Therefore, CEs are excluded from the requirement to prepare an Environmental Assessment (EA) (see [Chapter 24](#) of the *BDE Manual*) or Environmental Impact Statement (EIS) (see [Chapter 25](#) of the *BDE Manual*). The FHWA has listed examples of Class II actions in 23 CFR 771.117. Most transportation projects developed by LPAs do not have significant environmental impacts and, therefore, qualify as CEs.

PROCESSING CE PROJECTS

Figure 19-1A

HARD COPIES UNCONTROLLED

19-1.02 Applicable Federal Actions

References: 23 CFR 771.117(a) Characteristics of CE Projects
23 CFR 771.107(b) Definitions
Paragraph I.A of FHWA Technical Advisory T6640.8A, Documentation of Applicability

These procedures apply to any federal action, as defined in 771.107(b):

“A highway or transit project proposed for FHWA or FTA funding. It also includes activities such as joint and multiple permits, changes in access control, etc., which may or may not involve a commitment of federal funds.”

For example, a project may require an interstate access justification approval by FHWA, and the entire project would therefore be subject to all Federal requirements.

Federal actions approved as Categorical Exclusions do not require further compliance with the *National Environmental Policy Act* (NEPA) process. However, these actions may require compliance with other Federal environmental controls (e.g., Section 4(f), *Endangered Species Act*, Executive Order 11990 - Wetlands, Executive Order 11988 - Flood Plains, *Comprehensive Environmental Response, Compensation, and Liability Act* (CERCLA)). See [Chapter 20](#) for further information on special environmental studies.

19-1.03 CE Procedures

19-1.03(a) CE “Groups”

Projects that normally qualify as a Categorical Exclusion are divided into the following two groups:

1. State Approved CE. State Approved CE projects do not have any potential for unusual circumstances, as described in the Programmatic Agreement (PA) between FHWA and Illinois Department of Transportation (IDOT) and do not require individual approval by FHWA as CEs. Certain State Approved CE projects do not require a Project Development Report (PDR); see Section 19-1.03(b) for determination of whether or not a PDR is required.
2. Federal Approved CE. Federal Approved CE projects have the potential for unusual circumstances as described in the PA between FHWA and IDOT and require individual approval by FHWA as CEs. A PDR is required for these projects see Section 19-1.03(c).

19-1.03(b) State Approved CE Projects

References: 23 CFR 771.117(c) Examples of projects which normally will be a State Approved CE

Paragraph I.A of FHWA Technical Advisory T6640.8A, Documentation of applicability for CE projects

BUREAU OF LOCAL ROADS & STREETS
CATEGORICAL EXCLUSIONS - Federal Funds

19-1-4

May 2016

These projects must meet the definition of a CE in 23 CFR 771.117(a), and will be considered State Approved CE's if they do not involve any of the factors listed in Section 19-1.04 as indicators of potential for unusual circumstances. Documentation of determination that the project is a State Approved CE is required and should be included in the project files, including the date the determination was made and who is responsible for the decision. The following statement must be included:

"It has been determined that this project will not have any significant impacts on the human environment, or involve any unusual circumstances; therefore, it is a State Approved Categorical Exclusion.

IDOT has addressed all environmental requirements for this project and determined that it has met the following requirements of the CE Programmatic Agreement (approved October 14, 2015): (1) the scope is consistent with the project scope listed in Appendix A or B, and (2) none of the circumstances in Section V exist. Therefore, on behalf of FHWA, IDOT hereby approves this project as a CE."

This statement will be signed by the appropriate full time IDOT employee as indicated in the PA. To facilitate the documentation requirements and to comply with the PA, the State Approved CE determination shall be made using the form BLR 19110.

It is not required that State Approved CE projects be discussed at regularly scheduled FHWA/IDOT coordination meetings. However, State Approved CE projects may be discussed at a coordination meeting if any agency (LPA, IDOT, or FHWA) deems it necessary. Appropriate/adequate documentation should be retained by the LPA and respective district that documents the State Approved CE determination. FHWA or CBLRS may request to review State Approved CE documentation at any time. While a project may qualify as a State Approved CE action, other applicable federal and state requirements still must be satisfied (e.g. compliance with the National Historic Preservation Act, the Clean Air Act, etc.).

Actions that normally do not involve unusual circumstances and would qualify as State Approved CE actions include those listed in 23 CFR 771.117(c) and also include the actions listed below. Some actions will require preparation of a PDR (form [BLR 22210](#)) and others will not (form [BLR 19100](#)).

1. The following State Approved CE actions do not require a PDR; if constructed within the existing ROW. The LPA shall prepare form [BLR 19100](#) with the required attachments and submit to the district for approval.
 - traffic signal modifications and installation of new signals;
 - Local Agency Functional Overlay (LAFO) projects;
 - pavement resurfacing or milling and resurfacing (from face-of-curb to face-of-curb only for urban and the travel lanes only for rural);
 - signing;
 - pavement markings not affecting the number of through traffic lanes, lane width, lane usage or existing pavement marking configuration;
 - anti-skid treatments;
 - construction of sidewalks and/or ADA accessibility ramps;

HARD COPIES UNCONTROLLED

- curb and/or gutter repairs;
- historic preservation projects (except historic bridges) that do not have any potential for unusual circumstance as determined by the FHWA;
- lighting and electrical work including:
 - continuous and tower lighting,
 - tunnel lighting,
 - temporary lighting,
 - bridge lighting,
 - pedestrian lighting,
 - pumping station,
 - highway advisory radio,
 - control systems for changeable lanes,
 - traffic monitoring systems, and
 - changeable message signs
- bicycle racks/lockers;
- landscaping;
- sediment and erosion control work which may also include slope repair and reconstruction;
- storm sewer installations to eliminate open ditches (which do not reduce necessary urban runoff storage/retention);
- impact attenuator and glare screen installations and upgrading of safety features;
- highway/railroad grade crossing improvements with no roadway approach work:
 - repair/rehabilitation of crossing proper, and
 - upgrading of crossing protection;
- the following restoration-type projects:
 - retaining wall restoration,
 - fencing,
 - guardrail replacement and upgrading,
 - substantial pavement and shoulder patching/sealing, and
 - restoration of drainage structures;
- junkyard screening;
- the following bridge rehabilitation activities:
 - bridge rail replacement and upgrading,
 - bridge deck overlay and waterproofing,
 - expansion joint replacement and upgrading,
 - bearing replacement and upgrading,
 - substantial repairs to deck including partial or full-depth patches,
 - painting of all structural steel for a particular bridge,
 - stringer replacement for a portion of the superstructure, and
 - repairs to damaged rails, corroded or damaged structural steel members, and deteriorated areas of concrete elements including sidewalks, curbs, water tables, girders, and portions of the substructure above ground or water;
- approval of utility installations along or across a transportation facility;
- activities included in the highway safety plan developed pursuant to 23 USC 402;

- transfer of Federal lands pursuant to 23 USC 317 when the subsequent action is not an FHWA action;
- alterations to existing publicly owned buildings to provide for noise reduction and/or installation of noise abatement barriers; and
- emergency repairs under 23 USC 125 that do not substantially change the design of the facility, and which are initiated during or immediately after the occurrence of a declared national disaster;

The district will distribute the approved [BLR 19100](#) to the LPA and CBLRS for the project files.

2. The following types of projects typically require the preparation of a PDR (form [BLR 22210](#)). However, in consultation with the CBLRS, it may be determined form [BLR 19100](#) can be used:

- Projects listed in Item 1 above with minimal ROW and/or easements;
- Rural widening and resurfacing projects that require additional right-of-way and do not change the number of lanes;
- Bicycle, pedestrian, or shared use paths that do not have any potential for unusual circumstances;
- At-grade highway/railroad grade crossing improvements that includes roadway approach work;
- Projects that change the layout or function of the roadway such as, weaving lanes, turning lanes, or climbing lanes within the existing right-of-way, installation or removal of parking lanes;
- Any project that includes a bridge or structure requiring a structure number;
- Construction of additional lanes, including auxiliary turn lanes or through lanes;
- Projects that require additional ROW or easements;
- Projects that impact public property outside the existing ROW;
- Projects that require a jurisdiction transfer;
- Projects on a new horizontal alignment;
- Other projects that are determined to be State Approved CE by the FHWA at a coordination meeting.

The draft PDR (form [BLR 22210](#)) for these projects will be reviewed by the District prior to submittal to the CBLRS for review. After District and CBLRS comments have been addressed, the final PDR (form [BLR 22210](#)) may be submitted for approval. A decision will be made in consultation with the District and CBLRS for approval of the PDR. These types of projects may be a State Approved CE provided they do not have any potential for the unusual circumstances that are noted in Section 19-1.04.

19-1.03(c) Federal Approved CE Projects

The remainder of the CE-type projects is considered Federal Approved CE projects that require FHWA approval of CE determination and the preparation of a PDR (form [BLR 22210](#)) for approval by the CBLRS.

Early in project development the district may request concurrence of FHWA and CBLRS to process the project as a CE; however, for Federal Approved CE projects FHWA *must approve* the CE *determination after appropriate environmental analyses are completed*. Email approval from the FHWA ordinarily will be sufficient. Federal Approved CE may also be obtained at regularly scheduled district coordination meetings; see [Section 18-5](#). Minutes of the coordination meeting or an email to the file, as appropriate, shall document the discussions and approval by stating:

“This project will not have any significant impacts on the human environment; therefore, the FHWA approves the designation of this project as a Categorical Exclusion on [DATE].”

Sufficient information must be available to permit the FHWA/CBLRS to make an informed decision on the significance of any environmental effects involved. For projects that require the processing of an Environmental Survey Request (see [Section 20-2.02](#)), email CE approval may be requested only after the LPA has obtained the results of the Integrated Environmental Survey Process (for biological resources (e.g., threatened and endangered species, wetlands) and cultural resources (e.g., archaeological, historic)) and it has been determined there are no unusual circumstances. For projects that involve a site included on the CERCLIS, email approval may be requested only after the LPA has determined how the involvement with the CERCLIS site will affect the project. Occasionally, the FHWA may request an environmental study of a particular issue area (e.g., wetlands study) prior to giving email CE approval.

The FHWA will be provided with a copy of these coordination meeting minutes.

Documentation of the CE approval (email, coordination meeting minutes, or memorandum to file) must be included in the PDR (form [BLR 22210](#)).

19-1.04 Evaluation for Unusual Circumstances

References: 23 CFR 771.117(b)
Paragraph I.B of the FHWA Technical Advisory T6640.8A

Each project proposed as a Categorical Exclusion, whether State Approved CE or Federal Approved CE, must be evaluated for environmental factors that may involve unusual circumstances. This may require special studies or reports to be prepared to determine if the CE classification is appropriate. In evaluating proposed CE projects for unusual circumstances, all aspects of the project must be considered, including any detours and runarounds that the project will involve. A step in the evaluation for unusual circumstances, in certain projects, may be an on-site review, or field review, of the project area. The field review must be sufficient to identify whether there are obvious resource involvement(s) that could result in a significant impact or that will raise potential impact concerns sufficient to warrant the preparation of an EA or EIS. For projects processed through the environmental survey processes, the survey results will identify wetlands, biological resources, and cultural resources that may require special consideration and coordination. These and other environmental issues (e.g., farmland impacts, Section 404 permit requirements, noise) must be identified and appropriately considered in the evaluation of unusual circumstances.

BUREAU OF LOCAL ROADS & STREETS
CATEGORICAL EXCLUSIONS - Federal Funds

19-1-8

May 2016

Unusual circumstances include: (1) significant environmental impacts; (2) substantial controversy on environmental grounds; (3) significant impact on properties protected by Section 4(f) of the DOT Act or Section 106 of the National Historic Preservation Act; or (4) inconsistencies with any Federal, State, or local law, requirement or administrative determination relating to the environmental aspects of the action (23 CFR 771.117(b)). If environmental studies result in the identification of a project's involvement of one of the above mentioned unusual circumstances, it may not be appropriate to classify the project as a CE.

FHWA and IDOT have agreed that activities that indicate the project could involve unusual circumstances include, but are not limited to, those that will:

1. Require one or more residential or business relocations and/or the acquisition of more than 10 acres total for a non-linear improvement (spot improvement, e.g. bridge, intersection) or the acquisition of more than 3 acres per mile;
2. Are defined as a "Type I project" per 23 CFR 772.5 and therefore requires a noise analysis;
3. Result in an "adverse effect" finding to a historic property, as defined in 36 CFR 800.16(1);
4. Require the use of properties as defined and protected by Section 4(f) of the Department of Transportation Act (49 U.S.C. 303) that cannot be documented with either an FHWA de minimis determination or a programmatic Section 4(f) evaluation;
5. Involve impacts that would require an Individual Section 404 Permit from the U.S. Army Corps of Engineers or involve stream channelization or stream relocations;
6. Through Section 7 of the Endangered Species Act consultation, result in a finding of "may affect, likely to adversely affect" a federally listed or candidate species, or proposed or designated critical habitat;
7. Through consultation with the Illinois Department of Natural Resources (IDNR) under the Illinois Endangered Species Act, an Incidental Take Authorization will be required;
8. Require substantial changes in access, access control, or travel patterns. IDOT will present such information to FHWA to determine if changes are substantial;
9. Require the use of a temporary road, detour or ramp closure, unless the use of such facilities satisfies the following conditions:
 - a. Provisions are made for access by local traffic and so posted,
 - b. Businesses dependent on through-traffic will not be adversely affected,
 - c. To the extent possible, there is no interference with any local special event or festival,
 - d. There is no substantial change to the environmental consequences of the action, and
 - e. There is no substantial controversy associated with such facilities.
10. Involve State designated Nature Preserves, areas listed on the Illinois Natural Area Inventory, Land and Water Reserves;
11. Exceed the IDNR threshold for an increase in 100-year flood water surface elevations, or has potential for a "significant encroachment" to floodplains, as defined in Executive Order 11988;

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS
CATEGORICAL EXCLUSIONS - Federal Funds

May 2016

19-1-9

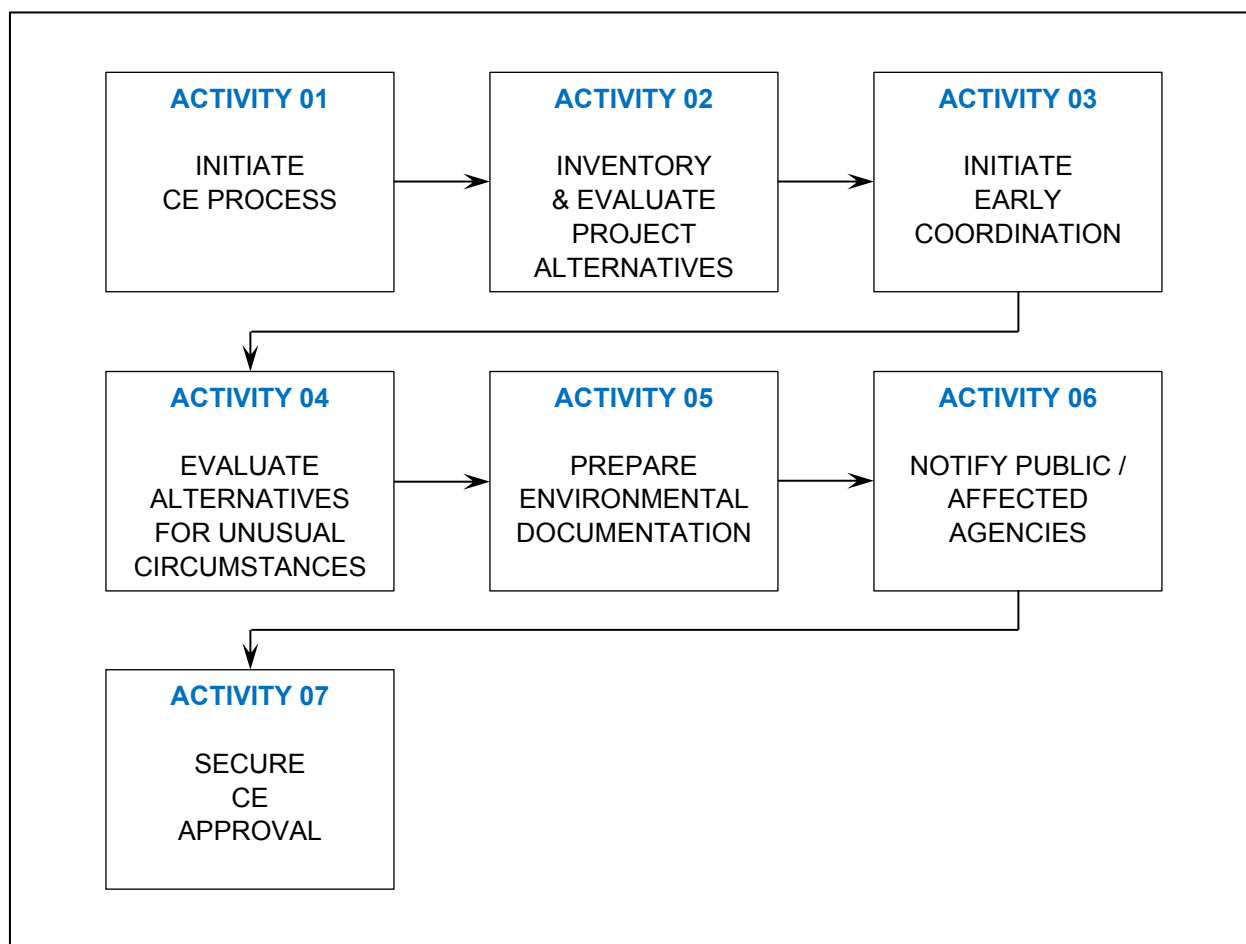

12. Require a permit from U.S. Coast Guard under Section 9 of the Rivers and Harbors Act of 1899;
13. Require an individual Water Quality Certification from the Illinois Environmental Protection Agency;
14. Require the acquisition of lands under the protection of Section 6(f) of the Land and Water Conservation Act of 1965 or other unique areas or special lands that were acquired in fee or easement with public-use money and have deed restrictions or covenants on the property;
15. Involve impacts to a stream listed on the National Park Service's National Rivers Inventory;
16. Have potential for controversy on environmental grounds as determined by FHWA, or inconsistency with Federal, State, or local requirements relating to the environment or planning.

HARD COPIES UNCONTROLLED

19-2 THE CATEGORICAL EXCLUSION (CE) PROCESS

Figure 19-2A presents a flowchart that graphically illustrates the general process for a Categorical Exclusion action. This is followed by a brief description of each activity. The user of Figure 19-2A should consider the following:

1. Lines of Communication. The rigid application of the flowchart would lead to predetermined, precise points at which communication occurs between responsible parties. This is neither realistic nor desirable. Communication between parties must be continuous.
2. Lead Agency. Figure 19-2A assumes that the FHWA is the lead agency for FHWA-funded projects. If another Federal agency is the lead agency, other procedures may be required.
3. Application. Figure 19-2A applies to all CE projects involving LPA projects.

PROCESS FOR CATEGORICAL EXCLUSION (CE)
(FHWA Lead Agency)

Figure 19-2A

Categorical Exclusion Process

Activity Title: Initiate CE Process

Activity No.: 01

Responsible Unit: Local Public Agency / District

Activity Description:

For actions that will ultimately be processed with a CE, this is often known at the time of project initiation. This process (Figure 19-2A) assumes that it is known at the time of project initiation that a CE will be required.

The LPA and the district will initiate the CE by discussing the project at a district coordination meeting. The LPA and the district will also assemble project information that may include:

- planning reports or studies,
- record plans (as-builts),
- letters/correspondence on the project,
- traffic data,
- documentation on any public or private meetings,
- original surveys,
- aerial photos,
- statistical data documenting need for improvement,
- scoping data providing recommended improvement,
- appropriate information from engineering databases,
- existing right-of-way, and
- results of the preliminary field check of project location.

- Section 19-1 *General*

Categorical Exclusion Process

Activity Title: Inventory and Evaluate Project Alternatives

Activity No.: 02

Responsible Unit: Local Public Agency / District / CBLRS / BDE / FHWA

Activity Description:

Based on the general project design concept, the LPA with technical assistance from the district, CBLRS, BDE, and FHWA will inventory the affected environment and evaluate the project alternatives as practical at this stage of project development. The evaluation of preliminary alternatives should be sensitive to those environmental resources for which analysis of alternatives for avoidance and minimization of adverse impacts is required (e.g., wetlands, flood plains, Section 4(f) properties/historic sites, threatened and endangered species). In addition, local agencies should recognize that avoidance of environmental resources requiring special compliance procedures for impacts should be the preferred course of action. Avoidance of such resources will help to shorten project development time by avoiding the reporting and coordination necessary for compliance. The compilation of these inventories should be pursued only as necessary to provide high-quality information on the environmental impacts of the proposed action and to promote decision-making. Discussion of the proposed project with resource agencies at a district coordination meeting may be helpful in determining the optimum level of effort for the inventorying activity.

The LPA should identify the full range of the environmental inventory by evaluating environmental databases, discussing the project at a district coordination meeting, and submitting an environmental survey request, as appropriate, to the CBLRS. Resources involved may include:

- Section 4(f) and/or 6(f) properties;
- archaeological and historical properties;
- flood plains;
- sensitive noise receptors;
- prime farmland;
- wetlands;
- threatened or endangered species habitat, nature preserves, and natural areas;
- wild and scenic rivers;
- status of air quality attainment;
- water quality of streams and lakes;
- special waste;
- social/economic characteristics of the population;
- visual quality factors;
- well-head protection areas;
- groundwater recharge areas; and
- other biological resources (biodiversity, riparian habitat, etc.).

After the inventory has been prepared, the LPA should perform a preliminary evaluation of the magnitude and importance of the potential environmental impacts precipitated by the proposed action. This will assist in initiating the early coordination process ([Activity 03](#)).

Categorical Exclusion Process

Activity Title: Initiate Early Coordination

Activity No.: 03

Responsible Unit: Local Public Agency / BDE

Activity Description:

Coordination with governmental agencies and the public, as appropriate, is one of the most important aspects of the CE process. This coordination should begin as early as practical in project planning. (see [Activity 06](#))

As necessary, the LPA throughout the District, CBLRS, and BDE will initiate early coordination with organizations and persons and appropriate local, State, and Federal agencies that have an interest in the project or have information or expertise concerning environmental issues that the project may involve. The purpose of this coordination will be to assist in the evaluation of alternatives and the social, economic, and environmental impacts of the proposed project and possible impact mitigation measures. One specific objective of this early coordination is to gather information from other entities that may assist in the effort to compile an inventory of the affected environment ([Activity 02](#)). This may be necessary to identify historic/archaeological sites (State Historic Preservation Officer (SHPO)), natural resources (IDNR), land-use activities (local governments), etc.

If applicable, the LPA should begin developing the public involvement plan for the project at this stage; see [Chapter 21](#).

Categorical Exclusion Process

Activity Title: Evaluate Alternatives for Unusual Circumstances

Activity No.: 04

Responsible Unit: Local Public Agency / District / CBLRS

Activity Description:

As a part of the CE process, the LPA, district, and CBLRS must evaluate the project alternatives for any potential unusual circumstances. This will be according to 23 CFR 771.117(b). If significant impacts are likely, an EIS or EA is required for a Federal action. If there is a question on whether or not unusual circumstances are involved, the LPA may need to perform additional studies and/or prepare an EA.

The LPA will initiate those studies necessary to determine the environmental impact of the proposed project alternatives. The depth of the studies will be as appropriate for the project consistent with its designation as a CE. The nature of the studies will include:

- coordination with affected local, State, and Federal agencies and the public; and
- an evaluation of the environmental impacts including:
 - + social/economic;
 - + agricultural;
 - + historical/archaeological;
 - + air quality;
 - + noise;
 - + energy;
 - + natural resources, threatened, and endangered species;
 - + water quality/resources;
 - + flood plains;
 - + wetlands (see [Chapter 10](#));
 - + special waste;
 - + Section 4(f)/6(f); and
 - + other issues as applicable (e.g., Wild and Scenic Rivers, well-head protection, regulated ground-water recharge areas).

Categorical Exclusion Process

Activity Title: Prepare Environmental Documentation

Activity No.: 05

Responsible Unit: Local Public Agency

Activity Description:

Once the LPA has completed its environmental evaluation of the project alternatives for unusual circumstances ([Activity 04](#)), the LPA will document its findings. The documentation will vary depending upon the CE processing type and whether or not a PDR (form [BLR 22210](#)) is required. CE processing types include the following:

1. State Approved. See Section 19-1.04(b).
2. Federal Approved. See Section 19-1.04(c).

Categorical Exclusion Process

Activity Title: Notify Public/Affected Agencies

Activity No.: 06

Responsible Unit: Local Public Agency / BDE

Activity Description:

In [Activity 03](#), the LPA will have made a preliminary identification of those agencies that may have an interest in the project. For proposed CE projects, the LPA and BDE will coordinate with the public and appropriate agencies to verify the decision, if applicable, that the project includes no unusual circumstances ([Activity 04](#)). Typically, the following agencies will be contacted when resource issues of concern to these agencies are involved:

BDE will be responsible for coordinating with:

- FHWA or other joint lead agency;
- US Environmental Protection Agency;
- US Fish and Wildlife Service;
- Illinois Department of Natural Resources;
- State Historic Preservation Officer (Illinois Historic Preservation Agency (IHPA));
- Advisory Council on Historic Preservation;
- governmental land management agencies whose properties are affected; and/or
- other governmental agencies which have special expertise, jurisdiction by law regarding a project issue, or otherwise have an interest in the project.

LPA will be responsible for coordinating with:

- Illinois Environmental Protection Agency;
- US Army Corps of Engineers;
- Sub-State Clearinghouse(s), Metropolitan Planning Organization(s), or other appropriate local planning agency;
- Natural Resources Conservation Service;
- Illinois Department of Agriculture.
- IDOT Bureau of Aeronautics / Federal Aviation Administration (FAA) ([Section 22-1.01\(a\)](#)).
- Railroad / Illinois Commerce Commission ([Section 22-1.01\(b\) and \(c\)](#)).
- US Coast Guard ([Section 7-4.04](#)).

Categorical Exclusion Process

Activity Title: Secure CE Approval

Activity No.: 07

Responsible Unit: District

Activity Description:

State Approved CE projects may be approved by the Regional Engineer or CBLRS provided that it is determined (form BLR 19110 and form [BLR 22210](#) as required) that the project does not involve any "potential for unusual circumstances." For Federal Approved CE projects (form [BLR 22210](#)), the CE approval must be made by the FHWA. See Section 19-1.04(c).

The project must also meet the procedural requirements of any specific environmental impacts identified in the environmental studies ([Activity 04](#)). These may include, for example, a separate Section 4(f) Statement, a Section 404 permit, National Pollutant Discharge Elimination System (NPDES) permit, etc.

- Section 19-1.04(c) *Federal Approved Actions*

19-3 ENVIRONMENTAL DOCUMENTATION FOR CATEGORICAL EXCLUSIONS

19-3.01 General

PDRs (form [BLR 22210](#)) are not required for certain State Approved CE projects (see Section 19-1), but are required for all Federal Approved CE projects. For those projects that have PDRs, they must include evidence of consideration of environmental factors as discussed elsewhere in this Chapter. Circulation of a PDR to outside agencies for comment normally is not required.

19-3.02 Content

[Section 22-2.11](#) discusses the engineering information included in the PDR (form [BLR 22210](#)) and the overall format and content of the PDR. The following provides guidance for the environmental documentation appropriate for inclusion in a PDR for Categorical Exclusion projects:

1. CE Determination. Where the FHWA/CBLRS request formal written submittal of an action for concurrence in its classification as a Categorical Exclusion, the PDR will include information for the specific environmental issues requested by the FHWA/CBLRS. The information must be sufficient to permit an evaluation of whether the environmental effects will involve unusual circumstances (see Section 19-1.03) requiring preparation of an EIS or EA for Federally funded/regulated actions.

In any other cases where actions are formally submitted for CE approval, a discussion will be provided in the PDR concerning those factors involved with the action indicating potential for unusual circumstances (see Section 19-1.04). The information must be adequate to permit an assessment of whether the effects of the action warrant preparation of an EIS or EA for Federally-funded/regulated actions.

2. Environmental Surveys and Mitigation Commitments. The PDR should summarize the results of any necessary environmental screening, surveys, and related coordination for biological resources, wetlands, cultural resources, and special wastes. If surveys are not required, the basis for this determination should be documented. The PDR should include a statement indicating that the CERCLIS list was reviewed and should indicate whether any sites on the list are located within the project limits. In addition, either a copy of the Special Waste Screening Form or the response to the Preliminary Environmental Site Assessment (PESA) should be included. Any mitigation commitments resulting from the environmental survey and coordination process should be briefly discussed. Environmental mitigation measures (e.g., wetlands, tree replacement, tree clearing restrictions, prairie replacement) to be implemented for the project should be described.
3. Special Reports. Where a special report(s) is prepared, the PDR should contain a summary of the circumstances, findings, and processing status of each report along with a copy of any approval. These include reports for Section 4(f), wetlands, Section 106, noise analysis, special waste site investigations, etc. Copies of the special reports will be maintained in the project files.

4. Coordination. [Section 18-5](#) and Section 19-2, of the CE Process; discuss the coordination required for a CE action. This should be summarized in the PDR (form [BLR 22210](#)). Specifically, where coordination with the Natural Resources Conservation Service and/or the Illinois Department of Agriculture is required, the PDR should include a brief summary of the results of the coordination (e.g., a copy of Form AD-1006, when required, and/or a synopsis of comments received and the related responses).
5. Permits. The PDR should indicate the permits (e.g., Section 404, Section 402, NPDES, Section 10, IDNR Office of Water Resources) required for the project.

19-3.03 Processing

The PA requires that only appropriate full time IDOT employees will be responsible for making a State Approved CE determination. In addition, the IDOT personnel must meet the following training and experience requirements:

1. Have completed the web based course FHWA-NHI-142052, "Introduction to NEPA and Transportation Decision-making" or equivalent; and
2. Have experience addressing NEPA compliance for transportation projects; or
3. Have their work reviewed by staff who has met items 1 and 2.

The PA places an accountability requirement on IDOT in the form of a process review and QC/QA activities by IDOT. To facilitate these processes, form BLR 19110 will be used to document the State Approved CE determination for projects requiring a PDR (form [BLR 22210](#)).

For all CE projects requiring PDRs (State Approved CE projects specified in Section 19-103(b) and all Federal Approved CE projects), the local agencies must include appropriate environmental information to document the basis for determining that the project qualifies as a CE. The district will review the PDR for State Approved CE projects and the CBLRS will review the PDR for all State Approved CE projects that include a bridge and Federal Approved CE projects for the following environmental information:

- for Federal Approved CE projects, the Regional Engineer shall ensure that all BLRS and FHWA recommendations and concerns are addressed prior to recommending Categorical Exclusion and Design Approval;
- information on the need for and results of environmental surveys;
- information indicating the environmental issues involved and why the project would not result in significant impacts on those issues;
- documentation of compliance with special waste procedures and other applicable requirements for specific environmental issues involved; and
- information on the need for and status of any environmental permits.

When Federal Approved CE PDRs are submitted for design approval, the CBLRS will advise the district of any problems or deficiencies with the environmental information or design criteria and will provide recommendations, as appropriate, for correcting the problems or deficiencies.

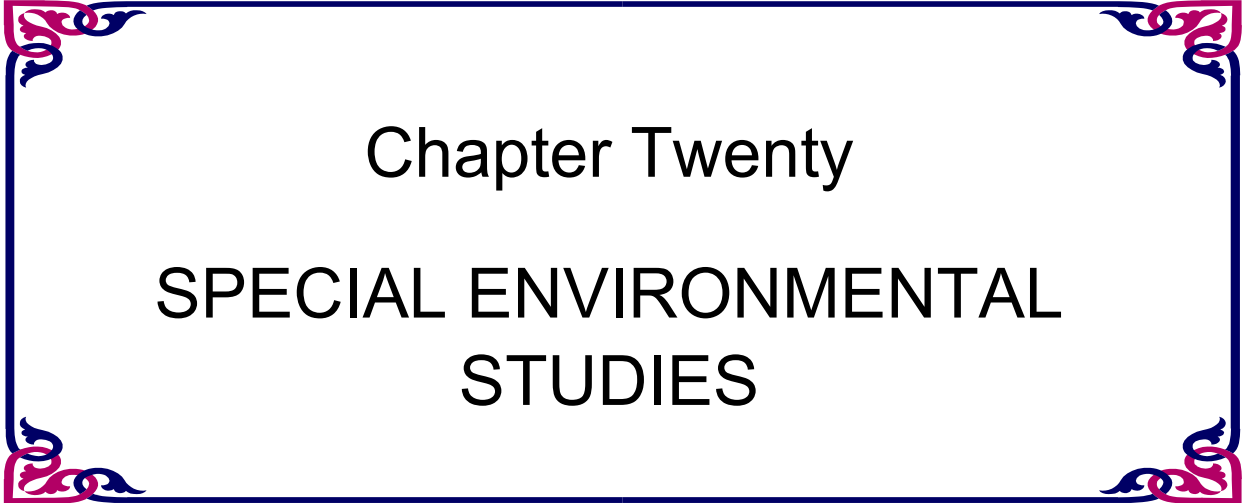

19-4 ACRONYMS

This is a summary of the acronyms used within this chapter.

ADA	<i>Americans with Disabilities Act</i>
BDE	Bureau of Design and Environment
CBLRS	Central Bureau of Local Roads and Streets
CE	Categorical Exclusion
CERCLA	<i>Comprehensive Environmental Response, Compensation, and Liability Act</i>
CERCLIS	<i>Comprehensive Environmental Response, Compensation, and Liability Information System</i>
CFR	Code of Federal Regulations
EA	Environmental Assessment
EIS	Environmental Impact Statement
FAA	Federal Aviation Administration
FHWA	Federal Highway Administration
IDNR	Illinois Department of Natural Resources
IDOT	Illinois Department of Transportation
IHPA	Illinois Historic Preservation Agency
LAFO	Local Agency Functional Overlay
LAPP	Local Agency Pavement Preservation
LPA	Local Public Agency
NEPA	<i>National Environmental Policy Act</i>
NHI	National Highway Institute
NPDES	National Pollutant Discharge Elimination System
PA	Programmatic Agreement
PDR	Project Development Report (form BLR 22210)
PESA	Preliminary Environmental Site Assessment
QC/QA	Quality Control / Quality Assurance
SHPO	State Historic Preservation Officer

Chapter Twenty

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

20-1 GENERAL

20-1.01 Introduction

Although the *National Environmental Policy Act* (NEPA) is the major mandate for environmental considerations, there are other laws, executive orders, regulations, agreements, etc., which require special studies, analyses, coordination, and documentation on specific environmental issues. Chapter 20 discusses these special requirements for federally funded projects. Chapter 26 of the *BDE Manual* provides additional information for each of the topics discussed in this Chapter.

As appropriate, impact analyses and related surveys, studies, and coordination made necessary by environmental laws and requirements other than NEPA shall be integrated with the development of environmental information for inclusion in environmental reports or Project Development Reports.

20-1.02 Topics

Special studies include the following:

- Environmental Surveys,
- Section 4(f) Evaluations,
- Section 6(f) Land Conversion Requests,
- OSLAD Land Conversion Requests,
- Historic Preservation Compliance Documentation,
- Noise Analyses,
- Flood Plain Findings,
- Wetlands Analyses,
- Threatened and Endangered Species/Natural Areas Impact Assessments,
- Evaluations of Farmland Conversion Impacts,
- Air Quality Conformity Documentation,
- Air Quality Microscale Analysis, and
- Special Waste.

20-1.03 Applicability

Many of the special environmental studies discussed in this Chapter are the result of federal requirements. Although the Federally required analyses primarily affect federally funded or regulated projects, some also may apply to State-only (or State and local) funded projects where the projects will affect resources regulated by the federal government. In addition, several of the special analyses discussed are the result of State requirements that also apply to federally funded projects. These State requirements are often more stringent than those at the federal level, and they may potentially affect any federally funded Local Public Agency (LPA) project if the project involves the specific types of resources.

20-2 ENVIRONMENTAL SURVEYS

The environmental survey process initiates the review for cultural, biological, wetland, and special waste resources.

20-2.01 Applicability

Environmental Survey Requests (ESR) for cultural, biological, and wetland resources are required for federal, State, or MFT funded projects, and any locally funded project that requires Department review and approval if any of the following criteria are met:

- involves acquisition of additional right-of-way or easements (temporary or permanent), or construction activities outside the existing right-of-way;
- requires a drainage structure runaround or any in-stream work (The installation of rip-rap on a stream bank is considered in-stream work);
- potentially affects a recognized Illinois Natural Areas Inventory site or Illinois-dedicated Nature Preserve, a wetland, or a location where a State- or federal-listed species is known to occur;
- Involves a historic structure or is within the limits of a historic district.
- If a project does not require additional right-of-way, but does require cultural or biological resource coordination (e.g., a project is located within a historic district or in-stream work), an ESR needs to be submitted to the district.
- Potentially affect a historical district or property listed on the national register of historic places;
- Involve replacement or rehabilitation of a bridge 50 years old or older;
- Involves any excavation on State right-of-way; or
- If there will be new road, bike trail, or sidewalk on new alignment regardless of who owns the right-of-way.

Survey requests for special waste are required regardless of funding source for the following types of local projects:

- When the project plans are prepared by IDOT for a LPA;
- Local project affecting State right-of-way or a road under State jurisdiction;
- Local project acquiring right-of-way in the name of the State; or
- Local project involving temporary or permanent easements in the name of the State;

These types of projects must be coordinated with the district Special Waste Coordinator (SWC).

20-2.02 Environmental Survey Request

IDOT has developed a web page for environmental surveys. This page has links to the survey request forms and instructions, permitting the LPA or its consultant to transmit the forms electronically to the appropriate district office. The district will automatically be notified of a transmittal and will download the forms into the Project Monitoring Applications (PMA), which is used to track the environmental survey process. The LPA/consultant will submit a printed copy of the completed form with the required number of attachments to the district for processing. These submittals should be made as early as practical in project development.

The forms include the ESR and an Addendum Environmental Survey Request (AESR). The ESR form should only be used for the first submittal of a project. An AESR is only necessary when changes in a project will affect areas outside the limits of the original ESR or if there is a change in project scope that could involve additional resources. The, AESR, will retain the sequence number that was assigned to the original ESR for the project.

The LPA or their consultant is required to fully prepare and send attachments with the ESR form electronically to the district. These attachments include:

1. A general project location map clearly showing the project location within the county,
2. A detailed (close-up) project location map and an ArcGIS shape file clearly delineating the environmental survey request limits of the project,
3. Preliminary plan sheets showing the existing and proposed right-of-way or easement lines (plan sheets showing the area to be surveyed shaded in color is preferred),
4. And photos of the project area and of any bridges, culverts, buildings, or structures of any type within or adjacent to the project area.

Photos of bridges and structures over 50 years old in particular are required, and photos must allow IDOT requirements for photo logs outlined in "Photographing Historic Structures: Guidelines and Photo Logs" which is posted on the IDOT website on the Environmental page. For projects involving State right-of-way, or any of the special waste criteria listed in Section 20-2.01 (Applicability), the attachments should include a figure delineating the portion of the project involving state right-of-way or state jurisdiction and also explain it in text. Also, document this in the text of the PMA.

If an AESR is submitted, the preliminary plan sheets must clearly differentiate between the area that was surveyed in the original ESR, and the area surveyed in the addendum.

20-3 SECTION 4(F) EVALUATIONS

20-3.01 Introduction

A Section 4(f) Evaluation is a Federal requirement that applies only to projects involving funding and an approval or permit from an agency of the US Department of Transportation (USDOT). Section 4(f) applies to any significant publicly owned public park, recreation area, wildlife and waterfowl refuge, or any land from an historic site of national, state, or local significance. These properties and their significance are documented in a Section 4(f) Evaluation during project development, addressing alternatives, measures to minimize any harm, and net benefits that would result from the use of Section 4(f) land.

20-3.02 Legal Authority

49 USC 303, commonly known as Section 4(f) of the *Department of Transportation Act of 1966* (Public Law 89-665), provides that the Secretary of the US Department of Transportation:

. . . may approve a transportation program or project requiring the use of publicly owned land of a public park, recreation area, or wildlife and waterfowl refuge, or land of a historic site of national, State, or local significance (as determined by the Federal, State, or local officials having jurisdiction over the park, recreation area, refuge, or site) only if:

- (1) there is no feasible and prudent alternative to using that land; and*
- (2) the program or project includes all possible planning to minimize harm to the park, recreation area, wildlife and waterfowl refuge, or historic site resulting from the use.*

20-3.03 Applicability

When Section 4(f) lands are involved, the specific applicability to a given action is based on regulatory criteria and interpretations, both by the courts and by agencies of the USDOT. FHWA regulatory criteria for applicability of Section 4(f) are stipulated in 23 CFR 771.135. Information concerning various interpretations that have been made regarding specific types of Section 4(f) resources and project actions is presented in the Section 4(f) Applicability/Q&A in the FHWA Section 4(f) Policy Paper (March 1, 2005). This policy paper and any revisions may be accessed at www.environment.fhwa.dot.gov/projdev/4fpolicy.htm. Where applicability questions arise that are not addressed by the FHWA regulatory criteria and/or interpretations that have been issued, the matter should be discussed with the Central BLRS and the responsible USDOT agency (in most cases the FHWA) as early as practical in the development of the action involved. The final determination of Section 4(f) applicability will be made by the responsible USDOT agency.

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

Jan 2006

Where there is a question concerning applicability of Section 4(f) to a specific resource involvement, any determination that Section 4(f) does not apply should be appropriately documented (e.g., a reference to a previously issued determination by the FHWA, a copy of a project-specific letter from the FHWA, a copy of meeting minutes, a memorandum to the files documenting discussions of the issue with the FHWA) in the Project Development Report or environmental document, and in the project files. This documentation should include, as appropriate, evidence of the views of the official having jurisdiction over the Section 4(f) resource.

20-3.04 Definitions

1. Section 4(f) Land. Land protected under 49 USC 303 Section 4(f) of the *USDOT Act of 1966*; i.e., any significant publicly owned public park, recreational area, or wildlife and waterfowl refuge; and any land from a historic site of national, State, or local significance as determined by the Federal, State, or local officials having jurisdiction over the park, recreational area, refuge or site. The term "historic site" includes both historic and prehistoric archaeological sites determined important for preservation in place.
2. Section 4(f) Evaluation. This is documentation of a project involving Section 4(f) land, addressing alternatives to use this land and mitigation measures that minimize any harm resulting from the proposed use.
3. Section 4(f) Approval. A finding that there is no feasible and prudent alternative to use other than the proposed Section 4(f) land and that all possible planning to minimize harm to Section 4(f) land is included in the proposed action.
4. Programmatic Section 4(f) Evaluation and Approval. An expedited evaluation and approval process, which addresses particular types of projects that involve the use of Section 4(f) land (e.g., independent walkway or bikeway construction projects). When studies and coordination with the officials having jurisdiction over the 4(f) resource indicate an action will conform to the requirements and conditions of a programmatic evaluation and approval, the processing of an individual Section 4(f) Evaluation document for that action is not required.
5. Use. For Section 4(f), use occurs (a) when land from a Section 4(f) site is permanently incorporated into a transportation project, (b) when there is a temporary occupancy of land that is adverse in terms of the preservationist purposes of Section 4(f), or (c) when the proximity impacts of a transportation project on a Section 4(f) site, without acquisition of land, are so great that the purposes for which the Section 4(f) site exists are substantially "impaired" (normally referred to by courts as a "constructive use"). See 23 CFR 771.135(p) and Section 4(f) Q&A Question #1 for further discussion concerning "use" under Section 4(f).
6. Significance. A publicly owned park, recreation area, or wildlife and waterfowl refuge must be a "significant" resource in order for Section 4(f) to apply. Resources are considered significant unless the official having jurisdiction concludes that the entire site is not significant. The FHWA must make an independent evaluation of significance. For purposes of Section 4(f), historic significance is based on whether a historic site is included on or eligible for inclusion on the National Register of Historic Places. Only those historic sites included on or eligible for inclusion on the National Register are subject to Section 4(f), unless the FHWA determines that the application of Section 4(f) is otherwise appropriate.

HARD COPIES UNCONTROLLED

20-3.05 Section 4(f) Evaluation**20-3.05(a) Development**

Each Section 4(f) Evaluation includes a draft and final evaluation. A separate Section 4(f) involvement must be prepared for each location within a proposed project where use of Section 4(f) land is involved. The draft evaluation addresses avoidance alternatives, and the final evaluation addresses the selected alternative that involves the use of Section 4(f) land, as appropriate.

The FHWA Division Office has the responsibility for giving Section 4(f) approval. Projects meeting certain criteria may be approved by use of a Programmatic Section 4(f) Evaluation that streamlines the process with the various responsible agencies. Section 20-3.07 describes the Programmatic Section 4(f) Evaluation process.

20-3.05(b) Draft Evaluation Format

For categorical exclusion projects, the Section 4(f) Evaluation is processed as a separate document.

For an EIS or EA, the information should be placed in a special section of the environmental document labeled "Section 4(f) Evaluation." The following format is recommended for the Section 4(f) Draft Evaluation:

- Cover Sheet,*
- Table of Contents,*
- Description of Proposed Action,
- Description of Section 4(f) Property(ies),
- Impacts on the Section 4(f) Property(ies),
- Avoidance Alternatives,
- Measures to Minimize Harm,
- Net Benefits, and
- Section 4(f) Coordination.

** These parts are needed only where the Section 4(f) Evaluation is prepared as a separate document.*

20-3.05(c) Draft Evaluation Content

The following will apply to the contents of a Section 4(f) Draft Evaluation:

1. Cover Sheet. The suggested format and content for a Section 4(f) Draft Evaluation cover sheet is presented in Figure 20-3A.
2. Table of Contents. The Table of Contents should provide the title and page numbers for each major section and subsection of the Evaluation. Maps, charts, tables, etc., should have separate listings in the Table of Contents.

BUREAU OF LOCAL ROADS & STREETS

20-3(4)

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

Jan 2006

3. Proposed Action. Where a separate Section 4(f) evaluation is prepared, describe the proposed project and explain the purpose and need for the project. When more than one alternative is under consideration, discuss each alternative requiring the use of Section 4(f) land.
4. Section 4(f) Property. Describe each Section 4(f) resource that would be used by any alternative under consideration. Provide the following information:
 - a. a detailed map or drawing of sufficient scale to identify the relationship of the alternatives to the Section 4(f) property;
 - b. size (acres (hectares) or ft² (m²)) and location (maps or other exhibits (e.g., photographs, sketches) of the affected Section 4(f) property;
 - c. ownership (e.g., city, county, State) and type of Section 4(f) property (e.g., park, recreation, historic);
 - d. function of, or available activities on, the property (e.g., ball playing, swimming, golfing);
 - e. description and location of all existing and planned facilities (e.g., ball diamonds, tennis courts);
 - f. access (e.g., pedestrian, vehicular) and usage (approximate number of users/visitors, etc.);
 - g. relationship to other similarly used lands in the vicinity;
 - h. applicable clauses affecting the ownership (e.g., lease, easement, covenants, restrictions, conditions (including forfeiture)); and
 - i. unusual characteristics of the Section 4(f) property (e.g., flooding problems, terrain conditions, other features) that either reduce or enhance the value of all or part of the property.
5. Impacts on the Section 4(f) Property. Discuss the impacts on the Section 4(f) property for each alternative (e.g., amount of land to be used, facilities and functions affected, noise, air pollution, visual).
6. Avoidance Alternatives. Identify and evaluate location and design alternatives that would avoid the Section 4(f) property. Generally, this would include alternatives to either side of the property. The design alternatives should be in the immediate area of the property and consider minor alignment shifts, a reduced facility, retaining structures, etc., individually or in combination, as appropriate.
7. Measures to Minimize Harm. Discuss all possible measures that are available to minimize the impacts of the proposed action on the Section 4(f) land.
8. Net Benefits. Discuss how the measures to minimize harm and the mitigation incorporated into the project results in overall enhancement of the Section 4(f) property when compared to the do nothing and avoidance alternative.
9. Coordination. Discuss the results of preliminary coordination with the public official having jurisdiction over the Section 4(f) property and with regional (or local) offices of Department of Interior (DOI) and, as appropriate, the US Department of Agriculture (USDA), the Regional Office of Housing and Urban Development (HUD), and the Forest Supervisor of the affected National Forest. Generally, the coordination should include a discussion of avoidance alternatives, impacts to the property, measures to minimize harm, and net benefits. In addition, the coordination with the public official having jurisdiction should include, where necessary, a discussion of significance and primary use of the property.

Jan 2006

20-3.05(d) Final Evaluation

When the preferred alternative uses Section 4(f) land, a final Section 4(f) Evaluation must be prepared. If the Section 4(f) Evaluation is a separate document, appropriate changes should be made in the Cover Sheet and Table of Contents to reflect that it is a Final Evaluation. In addition to the information in the Section 4(f) Draft Evaluation, the Section 4(f) Final Evaluation should include the following information:

1. Alternatives. A discussion of the basis for concluding that there are no feasible and prudent alternatives to the use of the Section 4(f) land. The supporting information must demonstrate that *“there are unique problems or unusual factors involved in the use of alternatives that avoid these properties or that the cost, social, economic, and environmental impacts, or community disruption resulting from these alternatives reach extraordinary magnitudes”* (23 CFR 771.135(a)(2)). This language should appear in the document together with the supporting information.
2. Planning Actions. A discussion of the basis for concluding that the proposed action includes all possible planning to minimize harm to the Section 4(f) property. When there are no feasible and prudent alternatives that avoid the use of Section 4(f) land, the final Section 4(f) Evaluation must demonstrate that the preferred alternative is a feasible and prudent alternative with the least harm; or provides a net benefit on the Section 4(f) resources after considering mitigation to the Section 4(f) resources.
3. Coordination. A summary of the appropriate formal coordination with the Headquarters Offices of DOI (and/or appropriate agency under that Department) and, as appropriate, the involved offices of USDA and HUD.
4. Comments. Copies of all formal coordination comments and a summary of other relevant Section 4(f) comments received and an analysis and response to any questions raised. Where Section 6(f) land is involved, document the National Park Service’s position on the land transfer.
5. Concluding Statement. Include a concluding statement as follows: “Based upon the above considerations, there is no feasible and prudent alternative to the use of land from the (identify Section 4(f) property) and the proposed action includes all possible planning to minimize harm to the (Section 4(f) property) resulting from such use.”

20-3.06 Coordination and Processing

The Section 4(f) Draft Evaluation must be circulated for review. The Department of Interior (DOI) should receive seven copies of the Section 4(f) Draft Evaluation for coordination. In addition to coordination with DOI, Section 4(f) Draft Evaluations must be coordinated with the officials having jurisdiction over the Section 4(f) property as well as HUD and USDA, where these agencies have an interest in or jurisdiction over the affected Section 4(f) resource (23 CFR 771.135(i)). The point of coordination for HUD is the appropriate Regional Office and for USDA, the Forest Supervisor of the affected National Forest. One copy should be provided to the officials with jurisdiction of the Section 4(f) property and two copies should be submitted to HUD and USDA when coordination is required. The minimum period of time for receipt of comments is 45 days. DOI should also receive seven copies of the Section 4(f) Final Evaluation for information.

HARD COPIES UNCONTROLLED

Comments received as a result of coordinating the Section 4(f) Evaluation must be given careful consideration. If the selected alternative requires the use of Section 4(f) land, the IDOT District Office and the FHWA Division Office must ensure that the EA/FONSI, the Final EIS, or Section 4(f) Final Evaluation includes sufficient information to fully support Section 4(f) approval.

20-3.07 Programmatic Section 4(f) Evaluations and Approvals

Appendix A of the *BDE Manual* includes the Programmatic Section 4(f) Evaluations for the following:

- historic bridges;
- minor involvements with public parks, recreations lands, and wildlife and waterfowl refuges;
- minor involvements with historic sites;
- independent bikeway or walkway construction projects; and
- projects that have a net benefit ⁽¹⁾.

Note: 1. The Programmatic 4(f) Evaluation for projects that have a net benefit is available at www.environment.fhwa.dot.gov/projdev/4fnetbenefits.htm.

Uses of Section 4(f) land covered by a Programmatic Section 4(f) Evaluation shall be documented and coordinated as specified in the applicable Programmatic Evaluation. Where Section 4(f) approval is given under a Programmatic Evaluation, a copy of the approval documentation should be included in the Project Development Report or environmental report for the action. Figure 20-3B presents the recommended format for the Cover Sheet (and approval documentation) for a Programmatic Section 4(f) Evaluation submittal. The recommended Cover Sheet format includes a paragraph that identifies which Programmatic Section 4(f) Evaluation is being used. This paragraph includes a space for entering the date on which the Programmatic Section 4(f) Evaluation was approved. For use of the Programmatic Section 4(f) Evaluations on minor involvements, the "issued on" date, indicated at the end of each, should be entered as the "approved on" date in the Cover Sheet paragraph. For use of the Programmatic Section 4(f) Evaluation on bikeway/walkway projects, enter May 23, 1977 in the Cover Sheet paragraph; the date that the Programmatic Section 4(f) Evaluation was originally approved and issued.

*[Project Information
(e.g., FAP number, termini, location)]*

SECTION 4(f) APPROVAL

US Department of Transportation
Federal Highway Administration

The Federal Highway Administration (FHWA) has determined that this project meets all requirements for processing under the nationwide Programmatic Section 4(f) Evaluation for *[historic bridges; bikeways; publicly owned parks, recreational lands, or wildlife and waterfowl refuges; or historic sites]* approved on *[(date)]*. This determination is based on the attached documentation which has been independently evaluated by FHWA and determined to adequately and accurately discuss the Section 4(f) considerations on this project. Accordingly, FHWA gives Section 4(f) approval under the nationwide Section 4(f) Evaluation for *[(AlternativeX)]*, which uses land from *[(resource name)]*.

HARD COPIES UNCONTROLLED

20-4 SECTION 6(F) REQUESTS**20-4.01 Section 6(f) Land Conversion Request****20-4.01(a) Introduction**

Special procedures must be followed when lands purchased and developed by using Land and Water Conservation (LAWCON) funds will be used for highway purposes. Section 20-4 discusses these procedures. Similar procedures may be required where lands are involved that have been improved or developed with funds under *the Urban Park and Recreation Recovery Act of 1978* § 1010, 16 U.S.C. § 2509 (Pub. L. 95-625, § 1010, 92 Stat. 3538 (1978)) or the *Illinois Open Land Trust Act*, 525 ILCS 33/1 *et seq.* Specific procedural requirements will be addressed on a case-by-case basis.

20-4.01(b) Legal Authority

16 USC 460I-8(f)(3), commonly known as Section 6(f) of the *Land and Water Conservation Fund Act of 1965*, Pub. L. 88-578, §6, 78 Stat. 897 (1964), requires that:

No property acquired or developed with assistance under this section shall, without the approval of the Secretary, be converted to other than public outdoor recreation uses. The Secretary shall approve such conversion only if he finds it to be in accordance with the then existing comprehensive statewide outdoor recreation plan and only upon such conditions as he deems necessary to assure the substitution of other recreation properties of at least equal fair market value and of reasonably equivalent usefulness and location.

“Secretary” refers to the Secretary of the U.S. Department of Interior. The authority to approve Section 6(f) land conversions has been delegated to the Regional Directors of the National Park Service (NPS).

20-4.01(c) Applicability

Section 6(f) procedures must be followed for all projects, regardless of project type or funding source, which involve the taking of property acquired or developed with LAWCON funds.

20-4.01(d) Procedures

Use the following procedures when processing Section 6(f) land conversion requests:

1. Coordination. Early and ongoing coordination with the official having jurisdiction over the 6(f) land, IDNR, and the NPS Regional Director should be diligently pursued.
2. Report Requirements. When a project proposes use of land in which LAWCON funds have been involved in its purchase or development, Section 6(f) requires the approval of the Secretary of the Interior for the conversion of the land to other than public outdoor recreational use. Section 6(f) does not otherwise require a special report.

BUREAU OF LOCAL ROADS & STREETS

20-4(2)

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

Jul 2013

3. Conversion Request. Requests to convert LAWCON-assisted properties in whole or in part to other than public outdoor recreational uses must be submitted through IDNR to the appropriate NPS Field Director in writing. NPS will consider the conversion request if the prerequisites described below have been met. As applicable, the LPA should submit a request for Section 6(f) land conversion approval to the IDNR Division of Grant Administration for submittal to the appropriate NPS Field Director. Formal review periods for conversion requests are not specified in the regulation. IDNR has advised that the typical time frame for NPS response to conversion requests is 60 to 90 days. The conversion request should include information to address each of the following points:
 - Alternatives. All practical alternatives to the proposed conversion have been evaluated.
 - Value. The fair market value of the property to be converted has been established and the property proposed for substitution is of at least equal fair market value as established by an approved appraisal (prepared according to uniform federal appraisal standards), excluding the value of structures or facilities that will not serve a recreational purpose.
 - Replacement Property. The property proposed for replacement is of reasonably equivalent usefulness and location as that being converted. Depending on the situation, and at the discretion of the NPS Field Director, the replacement property need not provide identical recreational experiences or be located at the same site, provided it is in a reasonably equivalent location. Generally, the replacement property should be administered by the same political jurisdiction as the converted property. For additional guidance on replacement property, see Section 26-3 of the *BDE Manual*.
4. Coordination. All necessary coordination with other federal agencies has been satisfactorily accomplished.
5. Environmental Review. The guidelines for environmental evaluation have been satisfactorily completed and considered by NPS during its review of the proposed 6(f) action. Where the proposed conversion arises from another federal action, final review of the LPA's proposal will not occur until the NPS Regional Office is assured that all environmental review requirements related to that other action have been met.
6. State Clearinghouse. If the proposed conversion and substitution constitute significant changes to the original LAWCON project, ensure that the State intergovernmental clearinghouse review procedures have been met.
7. Statewide Comprehensive Outdoor Recreation Plan (SCORP). Ensure the proposed conversion and substitution are consistent with SCORP and/or equivalent recreational plans.

HARD COPIES UNCONTROLLED

20-5 HISTORIC PRESERVATION COMPLIANCE DOCUMENTATION**20-5.01 Introduction**

In the development of a Federally funded or regulated project, it is necessary to consider the effects of the undertaking on properties included in, or eligible for inclusion in, the National Register of Historic Places. Where these properties will be affected, the Advisory Council on Historic Preservation (ACHP) must be afforded a reasonable opportunity to comment on the undertaking prior to project approval.

20-5.02 Legal Authority

The following legal authority regulates or influences the policies and procedures for Section 106 documentation:

- 16 USC 470f, Section 106 of the *National Historic Preservation Act of 1966*, as amended.
- 16 USC 470h-2, Section 110(f) of the *National Historic Preservation Act of 1966*, as amended.
- Executive Order 11593, Protection and Enhancement of the Cultural Environment.

Appendix C in Part III “Environmental Procedures” of the *BDE Manual* briefly describes each of these.

20-5.03 Applicability

The procedures described in Section 20-5 apply to all Federally funded/regulated highway projects that may result in changes in the character, setting, or use of a historic property.

20-5.04 Policy

In the development of a proposed Federally funded or regulated project, appropriate measures must be taken to evaluate the undertaking’s effect on properties included in, or eligible for inclusion in the National Register of Historic Places. Where these properties will be affected, the Advisory Council on Historic Preservation must be given a reasonable opportunity to comment prior to project approval. Special efforts must be made to minimize harm to any National Historic Landmark that may be directly and adversely affected by a proposed Federally funded or regulated undertaking.

20-5.05 Definitions

The following definitions apply to historic preservation:

1. Area of Potential Effects. The geographic area or areas within which an undertaking may cause changes in the character or use of historic properties, if these properties exist.

BUREAU OF LOCAL ROADS & STREETS

20-5(2)

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

Jan 2006

2. Council. The Advisory Council on Historic Preservation or a Council member or employee designated to act for the Council.
3. Historic Property. Any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register. This term includes, for the purposes of these regulations, artifacts, records, and remains that are related to and located within these properties. The term "eligible for inclusion in the National Register" includes properties formally determined as such by the Secretary of the Interior and all other properties that meet National Register listing criteria.
4. Indian Tribe. The governing body of any Indian tribe, band, nation, or other group that is recognized as an Indian tribe by the Secretary of the Interior and for which the United States holds land in trust or restricted status for that entity or its members.
5. Interested Person. Those organizations and individuals that are concerned with the effects of an undertaking on historic properties.
6. Local Government. A county, township, municipality, or other general purpose political subdivision of a State.
7. National Historic Landmark. A historic property that the Secretary of the Interior has designated as a National Historic Landmark.
8. National Register. The National Register of Historic Places maintained by the Secretary of the Interior.
9. National Register Criteria. The criteria established by the Secretary of the Interior for use in evaluating the eligibility of properties for the National Register.
10. State Historic Preservation Officer (SHPO). The official appointed or designated pursuant to Section 101(b)(1) of the *National Historic Preservation Act* to administer the State historic preservation program or a representative designated to act for the SHPO. The SHPO for Illinois is the Director of the State Historic Preservation Agency, or their designee.
11. Undertaking. Any project, activity, or program that can result in changes in the character or use of historic properties, if any historic properties are located in the area of potential effects. The project, activity, or program must be under the direct or indirect jurisdiction of a Federal agency, or licensed or assisted by a Federal agency. Undertakings include new and continuing projects, activities, or programs and any of their elements not previously considered under Section 106.

20-5.06 Development

The following guidance reflects the assumption that FHWA, in most cases, will be the lead Federal agency for a project subject to the Section 106 requirements. If a different Federal agency is the lead (e.g., USACE for a local- or State-funded project requiring a Section 404 permit), that agency would fulfill the functions indicated for FHWA:

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

Jan 2006

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

20-5(3)

1. Identification. Identify historic properties in the area of potential effects of a proposed highway undertaking as early as practical in the development of the project. Properties may be identified from listings of the National Register and eligible properties published by the Keeper of the National Register (e.g., in the Federal Register); from local (e.g., county, city) inventories of historic sites; through coordination with the State Historic Preservation Officer (SHPO) or local historic groups; through field investigations (e.g., conducted as part of the IDOT "Integrated Process for Environmental Surveys, Studies, and Associated Preliminary Coordination"); or for a list of historic bridges in Illinois, see IDOT's website.
2. No Sites Identified. If no historic properties are found, provide documentation to the SHPO. Ordinarily, the documentation will consist of the Environmental Survey Request form for the project on which the results of the survey will be indicated. Coordination of this information with the SHPO will be accomplished by BDE. A copy of the response from the SHPO, if any, will be returned to the district. Persons and parties known to be interested in the undertaking and its possible effects on historic properties should be notified of the finding. For some project types, agreements with the SHPO and the Federal Highway Administration permit BDE to issue an "in-house" clearance on historic properties without the need for field surveys or project-specific coordination with the SHPO. For these projects, the Cultural Resources form, from the Project Monitoring application (PMA) with the "Cleared for Design Approval" and "Cleared for Letting" date field completed, constitutes the necessary documentation of Section 106 compliance. A copy of the PMA screen will be sent to the LPA by the district and will be placed in the EA and/or PDR. The agreement also allows that no survey request needs to be submitted on some projects.
3. Potential Sites Identified. If sites, buildings, structures, or objects are identified in the area of potential effects of an undertaking for which the National Register eligibility status has not been determined, appropriate information must be coordinated with the SHPO and, as appropriate, the Keeper of the National Register (in the US Department of Interior) for a determination of eligibility. This coordination ordinarily will be accomplished by BDE. In most cases, the information needed for the eligibility determination will be obtained through the studies conducted in response to the submittal of the Environmental Survey Request form for the undertaking. Where additional information is needed, BDE may request the assistance of the LPA in obtaining specific items of information.
4. Determining Effect. For all historic properties in the area of potential effects of a highway undertaking, the effects of the undertaking must be assessed. This assessment will be based on the Criteria of Effect and Adverse Effect (see Section 26-5 of the *BDE Manual*, developed by the Advisory Council on Historic Preservation (ACHP)).
5. "No Effect" Finding. If it is determined that the undertaking will have no effect on historic properties, BDE will provide documentation of this finding, ordinarily a letter and the results of the Cultural Resources portion of the environmental survey, to the SHPO and to interested persons who have made their concerns known. Unless the SHPO objects within 30 days of receiving this notice, no further actions are required for Section 106 compliance. If the SHPO provides a written response concurring in the no-effect finding, the district will provide a copy to the LPA.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

20-5(4)

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

Jan 2006

6. Determining Adverse Effect. If an effect on a historic property is found, or if the SHPO objects to a no-effect finding, the effect must be evaluated under the Criteria of Adverse Effect; see Section 26-5 of the *BDE Manual*. In addition, the public and interested persons must be afforded notice of the opportunity to comment on any project affecting a site on or eligible for the National Register. LPAs may accomplish this notification as part of the announcements for public involvement activities or the public availability of environmental documents for comment, or through publication of a separate notice specifically for that purpose. The announcement or notice should include a statement to the effect that:

In accordance with the National Historic Preservation Act, the views of the public and interested persons are being sought regarding the effect of the project on [list the specific National Register or eligible property(ies) involved] which is included on [or eligible for inclusion on] the National Register of Historic Places.

This published notice will be in addition to any other direct contacts the LPAs may have with the public or interested persons to obtain their views regarding the project's effect on historic resources. Any views received in response to the notification should be considered and documented in the Section 106 compliance information.

7. Finding of No Adverse Effect. If the effect is not considered adverse under the Criteria of Adverse Effect, BDE will coordinate this finding with the SHPO. The following outcomes may occur:
- a. If, within 30 days, the SHPO concurs in the finding, BDE will notify ACHP, via the FHWA, and will provide summary documentation (i.e., the information that was coordinated with the SHPO) to support the finding.
 - b. If the SHPO does not concur in the finding, BDE will submit documentation of the Finding of No Adverse Effect to ACHP, via the FHWA, for a 30 day review period and will notify the SHPO.
 - c. If the ACHP does not object to the Finding of No Adverse Effect within 30 days of receipt of notice, or if ACHP objects but proposes changes that are accepted (by IDOT and FHWA), no further steps are required in the Section 106 process other than to comply with any agreement with the SHPO or ACHP concerning the undertaking.
 - d. If the ACHP objects to the Finding of No Adverse Effect or changes proposed by the ACHP, if any, are not accepted, then the effect will be considered adverse.

The purpose of Section 106 documentation is to provide sufficient information to explain how the Finding of No Adverse Effect was determined. The required documentation is as follows:

- a description of the undertaking including photographs, maps, and drawings, as necessary;
- a description of historic properties that may be affected by the undertaking;
- a description of the efforts used to identify historic properties;
- a statement of how and why the criteria of adverse effect were found inapplicable; and
- the views of the SHPO, affected local governments, Indian tribes, Federal agencies, and the public, if any were provided, and a description of the means employed to solicit those views.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

Jan 2006

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

20-5(5)

8. Adverse Effect Finding. If an adverse effect on historic properties is found, BDE will notify the ACHP, via the FHWA (except in cases where the ACHP has objected to a Finding of No Adverse Effect), and will initiate consultation in cooperation with the Central BLRS, the district, and the LPA to seek ways to avoid or reduce the effects on historic properties. The SHPO or IDOT/FHWA may request the ACHP to participate. The ACHP may participate in the consultation without this request. Interested persons will be invited to participate as consulting parties when they so request. Members of the public also shall have an opportunity to receive information and express their views. BDE will provide each of the consulting parties' documentation of the Finding of Adverse Effect.

The required documentation, provided by the LPA, for a finding of "Adverse Effect" is as follows:

- a description of the undertaking including photographs, maps, and drawings, as necessary;
 - a description of the efforts to identify historic properties;
 - a description of the affected historic properties, using materials already compiled during the evaluation of significance, as appropriate; and
 - a description of the undertaking's effects on historic properties.
9. Memorandum of Agreement. If IDOT/FHWA and the SHPO agree upon ways to avoid or reduce adverse effects, or agree to accept these effects, they must execute a Memorandum of Agreement (MOA). Ordinarily, BDE will prepare the MOA in consultation with the LPA, district, Central BLRS, FHWA, and SHPO. When the ACHP participates in the consultation, it will execute the MOA with the LPAs, IDOT/FHWA, and the SHPO. When the ACHP has not participated in consultation, BDE will submit, via the FHWA, the MOA, with appropriate documentation; see Section 26-5 of the *BDE Manual*. As appropriate, IDOT/FHWA, SHPO, and ACHP, if participating, may agree to invite other parties to concur in the Agreement.

When IDOT/FHWA submits an MOA and related documentation to the ACHP, the ACHP will have 30 days from receipt to review it. Before this review period ends, ACHP will:

- accept the MOA, which concludes the Section 106 process;
- advise IDOT/FHWA of changes to the MOA to make it acceptable; subsequent agreements by IDOT/FHWA, the SHPO, and ACHP conclude the Section 106 process; or
- decide to comment on the undertaking, in which case, the ACHP will provide its comments within 60 days of receiving the submittal from IDOT/FHWA, unless IDOT/FHWA agrees otherwise.

When an MOA is submitted for review, the documentation, in addition to that specified in the "Finding of Adverse Effect", will also include a description and evaluation of any proposed mitigation measures or alternatives that were considered to address the undertaking's effects and a summary of the views of the SHPO and any interested persons.

When an MOA becomes final, the undertaking must be implemented according to the terms of the Agreement. This evidences fulfillment of Section 106 responsibilities. Failure to implement the terms of an MOA requires that the undertaking be resubmitted to the ACHP for comment.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

20-5(6)

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

Jan 2006

10. Request for Comments. Where IDOT/FHWA and the SHPO cannot agree upon measures to avoid or reduce adverse effects nor agree to accept these effects, BDE will request, via the FHWA, the ACHP's comments and provide documentation for a Request for Comments When There is No Agreement; see Section 26-5 of the *BDE Manual*.

When the ACHP has commented on an undertaking, the comments will be considered by IDOT/FHWA in reaching a final decision on the proposed undertaking. BDE will report, via the FHWA, the decision to the ACHP prior to initiating the undertaking, if possible.
11. Discovery During Construction. Where historic properties are discovered during construction, the Central BLRS should be contacted for guidance concerning the specific actions necessary for compliance.
12. Documentation in Environmental Report. The results of compliance actions under Section 106 will be summarized in the environmental report for the action.

20-5.07 Section 106 Programmatic Agreement for Transportation Enhancement Projects

The Section 106 Programmatic Agreement is an expedited process for transportation enhancement activities funded with Surface Transportation Program (STP) funds that fall within the following categories:

- acquisition of scenic easements and scenic or historic sites;
- scenic or historic highway programs;
- landscaping and other scenic beautification;
- historic preservation;
- rehabilitation and operation of historic transportation buildings, structures, or facilities, including historic railroad facilities and canals;
- preservation of abandoned railway corridors including the conversion and use thereof for pedestrian or bicycle trails;
- control and removal of outdoor advertising;
- archeological planning and research;
- mitigation of water pollution due to highway runoff; and
- facilities for pedestrians and bicycles.

The guidance provided in Section 20-5.06 remains the same with the exception of the "No Effect Finding" and "Finding of No Adverse Effect" procedures. For both steps, BDE will provide a written determination of the finding to the SHPO. The SHPO will provide written concurrence or comments within 15 days. If the district and the SHPO agree on the finding, BDE will document that finding, which will be available for public inspection, and proceed with the activity without further review by the ACHP.

The Section 106 Programmatic Agreement for Enhancement Projects can be obtained through the Central BLRS.

HARD COPIES UNCONTROLLED

20-5.08 Documentation Requirements

The following discussion stipulates the documentation required for specific findings, agreements, or requests for comments in the Section 106 compliance process. For archaeological resources, BDE ordinarily will prepare the Section 106 compliance documentation, in cooperation with the LPA, Central BLRS, district, and the FHWA. For historic or architectural resources, the LPA ordinarily will prepare the documentation. See Section 20-5.06 for the documentation requirements.

20-5.09 Coordination

Coordination is conducted by BDE to comply with Section 106. Coordination primarily involves the FHWA, SHPO, the Keeper of the National Register, and ACHP. However, in the identification of historic properties and the evaluation of the effects of proposed undertakings on these properties, careful consideration should be given to information and views provided by contacts with:

- interested and affected persons;
- local governments;
- Indian tribes;
- public and private organizations; and
- applicants for or holders of grants, permits, or licenses and owners of affected lands.

When an adverse effect on historic properties is involved, these parties must be invited to participate in the Section 106 consultation process, if they request to be so involved.

20-5.10 Historic Bridge Memorandum of Understanding

For information on IDOT's Memorandum of Understanding with the FHWA, see Section 10-1.06.

20-6 NOISE ANALYSES

20-6.01 Introduction

In the development of a Federally funded project, it may be necessary to undertake special technical analyses to identify and evaluate the potential noise impacts that the project will involve. This topic prescribes procedures for these analyses, noise abatement measures and related coordination, and the noise abatement criteria prescribed by Federal regulations.

20-6.02 Complementary Technical Manual

The IDOT Highway Traffic Noise Assessment Manual (Manual) provides technical information and technical procedures associated with the provisions of this topic. The Manual contents will comply with the procedures described herein.

20-6.03 Legal Authority

The following legal authority regulates or influences the policies and procedures for noise analyses:

- 42 USC 4901-4918, commonly known as the *Noise Control Act of 1972* (Public Law 92-574).
- 23 USC 109(h) and (i), which are amendments to the *Federal-aid Highway Act of 1970* (Public Laws 93-87 and 91-605).
- 42 USC 4331 and 4332, which are portions of the *National Environmental Policy Act of 1969* (Public Law 91-190).
- 23 CFR Part 772 "Procedures for Abatement of Highway Traffic Noise and Construction Noise."
- "Highway Traffic Noise: Analysis and Abatement Guidance," by the US Department of Transportation, Federal Highway Administration June 2010, as revised January 2011.

20-6.04 Policy

Special efforts must be made in the development of a project to comply with Federal, State, and local requirements for noise control, to consult with appropriate officials to obtain the views of the affected community regarding noise impacts and abatement measures, and to mitigate highway-related noise impacts, where reasonable and feasible. The reasonableness evaluation for noise abatement will include the solicitation of viewpoints from the benefited receptors.

For detailed information, see the "Highway Traffic Noise Analysis and Abatement — Policy and Guidance," by the US Department of Transportation, Federal Highway Administration, Office of Environment and Planning, Noise and Air Quality Branch, Washington D.C., June 1995.

20-6.05 Definitions

The following definitions apply to noise analyses:

1. Existing Noise Levels. The worst hourly noise level resulting from the combination of natural and mechanical sources and human activity usually present in a particular area.
2. Facility or Existing Highway. Any road or street on the highway system that falls under the jurisdiction of IDOT, county, road district, or municipality.
3. Noise Barrier. A physical obstruction (i.e. stand alone noise walls, noise berms (earth or other material), and combination berm/wall systems) that is constructed between the highway noise source and the noise sensitive receptor(s) that lowers the noise level at the receptor location.
4. Receptor. A discrete or representative location of a common noise environment(s), for any of the land uses listed in Figure 20-6A.
5. Residence. A dwelling unit. Either a single family residence or each dwelling unit in a multifamily dwelling.
6. Type I Project.
 - The construction of a highway on new location; or,
 - The physical alteration of an existing highway where there is either:
 - *Substantial Horizontal Alteration*. A project that halves the distance between the traffic noise source and the closest receptor between the existing condition in the future build condition; or
 - *Substantial Vertical Alteration*. A project that removes shielding, therefore exposing the line-of-sight between the receptor and the traffic noise source. This is done by either altering the vertical alignment of the highway or by altering the topography between the highway traffic noise source and the receptor; or,
 - The addition of a through-traffic lane(s). This includes the addition of a through-traffic lane that functions as a HOV lane, Highway-Occupancy Toll (HOT) lane, bus lane, or truck climbing lane; or,
 - The addition of an auxiliary lane, except for when the auxiliary lane is a turn lane; or,
 - The addition or relocation of interchange lanes or ramps added to a quadrant to complete an existing partial interchange; or,
 - Restriping existing pavement for the purpose of adding a through-traffic lane or an auxiliary lane; or,
 - The addition of a new or substantial alteration of a weigh station, rest stop, ride-share lot or toll plaza.
7. Type II Project. A Federal or Federal-aid highway project for noise abatement on an existing highway.
8. Type III Project. A Federal or Federal-aid highway project that does not meet the classifications of a Type I or Type II project. Type III projects do not require a noise analysis.

BUREAU OF LOCAL ROADS & STREETS

Jul 2013

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

20-6(3)

9. Undeveloped Lands. Those tracts of land or portions thereof that do not contain improvements or activities devoted to frequent human habitation or use (including low-density recreational use) and for which no such improvements or activities are permitted.
10. Worst Hourly Traffic Noise. The noise level resulting from the highest hourly volume a facility can handle while maintaining stable flow. This traffic volume will be either the design hourly volume or the maximum volume that can be accommodated under Level of Service C (i.e., where high traffic volumes begin to restrict speed and drivers' maneuverability).

20-6.06 Applicability

The noise analysis procedures described in this Section applies to all Type I and Type II projects; see Section 20-6.05 for definitions. If a project is determined to be a Type I project, then the entire project area as defined in the NEPA environmental document is a Type I project. For further information on noise analysis procedures and abatement measures, see Section 26-6 of the *BDE Manual*.

20-6.07 Procedures

The *IDOT Traffic Noise and Vibration Manual* provides technical information and technical procedures associated with the provisions of this topic. Its contents should be considered in complying with these procedures.

20-6.07(a) Analysis and Reporting

The analysis and reporting of noise impacts must be accomplished in accordance with the following:

1. Traffic Noise Analysis. In the development of proposed projects, expected traffic noise impacts must be determined and analyzed, and the overall benefits that can be achieved by noise abatement measures to mitigate these impacts will be determined, giving weight to any adverse social, economic, and environmental effects. The level of analysis may vary from simple calculations for rural and low-volume highways to extensive analysis for high-volume, controlled-access highways in urban areas. Noise abatement criteria are listed in Figure 20-6A.

The traffic noise analysis shall be conducted in the following manner:

- Identify existing activities, developed areas, and undeveloped lands which may be affected by noise from the highway. Land uses shall be characterized based on the activity categories and descriptions listed in Figure 20-6A. Undeveloped lands permitted for development by the date of public knowledge shall be evaluated for traffic noise impacts and noise abatement (if impacts are identified) based on the permitted land use description.

HARD COPIES UNCONTROLLED

- Predict the traffic noise levels for each reasonable alternative carried forward under detailed study (including the “no-action” alternative) using the most current version of the FHWA-approved Traffic Noise Model (TNM) which is described in “FHWA Traffic Noise Model” Report No. FHWA-PD-96-010, or any other model determined by the FHWA to be consistent with the methodology of the FHWA TNM. The pavement type in TNM shall be the average pavement type unless a different pavement type has been approved by FHWA.
 - When determining traffic noise impacts, primary consideration shall be given to exterior areas where frequent human use occurs *for Activity Categories A, B, C, and E*. Traffic noise impacts for land uses within Activity Category D shall be predicted for interior areas only if no exterior use areas are identified. See the *IDOT Highway Traffic Noise Assessment Manual* for further guidance.
 - Determine the existing noise levels using field measurements, modeling, or both, using the most current version of the FHWA-approved TNM or any other model determined by the FHWA to be consistent with the methodology of the FHWA TNM. Modeling of existing conditions may not be appropriate when the project involves construction of a new roadway in a new location where there is no existing traffic noise contribution. Predicted noise levels shall be validated through comparison between measured and predicted noise levels. The $L_{eq}(h)$ noise metric shall be used to quantify the measurement of both existing and predicted noise levels.
2. Noise Abatement. See Section 26-6.05(d) of the BDE Manual for noise abatement measures.
3. Construction Noise. The following general steps for addressing construction noise will be performed for all Type I and Type II projects:
- Identify land uses or activities that may be affected by noise from construction of the project. This identification must be performed during the project development studies.
 - Determine the measures recommended for inclusion in the contract plans and specifications to minimize or eliminate adverse construction noise impacts on the community. This determination includes a weighing of the benefits to be achieved and the overall adverse social, economic, and environmental effects and the costs of the abatement measures.
 - Incorporate the recommended abatement measures into the contract plans and specifications.
- See Section 26-6.08 of the BDE Manual for additional guidance on construction noise.
4. Documentation in Reports. Although there may be instances in which a noise analysis is conducted independent of environmental documentation for a highway project (e.g., for Type II noise abatement projects), the analysis typically is conducted concurrently with the development of an EIS, EA, or other environmental report (or Project Development Report, where applicable). It is important that appropriate information from the technical noise study be made a part of the environmental documentation. Therefore, careful planning should be undertaken to ensure that the technical study reaches appropriate milestones in time to incorporate summaries of the noise analysis results into the environmental documentation for circulation and comments, as appropriate. See Section 26-6.09 of the BDE Manual for further guidance.

The technical report should be reviewed by the district or be submitted by the district to the Central BLRS so it can be forwarded to BDE for review.

20-6.07(b) Coordination

Coordination with Metropolitan Planning Organizations (MPOs) and with local officials (within whose jurisdiction the highway project is located) will be undertaken for all Type I projects. The LPA will provide the following information to these organizations:

- approximate generalized future noise levels (for various distances from the highway improvement) for both developed and undeveloped lands or properties in the immediate vicinity of the project, and
- information that may be useful to local communities to protect future land development from becoming incompatible with anticipated highway noise levels.
- Compare the predicted design year build traffic noise levels based on traffic characteristics that yield the worse traffic noise impact for the preferred alternative, or for each alternative under detailed study, with the existing noise levels and with the noise abatement criteria (see Figure 20-6A). This comparison shall also include predicted traffic noise levels for the “no-action” alternative in the design year. Such information shall be used primarily to describe the noise levels of proposed highway improvements in contrast with noise levels likely to be reached in the same area if no highway improvement is undertaken. Noise impacts are defined when the predicted traffic noise levels for the design build year approach (defined by the Department as “within 1 decibel of”) or exceed the Noise Abatement Criteria provided in Figure 20-6A, or when the predicted traffic noise levels for the design year are substantially higher (defined by the Department as “more than 14 decibels greater”) than the existing noise levels.
- Examine and evaluate noise abatement measures (see Section 26.05(d) of the BDE Manual) for existing activities, developed lands, and undeveloped lands for which development is permitted where traffic noise impacts have been identified. Before project plans and specifications are approved, it must be determined that noise abatement measures determined to be feasible and reasonable have been incorporated. Because decisions on noise abatement are prerequisites to determining environmental impacts, and because these impacts influence decisions on adoption of a highway location, it is important that a preliminary determination be made of likely noise abatement measures.
- Design year build noise levels shall be predicted for undeveloped lands for which there will be no development permitted by the date of public knowledge. The results shall be documented in the NEPA environmental documents and noise analysis documents. The information presented may include a prediction of noise contours or a prediction of distances from the highway for which impacts would likely occur. A noise abatement evaluation is not warranted for these undeveloped lands provided that development is not permitted by the date of public knowledge. See Section 26-6.05(e) of the BDE Manual for additional information to be provided to local officials for undeveloped lands.

BUREAU OF LOCAL ROADS & STREETS

20-6(6)

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

Jul 2013

Activity Category	L _{eq} (h)	Evaluation Location	Activity Description
A	57	Exterior	Lands on which serenity and quiet are of extraordinary significance and serve an important public need and where the preservation of those qualities is essential if the area is to continue to serve its intended purpose.
B	67	Exterior	Residential.
C	67	Exterior	Active sports areas, amphitheatres, auditoriums, campgrounds, cemeteries, day care centers, hospitals, libraries, medical facilities, parks, picnic areas, places of worship, playgrounds, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, recreation areas, Section 4(f) sites, schools, television studios, trails, and trail crossings.
D	52	Interior	Auditoriums, day care centers, hospitals, libraries, medical facilities, places of worship, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, schools, and television studios.
E	72	Exterior	Hotels, motels, offices, restaurants/bars, and other developed lands, properties or activities not included in A-D or F.
F	---	---	Agriculture, airports, bus yards, emergency services, industrial, logging, maintenance facilities, manufacturing, mining, rail yards, retail facilities, shipyards, utilities (water resources, water treatment, electrical), and warehousing.
G	---	---	Undeveloped lands that are not permitted.

*Note: The Noise abatement Criteria are noise impact thresholds for considering abatement. (Abatement must be considered when predicted traffic noise levels for the design year approach (i.e., within 1 decibel of) or exceed the noise abatement criteria, or when the predicted traffic noise levels are substantially higher (i.e., more than 14 decibels greater) than the existing noise level.) The Noise Abatement Criteria are **not** attenuated design criteria or targets. The goal of noise abatement measures is to achieve the feasibility noise reduction criteria and the noise reduction design goal. The reductions may or may not result in design year noise levels at or below the Noise Abatement Criteria.*

**NOISE ABATEMENT CRITERIA
(Hourly Sound Level - decibels (dBA))**

Figure 20-6A

20-7 FLOOD PLAIN FINDING (EXECUTIVE ORDER 11988)**20-7.01 Introduction**

In the development of a Federally funded/regulated project, Executive Order 11988 imposes special requirements when the project will entail a significant flood plain encroachment. The following discussion explains the Executive Order 11988 requirements. These are in addition to IDNR Office of Water Resources flood plain permit requirements discussed in Chapter 7 and the special hydraulic analyses associated with determining structure openings and elevations for facilities located in flood plains discussed in Section 10-2.03.

A project that will involve a significant flood plain encroachment, as defined under the Executive Order 11988 requirements, will require the preparation of an EA or EIS.

20-7.02 Legal Authority

The following legal authority regulates or influences the policies and procedures for flood plains:

- Executive Order 11988, Flood Plain Management.
- US Water Resources Council's Flood Plain Management Guidelines for Implementing Executive Order 11988.
- US Department of Transportation Order 5650.2, Protection and Management of Flood Plains.
- Federal Highway Administration regulations on Location and Hydraulic Design of Encroachments on Flood Plains (23 CFR 650A).
- Title 92 IAC 708, implementing Sections 23, 29, and 30 of the *Rivers, Lakes, and Streams Act*, 615 ILCS 5/23, 29a, and 30.

See Appendix C of Part III "Environmental Procedures" of the *BDE Manual* for more information.

20-7.03 Policy

In the development of a Federally funded/regulated project, special efforts must be made to:

- encourage a broad and unified effort to prevent uneconomic, hazardous, or incompatible use and development of flood plains;
- avoid longitudinal encroachments, where practical;
- avoid significant encroachments, where practical;
- minimize impacts of actions that adversely affect base flood plains;
- restore and preserve the natural and beneficial flood plain values that are adversely impacted by LPA actions;
- avoid support of incompatible flood plain development; and
- be consistent with the intent of the Standards and Criteria of the National Flood Insurance Program, where appropriate.

20-7.04 Applicability

The following Sections discuss the procedures that apply to all Federally funded/regulated projects that will entail encroachment or which otherwise will affect base flood plains, except for repairs made with emergency funds during or immediately following a disaster. The assessment of flood plain encroachments should be incorporated into the development and analysis of design alternatives so that flood plain impacts will not be considered in isolation from other social, economic, environmental, and engineering considerations.

20-7.05 Definitions

The following definitions apply to floodplain findings:

1. Action. Any highway construction, reconstruction, rehabilitation, repair, or improvement undertaken for Federally funded/regulated projects.
2. Base Flood. The flood or tide having a 1% chance of being exceeded in any given year.
3. Base Flood Plain. The area subject to flooding by the base flood.
4. Encroachment. An action within the limits of the base flood plain. Generally, any increase in the 100-year-water-surface elevation produced by a longitudinal encroachment on a National Flood Insurance Program (NFIP) flood plain should not exceed the 1 ft (300 mm) allowed by the Federal NFIP standards and must be supported by the design risk assessment.
5. Longitudinal Encroachment. An action that is parallel to the channel and within the limits of the base flood plain.
6. Minimize. To reduce to the smallest practical amount or degree.
7. Natural and Beneficial Flood Plain Values. These include, but are not limited to fish, wildlife, plants, open space, natural beauty, scientific study, outdoor recreation, agriculture, aquaculture, forestry, natural moderation of floods, water quality maintenance, and groundwater recharge.
8. Practical. Capable of being done within reasonable natural, social, or economic constraints.
9. Preserve. To avoid modification to the functions of the natural flood plain environment or to maintain it as closely as practical in its natural state.
10. Regulatory Floodway. The flood plain area that is reserved in an open manner by Federal, State, or local requirements (i.e., unconfined or unobstructed either horizontally or vertically) to provide for the discharge of the base flood so that the cumulative increase in water surface elevation is no more than a designated amount (not to exceed 1 ft (300 mm)) as established by the Federal Emergency Management Agency (FEMA) for Administering the National Flood Insurance Program.
11. Restore. To re-establish a setting or environment in which the functions of the natural and beneficial flood plain values adversely impacted by the highway agency action can again operate.

BUREAU OF LOCAL ROADS & STREETS

Jan 2006

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

20-7(3)

12. Risk. The consequences associated with the probability of flooding attributable to an encroachment. It will include the potential for property loss and hazard to life during the service life of the highway.
13. Significant Encroachment. A highway encroachment and any direct support of likely base flood plain development that would involve one or more of the following construction- or flood-related impacts:
 - a significant potential for interruption or termination of a transportation facility which is needed for emergency vehicles or provides a community's only evacuation route,
 - a significant risk, or
 - a significant adverse impact on natural and beneficial flood plain values.
14. Support Base Flood Plain Development. To encourage, allow, serve, or otherwise facilitate additional base flood plain development. Direct support results from an encroachment; indirect support results from an action out of the base flood plain.
15. Transverse Encroachments. The network of the natural surface drainage system does not allow any alternative to transverse encroachments by a highway program. Therefore, it is essential that the design selected for transverse encroachments be supported by analysis of design alternatives with consideration given to capital costs, risk, and other site-specific factors. "Supported" means that the design is either shown to be cost-effective or justified on some other engineering basis. The analysis used to develop this support is referred to as a design risk assessment (see Section 20-7.06(b)). Justification for the structure size selected for design must be documented in a Hydraulic Design Study Report and retained in the project file.

20-7.06 Procedures

The *IDOT Water Quality Manual* provides additional information and procedures to assist in fulfilling the requirements herein. The *IDOT Drainage Manual* discusses hydraulic analyses for flood plain encroachments.

20-7.06(a) Assessment and Documentation of Flood Plain Encroachments

When considering flood plain encroachments, projects are divided into six categories. This Section provides guidance on the appropriate assessment and documentation for the different categories of work. The Central BLRS or FHWA may require additional information on individual projects prior to environmental or design approval.

Assessments of flood plain encroachments may range from inspections resulting in certifying statements, as suggested in Categories 1 and 2, to a lengthy detailed analysis, as suggested in Category 6. Different levels of analysis have been established for different categories of projects depending upon their size, scope, and impact upon the flood plain. Each of the categories is based upon certain assumptions. If these assumptions are not totally accurate, the level of analysis should be modified so that sufficient information is contained to support the conclusions and recommendations.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

20-7(4)

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

Jan 2006

A single highway improvement project may involve two or more of the categories listed below. When this occurs, it is necessary to include information in the Project Development Report (PDR) or environmental document to address each of the categories that may be involved. Each drainage structure on the proposed project must be addressed in the report and a determination made on the significance of any encroachments. If a given situation does not fit a category, these guidelines should be used as a basis for developing a reasonable approach to fit that situation.

The categories are the following:

Category 1. Projects that will not involve any work below the 100 year flood elevation. When the 100 year flood elevation is available from existing information without additional detailed analysis and it can be determined that certain projects (e.g., resurfacing, widening and resurfacing, bridge deck repairs) will not involve any work below the 100 year flood elevation, it should be sufficient to state in the PDR:

Although this project involves work within the horizontal limits of the 100 year flood plain, no work is being performed below the 100 year flood elevation and as a result this project does not encroach upon the base flood plain.

Category 2. Projects that do not involve the replacement or modification of any drainage structures. Projects in this Category must be on an existing alignment. They may involve a change in the profile grade elevation of a magnitude normally associated with resurfacing. If a profile change is proposed, an inspection of the flood plain is required to determine if an increase will result in a significant change in damage or risks. It is assumed that there are no known drainage problems within the limits of the project or that other factors were considered to override the need for concurrent drainage improvements. The following information should be included in the PDR:

This project will not involve the replacement or modification of any existing drainage structures or the addition of any new drainage structures. As a result, this project will not affect flood heights or flood plain limits. This project will not result in any new, or increase the adverse effects of any existing, environmental impacts; it will not increase flood risks or damage; and it will not adversely affect existing emergency service or emergency evacuation routes; therefore, it has been determined that this encroachment is not significant.

BUREAU OF LOCAL ROADS & STREETS

Jan 2006

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

20-7(5)

Category 3. Projects involving modification to existing drainage structures. Projects within this Category will not involve the replacement of any existing drainage structures or the construction of any new drainage structures. It is intended to apply only to those projects that modify existing structures (e.g., extending crossroad culverts, adding headwalls, extending existing bridge piers). Some projects involving modifications of existing drainage structures will affect flood heights and flood limits; however, these effects should be minimal. Some analysis may be necessary to support statements concerning the insignificance of the modifications. For example, if a number of culverts will be lengthened, a typical calculation addressing the worst-case situation should be included to demonstrate the magnitude of the expected changes in backwater elevations. In addition to calculations relative to changes in capacity of existing structures, an inspection of the flood plains should be made to determine if any expected increases in flood heights could result in a significant damage not expected under current conditions. An example of this might be an existing levee that will be overtopped by even a small increase in flood heights.

A statement similar to the following, together with a summary of appropriate analyses required to support conclusions therein, should be included in the PDR:

The modifications to drainage structures included in this project will result in an insignificant change in their capacity to carry floodwater. This change will cause a minimal increase in flood heights and flood limits. These minimal increases will not result in any significant adverse impacts on the natural and beneficial flood plain values; they will not result in any significant change in flood risks or damage; and they do not have significant potential for interruption or termination of emergency service or emergency evacuation routes; therefore, it has been determined that this encroachment is not significant.

Category 4. Projects involving replacement of existing drainage structures on existing alignment. This Category does not include those replacement projects that reduce the effective waterway opening from that which currently exists. In addition, there should be no record of drainage problems and no unresolved drainage complaints from residents in the area. The site should be inspected to determine if there are any existing conditions that would affect the usual design of the replacement structure. If these conditions are satisfied, a discussion similar to the following should be included in the PDR:

The proposed structure will have an effective waterway opening equal to or greater than the existing structure, and backwater surface elevations are not expected to increase. As a result, there will be no significant adverse impacts on natural and beneficial flood plain values; there will be no significant change in flood risks; and there will be no significant increase in potential for interruption or termination of emergency service or emergency evacuation routes; therefore, it has been determined that this encroachment is not significant.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

20-7(6)

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

Jan 2006

When downstream flood heights are affected, the area should be inspected to determine if the anticipated increase could result in a significant impact. If no significant impacts are expected, that information should be added to the discussion in Category 4. If significant impacts are expected, the project should follow the guidelines in Category 5.

Category 5: Projects on new alignment and projects with potentially significant increases in 100 year flood water surface elevations. Projects in this Category are expected to require a hydraulic analysis to determine pipe size or waterway opening. If other factors cause consideration of a significant change to the pipe size or waterway opening of an existing structure, an analysis will be necessary to determine the resultant change in flood heights upstream and downstream, when appropriate. In either case, the expected change in water surface elevations must be calculated to first determine the appropriate level of assessment and then to make the assessment.

If the hydraulic analysis results in a finding that flood water surface elevations will not change, the PDR should contain a discussion similar to that suggested in Category 3. If a new alignment is involved, it will be necessary to discuss whether or not it is likely to support incompatible flood plain development. If support is anticipated, alternatives to that support must be discussed. New alignments will also require a determination of whether the roadway will be overtopped more than once every 100 years. If yes, the frequency and its impact should be discussed in the PDR.

If the hydraulic analysis results in a finding that flood water surface elevations will increase either upstream or downstream, the area affected must be inspected to determine the potential for significant increases in flood impacts. The inspection should identify flood receptors that may experience significant adverse impacts as a result of the anticipated increase in flood heights. The impact on those receptors should be assessed and a summary of the types of receptors likely to be affected, and the degree of impact should be included in any PDR. Consultation with natural resource and flood plain management agencies should be initiated when necessary to adequately assess flood impacts. If significant adverse impacts are not predicted, the summary should be followed by a discussion similar to that suggested in the preceding paragraph and a determination that the encroachment is not significant.

If the assessment of impacts results in a prediction of significant adverse impacts on natural and beneficial flood plain values, significant increases in flood risks, or a significant increase in potential for interruption or termination of a transportation facility that is needed for emergency service or emergency evacuation routes, the encroachment should be considered significant and the guidelines in Category 6 followed.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

Jan 2006

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

20-7(7)

When new alignments are classified as longitudinal encroachments, they should be analyzed to determine the resultant increase in flood heights, if any. The impact of the increase should be assessed in accordance with the preceding two paragraphs. In addition, the PDR and accompanying environmental documentation should evaluate and discuss alternatives to the longitudinal encroachment on the flood plain.

Category 6: Significant Encroachments. Any proposed project that encroaches on a flood plain, either transversely or longitudinally, and which is predicted to result in a significant adverse impact on natural and beneficial flood plain values, a significant increase in flood risk, or a significant increase in potential for interruption or termination of emergency service or emergency evacuation routes, must be accompanied by a complete hydraulic analysis, a risk analysis, a flood plain study (Section 20-7.06(b)), and a flood plain finding (Section 20-7.06(c)). When it is determined that encroachments are significant, an EIS or EA must be prepared. When significant transverse encroachments are proposed, the accompanying reports must include consideration of alternatives that do not include such encroachments. No significant encroachment will be approved unless there is no practical alternative.

The hydraulic analysis must provide the following information that must be summarized in the PDR:

- a. For a 100-year flood frequency:
 - discharge,
 - backwater, and
 - water surface elevation before and after proposed project.
- b. For the design frequency (if other than 100 years):
 - frequency,
 - discharge,
 - backwater,
 - water surface elevation before and after proposed project, and
 - waterway opening.
- c. The frequency with which the highway is likely to be overtopped in 500 years or less. If over 500 years, it should be so stated. The location of the overtopping should be indicated.

The risk analysis should include an economic comparison of design alternatives using expected total costs (i.e., construction costs plus risk and damage costs) to determine the alternative with the least total expected cost to the public. The comparison includes probable flood-related costs during the service life of the facility for highway operation, maintenance, and repair; for highway-aggravated flood damage to other property; and for additional or interrupted highway travel.

HARD COPIES UNCONTROLLED

The flood plain study will require an inspection of the flood plain to determine the increase in the number of flood receptors and the increase in the damage to present flood receptors that will result from the expected increase in flood heights. Consultation with natural resource and flood plain management agencies should be initiated where necessary to adequately assess encroachments. Following the inspection and consultation, the flood plains subsection of the appropriate environmental report should be prepared.

When significant encroachments are under consideration, public involvement notices published in the news media must indicate that encroachments are being considered. Identify all encroachments during presentations at public hearings or meetings.

20-7.06(b) Design Risk Assessment

Justification or “support” is achieved through the design risk process. The degree of support is to be commensurate with the sensitivity of each site, and will range from conducting an economic analysis to simply describing the constraint(s) that justifies the design.

An economic analysis is a monetary exercise that determines whether a proposed hydraulic structure is cost-effective by demonstrating that an appropriate balance exists between the capital costs and the risk costs attributable to the encroachment. This method of support should be used to the extent that existing risk is quantifiable. Risk is defined as the consequences associated with the probability of flooding attributable to an encroachment. It includes the potential for property loss and hazard to life during the design life of the highway.

An economic analysis demonstrating the cost-effectiveness of a design should include consideration for both the design frequency and the 100 year frequency. In some cases, even a lower frequency occurrence may have significant risk costs.

There are many projects where the optimum design is controlled by obvious economic, environmental, or physical constraints. In these situations, a description of the constraint with a statement explaining how the constraint justifies the design will be sufficient support for the design risk assessment. Some examples of constraints include:

- rehabilitation of existing structure (including superstructure replacement, deck replacement or repairs, widenings, and culvert extensions);
- extensive development adjacent to the flood plain;
- reservoir and dam crossing;
- channel stability problems;
- supercritical flow;
- roadway overtopping;
- minimum opening that spans the channel;
- smallest standard bridge design that does not exceed acceptable backwater;
- major ice or debris problems;
- flood control projects;

BUREAU OF LOCAL ROADS & STREETS

Jan 2006

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

20-7(9)

- topography (e.g., deep ravine);
- geometrics (e.g., navigation clearances);
- foundation problems;
- multiple-use structure (e.g., combination stream and grade separation structure, cattle pass); and
- environmental commitments (e.g., threat to endangered species, encroachment on historic sites, parks, recreation areas, wildlife and waterfowl refuges).

20-7.06(c) Flood Plain Studies

Special technical studies assessing the effect of any encroachment and determining the practicability of alternatives to significant encroachments and longitudinal encroachments, when applicable should be undertaken for all projects. The following should be considered when preparing these studies:

1. NFIP Maps. Use National Flood Insurance Program (NFIP) maps, if available, and other information developed by IDOT and/or local, State, or Federal water resources and flood plain management agencies to determine whether a highway location alternative will include an encroachment.
2. EO 11988. The intent of Executive Order 11988 can be satisfied for many actions without documenting the exact flood plain limits. The required determination of encroachments can be accomplished without detailed study.
3. Alternatives. Flood plain studies include evaluation and discussion of the practicability of alternatives to any longitudinal encroachments or to any significant encroachments or any support of incompatible flood plain development.
4. Scope of Discussion. Flood plain studies include a discussion of the following items, commensurate with the significance of the risk or environmental impact, for all alternatives containing encroachments, and for those actions that would support base flood plain development:
 - the risks (e.g., flooding risk) associated with implementation of the action;
 - the impacts on natural and beneficial flood plain values;
 - the support of probable incompatible flood plain development;
 - the measures to minimize flood plain impacts associated with the action; and
 - the measures to restore and preserve the natural and beneficial flood plain values impacted by the action.
5. Documentation. Summarize the flood plain studies in the project's Environmental Impact Statement (EIS), Environmental Assessment (EA), or Project Development Report. No documentation is needed for a Group I Categorical Exclusion.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

20-7(10)

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

Jan 2006

20-7.06(d) Flood Plain Finding

A proposed action that includes a significant encroachment will not be approved unless the FHWA finds that the proposed significant encroachment is the only practical alternative. This finding is included in the recommendation for a FONSI or in a special subsection entitled "Only Practical Alternative Finding" within the Final EIS. This finding must be supported by the following information:

- a reference to Executive Order 11988 and 23 CFR 650, Subpart A;
- the reasons why the proposed action must be located in the flood plain;
- the alternatives considered and why they were not practical; and
- a statement indicating whether the action conforms to applicable State or local flood plain protection standards.

This finding must be included in the environmental report and forwarded to the appropriate State and local clearinghouses. The clearinghouse copies may be included in the appendix of the regular design stage contact.

20-7.06(e) Coordination

Local, State, and Federal water resources and flood plain management agencies, including the IDNR Office of Water Resources (OWR), should be consulted to determine if the proposed highway action is consistent with existing watershed and flood plain management programs, and to obtain current information on development and proposed actions in the affected watersheds.

20-8 WETLAND ANALYSES AND FINDINGS**20-8.01 Legal Authority**

Federal Executive Order 11990 applies special requirements for addressing the impacts of Federal projects on wetlands. Wetlands also are subject to regulation under the *Clean Water Act* (33 USC 1251-1376) as a part of the Section 404 permit process and the Section 401 Water Quality Certification requirements (33 CFR Parts 320 through 330). In addition, the Illinois *Interagency Wetland Policy Act of 1989* (20 ILCS 830) and the implementing rules for the Act (17 IAC 1090) address State policy for wetlands.

20-8.02 General

For Federal, State, and Motor Fuel Tax (MFT) funded projects and any locally funded project that requires IDOT review and approval, the submission of the Environmental Survey Request (ESR) will initiate the identification and delineation process for wetlands by BDE at no cost to the LPA. The results will be sent to the LPA upon completion of the delineation by BDE. After the wetlands have been delineated in the project vicinity, the LPA will be required to prepare the Wetland Impact Evaluation form in accordance with Section 20-8.05. The LPA also has the option of having the delineation performed by a consultant pre-qualified by the Department. In all cases, at the time of submission of the ESR, it should be noted on the ESR whether the LPA or BDE will be responsible for performing the delineation.

20-8.03 Definitions**20-8.03(a) Definitions**

The following definitions apply:

1. Adverse Impact. Any land management activity, construction, or related activity that directly or indirectly reduces the size of a wetland or impairs a wetland's functional value or impairs a wetland's functional value or the hydrologic characteristics of a wetland
2. Compensation Ratios. This refers to replacement area, quantified wetland functions, or dollar value when compared to the wetland area that is adversely impacted. The procedure for computing wetland compensation requirements is to multiply the appropriate wetland compensation ratio by the unit of compensation.
3. Floristic Quality Index. An index derived from floristic inventory data that is considered in determining mitigation ratios for wetland compensation, in accordance with the provisions of 17 Ill. Adm. Code 1090. The FQI is calculated and identified on the INHS wetland delineations. In general, an index score below 10 suggests a site of low natural quality; below 5, a highly disturbed site. An FQI value of 20 or more suggests that a site has evidence of native character and may be considered an environmental asset.
4. Hydrologic Unit. The drainage basin of a river or a stream as identified in Figure 20-8A
5. Mitigation Bank. A site where wetlands and/or natural habitats are restored, created, enhanced, or preserved, expressly for the purpose of providing compensatory mitigation in advance of authorized impacts to similar type resources.

BUREAU OF LOCAL ROADS & STREETS

20-8(2)

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

Jul 2013

6. National Wetlands Inventory. A mapping program administered by the US Fish and Wildlife Service (USFWS) for identifying the locations of wetlands and deepwater habitats. Quadrangle-based maps are available for Illinois that include Riverine (streams), Lacustrine (lakes), and Palustrine (wetland) systems.
7. Off-Site. A wetland compensation area located within the same Hydrologic Unit boundary, but more than 1 mile (1.6 kilometers) from the proposed project limits for which the wetland compensation is required.
8. On-Site. When a wetland compensation area is located within the same Hydrologic Unit boundary, as shown in Figure 20-8A, and within 1 mile (1.6 kilometer) of the proposed project limits for which the wetland compensation is required.
9. Out-of-Basin. When a wetland compensation area is located outside the Hydrologic Unit boundary that includes the site of the proposed project for which the wetland compensation is required.
10. Programmatic Review Actions. Programmatic review actions involve impacts to wetlands where construction is within the existing right-of-way or in new right-of-way that is contiguous to the existing right-of-way. For projects that qualify as programmatic review actions, project-specific coordination with IDNR for wetland compliance will generally not be required. In these cases, BDE will determine replacement ratios, approve any compensation plans, and coordinate with IDNR, as necessary. The LPA is responsible for maintaining complete files on all actions processed under this programmatic procedure. These files will be made available for audit upon request.
11. Replacement Area. The area of wetland compensation that is required. It is computed by multiplying the wetland area that is adversely impacted by the appropriate compensation ratio.
12. Significant Alteration. An adverse wetland impact that does not meet the criteria to be defined as a programmatic action and that causes either:
 - the alteration of pre-existing hydrology or soils of 0.5 acre (0.2 hectare) or less of a wetland for more than 12 months. This includes, but is not limited to, the placement of dredge or fill material into a wetland, the drainage of a wetland, filling in of a wetland through sedimentation, etc. or
 - the removal or loss of more than 0.5 acre (0.2 hectare) but less than 2 acres (0.8 hectare) of wetland vegetation but that does not alter the pre-existing hydrology of the wetland for a period of more than 12 months (a temporary impact).
13. Standard Review Action. Involves projects with unavoidable adverse wetlands impacts that do not qualify as programmatic review actions. Coordination will be required with IDNR on a project-by-project basis.
14. Value. A unit of measure (i.e., acres (hectares), wetland functions, or dollars) that is multiplied by the appropriate wetland compensation ratio to determine the amount of wetland compensation required.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

Jul 2013

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

20-8(3)

15. Wetlands. Those areas that are inundated or saturated by surface or groundwater at a frequency and duration to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. For purposes of the *Interagency Wetland Policy Act of 1989*, the term includes areas that are restored or created as the result of mitigation or planned construction projects and that function as a wetland even when all three wetland parameters (i.e., hydric soils, inundation or saturation by surface or groundwater, and prevalence of hydrophytic vegetation) are not present.
16. Wetlands Classification. A system for designating wetlands and deepwater habitats as to type, based on vegetation and other pertinent characteristics. The Cowardin classification of wetlands and deepwater habitats is used on the National Wetland Inventory maps. Sites depicted as palustrine on these maps may be jurisdictional wetlands. On-site wetland determinations are required to confirm the jurisdictional status of the site. Classes of palustrine wetlands include emergent, scrub-shrub, and forested.
17. Wetland Compensation Plan. A plan developed for each individual construction affecting wetlands that details how compensation will be provided for unavoidable adverse impacts.
18. Wetland Creation. The establishment of a wetland where a wetland does not currently exist.
19. Wetland Delineation. Determining the boundary of a wetland area. The determination is based on the presence of three criteria:
 - a prevalence of hydrophytic vegetation,
 - hydric soils, and
 - wetland hydrology.

To accurately delineate a wetland, a person must have the ability to identify vascular plants to the species level (plant taxonomy), be able to identify soil types, and have at least a general knowledge of wetland hydrology.
20. Wetland Impact Evaluation (WIE) Form. An IDOT form that must be completed and submitted to the district for processing when it is determined that a project would impact wetlands.

Drainage Basins for the Evaluation of Wetland Resources Displayed with County Boundaries and IDOT Districts

HYDROLOGIC UNITS – WETLAND ACTION PLAN

Figure 20-8A

20-8.04 Identification and Delineation of Wetlands

For Federally, State, and MFT funded and any locally funded project that requires Department review and approval, the submittal of the Environmental Survey Request (ESR) with the biological box checked will initiate the identification and delineation process for wetlands by BDE at no cost to the local agency. If BDE (in consultation with IDNR) determines wetlands are present within 250 feet from the project location, they will task the Illinois Natural History Survey (INHS) to perform the wetland delineations. After INHS completes the wetland delineations, they will prepare a report. If the information clearly indicates that no wetlands are present in or near the project vicinity, BDE will provide a sign-off indicating that further action under the wetland requirements will not be necessary, unless the scope or location of the project changes and it would potentially affect location beyond the area previously reviewed for wetlands. If the wetland report shows that any wetland sites have an adverse wetland impact by the project, the local agency will be required to prepare a Wetland Impact Evaluation (WIE) Form.

20-8.05 Wetland Impact Evaluation (WIE)

When preparing a WIE form, the local agency should consider the following, while giving due consideration to safety and appropriate design standards:

- First Priority. Avoid the adverse wetland impacts.
- Second Priority. Minimize the adverse wetland impacts.
- Third Priority. Compensate for unavoidable adverse wetland impacts.

The WIE form, which can be found on IDOT's website for environmental surveys, will document all information regarding any potential wetland impacts including alternatives for avoiding and minimizing adverse impacts. The WIE will include the following:

- Information either stating there will be no wetland sites impacted, or identifying the wetland site(s) impacted,
- A summary of why there are no practicable alternatives to the use of wetlands,
- The type of wetland mitigation being proposed (i.e. wetland bank, on-site),
- The wetland impacts and amount of mitigation required for each site. This includes the type of wetlands, the type of work and the acres of impact,
- Plan sheets clearly showing the impacts to the wetland site(s) must be included with the WIE form.

Submit the WIE and attached plan sheets electronically to the district. The district will forward the necessary documents to the Central BLRS for submittal to BDE. From the information contained in the WIE form, BDE will determine the amount of wetland compensation, generally based on the compensation ratios in Figure 20-8B.

BUREAU OF LOCAL ROADS & STREETS

Adverse Impact	On-Site	Off-Site	Out-of-Basin
Minimal Alteration	1.0:1*	1.5:1	2.0:1
	1.5:1**		
Significant Alteration	1.5:1	2.0:1	3.0:1
Destruction	2.5:1	4.0:1	5.5:1

* The 1.0:1 ratio applies to all other types of wetland vegetation, substrate, or wetland type except those wetlands that have woody vegetation.

** The 1.5:1 ratio applies if the vegetation of the adversely impacted wetland is woody.

WETLAND COMPENSATION RATIOS

Figure 20-8B

According to 17 Ill. Admin. Code 1090.50(c)(8), the compensation ratio used to determine the amount of wetland compensation required is always 5.5:1 if the adversely impacted wetland has one or more of the following situations present:

- the presence of a State or federally listed endangered and threatened species,
- the presence of essential habitat of a State or federally listed endangered and threatened species,
- the presence of an Illinois Natural Inventory (INAI) Site, maintained and updated by IDNR, and/or
- a wetland that is comprised of a plant community that receives a floristic quality native index score of 20 or more and/or a native mean coefficient of conservatism of 4.0 or greater using the procedure described in the publication *Plants of the Chicago Region*.

20-8.06 Wetland Compensation Plan Development

After the amount of anticipated unavoidable adverse impacts has been established for a project, the compensation process can begin.

The preferred mitigation for adverse wetland impacts of less than 0.1 acre (0.04 hectare) is wetland banking for compensation in a larger compensation site or sites with the approval of BDE only if the project is outside of wetland bank area. See Section 20-8.11 for wetland banking. If wetland banking is not practiced, BDE may allow wetland accumulations in certain cases.

For impacts equal to or greater than 0.1 acre (0.04 hectare), opportunities for on-site compensation may be considered. Options that are off-site, but in-basin, must be considered before out-of-basin alternatives are proposed if wetland banking is not proposed. The local agency is encouraged to purchase credits from an approved wetland mitigation bank rather than restoring or creating wetlands on or near the development site. A wetlands mitigation bank is a wetland area that has been restored, created, enhanced, or (in exceptional circumstances) preserved, which is then set aside to compensate for future conversions of wetlands for development activities. Use of wetland banks or other approved sources of pre-existing wetland credits may be proposed provided this sequencing requirement is satisfied.

A wetland compensation plan must be developed when some form of compensation is provided. Additional information can be found in the *BDE Manual*.

1. Pre-existing Wetland Credits. If all of the wetland compensation is from a wetland bank or an approved source of preexisting compensation credits, the Wetland Compensation Plan will contain the following information:
 - project name, number, location, and description,
 - name and address of responsible agency,
 - types, amounts, and locations of affected wetlands, including any drainage basins and watercourses involved,
 - description of alternatives that would provide avoidance or minimization of adverse impacts to the wetland and, as applicable, the reasons for their rejection,
 - reasons for proposing use of an approved wetland compensation account or other source of pre-existing wetland credits, and
 - description of applicable compensation ratios, the amount and type of compensation credit to be provided, and the source of the credits, including location, current balances, and any pending changes.
2. Restoration, Enhancement, and/or Creation of Wetlands. If compensation will be provided through wetlands restoration, enhancement, and/or creation, the local agency should take the lead in locating a suitable compensation site, giving appropriate consideration to the effect of the applicable compensation ratios on the amount of compensation needed.

After the local agency has identified one or more potential compensation sites, it should submit information concerning the sites to the district for an assessment of the suitability of the site by BDE. An agency or applicant may request approval to use existing public lands for wetland compensation projects. IDNR will have the final approval on the use of existing public lands for this purpose. Once a site has been determined to be suitable for compensation, a Compensation Plan will be prepared by the local agency.

20-8.07 Conceptual Compensation Plan for the Creation of Wetlands

The local agency will first develop a Conceptual Compensation Plan, if they propose to create a wetland. The conceptual plan should contain enough information to enable BDE and IDNR to concur in the proposed approach and the project's location prior to proceeding with its implementation. The Conceptual Plan includes:

- project name and number, location, and description,
- name and address of the responsible agency,
- summary statement and date of surveys,
- name, work address, email address, and phone numbers of persons conducting surveys,
- types and amounts of affected wetland, including drainage basins and watercourses involved,
- description of alternatives considered that would avoid or minimize the adverse impacts to the wetland and, as applicable, the reasons for their rejection,
- description of the precise location of the proposed wetland replacement site (including a map, legal description, the distance from the impacted wetland, current land use, current vegetation, biological, hydrological, and soil characteristics),
- description of the proposed wetland compensation, including a clear statement of goals,
- description of wetland to be created, restored, acquired, compensation ratios to be applied, any research funding proposed in lieu of a component of the total compensation and, if use of pre-existing wetland credits is proposed as a component of the total compensation, the source of the credits, including current balances and pending changes,
- general description of the work (e.g., grading, planting, alteration of hydrology) proposed to establish compensation sites, and
- the names of the entities to assume long-term responsibility for compensation sites to be established.

The project environmental documentation should summarize the Conceptual Compensation Plan as concurred by BDE and IDNR.

20-8.08 Compensation Design Plan for the Creation of Wetlands

Once approval is given for the Wetland Compensation Plan, the local agency will prepare a detailed construction plan reflecting the proposed work for the creation of a new wetland. The local agency will provide BDE the opportunity to review the preliminary plans. BDE will have 2 weeks to comment.

The Compensation Design Plan will include the following items:

- a detailed site plan that includes the plant materials and methods to establish those plant materials, proposed contours of the wetland and surrounding buffer to be established, source of water, anticipated hydro-period of the proposed wetland and any water control structures, the watershed draining into the proposed wetland, and the relationship of the site to surrounding land uses,
- the operation, management, and maintenance plan for the site, including procedures to restrict further adverse impacts to the site (e.g., the use of buffer areas, restricting future construction within the wetland compensation area),

- a monitoring plan that evaluates the success and/or failure of the wetland establishment effort, including the use of measures to correct identified deficiencies or problems, and
- the anticipated starting and ending dates of the wetland compensation plan.

Projects should not proceed to letting until the compensation plan has been approved. Approval of the compensation plan is valid for 2 years.

20-8.08(a) Compensation Plan Implementation

The following procedures apply:

1. Use of Pre-existing Wetland Credits. Once the compensation plan has been approved, the local agency should proceed with acquiring or accomplishing the necessary accounting for the application of credits on the project. The credits must be provided/secured before the associated adverse wetland impacts occur.
2. Wetlands Creation. During the construction phase of the wetland compensation areas, the local agency will notify BDE when grading is complete before landscaping and again once landscaping is complete. BDE is to be notified when the inspection of the plant material is scheduled so that they may be present. At the end of the construction phase, the local agency will provide BDE a copy of the grading and planting plans of record.

20-8.09 Monitoring of Wetland Compensation Area

Monitoring and reporting procedures for wetland compensation areas will be as stated in the Wetland Compensation Plan. If BDE is monitoring the wetland compensation area, BDE will write and process the annual wetland monitoring report and send a copy of the report to the local agency. If BDE is not monitoring the wetland compensation area, 2 copies of the annual wetland monitoring report must be sent to the district by the local agency for transmittal to BDE.

20-8.10 Transfer of Wetland Compensation Area

When a local agency can transfer management responsibility for wetland compensation area without impacting the project operation, a written request will be submitted through IDOT to IDNR for approval. The request will contain information identifying the proposed recipient of the lands and an outline of the terms of the transfer agreement.

20-8.11 Wetland Banking

The Department's preferred method of wetland compensation involves the use of pre-existing wetland credits from a commercial or Department-owned wetland mitigation bank site. This preference may be met when the project is within the service area of a bank site. Information on Department-owned wetland mitigation bank sites and service areas may be accessed at the Department's Environment webpage. The local agency will be required to purchase the credits from the wetland mitigation bank at either their own cost or as part of the project cost.

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

20-9(1)

20-9 THREATENED AND ENDANGERED SPECIES/NATURAL AREA IMPACT ASSESSMENTS

20-9.01 Introduction

In the development of a project, special studies and coordination are required when the action may affect Federally listed threatened or endangered species (T&E Species). This Section addresses the reporting and processing requirements for these actions. This applies to all Federal, State, and Motor Fuel Tax (MFT) funded projects and any locally funded project that requires IDOT review and approval.

20-9.02 Legal Authority

The *Federal Endangered Species Act* (50 CFR 402) is the legal authority that regulates or influences the policies and procedures for threatened and endangered species.

20-9.03 Policy

In the development of a project, an assessment shall be made on the likely impacts on species of plants or animals listed as threatened or endangered. Every effort will be made to minimize the likelihood of jeopardizing the continued existence of listed threatened or endangered species, or the destruction or adverse modification of a Natural Area, or an area of habitat that has been designated as a critical habitat or essential habitat. See Section 20-9.04 for the definition of critical and essential habitat.

20-9.04 Definitions

The following definitions apply:

1. Biological Assessment. Information on listed and proposed species and designated and proposed critical habitat that may be present in the action area and the evaluation of potential effects of the action on these species and habitat.
2. Biological Opinion. The document that states the opinion of the US Fish and Wildlife Service (USFWS) on whether or not an action is likely to jeopardize the continued existence of listed species or result in the destruction or adverse modification of critical habitat.
3. Critical Habitat. An area designated by the USFWS as critical habitat.
4. Destruction or Adverse Modification. A direct or indirect alteration that appreciably diminishes the value of critical habitat for both the survival and recovery of listed species. Alterations include, but are not limited to, alterations adversely modifying any of those physical or biological features that were the basis for determining the habitat to be critical.
5. Essential Habitat. The habitat necessary to prevent the depletion of a threatened and/or endangered species.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

20-9(2)

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

Jul 2013

6. Formal Consultation. A process between the USFWS and the Federal agency responsible for a proposed action that commences with the Federal agency's written request for consultation and concludes with the USFWS issuance of a biological opinion.
7. Jeopardize the Continued Existence. To engage in an action that reasonably would be expected, directly or indirectly, to reduce appreciably the likelihood of both the survival and recovery of a listed species in the wild by reducing the reproduction, numbers, or distribution of that species.
8. Listed Species. Any species of fish, wildlife, or plant that has been determined to be endangered or threatened pursuant to the *Federal Endangered Species Act*.
9. Proposed Species. Any species of fish, wildlife, or plant that is proposed to be listed under Section 4 of the *Federal Endangered Species Act*.

20-9.05 Federal T&E Species Requirements

20-9.05(a) Applicability

The preparation of a Biological Assessment is required for any Federally funded/regulated "major construction activity" where listed species or critical habitat may be present in the action area. A Biological Assessment also may be appropriate for other actions where listed species or critical habitat may be present and it is unclear whether they may be affected. If they may be affected, formal consultation is required.

20-9.05(b) Processing Procedures

As a part of the environmental survey and coordination process for a proposed undertaking, BDE will evaluate affected habitat in the action area and, as appropriate, will either:

- request from the USFWS information concerning any listed or proposed species, or designated or proposed critical habitat, that may be present in the action area; or
- provide the USFWS with written notification of species and critical habitat that has been determined, on the basis of surveys or available information, to be potentially present in the action area.

In response to the contact from BDE, the USFWS will:

- provide information regarding listed or proposed species or designated or proposed critical habitat that may be present in the action area, and a list of candidate species* that may be present in the action area;
- concur with or revise the information provided by BDE; or

* Candidate species refers to any species being considered by the USFWS for listing as endangered or threatened but not yet formally proposed or listed. Candidate species are accorded no protection under the *Endangered Species Act*. Notification concerning each species is intended to alert agencies of potential proposals or listings. These species should be identified in the environmental report for a proposed undertaking. Also, close contact should be maintained with BDE on the disposition of the candidate species during the environmental processing of a project.

BUREAU OF LOCAL ROADS & STREETS

Jul 2013

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

20-9(3)

- where a list is not provided, advise whether, based on the best scientific and commercial data available, any listed or proposed species or designated or proposed critical habitat may be present in the action area.

If, as a result of the coordination with the USFWS, a determination is made that no listed species or critical habitat may be present, a Biological Assessment is not required. In these cases, further consultation with the USFWS on listed species or critical habitat also is not required. If it is determined that only candidate species or proposed critical habitat may be present, a Biological Assessment is not required unless the proposed listing and/or designation become final before the action is completed.

If the coordination with the USFWS results in a determination that listed species or critical habitat may be present, a Biological Assessment should be prepared. Where candidate species or proposed critical habitat also may be present, they should be addressed in the Biological Assessment.

The *IDOT Ecological and Natural Resources Manual* provides additional information and procedures to assist in fulfilling the requirements herein.

See Section 26-9 of the *BDE Manual* for details concerning the preparation of a biological assessment.

20-9.05(c) Processing of the Biological Assessment

The Biological Assessment will be coordinated with the FHWA and transmitted by BDE to the USFWS for review. The USFWS will respond in writing within 30 days on whether it concurs with the findings of the Biological Assessment.

If the Biological Assessment indicates the action is not likely to jeopardize the continued existence of proposed species or result in the destruction or adverse modification of proposed critical habitat and USFWS concurs, a conference is not required. If it is determined that the action is likely to jeopardize the continued existence of proposed species or result in the destruction or modification of proposed critical habitat, a conference is required.

If the Biological Assessment indicates there are no listed species or critical habitat present that are likely to be adversely affected by the action and the USFWS concurs, formal consultation is not required. If listed species or critical habitat are present and it is determined they are likely to be adversely affected by the action, formal consultation is required.

If required, a written request will be made by BDE to the USFWS to initiate formal consultation.

Formal consultation will be directed toward further analysis of the species and/or critical habitat involved and alternatives to the proposed action. The purpose of these analyses is to allow the USFWS to develop its opinion concerning whether the action is likely to jeopardize the continued existence of listed species, or result in the destruction or adverse modification of critical habitat.

Formal consultation will be concluded within 90 days after its initiation unless a longer period is mutually agreed to. Within 45 days after concluding formal consultation, the USFWS will provide its Biological Opinion concluding that:

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

20-9(4)

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

Jul 2013

- the action is likely to jeopardize the continued existence of a listed species or result in the destruction or adverse modification of critical habitat (a “jeopardy” biological opinion); or
- the action is not likely to jeopardize the continued existence of a listed species or result in the destruction or adverse modification of critical habitat (a “no-jeopardy” biological opinion).

If a “jeopardy” biological opinion is issued, the USFWS must be notified of the final decision on the action (i.e., whether the action will be modified and, if so, how).

If the final decision on the action will involve a likelihood of jeopardizing the continued existence of a listed species or resulting in the destruction or adverse modification of critical habitat, the action may not proceed (under Federal approvals or with Federal funds) unless, and until, an exemption from the requirements of Section 7(a)(2) of the *Endangered Species Act* (which directs Federal agencies to “ensure” that their actions are not likely to “jeopardize” listed species or destroy or adversely modify critical habitat) is obtained.

20-9.06 State T&E Species Requirements

20-9.06(a) Applicability

The pre-screening procedures discussed in Section 20-9.06(b) are applicable to all projects requiring submittal of an Environmental Survey Request pursuant to the criteria in Section 20-2. The procedures in the remainder of this Section are applicable to all projects.

20-9.06(b) Review for State-listed Threatened and Endangered Species and Illinois Natural Areas Inventory Sites

For all projects meeting the applicability criteria in Section 20-2.01, BDE will determine if the projects may have an adverse effect on a state-listed T&E Species, or a site listed on the Illinois Natural Areas Inventory (INAI), which include Illinois Natural Area Inventory sites, dedicated Illinois Nature Preserves, and registered Land and Water Reserves. BDE may cause biological surveys to be conducted to assist in their determination of affect. BDE will develop measures to avoid, minimize or mitigate potential adverse effects to T&E species or INAI sites.

20-9.06(c) Consultation

BDE will submit to the IDNR Ecological Compliance Assessment Tool (EcoCAT) website a consultation requests for proposed actions that may have an adverse effect, that are adjacent to a Nature Preserve or Land and Water Reserve, or that entail excavation outside of an existing right-of-way and are within one mile of a Nature Preserve or Land and Water Reserve. The IDNR will review the EcoCAT reports within 30 days of receipt. After review, IDNR will either:

1. Terminate consultation because adverse affects are unlikely; or
2. Request additional information and /or request a biological survey.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

Jul 2013

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

20-9(5)

BDE will submit any measures to avoid, to minimize, or to mitigate potential adverse effect to T&E species or INAI sites to the IDNR for concurrence. The IDNR will review mitigation measures submitted by IDOT and coordinate with appropriate IDNR staff to determine whether further analysis or recommendations are required. Within 90 days of receipt of IDOT-proposed mitigation measures, IDNR will either:

1. Recommend additional measures to avoid or minimize adverse effects; or
2. Concur with proposed mitigation measures and terminate consultation.

Both IDOT and IDNR have 45 days to resolve any differences that may remain. If a resolution is not reached within this time, both agencies may agree to:

1. terminate consultation;
2. elevate the issue within each agency; or
3. continue negotiations.

20-9.06(d) Expiration

If the project involves other resource concerns requiring further review, BDE will re-screen the project against the Illinois Natural Heritage Database prior to any final action confirming satisfactory disposition of the other resource issues. The BDE review or the IDNR consultation is valid for 3 years from the initial date on the BDE review, date on the EcoCAT submittal or from the date of final confirmation from IDNR on resolution of other resource concerns, if applicable. Before a project is advertised for a bid letting, the BDE review must be renewed if more than 3 years have elapsed since the last update on the screen or the project scope has changed. If the 3-year time period has elapsed, the LPA should request to update the BDE review by sending a copy of the original BDE review with appropriate attachments (i.e. topographic and/or GIS maps) to the district. The district will process the request similar to the procedures of an Environmental Survey Request. A copy of the renewed BDE review will be sent to the LPA through the district. See Chapter 18 for further guidance on the general principles of coordination with IDNR.

20-9.07 Coordination of Federal/State Requirements

Where a species involved with an action is listed at both the Federal and State level, the Biological Assessment (Federal) and Detailed Action Report (State) prepared for the action will be processed concurrently with the USFWS and IDNR, as practical. Although processing may be concurrent and the results of consultation may be considered by either agency, the Federal and State requirements are independent; both must be satisfied when species are on both the Federal and State lists.

20-10 EVALUATIONS OF FARMLAND CONVERSION IMPACTS**20-10.01 Introduction**

In the development of a project, consideration must be given to the impacts that the action will cause in the conversion of farmland to non-farm uses. Under certain circumstances, coordination must be initiated with the US Department of Agriculture, Natural Resources Conservation Service (NRCS) and/or the Illinois Department of Agriculture (IDOA) to evaluate the impacts on farmland and obtain the views of those agencies on alternatives to the proposed action. This Section discusses the criteria and procedures for accomplishing the necessary coordination with NRCS and IDOA. Coordination is discussed in Section 10-1.08.

20-10.02 Legal Authority

The following legal authority regulates or influences the policies and procedures on farmland conversions:

- 7 USC 4201-4209, *Farmland Protection Policy Act of 1981* (Public Law 97-98).
- 7 CFR 658, Farmland Protection Policy.

See Appendix C of Part III “Environmental Procedures” of the *BDE Manual*, for more information.

20-10.03 Policy

In the development of a project, an evaluation is made of the action’s effects on conversion of farmland to non-farm use. Coordination between NRCS and/or IDOA, as appropriate, is necessary to obtain their views on any anticipated farmland conversion. This evaluation and coordination with NRCS and IDOA is accomplished in conformance with Federal and State statutes, regulations, Executive Orders, and IDOT agreements concerning farmland. Consideration is given to alternatives that could reduce adverse impacts to farmland. Proposed actions are developed to be compatible with State and local governments and private programs and policies to protect farmland.

20-10.04 Definitions

The following definitions apply:

BUREAU OF LOCAL ROADS & STREETS

20-10(2)

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

Jul 2013

1. Farmland. Prime or unique farmlands, as defined in Section 1540(c)(1) of the *Farmland Protection Policy Act*, or farmland that is determined by the appropriate State or unit of local government agency or agencies with concurrence of the Secretary of Agriculture to be farmland of Statewide or local importance. "Farmland" does not include land already in or committed to urban development or water storage. Farmland "already in" urban development or water storage includes all land with a density of 30 structures per 40 acre (16 per ha) area. Farmland already in urban development also includes lands identified as "urbanized area" (UA) on the Census Bureau Map, or as urban area mapped with a "tint overprint" on the USGS topographical maps, or as "urban-built-up" on the USDA Important Farmland Maps. Areas shown as white on the USDA Important Farmland maps are not "farmland" and, therefore, are not subject to the *Act*. Farmland "committed to urban development or water storage" includes all land that receives a combined score of 160 points or less from the land evaluation and site assessment criteria.
2. Site. The location that would be converted by the proposed action.

20-10.05 Federal Requirements

20-10.05(a) Applicability

A project that requires additional right-of-way outside any corporate limits must be coordinated with NRCS unless any one of the following applies:

1. There are no federal funds involved in the project.
2. None of the land to be acquired is prime farmland or farmland of Statewide or local importance.
3. The land to be acquired is in urban development (i.e., has a minimum current density of 30 structures (permanently affixed to the ground) per 40 acre (16 ha) tract).
4. The project is exclusively for widening and resurfacing and does not involve borrow areas, mitigation sites, or new alignment in which the right-of-way diverges from and is not contiguous to the existing right-of-way.
5. The project is nonlinear (e.g., bridge or intersection improvements) and requires acquisition of no more than 10 acres (4 ha) of land. This threshold applies to nonlinear projects other than new rest areas and new truck weigh stations. All new rest area and truck weigh station projects must be coordinated with NRCS, regardless of the amount of acquisition involved. When the areas of right-of-way for the project approach the 10 acre (4 ha) threshold for coordination and the project will likely involve additional acquisition for borrow or mitigation, the project should be coordinated with NRCS. Anticipated sites for borrow and mitigation should be indicated if known.
6. The project is linear; requires acquisition of no more than 3 acres of land per project mile (0.75 ha of land per project kilometer) (area of acquisition divided by project length), and does not involve alternative alignment(s) in which the right-of-way diverges from, and is not contiguous to, the existing right-of-way. When the amount of right-of-way to be acquired approaches the 3 acres per project mile (0.75 ha per project kilometer) threshold for coordination and the project will likely involve additional acquisition for borrow or mitigation, the project should be coordinated with NRCS. Anticipated sites for borrow and mitigation should be indicated if known.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

Jul 2013

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

20-10(3)

The categories of projects addressed by these items have been programmatically addressed in consultations with NRCS, and a general Form AD-1006 (see Section 20-10.05(c)) has been prepared for these actions. Further project-specific review by NRCS on these projects ordinarily will not be necessary. See Section 20-10.05(b) for further discussion of requirements for these types of actions.

If there is a question on whether any of the above conditions are met, contact the Central BLRS for a determination of applicability.

20-10.05(b) Procedures

The following will apply:

1. NRCS Coordination. For all projects requiring coordination with NRCS according to the criteria in Section 20-10.05(a), contact with NRCS should be made as early in the project development process as practical. The initial contact should be made with the State Office of the NRCS in Champaign. Form AD-1006 must be forwarded to the NRCS Office as part of the coordination process as soon as sufficient information is available. Coordination may be initiated prior to completion of the forms, as appropriate.
2. Minor Impacts. Where a project appears to be covered by Items 5 and 6 in Section 20-10.05(a), care should be taken to ensure that the project does not involve more than minor impacts on farmland and that there are no unusual circumstances that would make the criteria described inapplicable to the project. If more than minor impacts on farmland are involved or if unusual circumstances are present, coordination should be initiated with NRCS as discussed in Item 1 above.

If such impacts/circumstances are not involved, include documentation in the project file indicating the applicability of the criterion in Section 20-10.05(a) as the basis for not coordinating with NRCS. Also, include a copy of the general Form AD-1006 for these projects in the file. An appropriate paragraph similar to the following should be included in the Project Development Report or environmental report, as appropriate:

The impact of this project on farmland conversion has been evaluated in accordance with the requirements of the US Natural Resources Conservation Service (NRCS). The project will convert 3 acres or less of farmland per mile (0.75 ha or less of farmland per kilometer) and the conversion will not result in more than minor impacts. Accordingly, the project conforms to the general Form AD-1006 prepared by NRCS. Therefore, further coordination with NRCS on this project will not be necessary.

20-10.05(c) Form AD-1006

The following will apply:

1. The LPA should complete Parts I and III of Form AD-1006 and submit it to the State NRCS office when information is submitted to IDOA in accordance with State farmland protection requirements; see Section 10-1.08. NRCS will complete Parts II, IV, and V and will then send the Form to IDOA for completion of the Site Assessment portions of the Form. When completed, IDOA will return the form to the LPA.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

20-10(4)

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

Jul 2013

2. Form AD-1006 is the primary means of coordination with NRCS. It may, however, be supplemented with other information. It is recommended that a copy of the information sent to IDOA (see Section 20-10.06) be sent to NRCS with Form AD-1006. The additional information will help to expedite the review and minimize turnaround time. An informational copy of the completed AD-1006 form should be provided to IDOA when it is submitted to NRCS.
3. On new construction and reconstruction projects, early contacts with the local field offices and the Statewide office of NRCS are recommended. This will notify NRCS of the project and allow early comments while maximum flexibility still exists. Form AD-1006 may follow after the project development has determined the impacts. In this manner, substantive comments are discovered early and the potential for major changes in the later stages of project development will be reduced.

AD-1006 forms should not be sent to NRCS county field offices. AD-1006 forms for single and multi-county projects should be sent to the State NRCS office. See IDOT's website for the appropriate address.

20-10.05(d) Siting Requirements

Sites or alternatives with the highest combined scores, determined on Form AD-1006, should be regarded as most suitable for protection from conversion to non-farm use, and sites/alternatives with the lowest scores as least suitable for protection. Sites or alternatives receiving total scores of 175 or fewer points require only minimal consideration for protection from conversion, and no additional sites/alternatives need be evaluated. Sites or alternatives with scores of 176 to 225 points are in the moderate range for consideration of protection from conversion. At least one build alternative should be considered for these projects. Sites or alternatives receiving scores over 225 points should receive the highest priority for protection from conversion to non-farm uses. For these sites or alternatives, give consideration to other alternatives (e.g., rehabilitation of existing facilities, alignments that use lesser amounts of farmland).

The *Federal Farmland Protection Policy Act* (FPPA) regulations provide that:

If, after consideration of the adverse effects and suggested alternatives, the applicant wants to proceed with the conversion, the Federal agency may not, on the basis of the Act or these regulations, refuse to provide the requested assistance.

Therefore, alternatives that adversely affect agriculture may be recommended, but only after full consideration of adverse effects and less damaging alternatives. The coordination with NRCS will ensure the adequacy of that consideration. The results of coordination with NRCS should be summarized in the environmental report or Project Development Report for the action.

HARD COPIES UNCONTROLLED

20-10.05(e) Notification of Selected Alternative

NRCS requires that, when a Federally funded project has one or more alternatives that require acquisition of farmland subject to the FPPA and is not otherwise exempted from the requirement to submit Form AD-1006, the project agency should provide NRCS a copy of Form AD-1006 indicating the project alternative selected for implementation. Upon receiving design approval for projects, the LPA will inform the State NRCS office which alternative was selected for implementation. The LPA should use a copy of the previously coordinated Form AD-1006 for providing this notification. The LPA should complete the parts of the Form entitled "Site Selected" (enter appropriate site identification letter from the AD-1006) and "Date of Selection" (use design approval date) and should then send 1 copy to the State NRCS office. To aid NRCS in its record keeping, note on the top of the Form that it is a "Final Decision Notification."

20-10.06 State Requirements

The results of the evaluations of farmland conversion impacts, mitigation measures, and associated coordination with IDOA should be summarized in the project's environmental report or Project Development Report, as appropriate. The results of coordination with IDOA should also be summarized in the environmental report or Project Development Report for the action.

See Section 10-1.08 for detailed information on the State's requirements for the evaluations of farmland conversions.

20-10.07 Relationship of Federal and State Requirements

Requirements for coordination with the NRCS, although similar to those for the Illinois Department of Agriculture (IDOA), are separate and distinct. Coordination with IDOA does not preclude the need to coordinate with NRCS. Projects that require coordination with NRCS will normally also require coordination with IDOA.

20-11 AIR QUALITY CONFORMITY DOCUMENTATION**20-11.01 Background**

Section 176(c)(4) of the *Clean Air Act* Amendments of 1990 requires that transportation plans, programs, and projects that are funded or approved under Title 23 USC must conform to State or Federal air implementation plans. The implementation plans describe how air quality standards will be achieved. Conformity to an implementation plan is defined in the *Clean Air Act* as conformity to an implementation plan's purpose of eliminating or reducing the severity and number of violations of the national ambient air quality standards. Federal activities may not cause or contribute to new violations of air quality standards, exacerbate existing violations, or interfere with the timely reduction of emissions as reflected in the State implementation plan. The implementing regulations for determining conformity of transportation projects (40 CFR Part 93, "Criteria and Procedures for Determining Conformity to State or Federal Implementation Plans of Transportation Plans, Programs, and Projects Funded or Approved Under Title 23 USC or the *Federal Transit Act*") also impose requirements upon "regionally significant projects" in non-attainment areas regardless of whether those projects involve Federal funding or approvals.

Non-attainment areas are those areas of the country where air pollution levels persistently exceed the national ambient air quality standards.

"Regionally significant projects" means transportation projects (other than exempted projects) that are on facilities which serve regional transportation needs (e.g., access to and from the area outside of the region, major activity centers in the region, major planned developments such as new retail malls and sports complexes, transportation terminals), and would normally be included in the modeling of a metropolitan area's transportation network, including, at a minimum, all principal arterial highways and all fixed guideway transit facilities that offer an alternative to regional highway travel.

Illinois includes non-attainment areas in which standards are being exceeded for one or more of the air pollutants that the US Environmental Protection Agency (USEPA) has defined as "criteria pollutants" (e.g., Ozone (O₃), Carbon Monoxide (CO), Nitrogen Dioxide (NO₂)). The Illinois Environmental Protection Agency's (ILEPA) website (www.epa.state.il.us) has a complete list of non-attainment areas in Illinois under the Air Section.

20-11.02 Applicability

The following procedures are applicable to all highway projects funded or approved by the FHWA under Title 23 USC and to "regionally significant projects" in non-attainment areas, regardless of whether these projects are Federally funded or approved under Title 23.

20-11.03 Procedures**20-11.03(a) Determining Project Involvement with Designated Non-attainment Areas**

In the preparation of environmental documentation for projects subject to these procedures, districts should review the most recent information from the Central Office of Planning and Programming regarding those areas of Illinois that have been designated as non-attainment for one or more of the criteria pollutants. If the proposed improvement is partially or completely within a designated non-attainment area it will be subject to the conformity requirements unless the type of work involved is exempted; see Section 20-11.03(c). USEPA rules do not currently require conformity determinations for projects outside of non-attainment areas (i.e., within attainment areas).

20-11.03(b) Determining Project Exemption from Conformity Requirements

The USEPA conformity rules for transportation projects exempt the project types listed below from the requirement for a conformity determination. The determination of whether a particular action is exempt from the conformity requirement, in most cases, is made during the development of the Transportation Improvement Program (TIP) prior to the initiation of project planning. Note that a particular project of a type listed is not exempt if the Metropolitan Planning Organization (MPO), in consultation with other agencies, EPA, and the FHWA, concurs that it has potentially adverse emissions impacts for any reason.

20-11.03(c) Exempt Projects

The following describes the types of projects considered exempt from air quality conformity documentation:

1. Safety. The following safety projects are exempt:
 - railroad/highway crossing;
 - hazard elimination program;
 - safer non-Federal-aid system roads;
 - shoulder improvements;
 - increasing sight distance;
 - safety improvement program;
 - traffic control devices and operating assistance other than signalization projects;
 - railroad/highway crossing warning devices;
 - guardrails, median barriers, crash cushions;
 - pavement resurfacing and/or rehabilitation;
 - pavement marking demonstration;
 - emergency relief;
 - fencing;
 - skid treatments;
 - safety roadside rest areas;
 - adding medians;
 - truck-climbing lanes outside urbanized areas;

BUREAU OF LOCAL ROADS & STREETS

Nov 2007

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

20-11(3)

- lighting improvements;
 - widening narrow pavements or reconstructing bridges with no additional travel lanes; and
 - emergency truck pullovers.
2. Air Quality. Bicycle and pedestrian facility projects are exempt.
3. Other. The following are also considered exempt:
- specific activities that do not involve or lead directly to construction (e.g., planning and technical studies, Federal-aid systems revisions, planning activities conducted pursuant to 23 USC and 49 USC);
 - engineering to assess social, economic, and environmental effects of a proposed action or alternatives to that action;
 - noise attenuation;
 - advance land acquisitions (23 CFR Part 712 or 23 CFR Part 771);
 - acquisition of scenic easements;
 - plantings, landscaping, etc.;
 - sign removal;
 - directional and informational signs;
 - transportation enhancement activities (except rehabilitation and operation of historic transportation buildings, structures, or facilities); and/or
 - repair of damage caused by natural disasters, civil unrest, or terrorist acts, except projects involving substantial functional, locational, or capacity changes.
4. Regional Emissions Analyses. The following projects are exempt from regional emissions analyses:
- intersection channelization projects;
 - intersection signalization projects at individual intersections;
 - interchange reconfiguration projects;
 - changes in vertical and horizontal alignments; and
 - truck size and weight inspection stations;

20-11.03(d) Determining Highway Project Conformity

The project conforms with the requirements of the *Clean Air Act* if the district confirms that the following statements are applicable to the action:

- The project was included in a conforming transportation plan and TIP.
- The project design concept and scope have not changed significantly from what was reflected in the conformity analysis for the plan and TIP.
- The project will comply with PM₁₀ control measures in the State Implementation Plan. PM₁₀ refers to particular matter measured in the ambient air with an aerodynamic diameter less than or equal to a nominal 10 micrometers.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

20-11(4)

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

Nov 2007

Other criteria and procedures will apply for determining conformity of projects within CO or PM₁₀ non-attainment areas. Districts should contact the Central BLRS for further guidance regarding these projects as the need arises.

To determine conformity for projects in non-attainment areas or maintenance areas outside of locations served by Metropolitan Planning Organizations (MPOs), the district should contact the Central BLRS and the Central Office of Planning and Programming to initiate a regional emissions analysis.

Projects must be found to conform before they are adopted, accepted, approved, or funded. Conformity must be redetermined if none of the following major steps has occurred within 3 years of the conformity determination — NEPA process completion; start of final design; acquisition of a significant portion of the right-of-way; or approval of the plans, specifications, and estimates. A new conformity determination also will be required if there is a significant change in project design concept and scope or if a supplemental environmental document for air quality purposes is initiated.

For further information on Project Conformity, see Section 26-11 of the *BDE Manual*.

20-11.03(e) Documentation

The environmental documentation for all projects subject to these procedures must include a statement regarding the status of the project with regard to the *Clean Air Act* conformity regulations (i.e., indicating that the project is outside of any designated non-attainment area or maintenance area; that the project is of a type exempted from conformity requirements; or that the project has been determined to satisfy the conformity regulations). Section 26-11 of the *BDE Manual* provides example air quality conformity document statements for the following situations:

- projects outside of non-attainment areas or maintenance areas,
- exempt projects,
- projects within a portion of a non-attainment area or maintenance area for which the Chicago Area Transportation Study (CATS) is the MPO,
- projects within a non-attainment area or maintenance area served by a MPO other than CATS,
- projects within a non-attainment or maintenance area not served by a MPO, and
- “regionally significant” non-Federal projects within a non-attainment area or maintenance area.

20-11.04 Microscale Analysis

If the screening analysis indicates the project “fails” (i.e., that it has potential for contributing to a violation of the NAAQS for CO), or if the project does not fit the assumptions for use of the screening analysis, a detailed air quality analysis is required. The worst-case location and calculated 8 hour results of this analysis should be described, following the guidance in the *IDOT Air Quality Manual*. The latest USEPA Mobile model should be used for emissions factors. Comparison of these results to the National Ambient Air Quality Standards (NAAQS) for CO shall determine whether the project supports the maintenance of the CO NAAQS in Illinois. Analysis results below the 8 hour CO NAAQS (less than 9 ppm) will indicate no impacts present to the local atmospheric conditions that are necessary to protect the public health and welfare. Analysis results above the 8 hour CO NAAQS will indicate impacts present, which will require mitigation measures to be discussed with the FHWA, USEPA, and IEPA. Any mitigation measures should be described in the EA or EIS.

A determination must be made as to whether the highway project is located wholly or partially in a portion of the State classified by the USEPA as a non-attainment area or maintenance area for any of the six criteria pollutants (40 CFR Part 81). This determination should be made and documented in accordance with the procedures in Section 26-11 of the *BDE Manual*.

Version 2.0 of the Illinois Carbon Monoxide (CO) Screen for Intersection Modeling (COSIM) includes a pre-screen feature that replaces the 16,000 ADT criterion previously used for screening highway projects for CO microscale analysis purposes.

See BDE Procedure Memorandum 37-03 for more details on this type of analysis.

20-11.05 Construction Related Particular Matter

The following text should be added in the Air Quality section of the ECAD, EA, EIS, or Project Development Report:

Demolition and construction activities may result in short-term increases in fugitive dust and equipment-related particulate emissions in and around the project area. Equipment related particulate emissions may be minimized if the equipment is well maintained. The potential air quality impacts will be short-term, occurring only while demolition and construction work is in progress and local conditions are appropriate.

The potential for fugitive dust emissions typically is associated with building demolition, ground clearing, site preparation, grading, stockpiling of materials, on-site management of equipment, and transportation of materials. The potential is greatest during dry periods, periods of intense construction activity, and during high wind conditions.

BUREAU OF LOCAL ROADS & STREETS

20-11(6)

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

Nov 2007

The Department's Standard Specifications for Road and Bridge Construction include provisions on dust control. Under these provisions, dust and airborne dirt generated by construction activities will be controlled through dust control procedures or a specific dust control plan, when warranted. The contractor and the Department will meet to review the nature and extent of dust generating activities and will cooperatively develop specific types of dust control techniques appropriate to the specific situation. Techniques that may warrant consideration include measures such as minimizing track-out of soil onto nearby publicly traveled roads, reducing speed on unpaved roads, covering haul vehicles, and applying chemical dust suppressants or water to exposed surfaces, particularly those on which construction vehicles travel. With the application of appropriate measures to limit dust emissions during construction, this project will not cause any significant, short-term particulate matter air quality impacts.

See BDE Procedure Memorandum 42-04.

20-11.06 Mobile Source Air Toxics (MSATs)

The FHWA has developed a tiered approach for analyzing MSATs in NEPA documents. Depending on the specific project circumstances, FHWA has identified three levels of analysis:

- No analysis for projects with no potential for meaningful MSAT effects;
- Qualitative analysis for projects with low potential MSAT effects; or
- Quantitative analysis to differentiate alternatives for projects with higher potential MSAT effects.

Documentation of MSAT Evaluation will be included in the PDR, ECAD, EA, or EIS. MSAT level of documentation should be discussed at a coordination meeting and the meeting minutes should document FHWA's recommendation. Guidance is found in USDOT's *Interim Guidance on Air Toxic Analysis in NEPA Documents*.

20-11.06(a) MSAT Required Analysis

1. Exempt Projects or Projects with No Meaningful Potential MSAT Effects. The types of projects included in this category are:
 - Projects qualifying as a categorical exclusion under 23 CFR 771.117 (c). See BLRS Manual Section 19-1.04(b) for examples of actions that would typically qualify as Group I Actions listed in 23 CFR 771.117 (c);
 - Projects exempt under the Clean Air Act conformity rule under 40 CFR 93.126. See BLRS Manual Section 20-11.03(c)(1-3) for exempt project types; or
 - Other projects with no meaningful impacts on traffic volumes or vehicle mix

For project types qualifying as a categorical exclusion (Group I), under 23 CFR 771.117 (c), or for projects that are exempt under the Clean Air Act conformity rule under 40 CFR 93.126, include the following certifying paragraph in the Phase I Engineering Report:

HARD COPIES UNCONTROLLED

Mobile Source Air Toxics

This project is of a type qualifying as a categorical exclusion (Group I) under 23 CFR 771.117(c), or exempt under the Clean Air Act conformity rule under 40 CFR 93.116, and as such, a Mobile Source Air Toxics analysis is not required.

For project types with no meaningful impacts on traffic volumes or vehicle mix such as found in 23 CFR 771.117(d) (See BLRS Manual Section 19-1.04(c)), or 40 CFR 93.127 (See BLRS Manual Section 20-11.03(c)(4)), include the following text in the Phase I Engineering Report and associated Environmental Document:

Mobile Source Air Toxics

This project will not result in any meaningful changes in traffic volumes, vehicle mix, location of the existing facility, or any other factor that would cause an increase in emissions relative to the no-build alternative. As such, FHWA has determined that this project will generate minimal air quality impacts for Clean Air Act criteria pollutants and has not been linked with any special Mobile Source Air Toxic concerns. Consequently, this effort is exempt from analysis for MSATs.

Moreover, EPA regulations for vehicle engines and fuels will cause overall MSATs to decline significantly over the next 20 years. Even after accounting for a 64 percent increase in VMT, FHWA predicts MSATs will decline in the range of 57 to 87 percent, from 2000 to 2020, based on regulations now in effect, even with a projected 64 percent increase in VMT. This will both reduce the background level of MSATs as well as the possibility of even minor MSAT emissions from this project.

2. Projects with Low Potential MSAT Effects. The types of projects included in this category are those that serve to improve operations of highway, transit or freight without adding substantial new capacity or without creating a facility that is likely to meaningfully increase emissions. This category covers a broad range of projects.

Any projects not meeting the threshold criteria for higher potential effects set forth in subsection (3) below and not meeting the criteria above should be included in this category. Examples of these types of projects are minor widening projects and new interchanges, such as those that replace a signalized intersection on a surface street or where design year traffic is not projected to exceed the 140,000 AADT criterion.

For project types that have a low potential for MSAT effects, a qualitative assessment of emissions projections should be conducted. Four types of project documentation are offered in BDE Procedure Memorandum 52-06.

In addition to the qualitative assessment, the NEPA document for this category of projects must include a discussion of information that is incomplete or unavailable for a project specific assessment of MSAT impacts, in compliance with CEQ regulations 40 CFR 1502.22 (b). Recommended prototype language for this discussion is included in BDE Procedure Memorandum 52-06.

3. Projects with Low Potential MSAT Effects. This category includes projects that have the potential for meaningful differences among project alternatives. To fall into this category, projects must:

BUREAU OF LOCAL ROADS & STREETS

20-11(8)

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

Nov 2007

- Create or significantly alter a major intermodal freight facility that has the potential to concentrate high levels of diesel particulate matter in a single location; or
- Create new or add significant capacity to urban highways such as interstates, urban arterials, or urban collector-distributor routes with traffic volumes where the AADT is projected to exceed 140,000 by the design year; and,
- Be proposed to be located in proximity to populated areas or in rural areas, in proximity to concentrations of vulnerable populations (i.e., schools, nursing homes, hospitals).

Projects falling within this category should be more rigorously assessed for impacts. If a project falls into this category, the LPA should contact the District for assistance in developing a specific approach for assessing impacts.

20-11.06(b) MSAT Mitigation Strategies

Lessening the effects of mobile source air toxics should be considered for projects with substantial construction-related MSAT emissions that are likely to occur over an extended building period, and for post-construction scenarios where the NEPA analysis indicates potentially meaningful MSAT levels. Such mitigation efforts should be evaluated based on the circumstances associated with individual projects, and they may not be appropriate in all cases. However, there are a number of available mitigation strategies and solutions for countering the effects of MSAT emissions.

20-11.06(c) Mitigating for Construction MSAT Emissions

Construction activity may generate a temporary increase in MSAT emissions. Project-level assessments that render a decision to pursue construction emission mitigation will benefit from a number of technologies and operational practices that should help lower short-term MSATs. In addition, the SAFETEA-LU has emphasized a host of diesel retrofit technologies in the law's CMAQ provisions - technologies that are designed to lessen a number of MSATs.¹

Construction mitigation includes strategies that reduce engine activity or reduce emissions per unit of operating time. Operational agreements that reduce or redirect work or shift times to avoid community exposures can have positive benefits when sites are near vulnerable populations. For example, agreements that stress work activity outside normal hours of an adjacent school campus would be operations-oriented mitigation. Also on the construction emissions front, technological adjustments to equipment, such as off-road dump trucks and bulldozers, could be appropriate strategies. These technological fixes could include particulate matter traps, oxidation catalysts, and other devices that provide an after-treatment of exhaust emissions. The use of clean fuels, such as ultra-low sulfur diesel, also can be a very cost beneficial strategy.

The EPA has listed a number of approved diesel retrofit technologies; many of these can be deployed as emissions mitigation measures for equipment used in construction. This listing can be found at: www.epa.gov/otaq/retrofit/retroverifiedlist.htm

20-11.06(d) Post-Construction Mitigation for Projects with Potentially Significant MSAT Levels

Longer-term MSAT emissions can be more difficult to control, as variables such as daily traffic and vehicle mix are elusive. Operational strategies that focus on speed limit enforcement or traffic management policies may help reduce MSAT emissions even beyond the benefits of fleet turnover. Well traveled highways with high proportions of heavy-duty diesel truck activity may benefit from active Intelligent Transportation System programs, such as traffic management centers or incident management systems. Similarly, anti-idling strategies, such as truck-stop electrification can complement projects that focus on new or increased freight activity.

The initial decision to pursue MSAT emissions mitigation strategies should be in consultation with BDE's Air Quality Specialist.

20-12 SPECIAL WASTE PROCEDURES**20-12.01 Definitions**

1. Adjoining Property. Any real property or properties of which the border is contiguous with that of the subject property (project limits), or that would be contiguous with that of the property but for a street, road, or other public thoroughfare separating them.
2. Agriculture Property. Any real property for which the present or post-remediation use is growing agricultural crops for food or feed, either as harvested crops, cover crops, or as pasture. This definition includes but is not limited to, properties used for confinement or grazing of livestock or poultry and for forestry operations. Excluded from this definition are farm residences, farm outbuildings, and agrochemical facilities.
3. Conservation Property. Any real property for which the present or post-remediation use is primarily for wildlife habitat.
4. Excavation. For the purposes of this section, excavation is the digging or grading of any soil or fill material, including in-stream work and underground utility works such as installation of fiber optic cabling, with the exception of aggregate fills with are not considered a soil or fill material of concern. The following types of maintenance projects are not considered excavation when the excavated material is left on, or incorporated within, the IDOT or LPA ROW:
 - a. bridge maintenance
 - b. ditch cleaning
 - c. working within the sub-base or pavement
 - d. removal and replacement of shoulders, curb and gutter, or curb ramps
5. Industrial/Commercial Property. Any real property not meeting the definition of residential property, conservation property, or agriculture property. For the purposes of special waste screening, the term also includes real property used historically or previously for industrial, commercial, or retail purposes.
6. Leaking Underground Storage Tank (LUST). An underground storage tank where the contents have leaked into the environment.
7. Preliminary Environmental Site Assessment (PESA). A detailed evaluation of available records dealing with site history, including a field visit to the site to visually inspect and investigate conditions.
8. PESA Validation. The re-evaluation of the project area to check for the possibility of new reported releases and determine if land uses have changed within the project area. This process reflects the realization that special wastes and other regulated substance contamination often may be introduced (through illegal disposal, migration from off-site, or generation from new land uses) into areas previously evaluated for contamination. The re-evaluation should consider any changes in the proposed action, the affected environment, and anticipated special waste/regulated substance involvement.
9. Preliminary Site Investigation (PSI). A preliminary investigation of the site, including sampling, testing, and analysis of soil or groundwater, as necessary, and an estimate of the cost of cleanup by parcel, if possible, for the Department's project.

BUREAU OF LOCAL ROADS & STREETS

20-12(2)

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

Jul 2013

10. Project Monitoring Application (PMA). The electronic database used by BDE to manage Environmental Survey Requests (ESR). Each project in PMA is assigned a unique BDE sequence number and is also referenced to a construction job number and contract number when available. The database is accessible to designated IDOT Central Office personnel and district environmental personnel.
11. Recognized Environmental Condition (REC). The presence or likely presence of any regulated substances on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any regulated substances into structures on the property or into the ground, groundwater, or surface water of the property. The term includes regulated substances even under conditions in compliance with laws. The term is not intended to include de minimis conditions that generally do not present a material risk of harm to public health or the environment, and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.
12. Residential Property. Any real property used for habitation by individuals, or where children have the opportunity for exposure to contaminants through soil ingestion or inhalation at educational facilities, health care facilities, childcare facilities, or outdoor recreational areas.
13. Resource Conservation and Recovery Act (RCRA). This Act governs the management of hazardous wastes. The process for identifying a hazardous waste involves many steps. There is no single, comprehensive list of hazardous wastes that is regularly updated. To be considered a hazardous waste, a material first must be classified as a solid waste (40 CFR 261.2 "Definition of Solid Waste"). EPA defines solid waste as garbage, refuse, sludge, or other discarded material (including solids, semisolids, liquids and contained gaseous materials). If a waste is considered solid waste, it must then be evaluated to determine if it is a hazardous waste (40 CFR 262.11 "Hazardous Waste Determination"). EPA defines wastes as hazardous if they are specifically named on one of four lists of hazardous wastes included in Subpart D of 40 CFR 261 "Lists of Hazardous Wastes" (see 40 CFR 261.30 through 261.35) or if they exhibit any of the four characteristics discussed in Subpart C of 40 CFR 261 "Characteristics of Hazardous Waste" (see 40 CFR 261.20 through 261.24).
14. Site Reconnaissance. A visit to the project site and adjoining properties during which observations are made. The objective of site reconnaissance is to obtain information indicating the possible presence of environmental conditions within the minimum search distances listed in BDE Manual Chapter 27-3, Figure 27-3.B. Environmental conditions include situations that may negatively affect the property including the presence of, for example, illegal dumping, unknown containers and vessels, waste associated with 'crack' and methamphetamine houses (e.g., discarded hazardous material on the outside of a property), battery piles, paint spills, abandoned transformers, surface staining, and vegetative damage. This level of inspection generally does not require the investigator to enter onto a property and may be done from the existing ROW. During the site reconnaissance, observations are documented and photographic evidence is obtained to assist in completing the Environmental Survey Request (ESR).
15. Special Waste. Special waste means any of the following:
 - a. potentially infectious medical waste;

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

Jul 2013

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

20-12(3)

- b. hazardous waste, as determined in conformance with RCRA hazardous waste determination requirements set forth in 35 Ill. Admin. Code 722.111, including a residue from burning or processing hazardous waste in a boiler or industrial furnace unless the residue has been tested in accordance with 35 Ill. Admin. Code 726.212 and proven to be non-hazardous;
- c. industrial process waste or pollution control waste, except:
 - any such waste certified by its generator, pursuant to Section 22.48 of the Illinois Environmental Protection Act, not to be any of the following:
 - + a liquid, as determined using the paint filter test set forth in subdivision (3)(A) of subsection (m) of 35 Ill. Admin. Code 811.107;
 - + regulated asbestos-containing waste materials, as defined in 40 CFR 61.141, under the National Emission Standards for Hazardous Air Pollutants;
 - + polychlorinated biphenyls (PCBs) regulated pursuant to 40 CFR 761;
 - + an industrial process waste or pollution control waste subject to the waste analysis and recordkeeping requirements of 35 Ill. Admin. Code 728.107 under the land disposal restrictions of 35 Ill. Admin. Code 728; and
 - + a waste material generated by processing recyclable metals by shredding and required to be managed as a special waste under Section 22.29 of the Illinois Environmental Protection Act.
 - any empty portable device or container, including but not limited to a drum where a special waste has been stored, transported, treated, disposed of, or otherwise handled, provided that the generator has certified that the device or container is empty and does not contain a liquid, as determined using the paint filter test set forth in subdivision (3)(A) of subsection (m) of 35 Ill. Admin. Code 811.107. For purposes of this definition, "empty portable device or container" means a device or container where removal of special waste, except for a residue not to exceed one inch (25 mm) in thickness, has been accomplished by a practice commonly employed to remove materials of that type. An inner liner used to prevent contact between the special waste and the container shall be removed and managed as a special waste; or
 - as may otherwise be determined under Section 2.9 of the Illinois Environmental Protection Act.

Special waste does not mean fluorescent and high-intensity discharge lamps as defined in subsection (a) of Section 22.23a of the Illinois Environmental Protection Act, waste that is managed in accordance with the universal waste requirements set forth in Title 35 of the Illinois Administrative Code, Subtitle G, Chapter I, Subchapter c, Part 733, or waste that is subject to rules adopted pursuant to subsection (c)(2) of Section 22.23a of the Illinois Environmental Protection Act. (415 ILCS 5/3.475)

BUREAU OF LOCAL ROADS & STREETS

20-12(4)

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

Jul 2013

16. Special Waste Coordinator (SWC). The district IDOT person primarily responsible for screening projects for the possible presence of waste using the processes described in this chapter. The individual is additionally responsible for coordinating and preparing the Environmental Survey Request (ESR) for DOH projects and the state portion of local projects involving state right of way or when project plans are prepared by IDOT for the Local Public Agency (LPA). Screening of projects for special waste should be conducted by those with environmental experience and expertise, typically the District Environmental Coordinator.
17. Survey Target Date. The date established by the district by which the completed survey report (e.g., the PESA) is desired. This target date is used by BDE for internal scheduling purposes for all the requested environmental surveys and does not necessarily represent the completion date of the respective survey(s). The size, length, and complexity of the proposed project, along with seasonal field conditions and minimum timing required by policy, should be considered when establishing the date.
18. Underground Storage Tank (UST). Any single tank or combination of tanks (including underground pipes connected to the tank(s)) used to contain an accumulation of regulated substances, and that has 10% or more of its volume (including the volume of associated underground pipes) beneath the surface of the ground. The term does not include any of the following facilities or associated pipes:
 - a. farm or residential tank with a capacity of 1100 gallons or less, used for storing motor fuel for noncommercial purposes;
 - b. septic tank;
 - c. pipeline facility (including gathering lines) regulated under the Natural Gas Pipeline Safety Act of 1968 or the Hazardous Liquid Pipeline Safety Act of 1979 (both codified in 49 USC 60101, et seq.), or that is an intrastate pipeline facility regulated under State laws as provided in either of the aforementioned statutes, and that is determined by the Secretary of Energy to be connected to a pipeline or to be operated or intended to be capable of operating at pipeline pressure or as an integral part of a pipeline;
 - d. surface impoundment, pit, pond, or lagoon;
 - e. storm water or waste water collection system;
 - f. flow-through process tank;
 - g. liquid trap or associated gathering lines directly related to oil or gas production and gathering operations; or
 - h. storage tank situated in an underground area (e.g., basement, cellar, mine working, drift, shaft, tunnel) if the storage tank is situated upon or above the surface of the floor.

The term also means an underground storage tank used exclusively to store heating oil for consumptive use on the premises where stored and that serves other than a farm or residential unit (415 ILCS 5/57.2).

20-12.02 Applicability

These procedures apply to all LPA projects using Federal, State and MFT funded projects, or any LPA project affecting State property.

HARD COPIES UNCONTROLLED

20-12.02(a) Applicability for Special Waste Affecting State Property

Early in project development, the LPA must determine who will hold title to the acquired property, who will prepare plans, and who owns and manages the existing right-of-way. Specifically, if any portion of the local project involves any of the following situations, regardless of funding source, then the project is additionally subject to review by Chapter 27-3 (Special Waste Procedures) of the BDE Manual:

- Project plans are prepared by IDOT for a LPA;
- Title is held or will be held in the name of the State;
- Work involves acquiring temporary or permanent easements in the name of the State;
- Work (including excavation) affects State ROW or a road under state jurisdiction; or
- Work requires acquiring right-of-way in the name of the State.

In these cases, the LPA must contact the District BLRS who will communicate with the District Special Waste Coordinator (SWC) early in the planning process and co-coordinate the special waste review. Involvement of the Department in these types of projects acknowledges that BLRS and BDE must coordinate efforts in order to deliver timely and comprehensive environmental review.

20-12.03 Special Waste Screening

The LPA must screen all projects on the local highway system in order to determine whether they require further documentation for special waste contamination on sites otherwise potentially impacted by regulated substances. Follow the Special Waste Assessment (SWA) Screening Criteria shown on Figure 20-12A. The screening process applies criteria for determining a project's potential involvement with special waste and other regulated substances and leads to a determination whether or not further action is necessary.

The LPA must also determine when a project involves any of the bulleted items listed in Section 20-12.02(a) (Applicability for Special Waste Affecting State Property), and if so, these projects must also follow BDE Manual Chapter 27-3 and require co-ordination with the District SWC, as described below in more detail.

20-12.03(a) Special Waste Screening on State Property

For a project where the plans are prepared by IDOT on behalf of a LPA [bullet #1 in Section 20-12.02(a)], the entire project must follow BDE Chapter 27-3 procedures and IDOT will be responsible for the preparation of the PESA and a Preliminary Site Investigation (PSI), if necessary. For a project involving any one of the other bulleted items, the portion(s) of the project involving the State must follow BDE Chapter 27-3 procedures; the remaining portions of the project must follow BLRS Chapter 20 procedures. The coordination of these projects lies with the LPA and their District BLRS coordinator. The district SWC and BDE provide guidance to ensure that Chapter 27 is followed for the state-affected portion of the project.

Follow these steps when the project involves any one of the five bulleted situations in Section 20-12.02(a):

BUREAU OF LOCAL ROADS & STREETS

20-12(6)

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

Jul 2013

- Fully complete the ESR and check the Special Waste box.
- Clearly identify the portion(s) of the project where ISGS should complete the PESA for BDE; show this area on a figure, explain in text, and include with the ESR submittal.
- The District will alert the District (Highways) SWC who is responsible for ensuring that BDE Manual Chapter 27 is followed for the portion of the project affecting State jurisdiction.

The district BLRS will forward the special waste portion of the ESR to the district SWC for special waste screening according to BDE Manual Section 27-3.02. The PESA effort will be divided between BDE and LPA on a case-by-case basis by the District SWC and BDE using the information supplied with the ESR. In most cases, BDE will complete a PESA on the state road portion of the project, and the LPA/consultant will complete a PESA on the non-state road portion(s) of the project. If the project does not involve any of the five bulleted criteria in Section 20-12.02(a), do not check the special waste box or complete the special waste screen on the ESR.

The district SWC will ensure that the special waste box is checked on the Project Monitoring Application (PMA) and will review the state portion of the project using the information provided by the LPA. The SWC will ensure the LPA has provided the necessary information on the special waste screen on the ESR and place it in the Project Monitoring Application (PMA) for subsequent processing by BDE. For certain projects that meet Level I or Level II screening criteria, the district SWC may sign-off on the special waste and a PESA is not required. All other projects with the special waste box checked in the PMA will require a PESA.

BDE will send a request for a PESA to the Illinois State Geological Survey (ISGS). The target date for the completion of the PESA report is a minimum 6 months from the date ISGS is alerted of the PESA request. Upon receipt of the final PESA report, the district notifies the LPA of the findings and awaits a PESA Response. The district coordinates the PESA Response with the district SWC. If a PSI is necessary, BDE will contact the Statewide Special Waste Investigation Consultant and request a work plan and estimated budget for the PSI. See BDE Manual Section 27-3.05 (Preliminary Site Investigation) for the PSI procedures. In any case, a PSI by BDE will be conducted only on the state road portion of the project. The LPA/consultant is responsible for conducting a PSI on the non-state portion(s) of the project.

In summary, a local project involving any of the five bulleted criteria must follow BDE Chapter 27-3 for the portion of the project that involves State highway, or in the case when IDOT is preparing the plans for the LPA, the entire project must follow BDE Chapter 27. The State portion of the project must be coordinated with the district SWC and managed through PMA.

20-12.03(b) Special Waste Screening on non-State Property

Taking title (or lesser interest) to property containing special waste, or moving contaminated soil off-site, exposes the LPA to potential liability for associated investigation and cleanup costs. To limit liability, projects must be screened/assessed for special waste or other regulated substances as described in the following sections and as flowcharted in Figure 20-12A. Successfully following the screening process and appropriately documenting the results limit the LPA's potential environmental liability.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

Jul 2013

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

20-12(7)

1. General Screening Information. The LPA conducting the screening shall complete the applicable portion of the ESR form, sign and date the form, and send an electronic (or paper copy) of the signed and dated form to the District BLRS. The district shall ensure the form is retained in the project file and included in the environmental documentation for the project to support the finding that further investigations are not warranted.

For purposes of the screening process, the project and project area shall include the area encompassing the current right of way or easements (temporary or permanent) plus the outer most limits of the proposed right of way or easements. Furthermore, the minimum search distance when conducting the screening is measured from the outermost edges of the project area.
2. Level I Screening. The LPA shall screen projects to determine if special waste investigations are necessary. That is, the LPA may sign-off the project and not undertake further action to identify and assess special wastes or other regulated substance contamination if the project does not:
 - a. involve acquisition of additional right-of-way or easements (temporary or permanent);
 - b. cross or otherwise involve a railroad's right-of-way other than a single rail rural right-of-way with no maintenance facilities; or
 - c. involve excavation (see definition of excavation) or subsurface utility relocation.
3. Level II Screening. Projects that don't pass Level I screening due to situations 2a and 2c may be further screened by the LPA to determine if a PESA will be necessary or if the project is still eligible for a LPA sign-off. Projects that involve situation 2b are ineligible for LPA sign-off and must go through the PESA process.

To be eligible for LPA Level II sign-off, the following must be met:
 - there are no conditions or database occurrence within the minimum search distances shown in BDE Manual Chapter 27, Figure 27-3.B;
 - a site reconnaissance was conducted and no concerns were identified, and;
 - the ESR form was thoroughly completed and processed through CBLRS.
If application of the Level II screening leads to a determination that further action is required, a PESA will be necessary.

20-12.04 Preliminary Environmental Site Assessment (PESA)

The purpose of a PESA is to determine the environmental condition of a site prior to the acquisition of right-of-way, easements (temporary or permanent), or improvements to existing right-of-way or easements.

The LPA or a consultant will prepare a PESA using the processes described in *A Manual for Conducting Preliminary Environmental Site Assessments for Illinois Department of Transportation Infrastructure Projects, Second edition, January 2012.*

BUREAU OF LOCAL ROADS & STREETS

20-12(8)

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

Jul 2013

20-12.04(a) PESA Findings

The following procedures apply:

1. No "Recognized Environmental Condition" (REC) Finding. If the final PESA report indicates that the property(ies) investigated within the project limits have no RECs (other than de minimis), the LPA shall document this finding in the PDR or environmental document for the project. The documentation should include a copy of the final PESA report's risk finding. The LPA need not take any further action regarding property(ies) that do not contain any REC unless a re-evaluation for special wastes becomes necessary or a previously unidentified property is encountered. No further action is necessary regarding sites potentially impacted with regulated substances unless a reevaluation for special wastes become necessary under the Validation of Special Waste Assessment Results, see Section 20-12.07, or if a previously unidentified site is encountered. If another site is encountered, work affecting the site should immediately cease until the LPA has assessed the situation and determined an appropriate course of action.
2. "Recognized Environmental Condition" (REC) Finding. If the PESA results in a determination that the project has a REC(s), further investigation is required. For special waste or other sites potentially impacted with regulated substances, determine conditions for reducing the risk to an acceptable level through means of avoidance.
 - a. Avoidance of Contaminated Site Possible. If it is determined that the project can avoid the site containing the REC(s), indicate it in the environmental document or Project Development Report. Avoidance of the site may be a horizontal or vertical change in alignment so that the LPA does not acquire the contaminated site, or a part that is contaminated or impacts it during construction. No further action is necessary regarding sites potentially impacted with regulated substances unless a re-evaluation for special wastes becomes necessary under the Validation of Special Waste Assessment Results, see Section 20-12.08, or if a previously unidentified site is encountered during construction. If another site is encountered, work affecting the site should immediately cease until the LPA has assessed the situation and determined an appropriate course of action.
 - b. Avoidance of Contaminated Site Not Possible. If it is determined that the project cannot avoid the site containing the REC(s), prepare a Preliminary Site Investigation (PSI) with a consultant or LPA personnel. The PSI will determine the nature and extent of contamination (i.e., above or below the clean-up objectives).

20-12.05 Preliminary Site Investigation (PSI)

20-12.05(a) PSI Work Plan

Prior to initiating the PSI, the LPA or it's consultant will prepare a PSI Work Plan that presents the scope of work and cost estimate for the potential waste sites affected by the project. At a minimum, the Work Plan should include the following information:

- Introduction
 - REC site background (referenced from PESA)
- Scope of Work (field investigation, drilling and laboratory subcontractor)

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

Jul 2013

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

20-12(9)

- Health and safety
- General sampling approach
- Soil Sampling methodology
- Groundwater sampling methodology
- Sample handling, decontamination & investigation-derived waste
- Analytical methodology and procedures
- Geotechnical and analytical contractors
- Scope of Work (PSI Report)
- Project Organization, Schedule and Cost Estimate

The work plan should also include supporting tables and figures and appendices as necessary including excerpts and maps from the pertinent sections of the PESA.

20-12.05(b) PSI and Report

The purpose of the typical PSI is to assess environmental conditions within the existing and proposed right-of-way (ROW) or easements, to determine environmental impacts to soil and groundwater and/or sediment in the project area, and to evaluate how these impacts may affect proposed construction activities and/or land acquisition. The scope of the proposed investigation typically includes the following objectives:

- Determine the nature and extent of soil contamination within the ROW and at any proposed acquisition properties associated with the project area. If groundwater is encountered during the investigation, determine environmental impacts to the uppermost unit of groundwater.
- Based on the results of the soil and groundwater chemical analysis, prepare a site investigation report with finding, conclusions, and recommendations which include the remediation scope of work. The remediation scope of work should include an estimate of contaminated soil excavation quantities and an estimated cost for remediation. If groundwater is impacted and sufficient data on the extent and source of contamination are available, remedial alternatives will also be provided to implement cleanup. If necessary, a supplemental site characterization will be proposed to better determine the nature and extent of contamination.
- Evaluate the potential for contaminant migration to surrounding properties within the project area and present recommendations for reducing or eliminating such migration, if necessary, when the potential for migration is determined to be high.

The PSI report should include the following information:

- Introduction
- Site background
- Field investigation procedures and sampling rationale
- Field Investigation results
 - Analytical results
 - Comparison of analytical results t with regulatory standards
- Conclusions and recommendations

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

20-12(10)

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

Jul 2013

- Prevention of contaminant migration
- Comparison of concentrations to TACO
- References

The report should also include supporting tables and figures and appendices as necessary including PESA excerpts, boring logs, summary of analytical results, laboratory data packages, site photographs, and uncontaminated soil certification forms. The figures should show the areas impacted by special waste or regulated substances. The report should include cost estimates to excavate, transport, and dispose of the contaminated material, and a special provision for managing the contamination including pay items and quantities.

Send a copy of the PSI to the IEPA if a LUST or Site Remediation Program (SRP) site is investigated and results exceed Tiered Approach to Corrective Action Objectives (TACO) levels. Send a copy of the PSI to the Office of State Fire Marshall (OSFM) if the site investigated is on the UST list and exceed TACO levels.

20-12.06 Relationship of Special Waste Process Results to Design Approval

Categorical exclusion concurrence and design approval for Federally funded projects may be given upon request of the LPA when results of the special waste process support one of the following determinations:

1. Application of the SWA screening criteria resulted in a finding that the project has no potential for involving special waste sites or other sites impacted with regulated substances.
2. The PESA has resulted in a finding that the project has no RECs for involvement with special waste sites or other sites impacted with regulated substances.
3. The PESA has resulted in a finding that the project has REC(s) for involvement with special wastes sites or other sites impacted with regulated substances and the LPA has determined that it can avoid the site. The request for design approval must include in the environmental documentation or PDR the LPA's determination that the site can be avoided. The information regarding the avoidance determination must be included in the commitment file for the project to ensure follow-through in subsequent stages of project development and implementation.
4. The PESA resulted in a finding that the project has REC(s) for involvement with special waste sites or other sites impacted with regulated substances, and the LPA cannot avoid the site and:
 - the nature and extent of the involvement is known;
 - the cost of addressing the site is known, based on the results of the PSI or subsequent studies or assessments, as needed;
 - the LPA has determined that the above cost is acceptable; and
 - the areas of contamination will be managed and disposed of in accordance with all applicable State and Federal regulations.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

Jul 2013

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

20-12(11)

The request for design approval must include documentation of the LPA's determination that the cost and effort involved in addressing the site is acceptable. When the proposed project is on existing alignment or involves only a single alignment alternative, the LPA may request design approval prior to receiving the results of the PSI. Prior to initiation of the PSI, the LPA should re-screen the project to evaluate whether anything has changed in the project area that would affect the results of the PESA and should update the PESA as necessary. If design approval has been given and federal funds will be used to purchase ROW, the PSI and subsequent studies must be completed prior to the acquisition of any parcels that contains a REC(s).

If the identified contaminated area is located on property that is held or will be acquired in the name of the State or if contract plans will be prepared by IDOT, the LPA may submit a request to the district for design approval before the special waste procedures are completed provided that the special waste screen on the PMA shows the project is cleared for design approval. The district will coordinate the request with the district SWC. The waiver request will be submitted to the Central BLRS.

If the identified contaminated area is located on property that is held or will be acquired in the name of the LPA, the LPA may submit a request to the district for design approval before the special waste procedures are completed if one of the determinations stated above apply. The request will be given via a special waste waiver. The waiver request will be submitted to Central BLRS.

20-12.07 Relationship of Special Waste Process Results to Contract Letting

Anytime design approval is requested before a PSI has been completed a commitment stating that the PSI will be completed before the project is included on a letting must be included in the PDR or environmental document. The LPA will be required to complete the PSI, when applicable, and ensure all commitments in the Project Development Report, Design Report, or environmental document regarding the monitoring and management of regulated substances are included in the contract documents prior to letting. The LPA will provide the district with written notification that all required special waste studies has been completed.

20-12.08 Validity of Special Waste Assessment Results

If significant changes in land use, or more than 180 days and less than 3 years have elapsed since the last examination of a project for special waste/regulated substance contamination (i.e., LPA screening/sign-off or PESA), the LPA must validate the examination results before proceeding with arrangements for further special waste/regulated substance investigations before submitting the Project Development Report or environmental document for approval, if required, or before initiating land acquisition. The validation review should include a site reconnaissance and a check of the databases; see Section 20-12.08, for new reported releases and new land uses of potential concern. If changes are identified, a PESA should be conducted to evaluate the new reported release(s) and/or new potential land use concern(s).

BUREAU OF LOCAL ROADS & STREETS

20-12(12)

SPECIAL ENVIRONMENTAL STUDIES - Federal Funds

Jul 2013

If 3 years or more have elapsed since the last examination for special waste/regulated substance contamination, LPA screening and sign-off or completion of a PESA, the entire project should be re-evaluated as a new action, that is, a new PESA should be performed, prior to proceeding with arrangements for further special waste/regulated substance investigations, before submitting for approval, or before initiating land acquisition. If a project was initially screened and cleared by the LPA and no PESA was completed, the re-evaluation after 3 years may again consist of LPA screening using the Level 2 screening tool, and clearance provided no changes have occurred in the project area that would alter the findings upon which the original clearance was based.

If a PSI was conducted for a project and 5 years or more have elapsed since it was completed, the entire project should be evaluated for regulated substances as a new action and a new PESA must be conducted prior to proceeding with the aforementioned project actions. In any case, a valid PESA is required and must be current up until the time of project letting. Completion of a PSI does not negate the need for an up-to-date PESA.

When validation of the results of special waste/regulated substance evaluations is necessary, the review should consider any changes in the proposed action, the affected environment, anticipated special waste/regulated substance involvement, and proposed measures for addressing the special waste/regulated substance.

20-12.09 Resources

The Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) list can be found on the EPA website. The Environmental Protection Agency's current list of Leaking Underground Storage Tanks (LUST) can be found on the Illinois EPA website. The list of LUST sites is an unconfirmed list and should not be used as a final determination regarding whether releases have occurred at sites on the list. BDE Manual Chapter 27, Figure 27-3.B contains a listing of all the databases required for a Level II screening.

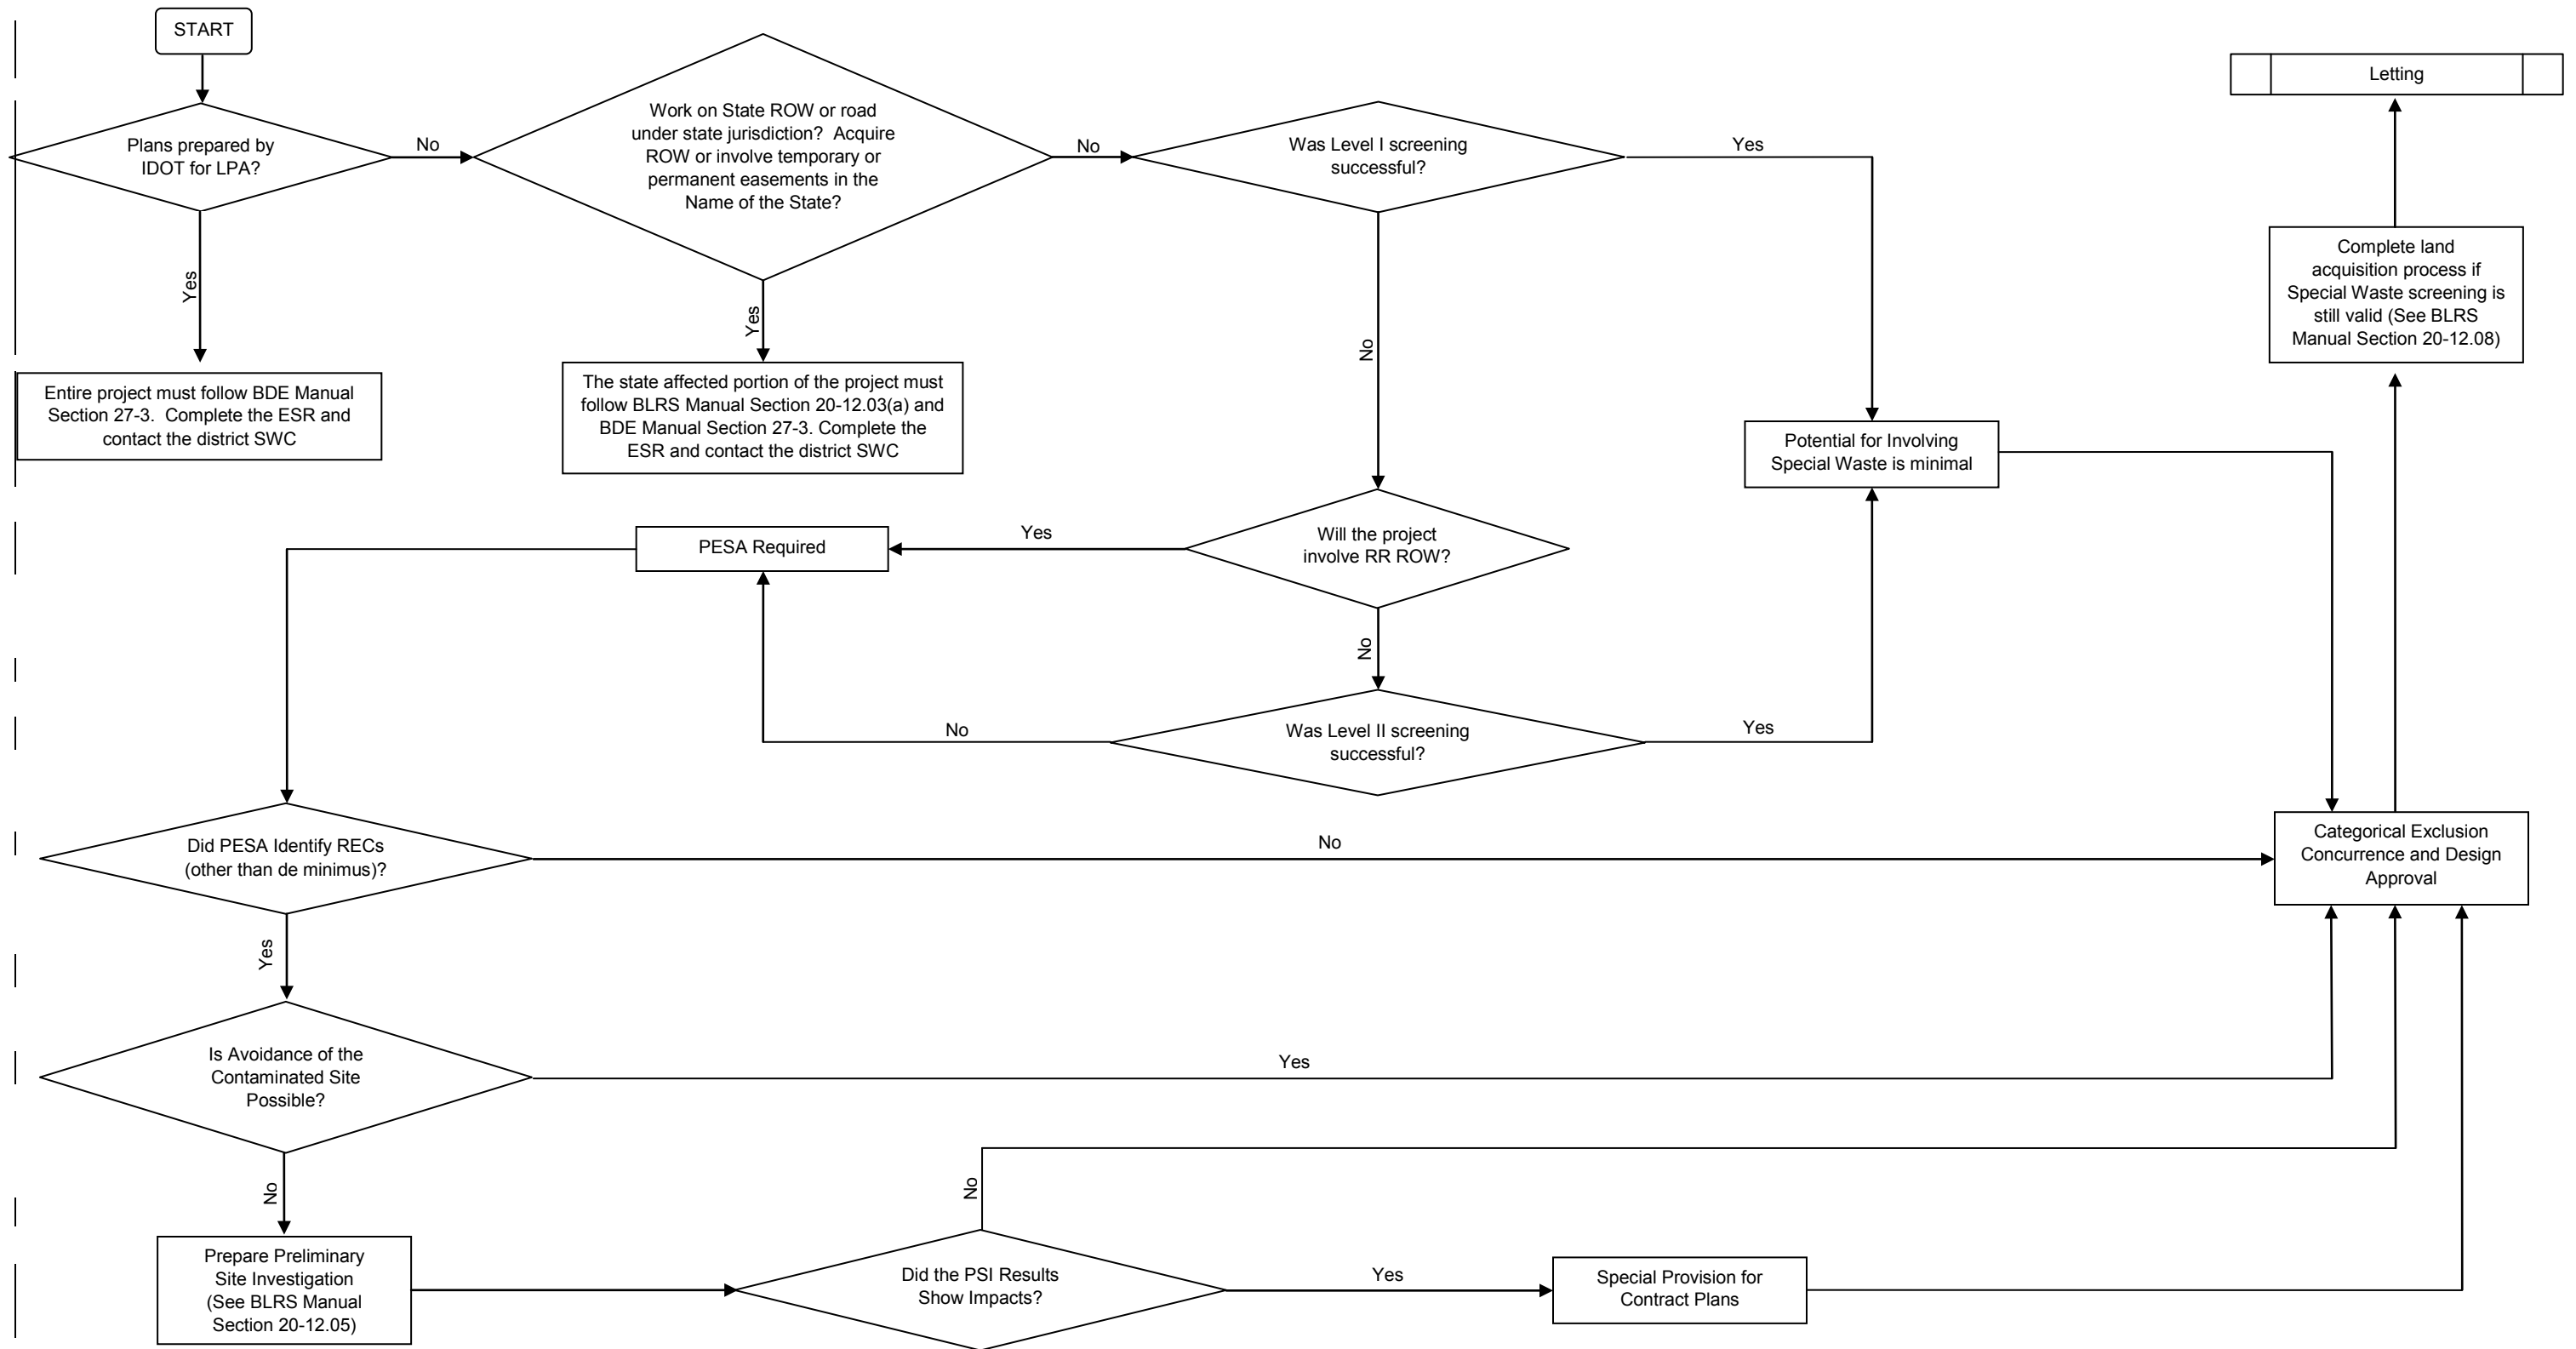

If a project involves a property on which the existence of an UST is suspected and does not appear on the list, contact the State Fire Marshal's office to check the most current registrations. The *Standard Specifications for Road and Bridge Construction* also contains guidance on proper procedures for UST removal.

Chapter 21

REQUIREMENTS FOR PUBLIC INVOLVEMENT PROGRAMS - Federal Funds

The information detailed in this chapter is the Illinois Department of Transportation's (IDOT) public involvement policies and procedures that are required for all projects processed through the Bureau of Local Roads and Streets (BLRS).

21-1 FEDERAL REQUIREMENTS FOR PUBLIC INVOLVEMENT PROGRAMS

Section 128 of Title 23 of the *United States Code (USC)* specifically requires:

- (a) Any State transportation department which submits plans for a Federal-aid highway project involving the by passing of or, going through any city, town, or village, either incorporated or unincorporated, shall certify to the Secretary that it has had public hearings, or has afforded the opportunity for such hearings, and has considered the economic and social effects of such a location, its impact on the environment, and its consistency with the goals and objectives of such urban planning as has been promulgated by the community.
- (b) When hearings have been held under subsection (a), the State transportation department shall submit a copy of the transcript of said hearings to the Secretary, together with the certification and report.

In accordance with the Federal Highway Administration (FHWA) Regulations on Environmental Impact and Related Procedures (23 CFR 771.111(h)1) and pursuant to 23 USC 128 and 139 and Council on Environmental Quality (CEQ) regulations, each State must have procedures approved by FHWA to carry out a public involvement/public hearing program.

These procedures must provide for:

1. coordination of public involvement activities and public hearings with the entire *National Environmental Policy Act (NEPA)* process;
2. early and continuing opportunities during project development for the public to be involved in the identification of social, economic, and environmental impacts as well as impacts associated with relocation of individuals, groups, or institutions;
3. one or more public hearings or the opportunity for hearing(s) to be held at a convenient time and place for any Federal-aid project that:
 - requires significant amounts of right-of-way (ROW);
 - substantially changes the layout or functions of connecting roadways, or of the facility being improved;
 - has a substantial adverse impact on abutting property;
 - otherwise has a significant social, economic, environmental, or other effect; or

BUREAU OF LOCAL ROADS & STREETS

21-1-2

PUBLIC INVOLVEMENT PROGRAMS - Federal Funds

April 2018

- FHWA determines that a public hearing is in the public interest.
4. reasonable notice to the public of either a public hearing or the opportunity for a public hearing. Such notice will indicate the availability of explanatory information and provide information that is required to comply with the public involvement requirements of other laws, executive orders, and regulations; and
 5. an explanation at the public hearing of the following information, as appropriate:
 - the project's purpose, need, and consistency with the goals and objectives of any local urban planning;
 - the project's alternatives and major design features;
 - the social, economic, environmental, and other impacts of the project;
 - the relocation assistance program and the ROW acquisition process; and
 - the State highway agency's procedures for receiving both oral and written statements from the public.
 6. Submission to the FHWA of a transcript of each public hearing and a certification that a required hearing or hearing opportunity was offered.
 7. An opportunity for public involvement in defining the purpose and need and the range of alternatives, for any action processed as an Environmental Impact Statement (EIS).
 8. Public notice and an opportunity for public review and comment on a Section 4(f) *de minimis* impact finding, in accordance with 49 U.S.C. 303(d).

HARD COPIES UNCONTROLLED

21-2 DEFINITION AND APPLICATION

The following Sections provide guidance on the application of public involvement programs. When there is a question as to whether a public hearing is required, a determination must be obtained from the Central BLRS (CBLRS) and FHWA. This is typically done at a district coordination meeting.

21-2.01 Public Involvement Process and the NEPA Process

FHWA regulations require coordination of public involvement activities with the entire *NEPA* process and early and continuing opportunities during the project development process for the public to be involved in identification of impacts. The intent of public involvement is to obtain input from and inform affected property owners, the traveling public and other interested parties about the project and its impacts to the environment. The public involvement process includes a range of activities from sending a letter to an impacted property owner to holding formal public hearings. Whenever comments are received from the public, the local public agency (LPA) is obligated to respond to the comments in an attempt to resolve any concerns about the project.

The application of the public involvement process is intended to be flexible so that it can be applied to any project from a simple bridge replacement to a new roadway on a new alignment.

Public involvement coordination is a continual process throughout the entire *NEPA* process and through the Phase 2 design stage of the project.

Proposed actions “that significantly affect the environment” will require preparation of an EIS (23 CFR 771.115(a)). Significance of impacts requires consideration of context (existing environment and setting) and intensity (severity and degree) (40 CFR 1508.27). Early coordination with BLRS and FHWA will be necessary to determine if an action will likely “significantly affect the environment” and require preparation of an EIS (see [Chapter 25](#) – Environmental Impact Statements and [Chapter 26](#) – Special Environment Analyses in the *Bureau of Design and Environment (BDE) Manual*).

21-2.02 Significant Right-of-Way (ROW)

When a project is planned for new location, it will involve a “significant” amount of ROW in the context of 23 CFR 771.111(h)(2)(iii) and may have considerable impact on the area in which it is located. For those projects that use the existing alignment with minor relocations or require additional strips of ROW, the district/LPA must consider several factors in determining whether acquisition is a significant amount. When it is determined to be a significant amount, a public hearing or an opportunity for a hearing must be held or given.

Factors that may determine whether there is a significant amount of ROW include the following:

- Quantity and location of land to be acquired;
- Number of property owners from which ROW will be acquired;
- Usage of the property to be acquired.

21-2.02(a) Quantity

The first factor to consider is the quantity of land to be acquired. The significance of the quantity will vary depending upon the character of the surrounding land. In rural areas, the acquisition of several acres (hectares) per mile (kilometer) for a project may be insignificant. In urbanized areas, acquisitions involving less than 1 acre (0.5 ha) might be significant if high-occupancy properties will be affected. Each location must be evaluated separately considering the density of population, types of properties, and the remaining open space available.

21-2.02(b) Number of Property Owners

The number of property owners involved can also be a factor in determining the significance of the ROW taking. The number of affected property owners does affect the type of public involvement activity to be held; however, there is no specific number of affected property owners above which a public hearing or opportunity for a hearing is required. At a minimum, the LPA must contact individual property owners from whom land will be acquired, during the project development stage. At some point, it is practical to hold one meeting rather than to separately contact all the property owners involved. Generally, separate contacts of 10 or more property owners are not as cost effective as offering a public hearing or holding an informational meeting.

21-2.02(c) Usage

The use of the property to be acquired can result in a significant amount of ROW even if the number of owners involved is small. Other effects that could be considered significant are acquisitions that will impact improvements that have been made on the property. A typical example is the taking of storage tanks or pumps from service stations at intersections. Although the property taking might be minimal, the impact on the business, and perhaps on the neighborhood, may be considered significant. Other situations might involve water supplies or power supplies feeding particular communities or neighborhoods, or small takings along a street, which might affect a neighborhood or community commercial area.

If a property proposed for acquisition is used as a recreational area or wildlife refuge, or if it is a historic property (see [Section 20-5](#)), it may be protected under Section 4(f) of the 1966 Department of Transportation Act (see [Section 20-3](#)). The public must be offered an opportunity to review and comment on impacts to Section 4(f) property when FHWA intends to issue a “de minimis” finding for a transportation use of a Section 4(f) property. This requirement can be satisfied in conjunction with other public involvement procedures for the project or through one or more activities specifically for that purpose (e.g., a public hearing, public meeting, or a newspaper notice seeking comments on the Section 4(f) resource impacts).

21-2.03 Changes in the Layout or Function

Projects that change the layout of a facility or the layout of the roads and streets that connect to it could have considerable impact upon abutting properties and users of the facility. Generally, changes in layout will involve the acquisition of additional ROW, and the LPA should consider the factors discussed in Section 21-2.01. Projects that cause adverse travel and that affect service to abutting properties, including change in access, usually result in considerable public interest, regardless of the amount of ROW acquired. The development of a public involvement program is warranted to address these impacts and, if substantial changes will occur, a public hearing is required.

BUREAU OF LOCAL ROADS & STREETS

April 2018

PUBLIC INVOLVEMENT PROGRAMS - Federal Funds

21-2-3

Changes in the function of a street or highway, especially when not accompanied by the acquisition of additional ROW, result in more subtle impacts to abutting property owners and other citizens. These impacts, whether real or perceived, may create considerable public interest in a highway project. The district and LPA should carefully consider this when planning a public involvement program or the possibility of a public hearing.

There are several changes which are sufficient to cause a change in the function of a facility or of connecting roads and streets. These changes do not necessarily require the acquisition of additional ROW, but rather alter the character of use (e.g., changing from local access to through traffic). The following is a list of typical actions that are considered changes in function:

- change in access to individual properties, such as addition of frontage road, right-in/right-out;
- change from two lanes to four or more lanes;
- change from no median or a flush median to a raised median;
- changing to a one-way couple that involves a street not previously carrying through traffic;
- converting a conventional intersection into a roundabout;
- road closures; and
- removal of marked on-street parking.

The reverse of these actions also constitutes a change in the function.

Changes in function can result in many impacts that may create considerable controversy or public interest. The following are typical impacts that may result from the changes in the function of a facility or its connecting roads and streets:

- changes in traffic volumes;
- changes in the type and character of traffic (e.g., volume of trucks, local or through traffic, low- or high-speed traffic);
- change in commercial or residential development affecting the neighborhood character;
- change in property use;
- change in pedestrian accessibility such as constructing new sidewalk, on existing ROW, where none currently exists;
- change in accessibility to abutting properties; and
- changes in travel patterns.

The following projects will not normally require the holding or offering of a public hearing because of 23 USC 128:

- upgrading an existing road or street to current design criteria for 20-year traffic including the acquisition of additional ROW, but not including additional through traffic lanes;
- intersection improvements including signals, radius returns, throat widening, adding turn lanes, and other channelization;

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

21-2-4

PUBLIC INVOLVEMENT PROGRAMS - Federal Funds

April 2018

- widening less than a one-lane width and resurfacing, with or without additional ROW;
- changing from open ditches to closed drainage; and/or
- projects in rural areas that do not pass through or bypass a city, town, or village.

21-2.04 Social, Economic, Environmental Effects and Relocations

See [Chapter 19](#) of the *BDE Manual* for guidance in determining if a public hearing is warranted based on social, economic, environmental effects and relocations caused by a project.

21-2.05 Environmental Impact Statements (EIS)

Public involvement activities for an EIS must comply with 23 USC 139. See Chapters [19](#) and [25](#) of the *BDE Manual* for additional information. If during project development, FHWA determines an action will “significantly affect the environment”; the preparation of an EIS will be required (23 CFR 771.115(a)). In the context of *NEPA* determining the “significance” of impacts requires consideration of context (existing environment and setting) and intensity (severity and degree) (40 CFR 1508.27). Early coordination with BLRS and FHWA will be necessary to determine if an action will likely “significantly affect the environment” and require preparation of an EIS.

21-2.06 NEPA Re-evaluations and Project Development Report (PDR) Addenda

If, after *NEPA* approval has been granted (Categorical Exclusion (CE), Finding of No Significant Impact (FONSI), or Record of Decision (ROD)), the LPA discovers new impacts to cultural or biological resources, changes the scope of work, or if additional ROW and/or easements are needed, the *NEPA* decision must be re-evaluated to determine if the CE, FONSI, or ROD is still valid. The LPA shall consult with the District and CBLRS prior to requesting any major approvals or grants to establish whether or not the approved environmental document or CE designation remains valid for the requested FHWA action. These consultations will be documented when determined necessary by the FHWA (see 23 CFR 771.129(c)). Additional public involvement activities may be required during the re-evaluation. The proposed changes to the scope of work, environmental impacts or additional ROW will determine if additional public involvement activities are required. The LPA shall coordinate with the District and CBLRS to determine the level of required public involvement activities and required environmental clearances. See [Section 22-2](#) for more information about PDR addenda.

21-2.07 General Public Interest

Those projects in which there is a high public interest or controversy must be discussed at a district coordination meeting. The appropriate public involvement activities will be determined in consultation with the CBLRS and the FHWA. Public interest in a project, especially public controversy, may be sufficient enough to warrant a public hearing not otherwise warranted under Sections 21-2.01 through 21-2.06.

21-3 DESIGNING PUBLIC INVOLVEMENT PROGRAMS

An effective public involvement program can consolidate overall public support and contribute significantly to the timely completion of projects with the additional benefit of a positive attitude towards IDOT and the LPA. Providing advance notice and a public forum for the citizenry to receive information about a project and to comment where appropriate can avert much controversy or antagonism.

21-3.01 Types of Public Involvement Activities

The following are examples of public involvement activities that can be implemented during project development. LPAs should consider the context and intensity of the proposed action when selecting which activity, or combination of activities, are appropriate for each project.

- 1) Property Owner Notifications by letter – Notify all property owners that will have either temporary or permanent ROW acquired;
- 2) Individual property owner meetings – either the property owner requested meeting as a follow up to notification letter or LPA chooses to have a meeting;
- 3) Newspaper notice – *de minimis* Section 4(f), Section 106 marketing of historic bridges, and other required notices to the public;
- 4) Public Informational Meetings – substantial change in access (either temporary or permanent). Substantial amounts of ROW, substantial social, economic, and environmental impacts, substantial number of relocations of individuals, groups, or institutions; and/or
- 5) Public Hearing.
 - o Significant amounts of ROW (Section 21-2.02);
 - o Substantial changes to the layout or function (Section 21-2.03);
 - o Substantial adverse impact on abutting property (Section 21-2.02(c));
 - o Significant social, economic, environmental or other effect (Section 21-2.04); or
 - o FHWA determines that a public hearing is in the public interest (Section 21-2.07).

This *Manual* does not provide a fixed format or schedule of public involvement activities because a tailored approach is recommended to fit each project and achieve maximum effectiveness. The program may include any or all the above activities, or additional activities appropriate for a project. If a public hearing is deemed necessary, the LPA in consultation with FHWA and IDOT may determine when and in what format public hearings will be held.

There is sometimes a delay from the time public involvement activities have taken place to the time land acquisition or construction begins. When a project again becomes active, the project area should be reviewed to ensure that any new development or new property owners affected by the project are aware of the proposed improvement. It may be necessary to issue a press release or individually contact the new property owners. In some cases, an additional public involvement activity should be held.

21-3.02 Public Involvement Activities

If a project meets the public hearing criteria discussed in Sections 21-1 and 21-2, the LPA must include the holding or offering of at least one public hearing in the public involvement program. On all other Federal-aid projects several options for obtaining public involvement are available.

For those projects that involve additional ROW including the use of temporary easements, the LPA will have the following options available:

1. Property Owners Notification by Letter. This option is generally suitable when the project involves acquisition of minimal ROW from a small number of property owners (e.g., less than 10, depending on context). Under this option the LPA will contact each property owner from which ROW will be acquired and provide them with an opportunity to comment on the project. The LPA shall contact owners via certified mail with return receipt requested. For follow-up contacts, a representative of the LPA can make personal contact via telephone or on-site visits. All personal contacts are to be documented in a memorandum to the file. The letter should describe:

- the reason for the contact;
- policy on public involvement;
- property affected;
- scope of project;
- reason the ROW is needed;
- scheduling of the project;
- how to comment;
- options for commenting;
- where to get more information; and
- acquisition procedures.

See Figure 21-3A for a sample letter. The LPA should send two copies of the letter (i.e., one original and one copy), with an exhibit showing the property and proposed taking, by certified mail with a return receipt requested and a self-addressed stamped envelope for returning comments. Make a record of any comments from the property owner, whether contacted in person or by certified mail, and inform the owner of any actions taken to resolve any objections or suggested changes.

2. Individual Property Owner Meetings. These types of meetings are appropriate when either a property owner has requested a meeting as a follow up to a notification letter or the LPA chooses to have the meeting.
3. Public Information Meeting. This option is generally suitable when the project involves acquisition of more than minor amounts of ROW, involves the taking of improvements on affected properties, or involves known controversy, organized opposition, or potentially "significant" impacts in the context of NEPA. Under this option, the LPA will schedule and hold an involvement activity open to the public and advertise in advance.
4. Public Hearing Offer. Depending on the scope of work and with consultation with CBLRS and the FHWA, the LPA may determine the level of public interest in a project by publishing a notice in the newspaper of an offer to hold a public hearing. When

BUREAU OF LOCAL ROADS & STREETS

April 2018

PUBLIC INVOLVEMENT PROGRAMS - Federal Funds

21-3-3

regulations require a public hearing, but other activities have apparently satisfied the need for public involvement, or when there is no apparent adverse impact or interest in a project, the regulations may be satisfied by publishing a notice in a newspaper offering an opportunity to request the LPA to hold a public hearing. The LPA should publish the notice of the offer at least twice, approximately one week apart in at least one newspaper of general circulation near the project. The deadline for requesting a public hearing must be at least 21 days after the notice announcing the offer first appears in a newspaper. When an offer for a public hearing has been published and the process completed, a letter must be sent to the FHWA certifying that the offer to hold a public hearing had been made and a resolution of any comments received. See Figure 21-4B for a sample letter that is to be sent to the FHWA.

5. Public Hearing. The decision to offer or hold a public hearing should be based on analyzing the factors in Sections 21-2.02 through 21-2.04. There could be circumstances when there is no public interest or no organized opposition, but the project still warrants a public hearing because there is “significant ROW”, or “changes in the layout or function” etc. required by the project.

On those projects which involve no additional ROW and for which no public involvement activity is planned, the LPA should determine what information will be released to the news media to inform the public of the project.

PUBLIC INVOLVEMENT PROGRAMS - Federal Funds

April 2018

[Project Identification]

[Date]

[Property Owner Identification]

Dear _____:

The purpose of this letter is to notify you that ***[LPA]*** is presently in the preliminary engineering phase of a study of the improvement of ***[identify project and termini]***. This project is tentatively scheduled for construction in ***[date]***.

It is the policy of the Illinois Department of Transportation (IDOT) and ***[LPA]*** to provide the public an opportunity to become acquainted with highway proposals of potential concern to them and to provide an opportunity for their input.

Based on a review of the tax record of ***[county name]*** County, you are identified as the owner of the property located ***[description]*** as shown on the attached ***[aerial photograph or drawing]***.

The proposed improvement generally consists of ***[project description]***. The proposed right-of-way that is to be acquired from your property for this improvement is indicated on the enclosed preliminary plan sheet. The right-of-way acquisition is needed to ***[give reason]***.

At the end of this letter is an area where you can indicate your comments, if any. You may also request further discussions with us, either via the telephone or a personal meeting. Please indicate the appropriate response and return one copy to us in the enclosed self-addressed envelope. If no response is received within 21 days, it will be construed as a "no comment" response.

Upon completion of our study, a report will be prepared describing the proposed work and submitted to IDOT for approval. After approval is received, we will proceed with the plan preparation and land acquisition phase. In that phase, a representative of ***[LPA]*** will contact you regarding any necessary acquisition.

Please note that your response or lack thereof will in no way influence the amount of compensation you will receive for your property if acquired as part of the project.

If you have any questions, please contact ***[LPA representative, email address, and phone number]***.

Very truly yours,

[LPA Representative]

21-3.03 Format Options of Public Meetings and Hearings

There are several primary differences between a public information meeting and a public hearing. A public hearing requires the following:

1. A formal presentation to the public;
2. The public is allowed to make comments to the project representatives in a public forum;
3. Comments during the public forum must be recorded by either a court reporter or by electronic means;
4. The hearing shall be held after all the environmental studies are complete and prior to the conclusion of the *NEPA* process (CE determination, FONSI, Final EIS/ROD).
 - a. The approved EA shall be available at the public hearing and for a minimum of 15 days in advance (see 23 CFR 771.119(e)).

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

21-3-6

PUBLIC INVOLVEMENT PROGRAMS - Federal Funds

April 2018

- b. The approved Draft EIS shall be available at the public hearing and for a minimum of 15 days in advance (see 23 CFR 771.123(h)).
5. Submission to FHWA a transcript of each public hearing, and a certification that a required hearing or hearing opportunity was offered, and copies of all written statements from the public that were submitted at the hearing and during an announced period after the hearing (23 CFR 771.111(h)(2)(vi)).

While it is a good practice to provide the above activities at a public information meeting, the above is not required for a public information meeting.

The following information shall be explained at a public informational meeting or a public hearing:

- the project's purpose, need, and consistency with the goals and objectives of any local planning;
- the project's alternatives, and major design features;
- the social, economic, environmental, and other impacts of the project;
- the relocation assistance program and the ROW acquisition process; and
- the procedures for receiving both oral and written statements from the public.

Public hearings/meetings may use several formats to provide information to the public and receiving public input. The LPA should select the format for an activity according to the situation. Many people prefer one-on-one contact, which does not require speaking before large groups. The following provides a description of the more common formats. Other formats are discussed in [Section 19-3](#) of the *BDE Manual*:

1. Open House Public Information Meeting. An open house public information meeting offers the public an opportunity to meet with LPA representatives at a time and place that is reasonably convenient to discuss a proposed project. Appropriate members of the LPA will be available to discuss the project with the public and answer questions. Informational meetings are informal public gatherings that can blend the individual discussions of an open house with the group interaction of public hearings. They may include an informal one-on-one discussion period characteristic of an open house, a formalized presentation, a group question-and-answer period and, if questions remain, another informal discussion period. A transcript of the meeting is not required, however; notes on the questions and answers are kept.
2. Formal Public Hearings. Formal public hearings are proceedings conducted by appropriate officials to inform the public of proposed projects or programs, to explain the alternatives under consideration, and to receive and document public input. This format generally has a speaker addressing a large audience. Members of the audience in turn have an opportunity to address the speaker in a public forum. Depending on the size of the audience, the program must be structured allowing for very little informal exchange of information. 23 CFR 771.111(h) requires that, if a public hearing is held, a transcript of the proceedings must be recorded and a certification that a required hearing or hearing opportunity was offered, and copies of all written statements from the public that were submitted at the hearing and during an announced period after the hearing. This transcript can be advantageous because it eliminates conjecture and interpretation. Recording the proceedings must be by a court reporter or electronic means. A variety of

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

April 2018

PUBLIC INVOLVEMENT PROGRAMS - Federal Funds

21-3-7

governmental agencies have extensively used the formal public hearing format, and the public is generally familiar with the process and the role expected of them.

3. Hybrid Open House Public Hearings. These meetings are like an open house public information meeting in set-up and format. The difference is that the hybrid open house public hearing includes a formalized presentation and an opportunity for members of the audience to express their comments and concerns in front of other members of the public, as required for a public hearing. A transcript of the meeting is recorded by a court reporter or electronic means and notes on the question and answers are kept. FHWA has recognized the benefits of this format and encourages its use as an effective public involvement method that meets the requirements of a public hearing .

HARD COPIES UNCONTROLLED

21-4 NOTIFYING THE PUBLIC

After the format of the public involvement program has been determined, the LPA must decide how to transmit information to the public, so it will be aware of the opportunities for involvement in project development.

The following Sections briefly discuss these topics. For a more detailed discussion, see the *BDE Manual*.

21-4.01 Announcements of Involvement Activities

Generally, activities to which the public is invited (e.g., open houses, information meetings, public hearings) should be advertised via the news media, mailing lists, websites, and other media as needed. Presentations to specific groups and other activities that the general public is not expected to attend do not require advanced advertising of the presentation.

21-4.01(a) Timing and Number

Each public hearing/meeting shall have a minimum of two newspaper advertisement / notices published as noted below. More than two notices may be published if a special effort is needed to ensure an adequate public response or if there is considerable public interest in the project. The first notice of a public hearing and for all other public involvement activities on a project being processed as a CE must be published at least 15 days in advance of the hearing/activity. In all cases, the second notice must be published 3 to 7 days before the meeting or hearing.

- For projects that are being processed as CEs, if a public hearing is required it should be held after environmental studies and the preliminary design have been completed, but before CE approval is given.
- An Environmental Assessment (EA) or Draft EIS must be approved and available for review a minimum of 15 days before the public hearing is held.
- The first notice of a public hearing on a project requiring an EIS must be published at least 30 days in advance of the hearing. The first notice of a public hearing on a project requiring an EA must be published at least 15 days in advance of the hearing/activity. In all cases, the second notice must be published 3 to 7 days before the activity.

21-4.01(b) Distribution

Before steps are taken to notify the public, the LPA must determine which groups or sectors will be contacted and what means, or media are most appropriate. When identifying groups to be notified, consider several general categories:

- those who live in the geographic area of the project and may be affected;
- groups who are known to be, or are likely to be, directly affected by property acquisition; and
- potential users of the facility.

Once the proper recipients of project information have been identified, the next action is to determine the most appropriate means of announcing the involvement activity to the public. It is not necessary to publish legal notices of upcoming activities. Paid advertisements in newspapers and on radio and television are acceptable and frequently more effective.

BUREAU OF LOCAL ROADS & STREETS

21-4-2

PUBLIC INVOLVEMENT PROGRAMS - Federal Funds

April 2018

However, where local news media are reluctant to carry these advertisements, a legal notice may be one means of ensuring verbatim publication and specific timing. It may also be necessary to advertise notices in more than one newspaper or on more than one radio or television (including cable) station to provide adequate coverage.

In areas where there may be limited newspaper delivery, notices should be posted at locations where the public are known to congregate or visit on a regular basis. These locations could include, but are not limited to, the local post office, restaurants, gasoline stations, or convenience stores. Every practicable effort should be made to ensure that the affected public receives notice and the opportunity for comment.

The use of social media such as LPA websites, Facebook or Twitter may augment an advertising campaign for the public involvement activity. However, it is not a substitute to the published notices.

21-4.01(c) Content

For an announcement in a newspaper to be effective, it must be strategically located and of sufficient size to attract attention. The announcement should state the type of activity, the purpose of the activity, and the time and location. It should state that all interested persons are invited to attend and participate and should also state that personnel will be present to receive input, provide information, and answer questions. The announcement should include a description of the proposed improvement. When individuals or businesses will be relocated, the notice must state that ROW acquisition and relocation assistance information will be available. It should further indicate the name, address, and telephone number of the person to contact to obtain additional information. As practical and economically feasible, a map should be included to further define the area affected by the project. Announcements also must contain information on accessibility for persons with a disability. Depending on the ethnicity of the area, the announcement may have to be printed in another language.

Figure 21-4A presents an example of an announcement for a public information meeting. Figure 21-4D presents an example of an announcement for a public hearing.

Public Information Meeting

Scheduled by

[LPA]For Improvement of **[Location]**

The **[LPA]** will hold a Public Information Meeting concerning the proposed improvement of **[project location]**. The public information meeting will be held at **[location]** on **[date]** at **[time]**. All persons interested in this project are invited to attend this meeting. Persons with disabilities planning to attend this meeting should contact the individual listed below by **[date]**. Persons with a disability desiring to participate in this activity should contact the person listed in this Notice by (date 5 days prior to meeting) to make arrangements for participating. The contact may be by telephone, in writing, by fax or by telecommunications device for the deaf (TTY).

This is a federally-funded project, and the public Information Meeting is being held in compliance with *National Environmental Policy Act (NEPA)* requirements and the Illinois Department of Transportation's public involvement policy.

[Add specific language as needed from Section 21-4.01(d)]

The meeting will be conducted on an informal basis. Representatives of **[LPA]** will be available from **[time]** until **[time]**. Representatives will answer individual questions and record comments offered by those in attendance. Verbatim comments will not be recorded. The LPA representatives will address topics such as the need for the project, the design alternatives under consideration, right-of-way acquisition and relocation assistance, and the tentative construction schedule. Preliminary reports, including environmental documents (*Environmental Impact Statement (EIS)* or *Environmental Assessment (EA)*, when applicable) and an engineering analysis with drawings, maps, and aerial photography, will be available for inspection and viewing during the entire time. The same material is currently available for review and inspection at **[location]**.

For more information, contact **[LPA representative, address, email address, and telephone number]**.

Springfield, Illinois 62703

Dear **[Name]**,

In accordance with 23 CFR 771(h)(2)(vi), **[LPA]** certifies that an offer to hold a public hearing was published on **[date]** and **[date]** in the **[Newspaper]**. Attached are the following items:

- a. Newspaper announcement;
- b. Newspaper publication certifications;
- c. Written comments received during the public comment period and our responses; or
- d. If no comments are received, the LPA shall state "No written comments were received during the public comment period."

Sincerely,

CERTIFICATION TO FHWA ON AN OFFER FOR A PUBLIC HEARING

Figure 21-4B

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

April 2018

PUBLIC INVOLVEMENT PROGRAMS - Federal Funds

21-4-5

The notice offering a public hearing should state that a public hearing will be held if sufficient interest is demonstrated. The LPA, in consultation with the district, CBLRS and the FHWA, will make the determination of sufficiency. If sufficient interest is not demonstrated, each requestor will be contacted by a LPA representative or by certified mail with return receipt and informed of the lack of sufficient interest. The LPA will also advise the requestor that comments are welcome. If a personal contact is made, record all comments during the contact. If the contact is by certified mail, include a stamped, self-addressed envelope for returning comments and the name and telephone number of a contact person.

Public hearing offers can be announced by use of paid advertisements in newspapers. Although not required, legal notices may also be used to ensure verbatim publication and specified timing. Publishing a legal notice often includes a certification that the notice was published on specific dates. Public hearing offers should normally contain the following information:

- proposal and project description;
- information concerning the availability of the PDR, EIS or EA;
- an invitation to the public to request a hearing;
- the name and address where requests should be sent;
- the date by which all requests must be received;
- an announcement that data is available for viewing and inspection including the name, address, and telephone number of the person to be contacted for arranging to view that information and to obtain other information desired; and
- as practical and economically feasible, a map showing the location of the improvement.

Figure 21-4C presents an example of a typical offer of a public hearing.

21-4.01(d) Additional Required Language for Public Meeting and Public Hearing Notices

The following language is to be included, as applicable, in notices announcing a public information meeting, a public hearing or an offer to hold a public hearing.

1. Section 106 Effect Finding & Determinations

This meeting will also serve to involve and obtain the views of the public for purposes of Section 106 of the National Historic Preservation Act of 1966, as amended. Information will be available on known historic resources that may be affected by the proposed project and the historic resources protection process. IDOT requests comments from the public on effects to historic resources to assist in consultation with the Illinois State Historic Preservation Officer.

2. PM2.5 Hot Spot Analysis

The [LPA] is currently proposing improvements from [project limits]. The project scope includes [describe scope]. On March 10, 2006, the US Environmental Protection Agency issued new regulations on Particulate Matter (PM2.5 and PM10) Hot-Spot Analysis in Project-Level Transportation Conformity Determinations. A Hot-Spot analysis is defined in 40 CFR 93.101 as an estimation of likely future localized PM2.5 or

HARD COPIES UNCONTROLLED

PM10 concentrations and a comparison of those concentrations to the relevant air quality standards.

The proposed project has been identified as a project of air quality concern requiring a Hot-Spot analysis as part of the project level conformity determination. [LPA] has completed a Hot-Spot analysis for the proposed improvement that is available for public comment. The Hot-Spot analysis is available for review on [date] or at [location]. A hard copy of this analysis can be obtained by contacting [LPA representative] at [address, email address, and telephone number]. Comments should be received no later than [date]. (Thirty days is recommended. For shorter time-periods consult BDE and FHWA.) Written correspondence related to this Hot-Spot analysis should be addressed to [LPA representative].

3. **Executive Order on Floodplains (EO 11988 as amended by EO 13690)**

The proposed project will require construction in a floodplain. Pursuant to EO 11988, as amended by EO 13690, public review and comment on this proposal and its alternatives are hereby requested.

4. **Section 4(f) de minimis Finding**

The [LPA] is seeking public comments on the effects that proposed improvements to [route] will have on the [Section 4(f) property name]. The [Section 4(f) property name], which is under the jurisdiction of the [Section 4(f) property owner], is a significant, publicly owned [describe land use of Section 4(f) property]. As such, it is subject to protection under Section 4(f) of the U.S. Department of Transportation Act of 1966. For the [route] project, [LPA] intends to seek a Section 4(f) "de minimis" impact finding from the Federal Highway Administration based on a determination that the project will not adversely affect the features, attributes, or activities that qualify the [Section 4(f) property name] for protection under Section 4(f).

Effects of the [route] project on the [Section 4(f) property name] will include [describe the project aspects that will affect the property and the nature and extent of the resulting effects]. Mitigation will include [describe proposed mitigation measures for the effects to the property]. Detailed documentation describing the impacts and mitigation associated with the effects of the [route] project on the [Section 4(f) property name] will be available for review at [location] from [date] to [date].

21-4.02 Mailing Lists

Each LPA should develop and maintain mailing lists for distributing information on highway projects. A general mailing list should include agencies, organizations, and appropriate individuals that are generally interested in being advised of all highway projects scheduled under the jurisdiction of a LPA. A project-specific list should include the general mailing list and any additional individuals or groups that are interested in specific highway projects. At the very least, a project specific mailing list should include all the affected property owners along the project limits.

Public Hearing Offer

The **[LPA]** is proposing to improve **[route]** from **[termini]** to **[termini]** in **[city]**. The project will consist of **[project scope of work]**. The project will include **[additional work needed to complete project]**. Alternatives under consideration have potentially significant impacts to **[sensitive site]**. A Project Development Report (or *an approved Environmental Assessment* or *an approved Draft Environment Impact Statement*) has been prepared for this project.

Any interested person who desires that a public hearing should be held for this project may request a hearing be held by contacting **[LPA representative]** at **[address, email address, and telephone number]**. To be considered, requests must be received by **[date]**. A hearing will be held if the public demonstrates sufficient interest.

This is a federally-funded project, and this hearing is being offered as part of the *National Environmental Policy Act (NEPA)* requirements and in accordance with the Illinois Department of Transportation's public involvement policy.

[Add additional language as necessary from Section 21-4.01(d)]

Maps, drawings, aerial photography, the Project Development Report (*or Environmental Assessment*) and project related information are available for viewing and inspection by the public are held by the **[LPA]** at the above address. If additional information is desired, contact the **[LPA representative]**.

PUBLIC HEARING OFFER EXAMPLE

Figure 21-4C

Public Hearing
Scheduled by
[LPA]
For Improvement of **[Location]**

[LPA] will hold a Public Hearing concerning the proposed improvement of **[project location]**. The public hearing will be held at **[location]** on **[date]** at **[time]**. All persons interested in this project are invited to attend this meeting. Persons with a disability desiring to participate in this activity should contact the person listed in this Notice by **[date]** (*five days prior to meeting*) to make arrangements for participating. The contact may be by telephone, in writing, by fax or by telecommunications device for the deaf (TTY).

This is a federally-funded project, and this public hearing is being held in compliance with the *National Environmental Policy Act (NEPA)* requirements and IDOT's public involvement policy.

[Add specific language as needed from Section 21-4.01(d)]

A brief presentation on the status of the project, the proposals under consideration, and any alternatives under consideration will begin at **[time]**. After the presentation, there will be an opportunity for comments or questions to be made in a public forum. Representatives of **[LPA]** will be available from **[time]** until the presentation and after the presentation until approximately **[time]** to discuss the project. Representatives will answer individual questions and record comments offered by those in attendance. Verbatim comments will be recorded. The presentation will address topics such as the need for the project, the design alternatives under consideration, right-of-way acquisition and relocation assistance, and the tentative construction schedule. Preliminary reports, including environmental documents (*Environmental Impact Statement (EIS)* or *Environmental Assessment (EA)*, when applicable) and an engineering analysis with drawings, maps, and aerial photography, will be available for inspection and viewing during the entire time. The same material is currently available for review and inspection at **[location]**.

For more information, contact **[LPA representative, address, email address, and telephone number]**.

PUBLIC HEARING ANNOUNCEMENT EXAMPLE

Figure 21-4D

21-5 PREPARING FOR AND CONDUCTING PUBLIC MEETINGS AND HEARINGS

The LPA must carefully prepare and develop public involvement activities not only to attract and hold the public's attention, but to create a pleasant atmosphere for discussion of highway projects.

This Section briefly discusses the process for planning an individual activity, whether it is an open house, an informational meeting, or a public hearing. See [Section 19-4](#) of the *BDE Manual* for a more detailed discussion on planning a public meeting.

21-5.01 Pre-Meeting Activities

While developing a public involvement program, the LPA generally will have gained some insights on the profile of the potential audience. The knowledge of which public sectors are most likely to attend, what they are likely to expect, and their likely positions may be helpful in selecting a format for the involvement activity that will be most effective.

After the meeting site has been selected and the timing of the activity has been set, an inspection of the site should be performed to ensure all the necessary equipment can be accommodated.

The LPA should ensure the site is ADA accessible; and if necessary, secure the appropriate language interpreters. If the LPA is holding a public hearing, secure a certified court reporter or electronic equipment to record verbatim comments. The site should also be accessible to those members of the public who rely on municipal transit systems for transportation.

21-5.02 Preparing the Meeting Site

When all personnel have reached the site, and set up the equipment, perform a final check to ensure all equipment, especially which is furnished at the site, is operational. Set up a table at each entrance. Assign personnel to each table to handle the registration and to direct attention to the available handout materials. Entrances used for the meeting should be properly signed. Place other signing determined necessary at the meeting location. Set up displays and orient them with the North arrow in the same direction on each. Ensure all the necessary steps are taken to facilitate the presentation information to all the attendees (e.g. non-English speaking persons and persons with disabilities).

21-5.03 The Presentation**21-5.03(a) General Requirements**

Public participation and attitudes may depend on how well the personnel conducting the activity understand and react to the public's viewpoints and reasons for participation. With the proper approach, both the public and the LPA can use the involvement activity to benefit its interests.

21-5.03(b) Content

Generally, the format of the presentation should be as follows:

- opening remarks;

BUREAU OF LOCAL ROADS & STREETS

21-5-2

PUBLIC INVOLVEMENT PROGRAMS - Federal Funds

April 2018

- introductions;
- presentation of project design;
- purpose and need, consistency with goals and objective of any local planning organization;
- alternatives, and major design features;
- social, economic, environmental, and other impacts;
- tentative project schedule;
- ROW acquisition;
- procedures for receiving both oral and written statements from the public; and
- formal comment period.

The selected approach may vary somewhat, and the exact nature of the data presented may vary from activity to activity depending upon the anticipated participants. The presentation should describe the project in appropriate detail. If the purpose of the meeting is to collect data, the description should briefly outline the work that is proposed and describe the type of information that is desired from the participants. If the project is further advanced and the participants are expected to offer information concerning the development of alternatives, the description should include a discussion of some of the work completed to date. If the involvement activity occurs when the project is in an advanced stage and the purpose is to provide information that will facilitate a choice among alternatives, provide more information to indicate the status of the improvement and the scope of the options or alternatives that remain.

21-5.04 Post Activity Follow-Up

Those who attend a public involvement activity are normally interested in the results of the input provided. This includes the follow-up to questions for which answers were not available at the time of the activity. The public may determine the success or failure of a public involvement activity based on the actions taken after the activity. Therefore, the follow-up is a critical action to minimize opposition and create a positive relationship with the public. The LPA must respond in writing to all written and recorded oral comments received at a public hearing or public information meeting or received as part of an individual property owner contact letter. If other forms of communications (i.e. field meetings, phone calls, emails) are used, the LPA should document the discussions with a memo to the file and be included in the PDR.

21-6 RECORDS AND REPORTS**21-6.01 Recording Public Comments**

The LPA must record all comments received on a given highway improvement and maintain these comments in the project file. Encourage all commenters to put their comments in writing and include their name and address. This relieves personnel from the responsibility of interpreting the meaning of the commenter's spoken word in recording their input. Consider providing a Comment Form that commenters may complete and return. Include on the form the date by which the form should be returned.

Not all comments must be recorded verbatim. There will not be a transcript of most informal involvement activities, and LPA representatives therefore must ensure that all non-written comments are properly noted and documented. The recorder of comments may use tape recorders or each representative may carry a note pad and record comments during his/her conversations with the public. Two-person teams may be formed – one to interact with the public and one to record comments. Take notes during the receipt of comments to ensure that none are overlooked. Attempt to obtain the name and address of those persons offering comments so a response can be provided later.

Record comments when they are received, whether or not they were received as a part of an involvement activity. For example, if an individual visits or calls the LPA and comments on a project, record that comment in the project files. All comments received must be addressed.

There is sometimes a delay from the time public involvement activities have taken place to the time land acquisition or construction begins. When a project again becomes active, the project area should be reviewed to ensure that any new development or new property owners affected by the project are aware of the proposed improvement. It may be necessary to issue a press release or individually contact the new property owners. In some cases, an additional public involvement activity should be held.

21-6.02 Transcripts

A transcript is required for all public hearings, regardless of the format used. Transcripts also may be useful for other meetings and activities, especially if critical discussion or input is anticipated. This might include meetings with organized opposition or officials of agencies likely to be impacted by the project. These transcripts can be obtained by transcribing the record from a tape recorder, or utilizing certified shorthand reporters or court reporters. In this manner, important meetings can be recorded exactly and there is no summary or interpretation to be questioned.

For formal and open house public hearings, the record of the transcript will include a copy of:

- the newspaper announcement,
- newspaper publication certifications,
- handout,
- the attendance list,
- all written comments received at and during the public comment period after the hearing,

BUREAU OF LOCAL ROADS & STREETS

21-6-2

PUBLIC INVOLVEMENT PROGRAMS - Federal Funds

April 2018

- a written copy of the narrative from the general presentation,
- a written copy of the verbal comments recorded by the official recorder, written responses to any comments received at the public hearing or during the public comment period after the hearing, and
- written responses to any verbal comments recorded by the official recorder.

The LPA shall submit to the district the following:

- a copy of the public hearing transcript;
- a certification letter that a public hearing was held (See Figure 21-5A for a sample letter); and
- copies of all written statements from the public (both submitted at the public hearing or during an announced period after the public hearing).

CBLRS will submit this information to FHWA.

[Title of LPA Official]

CERTIFICATION TO FHWA ON A PUBLIC HEARING

Figure 21-5A

HARD COPIES UNCONTROLLED

21-6.03 Documenting Public Comments and Responses

All comments must eventually become a part of the project files and summarized in the PDR, EA/FONSI, or Final EIS/ROD. If a public hearing was held, the transcript and certification must be provided to the FHWA. The transcript is required to be included for public hearings. For other public involvement activities, if a transcript is not available, prepare a summary of the substantive comments that have been received from the public and include this in the PDR, EA/FONSI, or Final EIS/ROD. In either case, the report should also contain a response to each of the comments included in the transcript. If a comment is addressed in the body of the report, it is not necessary to repeat that information in the responses. Instead, refer to the applicable pages of the report.

21-6.04 Responding to Public Comments

The LPA shall acknowledge in writing all written and oral comments received from the public, including individuals, private organizations, or government agencies.

The acknowledgment should thank them for their input and provide a response to their questions or comments. If an answer will not be available for some time, acknowledge receipt of the comment with an indication that a final response will be forwarded later. Verbal comments should also be acknowledged and responded to when the name and address of the commenter is available.

To reduce the workload of responding to comments after scheduled public involvement activities, forward copies of the summary of comments and responses with a letter thanking them for their participation, to all who attended the activity. Separate responses need not be prepared.

The LPA should also acknowledge and respond to comments received from other governmental agencies.

21-7 CONTEXT SENSITIVE SOLUTIONS (CSS)

CSS ([605 ILCS 5/4-219](#)) principles place emphasis on the importance of an effective stakeholder involvement process for identifying the transportation and community concerns and values that need to be considered on each project. CSS also highlights the need for appropriate flexibility in the application of design criteria to accommodate the development of innovative solutions that effectively respond to the identified concerns and values. If a LPA decides to use CSS, the procedures outlined in the *BDE Manual* should be used.

While CSS is a LPA option on most projects, the District may require a LPA to use CSS under the following criteria:

- A LPA project on a highway under department jurisdiction;
- a project initiated by the LPA to be completed by the department; or
- a project initiated by the department to be completed by the LPA.

21-8 ACRONYMS

This is a summary of the acronyms used within this chapter.

BDE	Bureau of Design and Environment
BLRS	Bureau of Local Roads and Streets
CBLRS	Central Bureau of Local Roads and Streets
CE	Categorical Exclusion
CEQ	Council on Environmental Quality
CFR	Code of Federal Regulations
CSS	Context Sensitive Solutions
EA	Environmental Assessment
EIS	Environmental Impact Statement
EO	Executive Order
FHWA	Federal Highway Administration
FONSI	Finding of No Significant Impact
IDOT	Illinois Department of Transportation
<i>ILCS</i>	<i>Illinois Compiled Statutes</i>
LPA	Local Public Agency
<i>NEPA</i>	<i>National Environmental Policy Act</i>
PDR	Project Development Report (Form BLR 22210)
PM	Particulate Matter
ROD	Record of Decision
ROW	Right-of-Way
TTY	Teletype (preferred) or a Telecommunications Device for the Deaf (TDD)
<i>USC</i>	<i>United States Code</i>

PROJECT DEVELOPMENT - Federal Funds

22-1 COORDINATION

22-1.01 Airports/Railroads/Utilities

22-1.01(a) Airport Coordination

Highway and bridge improvements within 2 miles (3.2 km) of publicly owned airports, within 1 mile (1.6 km) of privately owned airports open to the public, and within 0.5 miles (0.8 km) of restricted-landing areas require coordination with the Illinois Department of Transportation (IDOT) Bureau of Aeronautics in the Office of Intermodal Project Implementation. These coordination requirements concerning distance to an airport are in conjunction with height obstructions of 15 ft (4.6 m) or more above the roadway. Additionally, the local public agency (LPA) must coordinate with the Bureau of Aeronautics for all realignments and construction improvements on new location regardless of the height of obstruction. [Section 10-2.01\(e\)](#) further discusses coordination requirements near airports.

22-1.01(b) Railroad Coordination

When a project is involved with an at-grade railroad grade crossing or grade separation, coordination with the affected railroad should take place at an early stage to determine if any improvement is necessary to the railroad facility and to determine funding responsibilities for the improvement. When a railroad crossing is within or near the terminus of a project, the crossing shall be evaluated per [Chapter 40](#). Improvements determined from the evaluation to the railroad crossing will be scheduled to be completed prior to or at the same time as the project. [Section 10-2.01\(f\)](#) discusses coordination requirements with railroads.

22-1.01(c) Procedure for Joint State-LPA Railroad Improvements

Where IDOT will be responsible for letting a roadway project with a railroad crossing, the LPA must coordinate with the district during the project's initiation. The railroad crossing portion of the project generally should be programmed as separate project. These projects must be identified and included in the district's annual program when the original program is developed. Crossing projects will generally be authorized much earlier than the roadway project due to the time required for the railroad to process the agreement and for the railroad to perform the work in a timely manner. IDOT will be responsible for the following:

1. Districts. The district will conduct the following:
 - Identify the need for railroads to adjust or alter their facilities when preparing original program submissions.
 - Submit the railroad work as a separate project in the program submission. It may be necessary to program the railroad work in the year preceding the roadway project.

- As soon as the work is identified, prepare a railroad agreement and forward it to the railroad and the appropriate LPA with a copy to the Central Bureau of Local Roads and Streets (CBLRS). Correspondence with the railroad should indicate the proposed letting schedule. If questions occur during the preparation of the agreement, contact the CBLRS.
 - Submit a project status sheet requesting authorization of the railroad work.
 - Cross-reference the roadway and railroad projects in the data base so that both projects can be coordinated and tracked.
 - Obtain signed railroad agreements from the railroad and LPA along with a copy of a detailed estimates and general layout plan and forward them to the CBLRS for execution.
 - Upon execution of the agreement, the CBLRS will notify the railroad to proceed with the ordering of materials and scheduling of the work.
2. CBLRS. The CBLRS will conduct the following:
- Upon approval of the Project Development Report (PDR) for the roadway work, remind the district that the railroad work must be coordinated early.
 - Review each district's annual program to ensure all roadway projects with railroad involvement that the railroad portion is programmed as a separate project.
 - If not already prepared, request the district to prepare a railroad agreement.
 - Check the project status sheets to ensure all necessary railroad agreements have been executed and the programming and authorization have been accomplished. Projects involving railroad crossing work will not be advanced to letting without a fully executed railroad agreement.

Occasionally a signal/circuitry project may require a nearby crossing to also be upgraded. The district and Bureau of Program Development (BDE) will be responsible for coordinating the designs between the crossings.

Where an IDOT project will affect a local railroad crossing, the district should contact the CBLRS to determine if Grade Crossing Protection Funds (GCPF) may be eligible for the local crossing; see [Section 10-2.01\(f\)](#). Where a local project affects a State highway crossing, federal safety funds set aside for local improvements or GCPF may be eligible for work on the State highway crossing.

22-1.02 District Coordination Meetings

The district conducts periodic coordination meetings, which involve personnel from the CBLRS, BDE, Federal Highway Administration (FHWA), and may involve personnel from other bureaus or agencies, as appropriate. The goal is to coordinate planning; identify social, economic, and environmental impacts; minimize these impacts through mitigation; and develop the best overall solution to satisfy the transportation needs. FHWA will usually concur with the processing of projects as Categorical Exclusions. The coordination meetings may also result in field approvals of design exceptions and PDRs.

22-1.02(a) Scheduling Coordination Meetings

Coordination meetings are regularly scheduled on a monthly basis in District's One and Eight and bi-monthly in the other districts. BDE will develop an annual coordination meeting schedule in cooperation with the districts, CBLRS, and FHWA to eliminate meeting conflicts and to allow appropriate central office personnel to be available. Additionally, the district may schedule special coordination meetings on an as needed basis. The LPA should complete reports eligible for field approval prior to coordination meetings to minimize project delays and transmittals to the CBLRS. The LPA should contact the district to schedule a project for discussion at a coordination meeting. A tentative agenda should be distributed at least 2 weeks in advance of each coordination meeting along with the initial coordination meeting data sheet (form [BLR 22410](#)).

22-1.02(b) Appropriate Representation

The LPA and/or their consultant must be present at the coordination meeting. Ensure the individuals having a role in project development and decision making (e.g., BDE environmental specialists, district environmental, geometric, or land acquisition specialists) are invited to the meeting.

If projects will significantly affect other agencies or require special expertise or coordination, the district should invite all affected agencies to the coordination meeting. Discuss this need with the appropriate Project Development Engineer in the CBLRS. Highlight the projects and issues requiring the expertise of other agencies in the invitations and agendas. State agencies (e.g., Illinois Department of Natural Resources (IDNR), Illinois Historic Preservation Agency (IHPA), Illinois Department of Agriculture (IDOA), Illinois Environmental Protection Agency (IEPA)) and federal agencies (e.g., Department of the Interior, Army Corps of Engineers) may be involved.

22-1.02(c) Topics for Discussion

Coordination meetings should address all necessary topics such as logical termini, environmental reports, special reports, commitments, public involvement requirements, typical sections, need for additional rights-of-way, design exceptions, and the environmental processing. The scoping of environmental issues is an appropriate topic for coordination meetings. When other agencies are present, the coordination meeting may serve as the scoping meeting.

The LPA should complete form [BLR 22410](#) for each scheduled project and send it to the district. The district should transmit an agenda, with a completed form [BLR 22410](#) attached for each project, to the intended participants at least 2 weeks prior to the meeting. Include all necessary documentation with the agenda to support the desired action for specific projects.

22-1.02(d) Information Presented

The information presented at a coordination meeting usually depends on the following issues:

- the scope of the project,
- the project development stage, and
- coverage at previous coordination meetings.

A major project or a project on new alignment may involve many topics and presentations at numerous meetings over the duration of the study. If a minor project requires discussion, a brief presentation may be sufficient.

If a project has been discussed at a previous coordination meeting, information that has been previously presented and discussed need not be repeated. However, the meeting should include a brief summary of important points previously discussed and any decisions reached on each project. Attach copies of the minutes from previous coordination meetings to the agenda.

If design exceptions are requested, include form [BLR 22120](#) and provide supporting documentation/justification. The supporting documentation/justification for design exceptions ultimately will be included in the PDR.

The LPA/consultant should also make available appropriate information on the mitigation of impacts, effects on sensitive areas, detours, and stream crossings.

22-1.02(e) Documentation

At all coordination meetings, the LPA or their consultant must maintain a record of who attended and what transpired. Although a verbatim transcript is not necessary for coordination meetings, a recording on tape may be useful if questions arise on the accuracy of typed minutes. The LPA or their consultant should promptly prepare minutes after the meeting and send them to the district. The district will submit the minutes to the CBLRS for review. FHWA will also be required to review the minutes. After the corrections are made, the LPA will send the minutes to all agencies and individuals that were in attendance.

The suggested format for the coordination meeting minutes is shown in Figure 22-1A. Identify each project discussed in the minutes, and provide special attention to any scoping actions because documentation may be required later. Each project should be covered on a separate page. Attach form [BLR 22410](#) and/or form [BLR 22120](#) to the minutes.

22-1.02(f) Recommended Practices

The following practices are recommended for coordination meetings to improve their effectiveness:

- Provide to FHWA and CBLRS an agenda with a completed form [BLR 22410](#) for each project at least two weeks in advance of the meeting.
- Use video-conference for meetings with minor discussion items.
- Allow time for projects eligible for field approval prior to or after the regular meeting. Indicate the schedule in the agenda and provide appropriate information for action in advance.
- Schedule separate meetings for large or complex project issues, including the review of report comments.
- Resolve minor issues over the phone or between the district and the LPA.
- Keep the discussion focused on the desired action.
- Use slides, photographs, aerial photos, and other visual exhibits to clarify issues.

- Provide appropriate handouts (e.g., location maps, ADT/DHV schematics, typical section drawings, crash history information, synopsis of environmental issues, critical path items).
- Provide draft meeting minutes to the districts within five working days of the meeting and the final minutes to participants within two weeks after receipt of comments on the draft.

- Design exceptions presented and action taken.
- Environmental processing.
- Required public involvement.
- Attach forms [BLR 22410](#) and [BLR 22120](#), as applicable.

EXAMPLE COORDINATION MEETING MINUTES**Figure 22-1A****HARD COPIES UNCONTROLLED**

22-2 PROJECT STUDIES/REPORTS

Section 22-2 provides guidance for the preparation of various project studies and reports for Federal-aid LPA projects. The various reports and studies discussed in this Section are written summaries of design issues concerning a highway improvement. This Section pertains to procedural aspects involved in the completion of these studies and reports up to and including design approval. [Chapters 11](#) and [12](#) of the *BDE Manual* provide additional guidance on studies and reports required for federal projects.

22-2.01 General

The development of a federal project requires the preparation of various studies and reports. This necessitates an integrated engineering analysis to determine highway improvement needs. The scope and depth of the engineering analyses for preliminary studies will vary depending on the project scope of work. These studies may be less than that required for final plans, but they should be sufficiently accurate to preclude significant design or major cost estimate revisions during final construction plan preparation. When determining the scope, extent, and accuracy needed for a specific engineering study, the effects on adjacent property owners are often a good indicator.

To properly conduct engineering analyses and to develop a functional design, diverse sources of information must be used. Data for engineering analyses may be obtained from various sources. It is important that the designer be familiar with data available from outside sources and understands how to use it correctly in engineering analyses. Also, the designer must ensure that the scope, extent, and accuracy of the data requested from other sources are commensurate with the intended use of the engineering analysis being performed.

22-2.02 Information Sources

Engineering investigations determine if the proposed highway improvement satisfies the need for safe, economical, and efficient transportation and provides other relevant benefits (e.g., traffic benefits, public services, reduction of crashes, pedestrian facilities, transit considerations). The following Sections identify informational sources that are important in establishing the need for the highway improvement.

22-2.02(a) **Functional Classification**

The Office of Planning and Programming (OPP) is responsible for coordinating functional classification of all roads and streets with LPAs and FHWA. For additional information on functional classification contact the Bureau of Statewide Planning and Programming in OPP or see FHWA publication *Highway Functional Classification Concepts, Criteria and Procedures*. [Five Year Functional Classification Maps](#) for counties and urban areas can be found on the department's website or an interactive map is available at [Getting Around Illinois](#).

22-2.02(b) Highway Data Bank

OPP is responsible for maintaining the Illinois Roadway Information System (IRIS) and Illinois Structure Inventory System (ISIS). OPP can provide computer generated route log listings for State routes and local roads and streets. The available data is dependent on the highway system. The following major items may be available:

- administrative classification,
- physical dimensions,
- roadway characteristics,
- traffic data,
- geometric data,
- pavement cross sections, surface type, drainage, and shoulder conditions, and
- bridge inspection and appraisal data.

A complete listing of items is shown in the indices of the [IDOT Roadway Information and Procedure Manual](#) and the [IDOT Structure Inventory and Procedure Manual](#).

22-2.02(c) Urban Transportation Planning

The urban transportation planning process discussed in [Chapter 17](#) provides information on local governmental functions in urbanized areas of over 50,000 inhabitants. The Metropolitan Planning Organizations (MPO) administer a continuing, cooperative, and comprehensive transportation planning process that results in transportation improvement plans and programs consistent with the planned development of the urbanized areas. This process determines the transportation modal choice. In urbanized areas, the project must be consistent with local transportation planning. Major urban improvements must meet joint FHWA/FTA regulations for major highway improvements in urban areas. The urban transportation planning process also can provide other social, economic, environmental, and engineering information for preliminary studies.

22-2.02(d) Current and Projected Traffic Volumes

Under the general guidance of OPP, the districts count and classify existing traffic volumes on the State highway system and some local roads and streets. OPP also maintains data used to project future traffic volumes (e.g., annual traffic growth factors). The following traffic data may be available from the district:

- current hourly and daily traffic volumes,
- current turning movement volumes,
- traffic projections and assignments for new facilities, and
- traffic projections for future design years on existing facilities.

Similar data, developed in conjunction with the Urban Transportation Planning Process, also may be available from the MPOs. Because the design of a project greatly depends upon the projected design hourly volumes, these figures must be carefully examined and questioned before using for design purposes. Improper traffic projections can result in the construction of unnecessary or inadequate highway improvements.

22-2.02(e) Crash and Skid Reduction Analyses

During the preliminary study, identify High Accident Locations (HAL), rates, and all crash patterns (e.g., fixed objects) at various sites throughout the project. The Division of Traffic Safety regularly furnishes the district with crash information and provides crash information upon request. The following is a partial listing of available crash information:

- collision diagram printouts for roads and streets on the local system when the LPA is part of the Local Accident Reference System and for intersections with State highways. Collision diagram computer plots may also be requested for intersections;
- individual crash reports for above locations, upon request from a microfilm or imaging retrieval system;
- State highway HAL maps and computer generated listings that report supplemental data for high crash spots and roadway sections;
- wet pavement crash cluster sites for State highways (computer generated listings);
- county crash summaries;
- municipal crash summaries;
- statewide average crash rates, distributed annually, for comparison with existing project crash rates for proposed improvement justification; and/or
- summaries of Motor Vehicle Traffic Crashes and statewide average percentages by type of collision, light condition, and road surface. These percentages may be compared with project percentages from collision diagram summary sheets to help identify over-represented crash patterns.

22-2.03 Geometric Design Criteria

Part IV, Project Design, of this *Manual* presents the recommended geometric design criteria for the different types of highways. This is an important element for all preliminary studies. The following briefly summarizes the information provided in Part IV:

1. Basic Design Controls. [Chapter 27](#) discusses the design controls that have an overall impact on the geometric design of a highway facility. As discussed in [Chapter 27](#) and, as appropriate, the designer should evaluate the following:

- a. Project Scope of Work. The project scope of work will determine the type of design criteria to be used. [Section 27-2](#) defines the project scope of work for new construction, reconstruction, and 3R type projects. [Chapter 32](#) presents the design criteria that apply to new construction/reconstruction projects. For these projects, the designer often has the liberty of designing the highway to meet the most desirable criteria. However, available finances do not always permit the reconstruction of existing highways to this level. The geometric design of projects on existing highways must be viewed from a different perspective. These projects are often initiated for reasons other than geometric design deficiencies (e.g., pavement deterioration, crashes), and they often must be designed within existing right-of-way, financial limitations, and/or environmental constraints. As a result, the design criteria for new construction and reconstruction are often not attainable without major cost and, frequently, adverse impacts. At the same time, the LPA must make cost effective and practical improvements to existing highways and streets. For these reasons, the separate geometric design guidelines for 3R projects on existing highways are provided in [Chapter 33](#).
 - b. Functional Classification. [Section 27-3](#) discusses the application of the functional classification system in Illinois for geometric design applications. All highway improvements must be compatible with the functional classification of the highway under design. A highway's functional classification is an important factor in determining which design policies and criteria to use.
 - c. Design Speed. This is a critical highway design element and is therefore selected before initiating any studies. [Section 27-5.02](#) discusses the overall philosophy in design speed selection. [Chapters 32](#) and [33](#) present specific numerical criteria for project design speed based on functional classification, highway type, urban/rural location, and project scope of work.
 - d. Traffic Volume Analysis. [Section 27-6](#) provides definitions for highway capacity terms, selection of the design year, and design hourly volume for highway capacity analyses. It references the *Highway Capacity Manual* for detailed highway capacity techniques.
2. Sight Distances. [Chapter 28](#) presents the criteria for sight distances based on design speed. Stopping sight distance (SSD) is a determining factor in an acceptable highway design, especially for vertical alignment. Other sight distances which may be applicable include intersection sight distance and passing sight distance.
 3. Horizontal Alignment. [Chapter 29](#) discusses horizontal alignment for new construction/reconstruction projects (e.g., minimum radii, superelevation, horizontal sight distance).
 4. Vertical Alignment. [Chapter 30](#) discusses maximum and minimum grades, vertical alignment, and vertical clearances for new construction/ reconstruction projects.
 5. Cross Section Elements. [Chapter 31](#) presents the general criteria for cross section elements, and [Chapters 32](#) and [33](#) present specific numerical criteria for cross sections based on the highway type, design speed, traffic volumes, urban/rural location, and project scope of work. The designer must review the cross section criteria in these Chapters and determine the most appropriate design for the given conditions. The selected roadway cross section should be based on the type of operations and maximum allowable design speed, and will be a factor in determining the right-of-way needs of a highway facility. The proposed typical section should identify:

- the number and width of travel lanes,
 - the selection of an urban (curbed) or rural section,
 - the shoulder width, if applicable,
 - the gutter width, if applicable,
 - cross slopes,
 - the type and width of median,
 - parking lanes, if applicable,
 - sidewalks and bike lanes/paths, if applicable,
 - side slope configuration (i.e., fill slopes, cut slopes, roadside ditches), and
 - type of pavement.
6. Intersections. [Chapter 34](#) presents IDOT's criteria for the design of intersections.
7. Roadside Safety. [Chapter 35](#) presents the criteria for roadside safety, including clear zones, barrier warrants, barrier design and layout, impact attenuators, and glare screens. Most of the information in [Chapter 35](#) is applicable to the detailed design completed during the development of the final plans.

22-2.04 Environmental Issues

During project development, it is important for the designer to understand the environmental issues that may impact the project. Environmental reviews can be a significant portion of project development and project schedules can be greatly affected. For detailed information on environmental procedures, see [Chapters 10, 18, 19, and 20](#).

22-2.05 Highway Capacity Studies

22-2.05(a) General

The desired level of service (LOS) (e.g., mobility and freedom from delay and congestion) for a highway is determined by its functional classification and urban/rural location. The tables of geometric design criteria in [Chapter 32](#) present the recommended minimum LOS criteria for each functional class.

22-2.05(b) Responsibility

For LPA projects, the LPA or their consultant is responsible for conducting the capacity analysis. The District Geometric Engineer may be available as a resource to the LPA to assist in capacity analyses. The results are reviewed by the district before submission to the CBLRS.

22-2.05(c) Roadway Mainline Analysis

The following presents the simplified procedure for conducting a capacity analysis for the roadway mainline:

1. Select the design year; see [Section 27-6.02](#).
2. Determine the DHV; see [Section 27-6.03](#).

3. Select the level of service; see [Chapter 32](#) or [Chapter 33](#).
4. Document the proposed roadway geometric design (e.g., lane width, number and width of approach lanes at intersections).
5. Using the *Highway Capacity Manual*, analyze the capacity of the roadway element for the proposed design:
 - determine the maximum flow rate under ideal conditions,
 - adjust the maximum flow rate for prevailing roadway, traffic, and traffic conditions, and
 - calculate the service flow rate for the selected level of service.
6. Compare the calculated service flow rate to DHV. If DHV is less than or equal to the service flow rate, the proposed design will meet the objectives of the capacity analysis. If DHV exceeds the service flow rate, the proposed design may need further evaluation. The designer should either adjust the roadway design or adjust one of the capacity elements (e.g., the selected design year, level of service goal).

22-2.05(d) Intersection Design Studies

An intersection design study (IDS) is a graphic representation of a proposed treatment for the development or improvement of an intersection facility. It is based on an analysis of traffic needs and an evaluation of physical and economic elements at the intersection site. [Section 10-2.02](#) provides guidelines for when IDS should be prepared. [Chapter 14](#) of the *BDE Manual* provides guidelines for the preparation of IDS and the data that is required to be documented. [Chapter 34](#) provides the design criteria for intersections.

IDS's for federally funded projects will be submitted to the district for review. For intersections with State highways, the District Geometric Engineer will review the design to the extent appropriate and, if necessary, will obtain any approvals of exceptions to the geometric policies affecting the State highway from BDE before concurring with the design. The district may also submit a preliminary copy of IDS to the CBLRS.

22-2.06 Bridge Condition/Hydraulic Reports

22-2.06(a) Bridge Condition Report

The Bridge Condition Report (BCR) summarizes the findings of the investigation of a bridge and its components. It is used to establish the scope of work on the extent of repair, replacement (partial or total), widening or other improvements. BCR allows the LPA and IDOT to determine the most cost effective method of correcting the reported structural, geometric, or hydraulic deficiencies, and for restoring a bridge to a structurally adequate and functionally serviceable condition.

An abbreviated BCR may be used for structure replacements.

An in-depth BCR is required for all structures that are to remain. This report must include color photos. The following items are necessary in an in-depth report:

1. Introduction. The introduction should provide the reason for the report.

2. Administrative and Geographical Information. The report should include detailed administrative and geographical information (e.g., facility carried, feature crossed, age of bridge).
3. Inspection Information. Include what type of inspection was performed (e.g., visual, testing type, equipment), results of inspection, degree of impairment to structure, and any structural deficiencies. Precast prestressed deck beams should be sounded and scaled as part of the inspection.
4. Description. The report should include a description of the physical condition of the bridge and the deficiencies that require correction.
5. Verification. The ability and capacity of the existing structure for reuse should be verified and documented. This should at least include a statement that the structure is adequate for the required and stated design load. In addition, for structures to remain over waterways, BCR should verify the adequacy of the structure for scour.
6. Recommendations. Note all recommended repairs and any methods of repair.
7. Justification. Provide justification for any proposed work.
8. Photos. Include color photos of deficient areas.
9. Master Structure Report (S-107). This report is output from the Structure Information Management System (SIMS). The current Report S-107 should also be included with BCR.

For structures on 3R and resurfacing only projects that do not require any rehabilitation, provide a description of the structures as described in the Master Structure Report. These structures should be in good condition. A formal BCR then will not be required for these structures.

When the scope of the anticipated rehabilitation work is limited to bridge deck and minor structural repairs without need for a widening or replacement, only the preparation of a BCR for Deck Repair is required. Because the geometrics of the structure will not be altered, this type of work usually will not require a Type, Size, and Location (TS&L) submittal as discussed in [Section 10-2.03\(b\)](#).

Submit the BCR to the district. The district will forward the BCR to the Local Bridge Unit in the Bureau of Bridges and Structures for review and approval. BCR must be approved prior to or with the approval of the Preliminary Bridge Design and Hydraulic Report (PBDHR).

22-2.06(b) Preliminary Bridge Design and Hydraulic Report

The PBDHR contain the necessary information for use by IDOT personnel in reviewing the preliminary bridge design and processing the hydraulic reports for LPA bridge and culvert construction projects. [See Section 10-2.03\(b\)](#) for guidance on preparing PBDHR.

22-2.07 Hydraulic (Drainage) Studies

The roadway alignment is dependent on the interrelationships of several variables, including suitable stream crossing locations. The gradeline is directly influenced by high water elevations at stream crossings, and the depth of roadway ditch flow for surface drainage. Hydraulic structure sizes and storm sewer systems may significantly affect project cost estimates. For these and other reasons associated with drainage controls, a drainage study containing preliminary hydrologic and hydraulic analyses should be prepared where highway drainage and/or structures will significantly affect the design or cost of a project.

Where hydraulic structure sizes can affect the selection of alignments or grades, the LPA should perform a detailed hydraulic analysis. Rehabilitations that have no history of flooding or high water problems may be handled with detailed hydraulic computations to be completed in the design phase. Rehabilitations that have experienced hydraulic problems (e.g., severe scour, inundation, debris) will require a detailed hydraulic analysis during the preliminary study phase, as results may influence the scope of work.

Assessment of flood damage potential during location studies will include inspection of IDNR Office of Water Resources Regulatory Flood Plain Maps, Federal Insurance Administration Flood Hazard Boundary Maps, and/or Flood Insurance Rate Maps to determine if a proposed flood plain encroachment or hydraulic modification is within a special flood hazard area. Section 20-7 discusses the requirements that apply to federally funded and regulated projects when the project will involve a flood plain encroachment. Compliance with LPA flood regulations should also be discussed. Proposals to mitigate adverse effects and to resolve conflicts may also be described.

In addition to recommended improvements to hydraulic structures, the LPA should analyze and describe other proposed hydraulic improvements or modifications (e.g., unavoidable channel changes; the conversion of open ditches to storm sewer systems, including suitability of outfalls; pumping stations; detention facilities; highway embankments, including those parallel to stream flow; other flood plain encroachments). Analyses should include planning for future land use changes and development that could influence runoff rates and rural/urban cross section selections. Discuss the effects of restricted outlets, existing storm sewer capacities, and drainage constrictions (upstream or downstream) on highway drainage systems, particularly in rapidly developing urban areas.

A summary of the hydraulic design for each project will be prepared and submitted to the district for review. See [Chapter 36](#) for culvert designs and [Chapter 38](#) for storm sewer designs. The hydraulic design summary should include the following:

- the set of plans or a sketch showing the outline of the proposed drainage system for storm sewers, culverts, ditches, etc., and
- design computations that include criteria and procedures used, assumptions made with verification of those assumptions, and a listing of design exceptions.

For additional guidance on hydraulic and drainage design issues, see [Chapter 38](#) of this *Manual* and the [IDOT Drainage Manual](#).

22-2.08 Geotechnical Reports/Pavement Design

The purpose for a Geotechnical Report is to provide insight into area geology, pedology, and other engineering factors to be used by the designer. If soil stability problems are anticipated, a preliminary Geotechnical Report should be prepared during the preliminary study phase. Information on the geotechnical reports can be found in [IDOT Geotechnical Manual](#). While a final pavement design is usually not needed until plan preparation, a determination of pavement type and approximate thickness may be needed during the preliminary study phase. [Chapter 44](#) discusses pavement design procedures and when a Geotechnical Report is required.

22-2.09 Commitments**22-2.09(a) Definitions**

The following definitions apply:

1. **Commitment**. A commitment is a documented obligation or promise made by a properly authorized representative of the LPA for carrying out a specific action or actions affecting the planning, design, land acquisition, construction, or operation of a highway project that involves special consideration and action. Note that statements in the PDR and/or environmental reports to the effect that adverse impacts to wetlands or other sensitive resources will be avoided, minimized, or mitigated, will create an obligation to take specific actions (e.g., to follow-up on avoiding, minimizing, and mitigating impact) and should therefore be treated as commitments.
2. **Commitment List**. This is a cumulative list of commitments that states the date, a brief description of the commitment, who made the commitment, and when it was completed. This list is initiated during the Phase I study, included in the plan submittal, discussed at the pre-construction meeting, and checked during the final inspection of the project.
3. **Commitment File**. This is a file created by the LPA and maintained by both the LPA and district for each project. The file should include a commitment list, information on the nature of each commitment, the date when the commitment was made, the parties affected, permits or environmental clearances, and documentation showing that the commitment has been fulfilled. A commitment file must be kept for all Federal and State-funded local projects. These commitments may include:
 - funding arrangements between FHWA, IDOT, LPAs, and/or developers, which may include construction costs, signal maintenance, lighting agreements, etc.;
 - notification requirements to IDOT, public agencies, owners, local officials, etc., prior to construction;
 - requests for verification of the area to be disturbed by the project;
 - commitments to owners, IDOT, and/or other public agencies for plant replacement, removal, or retainage (e.g., trees, shrubs, wetland plants);
 - environmental commitments to IDOT, other public agencies, and/or other groups (e.g., wetland replacement, tree clearing restrictions, hazardous material removal);
 - relocation, removal, or replacement agreements/requests for existing buildings;

- drainage agreements, including detention areas, culvert locations, ditch construction, etc.;
- relocation, rebuilding, addition, or removal agreements/requests for private and commercial entrances;
- special construction requests (e.g., timing of construction, type of construction, limits of construction);
- existing sign removal and replacement; and/or
- any other special agreements made between the LPA and land owners during right-of-way negotiations.

22-2.09(b) Procedures

The LPA is responsible for maintaining the commitment file and ensuring that these commitments are incorporated into the final plans and agreements. The following procedures will apply:

1. Recording Commitments. Commitments can occur early in the design (e.g., Environmental Survey Request (ESR), PDR) through construction. The designer will need to carefully review all minutes of meetings, transcripts of public hearings, and the project study files to ensure all commitments have been listed. If there are any questions, the designer should contact the author of the PDR. During plan development, the designer will also add to the file any commitments made to property owners or others affected by the project.

When applicable, note the commitments in the project agreements and contract documents. The LPA is responsible for providing the district with a copy of their commitment file at the same time as the rest of the project file is submitted.

2. Discussion of Commitment Information. On federal projects, commitments should be discussed at the bi-monthly coordination meeting with FHWA (see Section 22-1.02), to ensure that all affected parties are aware of the nature and scope of the commitments.

When a preconstruction conference is held, commitments should be discussed to ensure awareness and understanding of any special considerations affecting construction, and to emphasize the importance of follow through as construction proceeds. Other parties affected by the commitments may be invited to attend the preconstruction conference.

3. Commitment Change. If it is discovered during project development, implementation, or maintenance that a change is required to a previous commitment or a commitment cannot be met, the designer must immediately notify the district and/or CBLRS so that appropriate action can be taken. Failure to provide the appropriate notification and review may result in project delays. All affected parties should be considered prior to making the final decision on the previous commitment.

The designer is responsible for updating the commitment file and providing documentation on the coordination with the affected parties and the ultimate decision on the proposed change.

4. Closeout. It is the LPA's responsibility to ensure and document that all commitments have been fulfilled. The LPA will provide the district with a copy of the commitment list at the final inspection after the project is completed. The district will forward a copy of the finalized commitment list to the CBLRS.

22-2.10 Design Exceptions

In general, the designer is responsible for making a reasonable effort to meet the design criteria presented in this *Manual*. However, recognizing that this will not always be practical or cost effective, [Section 27-7](#) discusses the process to evaluate and approve exceptions to the geometric design criteria. The process described in [Section 27-7](#) applies to all LPA new construction, reconstruction, and 3R type projects using federal funds.

Form [BLR 22120](#) is used to document the justification and approval of exceptions that are necessary for the completion of the project. Complete the form in its entirety for all LPA federal projects.

The information in the form may be presented at district project coordination meetings. Coordination meetings are discussed in Section 22-1.02. The minutes of the coordination meeting would serve as the documentation of the approval. Requests for exceptions may also be submitted in writing to the district on form [BLR 22120](#). A written response to the request will then be sent to the LPA.

22-2.11 Project Development Report (PDR)**22-2.11(a) General**

A PDR is prepared to ensure environmental issues and design features are consistent with federal, State, and local goals and objectives. PDR is required for all projects that qualify for a Federal Approved Categorical Exclusion (CE) and for certain projects classified as State Approved CE; see [Chapter 19](#). Use form [BLR 22210](#) for CE PDRs.

22-2.11(b) Contents

The following information should be included in PDR, when applicable:

1. Location. Include a narrative description of the project location along with a location map.
2. Description of Existing Conditions. Describe the existing facility (e.g., alignment, typical sections, bridges, railroad crossings, utilities) within the improvement. For existing railroad crossings, PDR should document the number of trains per day, the existing warning devices, and the geometrics at the crossing. Also, describe the contiguous sections.
3. Design Traffic Data. Include current ADT, design ADT, DHV when applicable, and the percent trucks.
4. Purpose/Need for Project. Discuss the purpose and need for the project.
5. Design Guidelines. Indicate whether the project is being designed using urban or rural design guidelines for new construction/reconstruction or the 3R guidelines. Include the functional classification, the design speed, and the regulatory speed.
6. Description of Proposed Improvement. Include the following in the description of the proposed improvement:

- a. Roadway. The description should include a discussion of side slopes and the widths of through lanes, turning lanes, traffic control, non-motorized user facilities, parking lanes, and shoulders. Discuss any alignment changes and intersection improvements. Attach typical sections, plan and profile sheets, and intersection design studies, when appropriate.
- b. Structures. The degree of proposed bridge descriptions contained in PDR will depend on the type of improvement. A bridge rehabilitation project will need to discuss more individual bridge elements needing improvement and possible alternatives for widening under traffic, but not specifics (e.g., beam types). A structure on new location might only require enough details necessary to set approximate roadway profiles, assess hydraulic impacts including streambed environment, and develop a cost estimate. The recommended scope of work should address the approximate dimensions of the replacement structure envisioned, but not so precisely that configuration refinements resulting from subsequent hydraulic, soils, or structural-economic studies are restricted. This is necessary to determine approximate right-of-way requirements, assess environmental impacts, consider necessary hydraulic and flood plain effects, and to make a reasonable cost estimate. [Chapter 36](#) provides guidance on the design of bridges and structures.
- c. Hydraulics (Drainage). PDR should contain a summary of the preliminary hydrologic and hydraulic analyses where highway drainage and/or structures will significantly affect the design or cost of a project. Rehabilitations that have no history of flooding or high water problems may be handled with brief statements of past performance in PDR with detailed hydraulic computations to be completed in the design phase. Discuss the effects of restricted outlets, existing storm sewer capacities, and drainage constrictions (upstream or downstream) on highway drainage systems, particularly in rapidly developing urban areas. For additional guidance on hydraulic and drainage design issues, see [Chapter 38](#) of this *Manual* and the [IDOT Drainage Manual](#).
- d. Miscellaneous Highway Features. PDR should reflect, as appropriate, other elements as follows:
 - i. Utilities. Describe any proposed modifications, changes, or multiple uses of right-of-way. Prior to beginning of work, a written agreement must be made between the LPA and each utility, defining the work responsibilities and estimate of cost. See [Section 5-8](#) for guidance on preparing utility agreements and [Section 10-4](#) for guidance on utility coordination.
 - ii. Railroads. PDR must determine if crossings will be at-grade or grade-separated. This will be a collaborative effort between the LPA, IDOT, the affected railroad, and the Illinois Commerce Commission. In most cases for at-grade crossings, it will be appropriate in the preliminary stage to specifically determine the type and proposed location of warning devices at the crossing (e.g., automatic gates, flashing signals) and width of crossing surface. The CBLRS will review and approve the plans, specifications, and estimates without prices for all railroad crossing improvements. [Section 10-2.01\(f\)](#) provides additional information on the coordination with railroads. Section 22-1.01(d) and [Chapter 40](#) provide guidelines on the design of highway/railroad crossings.

- iii. Lighting. [Section 41-7](#) provides guidelines for highway lighting and illumination. In PDR, describe proposed illumination levels including uniformity ratios and glare levels.
- iv. Erosion and Sediment Control. Evaluate the need for erosion and sediment control measures. This may require additional right-of-way to accommodate erosion and sediment control implementation. See [Section 41-10](#) for guidelines on the design and implementation of erosion and sediment control.
- v. Hazardous Mailbox Supports. During the preparation of PDR, the LPA should address the problem of hazardous mailbox supports. Document the existence of potentially hazardous mailbox supports and their locations in PDR. Removal and replacement of mailboxes can be a sensitive issue and should be reviewed with the local postal authorities and the postal patron. The following evaluation process is required on federal projects and may be used on other projects:
- Survey. Conduct an onsite survey to determine whether there are any hazardous mailbox supports within the clear zone of the project. Document these locations in PDR. If there are no hazardous supports on the project, note this in PDR.
 - Notification. If a mailbox box support is determined to be hazardous, the LPA is responsible for notifying the postal patron by certified mail that their mailbox may be potential hazard. The letter should discuss the following issues:
 - o type of hazard and the potential adverse safety effects,
 - o potential personal liability to the property owner,
 - o statement of the appropriate mailbox design issues (see [Section 41-8](#)),
 - o the recommended appropriate safety design,
 - o LPA's request to change the support to an acceptable design, and
 - o LPA's request to meet with the owner to ascertain the property's owner's decision.
 - Documentation. Ensure the following is documented in the project files:
 - o copies of all certified letters,
 - o meeting results,
 - o any subsequent verbal or written responses, and
 - o documentation of the LPA's effort to remove the hazardous mailbox.
- Summarize all decisions relative to the owner's decision, either agreeing or disagreeing to remove the hazardous support, in PDR.

- Notification by Postmaster. If no response is received from a postal patron who has a hazardous mailbox support, or if the owner indicates that he/she does not wish to change the support, the LPA may contact the local postmaster and ask for the postmaster's help in getting the mailbox support removed. If the local postmaster is agreeable, the local postmaster has the authority to notify the patron in writing of the safety hazard of an existing support. Postal regulations require that box supports must bend or break away when struck by a vehicle and that supports are now readily available for purchase. The local postmaster can give the owner 30 days' notice, and if compliance is not achieved, the postmaster has the authority to suspend mail delivery to the box.
 - Project Field Reviews/Construction Phase. If a hazardous mailbox support is constructed or discovered after design approval, use the above procedures and add the appropriate documentation to the files and reports.
Section 41-8 contains additional information concerning hazardous mailbox supports.
- vi. Truck and Parking Restrictions. List any truck or parking restrictions or parking removal in PDR.
- vii. Mail Delivery. Indicate any mail delivery from a traffic lane.
- viii. Airports. PDR must indicate that the project will have no effect on airport operations. Section 10-6 discusses airport coordination.
- ix. Traffic Control. Many traffic engineering elements are addressed during detailed design in the final plans (e.g., selection and location of traffic signs and pavement markings). However, as appropriate for the project scope of work, PDR should discuss proposed traffic control, especially at intersections, and include justification of those traffic engineering elements (e.g., traffic signal and multi-way stop warrants). Chapter 39 provides guidance on several traffic engineering issues.
- x. Sidewalks and Pedestrians. Describe the reasons for providing, or not providing sidewalks, and the coordination needed with local governmental units. See Section 41-6 for a discussion on sidewalks and ADA compliance. PDR must contain a discussion on satisfying ADA requirements including, if applicable, the selection of accessible routes for disabled individuals.
- xi. Bicycle Facilities. Identify the travel needs of bicyclists in PDR. Chapter 42 provides guidelines for the placement and design of bicycle facilities.
- xii. ADA. Section 41-6 discusses implementation of the *Americans with Disabilities Act* (ADA). PDR must contain a discussion on satisfying ADA requirements including, if applicable, the selection of accessible routes for disabled individuals. Any intersection design study (see Section 10-2.02) prepared during the preliminary study must indicate the location of the curb-cut ramps to be provided. PDR must discuss any request for a design exception from policies on accommodating disabled individuals and the justification for the request. The request must discuss the impact on the access route.

- xiii. Geotechnical Considerations. Conduct preliminary studies in cooperation with soils specialists and geologists when these elements influence the location and/or design of a proposed improvement. Additionally, the location of foundations for structures or high embankments may be an important item in the highway location. See the *IDOT Geotechnical Manual* for information on geotechnical considerations.
 - xiv. Agreements. PDR should document the need for any agreements with the State, other LPAs, consultants, railroads, and/or utility companies. [Chapter 5](#) provides guidance on the preparation of these agreements.
 - xv. Maintenance Considerations. The designer should develop PDR in cooperation with bridge and highway maintenance personnel who are responsible for the highway section under design. [Section 25-2](#) provides additional guidance on maintenance issues.
7. Design Exceptions. List all design exceptions along with any approvals. Include form [BLR 22120](#). See [Section 27-7](#) for additional information.
 8. Cost Estimate. Prepare a cost estimate for the project including construction, utility adjustment, land acquisition, and engineering costs. For major projects requiring more than one construction contract, provide cost estimates for individual usable segments. [Section 11-6](#) discusses the required information needed to document project costs.
 9. Crash Analyses. PDR should include, as appropriate, the following crash analyses to assist in demonstrating the need for a highway improvement:
 - a. Spot Map. Provide a crash spot map as basic crash information in PDR. As applicable, include a comparison of the calculated project crash rates with the statewide average crash rates for the same class of highway. Collision diagram summary sheet percentages also may be compared with statewide averages.
 - b. High-Crash/Crash Pattern Analyses. During the preliminary study, identify High Accident Locations (HAL), rates, and all crash patterns (e.g., fixed objects) at various sites throughout the project. Additionally, include schematic collision diagrams, results of field checks, crash analyses, and recommended countermeasures for these items, or provide a statement that no high crash locations or other crash patterns that exist along the proposed improvement.
 - c. Wet-Pavement Crashes. Identify and analyze any wet pavement crash clusters in accordance with the *Procedures for Identifying, Analyzing, and Improving Wet Pavement Accident Locations Within Rehabilitation/Resurfacing Projects*. These procedures are discussed in the [Illinois Highway Safety Improvement Program](#) available online coordinated through the Bureau of Safety Programs and Engineering (BSPE). Include friction numbers, if available, in the analysis of critical wet pavement crash locations combined with the recommended traffic, existing geometric features, grooving, profiling, and/or high friction resurfacing countermeasure alternative. Specify a high-friction resurfacing type and mix design to be used during the development of the final plans.
 - d. Time Period. Analyze the traffic crash data available for the most recent five years and update the data accordingly.

10. Right-of-Way Requirements. Describe the right-of-way acquisition including the existing land use, the total area required for permanent right-of-way, permanent easements, and temporary easements, the number of property owners affected, and anticipated effects on the remaining properties. Discuss any displacements to persons, businesses, and farms.
11. Environmental Issues. Discuss any involvement with environmental issues. Include the results of any environmental surveys. Include any signoffs and copies of other pertinent coordination. Discuss proposed mitigation measures and indicate any permit requirements.
12. Traffic Control and Alternative Routes During Construction. Include in PDR a discussion on the development of a conceptual plan to accommodate traffic during construction. If the highway is to be kept open to traffic during construction or if detours or runarounds are involved, indicate this in PDR. Discuss all feasible alternatives for handling traffic during construction and methods to provide pedestrian accommodations. For additional guidance on traffic control devices during construction, see [Chapter 39](#).

When deciding on alternative routes during a road closure, several factors should be considered. Some of these factors include the type of pavement and ability for the alternative route to handle the additional load, the impact that the additional ADT would have on the traffic control at intersections and railroad crossings, the effect of larger vehicles have on the turning radii at intersections, and the coordination with the agencies having jurisdiction of the alternative routes. If a marked detour is provided during a road closure, all agencies having jurisdiction of the detour route must approve the detour signing.

Before closing a road during construction, any affected emergency services, school districts, and post offices should be notified. It is recommended that these agencies be contacted prior to submitting the PDR, and documentation of the contacts be included in the report.
13. Public Involvement. Summarize public involvement activities. Discuss any opposition to the project and how public hearing requirements are being fulfilled. Attach any property owner comments or signoffs.
14. Other Coordination. Attach minutes of the early involvement coordination meetings and applicable coordination letter with other agencies, utility companies, and railroads, as appropriate.

22-2.11(c) Project Development Report Review

Typically, the LPA will send the draft PDR (form [BLR 22210](#)) to the District for review. After District review, the PDR may need to be sent to CBLRS for review and comment. Once the District and CBLRS comments have been addressed, the final PDR (form [BLR 22210](#)) may be submitted for approval.

22-2.12 Design Reports

A design report will be required for all projects that require a separate environmental document for which an EA or EIS was prepared. The purpose of a design study is to investigate all plausible alignments within the approved corridor. Public involvement activities and environmental studies are conducted concurrently with the design study.

The report shall discuss the alternatives considered, but not studied, with an in depth explanation of why these alternatives were eliminated. For the final alternatives under consideration, include major design details and discuss the social, economic, and environmental advantages and disadvantages of these alternatives. The environmental impacts do not need to be discussed in detail in the design report, but should be summarized. Additionally, summarize the result of public involvement activities. The report shall identify the recommended design alternative and the reason for its selection.

Additional guidance concerning design studies and reports are provided in [Chapters 11](#) and [12](#) of the *BDE Manual*.

22-2.13 Approvals

22-2.13(a) Categorical Exclusion Approval

The following approval process is required:

1. State Approved Categorical Exclusion Projects. For State Approved CE projects, CE Approval is given by the district after the environmental coordination and any public involvement activity have been completed and the project has been determined to have no unusual circumstances. This is accomplished by the approval of form BLR 19110 indicating the project does qualify as a State Approved CE. Projects including an existing structure or proposed structure, requiring inclusion in the NBIS will require the district to consult with CBLRS to determine CE approval. Approval of form BLR 19110 must occur prior to the approval of either form BLR 19100 or BLR 22210.
2. Federal Approved Categorical Exclusion Projects. For Federal Approved CE projects, CE Approval is required by the FHWA. After the final PDR has been reviewed, environmental coordination and public involvement activities have determined there are no unusual circumstances, and there is an agreement on any mitigation measures, the CBLRS will contact the FHWA with a request for CE Approval. The request for CE Approval to the FHWA may be made at a coordination meeting, through email, or other method of contact. Documentation of the CE Approval will be included in the PDR.

22-2.13(b) Design Approval

All projects that require the preparation of a PDR (form [BLR 22210](#)) or a design report will require design approval.

For all State Approved CE projects, design approval by the district will be required. For all Federal Approved CE projects, design approval will be given by the CBLRS after environmental and public involvement requirements have been completed and the project has been determined to have no unusual circumstances.

22-2.13(c) Direct Approval

The CBLRS Project Development Engineers have the authority to conduct some official actions in the districts and at coordination meetings. Specifically, these actions will consist of evaluating and approving, when satisfactory, requests for CE determinations and design approvals for certain projects. Direct approvals are means of expediting the processing phases.

Consider the following before requesting direct approval:

- The LPA has submitted a PDR (form [BLR 22210](#)) or other design report.
- Projects that involve other than minor geometric revisions are not normally eligible for direct approval. Some projects with design deviations may still qualify for direct approval if prior concurrence for design deviations has been obtained from the CBLRS.

22-2.14 Addenda to Project Development and Design Reports

All changes during the preparation of final plans that affect the original PDR such as revised scope of work, significant alignment revisions, additional right of way or major design features of an approved project must be submitted in the same manner as the first approval.

Some examples of work that would cause a PDR addendum include the following:

- Acquiring more ROW or easements than the original PDR proposed;
- Switching from a widening and resurfacing project to reconstruction project;
- Revising the type of a stream crossing structure, i.e. from a box culvert to a bridge;
- Proposing a new stream crossing;
- Adding auxiliary lanes or traffic signals at an intersection;
- Changing the typical section in the PDR;
- Changing layout, function or access to roadway.

Some examples of work that would not require a PDR addendum include the following:

- Altering the skew of a stream crossing structure to better fit the channel alignment;
- Revising the work zone traffic control scheme from a more restrictive arrangement, such as a road closure, to a more liberal plan, such as maintaining through traffic in some manner;
- Acquiring less ROW or easements than original PDR proposed;

The addenda can often be handled with a memo, submitted by the LPA, detailing the changes to the approved PDR. The memo should discuss the revised proposed scope of work and justification for the revision. Similar to the original PDR, the appropriate exhibits should be attached to the memo.

The environmental processing of the PDR Addenda will be similar to the original PDR. In all cases, an ESR addendum will be required to provide the necessary environmental clearances.

Refer to Chapter 21 for the required public involvement activities that are needed for a PDR addendum.”

22-2.15 Reports for LPA Projects Involving a State Highway

The following procedures for processing and approval of Design Reports, PDRs, and other related documents will apply for LPA projects involving a State highway.

22-2.15(a) State Highway System

The following applies with regard to jurisdictional transfers:

1. No Jurisdictional Transfer. Discuss all projects at district coordination meetings before finalizing and submitting any reports. Reports prepared by the LPA or their consultant should be submitted to the CBLRS for review, approval, or information. When the need for a design exception is discovered at the local coordination meeting on routes under State jurisdiction, the CBLRS will coordinate and discuss this information with BDE prior to approval action. If a LPA is preparing the report for a State highway on the National Highway System (NHS), BDE will review the highway geometrics and cross section design during the development of preliminary alternatives. Once the geometrics and cross section designs are agreed to, the CBLRS will review the report and process it accordingly.
2. Jurisdictional Transfer to a LPA. Submit PDR to the CBLRS for review and approval. When the State is providing matching funds, the CBLRS will coordinate the design requirements with BDE prior to approval. It is imperative that these projects be discussed at the district coordination meetings. This will allow BDE and the CBLRS to become aware of proposed design features and costs and to determine if the project is still the same as originally discussed during programming meetings.

22-2.15(b) Combined Systems

For projects that have substantial work on both highway systems, and the LPAs and their consultants prepare reports, process the PDR through the district to the CBLRS. The CBLRS will coordinate any design requirements with BDE.

22-2.15(c) Modified Procedures

Where special or unusual situations arise during project development, modified review and processing procedures may be necessary. In such cases, the LPA, district, CBLRS, and BDE should agree on the modified procedures to use.

22-2.16 Interstate Access Studies

BDE and FHWA must approve all proposed new access points to the Interstate system and all proposed changes in interchange configurations, even if the number of access points does not change. Any changes to access for non-Interstate fully access controlled facilities, must be approved by BDE. This applies to any change regardless of the funding source.

FHWA revised access approval constitutes a federal action and, as such, National Environmental Policy Act (NEPA) procedures must be followed. Compliance with NEPA procedures should proceed concurrently with the analyses to determine engineering acceptability and feasibility.

An Access Justification Report (AJR) must be prepared to confirm the future safety and traffic operations along the Interstate corridor. The required contents of this document can be found in [Chapter 37](#) of the *BDE Manual*. The report is submitted to BDE for review and approval by IDOT and, when required, by FHWA.

22-2.17 Work Zone Transportation Management Plans for Impact on State Highways

22-2.17(a) General

A well-planned method for maintaining traffic flow is critical for meeting the Department's mobility goals, minimizing complaints from the traveling public, residents, and businesses, and reducing unnecessary capital costs. Therefore, when a LPA project impacts a State highway (owned or maintained), [Chapter 13](#) of the *BDE Manual* will apply to any work on the State highway.

While a majority of local highways are considered non-Significant Routes, there are a few local highways in urban areas that may be considered Significant Routes. Therefore, for federally funded projects, [Chapter 13](#) of the *BDE Manual* will apply as well.

The LPA is responsible for making a request to the District for a determination if a highway is considered a Significant Route.

22-2.17(b) Significant Route

A Significant Route is a roadway segment where a lane closure on the roadway is expected to cause sustained work impacts that are not considered tolerable based on work zone mobility goals or public opinion (see IDOT's website under [Work Zones](#) for Significant Route Location Maps).

If work is going to be performed on any Significant Route, the LPA project should be taken to a FHWA/IDOT coordination meeting.

22-2.17(c) Requirements

[Figure 13.1-A](#) of the *BDE Manual* shows the Work Zone Safety and Mobility Process Flow Chart in order to determine the level of significance of a project along a State highway.

For a Significant Project – Short Term (work less than three days on a Significant Route), the LPA will be responsible for preparing a Permitted Lane Closure Map (PLCM) based on the Significant Route Location Map and the District's knowledge. See [Section 13-1.03\(c\)](#) of the *BDE Manual* for details.

For a Significant Project – Long Term (work more than three days on a Significant Route), the LPA will be responsible for an Impact Analysis (an analysis of the safety and mobility impacts of a road construction or maintenance project). A full Traffic Management Plan (TMP) will be prepared by the LPA and submitted to the District. The District will review the TMP and coordinate the Department's review and approval. See [Section 13-1.03\(c\)](#) of the *BDE Manual* for details.

For a Non-Significant Project (work on a non-Significant Route), an Impact Analysis is not required. The final design may proceed with a TMP that consists of only a Traffic Control Plan (TCP).

22-2.17(d) Exceptions

If the TMP strategies have been evaluated and incorporated into the project and the mobility and/or queue goals are not met, the LPA will prepare an exception to compliance. The Request for Exception to Compliance must include:

- all strategies including those in the TMP;
- justification why it is not feasible to meet the goals of the policy; and
- the proposed strategies to mitigate work zone impacts.

The request must be sent to the District Department and FHWA review and approval. See Section 13-7 of the *BDE Manual* for the Request for Exception to Compliance form.

22-2.17(e) Funding for Work Zone Traffic Management Plans

The LPA will be responsible for the cost of any required Work Zone Traffic Management Plans along a State highway when included on a LPA project.

22-2.18 Complete Streets for Impact on State Highways

For federally funded projects that impact State highways, the LPA shall follow procedures contained in [Section 10-2.09](#) except the LPA:

- should address any issues regarding Complete Streets at FHWA/IDOT coordination meetings; and
- shall include signed documentation of the Secretary's concurrence of exception to Complete Streets in the PDR.

HARD COPIES UNCONTROLLED

22-3 RIGHT-OF-WAY

22-3.01 General

The LPA develops preliminary right-of-way cost estimates and relocation assistance plans as necessary and in accordance with the [IDOT Land Acquisition Policies and Procedures Manual](#).

Preliminary right-of-way costs are determined on a per acre (hectare) basis, or on a parcel-by-parcel basis, and include costs for persons displaced as a result of a proposed highway improvement (e.g., relocation, replacement housing). For major projects, a preliminary relocation plan is developed to estimate housing needs and available resources for persons displaced by a highway project. The steps in the land acquisition process are shown in the [IDOT Land Acquisition Policy and Procedures Manual](#).

When publicly owned facilities will be acquired, a decision should be made at the completion of PDR to either pay the market value for the property or to functionally replace it. Guidance on this issue is in the [IDOT Land Acquisition Policy and Procedures Manual](#).

In addition to securing cost estimates and relocation plans through the Land Acquisition Section, the designer should seek their assistance when determining special alignment and design features to avoid adverse property severance, undesirable access features, unnecessary damages, and odd-shaped takings. Additionally, consider existing property lines and the value of property to avoid excessive right-of-way costs. Often, alternative locations and designs can be selected with lower right-of-way costs.

When right-of-way is acquired for Federal-aid projects, full compliance with Title II and III of the *Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970* is mandatory. There must be full compliance with the requirements of Title II and III on Federal-aid LPA projects whether or not Federal funds are used to pay a part of the right-of-way costs.

22-3.02 Definitions

The following definitions apply:

1. Right-of-Way. Land acquired for permanent ownership by the LPA for activities that are the responsibility of the LPA for an indefinite period of time. The LPA obtains the fee simple title to the property. Right-of-way is typically acquired for roadways, roadsides, etc.
2. Permanent Easements. Easements acquired with the perpetual right to construct and maintain a public highway and incidental facilities over and across the surface of lands. Types of permanent easements include:
 - utility easements,
 - storm sewer easements, and
 - scenic easements.

3. Channel Easements. Easements acquired specifically for stream channel construction and maintenance, which provides the LPA with a permanent right of ingress and egress. The property owner relinquishes the right to modify the channel dimensions (e.g., slopes).
4. Temporary Construction Easement. Easements acquired for the legal right of usage by the LPA to serve a specific purpose for a limited period of time (e.g., construction, maintenance and protection of traffic during construction). Once the activity is completed, the LPA yields its legal right of usage. Although located outside or beyond the proposed highway right-of-way lines, all temporary construction easements or permits are considered as right-of-way parcels and must be reported as right-of-way required for construction of a project for purposes of obtaining authorization to advertise the project for letting.

Acquisition of temporary construction easements should be accomplished in the same manner as the appraisal and acquisition of a fee-taking or a permanent easement with respect to appraisal and acquisition requirements. Temporary easements should always be obtained for detour roads, borrow pits, removal of remainders of buildings situation partially on acquired right-of-way, channel changes (requiring infrequent or no future maintenance), etc., where the specified use is essential to completion of construction of the proposed improvement.

5. Temporary Use Permit. The temporary use permit is used to describe a license acquired by a LPA to do a particular act or series of acts on the land of another without possessing any estate or interest in the land. A property owner may terminate the permit at any time.

Acquisition of temporary use permits should be confined to those areas of construction such as for sloping of lawns, extending back slopes beyond the proposed highway right-of-way lines, reconstruction of driveways, where a nominal amount of money is involved, the probability of termination is minimal and the effect of termination would not jeopardize completion of the highway improvement. When acquired as the only parcel from a property owner, it is not necessary for the appraiser to offer the owner, or designated representative, the opportunity to accompany the appraiser on the inspection of the property, nor is it necessary to furnish the owner with a written Summary of Right of Way Acquisition and Offer Purchase.

Although located outside or beyond the proposed highway right-of-way lines, all temporary construction easements or permits are considered as right-of-way parcels and must be reported as right-of-way required for construction of a project for purposes of obtaining authorization to advertise the project for letting.

22-3.03 Title II – Uniform Relocation Assistance

The purpose of this Title is to establish a uniform policy for fair and equitable treatment of persons displaced as a result of federal and federally assisted programs to prevent disproportionate injuries as a result of programs designed for the benefit of the public as a whole.

Wherever the acquisition of real property for a project will result in the displacement of any person, the LPA is responsible for providing a relocation assistance advisory program. The LPA's relocation assistance advisory program must be in accordance with requirements of the [IDOT Land Acquisition Policies and Procedures Manual](#). If the Relocation Assistance and Payments Program is administered by the LPA, the program must be approved prior to the public hearing or commencing negotiations for the property.

22-3.04 Title III – Uniform Real Property Acquisition Policy

In order to encourage and expedite the acquisition of real property by agreements with owners, to avoid litigation, relieve congestion in the courts, to ensure consistent treatment for owners, and to promote public confidence in land acquisition practices, a LPA should follow the policy requirements contained in the [IDOT Land Acquisition Policy and Procedure Manual](#).

22-3.05 Certified Appraisers

Where federal funding is used in any phase of the project and a detailed appraisal is required, the appraiser must be certified in accordance with the *Financial Institution Reform Recovery and Enforcement Act*. LPA staff appraisers and reviewers will not require certification to prepare or review detailed appraisals, but their qualifications must be consistent with the level of difficulty of the assignment. If a fee appraiser or fee reviewer is required for a detailed appraisal, their selection must meet the following classifications:

1. State Certified Residential Real Estate Appraiser. The appraiser is limited to appraising residential property containing one to four units and vacant single family land zoned residential that will accommodate no more than one unit.
2. State Certified General Real Estate Appraiser. The appraiser is allowed to appraise any type of real estate.

A detailed appraisal is defined as a complex appraisal problem that requires thorough documentation to support the values and conclusions contained in the report. An appraisal is considered detailed under the following circumstances:

- Where damages to the remainder, excluding non-complex cost to cure items (e.g., fence relocations, sign relocations) exceed \$10,000.
- The acquisition involves the acquisition of a principle building.
- On acquisitions involving only land or land with minor improvements, a staff reviewing appraiser will determine if the appraisal problem is complex. Examples of complex appraisal problems include:
 - the highest and best use is different than present use,
 - a complex specialty report is required,
 - market data is inadequate and consideration must be given to the cost and/or income approaches as appropriate, and/or
 - there is a complicated valuation problem involved.

22-3.06 Early Acquisitions

In general, no new right-of-way can be acquired for a project prior to completion of the environmental process and design approval. However, under some circumstances this requirement may be waived and will not jeopardize Federal-aid participation in future project costs. Early acquisition may be acceptable if it is shown that the acquisition is necessary to:

- alleviate particular hardship to a property owner, on their request, in contrast to others because of an inability to sell the property (hardship acquisitions); and/or
- prevent imminent development and increased costs of a parcel that would tend to limit the choice of highway alternatives (protective buying acquisitions).

Additionally, the following requirements must be met:

- The acquired property must not influence the need to construct the project or the selection of the location of the project.
- The acquisition must comply with the *Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970*, as amended, 42 U.S.C. 4601-4655 and 49 C.F.R. 24.
- The acquisition must comply with Title VI of the *Civil Rights Act of 1964*.
- The acquisition must not include lands protected by Section 4(f) of the *Department of Transportation Act*.
- The final project must meet all requirements for a normal Federal-aid project (e.g., compliance with the *National Environmental Policy Act*, the *Historical Preservation Act*, the *Endangered Species Act*, the *Wetlands Executive Order*).
- Advance acquisition must not be used to circumvent federal laws or regulations.

Because acquiring large quantities of right-of-way in advance of environmental and design approvals could likely influence project location or need, the LPA should be aware that any full scale acquisition is done at its own risk.

22-3.07 Land Acquisition Donations

A donation of right-of-way can be accepted after an owner has been fully informed of their right to receive just compensation. The LPA is not required to appraise the property or to offer compensation. Process donations only after the environmental study of the project is completed and design approval received.

22-3.08 Documentation and Certification

All property within limits of the proposed highway improvement must be cleared either by acquisition, easement, or permit, before receiving authorization to proceed to letting. Any deviation in this policy will require submittal of a written statement by the LPA to the district indicating the location and reasons for the deviation before authorization will be issued by FHWA.

The LPA is responsible for documenting and maintaining their files to provide the necessary evidence that they have complied with the provisions of the *Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970*, as outlined in Section 22-3. The LPA's file must be available and open to inspection by IDOT and FHWA for a period of three years after the FHWA's payment of the final voucher on the project.

The district must certify prior to the State's advertising for bids that the LPA has acquired the necessary right-of-way and has provided relocation assistance, if applicable, in accordance with the requirements in Section 22-3.

22-3.09 Closing Right-of-Way Project

The LPA, upon completing the final transaction on a right-of-way project, will ensure that the proper certification forms have been completed and sent to IDOT for certification and acceptance.

Consider the following when closing right-of-way projects:

1. Final Invoice. Within 90 days after certification, submit a final invoice for the right-of-way cost to the district.
Statement of Cost of Right-of-Way. Include a Statement of Cost of Right-of-Way, see Figure 22-3A, with a copy of the appropriate cancelled checks with the submission of any progress or final invoice to provide documentation for the cost shown. Include the following in the Statement of Cost of Right-of-Way:
 - parcel number,
 - cost of parcel,
 - cost of excess land, if any, acquired from same ownership,
 - credits by parcel or project, and
 - incidental expense by parcel or project.
2. State Job Completion Notice - Form BFM-336. Upon receipt of the final invoice, the district will prepare form [BFM-336](#) to notify the appropriate offices of the project completion. Retain copies of all invoices and supporting documentation for auditing purposes for a period of three years after payment of the final voucher. Additional support documentation that is to remain on file includes:
 - right-of-way maps or plans showing the right-of-way authorized and the actual area acquired, including parcel identification numbers,
 - property lines of area actually acquired, and
 - any other pertinent data affecting cost (e.g., structures, improvements, fences).
3. Audits. IDOT will audit invoices in accordance with FHWA approved auditing procedures. Upon completion of the audit and resolution of any findings, IDOT will close out the Contract Obligation Document and submit a final voucher to FHWA.
4. Form BLR 13510. When MFT or TBP funds are used to pay a portion of the cost, the LPA is required to submit form [BLR 13510](#) upon completion of the project. This will close out the MFT or TBP portion of the project.

Chapter Twenty-three

PLAN DEVELOPMENT – Federal Funds

23-1 PLAN PREPARATION

The designer is responsible for preparing the plans so that they can be accurately constructed in the field. Chapter 23 discusses the procedures for plan preparation of federally funded projects.

23-1.01 Initiation

To properly prepare the plans, the designer must have a well defined scope of work. Section 11-1.01 discusses the required information and procedures for initiating a project.

23-1.02 Plan Types

Section 11-1.02 discusses the various plan types that are typically used to prepare a set of construction plans.

23-1.03 Plan Content

The designer should prepare the contract plans as simply as practical. Avoid the use of duplicated data and unnecessary cross-references. Section 11-1.03 presents guidelines for the various plan sheets used in the contract plans.

For State-let projects, include the contract number on each plan sheet.

23-1.04 Drafting Guidelines

See the *IDOT CADD Roadway Drafting Reference Guide* (CADD Manual) and Section 11-1.04 for a description on IDOT's drafting guidelines.

23-2 PLAN REVIEW**23-2.01 Preliminary Plan Review**

This is the most appropriate design stage for IDOT and other agencies that may have a role in the project to conduct a major review of the plans. This also may include a plan-in-hand field review, if deemed necessary. The preliminary plan review will occur after the designer has essentially completed the plans including the Cover Sheet, Plan and Profile Sheets, Detail Sheets, Cross Section Sheets, determination of pay items, special provisions, etc. During this stage, the designer should address any utility conflicts and determine if adjustments and/or agreements are necessary. The purpose of the preliminary plan review is to ensure that the plans are compatible with the approved Project Development Report and are in conformance with the design criteria presented in this *Manual*, other IDOT and local agency documents, and are appropriate for the site. All major comments must be made during this review period. Section 11-2.01 discusses the information and procedures required for the preliminary plan review.

23-2.02 Pre-Final Plan Review

Pre-final plans should be considered as final plans for review. If there are no preliminary review comments, these plans may be finalized, sent to the district, and then forwarded to the Central BLRS and BDE for letting. Prior to this review, the designer should:

- incorporate and/or address all comments made during the preliminary plan review,
- set up a plan-in-hand field review, if necessary, and
- determine the cost participation arrangements (e.g., federal, State, and local shares). These cost breakdowns should be noted on the Summary of Quantities Sheet.

IDOT and other agencies should be given the opportunity to review the pre-final plans to ensure that:

- their comments from the preliminary plan review have been incorporated or addressed in the disposition memorandum,
- the changes to the preliminary draft do not conflict with their commitments, and
- the plans still conform to the design criteria.

23-2.03 Final Plan Review

The purpose of the final plan review is to ensure that the reviewer's comments from the pre-final plan review have been addressed. Revisions or changes should not be necessary. If changes are deemed necessary, the reviewer should contact the designer directly.

23-2.04 **Final Plan Approval and Release**

Section 11-2.04 details the final plan approval and release.

23-3 SPECIFICATIONS AND SPECIAL PROVISIONS

23-3.01 General

Section 11-3 provides guidance on:

- *IDOT Standard Specifications for Road and Bridge Construction* (IDOT Standard Specifications).
- Supplemental Specifications,
- Recurring Special Provisions,
- BDE Special Provisions,
- Guide Bridge Special Provisions,
- Contract Special Provisions,
- preparation of project specific Special Provisions,
- patented or proprietary items,
- guaranty/warranty clauses, and
- specifying material.

23-3.02 Experimental Projects or Features

When an experimental feature is included in a federally funded project, the local agency must prepare an Experimental Features Work Plan for approval by the Central Bureau of Materials and Physical Research (BMPR) according to Section 11-3.06. FHWA approval or concurrence must be obtained prior to the submission of the plans for approval. The Central BMPR or the appropriate Project Development Engineer from the Central BLRS will obtain approval or concurrence from FHWA.

23-4 HIGHWAY STANDARDS

The *IDOT Highways Standards* are developed by the Bureau of Design and Environment (BDE) in collaboration with other Bureaus, and are approved for general use by BDE. Districts and local agencies may submit ideas and details for the *IDOT Highways Standards* to BDE.

The *IDOT Highways Standards* provide details on various design elements that are consistent from project to project. They provide information on how to construct the various design elements. Design data and/or specifications are not included on the highways standards. The designer is responsible for providing a copy of the standard in the proposal for local-let projects.

If plans are prepared as Abbreviated Contract Plans (8.5 in x 11 in (216 mm x 279 mm) sheets), a copy of each standard shall be included in the proposal for local and State let projects.

23-5 QUANTITY ESTIMATES

In addition to preparing clear and concise plans, as described in Section 23-2 and Section 11-1, the designer must compile an accurate summary of the project quantities. This information leads directly to the Engineer's Estimate, which combines the computed quantities of work and the estimated unit bid prices. An accurate summary of quantities is critical to prospective contractors interested in submitting a bid on the project. Section 11-5 and Chapter 64 of the *BDE Manual* presents guidelines on calculating quantities for highway construction projects.

23-6 COST ESTIMATES

An estimate is the predicted project cost at the time of receipt of bids developed from a knowledge of cost of labor, materials, equipment, overhead, profit, and incidental items. See Section 11-6 for guidance on local let projects. The following guidance applies to State let projects. Individual cost estimates are to be prepared by both the local agency and the district for all State awarded and local day labor projects.

23-6.01 Local Agency Requirements**23-6.01(a) Project Estimates**

Section 11-6.01 provides guidance on preparing project cost estimates.

23-6.01(b) Specialty Items

Certain items will require additional details. These items may include the following:

1. Estimates for Utility Adjustments. Prior to beginning work, a written agreement must be made between the local agency and utility defining the work responsibilities and estimate of cost. See Section 5-8 for guidance on preparing utility agreements and Section 41-11 for guidance on utility adjustments.
2. Cattle Passes. On projects involving the construction of cattle passes, the local agency is responsible for providing the following information:
 - the estimated cost of the stock passes,
 - estimated land value taken from the property owner plus any damages to the land not taken, if any,
 - the amount paid to the owner for the land, either in cash or other considerations, and
 - the estimated value to the traveling public because the stock crossing is underneath the roadway rather than at grade.

Because cattle passes are generally constructed as a right-of-way consideration, FHWA will not participate in their construction cost unless federal participation is involved in the acquisition of the right-of-way. If federal funds are not involved in the acquisition of right-of-way for cattle pass located on a waterway or natural channel for water, federal participation will be limited to the cost of a drainage structure sized for the anticipated runoff.

Where the improvement is on an existing road or street, the property owner will be responsible for the entire cost of the cattle pass. However, where the crossing is located on a waterway or natural channel for water, the owner will only be required to pay the additional cost required to increase the crossing beyond the cost of a drainage structure sized for the anticipated runoff. In special cases, the local agency may elect to join in the cost of the cattle crossing if it is more appropriate than an at-grade crossing. Where new or additional right-of-way is necessary, the value of the right-of-way can be considered as an offset on all or part of the cost.

3. Alternative Deliveries (Day Labor). On Federal-aid day labor projects, material proposals providing for the receipt of bids for a particular material for two or more alternative deliveries must have set forth therein unit price cost differentials for the purpose of determining the lowest bid favorable to the awarding authority.

This can be accomplished by predetermining and stipulating a certain unit price for unloading and a certain unit price for hauling the material in the material proposal. These unit prices, although estimated, should be as accurate as practical and be based on the best available estimate of cost for unloading and hauling.

23-6.01(c) Estimating Forms

Standard forms are available from each district for use by local agencies in preparing cost estimates for those pay items normally encountered during project construction (Form BDE-213). The information required to complete the forms can be obtained from the plans, material quotations, wage rates for the area, and the individual's knowledge of existing conditions.

23-6.02 IDOT Requirements

The local agency is required to prepare and transmit an "independent" estimate for the project to the district estimating engineer. The district estimator will review the local agency estimate and prepare a district estimate. This may be, but is not required to be, an independent estimate. If the district estimate is within 1% of the local agency's estimate, it will be entered into IDOT's Contract Management System (ECM). If the difference is greater than 1%, the district estimator will contact the local agency and negotiate an acceptable estimate for both parties. For guidance on IDOT's estimating procedures, see Chapter 65 of the *BDE Manual*.

23-7 PLANS, SPECIFICATIONS, AND ESTIMATES (PS&E) PROCESSING

23-7.01 PS&E Submittal

The local agency will submit PS&E for all improvements, including traffic signal and illumination improvements, to the district for review and approval. All highway plans must be sealed by an Illinois licensed professional engineer, which includes the licensee’s written signature, date of signing, and expiration date of the license. The plans must also be signed by an appropriate local agency official.

23-7.02 Approval of Bridge Plans

Bridge plans that are included in PS&E will be approved as follows:

1. Structural Engineer’s Seal, Signature, and Certification. The following applies to the requirements for a structural engineer’s seal, signature, and certification:

a. Plans Prepared by a Structural Engineer. For plans prepared by an Illinois licensed structural engineer, the seal of the structural engineer responsible for the design must be affixed to the plans. The plans must include the licensee’s written signature, date of signing, and expiration date of the license. The seal of a licensed professional engineer is not an acceptable substitute to the structural engineer’s seal.

b. Plans Prepared by the County Engineer (Non-Standard). The Engineer of Bridges and Structures will seal structure plans for counties, provided the plans have been prepared by a county engineer who is an Illinois licensed professional engineer. Sufficient time must be allowed for the review by the Bureau of Bridges and Structures (BBS). The county engineer will place the following statement on the General Plan and Elevation Sheet of the structure plans:

These plans were prepared by me or by a full-time member of my staff working under my personal supervision.

(P.E. Seal) Date: _____

Date of License
Expiration: _____

County Engineer
Illinois Licensed Professional Engineer #

If the design is found to be structurally adequate, the structural engineer’s seal of the Engineer of Bridges and Structures will then be affixed to the plans.

c. Certified Bridge/Box Culvert Plans. Local agency simple span bridges, continuous span bridges, and multiple box culverts are considered structurally

adequate by IDOT when the plans are appropriately certified by an Illinois licensed structural engineer. These certified structures should follow the design, standard details, and guidelines shown in the *IDOT Bridge Manual* and other Manuals maintained by the Bureau of Bridges and Structures (BBS). Review by BBS for structural adequacy and economical design will still be required for structures of unusual or complicated design, or for structures involving a State highway.

Place the following certification on the first sheet of the bridge plans:

I certify that to the best of knowledge, information and belief, this bridge/box culvert design is structurally adequate for the design loading shown on the plans. The design is an economical one for the style of structure and complies with requirements of the current *AASHTO Standard Specifications for Highway Bridges*.

The designer's Illinois structural engineer seal, as well as the written signature, date of signing, and expiration date of the license must accompany the above certification. This certification does not limit the responsibilities of the designer under 225 ILCS 325.

- d. IDOT's Standard Bridge Plans. IDOT's standard bridge plans have been accepted as structurally adequate and do not normally require a structural engineer's seal or certification. However, when the standard plans have been altered (e.g., modification of the substructure for use with a standard superstructure plan), a structural engineer's seal and certification must be affixed to the individual plan sheets of the special design. The licensee's written signature, date of signing, and expiration date of the license must also be included.
- e. Foundations Review. A foundation review by the BBS Foundations Unit is performed for all structures using IDOT's Standard Bridge Plans, unless the local agency elects to have this review performed by an Illinois licensed structural engineer. The foundations review includes consideration of pile type, negative skin friction, seismic affects, liquefaction, settlement, and slope stability. In order to facilitate this review, submission of foundation borings must be included with the Preliminary Bridge and Hydraulic Report.

If, in order to expedite review, a local agency elects to employ an Illinois licensed structural engineer to perform the foundations review of the structure, the structural engineer must be identified at the time of the Preliminary Bridge Design and Hydraulic Report (Form BLR 10210) submission. The structural engineer should take into account the issues above that are normally included in the BBS Foundations Unit review. Place the following certification statement next to the structural seal, signature, and date on the Standard Plan GP&E sheet.

I certify these Standard Bridge Plans for foundation treatment only.

- f. Seismic Review. For multi-span bridges in Items 1.b. and 1.c., a complete seismic analysis is required to ensure adequacy of the substructure and of the superstructure to substructure connection under seismic forces. This review may be performed, by request, by BBS. The local agency may use a qualified Illinois licensed structural engineer to perform this review. If so, place the following certification statement next to the structural seal, signature, and date on the Standard Plan GP&E sheet:

I certify these Standard Bridge Plans for seismic adequacy.

If the structural engineer is sealing the Standard Plans for both seismic and foundations, use the following certification statement:

I certify these Standard Bridge Plans for seismic adequacy and foundation treatment.

2. Hydraulic Responsibility. The responsibility for hydraulic and hydrological analyses and the geometrics of a bridge/box culvert lies with an Illinois licensed professional engineer. Therefore, all structure plans (including certified and standard bridge plans) require a professional engineer's seal, signature, date of signing, and expiration date of the license. The local agency and the designer are responsible for ensuring that PS&E conform to the Division of Water Resources construction permit and the approved Preliminary Bridge Design and Hydraulic Report.
3. Modifications to Approved Submittals. Revisions to the structure type, loading, hydraulic opening, profile grade, geometry, or other pertinent items from those shown in the approved Preliminary Bridge Design and Hydraulic Report may require resubmittal and approval from BBS.

Certain modifications, left unapproved, may invalidate the previous permit or approval. The BBS Local Bridge Unit should be contacted to determine the materials necessary for resubmittal and approval.

4. Preliminary Bridge Design and Hydraulic Report (Form BLR 10210) Approval. After IDOT approval of form BLR 10210, the local agency will not be required to submit the design plans for review and approval except for the following situations:
- when the plans are to be signed and sealed by the Engineer of Bureau of Bridges and Structures, for local agencies who have prepared the plans using a non-structural engineer;
 - for complex, unique, or major bridges, and/or
 - for city streets over State highways.

23-7.03 Approval of Contract Plans

The district will review and approve the plans and specifications and the local agency's estimate without prices for all projects, excluding railroad crossing improvements. The Central BLRS will review and approve the PS&E documentation for all railroad crossing improvements.

Some structures require the approval of the Engineer of Bridges and Structures, see Section 23-7.02. For these structures, the local agency should submit the original mylar of the General Plan and Elevation (GP&E) Sheet only after the final plans and special provisions have been reviewed and approved by BBS, and the licensed professional structural engineer stamp and signature has been obtained.

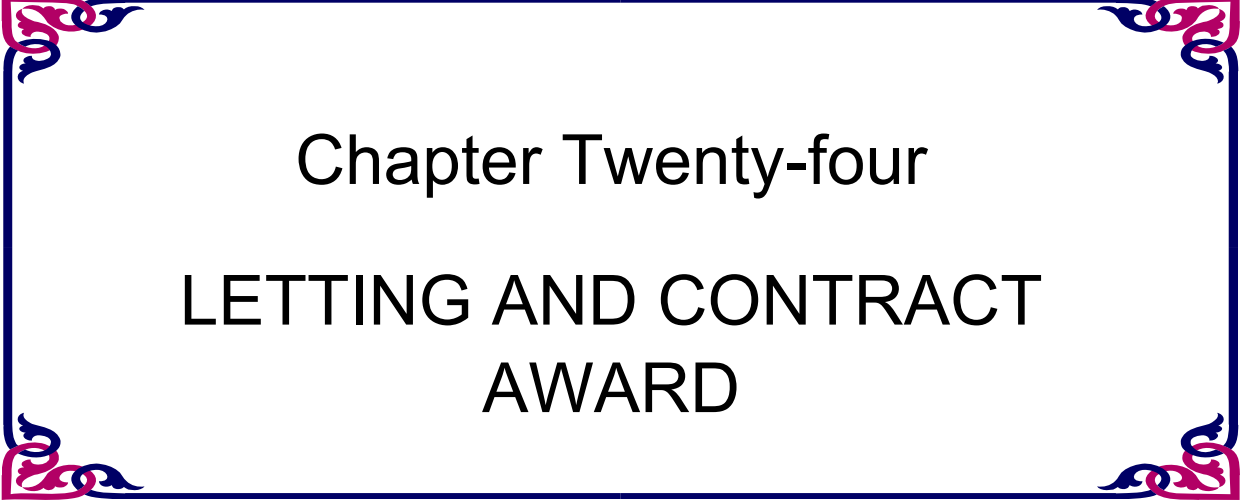

The seal, certification, and signature of the Illinois licensed structural engineer that is responsible for the project must be provided on the GP&E sheet prior to submittal to IDOT. Additionally, provide a space approximately 4 in x 4 in (100 mm x 100 mm) on the GP&E sheet for BBS approval.

23-7.04 Approval of Traffic Signal Plans

District One will review and approve the traffic signal PS&E for projects on the State Highway System. For other districts, submit the respective traffic signal PS&E for local agency projects to the Central BLRS for review and concurrence by the Central Bureau of Operations. After the Central Bureaus have completed their reviews, the district will approve plans. The district may approve all project plans based on the previously approved traffic signal prints after the review by Central Bureau of Operations.

23-7.05 Approval of Lighting Plans

See Section 11-2.01(c) and Section 11-7.04.

Chapter Twenty-four

LETTING AND CONTRACT AWARD - Federal Funds

Chapter 24 discusses the letting and contract award requirements for State let projects and federally funded local let, and day labor projects.

24-1 STATE LET PROJECTS

24-1.01 Local Agency Submission

24-1.01(a) Content

For State let projects, the local agency is responsible for submitting PS&E to the district for approval. For all PS&E packages, include the following information:

- original plan sheets, paper, and mylar are both acceptable. If paper is used, the cover sheet and the summary of quantities must be mylar. Final plans submitted should not contain suffix pages. Total sheet count should match total sheets in set. Pay item names should not be abbreviated,
- a copy of the draft joint agreement,
- the estimate of time,
- construction cost estimate,
- any Special Provisions,
- a completed "Check Sheet of Supplemental Specifications and Recurring Special Provisions," BDE Special Provisions,
- the status of right-of-way and utilities, and
- rail agreements, U.S. Army Corps of Engineers permits, and Storm Water Pollution Prevention Plan, where applicable.

24-1.01(b) Plans and Specifications

The local agency should ensure the following is completed when submitting the plans and specifications:

1. Special Provisions. Submit 3 copies of the Special Provisions to the district. Ensure that the Special Provisions included in the submission are camera ready originals, not copies, printed on one side, and are on letter sized plain white bond paper.

BUREAU OF LOCAL ROADS & STREETS

24-1(2)

LETTING AND CONTRACT AWARD - Federal Funds

Jan 2006

2. Estimate of Time Required. Exercise care when estimating contract time. Contract time, working days, and calendar days are defined in the *IDOT Standard Specifications*. Unreasonable time limitations will unnecessarily increase bid prices and the potential for claims, which is especially important if the proposal includes provisions for liquidated damages. However, time is of the essence on all construction projects. Once work has begun, the traveling public expects the construction to be completed in a timely manner with minimal delays. Excessive working days will allow the contractor to delay the completion of the project. The procedures and factors to consider when estimating contract time are discussed in Section 66-2 of the *BDE Manual*. Submit 4 copies of Estimate of Time Required (Form BDE-220).
3. IDOT Highway Standards. List the applicable *IDOT Highway Standards*, by number and title, in the index on the Plan Title Sheet. However, do not assign them a sheet number. These sheets will be inserted in the plans when they are printed.
4. Check Sheet. Submit the "Check Sheet for Supplemental Specifications and Recurring Special Provisions" with the applicable Special Provisions denoted by an "X." Show the route, section number, project number, and local agency name in the upper, right hand corner of the check sheet. Submit 4 copies of the check sheet.

24-1.01(c) Estimates

The local agency is responsible for preparing two separate Estimates of Cost Sheets (Form BDE-213), one with prices and one without. These are described as follows:

1. Estimate of Cost with Prices. Submit all estimates for local agency Federal-aid projects to be included in the State letting, directly to the district BLRS. Plainly mark the enclosing envelope "Confidential."
2. Estimate of Cost without Prices. Submit 3 copies (unless submitted electronically) of the Estimate of Cost without prices with the plans to the district. Include a summary of the quantities clearly listing the quantities, units, and pay items. Do not abbreviate pay item names.

24-1.02 IDOT Review and Approval

24-1.02(a) District Office

The district will perform the following functions:

1. Certification/Project Status. The district will complete the Certification/Project Status (Form BLR 24110) and include it with all PS&E submittals to the Central BLRS. This submission must be made at least 9 weeks before the scheduled letting date.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

Jan 2006

LETTING AND CONTRACT AWARD - Federal Funds

24-1(3)

2. Supporting Documentation. In addition to form BLR 24110, the district will include the following:
 - transmittal memo,
 - original plans,
 - project number, see Section 2-4,
 - 2 copies of the Special Provisions,
 - 2 copies of the Estimate of Time (Form BDE-220),
 - 2 copies of the "Check Sheet for Supplemental Specifications, Recurring Special Provisions" and BDE Special Provisions,
 - 2 copies of the Estimate of Cost without prices,
 - the status of utilities, if not addressed in the Special Provisions, and
 - rail agreements, U.S. Corps of Engineers permits, and Storm Water Pollution Prevention Plan, where applicable.

3. Independent Estimate. The district will prepare an independent estimate. The district estimate of cost will be compared to the completed estimate of cost prepared by the local agency. If the district's estimate varies by more than 1% from the local agency estimate, the district will contact the local agency to resolve the discrepancy.

24-1.02(b) The Bureau of Design and Environment Engineer of Estimates

The BDE Engineer of Estimates will review and approve all project estimates with prices. The BDE Engineer of Estimates will consult with the district to resolve differences.

24-1.03 Letting and Award

Adherence to the criteria contained in this Section is a necessary prerequisite to advance the construction of all Federal-aid projects. See Section 24-2 and 24-3, respectively, for additional information on federally funded local let and day labor projects.

24-1.03(a) Preparation/Assembly of Proposals

A proposal refers to the total compilation of pertinent bidding information relative to the project and assembled into a single booklet for issuance to prequalified bidders; see Section 24-1.03(d). The Project Support Unit in the Central BLRS is responsible for the preparation and assembly of proposals necessary for the successful completion of State-let projects. Consider the following:

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

24-1(4)

LETTING AND CONTRACT AWARD - Federal Funds

Jan 2006

1. Contents of Proposals. See Chapter 66 of the *BDE Manual* for additional guidance on the proposal contents. The proposal will state the location and description of the contemplated construction and will show the pay items. The proposal will include:
 - Notice to Bidders,
 - Proposal Form,
 - Schedule of Prices,
 - State required *Ethical Standards Governing Contract Procurement Assurances, Certifications, and Disclosures*,
 - Bidder's Employee Utilization Form (Form BC-1256),
 - Signature Sheet,
 - Proposal Bid Bond Form,
 - Check Sheet for Supplemental Specifications and Recurring Special Provisions,
 - Special Provisions including Special Provisions for DBE, and EEO and Affirmative Action percentage goals/forms,
 - Required Contract Provisions, and
 - Wage Rates Notice.
2. Wage Rates. Federal wage rates define the payment of wages for laborers, mechanics, and other workmen involved during the project construction. These rates, as determined by the U.S. Secretary of Labor, will be included in all Federal-aid contracts. These wage rates do not apply to Transportation Enhancement projects not located on Federal-aid highways.
3. DBE Requirements. Local agency projects awarded by IDOT (e.g., projects advertised in the *IDOT Transportation Bulletin*) will follow the DBE Program developed by IDOT.

24-1.03(b) Advertisement for Bids

An advertisement is a public announcement, as required by law, inviting bids for work to be performed or materials to be furnished. All Federal-aid projects must be advertised for bidding. IDOT issues advertisements for proposed State let projects in the *Transportation Bulletin*.

24-1.03(c) Securing Right-of-Way Prior to Advertisement

All right-of-way must be secured before the project is authorized by FHWA and advertised for letting. For the right-of-way to be clear, the right-of-way must be secured, paid for, and vacated. Prior to each letting, the district must submit a right-of-way certification letter to the Central BLRS for each project involving right-of-way at least 2 days before authorization. This letter

HARD COPIES UNCONTROLLED

should originate from the district Land Acquisition Section. It is important that the district Land Acquisition Section review is completed by the scheduled date, because FHWA requires right-of-way certifications before projects are authorized for advertisement. For purposes of reporting the right-of-way status, right-of-way includes all fee simple acquisitions, permanent or temporary easements, and/or temporary use permits required for the construction, operation, and maintenance of any project that is being considered for advancement to the letting stage. Secured right-of-way that requires the displacement of any individuals, families, businesses, or farm operations, or any of their personal property situated thereon, is considered vacated only when those being displaced have relocated themselves and all their personal property from the acquired right-of-way. For further guidance, see *IDOT Land Acquisition Manual*.

24-1.03(d) Issuance of Proposals and Plans

IDOT has established the following requirements with respect to contractor participation in the bidding process for lettings.

1. Authorization to Bid. Authorization to bid is issued to prequalified contractors who have sufficient financial and work ratings that indicate their ability to complete work on which they wish to bid. Requests for authorization to bid are submitted to the Central Bureau of Construction's Prequalification Section using the forms provided in the *Transportation Bulletin* or on the IDOT website. The Prequalification Section analyzes each request for authorization to determine if the contractor has sufficient prequalification. Upon determination of sufficient prequalification, notification is given to the Proposals and Contracts Subunit to send letters of authorization to bid to the contractor.
2. Subcontractors and Material Suppliers. Subcontractors and material suppliers are not required to be prequalified and will not be considered authorized to bid.
3. Addendums to Proposals and Plans. When an addendum will be issued on a project, the Central BLRS Project Support Unit will issue the addendum. Addendums will be posted on IDOT's website.

24-1.03(e) Letting of Projects

A letting is the official, public opening and reading of submitted bids by the awarding authority for the purpose of determining the lowest responsible bidder. At the time and place specified in the *Transportation Bulletin*, the total amount of each bid, including any alternates and combinations, is read aloud to those parties present.

24-1.03(f) Award/Execution of Contracts

An award is the decision of IDOT to accept the proposal of the lowest responsible bidder for the work, subject to the execution and approval of a contract and receipt of a contract bond. The following applies to contracts:

1. Award of Contract. The award of contract will be made within 45 days after the letting to the lowest responsible, qualified bidder whose proposal complies with all prescribed requirements. If the contract is not awarded within this time limit, a bidder may file a written request to IDOT and withdraw the bid. The following applies to the awarding of contracts:

Concurrence. The local agency must concur with the award. To expedite the contract award process, form BLR 05310 states that executing the joint agreement constitutes concurrence in the award of the construction contract to the lowest responsible bidder. All non-standard agreements should contain similar language. The local agency is responsible for providing the district with verbal concurrence after the letting.

Post-Letting Review. On the day of the State letting, BDE will publish a post-letting review, indicating the preliminary intent to award. This list is available on the IDOT web page by 3:00 pm on the day of the letting and only indicates if a project is within the awardable range. The following applies:

For projects within the awardable range, it is the district's responsibility to verify and notify the Central BLRS that the local agency concurs in the award. The award process will be initiated when notification is received from the district.

For projects outside the awardable amount of the Engineer's Estimate, the Central BLRS will discuss with BDE the issues concerning the project. If BDE believes that an award may be possible, the district should then contact the local agency to obtain their concurrence and notify the Central BLRS of the local agency's consent. Depending on the issues involved, BDE may request a letter from the local agency justifying their desire to award a project.

Because the award committee will meet on the second Tuesday after the letting, the district should notify the Central BLRS of the local agency's desire by early that morning so that the Central BLRS can make recommendations to the award committee and not delay the award process.

Award and Rejection Letters. An award letter is sent to the low bidder stating the bid prices and indicating if railroad insurance is required. A rejection letter is sent only to the second low bidder. If all bids are rejected, both the low bidder and second low bidder are sent a rejection letter.

Preparation of Contract. When a project is awarded, a contract is prepared by BDE and sent to the low bidder for execution.

BUREAU OF LOCAL ROADS & STREETS

Jan 2006

LETTING AND CONTRACT AWARD - Federal Funds

24-1(7)

2. Execution of Contract. The contract must be executed by the successful bidder and returned to BDE, together with the Contract Bond, within 15 days after the contract has been mailed to the bidder.

Failure of the successful bidder to execute the contract and file acceptable bonds within 15 days after the contract has been mailed to the bidder will be a just cause for cancellation of the award and forfeiture of the Proposal Guaranty. Award may then be made to the next lowest responsible bidder, or the work may be readvertised, as IDOT may decide. If the contract is not executed by IDOT within 15 days following receipt from the bidder of the properly executed contracts and bonds, the bidder may withdraw its bid without penalty.

3. Post Award Documents. After the project is awarded, the Central BLRS will prepare the detailed estimate, the project agreement, and the award notice. These are used as the basis for paying the contractor, billing the local agency for its share of the cost, and getting reimbursement from FHWA.

HARD COPIES UNCONTROLLED

24-2 LOCAL LET FEDERALLY FUNDED PROJECTS

24-2.01 Candidate Projects for Local Letting (Federal Funds)

Local let projects with federal funds may include:

- enhancement projects being constructed in conjunction with a larger MFT or local financed project
- projects so small that a local letting is more appropriate
- projects of a type not typically included in State lettings (e.g., buildings),
- non-highway projects (e.g., independent bikeways, sidewalks, landscaping), and
- projects for which federal funds are included in materials only.

Other instances will be determined on a case by case basis by the Central BLRS and the District Local Roads Engineer.

24-2.02 Approval of Local Agency to Local Let

If a local agency is found to be adequately staffed, IDOT may extend to the local agency the authority to let and award projects, but reserves the right for concurrence or rejection in the award. The district will submit to the Central BLRS a request from the local agency to administer a local letting. The memo will indicate that the district has determined the local agency is capable of administering a letting and contract for the type of project involved and include any district recommendations. The Central BLRS must concur in the request before any commitments to the local agency are made and prior to any the preparation of any documents.

24-2.03 Disadvantaged Business Enterprise Program (DBE)

The purpose of this program is to ensure the use of DBE's in all aspects of contracting by a local agency when federal funding is involved. The local agency will use this program for the procurement of consultant engineering and any procurement for construction projects that are awarded. This program should be circulated throughout the local agency's organization and to minority, female, and non-minority community business organizations. The following applies:

24-2.04 Contractor Prequalification Requirements

All prospective bidders on construction contracts estimated to cost more than \$50,000 must be prequalified. See Section 12-3.03(b) for additional information on prequalification. Consider the following:

1. Highway Projects. IDOT prequalification is required for highway related projects.

BUREAU OF LOCAL ROADS & STREETS

24-2(2)

LETTING AND CONTRACT AWARD - Federal Funds

Oct 2008

2. Non-Highway Projects. For non-highway projects (e.g., independent bikeways, sidewalks, landscaping), the local agency may request approval to use established local contractor qualification procedures.
3. Building Projects. The Capital Development Board (CDB) prequalification is required for building construction projects. The local agency should obtain a list of prequalified contractors from CDB one week prior to issuing any proposals. The local agency should require contractors to provide a copy of their CDB prequalification letter prior to receiving bidding documents.

24-2.05 Proposal Submittal and Review

For local let federally funded projects, the local agency is responsible for submitting the proposal to the district for the Central BLRS approval. The following applies:

1. Contract Proposals. Include the following with the contract for local let projects with federal funds:
 - BID Cover Sheet (Form BLR 12210),
 - Notice to Bidders (Form BLR 12220),
 - Contract Proposal (Form BLR 12221),
 - Schedule of Prices (Form BLR 12222),
 - Proposal Signatures (Form BLR 12223),
 - Proposal Bid Bond (Form BLR 12230),
 - Affidavit of Availability (Form BC-57), if IDOT prequalification is required,
 - Modified DBE Special Provision, if applicable,
 - DBE Participation Statement (Form SBE-2025), if applicable,
 - DBE Payment Agreement (Form SBE-2115), if applicable,
 - DBE Utilization Plan Modified for Use by the local agency (Modified Form SBE-2026), if applicable,
 - Bidder's Employees Utilization Form (Form BC-1256),
 - Certification and Assurances,
 - Check Sheet for Supplemental Specifications and Recurring Special Provisions,
 - Contract Special Provisions,
 - Required and Applicable Local Roads Special Provisions, BDE Special Provisions including for DBE participation in local-let contracts, and Guide Bridge Special Provisions,

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

Oct 2008

LETTING AND CONTRACT AWARD - Federal Funds

24-2(3)

- FHWA 1273 required Contract Provision,
 - Federal Wage Rates, and
 - Subcontractor Payment Agreement (Form BC 2115) if applicable (to be completed upon completion of the project).
2. Material Proposals. Include the following with material proposals for local let projects:
- BID Cover Sheet (Form BLR 12210),
 - Notice of Material Letting Material Proposal (Form BLR 12240),
 - Material Schedule of Prices (Form BLR 12241),
 - Check Sheet for Supplemental Specifications and Recurring Special Provisions,
 - Required and Applicable Local Roads Special Provisions, BDE Special Provisions, and Guide Bridge Special Provisions,
 - Contract Special Provision, and
 - Federal and State Prevailing Wage Rates, if applicable.
3. Environmental Requirements. All federal environmental requirements must be met for the entire contract as set forth in Chapters 18 and 19.
4. Right-of-Way. Federal right-of-way requirements must be met for the entire contract. This includes the Bureau of Land Acquisition certification.
5. Estimates. The District Estimator will review and advise the local agency and district of their findings. The Estimator will not need to establish an estimate in the BDE Contract Maintenance (ECM) System; however, standard pay item numbers should be used whenever possible to aid in estimate review.
6. EEO/DBE Considerations. The District BLRS Engineer will request the District EEO and the Labor Compliance Officer to review the project for compliance with the DBE requirements and establish required DBE percentage goals, where applicable. If DBE participation is assigned for the project, include the Special Provision "Modified DBE Special for Local Let and Awarded Projects" and the "Utilization Plan Modified for Use by local agency" in the bidding proposal. The contractor will submit its DBE Utilization Plan to the local agency within 7 working days of the letting.
7. Wage Rates. Federal wage rates apply to the entire contract. In any material proposals for day labor projects that contain bid items to be directly incorporated into the work with other than local agency forces (e.g., roadway components bid in place). The payment of prevailing wage rates relative to bid items in material proposals that are not directly incorporated into the work is governed by 820 ILCS 130/3 and may or may not apply. The current law appears to exempt hauling by material suppliers to a stockpile location. Wage rates included in material proposals apply only to that work performed by other than local agency forces. Do not include the wages of local agency forces in the bidding

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

24-2(4)

LETTING AND CONTRACT AWARD - Federal Funds

Oct 2008

documents. However, the wages paid to employees of the local agency should also comply with the appropriate requirements of 820 ILCS 130/4.

8. Certification/Project Status (Form BLR 24110). The district will approve and submit to the Central BLRS a copy of the proposed bidding proposal, form BLR 24110, and the PS&E. Federal participating items need to be broken out on all plans and estimates.

The Central BLRS will review proposal submittals to ensure compliance with federal requirements. Any additional requirements that need to be included will be sent to the district for inclusion in the approved bidding proposal. The Central BLRS will request federal authorization after receipt of the locally executed joint agreement and obligation of funds when all requirements have been addressed.

24-2.06 Advertisement

The Central BLRS will notify the district in writing when the project may be advertised in the *Notice to Contractor's Bulletin* and locally. A twenty-one (21) day advertisement period is required. See Section 12-3.01 for guidance on advertisements. The local agency may also advertise building construction contracts in the Capital Development Board Bid Information Newsletter. The Central BLRS will contact CDB if the local agency wants to advertise in the CDB Newsletter. The Central BLRS will coordinate the advertisement with CDB. Notify the Central BLRS as soon as practical when intending to advertise in the CDB Newsletter.

24-2.07 Letting and Award

The district is required to attend the local letting to ensure compliance with IDOT procedures. The Central BLRS will concur in the award for local-let contracts based on submission of the following:

- Recommendation to Award from the local agency and the district,
- Tabulation of Bids,
- Affidavit of Availability (Form BC-57), if applicable, and
- DBE Utilization Plan Modified for Use by local agency, if applicable.

The Central BLRS will concur in the award for local let, material only projects based on submission of the following:

- Tabulation of Bids, and
- the recommendation to award from the local agency and the district.

The district will approve the executed contract or Acceptance of Proposal to Furnish Material and Approval of Award (Form BLR 12330) and forward one copy to the Central BLRS. The

24-3 LOCAL DAY LABOR PROJECTS (FEDERALLY FUNDED)

23 C.F.R. 635 provides that a local agency may perform federally funded construction work either by contract or by day labor. Section 24-3 of this Manual describes the procedures that will ensure compliance with legal requirements, the timely execution of project documents, and the completion of the proposed local day labor project. All environmental, public involvement, and design issues shall be addressed and the project included in IDOT's Annual Program in the fiscal year construction is anticipated.

24-3.01 Local Agency Assessment

A local agency desiring to perform Federal-aid work with its own forces will prepare an assessment of its capabilities. The assessment should include all day labor projects proposed for a program year. The assessment will identify the local agency, section number(s), project number(s), and the information presented in the following Sections.

24-3.01(a) Contents

The assessment should contain the following:

1. Proposed Work. Include a description of work to be performed for the section(s) (e.g., termini, length, scope, estimated costs, estimated working days, major construction pay items).
2. Previous Work. Include a description of work of this type that the local agency has previously performed with its own forces (e.g., section number if applicable, length, scope, working days). Previous work performance by the local agency must demonstrate that the local agency can perform the proposed work in accordance with the *IDOT Standard Specifications*.
3. Personnel. Include a list of key personnel and their related experience that qualifies them to carry on all phases of the work properly and economically. Identify the resident engineer/resident technician in charge of construction, along with any other inspectors and their documentation training, as well as other pertinent training; or provide documentation of the resident engineer's experience and past performance. The resident engineer/resident technician assigned to the project by the local agency must have successfully completed IDOT's documentation class, or the local agency must provide documentation of satisfactory past performance of the assigned personnel. The completion of appropriate Specific Task Training Program courses is desirable.
4. Equipment. List the equipment needed to perform the work and to perform necessary testing, and indicate if it is owned or leased by the local agency. Identify all agencies that will be used to perform special testing. Sufficient local agency owned or leased equipment and forces must be available to perform the work required, and the

BUREAU OF LOCAL ROADS & STREETS

24-3(2)

LETTING AND CONTRACT AWARD - Federal Funds

Oct 2008

equipment must conform to the requirements prescribed in the *IDOT Standard Specifications*.

5. Other Information. Include any other information that will assist IDOT in its decision to approve this work to be performed by day labor forces.

24-3.01(b) Submittal

The local agency will submit the Local Agency Assessment to Perform Federal-Aid Work by Day Labor Forces to the district. Based upon the district's review of the local agency's capability, the district will forward the assessment with an appropriate recommendation to Central BLRS. In the case of counties, day labor projects will only be approved when a fully qualified county engineer is in place.

24-3.01(c) BLRS Review

The Central BLRS, once satisfied with the recommendation, will forward the local agency assessment to the Deputy Director of Highways for approval of projects estimated to cost greater than \$100,000. All other projects will be approved by the Central BLRS. Formal concurrence will be provided to the district.

24-3.02 PS&E Submittal

The local agency is responsible for submitting the PS&E to the district. The following applies:

1. Estimate. Estimates for day labor projects should be prepared using the BDE publication *Data for Cost Estimates of Highway and Street Construction*. The total estimate must be broken down into an estimate for proposed material costs and an estimate for proposed labor and equipment costs. If the local agency proposes to use existing stockpiled materials or material from approved quotations, documentation of costs established through competitive bidding will be required.

The BDE Engineer of Estimates will review the total estimate, accompanied by the material cost estimate, the labor, equipment cost estimate, and the supporting documentation. A comparison will be made to like pay items included in State let contracts that have been awarded in the area of the proposed work. For projects over \$30,000, it must be demonstrated that the use of day labor procedures is cost effective (e.g., contract construction versus day labor construction). If the proposed unit prices are not acceptable, the local agency will be notified to resolve differences and establish mutually acceptable pay items costs. A copy of the revised estimate will be sent to the district and local agency when applicable.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

Oct 2008

LETTING AND CONTRACT AWARD - Federal Funds

24-3(3)

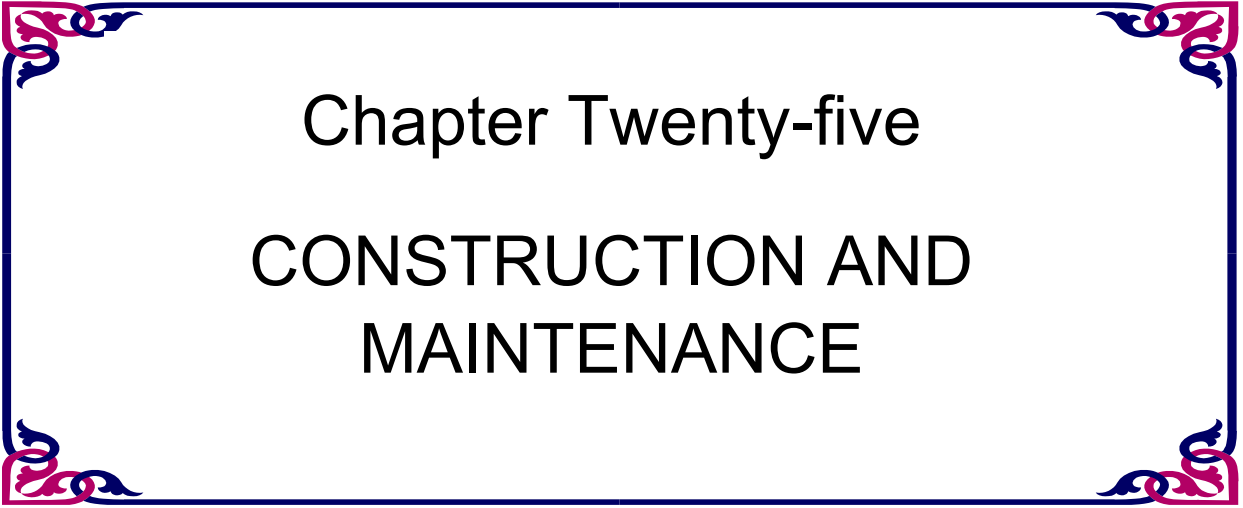

2. Plans, Specifications, and Material Proposals. Submit the plans, specifications, and material proposal with supporting documentation to the district. See Section 24-2.05 for contents of the material proposal.
3. Local Agency Agreement of Federal Participation (Form BLR 05310). The local agency will execute and submit to the district form BLR 05310 (See Chapter 5).
4. Certification/Project Status (Form BLR 24110). The district will complete form BLR 24110 and include it with the PS&E submittal to the Central BLRS.
5. Federal Authorization. Federal authorization will be requested once the plans, specifications, and estimate are approved and form BLR 05310 has been executed.

24-3.03 Letting and Award

The following procedures will apply:

1. Advertisement. After FHWA authorization is received, the local agency will be given authorization to advertise for bids on the items contained in the material proposal. All material lettings will be advertised for letting in the *Notice to Contractor's Bulletin* for a period of 21 days.
2. IDOT Approval. The Regional Engineer may proceed with the approval of form BLR 12330 and written notice to proceed with construction if the total project cost does not exceed the approved estimate by more than 5%. Any adjustment of quotations should also be considered in this 5% limit. All other bids will be submitted to the Central BLRS for review and approval prior to district approval of the form BLR 12330 and notice to proceed with construction. The district must submit a copy of their notice to proceed, bid tabs, documentation to support quotations, and/or stockpile materials, and a copy of completed "Schedule of Prices," when applicable, to the Central BLRS for all projects.
3. Unit Prices Agreement. The acceptable labor and equipment costs and the acceptable low bid material prices are combined to establish a unit price for each pay item. The Central BLRS will issue a letter instructing the local agency to adopt at their next board/council meeting form BLR 24310. The agreement establishes the unit prices with extensions and the total cost. These unit prices remain fixed for the duration of the project. The district will submit form BLR 24310 to the Central BLRS for IDOT execution. The project is entered into the Bureau of Construction's pay system at this point to be used as a basis for reimbursing the local agency. Projects costing less than \$30,000 will not be issued through the Bureau of Construction. The Central BLRS will pay the invoices for these projects.
4. Post Award Documentation. The Central BLRS prepares the detailed estimate and award report.

Chapter Twenty-five

CONSTRUCTION AND MAINTENANCE - Federal Funds

25-1 CONSTRUCTION

The Federal Highway Administration (FHWA) defines construction as:

“the supervising, inspecting, actual building, and all expenses incidental to the construction or reconstruction of a highway...and improvements which directly facilitate and control traffic flow...”

Section 25-1 briefly describes the policies and procedures for projects constructed with Federal funds.

25-1.01 Responsibilities

For the purposes of this Section, responsibilities are limited to activity between the preconstruction conference and the termination of construction by the contractor.

For information on the preconstruction conference, see Section 13-1.01 and the Bureau of Construction Memorandum No. 70, “Preconstruction Conference Guidelines.”

25-1.01(a) Contractor Responsibilities

The *IDOT Standard Specifications* and contract documents detail the contractor’s responsibilities.

25-1.01(b) Local Public Agency Responsibilities

If the construction is under the direct supervision of the local public agency (LPA), the LPA will provide a full-time LPA employee in responsible charge, a resident construction supervisor, and project inspectors to perform the functions outlined in Section 25-1.02 and the *IDOT Construction Manual*.

The full-time LPA employee in responsible charge and the resident construction supervisor represents the LPA and IDOT in dealings with the contractor, governmental agencies, and the public.

When a LPA uses its own forces to construct a project, the LPA also assumes the contractor’s responsibilities.

25-1.01(c) IDOT Responsibilities

IDOT has been designated as the official agency to administer Federal funds subject to FHWA review. The Regional Engineer is the project approval authority for construction matters coordinated with the Central Bureau of Construction for State-let and most local day labor projects.

25-1.01(d) Federal Responsibilities

The FHWA is the designated Federal agency to review highway project compliance with Federal rules and regulations.

25-1.02 Supervision and Inspection**25-1.02(a) General**

Federal Regulations provide that IDOT has responsibility for construction work involving Federal funds and requires that the work be satisfactorily completed according to the plans and specifications. All materials that are used for construction will be inspected and tested for compliance with the requirements of the *IDOT Standard Specifications*, the *Project Procedures Guide (PPG)*, and the project Special Provisions.

Supervision and inspection will be performed in accordance with the *IDOT Construction Manual* issued by the Bureau of Construction and the *PPG* issued by the Bureau of Materials and Physical Research. All reports will be on forms required for State construction contracts distributed in the manner indicated in the introduction to the forms and reports section of the *IDOT Construction Manual*.

25-1.02(b) IDOT Review

This general supervision by IDOT is not intended to replace the supervision and inspection required of the LPA. However, engineers from the district will make inspections on Federal-aid projects at times selected by them. LPA employees and consultants will cooperate with the IDOT representatives with their inspections. Any deviations from the plans and *Specifications* noted by the district will be called to the attention of the LPA. The district will note their comments in the project diary, and refer matters that require action promptly to full-time LPA employee in responsible charge and the resident construction supervisor. The district will also conduct progress and final documentation reviews in accordance with the documentation procedures in the *IDOT Construction Manual*.

The Regional Engineer will designate one or more staff engineers to be responsible for the supervision of construction for Federal-aid projects. The staff engineer's responsibilities are as follows:

- Inspect each contract at an early stage to determine that project personnel are knowledgeable of the *Specifications* and contract documents and are performing proper contract administration and documentation.
- Be present during or prior to the onset of major work items.
- Make final inspection in conjunction with the LPA.
- Notify FHWA of satisfactory completion of the contract.

25-1.02(c) Local Public Agency Construction Supervision

Supervision of construction is a function of the LPA and its engineers and inspectors.

BUREAU OF LOCAL ROADS & STREETS

Jan 2012

CONSTRUCTION AND MAINTENANCE - Federal Funds

25-1(3)

1. Local Public Agency Resident Construction Supervisor. Preferably, the county engineer, municipal engineer, or a full-time publicly employed registered professional engineer should be named the resident construction supervisor for the project. If this is not possible, the LPA will submit to the district for approval Form BC-775 that recommends a qualified full-time publicly employed individual or consulting engineer to serve as the resident construction supervisor.

If a consulting engineer is requested as the resident construction supervisor, the local public agency will:

- provide a full-time employee of the LPA to be in responsible charge of the project;
- require the consulting engineering firm to have Construction Inspection prequalification and for the consultant employee named as resident construction supervisor to have Documentation of Contract Quantities certification; and
- attach approved Form BC-775 to the appropriate LPA/consultant agreement form.

The full-time public employee in responsible charge of the project should perform the following duties and functions:

- Administer inherently governmental project activities, including those dealing with cost, time, adherence to contract requirements, construction quality and scope of projects;
- Maintain familiarity of day to day project operations, including project safety issues;
- Make or participate in decisions about changed conditions or scope changes that require change orders or supplemental agreements;
- Visit and review the project on a frequency that is commensurate with the magnitude and complexity of the project;
- Review financial processes, transactions and documentation to ensure that safeguards are in place to minimize fraud, waste, and abuse;
- Direct project staff, agency or consultant, to carry out project administration and contract oversight, including proper documentation; and
- Aware of the qualifications, assignments and on-the-job performance of the agency and consultant staff at all stages of the project.

The selection and Regional Engineer approval of the resident construction supervisor will be completed prior to the start of construction and the pre-construction conference minutes should reflect the name and position of the resident construction supervisor and the full-time public employee in responsible charge if different than resident construction supervisor.

2. Trained Technicians and Qualified Laboratories for Material Testing. Requirements for trained technicians and qualified laboratories are covered in IDOT's *Project Procedures Guide*.

BUREAU OF LOCAL ROADS & STREETS

25-1(4)

CONSTRUCTION AND MAINTENANCE - Federal Funds

Jan 2012

3. Local Public Agency Construction Inspectors. The individuals who perform the day-to-day duties of layout, inspection, quantity measurements, and documentation may be either public employees or consultant employees. It is the responsibility of the resident construction supervisor to ensure that adequate instructions have been given to the project inspectors concerning the requirements of the contract documents and the procedures contained in the *IDOT Construction Manual*.

The LPA will submit Form BC-776 to the district certifying that inspector(s) are trained and qualified to perform the day-to-day duties. If a consultant is selected as a project inspector, Documentation of Contract Quantities certification is required and the LPA will attach BC-776 to the appropriate consultant agreement form.

25-1.02(d) Inspection and Testing of Material

See Section 13-3 for detailed guidance on material inspection and testing.

25-1.03 Progress Billing

After the "Authorization to Proceed" has been given and a portion of the work has been completed, progressive billing (partial payments) may begin. The methods of payment will depend upon the type of work involved.

25-1.03(a) Utility Adjustments and Relocations

The LPA may pay the utility company for partial work completed in accordance with the provisions of the utility agreement. A request for reimbursement of the Federal funds should be sent to the district with supporting documentation.

25-1.03(b) Railroads

The railroad will conduct progressive billing in accordance with the stipulations and conditions included in the railroad agreement. The majority of agreements contain the following basic procedures:

The railroad company, for performance of its work, may bill IDOT monthly for the Federal share of the estimated work. In addition, the railroad company may bill the LPA monthly for the LPA's share of the expenses incurred. The progressive invoices will be rendered on the basis of the estimated expense, plus allowable additives. IDOT and the LPA, after verifying that the bills are reasonable and proper, will promptly reimburse the railroad company for the amount billed. Payment will not be claimed for any bill totaling less than \$500 excluding the final bill. If the agreement provides for the railroad to bill the LPA for the entire cost, the LPA should request reimbursement for the Federal share from the district. A copy of the railroad bill and a copy of the LPA's checks to the railroad must be submitted with the request.

25-1.03(c) Construction

Contractor payments for construction projects will be conducted in accordance with Construction Memorandum No. 76, "Contractor Payments – Articles 109.07 and 109.08." Retainage is not allowed on Federal-Aid construction projects.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

Jan 2012

CONSTRUCTION AND MAINTENANCE - Federal Funds

25-1(5)

25-1.03(d) Construction Engineering

Payments for construction engineering will be submitted to the district for review prior to submittal to the Central BLRS for reimbursement. Any project using Federal funds for construction engineering must be audited by the Central BLRS. The construction engineering agreement between the LPA and consultant or construction engineering by the LPA must be approved by the Central BLRS prior to reimbursement of Federal funds.

25-1.04 Project Closeout and Final Acceptance

25-1.04(a) General

Closure and final acceptance occur after the completion of project activity. The district is responsible for the general construction supervision of the entire project and for ensuring Federal procedures are followed. The projects will not be entered into the Bureau of Construction pay system. The LPA will be reimbursed by the State, through the Central Bureau of Construction, for the Federal share of construction work on the basis of periodic billings, provided the billings contain sufficient cost information and show evidence of payment by the LPA. The bills should be broken down to reflect the MFT portion, non-participating items, and Federal participating items. Also, although several project numbers may relate to a common project, each project number must be closed out separately.

Documents required to close a local let project include the following:

- Form BLR 13231 (Engineer's Final Payment Estimate);
- Form BLR 13510 (Final Report), showing both MFT and Federal funds expended on the project; and
- material certification.

25-1.04(b) Utility Adjustment and Relocation Projects

When utility adjustments or relocations have been completed, the LPA is responsible for ensuring that all work has been accomplished in accordance with the approved agreement and the PS&E. All deficiencies should be corrected and accepted prior to notifying the district of the project completion. After receiving this notification, the district will schedule a final inspection with the LPA. If acceptable, the FHWA will be notified of the completion of the work. Consider the following when closing utility projects:

1. Final Invoice. A final invoice of costs incurred by the utility will be submitted to the district. This invoice should be submitted within 90 days of the completion of the work. The final invoice should follow as closely as practical the order of the items in the estimate and include the following:
 - description and location of the project;
 - the Federal-aid project number, section number, and job number;
 - the date the agreement was executed and the date on which the earliest item of billed expense was incurred;
 - the date on which the work was completed or the last billed expense was incurred;

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

25-1(6)

CONSTRUCTION AND MAINTENANCE - Federal Funds

Jan 2012

- the location of all supporting records; and
 - the summation of actual costs (see Item 2 below).
2. Summation of Actual Costs. When covered by an approved agreement for lump sum payment, the summation of actual costs will consist of copies of the approved utility agreement, estimate of cost, and the final invoice from the utility. The summation of actual costs will also include:
- a. Labor. Include the total cost and detailed breakout of labor.
 - b. Equipment. Include the total cost and detailed breakout of equipment.
 - c. Installation and Removal. Include the total cost of installation and removal.
 - d. Material. The final invoice must account for all materials used or removed in completing the adjustment. Recovered material will be processed as follows:
 - Suitable Condition. Materials recovered in suitable condition for reuse by the utility are to be credited to the project. The credit allowances are subject to audit.
 - Unsuitable Condition with Salvage Value. Recovered materials that are not suitable for reuse by the utility, but which have a salvage value, will be sold by solicitation of bids or by a regularly practiced disposal system used by the utility. IDOT or the LPA will be given the opportunity to inspect the material. The utility may be held accountable for material disposed of without notice.
 - Unsuitable Condition without Salvage Value. Recovered materials that are not suitable for reuse by the utility and have no apparent salvage value may be considered worthless providing the LPA is given the opportunity to inspect the material. This notice to the LPA of the proposed inspection is the responsibility of the utility. The utility will be held accountable for full value of materials disposed of without notice.
 - e. Administrative Cost. Include administrative costs as follows:
 - overhead;
 - preliminary engineering, shown separately; and
 - construction engineering, shown separately.
3. State-Job Completion Notice — Form AA-336. Upon receipt of the final invoice, the district will prepare Form AA-336 to notify the appropriate offices of the project completion.
4. Documentation. The LPA will retain copies of all invoices and supporting documentation for auditing purposes for a period of 3 years after payment of the final voucher.
5. Audits. IDOT will audit invoices in accordance with the FHWA approved auditing procedures. Upon completion of the audit and resolution of any findings, IDOT will close out the Contract Obligation Document (COD) and submit a final voucher to the FHWA.
6. Form BLR 13510. When MFT or State funds are used to pay a portion of the cost, the LPA is required to submit Form BLR 13510 upon completion of the project. This will close out the MFT or other State funds administered by IDOT portion of the project.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

Jan 2012

CONSTRUCTION AND MAINTENANCE - Federal Funds

25-1(7)

25-1.04(c) Railroad Project

The railroad company, upon completion of its work, will promptly submit a certification of inspection of active protective devices and will render a detailed final statement of its actual expenses as incurred to IDOT. The LPA is responsible for performing an inspection to ensure that all work conforms to the approved agreement, including the final PS&E approved supplements. All deficiencies should be corrected and accepted prior to notifying the Central BLRS of the project's completion. After receiving this notification, the district will schedule a final inspection with representatives of the LPA. If acceptable, the FHWA will be notified of final acceptance of the project. Consider the following when closing railroad projects:

1. Final Invoice. The railroad company will submit to the Central BLRS or the LPA a final invoice for costs incurred on the project. This invoice should be submitted within 90 days of the completion of the work. The invoice should follow as closely as possible the order of items in the estimate and should also include the following:
 - description and location of the project;
 - the Federal-aid project number, section number, ICC order number (if applicable), and job number;
 - the date the agreement was executed and the date on which the earliest item of billed expense was incurred for the invoice;
 - the date on which the last work was performed or the last billed expense was incurred;
 - the location of all supporting records, including names and addresses; and
 - the summation of actual costs.
2. Summation of Actual Costs. The summation of actual costs will require the following:
 - a. Labor. The total cost and detailed breakout of labor.
 - b. Equipment. The total cost and detailed breakout of equipment.
 - c. Transportation. Include the following transportation costs:
 - Employee Transportation/Subsistence. The company's cost, consistent with the company's overall policy, of necessary employee transportation and subsistence directly attributable to the project.
 - Materials/Supplies/Equipment. The most economical movement of materials, supplies, and equipment to and from the project site, including loading and unloading. This may include the company using its own lines at the actual rate the company charges its customers.
 - d. Installation and Removal. The total cost of installation and removal of the railroad warning devices and/or crossing surface.
 - e. Materials and Supplies for Crossing Surfaces. Materials and supplies, if available, are to be furnished from company stockpile, except they may be obtained from other sources near the project site when available at a lesser cost. When not available from company stockpile, they may be purchased either under competitive bids or existing continuing contracts, under which the lowest available prices are developed. Include the costs for materials and supplies as follows:

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

25-1(8)

CONSTRUCTION AND MAINTENANCE - Federal Funds

Jan 2012

- Company Stockpile. Materials and supplies furnished from company stockpile will be billed at current stock price of new or used material at the time of issue.
 - Non-company Material. Materials and supplies not furnished by the company will be billed at actual cost to the company, delivered to the point of entry on the railroad company's line nearest the source of procurement.
- f. Materials Recovered. Recovered material will be processed as follows:
- Reusable. Materials recovered from temporary use and accepted for reuse by the company will be credited to the project at prices charged to the job, less a consideration for loss in service life at 10% for rails, angle bars, tie plates, and metal turnout materials, and 15% for all other materials. Materials recovered from the permanent facility of the company that are accepted by the company for return to stock will be credited to the project at current stock prices of used material.
 - Non-Reusable. Materials recovered and not accepted for reuse by the company, if determined to have a net sale value, will be sold to the highest bidder following an opportunity for inspection and appropriate solicitation for bids, or if the company practices a system of periodic disposal by sale, credit to the project will be at the going prices supported by the records of the company. Where applicable, credit for materials recovered from the permanent facility in length or quantities in excess of that being placed should be reduced to reflect any increased cost of railroad operation resulting from the adjustment.
- g. Overhead and Indirect Construction Costs. Overhead and indirect construction costs are not directly identified with a single, final cost objective. These costs will be distributed to all applicable work orders and other functions on an equitable and uniform basis in accordance with generally accepted accounting principles. The costs must be reasonable and those actually incurred.
- h. Administrative Cost. The company will include and show separately the construction engineering and preliminary engineering costs. If the LPA is billed, they should request reimbursement of the Federal share from the district.
3. State-Job Completion Notice — Form AA-336. Upon receipt of the final invoice, the district will prepare Form AA-336 to notify the appropriate offices of the project's completion.
4. Payment. IDOT and the LPA will reimburse the railroad company an amount equal to the total billing minus previous payments.
5. Documentation. The railroads will retain copies of all invoices and supporting documentation for auditing purposes for a period of 3 years after payment of the final voucher.
6. Audits. IDOT will audit invoices in accordance with FHWA approved auditing procedures. Upon completion of the audit and resolution of any findings, IDOT will close out the COD and submit a final voucher to the FHWA.
7. Form BLR 13510. When MFT or other State funds are used to pay a portion of the cost, the LPA is required to submit Form BLR 13510 upon completion of the project. This will close out the MFT or State-funded portion of the project.

BUREAU OF LOCAL ROADS & STREETS

Jan 2012

CONSTRUCTION AND MAINTENANCE - Federal Funds

25-1(9)

25-1.04(d) Construction Project

Upon completion of a construction project, the LPA is responsible for ensuring that all work has been accomplished in accordance with the approved agreement and the PS&E, including any approved changes. Any deficiencies on the project should be corrected and re-inspected before acceptance. Construction projects will be closed as follows:

1. Forms BC-71, BC-111, and BC-608. After acceptance, the LPA should submit Forms BC-71, BC-111, and BC-608 to the district.
2. Supporting Documentation. Include the following information with Form BLR 13231:
 - field measurement books;
 - Inspector's Daily Report (Form BC-628), if identified as a "Final Field Measurement";
 - cross sections;
 - weight tickets, bound and summarized by means of an adding machine tape;
 - project diary, not individual's diary;
 - calculation file for such items as concrete and reinforcement bars;
 - Form BC-981;
 - force account file with Form BC-635 with the contractor's invoice; and
 - Form SBE-1014 file with signed reports for "TRAINEES."

Use the *IDOT Construction Manual* to assist with documentation preparation. The *IDOT Construction Manual* contains detailed explanations of various documentation, project checklists, and forms.

3. Final Inspection. Upon receiving Items 1 and 2, IDOT will schedule a final inspection with representatives of the LPA. If acceptable, the FHWA will be notified of the final acceptance of the project.
4. Form BC-111. Prior to submittal of the final payment estimate, IDOT will review the project documentation using Form BC-111 and prepare a certification of materials.
5. Form BC-107 and Form AA-336. After final acceptance and documentation review, the final payment estimate will be processed for payment. At this time, the Central Bureau of Construction will complete Form BC-107 to notify the LPA and the contractor of the final acceptance of the project. The district will complete Form AA-336 to notify the appropriate IDOT offices of the project completion.
6. Audits. IDOT, in accordance with FHWA approved audit procedures, will audit all project costs. Upon completion of the audit and resolution of findings, a final voucher will be submitted to the FHWA, and the COD will be closed out. The LPA must keep copies of all payment estimates and supporting documentation on file for a period of 3 years after payment of the final voucher.
7. Form BLR 13510. When MFT or State funds are used to pay a portion of the cost, the LPA is required to submit Form BLR 13510 upon completion of the project. This will close out the MFT or State-funded portion of the project.

25-1.05(b) Work Zone Traffic Control

See Section 13-4.03 for information on work zone traffic control.

25-1.05(c) Temporary Sidewalk

See Section 13-4.04 for information on temporary sidewalks.

25-1.05(d) Erosion and Sediment Control

See Section 13-4.05 for information on erosion and sediment control.

25-1.05(e) Equipment

See Section 13-2.05 for information on equipment used on construction projects.

25-1.05(f) Mobilization

See Section 13-4.06 for information on mobilization.

25-2 MAINTENANCE OF PROJECTS**25-2.01 General**

The State highway department is responsible for maintaining or causing to be maintained any project constructed with Federal-aid funds (23 USC Section 116). It also requires that IDOT enter into a formal agreement for the maintenance of projects under LPA jurisdiction. Form BLR 05310 is used to establish this agreement between IDOT and the LPA.

An additional provision of the *United States Code* provides that if the Federal authorities find that any project is not being properly maintained, the highway agency will be notified. If the project is not restored to a proper condition of maintenance, authorization of additional Federal-aid projects for the highway agency will be withheld until the project is properly maintained.

“To maintain” is considered as to perform normal maintenance operations for the preservation of the entire project, including roadway surface, shoulders, roadsides, structures, and traffic control devices that are necessary for its safe and efficient utilization.

Federal funds may be used for selected maintenance activities as mutually determined by the LPA and IDOT.

25-2.02 Maintenance Monitoring

Local roads field engineers from the districts, during official highway travel over LPA projects, are responsible for observing general compliance with the provisions of this Section.

Either during official highway travel throughout the year or during a special review, the District Local Roads Engineer, or designated representative, will review completed LPA Federal-aid projects to determine the LPA’s maintenance effort. The district will review each county and urban area at least once in every 4-year period. More frequent reviews should be made if discovered deficiencies warrant.

The primary concern is whether or not Federal-aid projects are being maintained at an acceptable level of physical integrity and operation. The maintenance review is not meant to be a detailed review of a roadway system, but rather a brief review to observe the overall status of maintenance. The local roads field engineers should include positive comments when appropriate.

After the review, the district will forward a report of their findings during the calendar year to the LPA by December 1. The Maintenance Review Check Sheet, or similar format, will be used for this purpose.

Should an unsatisfactory condition be observed that threatens the integrity of a project constructed with Federal funds, it should be brought to the attention of the appropriate LPA officials. LPA officials will take corrective measures to avoid further deterioration. Based on further inspection, if within 90 days after receipt of the notice the highway or street has not been restored to a condition satisfactory to IDOT, IDOT may, with FHWA consent, withhold approval of any Federal projects.

BUREAU OF LOCAL ROADS & STREETS

25-2(2)

CONSTRUCTION AND MAINTENANCE - Federal Funds

Jan 2006

| The district should retain a copy of the maintenance report sent to the LPA and ensure it is available to representatives of the FHWA and Central BLRS upon request.

Chapter 27

BASIC DESIGN CONTROLS

Road and street design is predicated on many basic controls that establish the overall objective of the facility and identify the basic purpose of the project. Chapter 27 presents the basic controls that impact road design. The design criteria in Part IV “Project Design” of this *Manual* applies to all local public agency (LPA) projects funded with Federal, State, and Motor Fuel Tax (MFT) funds that are processed through the Central Bureau of Local Roads and Streets (CBLRS).

27-1 TERMINOLOGY

Many qualifying words are used in road and street design and in this *Manual*. For consistency and uniformity in the application of various design criteria, the following terms are in order of hierarchy from mandatory to permissive. Depending on the term used within a design criterion, it is possible for the hierarchy to change when a specific condition is met or not met as noted in a footnote or elsewhere.

Shall, require, will, must. A mandatory condition. Designers are obligated to adhere to the criteria and applications presented in this context or to perform the evaluation indicated. A design exception is required if the criteria and applications cannot be met. See Section 27-7 for Level of approval.

Limits (minimum, maximum, lower, upper). Provides a range of values generally accepted within the design community with the understanding these limits are not necessarily inviolable. However, when the criteria presented in this context are not met, a design exception is typically required. See Section 27-7 for the Level of approval.

Should, recommend. An advisory condition. Designers are strongly encouraged to follow the criteria and guidance presented in this context unless there is reasonable documented justification not to do so. A design exception is not required if the criteria or guidance is not followed.

Desirable, preferred. An advisory condition. An indication that the designer should make every reasonable effort to meet the criteria and that the designer should only use a “lesser” design after due consideration of the “better” design. A design exception is not required if the criteria or guidance is not followed.

May, could, can, suggest, consider. A permissive condition. Designers are allowed to apply individual judgment and discretion to the criteria when presented in this context. The decision is based on a case-by-case assessment. A design exception is not required.

The remaining terms are strictly in alphabetically order.

Acceptable. Design criteria that may not meet desirable values, but yet is considered to be reasonable and safe for design purposes.

Criteria. A term typically used to apply to design values, usually with no suggestion on the criticality of the design value. Because of its basically neutral implication, this *Manual* frequently uses “criteria” to refer to the design values presented.

Exception. Approval from the Illinois Department of Transportation (IDOT) for using design criteria which do not conform to the minimum criteria as set forth in this *Manual*.

Guideline. Indicating a design value that establishes an approximate threshold that should be met if considered practical.

Ideal. Indicating a standard of perfection (e.g., traffic capacity under “ideal” conditions).

Insignificant, minor. Indicating that the consequences from a given action are relatively small and not an important factor in the decision-making for road and street design.

Justified. Indicating that some set of conditions has been shown to be valid, sound, or conforming to fact or reason. This may be applied to either objective or subjective evaluations.

Policy. Indicating practice that IDOT generally expects the designer to follow, unless otherwise justified.

Possible. Indicating that which can be accomplished. Because of its connotation, this word will rarely be used in this *Manual* for the application of design criteria.

Practical, feasible, cost-effective, reasonable. Advising the designer that the decision to apply the design criteria should be based on a subjective analysis of the anticipated benefits and costs associated with the impacts of the decision. No formal analysis is intended, unless otherwise stated.

Significant, major. Indicating that the consequences from a given action are obvious to most observers and, in many cases, can be readily measured.

Standard. Indicating a design value that cannot be violated without severe consequences. This suggestion is generally inconsistent with geometric design criteria. Therefore, “standard” will not be used in this *Manual* to apply to geometric design criteria.

Transportation Facility / Facility. A transportation facility / facility may include but not limited to roads or streets, structures, shared-use lanes, shared-use paths, sidewalks, railroad crossings, and their respective appurtenances.

Typical. Indicating a design practice that is most often used in application and which is likely to be the “best” treatment at a given site.

Warranted. Indicating that some well-accepted threshold or set of conditions has been met. Note that, once the warranting threshold has been met, this is an indication that the design treatment should be considered and evaluated — not that the design treatment is automatically required.

27-2 PROJECT SCOPE OF WORK

The project scope of work reflects the basic intent of the LPA and determines the overall level of improvement. This scope, in combination with the roadway functional classification (see Section 27-3), determines which criteria in the *Manual* apply to the geometric design of the project. The following Sections provide the general scopes of work for the different types of construction. Each of the following Sections also references the applicable chapters in Part IV “Project Design” of this *Manual*.

27-2.01 New Construction

Generally, new construction is the construction of a transportation facility on new location. The project is usually based on at least a 20-year design period. Typically, the project will have a significant length and should connect logical termini. New construction also includes any intersection or interchange that falls within the project limits of a new facility. IDOT’s criteria for new construction by LPA’s on local facilities are presented in Chapters 27 – 32, Chapters 34 – 42, and 44.

27-2.02 Reconstruction

Reconstruction of an existing local facility will typically include the addition of travel lanes and/or reconstruction of the existing horizontal and/or vertical alignment, but the road or street will remain essentially within the existing corridor. These projects usually require some right-of-way acquisitions. The primary reasons for reconstruction of an existing facility are because:

- the facility cannot accommodate its current or future traffic demands,
- the existing alignment or cross section is significantly deficient, and/or
- the service life of the pavement has been exceeded.

Any intersection that falls within the limits of a reconstruction project will be reconstructed as needed.

Because of the significant level of work for reconstruction, the design of the project is generally determined by the criteria for new construction based on a 20 year design period. Chapters 28 – 32 and Chapters 34 – 42 apply to reconstruction projects.

27-2.03 3R Projects

3R projects (rehabilitation, restoration, and/or resurfacing) are primarily intended to extend the service life of the existing facility and to enhance safety. In addition, 3R projects should make cost-effective improvements to the existing geometrics, where practical. Typically, 3R work on the mainline or at an intersection is within the general constraints of the existing right-of-way and existing alignment. Right-of-way acquisition is occasionally included for:

- flattening slopes,
- changes in horizontal alignment,
- changes in vertical profile, and

- safety enhancements.

The overall objective of a 3R project is to perform the work necessary to return the facility to a condition of acceptable structural and/or functional adequacy. 3R projects may include any number of the following types of improvements:

- providing pavement resurfacing, and/or rehabilitation (full-depth pavement replacement may be justified in some instances);
- providing lane and shoulder widening (without adding through lanes);
- providing intersection improvements (e.g., adding turn lanes, flattening turning radii, corner sight distance improvements);
- rehabilitating or replacing existing structures;
- adding a Two-Way Left-Turn Lane (TWLTL);
- adding pavement markings;
- converting an existing uncurbed urban street into a curbed street;
- replacing existing curb and gutter;
- flattening an occasional horizontal or vertical curve;
- adjusting the roadside clear zone;
- flattening side slopes;
- providing landscaping;
- revising the location, spacing, or design of existing driveways along the mainline;
- adding, widening, or resurfacing parking lanes;
- adding or replacing sidewalks;
- adding bicycle accommodations;
- implementing improvements to meet the *Americans with Disabilities Act (ADA) / Public Rights of Way Access Guidelines (PROWAG)* accessibility criteria (e.g., sidewalk curb ramps);
- adjusting utility facilities;
- upgrading guardrail and other roadside safety appurtenances to meet current criteria;
- implementing drainage improvements; and/or
- upgrading highway/railroad grade crossings.

[Chapter 33](#) presents IDOT criteria for the design of 3R projects on local roads and streets.

27-2.04 Full-Depth Pavement Replacement

The extent of pavement replacement on an existing facility is one significant factor in determining if the project scope of work is “reconstruction” or “3R.” The more extensive the pavement work, the greater the opportunity to incorporate geometric improvements (e.g., lane and shoulder widening). However, the practical level of geometric improvements is dependent on many other factors (e.g., available right-of-way, environmental impacts, and/or construction costs).

Therefore, if a proposed project includes pavement replacement for a significant portion of the project length, the project scope of work is determined on a case-by-case basis.

27-2.05 Pavement Preservation Projects

These projects consist of repairing and resurfacing existing paved roadways on local facilities, both urban and rural. The purpose of pavement preservation projects is to extend the life of existing pavements. Pavements with significant and extensive structural distress are not eligible for these projects. A successful pavement preservation project improves the ride quality and reduces the life-cycle costs of pavement rehabilitation.

Because the project’s purpose is primarily to improve pavement serviceability, roadway design improvements are extremely limited for the project scope of work. These projects shall use the Local Agency Pavement Preservation policy as discussed in [Chapter 45](#).

27-3 FUNCTIONAL CLASSIFICATION SYSTEM

27-3.01 General

27-3.01(a) Terminology

1. Functional Classification. The classification of a road or street based on the character of service it is intended to provide.
2. Rural Areas. All areas outside of urbanized and small urban areas are rural areas.
3. Urban Areas. These are areas identified by the U.S. Bureau of Census and further defined by the Federal Highway Administration (FHWA) as having a contiguous population of 50,000 or more (urbanized areas) or 5,000 or more but less than 50,000 (small urban areas). The urban area boundaries are established by the State, in cooperation with the Metropolitan Planning Organizations (MPOs) and other appropriate local officials and approved by the FHWA.

27-3.01(b) Background

The *Intermodal Surface Transportation Efficiency Act (ISTEA) of 1991* required that every State functionally reclassify its public roads and streets. The [Illinois Highway Information System – Roadway Information and Procedure Manual \(IRIS\)](#) is used to identify routes for the National Highway System (NHS), for administering the Federal-aid programs, and for assessing the extent, conditions, and performance of the highway system. Figure 27-3A presents IDOT’s functional classification terminology.

Description	IRIS Code
Principal Arterial System	
Interstates	1
Other Freeways and Expressways	2
Other Principal Arterials (OPA)	3
Minor Arterials	4
Collector	
Major Collector	5
Minor Collector	6
Local (Roads & Streets)	7

IDOT FUNCTIONAL CLASSIFICATION TERMINOLOGY

Figure 27-3A

In order to maintain a 5 year anticipated functional usage of the street/highway network, the district, in cooperation with the appropriate local officials, is responsible for continually monitoring the need for functional classification revisions. These revisions must be based on changes in travel characteristics, new growth and development of an area (i.e., commercial, industrial, residential), new roadways, and/or significant roadway realignments. For proposed roads on new alignment, classification will occur once construction has been completed.

The Bureau of Statewide Program Planning in the Central Office of Planning and Programming is responsible for the final review and processing of all changes to the functional classification system. Once the appropriate local officials approve the change, the Bureau of Statewide Program Planning will process the district's request and will make the formal written request for approval for all revisions Statewide to the FHWA. For roads within a Metropolitan Planning Area (MPA), the LPA must present proposed changes to the functional classifications first to the MPO for approval. Additional information on MPO's can be found in [Section 17-2](#).

27-3.01(c) Relationship to Roadway Design

The functional classification concept is one of the most important determining factors in roadway design. The concept recognizes that the public highway network in Illinois provides two basic and often conflicting functions — access to property and travel mobility. Each road or street provides varying levels of access and mobility, depending upon its intended service. The overall objective of the functional classification system, when viewed in its entirety, is to yield an optimum balance between its access and mobility functions. When this balance is achieved, the benefits to the traveling public are maximized.

The functional classification system provides the foundation for highway planning functions and the framework for determining the geometric design of individual roads and streets. Once the function of the facility is defined, the designer can select an appropriate design speed, roadway width, roadside safety elements, amenities, and other design values. All of Part IV of this *Manual* is based upon this systematic concept to determine roadway design.

Before initiating project work, the designer should review the most recent highway functional classification data for the proposed project from [IRIS](#), the [Geographical Information System \(GIS\)](#), [Illinois Roadway Analysis Database System \(IROADS\)](#), or [Getting Around Illinois](#).

27-3.02 General Functional Classification Categories

The following identifies the basic characteristics of the three general categories within the functional classification system:

1. **Arterial**. Arterial highways are generally characterized by their ability to quickly move relatively large volumes of traffic, but often with restricted accessibility to abutting properties. The arterial system typically provides for high travel speeds and the longest trip movements. The rural and urban arterial systems are connected to provide continuous through movements at approximately the same level of service (LOS).
2. **Collector**. Collector routes are characterized by a relatively even distribution of access and mobility functions. Traffic volumes and speeds are typically lower than those of arterials.
3. **Local**. All public roads and streets not classified as arterials or collectors are classified as local roads and streets. The many points of direct access to adjacent properties characterize local roads and streets. Speeds and volumes are usually low and trip distances short.

The users of this *Manual* must understand that the term “local roads and streets” within the functional classification system differs from the term “local roads and streets” when referring to the jurisdiction for the facility. Many “local” facilities not on the State highway system are functionally classified as collectors, and a few are functionally classified as arterials. When applying the criteria in Part IV of this *Manual*, base the design on the facility’s functional classification.

The percent of mileage allocated nationally in each category is documented in the US DOT/FHWA’s Manual, *Highway Functional Classification — Concepts, Criteria and Procedures*. Roadway information is collected on all public highways and is in [IRIS](#).

The following Sections more explicitly describe the characteristics of these three general categories for rural and urban areas.

27-3.03 Functional Classification Categories

27-3.03(a) Principal Arterial System

In general, the principal arterial system carries the highest traffic volumes and accommodates the greatest trip lengths. These are subdivided into routes functionally classified as Interstates, other freeways and expressways, and OPAs.

In urban areas, these routes consist of a connected urban network of continuous routes having the following designations and characteristics:

- provide service to, through, or around urban areas from minor arterial routes in the rural area, and may be connecting links;
- serve generally as an extension of minor arterial routes in the rural area, and may be a major two-way city street or a one-way couple system;
- may warrant management of access to the highway;
- serve long-distance traffic within a city by connecting major regional activity centers not served by connecting links;
- in urbanized areas (50,000 population or greater), provide for significant urban and suburban travel demands. These trips would be between central business districts and outlying residential areas, between major inner city communities, or between major suburban centers;
- in urbanized areas, are located at spacing that are closely related to the trip-end density characteristics of specific portions of the urban area. The spacing may vary from 1 mile (1.5 km) between routes in the densely developed central business district areas to 5 miles (10 km) or more in the sparsely developed urban fringes;
- in smaller urban areas (under 50,000 but greater than 5,000 population), may be limited in the number and extent of routes. The importance of these routes is primarily to serve the central business district and to accommodate through travel at an appropriate LOS; and
- provide for an integrated network serving the entire urban area.

The rural system criteria are expressed primarily in qualitative, rather than quantitative terms. Because of varying geographic conditions (e.g., population density, spacing and size of cities, density and pattern of roadway network), it is not feasible to define uniform criteria of size of population centers, on length of trip and traffic volume, or on spacing of routes that would apply to all systems in all counties. The principal arterial system in a rural area provides connections between the major urban areas and OPAs and provides a LOS suitable for Statewide or Interstate travel.

27-3.03(b) Minor Arterials

When compared to the principal arterial system, minor arterials may provide lower travel speeds and accommodate shorter trip lengths and lower traffic volumes, but they provide more access to property. These routes have the following general characteristics:

- interconnect and supplement the principal arterial system by forming an integrated network of routes connecting to the OPAs and should provide inter-regional or inter-county service. Stub sections are seldom justified;
- connect with routes of the same function in adjacent States;
- be spaced at intervals consistent with population density, so that all developed areas of the State are within a reasonable distance of an arterial route;
- provide service to corridors with trip lengths and travel density greater than those predominantly served by major collectors, minor collectors, or local routes; and
- provide a design with relatively high overall travel speeds with minimum interference to through movements.
- may carry local bus routes and provide intra-community continuity (but will not, for example, penetrate neighborhoods);
- may be urban extensions of major collector routes from the rural area;
- may be partial access control; and
- considered together with all arterial routes in an urban area, are located from 2 - 3 miles (3 - 5 km) between routes in suburban fringes, but should not be more than 1 mile (1.5 km) apart in fully developed areas. Within the central business district, a spacing of 650 – 2,500 ft (200 - 800 m) is typical.

27-3.03(c) Major Collectors

The major collector road system generally includes those routes where the predominant travel distances are shorter than trips on arterial routes but greater than the shorter trips characteristic of the local road functional system. Consequently, more moderate speeds may be typical on the average. These routes have the following general characteristics:

- provide service to any county seat not on an arterial route;
- serve the more important intra-county or intra-regional travel corridors not served by higher route classifications;
- serve larger towns not directly served by higher route classifications nor other traffic generators of equivalent intra-county importance. These routes link nearby larger cities or other routes of higher classification;

- form an integrated network; however, stub sections are not uncommon. Consolidated school districts, shipping points, recreational areas, important mining and agricultural areas, or other equivalent traffic generators can be used to justify the inclusion of these stubs in this classification; and
- provide all-weather service for reliable and safe travel that considers both access and mobility.
- provide both access and traffic circulation within residential neighborhoods and commercial and industrial areas;
- may penetrate residential neighborhoods or commercial/industrial areas to collect and distribute trips to and from the arterial system;
- in the central business district, may include the routes that are not classified as arterials;
- have spacing of routes dependent on the density of development. In fully developed areas, spacing together with higher classifications should provide approximately 2,500 ft (800 m) between routes and, within the central business district, provide a spacing of 650 ft to 2,500 ft (200 m to 800 m); and
- may be urban extensions of minor collector routes in the rural area.

27-3.03(d) Minor Collectors

These are characterized as follows:

- provide service to any remaining small communities;
- are located at intervals, consistent with population density, to collect traffic from local routes and to connect all developed areas within a reasonable distance from a major collector route;
- include more stub sections than the major collector classification; and
- are designed for relatively reliable and year-around safe travel, with more emphasis on property access than mobility.

27-3.03(e) Local

The routes functionally classified as local roads or streets generally have the following characteristics:

- constitute mileage not designated as part of higher classifications;
- serve primarily to provide access to abutting property and connections to higher classified routes;
- typically will have a lower Average Daily Traffic (ADT);
- reflect minimal design criteria with primary consideration to access needs.
- offer the lowest level of mobility and usually contain no bus routes; and
- discourage through traffic movements.

BUREAU OF LOCAL ROADS & STREETS
BASIC DESIGN CONTROLS

27-3-6

August 2016

Except for the replacement or rehabilitation of existing structures greater than 20 ft (6 m) in length, projects for improvements on routes with a local functional classification are not eligible for Surface Transportation Program (STP) funds.

HARD COPIES UNCONTROLLED

27-4 TYPES OF DEVELOPMENT AREAS

The functional classification system is based in part on the urban or rural designation. In many cases, this is not sufficient to determine the appropriate roadway design criteria. Therefore, the type of area where the project is located further divides the criteria in this *Manual*. The refinement to the roadway design process allows the designer to better tailor the project to the constraints of the surrounding environment.

The following Sections briefly discuss the types of areas for rural and urban locations. Select the type of area that is most appropriate for the project under design.

27-4.01 Rural Highways and Roads

Many roads in Illinois are classified as rural but frequently pass through relatively developed areas. Therefore, [Chapters 32](#) and [33](#) present design criteria based on the extent of roadside development. The tables in the chapters provide criteria for the average number of access points per mile (kilometer) per side. These criteria provide some guidance, but they should not be considered rigid. In addition, consider the following narrative descriptions of roadside development:

1. Open. This fits the traditional concept of a rural area. The driver has almost total freedom of movement and is generally not affected by occasional access points along the road. For the purpose of determining the open classification, access points will average less than 15 per mile (10 per kilometer) per side. Right-of-way is usually available.
2. Low/Moderate Density. The roadside development has increased to a level where prudent drivers will instinctively reduce their speed as compared to an open roadway. Drivers must be more alert to the possibility of entering and exiting vehicles, but they are still able to maintain a relatively high travel speed. The estimated number of access points will average between 15 and 30 per mile (10 and 20 per kilometer) per side. Right-of-way may be difficult to obtain.
3. Moderate/High Density. The roadside development has increased to a level that is comparable to a suburban area within the urban limits or may be an incorporated municipality with a population less than 5,000. The extent of the development will have a significant impact on the selected travel speed of a prudent driver. Exiting and entering vehicles are frequent, and traffic signals are typical at major intersections. The estimated number of access points will average greater than 30 per mile (20 per kilometer) per side. Right-of-way is usually quite difficult to obtain.

27-4.02 Urban Roads and Streets

27-4.02(a) Suburban Roads and Streets

Suburban areas are within urban areas as defined in Section 27-3.01(a); however, they suggest a degree of development greater than that of an open rural area but less than that of a high-density urban area. The predominant character of the surrounding environment is usually residential, but it may also include a considerable number of commercial establishments and a few industrial parks. On suburban roads and streets, drivers usually have some freedom of maneuverability; nonetheless, they must devote some of their attention to entering and exiting vehicles. Roadside development is characterized by low to moderate density. Pedestrian and bicycle activity is often a design factor. Right-of-way may be more readily available for roadway improvements.

Local and collector streets in suburban areas are typically located in residential areas but may also serve a commercial area. Posted speed limits typically range between 30 mph and 45 mph. The majority of intersections will have stop or yield control, but there will be an occasional traffic signal.

A typical suburban arterial will have strip commercial development and perhaps a few residential properties. Posted speed limits usually range between 35 mph and 50 mph, and there will be a few signalized intersections along the arterial.

27-4.02(b) Urban Streets

For design purposes, urban areas (not including those considered suburban) are characterized by moderate/high density. These facilities are subdivided as follows:

1. Central Business Districts (CBD). On streets in the CBD or downtown area, abutting building development often prohibits space for off-street parking and entrances for individual businesses. Right-of-way is usually very limited. The streets may include high-density commercial or residential development (e.g., apartment complexes, row houses). Access to property is the primary function of the street network in CBDs. The designer often must select the cross-sectional criteria that will fit into the existing right-of-way. Pedestrian and bicycle considerations may be as important as vehicular considerations, especially at intersections.

Because of the high density of development in CBD areas, the primary distinction among the functional classes is often the relative traffic volumes and, therefore, the number of lanes needed. As many as half of the intersections may be signalized, and posted speed limits typically range between 25 mph and 30 mph.

2. Fringe Area/Outlying Business District (FRNG/OBD). These areas generally have off-street parking and driveway entrances which usually are quite numerous. Right-of-way may be restricted and will typically limit the practical options for roadway improvements. The extent of roadside development will have a significant impact on the selected speeds of drivers. Pedestrian and bicycle activity is common and warrants significant consideration in design.

Local and collector streets in FRNG/OBD areas typically have posted speed limits between 30 mph and 45 mph. The frequency of signalized intersections is substantially higher than in suburban areas. An arterial in FRNG/OBD areas will often have strip commercial development along its roadside, and posted speed limits will range between 35 mph and 45 mph.

27-5 SPEED**27-5.01 Terminology**

1. Design Speed. Design speed is the selected speed that is used to determine the various geometric design features of the roadway. Design speed does not necessarily have to equal posted speed.
2. 85th-Percentile Speed. The 85th-percentile speed is the speed below which 85% of vehicles travel on a given facility. The most common application of the value is its use as one of the factors for determining the posted, legal speed limit of a roadway section. In most cases, field measurements for the 85th-percentile speed will be conducted during off-peak hours when drivers are free to select their desired speed. Legal posted speed limits are discussed in [Section 3-2](#).
3. High Speed. For geometric design purposes, high speed is defined as greater than 45 mph (70 km/h).
4. Low Speed. For geometric design purposes, low speed is defined as 45 mph (70 km/h) or less.
5. Pace Speed. Pace speed is the specified increment of spot speed that includes the greatest number of speed measurements.

27-5.02 Design Speed**27-5.02(a) Range/Increments**

Design speeds for local projects typically range between 20 mph and 60 mph (30 km/h and 100 km/h), and they are selected in 5 mph (10 km/h) increments.

27-5.02(b) Selection

Each project will have a design speed selected that establishes criteria for several geometric design elements including horizontal and vertical curvature, superelevation, cross sectional features, and sight distance. [Chapter 32](#) presents the design speed criteria for new construction and reconstruction projects. [Chapter 33](#) presents the design speed criteria for 3R non-freeway projects. In general, the selected design speed is based on the following road design elements:

1. Functional Classification. The higher-class facilities (i.e., arterials) are designed with a higher design speed than the lower class facilities (i.e., collectors and locals).
2. Urban/Rural. Design speeds in rural areas are generally higher than those in urban areas. This is consistent with the typically fewer constraints in rural areas (e.g., less development).
3. Terrain. The flatter the terrain, the higher the selected design speed can be. This is consistent with the typically higher construction costs associated with more rolling terrain.
4. Traffic Volumes. On some facilities (e.g., rural collectors), the design speed varies by traffic volumes (e.g., as traffic volumes increase, higher design speeds are used).

BUREAU OF LOCAL ROADS & STREETS

27-5-2

BASIC DESIGN CONTROLS

August 2016

For geometric design application, the relationship between these road design elements and the selected design speed reflects general cost-effective considerations. For example, the higher the traffic volumes, the more benefits to the traveling public from a higher design speed. In addition, the anticipated posted/regulatory speed limit should be one factor when selecting the design speed.

Avoid artificially selecting a design speed low enough to eliminate any design exceptions. For example, if BLRS criteria dictates a design speed of 50 mph (80 km/h) and one or more geometric features are adequate only for 45 mph (70 km/h), the project design speed should be 50 mph (80 km/h) and not 45 mph (70 km/h). In this case, consider requesting design exceptions for the 45 mph (70 km/h) geometric features.

HARD COPIES UNCONTROLLED

27-6 CAPACITY METHODOLOGY

27-6.01 Terminology

1. Actuated Control. A defined phase sequence in which the presentation of each phase is on recall or the associated traffic movement has submitted a call for service through a detector.
2. Annual Average Daily Traffic (AADT). The total yearly volume in both directions of travel divided by the number of days in a year.
3. Average Daily Traffic (ADT). The calculation of average traffic volumes in both directions of travel in a time period greater than one day and less than one year and divided by the number of days in that time period. Although not precisely correct, ADT is often used interchangeably with AADT. The use of an ADT could produce a bias because of seasonal peaks and, therefore, the user should be aware of this.
4. Back of Queue. The maximum backward extent of queued vehicles during a typical cycle, as measured from the stop line to the last queued vehicle.
5. Capacity. The maximum number of vehicles that can reasonably be expected to traverse a point or uniform section of a lane or roadway during a given time period under prevailing roadway, traffic, and traffic control conditions. The time period most often used for analysis is 15 minutes. "Capacity" corresponds to a LOS E.
6. Cycle. A complete sequence of signal indications.
7. D-Factor. The portion of traffic moving in the peak direction of travel on a given roadway during the peak hour.
8. Delay. Additional travel time experienced by a driver, passenger, bicyclist, or pedestrian beyond that required to travel at the desired speed. The primary performance measure on interrupted flow facilities.
9. Demand Flow Rate. The count of vehicles arriving at the system element during the analysis period, converted to an hourly rate. This manual uses the term design hourly volume (defined below) in a similar manner as demand flow rate.
10. Density. The number of vehicles occupying a given length of lane, averaged over time. It is usually expressed as vehicles per mile per lane.
11. Design Hourly Volume (DHV). The one-hour volume in both directions of travel in the design year selected for determining the dimensions and configuration of the roadway design elements. For capacity analyses, the DHV is typically converted to an hourly flow rate based on the maximum 15-minute flow rate during the DHV. The term DHV is not used in the *Highway Capacity Manual (HCM)*, but its utility is similar to how demand flow rate (defined above) is used.
12. Directional Design Hourly Volume (DDHV). The traffic volume in peak direction of flow during the design hour.
13. Directional Distribution (D). A characteristic of traffic that volume may be greater in one direction than in the other during any particular hour on a highway.

BUREAU OF LOCAL ROADS & STREETS

27-6-2

BASIC DESIGN CONTROLS

August 2016

14. 85th-Percentile Speed. The 85th-percentile speed is the speed below which 85% of vehicles travel on a given facility. The most common application of the value is its use as one of the factors for determining the posted, legal speed limit of a roadway section. In most cases, field measurements for the 85th-percentile speed will be conducted during off-peak hours when drivers are free to select their desired speed. Legal posted speed limits are discussed in [Section 3-2](#).
15. Flow Rate. The equivalent hourly rate at which vehicles or other roadway users pass over a given point or section of a lane or roadway during a given time interval of less than one hour, usually 15 minutes.
16. Free Flow. A flow of traffic unaffected by upstream or downstream conditions.
17. Green Time (g/c) Ratio. The ratio of the effective green time of a phase to the cycle length.
18. Heavy Vehicles. A vehicle with more than four wheels touching the pavement during normal operation.
19. K-factor. The portion of AADT that occurs during the peak hour (DHV/AADT).
20. Lane Group. A lane or set of lanes designated for separate analysis.
21. Level of Service (LOS). A quantitative stratification of a performance measure or measures that represent quality of service, measured on an A to F scale, with LOS A representing the best operating conditions from the traveler's perspective and LOS F the worse.
22. Passenger-Car Equivalent. The number of passenger cars that will result in the same operational conditions as a single heavy vehicle of a particular type under specified roadway, traffic, and control conditions.
23. Peak Hour. The hour of the day in which the maximum volume occurs.
24. Peak-Hour Factor (PHF). A ratio of the volume occurring during the peak hour to the maximum rate of flow during a given time period within the peak hour (typically 15 minutes).
25. Pedestrian. An individual traveling on foot.
26. Permitted Turn. A left or right turn at a signalized intersection that is made by a vehicle during a time in the cycle in which the vehicle does not have the right-of-way.
27. Phase. The part of the signal cycle allocated to any combination of traffic movements receiving the right-of-way simultaneously during one or more intervals. A phase includes the green, yellow, and red clearance intervals.
28. Progression. The act of various controllers providing specific green indications in accordance with a time schedule to permit continuous operation of groups of vehicles along the street at a planned speed.
29. Protected Turn. The left or right turns at a signalized intersection are made by a vehicle during a time in the cycle when the vehicle has the right-of-way.
30. Queue Storage Ratio. The maximum back of queue as a proportion of the available storage on the subject lane or link.

HARD COPIES UNCONTROLLED

31. Red Clearance Interval. A brief period of time following the yellow indication during which the signal heads associated with the ending phase and all conflicting phases display a red indication.
32. Saturation Flow Rate. The equivalent hourly rate at which previously queued vehicles can traverse an intersection approach under prevailing conditions, assuming that the green signal is available at all times and no lost times are experienced.
33. Semi-Actuated Control. A signal control in which some approaches (typically on the minor street) have detectors and some approaches (typically on the major street) have no detectors.
34. Service Flow Rate. The maximum directional rate of flow that can be sustained in a given segment under prevailing roadway, traffic, and control conditions without violating the criteria for LOS *i*.
35. Service Measure. A performance measure used to define LOS for a transportation system element.
36. Volume-to-Capacity (v/c) Ratio. The ratio of flow rate to capacity for a system element.
37. Weaving. The crossing of two or more traffic streams traveling in the same direction along a significant length of highway, without the aid of traffic control devices (except for guide signs).

27-6.02 Design Year Selection

27-6.02(a) Roadway Design

The geometric design of a highway should be developed to accommodate expected traffic volumes during the life of the facility assuming reasonable maintenance. This involves projecting the traffic volumes to a selected future year. For new construction/reconstruction projects, 20 years is the usual design period. For current low volume roadways with ADTs of 400 or less, current traffic volumes may be used. However, if there is known development planned which may increase traffic to an ADT greater than 400, the traffic should be projected out based on the design period. For 3R projects, current traffic volumes for the year of construction are typically used, but the design period may be 10 years or longer. In all cases, the design year is measured from the expected construction completion date.

27-6.02(b) Other Highway Elements

The following presents the recommended criteria for selection of a design year for highway elements other than road design:

1. Bridges. The structural life of a bridge may be 75 years or more (e.g., substructure, superstructure). For new bridges (including bridge replacements), the clear roadway width of the bridge is based on the 20 year traffic volume projection beyond the construction completion date. For low volume roadways (i.e., ADT of 400 or less), the design criteria may be based on current traffic volumes. For bridges within the limits of 3R projects, see [Chapter 33](#).
2. Underpasses. The design year used for the geometric design of underpasses is determined on a case-by-case basis.

3. Drainage Design. Drainage appurtenances are designed to accommodate a flow rate based on a specific frequency of occurrence. The selected frequency is based on the functional class of the facility, the ADT, and the specific drainage appurtenance (e.g., culvert). See [Chapter 36](#) for more detailed information on drainage design.
4. Pavement Design. The pavement structure is designed to withstand the vehicular loads during the design analysis period without falling below selected terminal pavement serviceability. [Chapter 44](#) presents the criteria for selecting a design year for pavements.
5. Intersections. Use both AM/PM peak volumes for intersection analyses in suburban and urban areas where traffic volumes are high.
6. Traffic Signals. Use current traffic volumes for traffic signal analyses in suburban and urban areas where traffic volumes are high. Base the analyses on the criteria for warrants presented in the [Illinois Manual of Uniform Traffic Control Devices \(ILMUTCD\)](#).

27-6.03 Design Traffic Volumes

Most geometric elements are determined by traffic volumes projected for the design year. The traffic volumes may be either the ADT or the DHV depending on whether the road or street is located in a rural or an urban area, the functional classification, and the geometric criteria. Obtain projected traffic volumes from the district or from regional transportation studies.

27-6.03(a) ADT Selection

On two-lane urban collectors and local streets and on rural roads, ADT is used to determine most geometric design items including design speed and lane and shoulder width.

27-6.03(b) DHV Selection

The peaking characteristics are significant for most geometric design elements on arterials and multilane collectors in the urban area and for intersections. The local facility should be able to accommodate the DHV (adjusted for the peak-hour factor) at the selected LOS. This DHV will affect many design elements, including the number of through travel lanes, lane widths, and intersection geometrics. Analyze the proposed design using the AM and PM DHVs separately. This could have an impact on the geometric design of the facility. The *HCM* uses the term demand flow rate similarly as DHV.

Traditionally, the 30th highest hourly volume in the selected design year has been used to determine the DHV for design purposes. However, at the discretion of the district and LPA for urban facilities, it may be more appropriate to base the DHV on the 10th to 20th highest hourly volume in the selected design year. Because the design of the project is significantly dependent upon the projected DHV, carefully examine these projections before using them for design purposes.

BUREAU OF LOCAL ROADS & STREETS

August 2016

BASIC DESIGN CONTROLS

27-6-5

27-6.04 Level of Service (LOS)

LOS describes a quantitative stratification of a performance measure or measures that represents quality of service, measured on an A to F scale. A designated LOS is described in terms of service measures such as speed, density, delay, or percent time-spent-following.

Because drivers will accept different driving operational conditions, including lower travel speeds on different facilities, it is not practical to establish one LOS for application to every type of highway. Therefore, various levels of service have been established for the different types of highways facilities, location (i.e., rural or urban) and the scope of the improvement.

The *HCM* has established service measures used to define LOS for transportation system elements on various types of facilities. These are presented in Figure 27-6A for those elements on local roads and streets. For each service measure, the *HCM* provides the analytical tools to calculate the numerical value. Note that highway capacity service measures may be segregated into two broad categories: (1) uninterrupted flow, or open highway conditions, and (2) interrupted flow, as at stop-controlled or signalized intersections. Uninterrupted flow occurs on facilities where the influence of intersections and abutting property development is not significant, and the design volume can be determined by an hourly rate of flow.

Type of Facility	Service Measures
Vehicular	
Interrupted Flow Urban Street Segments Signalized Intersection Two-way Stop Intersection All-way Stop Intersection Roundabouts	Travel Speed, Base of Free Flow Speed Delay Delay Delay Delay
Uninterrupted Flow Two-lane Highway Multilane Highway	Percent Time-Spent-Following, Average Travel Speed, Percent of Free Flow Speed Density
Other Highway Users	
Pedestrian Bicycle Transit	Space, Delay, LOS Score LOS Score LOS Score
Off-Street Pedestrian or Bicycle Facility	
Pedestrian Bicycle	Space, Events LOS Score

SERVICE MEASURES FOR LOS

Figure 27-6A

The *HCM* provides the LOS (A to F) criteria for the capacity analysis for each highway element, including:

- multilane rural highways
- two-lane, two-way rural highways;
- signalized intersections;
- unsignalized intersections; and
- urban and suburban arterials.

[Chapters 32](#) and [33](#) present LOS criteria for each facility type based on the project scope of work.

27-6.05 Capacity Analyses

Design the roadway mainline or intersection to accommodate the DHV at the selected LOS. The methodologies in the HCM uses the DHV, or demand flow rate, and the various highway factors which affect capacity to determine the LOS. The service flow rate should be accommodated by adjusting the various highway factors which affect capacity until a suitable design is determined. The detailed calculations, factors, and methodologies are presented in the *HCM*.

The *HCM* provides the analytical techniques to determine the LOS for all highway elements (e.g., for basic roadway segments, intersections) for a given set of traffic and roadway conditions. For a major highway segment, for example, the capacity analysis will determine if an existing roadway will accommodate future traffic demands at the desired LOS or if roadway improvements are necessary (e.g., the addition of travel lanes).

Capacity analyses are normally required only at intersections. An analysis for uninterrupted flow may be required in urban areas to determine the number of through traffic lanes needed.

27-7 ADHERENCE TO DESIGN CRITERIA

Part IV "Project Design" of this *Manual* presents geometric design criteria for application to individual projects. In general, the designer is responsible for making a reasonable effort to meet these criteria in the project design for LPA projects. This will ensure that a local road and street system meets the transportation needs of the public and provides a reasonable level of safety, comfort, and convenience for the traveling public. However, recognizing that this is neither always practical nor cost effective, the following process evaluates and approves exceptions to the geometric design criteria.

27-7.01 Hierarchy of Design Criteria

The design criteria presented in the *BLRS Manual* have varying levels of importance. Therefore, IDOT has established Level One and Level Two design criteria for designers. These two levels of design criteria are intended to assist the designers in summarizing compliance and providing documentation for the proposed project design.

27-7.01(a) Level One Design Criteria

Level One design criteria are judged to be those design elements that are the most critical indicators of a highway's safety and its overall serviceability. Level One design criteria elements include:

- design speed;
- LOS for the mainline;
- lane widths (through lanes, turn lanes, parking lanes, bike lanes);
- traveled way cross slopes;
- shoulder widths;
- horizontal curvature (minimum radius);
- superelevation rates;
- maximum grades;
- intersection sight distance;
- stopping sight distance (vertical curvature (K values), horizontal clearances);
- clear roadway bridge widths;
- freeboard above design high water;
- vertical clearances;
- accessibility for individuals with disabilities;
- pedestrian and bicycle accommodations;
- roadside clear zones;
- LOS for intersection(s);
- warrants for stop signs and signals;

- guardrail; and
- angle parking.

27-7.01(b) Level Two Design Criteria

Level Two design criteria include additional important indicators of a facility's safety and serviceability but are not considered as critical as the Level One criteria. Level Two design criteria elements include:

- design period (design year);
- horizontal alignment (superelevation transition lengths, superelevation distribution);
- vertical alignment (minimum grades, minimum length of vertical curves, maximum K values);
- cross section elements (parking lane cross slopes; sidewalk widths, cross slope, and grades; median type and width; shoulder cross slopes, rollover factors, curb and gutter types, side slopes);
- drainage (flood frequency),
- intersections (LOS for individual movements, skew angle, approach gradients, design vehicle, turning radius, minimum island size, turn lane lengths and tapers, entrances);
- railroad crossing protection and widths;
- highway lighting;
- pavement design; and
- other items deemed important.

27-7.02 Identification of Design Criteria and Design Exceptions

The following procedure identifies project design criteria and design exceptions that will apply to all Federal, State, and MFT funded projects on local facilities for new construction, reconstruction, and 3R projects. Pavement preservation projects are not covered. The determination of whether or not the proposed project design meets the controlling design criteria is dependent upon the project scope of work (e.g., for a 3R project, the criteria in [Chapter 33](#) will apply). The following will apply:

1. Initial Documentation of Design Exceptions (Form [BLR 22120](#)). Form [BLR 22120](#) assists the designer in determining if any design element meets the design criteria presented in this *Manual*. Completing Form [BLR 22120](#) will ensure that any design exceptions being considered are evaluated appropriately. The LPA must fully document its evaluation of the project's design and clearly demonstrate that a design exception is justified. The designer should include a statement that:
 - a. identifies the design element,
 - b. identifies BLRS design criteria,
 - c. discusses the proposed design, and

BUREAU OF LOCAL ROADS & STREETS
BASIC DESIGN CONTROLS

August 2016

27-7-3

- d. provides justification for the design exception.
2. Submission. Submit Form [BLR 22120](#) and all justification to the district as early as possible in the project's development. For Federal funded projects, submit the form prior to submission of the Project Development Report; see [Chapter 22](#). For MFT and State funded projects, complete the form prior to submitting the plans to the district.
 - a. When requesting a design exception, the following will apply:
 - b. Federal Funded Projects. Complete Form [BLR 22120](#) in its entirety.
 - c. MFT and State Funded Projects. For LPAs that do not have an Illinois licensed professional engineer on its staff, complete Form [BLR 22120](#) in its entirety. This includes projects that are designed by a consultant even if there is a professional engineer on the consultant's staff. For projects where there is an Illinois licensed professional engineer on the LPA's staff, the designer only needs to complete the sections for the criteria on Form [BLR 22120](#) for which there is an exception.
 - d. Pavement Preservation Projects. Completion of Form [BLR 22120](#) is not required for these projects; however, the design exception process as described in this Section still applies.
3. District Coordination Meetings. Any contemplated design exceptions should be coordinated with the district early on in the project development phase. Many districts will discuss design exceptions at the district coordination meetings with attendance by representatives from the FHWA, CBLRS, and the LPAs and their consultants. The minutes of the coordination meeting may serve as documentation of the approval. These meetings are usually scheduled bi-monthly and monthly in Districts One and Eight,

When evaluating exceptions to design criteria, the primary considerations are:

- safety,
 - capacity,
 - compatibility with adjacent sections,
 - time to construction of ultimate improvement,
 - construction costs, and
 - impacts to the natural and built environment.
4. Approval. Exceptions from Level One design criteria must receive approval from CBLRS. Exceptions from Level Two design criteria will receive approval from the districts. LPAs operating under an Agreement of Understanding ([Section 5-1](#)) will be allowed to determine the acceptability of Level Two design exceptions without district approval. Exceptions which are denied should be returned to the LPA with reasons for the denial in writing. Exceptions denied by CBLRS will be sent to the district.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

27-7-4

BASIC DESIGN CONTROLS

August 2016

5. Final Documentation. For Federal funded projects, include Form [BLR 22120](#), the approval or denial, and copy of the minutes from the coordination meeting in the Project Development Report (PDR). For all other projects, include Form [BLR 22120](#), the approval, and a copy of the minutes from the coordination meeting in the LPA's project file.

For LPA projects which require improvements on facilities under the jurisdiction of the State and a design exception is being contemplated, it follows a similar process as on the local facilities except:

1. Policy and Procedure. [Section 31-8](#) of the *Bureau of Design & Environment (BDE) Manual* must be followed.
2. Documentation / Submission. Form [BDE 3100](#) must be submitted to the district for review, who will forward the form and the district's recommendation to BDE.
3. District Coordination Meetings. The LPA project may need to be brought to the state-side of the district coordination meeting for discussion among FHWA, BDE, various district staff, the LPA and their consultants.
4. Approval. The approval of Form [BDE 3100](#) is by BDE and in rare cases may require FHWA's approval.
5. Final Documentation. For Federal funded projects, include Form [BDE 3100](#), the approval, and copy of the minutes from the coordination meeting in the PDR. For all other projects, include Form [BDE 3100](#), the approval, and a copy of the minutes from the coordination meeting in the LPA's project file

27-7.03 Accessibility Standards for Individuals with Disabilities

[Section 41-6](#) presents the IDOT application of the Federal standards for accessibility for individuals with disabilities as promulgated in *ADA / PROWAG*. The following applies when accessibility standards cannot be met, but they are designed to the maximum extent practicable (MEP) within the scope of the project (non-compliant element):

1. Procedure. Where site conditions and/or topography creates a non-compliant element, an in-depth evaluation with documentation is required. However, approval of funding for projects with non-compliant elements are extraordinarily rare and, therefore, a LPA should pursue this option only as a last resort.

If the non-compliant element is on facilities under the jurisdiction of the State, the LPA shall follow the procedure in [Section 31-8](#) of the *BDE Manual* and document it on Form [BDE 3101](#).

2. Documentation / Submission. The LPA must fully document its evaluation of the project site conditions and must clearly demonstrate that the standards cannot be met and the design is to the MEP within the scope of the project. The content of the submission will vary on a case-by-case basis. Include the following information as appropriate:
 - location of the affected property,
 - a set of plans showing the location and the proposed deficient element, location of the affected property,

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS
BASIC DESIGN CONTROLS

August 2016

27-7-5

- photographs of the non-compliant element,
- what work is required to achieve the *ADA / PROWAG* standard, and
- the cost of achieving the *ADA / PROWAG* standards.

If the district concurs the LPA has properly documented the non-compliant element and cannot meet the standards and will be designed to the MEP, the district will submit the LPA's documentation to CBLRS with a request to concur the LPA has documented the MEP properly. If the request is on facilities under the jurisdiction of the State, the LPA's documentation shall be submitted to BDE.

3. District Coordination Meetings. Any contemplated non-compliant element shall be discussed at the district coordination meetings, if federal funds are included in the project. It is recommended an onsite field visit be scheduled to evaluate non-compliant elements.
4. Concurrence. IDOT concurrence is whether or not the LPA has properly documented that the non-compliant element is designed to the MEP and will be by CBLRS with concurrence from FHWA for requests on facilities under the LPA's jurisdiction. Facilities under the jurisdiction of the State shall follow the procedure in [Section 31-8](#) of the *BDE Manual*.
5. Final Documentation. For Federal funded projects, include the LPA's documentation, IDOT's concurrence in the LPA's documentation, and copy of the minutes from the coordination meeting in the Project Development Report. For all other projects, include the LPA's documentation and IDOT's concurrence in the documentation in the LPA's project file.

Chapter 28

SIGHT DISTANCE

28-1 STOPPING SIGHT DISTANCE (SSD)

SSD is the sum of the distance traveled during a driver's brake reaction time (i.e., perception / reaction time) and the braking distance (i.e., distance traveled while decelerating to a stop). To calculate SSD on level grade, use the following formulas:

$$\text{SSD} = 1.47 Vt + 1.075 \frac{V^2}{a} \quad (\text{US Customary}) \text{ Equation 28-1.1}$$

$$\text{SSD} = 0.278Vt + 0.039 \frac{V^2}{a} \quad (\text{Metric}) \text{ Equation 28-1.1}$$

Where:

SSD	=	stopping sight distance, ft (m)
V	=	design speed, mph (km/h)
t	=	brake reaction time, 2.5 s
a	=	driver deceleration, ft/s ² (m/s ²) – recommended at 11.2 ft/s ² (3.4 m/s ²)

The following briefly discusses the basic assumptions within the SSD model:

1. **Brake Reaction Time.** This is the time interval between when the obstacle in the road can be physically seen and when the driver first applies the brakes. Based on several studies of observed driver reactions, the assumed value is 2.5 seconds.
2. **Braking Action.** The braking action is based on the driver's ability to decelerate the vehicle while staying within the travel lane and maintaining steering control during the braking maneuver. A deceleration rate of 11.2 ft/s² (3.4 m/s²) is considered to be comfortable for 90% of the drivers.
3. **Design Speed.** The local facility's design speed is used to determine the initial driver speed.

Figure 28-1A provides SSD for vehicles on level grade (-3 to +3 percent). Figure 28-1B provides SSD for vehicles on downgrades or upgrades 3 percent or steeper. When applying the SSD values, the height of eye is assumed to be 3.5 ft (1.080 m) and the height of object 2 ft (600 mm).

STOPPING SIGHT DISTANCE ON GRADES

Figure 28-1B

28-2 PASSING SIGHT DISTANCE (PSD)

PSD considerations are limited to two-lane, two-way highways. On these facilities, vehicles may overtake slower moving vehicles, and the passing maneuver must be accomplished on a lane used by opposing traffic.

The minimum PSD for two-lane highways is determined from the sum of four distances as illustrated in Figure 28-2A. For a discussion on how to determine these four distances, review the American Association of State Highway and Transportation Officials (AASHTO) *A Policy on Geometric Design of Highways and Streets (The Green Book)* and/or [Section 47-2](#) of the *Bureau of Design and Environment (BDE) Manual*.

Figure 28-2B provides the minimum PSD for design on two-lane, two-way highways. These distances allow the passing vehicle to safely complete the entire passing maneuver. These values should not be confused with the values presented in the [Illinois Supplement to the Manual of Uniform Traffic Control Devices \(ILMUTCD\)](#) for the placement of no-passing zone stripes. These values are based on different operational assumptions (i.e., distance for the passing vehicle to abort the passing maneuver). The designer should also realize that the highway capacity adjustment in the *Highway Capacity Manual (HCM)* for two-lane, two-way highways is based on the [ILMUTCD](#) criteria for marking no-passing zones. It is not based on the percent of PSD from *The Green Book* and shown in Figure 28-2C.

PSD for passenger cars is measured from a 3.5 ft (1.080 m) height of eye to a 3.5 ft (1.080 m) height of object. The 3.5 ft (1.080 m) height of object allows the opposing driver to see the top of a typical passenger car. The recommended value of truck driver eye height for design is 7.6 ft (2.330 m) above the roadway surface.

On rural new construction / reconstruction projects, the designer should attempt to provide PSD over the length of the project consistent with the percentages shown in Figure 28-2C. In determining the percentages, each PSD segment should be greater than 1,500 ft (450 m). It is generally not cost effective to make significant improvements to the horizontal and vertical alignment solely to increase the available PSD.

Appreciable upgrades can increase the sight distances required for safe passing maneuvers. Where these upgrades are encountered in the design of the project, take this into account when selecting the appropriate PSD.

- d_1 = Initial maneuver distance, ft (m)
- d_2 = Distance while passing vehicle occupies left lane, ft (m)
- d_3 = Clearance length, ft (m)
- d_4 = Distance traversed by the opposing vehicle, ft (m)

Notes:

1. To determine d_1 , d_2 , d_3 , and d_4 , see *The Green Book* and/or [Section 47-2](#) of the *BDE Manual*.
2. The *ILMUTCD* definition for passing sight distance uses only the second phase of signing and pavement markings distances.

**ELEMENTS OF PASSING DISTANCE
(Two-Lane Highways)**

Figure 28-2C

28-3 INTERSECTION SIGHT DISTANCE (ISD)

28-3.01 General

In general, ISD refers to the corner sight distance available in intersection quadrants that allows a driver approaching an intersection to observe the actions of vehicles on the crossing leg(s). ISD evaluations involve establishing the needed sight triangle in each quadrant by determining the legs of the triangle on the two crossing roadways.

Within this clear sight triangle, the objective is to remove or lower any object that obstructs the driver's view, if practical. Sight obstruction may include:

- buildings,
- parked vehicles (see [Section 31-1](#)),
- vegetation (trees, hedges, bushes, un-mowed grass, tall crops)
- fences,
- roadside hardware,
- highway structures, railroad structures,
- retaining walls, and
- the actual ground line.

The additional costs and impacts of removing sight obstructions are often justified. If it is impractical to remove an obstruction blocking the sight distance; consider providing traffic control devices or design applications (e.g., warning signs, turn lanes) which may not otherwise be considered.

In general, point obstacles (e.g., traffic signs, utility poles) are not considered sight obstructions (i.e., the driver can move slightly to avoid these obstacles). Crops and un-mowed grasses are considered seasonal / non-permanent obstructions, give consideration to crops and un-mowed grasses within the corner sight distance triangle.

The height of eye for passenger cars is assumed to be 3.5 ft (1.080 m) above the surface of the minor road. The height of object (approaching vehicle on the major road) is also assumed to be 3.5 ft (1.080 m). An object height of 3.5 ft (1.080 m) assumes that a sufficient portion of the oncoming vehicle must be visible to identify it as an object of concern by the minor road driver. If there are a sufficient number of trucks to warrant their consideration, see [Section 36-6](#) of the *BDE Manual*.

The necessary clear sight triangle is based on the type of traffic control at the intersection and on the design speeds of the two roadways. Some of the cases are further divided by the movement at the intersection, however; the values in the figures in Section 28-3 will cover all movements. The types of traffic control and maneuvers are as follows:

BUREAU OF LOCAL ROADS & STREETS

- Case A – Intersections with no control,
- Case B – Intersections with stop control on the minor road,
 - B-1 (Left turns) / B-2 (Right turns) / B-3 (Crossing)
- Case C – Intersections with yield control on the minor road;
 - C-1 (Crossing) / C-2 (Left or right turns)
- Case D – Intersections with traffic signal control,
- Case E – Intersections with all-way stop control, and
- Case F – Left turns from the major road.

Gap acceptance is used as the conceptual basis for ISD criteria. For additional guidance on the gap acceptance design, see *The Green Book*.

**ADJUSTMENT FACTORS
FOR SIGHT DISTANCE BASED ON APPROACH GRADE**

Figure 28-3A

28-3.02 Case A – Intersections With No Control

Intersections between low-volume and low-speed roads/streets may have no traffic control. At these intersections, sufficient corner sight distance should be available to allow approaching vehicles to adjust their speed to avoid a collision, typically a reduction to 50% of their mid-block running speed. Figure 28-3B illustrates the corner sight distance triangles for intersections with no traffic control. Figure 28-3C provides the ISD criteria for these intersections. Example 28-3(1) provides the steps in determining the length of each of the legs of an intersection’s sight triangle. Consider providing the suggested sight distance, especially for new construction. If this sight distance cannot be provided, consider placing stop or yield signs on one of the roads, or installing intersection warning signs.

Where the grade along an intersection approach exceeds 3 percent, the leg of the clear sight triangle along that approach should be adjusted by multiplying the approach sight distance by the appropriate adjustment factor from Figure 28-3A.

**MEASUREMENT OF INTERSECTION SIGHT DISTANCE
(Case A – No Traffic Control)**

Figure 28-3B

BUREAU OF LOCAL ROADS & STREETS

US Customary		Metric	
Design Speed (mph)	Intersection Sight Distance (ft)	Design Speed (km/h)	Intersection Sight Distance (m)
20	90	30	25
25	115	40	35
30	140	50	45
35	165	60	55
40	195	70	65
45	220	80	75
50	245	90	90
55	285	100	105
60	325		

Note:

1. For approach grades that exceed 3%, multiply by the value in Figure 28-3A.

**INTERSECTION SIGHT DISTANCE
(Case A – No Traffic Control)**

Figure 28-3C

Example 28-3(1)

Given: No traffic control at intersection
 Approach grades are between -3% and +3%
 Design speed – 40 mph (Highway A – see Figure 28-3B)
 30 mph (Highway B – see Figure 28-3B)

Problem: Determine legs of sight triangle.

Solution: From Figure 28-3A – Adjustment Factor = 1.0
 From Figure 28-3C – $ISD_a = 195$ ft
 $ISD_b = 140$ ft

28-3.03 Case B – Intersections with Stop Control on the Minor Road

Where traffic on the minor road of an intersection is controlled by stop signs, the driver of the vehicle on the minor road must have sufficient sight distance for a safe departure from the stopped position assuming that the approaching vehicle comes into view as the stopped vehicle begins its departure.

The ISD is obtained by providing clear sight triangles both to the right and left as shown in Figure 28-3D. The length of legs of these sight triangles is determined as follows:

**CLEAR SIGHT TRIANGLES
(Case B – Stop-Controlled on the Minor Road)**

Figure 28-3D

1. Minor Road. The length of leg along the minor road is based on two parts. The first is the location of the driver's eye on the minor road. This is typically assumed to be 15 ft (4.5 m) from the edge of traveled way for the major road and in the center of the lane on the minor road. The second part is based on the distance to the center of the vehicle on the major road. For right-turning vehicles, this is assumed to be the center of the closest travel lane from the left. For left-turning vehicles, this is assumed to be the center of the closest travel lane for vehicles approaching from the right. See Figure 28-3E.
2. Major Road. The length of the sight triangle leg or ISD along the major road is determined using the following equation:

$$\text{ISD} = 1.47 V_{\text{major}} t_g \quad (\text{US Customary}) \text{ Equation 28-3.1}$$

$$\text{ISD} = 0.278 V_{\text{major}} t_g \quad (\text{Metric}) \text{ Equation 28-3.1}$$

Where:

ISD = length of sight triangle leg along major road, ft (m)

V_{major} = design speed of major road, mph (km/h)

t_g = time gap for minor road to enter the major road, sec

The critical time gap (t_g) varies according to the design vehicle, the maneuver type, the grade on the minor road approach, the number of lanes on the major roadway, the type of operation, and the intersection skew.

3. Design Vehicles. For local roads and streets, assume a passenger car as the design vehicle (i.e., $t_g = 7.5$ seconds).
4. Grades. If the approach grade on the minor road is on an upgrade that exceeds 3%, add 0.2 sec for each percent grade to t_g .
5. ISD Values. Figure 28-3E provides the ISD criteria for a passenger car turning left or right or crossing a two-lane major road. For other types of facilities (e.g., four-lanes, medians) or where trucks may control the design, see [Section 36-6](#) of the *BDE Manual*.

At a minimum, provide Case B sight distance at all intersections for reconstruction and new construction projects. Also, provide Case B sight distance on projects where the vertical alignment is changed.

BUREAU OF LOCAL ROADS & STREETS

August 2016

SIGHT DISTANCE

28-3-7

US Customary		Metric	
Design Speed (V_{major}) (mph)	ISD (ft) ⁽¹⁾⁽²⁾	Design Speed (V_{major}) (km/h)	ISD (m) ⁽¹⁾⁽²⁾
20	225	30	65
25	280	40	85
30	335	50	105
35	390	60	130
40	445	70	150
45	500	80	170
50	555	90	190
55	610	100	210
60	665		

Notes:

1. *These ISD values assume crossing or left or right turns onto a two-lane facility without a median for a passenger car. For other types of facilities (e.g., four-lanes, medians) or where trucks may control the design, see [Section 36-6](#) of the BDE Manual.*
2. *Where the approach grade on the minor road is on an upgrade that exceeds 3%, add 0.2 sec for each percent grade to t_g .*

**INTERSECTION SIGHT DISTANCES
(Two-Lane Facilities)
(Case B – Stop Control on the Minor Road)**

Figure 28-3E

28-3.04 Case C – Intersections With Yield Control On the Minor Road

At intersections controlled by a yield sign, drivers on the minor road will typically:

- slow down as they approach the major road to approximately 60% of the approach speed;
- based on their view of the major road, make a stop/continue decision; and
- either brake to a stop or continue their crossing or turning maneuver onto the major road.

Yield control criteria is based on a combination of the no control ISD discussed in Section 28-3.02 and the stop-controlled ISD as discussed in Section 28-3.03. Where yield control is proposed, consider the Case C sight distance on new construction and reconstruction projects.

BUREAU OF LOCAL ROADS & STREETS
SIGHT DISTANCE

28-3-8

August 2016

If adequate sight distance cannot be provided, consider replacing the yield sign with a stop sign. To determine the applicable clear sight triangles for a yield-controlled intersection, see Figure 28-3E.

US Customary			Metric		
Design Speed (mph)	Minor Road Approach (a) (ft) ^{1,2}	Major Road Approach (b) (ft)	Design Speed (km/h)	Minor Road Approach (a) (m) ^{1,2}	Major Road Approach (b) (m)
20	100	195	30	30	55
25	130	240	40	40	75
30	160	290	50	55	95

40	235	385	70	80	130
45	275	430	80	100	145
50	320	480	90	115	165
55	370	530	100	135	185
60	420	575			

Notes:

1. For "T" intersections, use 85 ft (25 m).
2. Values shown are for passenger cars crossing a two-lane facility with no median and grades 3% or less. For approach grades that exceed 3%, multiply by the value in Figure 28-3A.

**INTERSECTION SIGHT DISTANCE GUIDELINES
(Case C – Yield Control)**

Figure 28-3F

28-3.05 Case D – Intersections with Traffic Signal Control

At signalized intersections, provide sufficient sight distance from the stop bar so that the first vehicle on each approach is visible to all other approaches. Traffic signals are often used at high-volume intersections to address crashes related to restricted sight distances. Therefore, the ISD criteria for left- or right-turning vehicles as discussed in Section 28-3.03 are typically not applicable at signalized intersections. However, where right-turn-on-red is allowed, check to ensure that the ISD for a stop-controlled right-turning vehicle is available to the left. If it is not, consider restricting the right-turn-on-red movement. In addition, if the traffic signal is placed on two-way flash operation (i.e., flashing amber on the major-road approaches and flashing red on the minor-road approaches) under off-peak or nighttime conditions, consider providing the ISD criteria as discussed in Section 28-3.03 for a stop-controlled intersection.

28-3.06 Case E – Intersections With All-Way Stop Control

At intersections with all-way stop control, provide sufficient sight distance from the stop bar so that the first stopped vehicle on each approach is visible to all other approaches. Often, intersections are converted to all-way stop control to address limited sight distance at the intersection. Therefore, providing additional sight distance at the intersection is unnecessary.

28-3.07 Case F – Left Turns from the Major Road

At all intersections, regardless of the type of traffic control, consider the sight distance needs for a stopped vehicle turning left from the major road. This situation is illustrated in Figure 28-3G. The driver will need to see straight ahead for a sufficient distance to turn left and clear the opposing travel lanes before an approaching vehicle reaches the intersection. Sight distance for opposing left turns may be increased by offsetting the left-turn lanes.

Figure 28-3G provides ISD values for passenger cars turning left from the major road.

28-3.08 Effect of Skew

Where it is impractical to realign an intersection that is greater than 30° from the perpendicular, the designer may need to adjust the gap acceptance times to account for the additional travel time required for a vehicle to make a turn or cross a facility. At oblique-angled intersections, determine the actual path length for a turning or crossing vehicle by dividing the total distance of the lanes and/or median to be crossed by the sine of the intersection angle. If the actual path length exceeds the total width of the lanes to be crossed by 12 ft (3.6 m) or more, see [Section 36-6](#) of the *BDE Manual* for additional guidance.

US Customary			Metric		
Design Speed (mph)	ISD Crossing One-Lane ¹ (ft)	ISD Crossing Two-Lanes ^{1,2} (ft)	Design Speed (km/h)	ISD Crossing One-Lane ¹ (m)	ISD Crossing Two-Lanes ^{1,2} (m)
20	165	180	30	50	55
25	205	225	40	62	69
30	245	265	50	75	81

Chapter 29

HORIZONTAL ALIGNMENT

Chapter 29 presents Bureau of Local Roads and Streets (BLRS) criteria for the design of horizontal alignment elements. This includes horizontal curvature and superelevation for both rural and urban local facilities.

29-1 DEFINITIONS

This Section presents definitions for the basic elements of horizontal alignment:

1. Axis of Rotation. The line about which the pavement is revolved to superelevate the roadway. This line will maintain the normal roadway profile throughout the curve.
2. Broken-Back Curves. Closely spaced horizontal curves with deflection angles in the same direction with an intervening, short tangent section (less than 1500 ft (500 m)).
3. Compound Curves. A series of two or more simple curves with deflections in the same direction immediately adjacent to each other.
4. Deflection Angle (Δ). The external angle between the two projected tangents (beyond the point of intersection) of a simple curve.
5. Low-Speed Urban Streets. All streets within urbanized or small urban areas with a design speed of 45 mph (70 km/h) or less.
6. Maximum Superelevation (e_{max}). The upper limit for the superelevation rate used in the design of horizontal curves. Its selection depends on several factors including climatic conditions, terrain conditions, type of area (e.g., rural or urban), pavement type, and functional classification.
7. Normal Crown (NC). The cross slope on a tangent section of roadway (i.e., no superelevation).
8. Open Roadway Conditions. Rural facilities for all design speeds and urban facilities with a design speed \geq 50 mph (80 km/h).
9. Relative Longitudinal Gradient. For superelevation transition sections on two-lane facilities, the difference in grade between the centerline profile grade and the grade of the edge of traveled way.
10. Remove Adverse Cross Slope. The outside lane has been rotated from normal crown (NC) to a point prior to Remove Adverse Crown (RC). This is shown in Figure 29-3E transitioning from Section A to Section C.
11. Remove Adverse Crown (RC). A superelevated roadway section that is sloped across the entire traveled way in the same direction and at a rate equal to the cross slope on

- the tangent section (typically, 1.5% or 2.0%). This is shown in Figure 29-3E for Section C.
12. Reverse Curves. Two simple curves with deflections in opposite directions that are joined by a relatively short tangent distance or which have no intervening tangent (i.e., the Point of Tangent (PT) and Point of Curve (PC) are coincident).
 13. Simple Curves. Continuous arcs of constant radius that achieve the necessary roadway deflection without an entering or exiting transition.
 14. Superelevation (e). The amount of cross slope or “bank” provided on a horizontal curve to counterbalance, in combination with the side friction, the centrifugal force of a vehicle traversing the curve.
 15. Superelevation Rollover. The algebraic difference (A) between the superelevated travel lane slope and shoulder slope on the high side of a horizontal curve.
 16. Superelevation Transition Length. The distance transitioning the roadway from a normal crown section to the design superelevation rate. Superelevation transition length is the sum of the tangent runout (TR) and superelevation runoff (L) distances:
 - Tangent Runout (TR). Tangent runout is the distance needed to change from a normal crown section to a point where the adverse cross slope of the outside lane is removed (i.e., the outside lane is level).
 - Superelevation Runoff (L). Superelevation runoff is the distance needed to change the cross slope from the end of the tangent runout (adverse cross slope removed) to a section that is sloped at the design superelevation rate (e).
 17. Traveled Way. The portion of the roadway used for the movement of vehicles, exclusive of shoulders and auxiliary lanes.

29-2 HORIZONTAL CURVES

Horizontal curves are circular arcs that provide transitions between two tangents. The radius (R) defines the circular arc that a curve will transcribe. These changes in deflection are necessary in virtually all roadway alignments to avoid impacts on a variety of field conditions (e.g., right-of-way, natural features, and man-made features).

29-2.01 Types of Horizontal Curves

Section 29-2.01 discusses the types of horizontal curves that may be used to achieve the necessary roadway deflection.

29-2.01(a) Simple Curves

Because of their simplicity and ease of design, survey, and construction, it is strongly recommended to use simple curves on local facilities.

29-2.01(b) Compound Curves

The use of compound curves on roadway mainline is recommended only in special circumstances to meet field conditions (e.g., to avoid obstructions that cannot be relocated) where a simple curve cannot meet this need. When a compound curve is used on mainline, the radius of the flatter circular arc (R_1) should not be more than 50% greater than the radius of the sharper circular arc (R_2), therefore; $R_1 \leq 1.5 R_2$.

[Chapter 34](#) discusses the use of compound curves for intersections at-grade (e.g., for curb radii).

29-2.01(c) Reverse Curves

Where reverse curves are used, a distance adequate to provide the superelevation transition should be provided between the PT and PC of the two curves. Superelevation development for reverse curves requires special attention. This is discussed in Section 29-3.

29-2.01(d) Broken-Back Curves

Broken-back curves should be avoided on the roadway mainline because of the potential for confusing a driver, problems with superelevation development, and the unpleasant view of the roadway that is created. Instead, it is recommended that a single, flat simple curve be used. In rural and suburban areas, a minimum tangent length of 500 ft (150 m) should be provided between two horizontal curves with deflections in the same direction.

29-2.02 Basic Curve Equation

The point-mass formula is used to define vehicular operation around a curve. Where the curve is expressed using its radius, the basic equation for a simple curve is:

$$R = \frac{V^2}{15(e + f)} \quad \text{(US Customary) Equation 29-2.1}$$

$$R = \frac{V^2}{127(e + f)} \quad \text{(Metric) Equation 29-2.1}$$

where:

- R = radius of curve, ft (m)
- V = design speed, mph (km/h)
- e = superelevation rate, decimal
- f = side friction factor (constant based on design speed)

29-2.03 Minimum Radii

Figures 29-2A ($e_{\max} = 8.0\%$), 29-2B ($e_{\max} = 6.0\%$), and 29-2C ($e_{\max} = 4.0\%$) present the minimum radii for open-roadway conditions. See Section 29-3.01 for the selection of e_{\max} . In most cases, the designer should avoid the use of minimum radii because this results in the use of maximum superelevation rates. These rates should be avoided because the facility must often accommodate vehicles traveling over a wide range of speeds. This is particularly true in Illinois where the entire State is subject to ice and snow. Where vehicular speeds are slow or stopped and the rate of superelevation is high, vehicles could slide down the cross slope when the pavement is icy.

29-2.04 Side Friction Factor

The side friction factor (f) represents the contribution of the roadway/tire interface to counterbalance the centrifugal force of a vehicle traversing the curve. This factor varies according to design speed and open-roadway or low-speed urban street conditions. It is important to recognize that the side friction factor represents a threshold of driver discomfort and not the point of impending skid. Figure 29-2D presents the side friction factors used in Equation 29-2.1 for open-roadway conditions.

29-2.05 Maximum Deflection Without Curve

It may be appropriate to omit a horizontal curve where very small deflection angles are present. As a guide, the designer may retain deflection angles of approximately 1° or less (urban) and $0^\circ 15'$ (rural) on local agency facilities without providing a horizontal curve. For these angles, the absence of a horizontal curve should not affect operations or aesthetics.

SIDE FRICTION FACTORS
(Open-Roadway Conditions)

Figure 29-2D

29-2.06 Minimum Length of Curve

The radius is used to calculate the length of curve by using the following equation:

$$L = \frac{2\pi R\Delta}{360} \qquad \text{Equation 29-2.2}$$

where:

- L = length of curve, ft (m)
- Δ = deflection angle, degrees
- R = radius of curve, ft (m)

A longer than calculated length of curve may be necessary depending on the design speed. Figure 29-2E provides design values for the minimum length of curve based on design speed.

For small deflection angles, horizontal curves should be sufficiently long to avoid the appearance of a kink. With a deflection angle of 5°, the minimum length of curve should be 350 ft (120 m) for a design speed of 55 mph (100 km/h). Where the deflection angle is 5° or less, the minimum length of curve in Figure 29-2E should be adjusted by the factor in Figure 29-2F.

ADJUSTMENTS FOR MINIMUM LENGTHS OF CURVE ($\Delta < 5^\circ$)

Figure 29-2F

29-2.07 **Maximum Length of Curve**

To improve driver tolerance by reducing steering time in a circular path, the maximum curve length for high-speed, two-lane highways should not exceed 1 mile (1.6 km). On low-speed, two-lane highways, the maximum curve length should be limited to approximately ¼ mile (0.5 km). Lengths in excess of these values should be avoided.

29-3 SUPERELEVATION DEVELOPMENT (OPEN-ROADWAY CONDITIONS)

This Section presents criteria for superelevation development, which apply to all rural facilities and to urban facilities where $V \geq 50$ mph (80 km/h). See Section 29-4 for low-speed urban streets.

29-3.01 Superelevation Rates

29-3.01(a) Maximum Superelevation Rate

The selection of a maximum allowable rate of superelevation (e_{max}) depends upon several factors. These include urban/suburban/rural location (see [Section 27-4](#)), type of existing or expected roadside development, type of pavement surface, and prevalent climatic conditions within Illinois. For open-roadway conditions, the following typical e_{max} values apply:

1. Rural. Use $e_{max} = 8.0\%$ for all rural facilities, except for facilities with aggregate surfaces.
2. Urban/Suburban. Where $V \geq 50$ mph (80 km/h), use $e_{max} = 6.0\%$ for urban/suburban facilities.
3. Aggregate Surface. For rural facilities with an aggregate surface, use $e_{max} = 4.0\%$.
4. Seal Coat Surface. For all facilities with a seal coat surface, when newly placed by construction or maintenance may exhibit traits of an aggregate surface for a short time period. However, the e_{max} value should be based on the seal coat having characteristics similar to a hard surface roadway.

For Items 1 and 2, the designer may use a lower e_{max} .

29-3.01(b) Superelevation Tables

Based on the selection of e_{max} , Figures 29-3B, 29-3C, and 29-3D allow the designer to select the appropriate superelevation rate (e) for any combination of curve radius (R) and design speed (V). Note that the superelevation rates in the figures are expressed as a percent. The values in the figures should be calculated based on the curve radius and/or the superelevation rate to be used.

29-3.01(c) Use of Normal Crown and Remove Adverse Crown

A horizontal curve with a sufficiently large radius does not require superelevation, and the normal crown section (NC) used on tangent can be maintained throughout the curve. On sharper curves for the same design speed, a point is reached where a superelevation rate of 1.5% to 2.0% across the total traveled way is appropriate. This is called "remove adverse crown" (RC). Figures 29-3B, 29-3C, and 29-3D indicate the radii ranges where NC and RC apply.

29-3.02 **Transition Lengths**

As defined in Section 29-1, the superelevation transition length is the distance required to transition the roadway from a normal crown section to the full design superelevation rate. The superelevation transition length is the sum of the tangent runout distance (TR) and superelevation runoff length (L_1).

29-3.02(a) **Two-Lane Roadways**

1. Superelevation Runoff. The e_{max} tables (Figures 29-3B, 29-3C, and 29-3D) present the superelevation runoff lengths (L_1) for two-lane roadways for various combinations of curve radii and design speed. These lengths are calculated as follows:

$$L_1 = (e)(W)(RS) \qquad \text{Equation 29-3.1}$$

where:

- L_1 = superelevation runoff length for a two-lane roadway (assuming the axis of rotation is about the roadway centerline), ft (m)
- e = design superelevation rate (ft/ft (m/m)), decimal
- W = width of rotation for one lane (assumed to be 11 ft (3.3 m))
- RS = reciprocal of relative longitudinal gradient between the profile grade and outside edge of two-lane roadway; see Figure 29-3A

2. Tangent Runout. The tangent runout (TR) distance should be calculated using the tangent cross slope and the maximum relative longitudinal gradient based on the selected design speed; as shown in Figure 29-3A. TR is calculated as follows:

$$TR = (NC)(W)(RS) \qquad \text{Equation 29-3.2}$$

where:

- TR = tangent runout length for a two-lane roadway, (assuming the axis of rotation is about the roadway centerline), ft (m)
- NC = normal crown slope (assumed to be 0.015 ft/ft (m/m)), decimal
- W = width of rotation for one lane (assumed to be 11 ft (3.3 m))
- RS = reciprocal of relative longitudinal gradient between the profile grade and outside edge of two-lane roadway; see Figure 29-3A

3. Superelevation Transition Length. The total of the tangent runout (TR) distance and superelevation runoff length (L_1) equals the minimum superelevation transition length used for a two-lane roadway at an isolated horizontal curve.

Figure 29-3A

29-3.02(b) Multilane Roadways

For superelevation transition lengths for multilane roadways, see [Section 32-3](#) of the *BDE Manual*.

29-3.02(c) Application of Transition Length

Once the superelevation runoff and tangent runout have been calculated, the designer must determine how to fit the length into the horizontal and vertical planes. The following will apply:

1. **Tangent/Curve.** To simplify procedures, the total superelevation transition length should be distributed to be 75% on tangent and 25% on the curve. However, exceptions to this practice may be necessary to meet field conditions. The generally accepted range is 50% to 80% on tangent and 20% to 50% on curve. In extreme cases (e.g., to avoid placing any superelevation transition on a bridge or approach slab), the superelevation runoff may be distributed up to 100% on the tangent. This will usually occur only in urban or suburban areas with highly restricted right-of-way conditions. The ratio should be rounded up or down as needed to simplify design and layout in construction.
2. **Typical Figure.** Figure 29-3E presents one method for superelevation development on a two-lane highway. Other methods may also be acceptable.

29-3.03 **Axis of Rotation**

29-3.03(a) **Two-Lane Roadways**

The axis of rotation will typically be about the centerline of the roadway on two-lane, two-way roadways. This method will yield the least amount of elevation differential between the pavement edges and their normal profiles. Occasionally, it may be necessary to rotate about the inside or outside edge of the traveled way. This may be necessary to meet field conditions (e.g., drainage, roadside development).

29-3.03(b) **Multilane Roadways**

For axis of rotation on a multilane roadway, see [Section 32-3](#) of the *BDE Manual*.

AXIS OF ROTATION ABOUT CENTERLINE
(Two-Lane Highway)

Figure 29-3E

29-3.04 **Shoulder Superelevation**

Figure 29-3F illustrates the shoulder treatment on superelevated sections. The following discusses specific criteria.

29-3.04(a) **Shoulder (High Side of Curve)**

On the high side of superelevated sections, there will be a break in the cross slopes of the travel lane and shoulder. The following criteria will apply to the shoulder rollover:

1. Rollover Factor. The rollover factor is the algebraic difference between the traveled way and the shoulder cross slopes. The acceptable values depend on the design traffic volumes. See the Geometric Design Tables in [Section 32-2](#) for new/reconstruction projects and [Section 33-3](#) for 3R projects.
2. Minimum Shoulder Slope. On the high side of a curve, the shoulder slope may be designed for 0% so that maximum rollover is not exceeded. However, in this case, the longitudinal gradient at the edge of the traveled way should not be less than 0.5% for proper shoulder drainage.
3. Direction of Slope. The shoulder should slope away from the travel lane.

SHOULDER TREATMENT THROUGH SUPERELEVATED CURVE

Figure 29-3F

29-3.04(b) Shoulder (Low Side of Curve)

On the low side of a superelevated section, the typical practice is to retain the normal shoulder slope (4% typical) until the adjacent superelevated travel lane reaches that slope. The shoulder is then superelevated concurrently with the travel lane until the design superelevation rate is reached (i.e., the inside shoulder and travel lane will remain in the same plane section).

29-3.05 Reverse Curves

Because reverse curves are two closely spaced simple curves with deflections in opposite directions, it may not be practical to achieve a normal crown section between the curves. A plane section continuously rotating about its axis (e.g., the centerline) can be maintained between the two curves, if they are close enough together. The designer should adhere to the applicable superelevation development criteria for each curve. The following will apply to reverse curves:

1. Normal Crown Section. The designer should not attempt to achieve a normal crown between reverse curves unless the normal crown can be maintained for a minimum of two seconds of travel time, and the superelevation transition requirements can be met for both curves. These criteria yield the following minimum tangent distance (between PT of first curve and PC of second curve):

$$L_{\text{tan}} = 0.75(L_{1A} + TR_A) + 2(1.467V) + 0.75(L_{1B} + TR_B) \quad (\text{US Customary}) \quad \text{Equation 29-3.3}$$

$$L_{\text{tan}} = 0.75(L_{1A} + TR_A) + 2(0.278V) + 0.75(L_{1B} + TR_B) \quad (\text{Metric}) \quad \text{Equation 29-3.3}$$

where:

L_{tan} = tangent distance between PT and PC, ft (m)

L_{1A} = superelevation runoff length for first curve, ft (m)

TR_A = tangent runout length for first curve, ft (m)

V = design speed, mph (km/h)

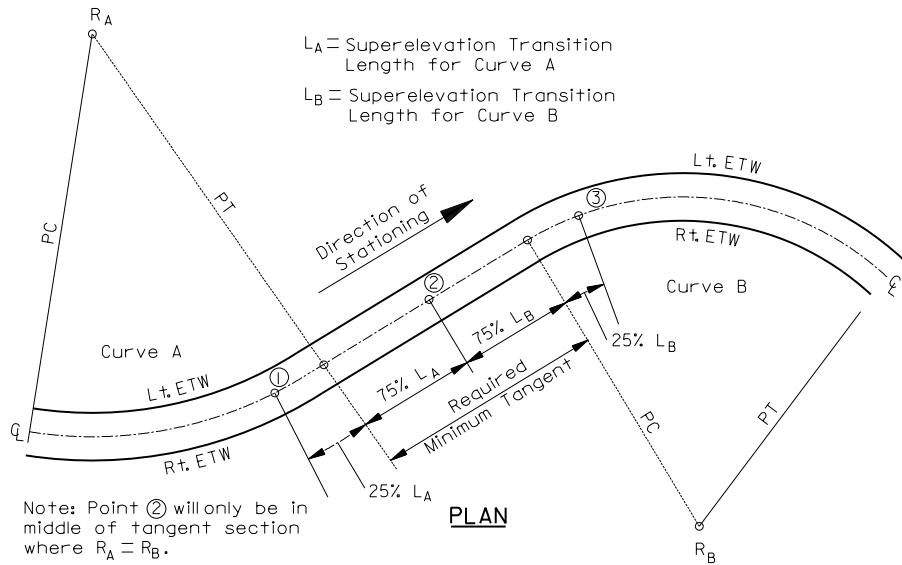

L_{1B} = superelevation runoff length for second curve, ft (m)

TR_B = tangent runout length for second curve, ft (m)

2. Continuously Rotating Plane. If a normal section is not provided, the pavement will be continuously rotated in a plane about its axis. In this case, the minimum distance between the PT and PC will be 75% of each superelevation transition requirement added together:

$$L_{\text{tan}} = 0.75(L_{1A}) + 0.75(L_{1B}) \quad \text{Equation 29-3.4}$$

Figure 29-3G illustrates superelevation development for reverse curves using a continuously rotating plane.

e_A = Design Superelevation Rate for Curve A
 e_B = Design Superelevation Rate for Curve B

**SUPERELEVATION DEVELOPMENT FOR REVERSE CURVES
(Continuously Rotating Plane)**

Figure 29-3G

29-3.06 **Bridges**

Superelevation transitions should be avoided on bridges and their approaches. Where a curve is necessary on a bridge, the desirable treatment is to place the entire bridge and its approaches on a flat horizontal curve with minimum superelevation. In this case, a uniform superelevation rate is provided throughout (i.e., the superelevation transition is not on the bridge). In some cases, however, superelevation transitions are unavoidable due to right-of-way constraints, especially on urban bridges.

Where a bridge is located within a superelevated horizontal curve, the entire bridge roadway will be sloped in the same direction and at the same rate (i.e., the shoulder and travel lanes will be in a plane section). This also applies to the approach slab and approach slab shoulders before and after the back of the abutment. However, as discussed in Section 29-3.04, the high-side shoulder on a roadway section will slope away from the traveled way at a rate so that the maximum rollover is not exceeded. This will require the high-side shoulder on the roadway section to be transitioned to the high-side shoulder of either the approach slab or bridge.

Therefore, it is necessary to transition the longitudinal shoulder slope adjacent to the roadway travel lanes to meet the shoulder slope adjacent to the travel lanes on the bridge. This transition should be accomplished by using a maximum relative longitudinal gradient of 0.40% between the edge of traveled way and outside edge of shoulder.

29-3.07 **Compound Curves**

See [Section 32-3](#) of the *BDE Manual* for a discussion on superelevation development for compound curves on mainline.

29-4 HORIZONTAL ALIGNMENT (LOW-SPEED URBAN STREETS)

29-4.01 General Application

For low-speed urban and suburban streets, the application of horizontal alignment criteria will differ from that for open-roadway conditions. Section 29-4 discusses the application to these facilities where $V \leq 45$ mph (70 km/h).

29-4.02 General Superelevation Considerations

For low-speed urban streets, the operational conditions and physical constraints are significantly different than those on rural roadways and high-speed urban roadways. The following lists some of the characteristics of low-speed urban streets that often complicate superelevation development:

1. Roadside Development/Intersections/Driveways. Built-up roadside development is common adjacent to low-speed urban streets. Matching superelevated curves with many driveways, intersections, sidewalks, etc., creates considerable complications. For example, this may require reconstructing the profile on side streets, and re-grading parking lots, lawns, etc., to compensate for the higher elevation on the high side of the superelevated curve.
2. Non-Uniform Travel Speeds. On low-speed urban streets, travel speeds are often non-uniform because of frequent signalization, stop signs, vehicular conflicts, etc. It is undesirable for traffic to stop on a superelevated curve, especially when snow or ice is present.
3. Limited Right-of-Way. Superelevated curves often result in more right-of-way impacts than would otherwise be necessary. Right-of-way is often restricted along low-speed urban streets.
4. Wide Pavement Areas. Many low-speed urban streets have wide pavement areas because of the number of traffic lanes, the use of a flush-type median, or the presence of parking lanes. In general, the wider the pavement area, the more complicated is the development of superelevation.
5. Surface Drainage. Proper cross slope drainage on low-speed urban streets can be difficult even on sections with a normal crown. Curves with superelevation introduce another complicating factor in controlling drainage.

29-4.03 **Horizontal Curves**

29-4.03(a) **Design Procedures**

Because of the different operational conditions for low-speed urban streets, it is appropriate to use a modified theoretical basis for horizontal alignment criteria when compared to open-roadway conditions. The net effect is:

- smaller minimum radii,
- fewer superelevated curves, and
- shorter superelevation runoff distances.

The practical benefit is that most horizontal curves can be designed with little or no superelevation on low-speed urban streets when compared to the criteria for open-roadway conditions in Section 29-3.

29-4.03(b) **Maximum Superelevation Rate**

For new construction projects, e_{\max} is 4.0% for low-speed urban streets. For urban reconstruction projects, existing horizontal curves can remain in place with a superelevation rate up to 6.0%.

29-4.03(c) **Minimum Radii**

Figure 29-4A presents for various design speeds for low-speed urban streets the:

- minimum radii for a normal crown section,
- minimum radii for $e_{\max} = 4.0\%$, and
- minimum radii for $e_{\max} = 6.0\%$.

Note that an $e_{\max} = 6.0\%$ may only be used to retain an existing superelevated curve on a reconstruction project.

29-4.03(d) **Superelevation Rate**

For any given design speed, Figure 29-4B allows the designer to use either a normal crown through the curve, to remove crown through the curve (i.e., superelevate at the typical cross slope), or to provide a curve with superelevation steeper than the typical cross slope.

**SUPERELEVATION RATES
(Low-Speed Urban Streets) (Metric)**

Figure 29-4B

Example 29-4.2

Given: Design speed = 35 mph
Radius = 450 ft
Cross slope (on tangent) = 1.5%

Problem: Determine if superelevation is needed.

Solution: From Figure 29-4B, the curve radius falls in the RC range. Therefore, the roadway must be uniformly superelevated at the cross slope of the roadway on tangent (i.e., e = +1.5%).

Example 29-4.3

Given: Design speed = 40 mph
Radius = 500 ft
Cross slope (on tangent) = 1.5%

Problem: Determine if superelevation is needed.

Solution: From Figure 29-4B, the required superelevation rate is between +5.0% to +5.5%. Therefore, the entire traveled way should be transitioned and superelevated at this rate.

Using Equation 29-2.1 and given f = 0.16 from Figure 29-4A, the superelevation rate is calculated as +5.33%.

$$R = \frac{V^2}{15(e + f)} \quad \Rightarrow \quad 500 = \frac{40^2}{15(e + 0.16)} \quad \Rightarrow \quad e = 0.0533$$

29-4.04 Superelevation Development

29-4.04(a) Transition Length

The superelevation transition length is the distance required to transition the traveled way from a normal crown section to the full design superelevated section. The superelevation transition length is the sum of the tangent runout distance (TR) and superelevation runoff length (L₁). See Section 29-3.

BUREAU OF LOCAL ROADS & STREETS

August 2016

HORIZONTAL ALIGNMENT

29-4-7

Section 29-3 presents the methodology for calculating the superelevation runoff and tangent runout for open-roadway conditions. This methodology also applies to superelevation transition lengths on low-speed urban streets, except that Figure 29-4C presents revised relative longitudinal gradients.

Based on values from Figure 29-4C, Figure 29-4B presents superelevation runoff lengths (L_1) for a two-lane urban street, assuming the axis of rotation is about the roadway centerline; i.e., the width of rotation is one travel lane of 13 ft (4.0 m). The 13 ft travel lane is based on a typical two-lane two-way urban roadway width of 30 ft from face of curb to face of curb with 2 ft gutters. See Section 29-3 for determining the tangent runout distance. See [Section 32-3](#) of the *BDE Manual* for determining superelevation transition lengths on multilane facilities.

US Customary			Metric		
Design Speed (mph)	Maximum Relative Gradient (%)	Reciprocal (RS)	Design Speed (km/h)	Maximum Relative Gradient (%)	Reciprocal (RS)
20	0.97	103	30	0.98	102
25	0.90	112	40	0.90	112
30	0.81	124	50	0.80	125
35	0.76	132	60	0.74	136
40	0.72	139	70	0.68	148
45	0.67	150			

**RELATIVE LONGITUDINAL GRADIENTS
(Low-Speed Urban Streets)**

Figure 29-4C

Typically, 75% of the superelevation transition length will be placed on tangent and 25% on curve. Exceptions to this practice may be necessary to meet field conditions. Generally, the accepted range is 50% to 80% on tangent and 20% to 50% on curve.

29-4.04(b) Axis of Rotation

On low-speed urban streets, the axis of rotation for horizontal curves is as follows:

1. Two-Lane Facilities. The axis of rotation is typically about the centerline of the roadway.
2. Multilane Facilities (Median Width ≤ 15 ft (5.0 m)). The axis of rotation is typically about the centerline of roadway or median.
3. Multilane Facilities (Median Width > 15 ft (5.0 m)). The axis of rotation is typically about the two median edges.

BUREAU OF LOCAL ROADS & STREETS
HORIZONTAL ALIGNMENT

29-4-8

August 2016

Low-speed urban streets may also present special problems because of the presence of two-way, left-turn lanes; turning lanes at intersections; intersections with major crossroads; drainage; etc. For these reasons, the axis of rotation may be determined on a case-by-case basis.

HARD COPIES UNCONTROLLED

29-5 HORIZONTAL SIGHT DISTANCE

Horizontal curves must be designed with sufficient clearance on the inside of the curve to allow a driver to see a distance equal to the stopping sight distance (SSD) for the design speed; see [Chapter 28](#).

29-5.01 Sight Obstruction (Definition)

Sight obstructions on the inside of a horizontal curve are defined as obstacles of considerable length that interfere with the line of sight on a continuous basis. These include walls, cut slopes, wooded areas, and buildings. In general, point obstacles (e.g., traffic signs, utility poles) are not considered sight obstructions on the inside of horizontal curves. While high farm crops are not present on a continuous basis, the designer may also want to take this into consideration when designing for sight distance. The designer must examine each curve individually to determine whether it is necessary to remove an obstruction or adjust the horizontal alignment to obtain the required sight distance.

29-5.02 Application

For sight distance applications at horizontal curves, the height of eye is 3.5 ft (1080 mm) and the height of object is 2 ft (600 mm). Both the eye and object are assumed to be in the center of the inside travel lane. The line-of-sight intercept with the obstruction is at the midpoint of the sightline and 2.75 ft (840 mm) above the center of the inside lane.

29-5.03 Curve Length > Sight Distance

Where the length of curve (L) is greater than the sight distance (S) used for design, the needed clearance on the inside of the horizontal curve is calculated using the following equation:

$$M = R \left(1 - \cos \left(\frac{28.65S}{R} \right) \right) \quad \text{Equation 29-5.1}$$

where:

M = middle ordinate, or distance from the center of the inside travel lane to the obstruction, ft (m)

R = radius of curve, ft (m)

S = sight distance, ft (m)

At a minimum, SSD will be available throughout the horizontal curve. Figure 29-5A provides the horizontal clearance criteria (i.e., middle ordinate) for various combinations of sight distance (see [Figure 28-1A](#)) and curve radii. For those selections of S, that fall outside of the figures (i.e., $M > 40$ ft (12 m) and/or $R < 100$ ft (50 m)), the designer should use Equation 29-5.1 to calculate the needed clearance.

The M values from Figure 29-5A apply between the PC and PT. In addition, some transition is needed on the entering and exiting portions of the curve. The designer should typically use the following steps:

- Step 1: Locate the point that is on the outside edge of shoulder and a distance of S/2 before the PC.
- Step 2: Locate the point that is a distance M measured laterally from the center of the inside travel lane at the PC.
- Step 3: Connect the two points located in Steps 1 and 2. The area between this line and the roadway should be clear of all continuous obstructions.
- Step 4: A symmetrical application of Steps 1 through 3 should be used beyond the PT.

The example in Figure 29-5B illustrates the determination of clearance requirements for the entering and exiting portions of a curve.

29-5.04 Curve Length < Sight Distance

When the length of curve is less than the sight distance used in design, the M value from the basic equation will never be reached. As an approximation, the horizontal clearance for these curves should be determined as follows:

- Step 1: For the given R and S, calculate M assuming $L > S$.
- Step 2: The maximum M' value will be needed at a point of L/2 beyond the PC. M' is calculated from the following proportion:

$$\frac{M'}{M} = \frac{1.2L}{S} \qquad \text{Equation 29-5.2}$$

$$M' = \frac{1.2(L)(M)}{S}$$

where:

- M' = middle ordinate for a curve where $L < S$, ft (m)
- M = middle ordinate for the curve based on Equation 29-5.1, ft (m)
- L = length of the curve, ft (m)
- S = sight distance, ft (m)

- Step 3: Locate the point that is on the outside edge of shoulder and a distance of S/2 before the PC.

- Step 4: Connect the two points located in Steps 2 and 3. The area between this line and the roadway should be clear of all continuous obstructions.
- Step 5: A symmetrical application of Steps 2 through 4 should be used on the exiting portion of curve.

**SIGHT DISTANCE AT HORIZONTAL CURVES
(SSD) (US Customary)**

Figure 29-5A

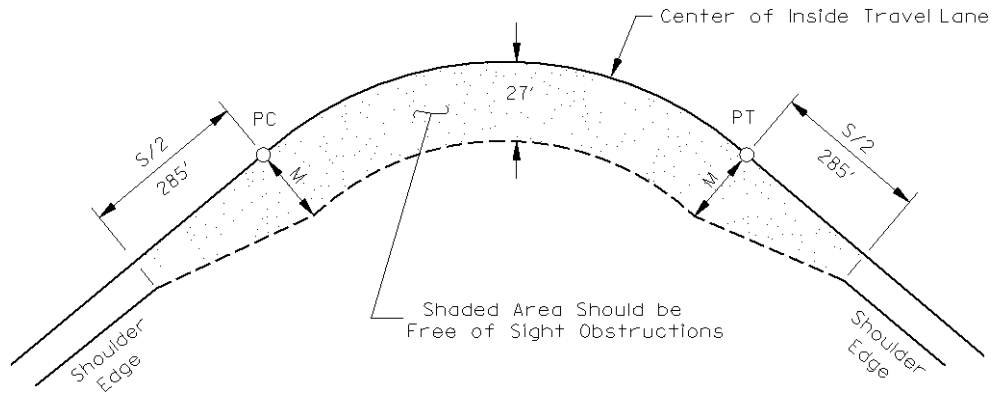

V=Design Speed (km/h)

**SIGHT DISTANCE AT HORIZONTAL CURVES
(SSD) (Metric)**

Figure 29-5A

**SIGHT CLEARANCE REQUIREMENTS FOR HORIZONTAL CURVES
(L > S)**

Figure 29-5B

Example 29-5.1

Given: Design Speed = 60 mph
R = 1500 ft

Problem: Determine the horizontal clearance requirements for a horizontal curve on a 2-lane highway that meets the SSD requirements.

Solution: [Figure 28-1A](#) yields a SSD = 570 ft Using Equation 29-5.1 for horizontal clearance (L > S):

$$M = R \left(1 - \cos \left[\frac{28.65 S}{R} \right] \right)$$

$$M = 1500 \left(1 - \cos \left[\frac{(28.65)(570)}{1500} \right] \right) = 27 \text{ ft}$$

This answer is verified by Figure 29-5A.

Figure 29-5B above, also illustrates the horizontal clearance requirements for the entering and exiting portion of the horizontal curve.

The example on Figure 29-5C below, illustrates the determination of clearance requirements for the entering and exiting portions of a curve where L < S.

**SIGHT CLEARANCE REQUIREMENTS FOR HORIZONTAL CURVES
(L < S)**

Figure 29-5C

Example 29-5.2

Given: Design Speed = 50 mph
R = 2050 ft
L = 300 ft

Problem: Determine the clearance requirements for the horizontal curve on a 2-lane highway that meets the SSD requirements.

Solution: [Figure 28-1A](#) yields a SSD of 425 ft for 50 mph. Therefore, L < S (300 ft < 425 ft), and the horizontal clearance is calculated from Equation 29-5.2 as follows:

$$M(L > S) = 2050 \left[1 - \cos \frac{(28.65)(425)}{2050} \right] = 11.01 \text{ ft}$$

$$M'(L < S) = \frac{1.2(300)(11.01)}{425}$$

$$M' = 9.3 \text{ ft}$$

Therefore, a minimum clearance of 9.3 ft should be provided at a distance of L/2 = 150 ft beyond the PC. The obstruction-free triangle around the horizontal curve would be defined by M' (9.3 ft) at L/2 and by points at the shoulder edge at S/2 = 212.5 ft before the PC and beyond the PT.

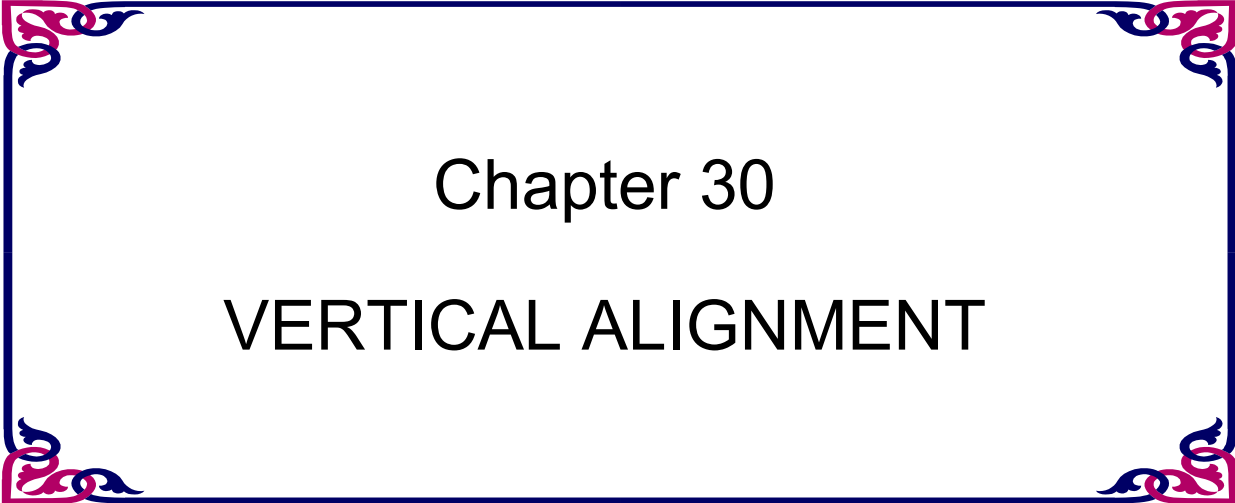

29-6 ACRONYMS

This is a summary of the acronyms used within this chapter.

Chapter 30

VERTICAL ALIGNMENT

Chapter 30 presents Bureau of Local Roads and Streets (BLRS) criteria for the design of vertical alignment elements. This includes vertical curvature and grades for both crest and sag vertical curves.

30-1 GRADES

30-1.01 Terrain

The topography throughout most of Illinois is considered either level or rolling. However, the northwest corner of the State, southern Illinois, and bluff areas near major rivers may be considered rugged. In general, if the terrain designation is not clear (e.g., level versus rolling), select the flatter of the two terrains.

30-1.02 Maximum Grades

[Figures 32-3A](#), [32-3B](#), and [32-3C](#) in [Chapter 32](#) present the maximum grade criteria based on functional classification, urban/rural location, type of terrain, and design speed. In addition, the designer should consider the following guidelines:

1. Grades should be as flat as is consistent with the surrounding terrain.
2. Only use maximum grades where absolutely necessary. Where practical, use grades flatter than the maximum.
3. Where grades of 4.0% or steeper are required, take special care to prevent erosion on slopes and open drainage facilities.

30-1.03 Minimum Grades

The following provides the criteria for minimum grades:

1. Uncurbed Roadways. It is desirable to provide a longitudinal grade of approximately 0.5%. This allows for the possibility of alterations to the original pavement cross slope due to swell, consolidation, maintenance operations, or resurfacing. Longitudinal grades of 0.0% may be acceptable on some pavements that have adequate cross slopes. These locations typically occur where a highway traverses a wide flood plain. In these cases, check the flow lines of the outside ditches for adequate drainage.
2. Curbed Streets. The centerline profile of streets with curb and gutter should have a minimum longitudinal grade of 0.3%; however, 0.5% is desirable. On curbed facilities,

the longitudinal grade at the gutter line will have a significant impact on the pavement drainage characteristics (e.g., water encroaching on travel lanes, flow capture rates by grates). See [Chapter 38](#) of the *BLRS Manual* and the [IDOT Drainage Manual](#) for more information on pavement drainage.

3. New Bridges. For bridges on new construction and reconstruction projects, desirably provide a minimum longitudinal grade of 0.5% across the bridge for structures with curbed cross sections, in order to prevent ponding on the bridge.

30-2 VERTICAL CURVE**30-2.01 Crest Vertical Curves****30-2.01(a) Basic Equations**

Crest vertical curves are in the shape of a parabola. The basic equations for determining the minimum length of a crest vertical curve are:

$$L = \frac{AS^2}{200(\sqrt{h_1} + \sqrt{h_2})^2} \quad (\text{Equation 30-2.1})$$

$$L = KA \quad (\text{Equation 30-2.2})$$

Where:

- L = length of vertical curve, ft (m)
- A = algebraic difference between the two tangent grades, %
- S = sight distance, ft (m)
- h_1 = height of eye above road surface, ft (m)
- h_2 = height of object above road surface, ft (m)
- K = horizontal distance needed to produce a 1.0% change in gradient, ft/% (m/%)

The length of a crest vertical curve will depend upon “A” for the specific curve and upon the selected sight distance, height of eye, and height of object. The calculated value should be rounded to the next highest 10 ft (10 m) increment.

30-2.01(b) Curve Lengths

The following discusses the application of K-values:

1. Vertical Point of Intersection (PVI). For crest vertical curves, it is acceptable to use an angle point (i.e., no vertical curve) for an algebraic difference of grade (Δ) of 0.6% or less.
2. Stopping Sight Distance (SSD). The principal control in the design of crest vertical curves is to ensure that SSD is available throughout the vertical curve. Figures 30-2A and 30-2B present the minimum K-values for passenger cars on a level grade by assuming $h_1 = 3.5$ ft (1.080 m), $h_2 = 2$ ft (600 mm), and $S = \text{SSD}$ in the basic equation for crest vertical curves (Equation 30-2.1). These values represent the lowest acceptable sight distance on a facility. Where cost effective, use higher than minimum stopping sight distances.

Design Speed (mph)	SSD ⁽¹⁾ (ft)	Rate of Vertical Curvature, K ⁽²⁾⁽³⁾ (ft/%)	Minimum Curve Length (ft)	Design Speed (km/h)	SSD ⁽¹⁾ (m)	Rate of Vertical Curvature, K ⁽²⁾⁽⁴⁾ (m/%)	Minimum Curve Length (m)
20	115	7	60	30	35	2	18
25	155	12	75	40	50	4	24
30	200	19	90	50	65	7	30
35	250	29	105	60	85	11	36
40	305	44	120	70	105	17	42
45	360	61	135	80	130	26	48
50	425	84	150	90	160	39	54
55	495	114	165	100	185	52	60
60	570	151	180				

Notes:

1. SSD values are from [Figure 28-1A](#).
2. Maximum K-value for drainage on curbed roadways and bridges is 167 (51).

3.
$$K = \frac{SSD^2}{2158}, \text{ where } : h_1 = 3.5 \text{ ft}, h_2 = 2 \text{ ft}$$

4.
$$K = \frac{SSD^2}{658}, \text{ where } : h_1 = 1.080 \text{ m}, h_2 = 600 \text{ mm}$$

K-VALUES FOR CREST VERTICAL CURVES — STOPPING SIGHT DISTANCES
(Passenger Cars)

Figure 30-2A

DESIGN CONTROLS FOR CREST VERTICAL CURVES

Figure 30-2B

3. Minimum Length. Vertical curve lengths should also meet the criteria in the following equations:

$$L_{\min} = 3 V \quad (\text{US Customary}) \text{ Equation 30-2.3}$$

$$L_{\min} = 0.6 V \quad (\text{Metric}) \text{ Equation 30-2.3}$$

Where:

L_{\min} = minimum length of vertical curve, ft (m)

V = design speed, mph (km/h)

Designs with vertical curve lengths of less than 90 ft (27 m) should be avoided, since these are difficult to construct.

4. Passing Sight Distance (PSD). At some locations, it may be desirable to provide PSD in the design of crest vertical curves. [Section 28-2](#) discusses the application and design values for PSD on two-lane, two-way highways. These “PSD” values are used in the basic equation for crest vertical curves (Equation 30-2.1). The height of eye (h_1) is 3.5 ft (1.080 m) and the height of object (h_2) is 3.5 ft (1.080 m). Figure 30-2C presents the K-values for passenger cars using the PSD presented in [Section 28-2](#).
5. Drainage. Proper drainage should be considered in the design of crest vertical curves where curbed sections are used. Typically, drainage problems should not be experienced if the vertical curvature is sharp enough so that a minimum longitudinal grade of at least 0.3% is reached at a point about 50 ft (15 m) from either side of the apex. To ensure that this objective is achieved, determine the length of the crest vertical curve assuming a K-value of 167 (51) or less. For crest vertical curves on a curbed section where this K-value is exceeded, carefully evaluate the drainage design near the apex.
6. Alignment Coordination. On rural facilities where crest vertical curves and horizontal curves occur at the same location, use the K-values in Figure 30-2A to ensure that the horizontal curve is visible as drivers approach the vertical curve.

(Passenger Cars)**

Figure 30-2C

30-2.02 Sag Vertical Curves

30-2.02(a) Basic Equations

Sag vertical curves are in the shape of a parabola. Typically, they are designed to allow the vehicular headlights to illuminate the roadway surface (i.e., the height of object = 0.0 ft (m)) for a given distance “S.” The light beam from the headlights is assumed to have a 1° upward divergence from the longitudinal axis of the vehicle. These assumptions yield the following basic equations for determining the minimum length of sag vertical curves:

$$L = \frac{AS^2}{200[h_3 + S(\tan 1^\circ)]} = \frac{AS^2}{200h_3 + 3.5S} \quad (\text{Equation 30-2.4})$$

$$L = KA \quad (\text{Equation 30-2.2})$$

Where:

- L = length of vertical curve, ft (m)
- A = algebraic difference between the two tangent grades, %
- S = sight distance, ft (m)
- h₃ = height of headlights above pavement surface, ft (m)
- K = horizontal distance needed to produce a 1.0% change in gradient

The length of a sag vertical curve will depend upon “A” for the specific curve and upon the selected sight distance and headlight height. For design purposes, round the calculated length to the next highest 10 ft (10 m) increment.

30-2.02(b) Curve Lengths

The following discusses the application of K-values:

1. Vertical Point of Intersection (VPI). For sag vertical curves, it is acceptable to use an angle point (i.e., no vertical curve) up to an algebraic difference of grade (Δ) of 0.6% or less.
2. Stopping Sight Distance (SSD). The principal control in the design of sag vertical curves is to ensure that SSD is available for headlight illumination throughout the sag vertical curve. Figures 30-2D and 30-2E present K-values for passenger cars assuming h₃ = 2.0 ft (600 mm) and S = SSD in the basic equation for sag vertical curves (Equation 30-2.4). These values represent the lowest acceptable sight distance on a facility. However, the designer should strive to use longer than the minimum lengths of curves to provide a more aesthetically pleasing design.

Notes:

1. SSD values are from [Figure 28-1A](#).
2. Maximum K-value for drainage on curbed roadways and bridges is 167 (51).

3.
$$K = \frac{SSD^2}{400 + 3.5 SSD}, \text{ where } : h_3 = 2 \text{ ft}$$

4.
$$K = \frac{SSD^2}{120 + 3.5 SSD}, \text{ where } : h_3 = 600 \text{ mm}$$

**K-VALUES FOR SAG VERTICAL CURVES — STOPPING SIGHT DISTANCES
(Passenger Cars)**

Figure 30-2D

DESIGN CONTROLS FOR SAG VERTICAL CURVES

Figure 30-2E

3. Minimum Length. For most sag vertical curves, the minimum length of curve should also be based on the following equations:

$$L_{\min} = 3 V \quad (\text{US Customary}) \text{ Equation 30-2.3}$$

$$L_{\min} = 0.6 V \quad (\text{Metric}) \text{ Equation 30-2.3}$$

Where:

L_{\min} = minimum length of vertical curve, ft (m)

V = design speed, mph (km/h)

Designs with vertical curve lengths of less than 90 ft (27 m) should be avoided, since these are difficult to construct.

4. Comfort Criteria. On fully lighted, continuous sections of highway and where it is impractical to provide SSD for headlights, a sag vertical curve may be designed to meet the comfort criteria. The length of curve equation for the comfort criteria is:

$$L = \frac{AV^2}{46.5} \quad (\text{US Customary}) \text{ Equation 30-2.5}$$

$$L = \frac{AV^2}{395} \quad (\text{Metric}) \text{ Equation 30-2.5}$$

Where:

L = length of vertical curve, ft (m)

A = algebraic difference between the two tangent grades, %

V = design speed, mph (km/h)

5. Drainage. Proper drainage must be considered in the design of sag vertical curves on curbed sections and bridges. Drainage problems are minimized if the sag vertical curve is sharp enough so that a minimum longitudinal grade of at least 0.3% is reached at a point about 50 ft (15 m) from either side of the low point. To ensure that this objective is achieved, base the length of the vertical curve upon a K-value of 167 (51) or less. This K-value is adequate for design speeds of 60 mph (100 km/h) or less.

For uncurbed sections of highway, drainage should not be a problem at sag vertical curves.

30-3 VERTICAL CLEARANCES

The tables in [Section 33-3](#) provide the roadway vertical clearances for 3R projects on non-freeways. The tables in [Sections 36-4](#) and [36-5](#) present the minimum roadway vertical clearances for new construction and reconstruction projects. In addition to the criteria presented in [Chapter 36](#), consider the following:

1. Existing Structures. The minimum clearance for structures allowed to remain-in-place is 14 ft-0 in (4.3 m) for all functional classifications.
2. Pedestrian Bridges/Sign Trusses. On all new or reconstruction projects, provide a minimum vertical clearance of 17 ft-3 in (5.25 m) under pedestrian bridges and sign trusses. For 3R projects existing pedestrian bridges and sign structures allowed to remain-in-place shall have a minimum clearance of 16 ft-9 in (5.1 m).
3. Traffic Signals. On all new or reconstruction projects, provide a minimum vertical clearance of 16 ft-0 in (4.9 m) with a maximum clearance of 18 ft-0 in (5.5 m). For 3R projects, a minimum vertical clearance of 14 ft-9 in (4.5 m) may be allowed to remain in place. This clearance is measured from the roadway surface to the bottom of the signal housing or to the bottom of the back plate.
4. Railroads. For all projects, the minimum vertical clearance for new and reconstructed structures over railroads is 23 ft-0 in (7.0 m) measured from the top of the highest rail. This clearance may be reduced with approval of the railroad and the Illinois Commerce Commission (ICC) ([Title 92 Illinois Administrative Code, Part 1500, Chapter 3, Subpart C](#)).

Chapter 31

CROSS SECTION ELEMENTS

31-1 ROADWAY SECTIONS

For rural cross sections, the roadway width is the combined width of the traveled way, any median, both shoulders, and any auxiliary lanes on the mainline facility. The traveled way is the combined width of all travel lanes. Figure 31-1A provides a typical cross section for rural two-lane highways.

For urban cross sections, the roadway consists of the travel lanes, auxiliary lanes including parking lanes, any bike lanes or median, and curb and gutter. Figures 31-B through 31-1E provide typical cross sections for urban streets. The roadway width is measured from face-to-face of curbs. The tables in [Chapters 32](#) and [33](#) provide the face-to-face widths based on the functional classification, traffic volume, and project scope of work.

31-1.01 Travel Lane Widths

31-1.01(a) Rural

The lane width of a roadway greatly influences the safety and comfort of driving. On the local highway system, travel lane widths generally vary between 8 ft (2.7 m) and 12 ft (3.6 m) depending on functional classification, traffic volumes, and project scope of work. While lane widths of 12 ft (3.6 m) are desirable, lanes that are 10 ft (3.0 m) wide are acceptable on low speed facilities and lanes that are 9 ft (2.7 m) are appropriate for low-volume roads. The tables in [Chapters 32](#) and [33](#) provide specific travel lane widths for these parameters.

31-1.01(b) Urban

Consider the following for urban streets:

1. Local Streets. Travel lanes shall be at least 10 ft (3.0 m) wide and preferably 11 ft (3.3 m). In industrial areas, travel lanes should be 12 ft (3.6 m). The width of new construction of local residential streets should either meet the criteria in [Chapter 32](#) or the Institute of Transportation Engineers' publication *Guidelines for Residential Subdivision Street Design, A Recommended Practice*. Where right-of-way (ROW) is restricted (e.g., additional ROW cannot be acquired due to economic, social, or environmental factors), travel lanes in industrial areas may be reduced to 11 ft (3.3 m). Off-tracking by trucks should be reviewed within horizontal curves where the travel lanes are reduced.
2. Collector Streets. Travel lanes shall be at least 10 ft (3.0 m) to 12 ft (3.6 m). In industrial areas, travel lanes should be 12 ft (3.6 m), except where ROW is restricted. In this case, the travel lane may be reduced to 11 ft (3.3 m). Sections of roadway within a horizontal curve off-tracking by trucks should be reviewed.

3. Arterial Streets. Travel lanes shall be at least 11 ft (3.0 m) to 12 ft (3.6 m). A 12 ft (3.6 m) travel lane should be provided, where practical, on free-flowing facilities with a 45 mph (70 km) design speed or where truck traffic is significant.
4. Bicycles. Lane widths may need to be increased to accommodate bicycles; see [Chapter 32](#) for design criteria and [Chapter 42](#) for guidance.

31-1.01(c) Bridges

In general, the approach roadway width should be provided across the bridge. For guidance on roadway widths across bridges, see [Section 36-4](#).

31-1.02 Number of Lanes

31-1.02(a) Rural/Suburban Facilities

For most rural and suburban local roads and collectors, capacity conditions normally do not govern and two travel lanes are generally appropriate. However, on suburban arterials, capacity needs may require more than two lanes. Where the design volume exceeds the capacity of an existing or proposed two-lane arterial, consider the following alternatives to increase the facility's capacity. The tables in [Chapters 32](#) and [33](#) present specific required criteria for the number of lanes and lanes widths.:

- Improve the alignment and profile to decrease the gradient and increase the percentage of the total length of roadway with sufficient sight distance to afford opportunities for passing.
- Improve capacity by adding climbing or passing lanes.
- Improve capacity through intersections by adding auxiliary lanes (e.g., left-turn lanes).
- Alleviate delays caused by mid-block left turns by providing two-way left-turn lanes (TWLTL) in suburban areas to remove turning traffic from the through lanes. For additional guidance, see Section 31-1.05(b) of this *Manual* and [Section 48-4](#) of the *Bureau of Design and Environment (BDE) Manual*.
- Modify the design to provide a four-lane highway initially or as planned stage construction.

31-1.02(b) Urban Facilities

The following guidelines apply to urban facilities:

1. Local Residential Streets. In some instances, local residential streets may be designed with one travel lane plus two parking lanes. This would consist of a single 12 ft (3.6 m) travel lane with two 8 ft (2.4 m) parking lanes. A minimum width of 30 ft (9.0 m) face-of-curb to face-of-curb needs to be provided. Opposing conflicting traffic will yield and pause in the parking lane until there is sufficient width to pass. However, on residential streets experiencing crash problems or where the extent of parking does not allow traffic to safely weave and yield, the designer should either provide a wider street to allow two-way traffic or restrict parking on one or both sides of the street.

2. Local and Collector Streets. For most local and collector streets, a minimum of two travel lanes is generally adequate. A minimum width of 30 ft (9.0 m) face-of-curb to face-of-curb needs to be provided. Where the current Average Daily Traffic (ADT) is 10,000 or more, the number of through lanes should be determined by a highway capacity analysis of the intersections through lanes. Desirably, conduct this analysis using the future design traffic volume. Consider providing stage development where the analysis indicates four or more lanes are required. Where the improvement is developed by stages, initially a rural cross section with shoulders may be provided. At later stages, the shoulder can be converted to a parking lane or another travel lane usually with outside curb and gutter. When the shoulder is being considered for conversion, current usage and user should be evaluated.
3. Arterial Streets. The number of travel lanes will vary on arterial streets, depending on traffic demand and available ROW. However, arterials will typically have four to eight lanes. Conduct a capacity analysis, including intersection and mid-block analyses, to determine the proper number of travel lanes.
4. Auxiliary Lanes. At some intersections, it may be appropriate to add auxiliary through lanes at an intersection to increase the capacity at the intersection. In some areas with numerous midblock left turns, consider providing a TWLTL.

31-1.03 Auxiliary Lanes

Auxiliary lanes are lanes adjacent to the through traveled way. They are intended for use by vehicular traffic for specific functions. Auxiliary lanes include:

- single left- and right-turn lanes at intersections;
- double left-turn lanes at intersections;
- acceleration/deceleration lanes at intersections;
- two-way left-turn lanes (TWLTL);
- parking lanes; and
- passing or climbing lanes.

Desirably, auxiliary lanes should be the same width as the adjacent through lanes, although in many cases a greater or lesser width may be appropriate. For local streets, the turn lanes should be 10 ft (3.0 m) wide or greater. For collectors and arterials, the turn lanes with few trucks may be 10 ft (3.0 m) wide and should be 12 ft (3.6 m) with higher truck volumes. The tables in [Chapters 32](#) and [33](#) present specific required criteria for widths of auxiliary lanes and curb type or shoulder widths adjacent to auxiliary lanes.

31-1.04 Parking

For most urban projects, the designer should evaluate the demand for parking. Desirably, parking needs will be accommodated by providing residential parking or by providing off-street parking facilities. [Section 41-2](#) provides guidelines for off-street parking. When providing on-street parking along urban streets, consider the following discussion.

31-1.04(a) **Design Considerations**

Section 31-1.04(b) provides guidance on parking lane widths. In addition, the designer should evaluate the following:

1. Configurations. There are two basic types of on-street parking — parallel and angle parking. These are illustrated in Figure 31-1F. Consider the following:
 - a. Capacity. Parallel parking is preferred when the street width is limited and traffic capacity is a major factor. Where angle parking is provided, the overall level of service for the facility preferably should be Level C or higher.
 - b. Number of Spaces. Angle parking provides more spaces per linear foot (meter) than parallel parking, but requires a greater street width.
2. Stall Dimensions. Figure 31-1F provides the width and a length criterion for parking stalls of various configurations. The Figure also indicates the number of stalls that can be provided for each parking configuration for a given curb length. The surface widths for urban streets shown in the tables in [Chapter 32](#) assume parallel parking on one or both sides of the street.
3. Americans with Disabilities Act (ADA) / Public Rights of Ways Access Guidelines (PROWAG) Requirements. [Section 41-6](#) presents the accessibility requirements for on-street parking for persons with disabilities.
4. Parking Restrictions. According to the *Illinois Vehicle Code* ([625 ILCS 5/11-1303](#)), parking is prohibited in the following locations:
 - in front of a public or private driveway;
 - within an intersection;
 - on the curb immediately opposite the ends of a safety zone, unless a different length is indicated by signs or markings;
 - within 15 ft (4.6 m) of a fire hydrant;
 - within 20 ft (6.1 m) of any crosswalk;
 - within 30 ft (9.1 m) on the approach leg to any intersection with a flashing signal, stop sign, yield sign, or traffic control signal located at the side of the roadway;
 - within 20 ft (6.1 m) of the driveway entrance to any fire station and on the side of a street opposite the entrance to any fire station within 75 ft (22.9 m) of this type of entrance (when properly signed);
 - within 50 ft (15.2 m) of the nearest rail of a highway/railroad crossing;
 - on bridges or within a highway tunnel; and

- in areas designated by local traffic and enforcement regulations (e.g., near school zones, loading zones, bus stops). See local ordinances for additional information on parking restrictions.
- between a safety zone and adjacent curb or within 30 ft (9.1 m) of points

31-1.04(b) Parallel Parking

In determining parking lane widths, consider the following:

1. Lane Conversion. Parking lane width determinations should include consideration for converting the parking lane into a travel lane during peak hour traffic or in the future (e.g., in areas where peak hour traffic may require additional through traffic lanes).
2. Measurement. Parking lane widths are generally measured from the face of the curb and typically include the gutter flag width. However, if the lane may be converted to a travel lane, the width should be in addition to that of the gutter flag.
3. Local Streets. Where used in residential areas, a parallel parking lane of at least 8 ft (2.4 m) should be provided on one or both sides, as appropriate to the conditions of lot size and intensity of development. In commercial areas, parking lanes should be 10 ft (3.0 m) wide and are usually provided on both sides.
4. Collector Streets. In residential areas, a minimum 8 ft (2.4 m) parallel parking lane should be provided on one or both sides of the street, as appropriate for the lot size and density of development. In commercial and industrial areas, parking lanes widths should range from 10 ft (3.0 m) to 12 ft (3.6 m) and are usually provided on both sides of the street
5. Arterial Streets. In general, parking along urban arterials should only be considered where it currently exists. However, parallel parking may be considered where adequate capacity is available in the through lanes and adequate parking is not available or practical on adjacent streets or off-street parking facilities. The parking lane width should be 10 ft (3.0 m) to 12 ft (3.6 m) if there is a future possibility of being converted to a travel lane, with the 12 ft (3.6 m) being desirable. This width is also adequate for an occasional parked commercial vehicle. A parking lane 10 ft (3.0 m) in width is acceptable for use as a future storage lane for turning vehicles at signalized intersections by prohibiting parking for some distance upstream from the intersection. Where it is unlikely there will be a future need to use the parking lane as a through or turn lane, the parking lane width may be as narrow as 8 ft (2.4 m).

* A + B = Parking Width. See Section 31-1.04(b) for parallel parking lane widths.

- Key:
- L = given curb length with parking spaces, ft (m)
 - N = number of parking spaces over distance L
 - A = required distance between face of curb and back of stall, assuming that bumper of parked car does not extend beyond curb face, ft (m)
 - B = clear distance needed for a parked vehicle to back out of stall while just clearing adjacent parked vehicles, ft (m)
 - ETW = Edge of Traveled Way

Note: For 3R projects, lesser widths may be allowed; see [Chapter 33](#).

CURB PARKING CONFIGURATIONS

Figure 31-1F

31-1.04(c) Angle Parking

Angle parking should be avoided where practical. However, when considering angle parking, the following applies:

1. Illinois Department of Transportation (IDOT) Authority. When an improvement requiring IDOT approval is planned, any new or existing angle parking to remain must be approved by Central Bureau of Local Roads and Streets (CBLRS). In addition, [625 ILCS 5/11-1304\(c\)](#) states:
Local authorities may permit angle parking on any roadway, except that angle parking shall not be permitted on any Federal-aid or State highway unless the Department has determined the roadway is of sufficient width to permit angle parking without interfering with the free movement of traffic.
2. Street Width. The width of the street must be able to accommodate the existing traffic flow and should provide a clear distance for a parked vehicle to back out.
3. Backing Maneuver. Angle parking requires the driver to back into the traveled way where sight distance may be restricted by adjacent parked vehicles. This maneuver may surprise an approaching motorist. As indicated in Figure 31-1F, the parked car will require a distance “B” to back out of its stall. Whether or not this is a reasonably safe maneuver will depend upon the number of lanes in each direction, lane widths, operating speeds, traffic volumes during peak hours, parking demand, and turnover rate of parked vehicles.
4. Angle. Angle parking should be 45° or less. In some conditions, a 60° angle for parking may be considered.
5. Adjacent Land Use. The adjacent land use must warrant the retention of the angle parking.
6. Crashes. After analyzing backing maneuver space, angle parking may be considered to remain after further review of crash history related to the existing angle parking along with the proposed design criteria (ADT, posted speeds, etc).

31-1.05 Medians**31-1.05(a) General**

Median design should be based upon economic, operational, and environmental considerations. The design will depend on the functional class of the highway, design speed, type of access management proposed, availability of ROW, construction costs, maintenance considerations, the anticipated ultimate development of the facility, operations at crossroad intersections, and field conditions. The median width is measured from the inside edge of the two traveled ways and includes inside shoulders and/or median curb and gutters. A median must be at least 2 ft (600 mm) wide to meet the minimum functional requirements. Section 31-1.05(b) and the tables in [Chapter 32](#) provide guidance on recommended median designs for urban facilities.

31-1.05(b) Median Types and Widths

For rural type medians (e.g., depressed), see [Section 34-3](#) of the *BDE Manual*. In addition, [Section 34-3](#) of the *BDE Manual* discusses the advantages and disadvantages for these various median types. Figure 31-1G provides typical sections for the following median types — flush, traversable, and raised curb. The following provides brief descriptions on these types of medians. The following applies:

1. **Flush Medians.** A flush median is defined where the surface is constructed as a smooth plane in conjunction with the adjacent roadway pavement and is usually distinguished with painted pavement markings. Flush medians are most often used on low-speed urban highways and streets. This flush type median should be slightly crowned to avoid ponding water in the median area. The following discusses typical flush medians:
 - a. **Flush.** Typical widths for a flush median on an urban street can range from 2 ft to 14 ft (600 mm to 4.2 m). For urban arterials, the minimum width should not be less than 4 ft (1.2 m). To accommodate a separate left-turn lane, a flush median should be 13 ft to 14 ft (3.9 m to 4.2 m) wide. This will allow for either an 11 ft (3.3 m) or 12 ft (3.6 m) turn lane and a minimum separation of 1 ft to 2 ft (300 mm to 600 mm) between left-turning vehicles and the opposing traffic.
 - b. **Two-Way Left-Turn Lanes (TWLTL).** TWLTL are also considered flush medians. Operating speeds, truck and bus volumes, number and spacing of entrances and intersections, availability of ROW, character of abutting property, parking facilities, etc., should be considered when determining appropriate TWLTL lane widths. Typical TWLTL design widths range from 10 ft to 14 ft (3.0 m to 4.2 m). A width of 12 ft (3.6 m) is desirable. For additional guidance on the selection and design of TWLTL, see NCHRP 395 *Capacity and Operational Effects of Midblock Left-Turn Lanes* and [Section 34-3](#) of the *BDE Manual*.
2. **Traversable Medians.** On certain streets in large metropolitan areas where traffic volumes and mid-block left turns are unusually high, the traversable median with an M-2.12 (M-5.30) Concrete Curb and Gutter (CC&G), although having a slightly higher initial cost than a flush median, may be the appropriate design option. This median type eliminates the frequent and somewhat hazardous striping operations and yet provides for TWLTL movements. Because the traversable median was developed as a direct substitute for the flush TWLTL, the M-2.12 (M-5.30) CC&G is not designed to be a physical barrier nor is it intended to impede left-turn movements across the median. The recommended traversable median width for new construction is 16 ft (4.8 m).
3. **Raised-Curb Medians.** A raised-curb median is defined when it contains a curb height greater than 2 in (50 mm) within its limits. Usually, a raised-curb median is proposed where there is a need to manage access to the street and to control left-turn movements.

For urban collectors and local streets, the raised-curb median width can be as narrow as 4 ft (1.2 m) to 6 ft (1.8 m) wide. For arterials and other high volume roadways, the recommended raised curb median width is 18 ft (5.5 m). This width should only be used where the majority of intersections along the street will be signalized and have protected left turns. If many intersections do not require signalization, the recommended width is 22 ft (7.0 m), assuming no ROW restrictions. The 22 ft (7.0 m) median width allows passenger vehicles to comfortably store within median crossovers at unsignalized intersections when making a maneuver in two moves. Where dual left-turn lanes are required, the minimum raised-curb median width is 32 ft (9.5 m) and desirably 35 ft (10.5 m).

Wider raised-curb medians (e.g., 4 ft (1.2 m) or wider) may be landscaped with turf or other low-growing plants. Ensure these plants are salt resistant and do not block the sight distances at intersections. See [Section 41-10](#) for additional information.

31-1.05(c) Median Openings

On local streets, median openings should be provided as necessary to serve the abutting property and the traffic demand, but the number should be minimized. On collector and arterial streets, median openings should be provided only at street intersections and at reasonably spaced driveways serving major traffic generators (e.g., industrial plants, shopping centers). In addition, consider the following:

- Where practical, the median openings should include left-turn lanes; see [Section 34-3](#) for the design of left-turn lanes.
- Ensure that there is adequate sight distance at the median opening; see [Section 28-3](#).
- The shape and length of the median openings will depend upon the width of the median and the vehicle type that must be accommodated. See [Section 36-4](#) of the *BDE Manual* for guidance on the design of median openings.

The minimum length of median openings should be that of the projected roadway width of the intersecting cross street or driveway. Desirably, the length of the median opening should be large enough to provide for a 50 ft (15 m) turning control radius for left-turning vehicles between the inner edge of the lane adjacent to the median and the centerline of the intersecting roadway.

31-1.06 Shoulders

In urban and many suburban areas, the availability of ROW generally precludes the use of shoulders. However, many low-volume urban streets may have shoulders rather than a gutter, curb, or curb and gutter. Where shoulders are included, use the width provided from the rural tables in [Chapters 32](#) and [33](#) for the applicable functional classification. Also, consider providing a curb and gutter or gutter at the outer shoulder edge. This may reduce construction costs and will confine drainage runoff to the shoulder area.

31-1.06(a) **Functions**

The following are some of the important functions of shoulders:

- provides structural support for the traveled way;
- provides support for guardrail and prevents erosion around guardrail posts;
- prevents or minimizes pavement edge drop-offs;
- provides space for emergency and discretionary stops;
- improves roadside safety by providing more recovery area for run-off-the-road vehicles;
- facilitates maintenance operations (e.g., snow removal and storage);
- facilitates pavement drainage;
- provides space for pedestrian and bicycle use; and
- provides space for mailbox turnouts.

31-1.06(b) **Shoulder Types**

There are several types of shoulders that may be used on local public agency (LPA) roads. A general discussion of the various shoulder types follows. The tables in [Chapters 32](#) and [33](#) present the minimum requirements for shoulder types based on functional classification and design traffic.

1. Paved. Paved shoulders are constructed with Hot Mix Asphalt (HMA) or concrete. They provide an all-weather surface with the ability to support occasional vehicle loads in all kinds of weather without rutting. Paved shoulders are usually used on arterials but may be provided on collectors, especially those with high-traffic volumes or substantial current or projected bicycle use. In some instances, a shoulder curb may be included to control drainage. The thickness of a paved shoulder will vary based on a number of factors (i.e. use as a parking lane, as part of stage construction, off tracking during turning maneuvers, etc.).
2. Aggregate. Aggregate shoulders are considered stabilized shoulders. They usually have a minimum thickness of 6 in (150 mm). These shoulders help to eliminate the rutting and drop-off adjacent to the edge of the traveled way and provide an adequate cross slope for drainage of the roadway. Aggregate shoulders are provided on most collectors and on higher volume local roads.

3. Turf. Turf shoulders are appropriate for most local roads and some low-volume collectors. These shoulders are unstabilized and generally undergo consolidation with time. Turf shoulders are subject to a rutting and/or buildup that may inhibit proper drainage of the traveled way. They require regular maintenance to correct drop-off at the edge of traveled way and to provide an adequate cross slope for drainage.
4. Aggregate Wedge. An aggregate wedge is normally used on 3R-type projects. The aggregate wedge is placed at the edge of a resurfaced traveled way to account for the drop-off caused by the resurfacing thickness. This minimizes disturbance to the existing turf or aggregate shoulder.

31-1.06(c) Shoulder Widths

Shoulder widths will vary according to functional classification, traffic volume, and the project scope. The shoulder widths for local roads and collectors normally vary from 2 ft to 8 ft (600 mm to 2.4 m). Where pedestrian and bicyclists are to be accommodated on the shoulders, a minimum usable shoulder width of 4 ft (1.2 m) should be provided. The tables in [Chapters 32](#) and [33](#) present the minimum shoulder width criteria. The minimum shoulder width to a roadside barrier should be 4 ft (1.2 m). It may be appropriate to provide additional width behind the barrier to provide lateral support for the guardrail posts.

31-1.07 Curb and Gutter

Curbs are used on urban and suburban facilities due to restricted ROW conditions and to control drainage, delineate pavement edges, channelize vehicular movements, manage access, provide separation between vehicles and pedestrians, and present an attractive appearance. In urban areas, curbs have a major benefit in containing the drainage within the pavement area and in channelizing or controlling traffic into and out of adjacent properties. In rural areas, curbing may be applicable where restricted ROW prohibits the use of a ditch section or to channelize traffic at isolated intersections.

31-1.07(a) Usage Guidelines

Selecting a curbed section or section with shoulders and outside ditches depends upon many variables, including vehicular speeds, urban/rural location, drainage, and construction costs. The following discusses some of the factors the designer should consider when determining whether or not to incorporate a curbed section into the design:

1. Urban Location. Because of restricted ROW, the need to control drainage, and other constraints, curb and gutter sections on the outside edges of the traveled way are almost always used in urban areas.
2. Suburban Location. The use of curbs and/or gutters will be determined on a case-by-case basis. Consider providing curbing where there are pedestrians, channelization needs, closed drainage requirements, and a desire to manage access to the street.
3. Rural Location. In general, the use of sloping type curbs and/or gutters along rural high-speed highways is limited to the edge of shoulder and to the following special conditions:
 - for roadway delineation in conjunction with channelization at intersections;
 - where there is sufficient development along the highway and there is a need to channelize traffic into and out of properties;

- where drainage control is required;
- where ROW is restricted for roadside ditches; and/or
- at other sites deemed necessary (e.g., interchange crossroads, major intersections with restricted sight distance, where the route turns, offset left-turn lanes).

31-1.07(b) Curb and Gutter Types

There are two basic types of curbs — barrier (vertical) and mountable (sloping). The [IDOT Highway Standards](#) provides information on design details and placement for various curb types. For most situations, an integral CC&G is used. The following notations are used by IDOT to define the various curb and gutter types:

1. Initial Letter. The initial letter “B” or “M” is used to denote whether the curb is barrier (vertical) type or mountable (sloping) type.
2. Numbers Prior to the Decimal Point. The first set of numbers indicates the height of the curb in inches (centimeters).
3. Numbers After the Decimal Point. The second set of numbers, if used, indicates the width of the gutter flag in inches (centimeters).

A Type B curb without a gutter flag can also be used in some instances.

The [IDOT Highway Standards](#) also includes information on gutter-only sections. These are used to control pavement drainage, especially for rural cross sections. They should be placed at the edge of the shoulder rather than along the edge of the traveled way because of their steep cross slope.

LPA's may use a gutter section with a shallow flow line along the edge of the traveled way on residential streets. This avoids the need to depress the curb at the numerous entrances, especially on subdivision streets. This gutter section should only be used on streets functionally classified as local.

31-1.07(c) Curb and Gutter Type Selection

The designer should consider the following guidelines when selecting a curb type:

1. Low-Speed Urban Facilities (Outside Edge of Traveled Way). Depending on the specific conditions, streets may be designed with either a mountable or barrier curb. Curb and gutter may be placed at the edge of the traveled way. Where the design speed is 45 mph (70 km/h) or less, B-6.24 (B-15.60), B-6.18 (B15.45), or B-6.12 (B-15.30) CC&G may be used along the right edge of the traveled way or parking lane. A lesser gutter width may be used adjacent to a right-turn or parking lane or where highly restricted ROW conditions exist. Barrier curbs should be offset at least 1 ft (300 mm) and desirably 2 ft (600 mm) from edge of the travel lanes. Also consider any drainage requirements in the selection of gutter type. Some LPA's have standard curb types that can be used.

BUREAU OF LOCAL ROADS & STREETS

August 2016

CROSS SECTION ELEMENTS

31-1-19

2. High-Speed Facilities (Outside Edge of Shoulder). In general, do not provide barrier curbs or continuous mountable curbs on high-speed facilities where posted speed limits are expected to be greater than 45 mph (70km/h). Where a high-speed facility is proposed with shoulders and side slopes, there may be occasional locations where the ROW is restricted or there is a need to control drainage. In these cases, use an M-4 (M-10) or M-6 (M-15) type curb and gutter or a Type B gutter, depending on drainage needs, along the outside edge of the shoulder. Do not place curb and gutter or Type B gutter immediately adjacent to the edge of the traveled way.
3. Pedestrians. In urban areas, consider the use of B-9 (B-22) curb along the right edge of the traveled way where some additional protection is desired for pedestrians (e.g., adjacent to schoolyards, playgrounds). On roadways with low speeds, use the B-9 (B-22) curb adjacent to sidewalks across bridges. B-9 (B-22) curbs should not be provided along parking lanes.
4. Medians. On divided streets, the type of median curbs should be determined in conjunction with the median width and the type of turning movement control. Consider the following:
 - a. Traversable Medians. Where there is a need to provide a continuous TWLTL along the street and where raised delineation of the center turn lane is desirable, use M-2.12 (M-5.30) CC&G to delineate the outside edge of the TWLTL.
 - b. Raised Curb Medians. Where cross median movements are undesirable or hazardous, a raised curb may be provided. Use the following curbing types for raised curb medians:
 - M-6.24 (M-15.60) or M-6.18 (M-15.45) CC&G on channelizing islands and medians where the design speed is less than 40 mph (60 km/h).
 - B-6.24 (B-15.60), B-6.18 (B-15.45), or B-6.12 (B-15.30) CC&G on channelizing islands and medians where the design speed is 45 mph (70 km/h).
 - For the design speed of 40 mph (60 km/h) or less, the designer has the option to use either an M-6 (M-15) or B-6 (B-15) type curb and gutter.
 - Use M-4 (M-10) curb on channelizing islands or medians where the design speed is 50 mph (80 km/h) or greater. Typically, curbing is only used at locations that would be channelized (e.g., offset left-turn lanes), near at-grade intersections, or on the crossroad through an interchange.
 - Except for channelized intersections, raised-curb medians are generally not considered an appropriate type of median cross section where posted speeds will exceed 45 mph (70 km/h).
5. Corner Islands. On streets or highways with a design speed of 45 mph (70 km/h) or less, use the M-6 (M-15) curb on all corner islands. On facilities with design speeds of 50 mph (80 km/h) or greater, use the following curb types:
 - Where traffic signals are not proposed, use an M-4 (M-10) curb with a specified gutter width on all corner islands adjacent to the high-speed facility.
 - Where traffic signals are present or proposed, use an M-6 (M-15) curb with a specified gutter width on corner islands adjacent to high-speed facilities.

HARD COPIES UNCONTROLLED

31-1.08 Cross Slopes**31-1.08(a) Travel Lanes**

Surface cross slopes are required for proper drainage of the travel lanes on tangent sections. A sufficient cross slope reduces the hazards of wet pavements by quickly removing water from the surface. The following cross slopes will apply to travel lanes on tangent roadway sections:

1. High-Type Pavements. High-type pavements (i.e., HMA, concrete) are those that retain smooth riding qualities and good nonskid properties in all-weather under heavy traffic volumes and loadings, with little maintenance required. For these pavements, use a cross slope of 1.5% to 2.0% and crown the traveled way pavement at the centerline. Use a minimum cross slope of 1.5% for the first lane away from the centerline. The second lane from the crown should have a cross slope of 2.0%.
2. Low-Type Surfaces. Low-type surfaces are treated earth surfaces, loose aggregate surfaces, and bituminous surface treatments. For low-type surfaces, the pavement cross slope should be 2.0% to 4.0%.

31-1.08(b) Auxiliary Lanes

The rate of cross slope for an auxiliary lane will be at least 2.0% except for curbed left-turn lanes and TWLTLs. The designer should increase the cross slope by 0.5% for each additional set of lanes adjacent to the crown. Single left-turn lanes with curb and gutter are usually sloped at 1.5% to 2.0% away from the median to accommodate snow plowing. TWLTL and flush left-turn lanes are usually crowned at the centerline and sloped at a minimum of 1.5% in each direction.

31-1.08(c) Shoulders

The cross slope of a shoulder depends on the type of shoulder and the construction project type. The following summarizes typical guidelines for shoulder cross slopes:

1. Paved Shoulders. On new construction and reconstruction projects, full-width paved shoulders on tangent sections should be sloped at 4.0%. On 3R projects, the shoulder slopes range from 2.0% to 6.0%.
2. Combination Shoulders. Combination paved/aggregate shoulders should be sloped at 4.0%.
3. Aggregate Shoulders. Aggregate shoulders should be sloped from 4.0% to 6.0%.
4. Turf Shoulders. Turf shoulders should be sloped from 5.0% to 8.0%.
5. Superelevated Sections. [Section 29-3](#) and the [IDOT Highway Standards](#) discuss the application of shoulder cross slopes on superelevated sections for new construction and reconstruction projects.

31-1.08(d) Rollover Factor

The rollover factor is the algebraic difference in cross slope between the shoulder and travel lanes. The maximum algebraic difference between the traveled way and the shoulder is 8.0% on roads with higher traffic volumes and 10.0% for those roads with lower traffic volumes. See [Chapter 32](#). This applies to both tangent and superelevated sections. For allowable shoulder rollover values on 3R projects, see [Chapter 33](#).

31-1.09 Rumble Strips

Rumble strips are grooved patterns constructed on, or in travel lane and shoulder pavements. Rumble strips may also be placed as part of the edgeline or centerline (also called rumble stripes). Rumble strips and rumble stripes create vibration and noise when driven over to indicate that the driver needs to take corrective action. Rumble strips and rumble stripes are an effective way to reduce certain types of crashes and provide a cost effective means of alerting drowsy or inattentive drivers. Rumble stripes have also shown to improve wet weather visibility.

Shoulder rumble strips should be considered for rural highways that have high run-off-the-road crashes and have an adequate paved shoulder width. On facilities in which bicyclists are prohibited or the paved shoulders are wider than 6 ft (1.8 m), the 16 in (400 mm) rumble strip design should be used. On facilities in which bicyclists are permitted and the paved shoulder width is 6 ft (1.8 m) or less, the 8 in (200 mm) rumble strip design should be used to maximize the clear shoulder width available for cyclists, see [Section 42-3.03](#).

Edgeline rumble stripes may be considered in place of shoulder rumble strips or at other locations, where run-off-the-road crashes are a concern, without adequate paved shoulders.

Centerline rumble stripes should be considered on undivided rural highways that have high head-on and opposite-direction sideswipe crashes. A secondary target is drift-off, run-off-the-road-to-the-left crashes. Centerline rumble stripes may also discourage risky passing.

Milling is the preferred method for installing rumble strips; however a formed-in option is allowed for installing the 16 in (400 mm) rumble strips in Portland Cement Concrete shoulders. When the shoulder will be used for traffic during construction, the formed-in option should be reviewed and not allowed if conflicts will occur. It may also be necessary to specify when the milled shoulder rumble strips may be installed if they conflict with the staging of traffic.

Transverse rumble strips may be considered on approaches to intersections and horizontal curves to indicate a need for the driver to slow down or stop. The use of transverse rumble strips supplements the visual warnings (signs and signals) with audible and sensory indications has some obvious and attractive advantages. Such warnings may reach a fatigued or dozing driver who might miss the visual ones. With the sound created from transverse rumble strips, placement near residences or quiet zones (schools, hospitals, etc.) should be reviewed prior to placement.

Transverse rumble strips should be located in advance of some sign (Stop Ahead, Stop, etc.) that either warns of or describes the action required on the part of the motorist. This will assist the driver to better understand the purpose of the transverse rumble strips. The recommended placement and configuration of the transverse rumble strips should be three groupings of strips 8 in (200mm) wide separated by 4 in (100mm) spaces if it is grooved into the pavement and 8 in (200mm) wide separated by 8 in (200mm) spaces if it is applied to the surface of the pavement, see Figure 31-1H.

FIGURE 31-1H

31-2 ROADSIDE ELEMENTS

31-2.01 Borders

On urban facilities, the border area between the roadway and the ROW line should be wide enough to serve several purposes. This includes providing space for sidewalks, snow storage, a buffer space between pedestrians and vehicular traffic, and an area for aesthetic features (e.g., grass, other landscaping), signs, and utilities. If a sidewalk will be constructed or is anticipated in the future, the border should be a minimum of 2 ft (1.2 m) and desirably 8 ft (2.4 m) or wider, plus the sidewalk width. The border begins at the back of curb in a typical urban section and at the edge of shoulder in a typical rural section. Where the available ROW is limited and in areas of high ROW costs, as in some industrial and commercial areas, a width of 2 ft (600 mm) plus the sidewalk width may be tolerated.

Where practical, a width of 12 ft to 15 ft (3.6 m to 4.5 m) should be provided between curb / shoulder and sidewalk, which should remain free of obstacles. In addition to the safety and environmental advantages, this space allows for the future addition of a lane, if needed. (In residential areas, wider building set back controls can also be used to attain these features.)

Typically, a 1 ft (300 mm) width is provided between the sidewalk and ROW line. Utility poles usually can be located behind the sidewalk in this area providing a minimum clear sidewalk width of 4 ft (1.2 m).

The slope of the border area is influenced by the surroundings and whether or not a sidewalk (or shared use path) will be provided. If a sidewalk (or shared use path) will be provided, it is aesthetically pleasing to provide a 2% slope for the entire border area. This will match the maximum cross slope of the sidewalk. The direction of the slope, to the curb or away from the curb, is dependent on the surrounding land use and ground elevation beyond the border area. Good economic engineering should be used in determining the best direction to take the water away from the border area. Draining the border area away from the curb in undeveloped area may have advantages. Draining the border area over the curb in developed areas may help the perception of preventing flooding of private property; however, this may increase the required size of the storm sewer system.

If no sidewalk (or shared use path) will be provided or is not anticipated, it is desirable to at least provide a 3 ft to 5 ft wide area with a 2% slope behind the curb. In a cut section, this flat area intercepts and slows the runoff from the higher elevation and provides a storage area from pavement snow removal. In a fill section, this flat area provides additional support for roadway and allows an area for the placement of signs. In both cases this flat area provides a reasonable slope for ease of maintenance and travel way for the occasional pedestrian.

31-2.02 Sidewalks

Sidewalks are considered integral parts of the urban environment. In these areas, travelers frequently choose to make their trip by foot, and pedestrians desire to use a paved surface for the trip. When constructing sidewalks, consider the following:

BUREAU OF LOCAL ROADS & STREETS

31-2-2

CROSS SECTION ELEMENTS

August 2016

1. Guidelines. Consider providing sidewalks on both sides of the street for pedestrians near schools, parks, shopping areas, transit stops, and along all streets located in commercial areas. In residential areas, a sidewalk should be placed on at least one side of all streets. Extend all sidewalks to logical termini. If sidewalks are not provided in the initial design, grading should be completed so that sidewalks can be added in the future.
2. Widths. A typical sidewalk is 5 ft (1.5 m) with a 2 ft to 3 ft (600 mm to 1.0 m) wide buffer area between the curb and sidewalk. If no buffer area is provided, the sidewalk should be 6 ft (1.8 m) wide to accommodate any appurtenances that may be included in the sidewalk. High pedestrian volumes may warrant greater widths in business areas and school zones. The minimum sidewalk width is 4 ft (1.2 m). However, this width must be evaluated against the requirements of ADA / PROWAG presented in [Section 41-6](#).
3. Buffer Areas. If the available ROW is sufficient, provide a buffer area between the back of curb and sidewalk. These areas provide space for snow storage and utilities and allow a greater separation between vehicles and pedestrians. The buffer area should be 2 ft to 3 ft (600 mm to 1.0 m) wide to be effective and wider, if practical. Buffer areas may also be used for the placement of roadside appurtenances.
4. Appurtenances. Where a buffer area cannot be provided, consider the impact of roadside appurtenances within the sidewalk (e.g., signs, mailboxes, fire hydrants, parking meters, utility poles). These elements may reduce the effective usable width because they interfere with the pedestrian access route and not meeting ADA / PROWAG requirements.
5. Central Business District (CBD) Areas. In CBDs, typically the entire area between the back of curb and the front of buildings is fully paved as a sidewalk.
6. Accessibility. Sidewalk widths, cross slopes, longitudinal grades, curb ramps, etc., along public rights-of-way must meet the ADA / PROWAG requirements presented in [Section 41-6](#).

31-2.03 Side Slopes

Earth slopes are required to provide a stable transition from the highway profile to adjacent terrain features. With maintenance operations, economy may be attained through the use of mechanized equipment that operates best on relatively flat earth slopes. Flat slopes also facilitate turf establishment and are often required for soil stability. In addition to aesthetic enhancement, flat and well-rounded side slopes, combined with proper roadway elevations above natural ground lines, minimize snow-drifting problems. With proper elevations, crosswinds sweep the snow from the roadway surface, thus facilitating snow removal operations.

Using broad, flat slopes on roadside ditches that are totally visible to the driver lessen the feeling of restriction and add considerably to a driver's willingness to use the shoulder and earth slope area in emergencies. The use of flat side slopes for roadside ditches reduces both the depth and velocity of water, and thereby minimizes damage from erosion.

Drivers who inadvertently leave the traveled way can often recover control of their vehicles if slopes are gentle and transitions are well rounded. This recovery area should be provided where terrain and ROW permit. For additional guidance on roadside safety issues, see [Chapter 35](#).

HARD COPIES UNCONTROLLED

The tables in [Chapter 32](#) provide the maximum slopes for rural facilities. For urban facilities, side slopes generally will be determined on a case-by-case basis considering the roadside development and ROW restrictions. For some urban projects, relatively steep side slopes and/or retaining walls may be required. The stability of the soil may also affect the front and back slopes that can be used in a project.

31-2.04 Ditches

A roadside ditch is defined as an open channel paralleling the highway embankment within the limits of the highway ROW. Its primary function is to collect runoff from the highway and areas adjacent to the highway that drain naturally to the highway and to transport this accumulated water to an acceptable outlet point. A secondary function of a roadside ditch is to drain the base of the roadway to prevent saturation and loss of support for the pavement. When designing ditches, consider the following:

1. Types. There are basically two types of ditches — V-ditch or flat-bottom ditch. Flat-bottom ditches are typically a minimum of 2 ft (600 mm) wide.
2. Side Slopes. The rural tables in [Chapter 32](#) provide the maximum side slope designs for ditches.
3. Roadside Safety. [Chapter 35](#) presents safety criteria for roadside drainage features.
4. Ditch Grades. Ensure that permanent erosion control is considered in the design of ditches in cut slopes. As a general guide, longitudinal ditch slopes less than 1.0% can be seeded, slopes of 1.0% to 3.0% usually will require sodding or seeding with an erosion control blanket, and slopes greater than 3.0% will require riprap or other protective lining. Very flat longitudinal ditch slopes (i.e., < 0.4%) may require a paved ditch to maintain the flowline over time.

For more information on the design of ditches, see [Section 38-1](#) and the [IDOT Drainage Manual](#).

31-3 RIGHT-OF-WAY (ROW)

31-3.01 General

The purpose of acquiring highway ROW is to provide sufficient room to construct the facility, to enable the safe operation of vehicles on the facility, and to permit the safe and efficient maintenance of the facility. Give consideration to future widening, sidewalks, and shared-use paths.

31-3.02 ROW Width

For new facilities, the minimum ROW width will be the sum of the traveled way, outside shoulders and/or curb and gutter width, median width (if applicable), necessary width for fill and cut slopes, sidewalks (if applicable), public utility facility strip, plus a maintenance border area beyond the construction limits. Except for townships, the total width will vary according to the functional classification and urban/rural environment. Townships are required to have a minimum width of 40 ft (12 m) ([605 ILCS 5/6-301](#)). In addition to the border area beyond the construction limits, allowance may be necessary for the provision of frontage roads, special drainage facilities, roadside clear zones, and future expansion of the highway. These border areas are required for maintenance operations, the retention of natural growth for scenic and ecological purposes, erosion control and, in some cases, for accommodating publicly owned utilities. Border areas also serve as a buffer between the limits of construction and abutting private development.

In rural areas, wide ROW allow the construction of flat slopes, resulting in enhanced safety for the motorist and providing for easier and more economical maintenance. The procurement of sufficient ROW at the time of the initial improvement permits the widening of the roadway and the widening and strengthening of the pavement at reasonable costs as traffic increases.

In urban/suburban areas, it may be more desirable to limit the ROW width to the practical minimum. However, the ROW should not be less than that required for all elements of the design section and appropriate border areas. The acquisition of additional ROW for municipal improvements with rural-type cross sections in built-up areas may not be practical where property damage would be large if standard slopes are constructed. However, where rural conditions exist in municipalities, use the widths for the traveled way and shoulders and slope rates from the applicable rural table in [Chapter 32](#) to determine the minimum ROW width.

In general, minimal additional ROW will be required for 3R projects. However, ditch cleaning and slope flattening may be desirable on these projects. Consequently, strips of a minimum width of ROW or easements may be required.

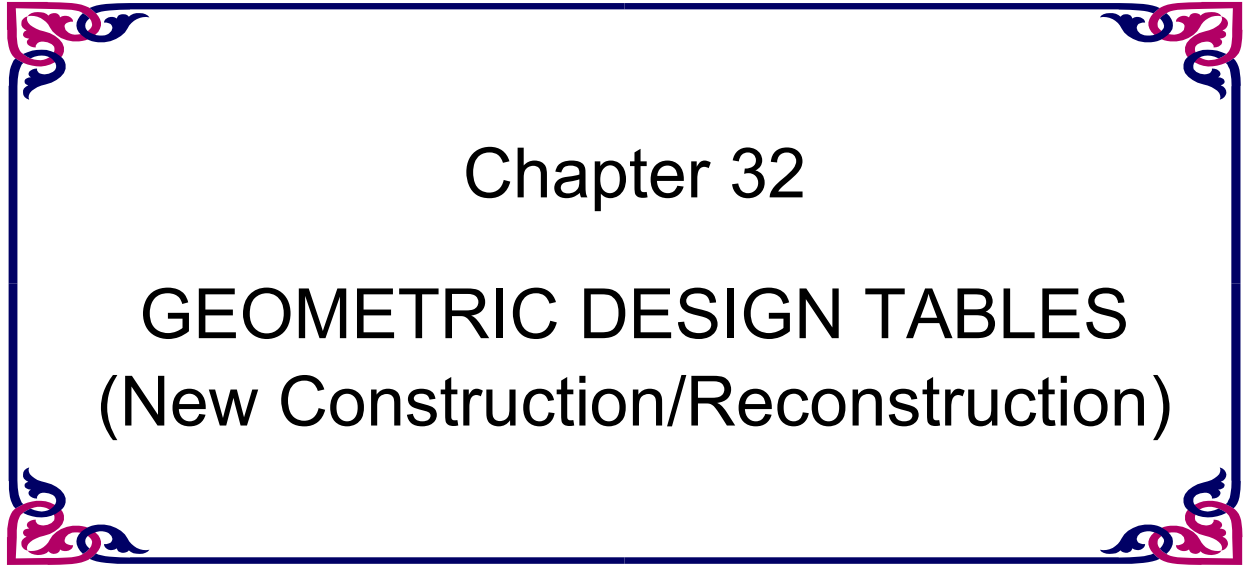

31-4 ACRONYMS

This is a summary of the acronyms used within this chapter.

3R	Rehabilitation, Restoration, and/or Resurfacing
AASHTO	American Association of State Highway and Transportation Officials
ADA	<i>Americans with Disabilities Act</i>
ADT	Average Daily Traffic
BDE	Bureau of Design and Environment
CBD	Central Business Districts

Chapter 32

GEOMETRIC DESIGN TABLES

(New Construction/Reconstruction)

32-1 GENERAL

This Chapter presents summary tables of the design criteria for the geometric design of local projects. They apply to new construction and reconstruction projects. The designer should consider the following in the use of these tables:

1. Functional Classification. The selection of design values depends on the functional classification of the highway facility. Functional classification is discussed in [Section 27-3](#). The first step in the design process is to determine the functional classification of the proposed improvement. If the classification is unknown, contact the local Illinois Department of Transportation (IDOT) district office.
2. Manual Section References. These tables are intended to provide a concise listing of design values for easy use. However, the designer should review the *Manual* section reference for more information on the design elements.
3. Footnotes. The tables include many footnotes, which are identified by a number in parentheses (e.g., (3)). The information in the footnote is critical to the proper use of these design tables.
4. Cross Section Elements. The designer should realize that some of the cross section elements included in a table (e.g., median width) are not automatically warranted in the project design. The values in the tables will only apply after the decision has been made to include the element in the highway cross section.
5. Bridge Elements. Design criteria for bridge elements are provided in [Chapter 36](#).
6. Controlling Design Criteria. Controlling design criteria are the elements judged to be the most critical indicators of highway safety and overall serviceability. The tables provide an asterisk to indicate controlling design criteria. [Section 27-7](#) discusses this in more detail and presents the process for approving design variances to controlling criteria.
7. Local Public Agency (LPA) Criteria. Illinois counties and cities may have developed their own geometric design criteria for local facilities. It may be acceptable to use the local agency criteria where there are conflicts with the criteria listed in this *Manual*. This decision will be made on a case-by-case basis or can be approved as an agency variance acceptable for all projects.

32-2 GEOMETRIC DESIGN CRITERIA

This Section presents the new construction/reconstruction geometric design criteria for various local facilities. Design criteria are provided for the following facilities:

- Figure 32-2A “Geometric Design Criteria for Rural Two-Lane Minor Arterials,”
- Figure 32-2B “Geometric Design Criteria for Rural Two-Lane Collectors,”
- Figure 32-2C “Geometric Design Criteria for Rural Two-Lane Local Roads,”
- Figure 32-2D “Geometric Design Criteria for Suburban Arterials,”
- Figure 32-2E “Geometric Design Criteria for Urban Two-Way Arterials,”
- Figure 32-2F “Geometric Design Criteria for Urban One-Way Arterials,”
- Figure 32-2G “Geometric Design Criteria for Urban Two-Way Collectors,”
- Figure 32-2H “Geometric Design Criteria for Urban One-Way Collectors,” and
- Figure 32-2I “Geometric Design Criteria for Urban Local Streets.”

For criteria on local rural two-lane principal arterials, the designer should review the criteria in [Chapter 47](#) of the *Bureau of Design and Environment (BDE) Manual*. Local rural two-lane principal arterial projects should be brought to early coordination for discussion.

32-2-3

Footnotes:

- (1) Design Criteria. The criteria for the minimum cross-section elements allowed to remain in place (see [Chapter 33](#)) provided it is cost effective and the safety record is satisfactory.
- (2) Traffic Volumes. The design hourly volumes (DHV) assumes base conditions (except for 8% heavy vehicles) and a PHF = 1 for LOS shown. Adjust these values according to the actual factors. [Section 27-6](#) further discusses capacity methodology and traffic volumes.
- (3) Design Speed.
 - a. In rolling terrain, a minimum design speed of 55 mph (90 km/h) may be considered with study and justification.
 - b. To determine the minimum design speed allowed to remain in place, consider the following:
 - i. Existing horizontal curves may remain in place provided they have a comfortable operating speed of 60 mph (100 km/h) (level) or 50 mph (80 km/h) (rolling) and there is no history of crashes.
 - ii. Existing sag vertical curves may remain in place if they have a design speed of 50 mph (80 km/h) or greater and do not have a history of crashes. If not, reconstruct the sag vertical curve to a design speed of 60 mph (100 km/h).
 - iii. Existing crest vertical curves may remain in place if they have a design speed of 50 mph (80 km/h) or greater and do not have a history of crashes. If not, reconstruct the crest vertical curve to a design speed of 60 mph (100 km/h).
 - iv. Consider the relationship between horizontal and vertical alignments simultaneously to obtain a desirable condition. [Chapter 33](#) of the *BDE Manual* discusses these relationships and their effect on aesthetics and safety.
- (4) Access Control. For bypass routes on new alignment, design the roadway with partial access control. See [Section 35-1](#) of the *BDE Manual*.
- (5) Cross Slopes.
 - a. Cross slopes for outside auxiliary lanes will be at least 2.0% and should be 0.5% greater than the adjacent travel lane.
 - b. Where an aggregate shoulder is part of the shoulder width, slope the aggregate portion of the shoulder at 6%.
- (6) Ditch Bottom Width. Provide a wider outside ditch bottom where detention storage of storm water is a consideration.
- (7) Back Slope. Where the height of cut exceeds 10 ft (3.0 m), consider using a 1V:2H back slope beyond the clear zone. Also, for heights of cut greater than 30 ft (9.0 m), consider the use of benching.
- (8) Fill Slope. For fill heights greater than 30 ft (9.0 m), use a 1V:2H uniform slope with a roadside barrier. Also, for heights greater than 30 ft (9.0 m), consider the use of benching.

ADT = Average Daily Traffic

**GEOMETRIC DESIGN CRITERIA FOR RURAL TWO-LANE COLLECTORS
(New Construction/Reconstruction)**

Figure 32-2B (Metric)

Footnotes:

- (1) Design Speed.
 - a. A rural collector may pass through a relatively built-up area. In these sections, a lower design speed may be selected with justification. However, the selected design speed should not be less than 30 mph (50 km/h). Consider the following:
 - i. For low to moderate density areas, the design speed may be reduced 5 mph to 10 mph (10 km/h) below the listed design speed.
 - ii. For moderate to high density areas, the design speed may be reduced 10 mph to 15 mph (10 km/h to 20 km/h) below the listed design speed.
 - b. For rural bridge projects, the design speed may be increased to the posted or regulatory speed limit to avoid a deficient NBIS rating for approach roadway alignment appraisal. All elements of the project will be designed to the chosen design speed. The chosen design speed will be certified by the County Engineer.
- (2) Traveled Way Width. On a reconstruction project, an existing 22 ft (6.6 m) traveled way width may be maintained where the alignment and safety records are satisfactory.
- (3) Surface Type. A high-type pavement is desirable.
- (4) Shoulder Width.
 - a. Where roadside barriers are included, provide a minimum offset of 4 ft (1.2 m) from the edge of the traveled way to the roadside barrier. When the 4 ft (1.2 m) width cannot be met because of a proposed or an existing bridge width (see [Section 36-5](#)), [Section 35-4](#) shall be followed to flare the roadside barrier until the 4 ft (1.2 m) width is met or until the length of need is exceeded.
 - b. Where the rural collector passes through a moderate to high density area, the shoulder width may be 4 ft (1.2 m). This width may include the width of Type B gutter or the gutter flag with curb and gutter at the outside edge of the shoulder.
- (5) Shoulder Type.
 - a. Aggregate shoulders may consist of a nominal 4 in (100 mm) thickness where the ADT is less than 750 vehicles/day.
 - b. For ADT's > 750 vehicles/day, an aggregate shoulder should be a minimum thickness of 6 in (150 mm) Type A shoulders.
- (6) Cross Slopes.
 - a. Cross slopes for outside auxiliary lanes will be at least 2.0% and should be 0.5% greater than the adjacent travel lane. Inside auxiliary lane cross slopes are sloped at 1.5% to 2.0% with high-type pavements.
 - b. Use 1.5% to 2.0% with high-type pavement.
- (7) Back Slopes. For isolated restricted right-of-way, the back slope may be 1V:2H for cut depths of 0 ft to 10 ft (0 m to 3 m) or 1V:1.5H for cut depths greater than 10 ft (3 m).

GEOMETRIC DESIGN CRITERIA FOR RURAL TWO-LANE LOCAL ROADS
(New Construction/Reconstruction)

Figure 32-2C (Metric)

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS
GEOMETRIC DESIGN TABLES

August 2016

32-2-9

Footnotes:

(1) Design Speed.

- a. A rural local road may pass through a relatively built-up area. In these areas, for highway projects with no bridges, a lower design speed may be selected with justification. However, the selected design speed should not be less than 20 mph (30 km/h). Consider the following:
 - i. For low to moderate density areas, the design speed may be reduced 5 mph to 10 mph (10 km/h) below the listed design speed.
 - ii. For moderate to high density areas, the design speed may be reduced 10 mph to 15 mph (10 km/h to 20 km/h) below the listed design speed.
- b. For highway projects with no bridges with ADT's less than 50 vehicles/day, the design speed may be 20 mph (30 km/h).
- c. For projects constructed with no bridges, other than Federal funds on the district road system with ADT's less than 150 vehicles/day, no design speed is required.
- d. For rural bridge projects, minimum design speed shall be as determined by the ADT. However, the design speed may be increased to the posted or regulatory speed limit to avoid a deficient NBIS rating for approach roadway alignment appraisal. All elements of the project will be designed to the chosen design speed. The chosen speed will be certified by the County Engineer.

(2) Traveled Way Width.

- a. For projects constructed with other than Federal funds on the district road system with ADT's less than 150 vehicles/day, the minimum width is 16 ft (4.8 m).
- b. On a reconstruction project, an existing 22 ft (6.6 m) traveled way may be maintained where the alignment and safety records are satisfactory.

(3) Surface Type. A high-type pavement may be provided.

(4) Shoulder Width.

- a. Where roadside barriers are included, provide a minimum offset of 4 ft (1.2 m) from the edge of the traveled way to the roadside barrier. When the 4 ft (1.2 m) width cannot be met because of a proposed or an existing bridge width (see [Section 36-5](#)), [Section 35-4](#) shall be followed to flare the roadside barrier until the 4 ft (1.2 m) width is met or until the length of need is exceeded.
- b. Where the rural local road passes through a moderate to high density area, the shoulder width may be 4 ft (1.2 m). This width may include the width of Type B gutter or the gutter flag with curb and gutter at the edge of the shoulder.

(5) Shoulder Type.

- a. Aggregate shoulders may consist of a nominal 4 in (100 mm) thickness where the ADT is less than 750 vehicles/day.
- b. For ADT's > 750 vehicles/day, an aggregate shoulder should be a minimum thickness of 6 in (150 mm) Type A shoulders.

(6) Cross Slopes.

- a. Cross slopes for outside auxiliary lanes will be at least 2.0% and should be 0.5% greater than the adjacent travel lane.
- b. Use 1.5% to 2.0% for high-type pavement.

(7) Side Slopes.

- a. For district road systems constructed with other than Federal funds, front slopes may be 1V:2H and back slopes may be 1V:1.5H.
- b. For isolated restricted right-of-way, the back slope may be 1V:2H for cut depths of 0 ft to 10 ft (0 m to 3 m) or 1V:1.5H for cut depths greater than 10 ft (3 m).

DHV = Design Hourly Volume / TWS = Two-Way Street

**GEOMETRIC DESIGN CRITERIA FOR SUBURBAN ARTERIALS
(New Construction/Reconstruction)**

Figure 32-2D (Metric)

BUREAU OF LOCAL ROADS & STREETS
GEOMETRIC DESIGN TABLES

32-2-12

August 2016

Footnotes:

- (1) Traffic Volumes. The design hourly volumes (DHV) are calculated using a PHF = 1.0; these values may be adjusted using local peak-hour factors. For more information, see the *Highway Capacity Manual (HCM)*.
- (2) Design Speed. A 60 mph (100 km/h) design speed may be considered in open-suburban areas.
- (3) Shoulder Width.
 - a. Concrete Curb & Gutter (CC&G) may be placed on the outside edge of the shoulder, especially if sidewalks will be placed along the shoulder. The gutter flag may be included in the shoulder width.
 - b. Where the design speed is 45 mph (70 km/h) or less, the shoulder may be replaced with a B-6.24 (B-15.60) CC&G.
- (4) Auxiliary Lane. Under restricted conditions, the gutter width adjacent to the edge of the turn lane may be narrowed or eliminated adjacent to a 12 ft (3.6 m) turn lane.
- (5) Cross Slope.
 - a. Use 2.0% minimum cross slopes for travel lanes not adjacent to the crown.
 - b. Curbed left-turn lanes may be sloped at 1.5% to 2.0% away from the median. Two Way Left Turn Lane (TWLTL) and flush left-turn lanes are sloped at the same rate as the adjacent traveled way. Cross slopes for outside auxiliary lanes will be at least 2.0% and desirably should be 0.5% greater than the adjacent travel lane.

 (New Construction/Reconstruction)**

Figure 32-2E (Metric)

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS
GEOMETRIC DESIGN TABLES

August 2016

32-2-15

Footnotes:

- (1) Traffic Volumes. The design hourly volumes (DHV) are calculated using a PHF = 1.0; these values may be adjusted using local peak-hour factors. For more information, see the *Highway Capacity Manual*.
- (2) Level of Service (LOS). A LOS D may be used in heavily developed sections of metropolitan areas.
- (3) Surface Width. The minimum surface width is 30 ft (9.0 m) face-of-curb to face-of-curb.
- (4) Parking Lane Width. The desirable width of the parking lane is 10 ft (3.0 m) and includes the gutter width. If the parking lane may be used as future travel lane, the 10 ft (3.0 m) width should be in addition to the gutter width. An 8 ft (2.4 m) width may be used where it is unlikely the parking lane will be used as through or turning lane in the future.
- (5) Cross Slope.
 - a. Use 2.0% minimum cross slopes for travel lanes not adjacent to the crown.
 - b. Curbed left-turn lanes may be sloped at 1.5% to 2.0% away from the median. Two Way Left Turn Lane (TWLTL) and flush left-turn lanes are sloped at the same rate as the adjacent traveled way. Cross slopes for outside auxiliary lanes will be at least 2.0% and desirably should be 0.5% greater than the adjacent travel lane.
- (6) Gutter Width. Under restricted conditions, the gutter width adjacent to the edge of a 12 ft (3.6 m) turn lane may be eliminated.
- (7) Sidewalk Width. Include a 2 ft to 3 ft (600 mm to 1.0 m) buffer strip between the curb and sidewalk. For sidewalks without a buffer strip, a minimum 6 ft (1.8 m) sidewalk width behind the curb must be provided.
- (8) Obstruction-Free Zone. Distance is measured from the face of the curb. Hazards behind curbs should be located outside of the clear zone shown for uncurbed roadways as discussed in [Section 35-2.02\(f\)](#).
- (9) Side Slopes. Side slopes to be determined on a case-by-case basis considering roadside development and right-of-way restrictions.

An 8 ft (2.4 m) width may be used where it is unlikely the parking lane will be used as through or turning lane in the future.
- (4) Cross Slope.
 - a. Use 2.0% minimum cross slopes for travel lanes not adjacent to the crown.
 - b. Cross slopes for outside auxiliary lanes will be at least 2.0% and desirably should be 0.5% greater than the adjacent travel lane.
- (5) Gutter Width. Under restricted conditions, the gutter width adjacent to the edge of a 12 ft (3.6 m) turn lane may be eliminated.
- (6) Sidewalk Width. Include a 2 ft to 3 ft (600 mm to 1.0 m) buffer strip between the curb and sidewalk. For sidewalks without a buffer strip, a minimum 6 ft (1.8 m) sidewalk width behind the curb must be provided.
- (7) Obstruction-Free Zone. Distance is measured from the face of the curb. Hazards behind curbs should be located outside of the clear zone shown for uncurbed roadways as discussed in [Section 35-2.02\(f\)](#).
- (8) Side Slopes. Side slopes are determined on a case-by-case basis considering roadside development and right-of-way restrictions.

Footnotes:

- (1) Travel Volumes. The design hourly volumes (DHV) are calculated using a PHF = 1.0; these values may be adjusted using local peak-hour factors. For more information, see the *Highway Capacity Manual*.
- (2) Design Speed. A 45 mph (70 km/h) design speed may be used in fringe areas and outlying business districts.
- (3) Surface Width. The minimum surface width is 30 ft (9.0 m) face-of-curb to face-of-curb.
- (4) Parking Lane. The minimum width of the parking lane is 8 ft (2.4 m) and includes the gutter width.
- (5) Cross Slope.
 - a. Use 2.0% minimum cross slopes for travel lanes not adjacent to the crown.
 - b. Curbed left-turn lanes may be sloped at 1.5% to 2.0% away from the median. Two Way Left Turn Lane (TWLTL) and flush left-turn lanes are sloped at the same rate as the adjacent traveled way. Cross slopes for outside auxiliary lanes will be at least 2.0% and desirably should be 0.5% greater than the adjacent travel lane.
- (6) Gutter Width. Under restricted conditions, the gutter width adjacent to the edge of a 12 ft (3.6 m) turn lane may be eliminated.
- (7) Sidewalk Width. Include a 2 ft to 3 ft (600 mm to 1.0 m) buffer strip between the curb and sidewalk. For sidewalks without a buffer strip, a minimum 6 ft (1.8 m) sidewalk width behind the curb must be provided.
- (8) Obstruction-Free Zone. Distance is measured from the face of the curb. Hazards behind curbs should be located outside of the clear zone shown for uncurbed roadways as discussed in [Section 35-2.02\(f\)](#).
- (9) Side Slopes. Side slopes are determined on a case-by-case basis considering roadside development and right-of-way restrictions.

BUREAU OF LOCAL ROADS & STREETS
GEOMETRIC DESIGN TABLES

August 2016

32-2-27

Footnotes:

- (1) Design Speed. A 20 mph (30 km/h) design speed may be used where the posted speed limit is 20 mph.
- (2) Surface Width. The minimum surface width is 30 ft (9.0 m) face-of-curb to face-of-curb.
- (3) Parking Lane. The minimum width of the parking lane is 8 ft (2.4 m) and includes the gutter width.
- (4) Cross Slope. Use 2.0% minimum for lanes away from the crown.
- (5) Curb and Gutter. Under restricted conditions, the gutter width adjacent to the edge of an 11 ft (3.3 m) turn lane may be eliminated. A shallow gutter may be used in place of CC&G.
- (6) Obstruction-Free Zone. Distance is measured from the face of the curb. Hazards behind curbs should be located outside of the clear zone shown for uncurbed roadways as discussed in [Section 35-2.02\(f\)](#).
- (7) Side Slopes. Side slopes are determined on a case-by-case basis considering roadside development and right-of-way restrictions.

GEOMETRIC DESIGN CRITERIA FOR URBAN LOCAL STREETS
(New Construction/Reconstruction)

Footnotes for Figure 32-2I

32-3 ALIGNMENT CRITERIA

This Section presents the new construction/reconstruction alignment criteria for various rural and urban facilities based on design speed. Alignment tables are provided for the following:

- Figure 32-3A “Alignment Criteria for Rural Two-Lane Highways,”
- Figure 32-3B “Alignment Criteria for Suburban/Urban Arterials,” and
- Figure 32-3C “Alignment Criteria for Urban Collectors/Local Streets.”

Design Element		Manual Section	Design Speed								
			20 mph	25 mph	30 mph	35 mph	40 mph	45 mph	50 mph	55 mph	60 mph
Stopping Sight Distance (SSD) *		28-1	115'	155'	200'	250'	305'	360'	425'	495'	570'
Passing Sight Distance (PSD)		28-2	710'	900'	1090'	1280'	1470'	1625'	1835'	1985'	2135'
Intersection Sight Distance * (1)		28-3	225'	280'	335'	390'	445'	500'	555'	610'	665'
Minimum Radii *	$e_{max} = 8\%$	29.2.03	76'	134'	214'	314'	444'	587'	758'	960'	1200'
	$e_{max} = 6\%$		81'	144'	231'	340'	485'	643'	833'	1060'	1330'
	$e_{max} = 4\%$		86'	154'	250'	371'	533'	711'	926'	1190'	1500'
Maximum Superelevation Rate *		29-3.01	Paved 8% / Aggregate 4%						8%		
Superelevation Transition Length (2)	$e_{max} = 8\%$	29-3.02	141'	150'	159'	169'	179'	194'	209'	222'	232'
	$e_{max} = 6\%$		111'	118'	125'	133'	142'	153'	165'	176'	184'
	$e_{max} = 4\%$		81'	87'	92'	98'	104'	112'	121'	129'	135'
Vertical Curvature (K-values based on SSD) *	Crest	30-2.01	7	12	19	29	44	61	84	114	151
	Sag	30-2.02	17	26	37	49	64	79	96	115	136
Vertical Curvature (K-values based on PSD)	Crest	30-2.01	180	289	424	585	772	943	1203	1407	1628
Maximum Grade * (3)	Level	30-1.02	8%	7%				6%			5%
	Rolling		11%	10%	9%	8%	7%	6%			
Minimum Grade		30-1.03	Desirable 0.5% / Minimum 0.0%								

* Controlling design criteria (see [Section 27-7](#)).

- (1) Intersection Sight Distance. Table values are for passenger cars at a stop-controlled intersection on a level grade based on the design speed for the major road. Increase these distances 10% for grades > 3.0% on the minor road.
- (2) Superelevation Transition Length. Superelevation transition rates will vary according to design speed, radii, and superelevation rates. Table values are based on the minimum radii for the given design speed, maximum superelevation rate, 11 ft travel lanes, and a 1.5% cross slope for the normal crown section.
- (3) Maximum Grade.
 - a. Grades 1.0% steeper may be used for existing roadways to remain in place.
 - b. Grades 1.0% to 2.0% steeper may be used on local roads and low-volume rural collectors (ADT < 400).

ALIGNMENT CRITERIA FOR RURAL TWO-LANE HIGHWAYS

Chapter 33

GEOMETRIC DESIGN OF EXISTING HIGHWAYS

33-1 GENERAL

[Chapter 32](#) presents the design criteria that apply to new construction and reconstruction projects. For these projects, the designer often has the flexibility to design the highway to meet the most desirable and stringent criteria possible. Therefore, exceptions to these criteria should be relatively rare.

Highways constructed to meet nationally recognized design criteria provide measurable advantages for the motoring public. The safety, comfort, and convenience of modern highways present strong incentives for funding programs based on ideal design considerations. However, available finances do not always permit the reconstruction of existing highways to an ideal level. A comparison of statewide needs demonstrates that, with available revenues, problems must be addressed not only at a project level but on a system-wide basis.

Therefore, the geometric design of projects on existing highways must be viewed from a different perspective. These projects are often initiated for reasons such as pavement deterioration rather than geometric design deficiencies, and they often must be designed within restrictive right-of-way (ROW), financial limitations, and environmental constraints. As a result, the design criteria for new construction and reconstruction are often not attainable without major and, frequently, unacceptable adverse impacts. At the same time, the local public agency (LPA) must exercise the opportunity to make cost-effective, practical improvements to the geometric design of existing highways and streets.

For these reasons, this chapter provides geometric design values for projects on existing highways that are, in many cases, less than the values for new construction/reconstruction. These criteria are based on a sound engineering assessment of the underlying principles behind geometric design, and on how the criteria for new construction/reconstruction can be legitimately modified to apply to existing highways while still providing a safe highway facility. These criteria are intended to find the balance among many competing and conflicting objectives. These include the objective of improving LPA's existing highways; the objective of minimizing the adverse impacts of highway construction on existing highways; and the objective of improving the greatest number of miles (kilometers) within the available funds.

33-2 3R POLICIES

33-2.01 Background

The *Federal-aid Highway Act of 1976* amended the term “construction” to permit Federal-aid funding of resurfacing and widening and resurfacing of existing rural and urban pavements with or without revision to the horizontal or vertical alignment or other geometric features. The 1982 *Surface Transportation Assistance Act* stipulated that resurfacing, rehabilitation, and restoration (3R) projects be constructed to standards to preserve and extend the service life of highways and enhance safety. [Section 49-2](#) of the *Bureau of Design and Environment (BDE) Manual* provides further history on the background and development of 3R criteria for existing highways and streets.

33-2.02 Objectives

From an overall perspective, the 3R program is intended to improve the greatest number of highway miles (kilometers) with the available funds for highway projects. “Improve” is meant to apply to all aspects that determine a facility’s serviceability, including:

- the structural integrity of the pavement, bridges, and culverts;
- the drainage design of the facility to provide pavement drainage and to prevent roadway flooding during the design-year storm;
- from a highway capacity perspective, the level of service provided for the traffic flow;
- the adequacy of access to abutting properties;
- the geometric design of the highway to safely accommodate expected vehicular speeds and traffic volumes;
- the roadside safety design to reduce, within some reasonable boundary, the adverse impacts of run-off-the-road vehicles;
- the traffic control devices to provide the driver with critical information and to meet driver expectancies; and
- see [Section 27-2.03](#) for other types.

The objectives of 3R projects are summarized as follows:

1. 3R projects are intended to extend the service life of the existing facility and to return its features to a condition of structural or functional adequacy. This includes providing smoother riding surfaces and structurally improving bridges.
2. 3R projects are intended to enhance highway safety. This includes upgrading roadside safety and improving identified high-crash locations and over-represented crash locations.

3. 3R projects are intended to incorporate cost-effective, practical improvements to the geometric design of the existing facility. This includes increasing roadway and bridge widths and providing spot improvements to correct alignment deficiencies.

To achieve these objectives, the Illinois Department of Transportation (IDOT) has adopted its policy for the geometric design of 3R projects.

33-2.03 Application

The design policies and criteria in Sections 33-2 and 33-3 apply to 3R projects using Federal, State, or MFT funds on existing facilities within the general constraints of the existing alignment and ROW. Section 33-2.04 contains guidance on when it is appropriate to replace a pavement using 3R guidelines. If the purpose and scope of the project is intended to replace or expand the facility, then Chapter 33 is not appropriate, and reconstruction criteria will apply. For definitions and application to new construction and reconstruction projects, see [Section 27-2](#).

The criteria presented in Sections 33-2 and 33-3 apply to the following LPA facilities that is functionally classified as:

- rural and urban local roads and streets,
- rural and urban collectors, and
- urban arterial streets.

For suburban and rural arterials, see the 3R criteria presented in [Chapter 49](#) of the *BDE Manual*.

The LPA may use either the criteria in Sections 33-2 and 33-3 or the criteria in [Chapter 32](#) when designing a 3R project.

33-2.04 3R Project Evaluation

Section 33-3 presents the specific geometric design and roadside safety criteria that will be used to define the scope of 3R projects. Items not discussed in Section 33-3 do not need to be considered in the development of a 3R project. In addition, the designer should consider several other factors and conduct applicable technical evaluations. The potential evaluations are discussed below:

1. Conduct Field Review. The LPA should normally conduct a thorough field review of the proposed 3R project to ascertain the appropriateness of 3R criteria and on-site conditions and their effects on project development decisions. Other personnel should accompany the designer as appropriate, including personnel from the district. Objectives of the field review should be to collect relevant field data, to identify potential safety

- problems, and to determine the type of improvements to the facility needed to extend its service life.
2. Document Existing Geometrics. The designer will normally review the most recent as-built highway plans and combine this with the field review to determine the adequacy of the existing geometrics within the project limits. The review includes lane and shoulder widths, horizontal and vertical alignment, intersection geometrics, and the roadside safety design. A field survey may also be needed to verify certain geometric features.
 3. Crash Data. Crash data and analysis of the data are critical to the identification of problem areas. This should include the following:
 - Evaluate the last five years of crash data available from the IDOT Division of Traffic Safety and from the LPA's records.
 - Identify over-represented crash trends and High Accident Locations (HAL) and propose appropriate countermeasures.
 - Evaluate Wet-Pavement Crash Location clusters in accordance with the Illinois Skid-Accident Reduction Program.
 4. Right-of-Way (ROW) Acquisition. 3R projects are generally constructed within the constraints of the existing ROW. However, ROW acquisition is sometimes justified for 3R projects to flatten slopes, for changes in horizontal and vertical alignment, and for safety enhancements. Therefore, determine the improvements that will be incorporated into the project design as early as feasible. If significant ROW can be obtained, give consideration to using the criteria for new construction or reconstruction presented in [Chapter 32](#).
 5. Pavement Condition. 3R projects are often programmed because of a significant deterioration of the pavement structure. The extent of deterioration will influence the decision on whether a project can be designed using the 3R design criteria or whether it should be designed using new construction/reconstruction criteria. The use of the 3R Policy for full-depth pavement replacement may be justified in some instances. This includes projects with short sections of pavement replacement within longer project lengths and projects where the existing alignment is adequate, but the pavement needs to be replaced and the existing ROW width is too narrow to accommodate the required side slopes and clear zones for reconstruction. See [Chapter 46](#) for the policies, procedures, and criteria for the rehabilitation of existing pavements.
 6. Geometric Design of Adjacent Highway Sections. Consistency is an important factor to be considered in the development of 3R projects. The designer should examine the geometric features and operating speeds of highway sections adjacent to the 3R project. This will include investigating any highway improvements in the planning stages. The 3R project should provide design continuity with the adjacent sections. This involves a consideration of factors such as driver expectancy, geometric design consistency, and proper transitions between sections of different geometric designs. Continuity of design may justify constructing certain highway elements to higher or lower design criteria than normally prescribed.

7. Level of Service. 3R projects are based on current traffic; however, consider if the 3R project will adequately accommodate traffic during the design life of the project. Except for relatively short sections, 3R work does not include the addition of continuous through lanes that change the basic number of lanes throughout the project.
8. Physical Constraints. The physical constraints within the limits of the 3R project may determine what geometric improvements are practical and cost-effective. These include topography, adjacent development, ROW, utilities, and environmental constraints. Identified safety countermeasures relative to impacts and costs should be considered and an appropriate balance achieved. The designer should work with the district to identify possible geometric and safety deficiencies that will remain in place (i.e., no improvement will be made).
9. Traffic Control Devices. Ensure all signing and pavement markings on 3R projects meet the criteria of the [Illinois Supplement to the Manual of Uniform Traffic Control Devices \(ILMUTCD\)](#).
10. Urban Streets. Urban widening and resurfacing may include lane widening, addition of auxiliary lanes, channelization, median installation, revision of median type, median widening, resurfacing in conjunction with appropriate widening, new or replaced curb and/or gutter, curb ramps to meet ADA / PROWAG requirements, pavement markings, landscaping, highway lighting, pedestrian and bicycle accommodations and any associated adjustments.
11. Bridges within Project Limits. One or more bridges may be within the limits of a 3R project. If bridge improvements are needed, they may be performed prior to, simultaneous with, or deferred from highway projects in accordance with the priorities established in Section 33-3.13.

Highway bridge improvements include all work necessary for the improvement of existing rural or urban bridges to be consistent with 3R objectives for increased safety, improved operating conditions, and structural adequacy. Bridge improvements could include complete replacement of a bridge when no other cost-effective means of meeting these criteria are feasible. For definition and clarification, a bridge constructed at a different location or an existing bridge requiring replacement of all elements as a part of a 3R project is designated as a replacement rather than a new bridge. New bridge designations are reserved for new construction/reconstruction projects because they generally are subject to different width requirements than replacement bridges.

12. Design Exceptions. The use of lower design criteria than that described in Section 33-3 or [Chapter 32](#) will require approval from IDOT. Where variances from these criteria are necessary, they should be processed according to the procedures described in [Section 27-7](#). There are no minimum design criteria for the geometric design elements not addressed in Section 33-3.
13. Spot Improvements. Recently completed spot improvements (e.g., safety or bridge projects) may be considered for omission from 3R projects. The proposed limits of an omission should be identified and the omissions reviewed to ensure that the omissions are in accordance with 3R policies. Identify and address any variances to the 3R criteria

in accordance with the 3R procedures. For Federally funded projects, all applicable features within the limits of the spot improvement should be discussed at district coordination meetings and included in the Project Development Report (PDR).

33-3 3R GEOMETRIC DESIGN CRITERIA

33-3.01 Tables of Design Criteria

Figures 33-3A through 33-3F present the summary tables of the design criteria for the geometric design of LPA 3R projects. They apply to LPA 3R projects for roads and streets functionally classified as local, collectors, and minor arterials in both rural and urban areas, and for arterials in the urban areas. The criteria for rural principal arterials can be found in [Chapter 49](#) of the *BDE Manual*. Local rural two-lane principal arterial projects should be brought to early coordination for discussion. The designer should consider the following in the use of these tables:

1. Functional Classification. The selection of design values depends on the functional classification of the highway facility. Functional classification is discussed in [Section 27-3](#). The first step in the design process is to determine the functional classification of the proposed improvement. If the classification is unknown, contact the district.
2. Manual Section References. These tables are intended to provide a listing of design values for easy use. However, the designer should review the *Manual* section reference for more information on the design elements.
3. Footnotes. The tables include many footnotes, which are identified by a number in parentheses. The information in the footnote is critical to the proper use of these design tables.
4. Cross Section Elements. The designer should realize that some of the cross section elements included in a table (e.g., median width) are not automatically warranted in the project design. The values in the tables will only apply after the decision has been made to include the element in the highway cross section.
5. Bridge Elements. Design criteria for bridge elements are provided in Section 33-3.13.
6. Controlling Design Criteria. Controlling design criteria are the elements judged to be the most critical indicators of highway safety and overall serviceability. The tables provide an asterisk to indicate controlling design criteria. [Section 27-7](#) discusses this in more detail and presents the process for approving design variances to controlling criteria.

33-3.02 Design Speed

Figures 33-3A through 33-3F provide the minimum design speed based on functional classification of the facility. The selected design speed may be the regulatory speed or the posted speed, if it is less than the design speed for the functional classification. In urban and suburban areas, use a maximum design speed of 45 mph (70 km/h) where there is a two-way left-turn lane (TWLTL) in the street/highway design, and/or where there is continuous curbing used to delineate the edges of the traveled way.

Design Element		Manual Section	Design Volume (Two-Way DHV)	
			Elements to Remain-in-Place DHV < 975 (2)

DHV = Design Hourly Volume

GEOMETRIC DESIGN CRITERIA FOR RURAL TWO-LANE MINOR ARTERIALS
 (3R Projects)

Figure 33-3A (US Customary / Metric)

HARD COPIES UNCONTROLLED

Footnotes:

- (1) Design Criteria. The criteria for the minimum cross-section elements allowed to remain in place provided it is cost effective and the safety record is satisfactory.
- (2) Traffic Volumes. The design hourly volumes (DHV) assumes base conditions (except for 8% heavy vehicles) and a PHF = 1 for LOS shown. Adjust these values according to the actual factors. [Section 27-6](#) further discusses capacity methodology and traffic volumes.
- (3) Design Speed.
 - a. In rolling terrain, a minimum design speed of 55 mph (90 km/h) may be considered with study and justification.
 - b. To determine the minimum design speed allowed to remain in place, consider the following:
 - i. Existing horizontal curves may remain in place provided they have a comfortable operating speed of 60 mph (100 km/h) (level) or 50 mph (80 km/h) (rolling) and there is no history of crashes.
 - ii. Existing sag vertical curves may remain in place if they have a design speed of 50 mph (80 km/h) or greater and do not have a history of crashes. If not, reconstruct the sag vertical curve to a design speed of 60 mph (100 km/h).
 - iii. Existing crest vertical curves may remain in place if they have a design speed of 50 mph (80 km/h) or greater and do not have a history of crashes. If not, reconstruct the crest vertical curve to a design speed of 60 mph (100 km/h).
 - iv. Consider the relationship between horizontal and vertical alignments simultaneously to obtain a desirable condition. [Chapter 33](#) of the *BDE Manual* discusses these relationships and their effect on aesthetics and safety.
- (4) Access Control. For bypass routes on new alignment, design the roadway with partial access control. See [Section 35-1](#) of the *BDE Manual*.
- (5) Cross Slopes.
 - a. Cross slopes for outside auxiliary lanes will be at least 2.0% and should be 0.5% greater than the adjacent travel lane.
 - b. Where an aggregate shoulder is part of the shoulder width, slope the aggregate portion of the shoulder at 6%.
- (6) Ditch Bottom Width. Provide a wider outside ditch bottom where detention storage of storm water is a consideration.
- (7) Back Slope. Where the height of cut exceeds 10 ft (3.0 m), consider using a 1V:2H back slope beyond the clear zone. Also, for heights of cut greater than 30 ft (9.0 m), consider the use of benching.
- (8) Fill Slope. For fill heights greater than 30 ft (9.0 m), use a 1V:2H uniform slope with a roadside barrier. Also, for heights greater than 30 ft (9.0 m), consider the use of benching.

ADT = Average Daily Traffic

GEOMETRIC DESIGN CRITERIA FOR RURAL TWO-LANE COLLECTORS
 (3R Projects)

Figure 33-3B (Metric)

Footnotes:

- (1) Design Speed. When the regulatory or posted speed is less than the design speed values in the table, the regulatory or posted speed may be used as the design speed. However, the selected design speed should not be less than 30 mph (50 km/h).
- (2) Traveled Way Width. On resurfacing only project, the traveled way width may be reduced by 2 ft (600 mm).
- (3) Shoulder Width.
 - a. Where roadside barriers are included, provide a minimum offset of 4 ft (1.2 m) from the edge of the traveled way to the roadside barrier.
 - b. Where the rural collector passes through a moderate to high density area, the shoulder width may be 4 ft (1.2 m). This width may include the width of Type B gutter or the gutter flag with curb and gutter at the edge of the shoulder.
- (4) Shoulder Type.
 - a. Turf shoulders should consist of compacted stable roadway embankment or granular material capable of supporting growth and should not contain a high percentage of organic or unstable material.
 - b. The width of the aggregate wedge should be 3 ft (900 mm) or equal to the width of the usable shoulder if less than 3 ft (900 mm). The minimum wedge thickness will equal the depth of the resurfacing at the edge of pavement and tapering to zero. The aggregate wedge should be reviewed for maximum shoulder slope and/or maximum breakover.
 - c. For ADT's > 5000, provide a 6 in (150 mm) thick aggregate shoulder over the full width of a shoulder.
- (5) Cross Slopes.
 - a. Cross slopes for outside auxiliary lanes will be at least 2.0% and desirably should be 0.5% greater than the adjacent travel lane. Inside auxiliary lane cross slopes are sloped at 1.5% to 2% with high-type pavements.
 - b. Use 1.5% to 2% with high-type pavement.
- (6) Rollover Factor. The maximum rollover factor should be 10% when the shoulder is 6 ft (1.8 m) or wider.
- (7) Slopes. When the roadway is widened it may be necessary to steepen the existing front and back slopes to remain within the existing ROW or to maintain the existing drainage. Where existing ROW may permit significant slope flattening or grading, consider flattening slopes, particularly at horizontal curves. See [Figure 32-2A](#) for recommended slope criteria.

 (3R Projects)**

Figure 33-3C (Metric)

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

August 2016

GEOMETRIC DESIGN OF EXISTING HIGHWAYS

33-3-9

Footnotes:

- (1) Design Speed. The design speed may be reduced to the posted or regulatory speed if less than the values in the figure, but should not be less than 30 mph (50 km/h) with the following exceptions:
 - a. For ADT's less than 50 vehicles/day the design speed may be 20 mph (30 km/h).
 - b. For projects constructed with other than Federal funds on the district road system with ADT's fewer than 150 vehicles/day, no design speed is required.
 - c. For highway-rail grade crossing approaches constructed with other than Federal funds on the district road system, the design speed may be reduced by 10 mph (15 km/h); however, the crossing surface should be at the same plane as the top of the rails for a distance of 2 ft (0.6 m) outside the rails and the surface of the highway should also not be more than 3 in (75 mm) higher or lower than the top of the nearest rail at a point 30 ft (9 m) from the rail unless track super-elevation makes a different level appropriate. ([Requirements for Railroad/Highway Grade Crossing Protection](#))
 - d. For rural bridge projects, minimum design speed shall be as determined by the ADT. However, the design speed may be increased to the posted or regulatory speed limit to avoid a deficient NBIS rating for approach roadway alignment appraisal. All elements of the project will be designed to the chosen design speed. The chosen speed will be certified by the County Engineer.
- (2) Traveled Way Width.
 - a. For projects constructed with other than Federal funds on the district road system with ADT's fewer than 150 vehicles/day, the minimum width is 16 ft (4.8 m).
 - b. On resurfacing only projects the traveled way width may be reduced by 2 ft (600 mm).
 - c. For highway-rail grade crossings constructed with other than Federal funds on the district road system, the traveled way width may be 16 ft (4.8 m) or the existing traveled way width, whichever is greater. ([Requirements for Railroad/Highway Grade Crossing Protection](#))
- (3) Shoulder Width.
 - a. Where roadside barriers are included, provide a minimum offset of 4 ft (1.2 m) from the edge of the traveled way to the roadside barrier.
 - b. Where the rural local road passes through a moderate to high density area, the shoulder width may be 4 ft (1.2 m). This width may include the width of Type B gutter or the gutter flag with curb and gutter at the edge of the shoulder.
- (4) Shoulder Type.
 - a. Turf shoulders should consist of compacted stable roadway embankment or granular material capable of supporting growth and should not contain a high percentage of organic or unstable material.
 - b. The width of the aggregate wedge should be 3 ft (900 mm) or equal to the width of the usable shoulder if less than 3 ft (900 mm). The minimum wedge thickness will equal the depth of the resurfacing at the edge of pavement and tapering to zero. The aggregate wedge should be reviewed for maximum shoulder slope and/or maximum breakover.
 - c. For ADT's > 5000, provide a 6 in (150 mm) thick aggregate shoulder over the full width of a shoulder.
- (5) Cross Slopes.
 - a. Cross slopes for outside auxiliary lanes will be at least 2.0% and desirably should be 0.5% greater than the adjacent travel lane.
 - b. Use 1.5% to 2 % for high-type pavements.
- (6) Rollover Factor. The maximum rollover factor is 10% when the shoulders are 6 ft (1.8 m) or wider.
- (7) Side Slopes. Where the roadway is widened, it may be necessary to steepen the front and back slopes to remain within existing ROW and maintain existing drainage. Where existing ROW may permit significant slope flattening or grading, consider flattening slopes, particularly at horizontal curves. See [Figure 32-2B](#) for recommended slope criteria.

DHV = Design Hourly Volume / TWS = Two-Way Street

**GEOMETRIC DESIGN CRITERIA FOR URBAN TWO-WAY ARTERIALS AND COLLECTORS
 (3R Projects)**

Figure 33-3D (Metric)

Footnotes:

- (1) Traffic Volumes. The design hourly volumes (DHV) are calculated using a peak hour factor = 1.0; adjust these values using local peak-hour factors. For more information, see the *Highway Capacity Manual (HCM)*.
- (2) Parking Lane Width and Auxiliary Lane Width. The minimum width lane may include the gutter width.
- (3) Cross Slope.
 - a. Use 2% minimum cross slopes for travel lanes not adjacent to the crown.
 - b. Curbed left-turn lanes may be sloped at 1.5% to 2% away from the median. TWLTL and flush left-turn lanes are sloped at the same rate as the adjacent traveled way. Cross slopes for outside auxiliary lanes will be at least 2% and desirably should be 0.5% greater than the adjacent travel lane.
- (4) Gutter Width. Under restricted conditions, the gutter width adjacent to the edge of the turn lane may be considered part of the 10 ft (3.0 m) turn lane.
- (5) TWLTL Width. For resurfacing projects on collectors, the width of a TWLTL may be 10 ft (3.0 m).
- (6) Sidewalk Width. Include a 2 ft to 3 ft (600 mm to 1.0 m) buffer strip between the curb and sidewalk. For sidewalks without a buffer strip, a minimum 6 ft (1.8 m) sidewalk width behind the curb must be provided.
- (7) Obstruction-Free Zone. Distance is measured from the face of the curb. Hazards behind curbs should be located outside of the clear zone shown for uncurbed roadways as discussed in Section 35-2.02(f).
- (8) Side Slopes. For rural cross sections, possible side slopes flattening will be determined on a case-by-case basis considering roadside development and ROW restrictions.

DHV = Design Hourly Volume / OWS = One-Way Street

**GEOMETRIC DESIGN CRITERIA FOR URBAN ONE-WAY ARTERIALS AND COLLECTORS
 (3R Projects)**

Figure 33-3E (Metric)

HARD COPIES UNCONTROLLED

Footnotes:

- (1) Traffic Volumes. The design hourly volumes (DHV) are calculated using a peak hour factor = 1.0; adjust these values using local peak-hour factors. For more information, see the *Highway Capacity Manual (HCM)*.
- (2) Parking Lane Width and Auxiliary Lane Width. The minimum width lane may include the gutter width.
- (3) Cross Slope.
 - a. Use 2% minimum cross slopes for travel lanes not adjacent to the crown.
 - b. Cross slopes for outside auxiliary lanes will be at least 2% and desirably should be 0.5% greater than the adjacent travel lane.
- (4) Gutter Width. Under restricted conditions, the gutter width adjacent to the edge of the turn lane may be considered part of the 10 ft (3.0 m) turn lane.
- (5) Sidewalk Width. Include a 2 ft to 3 ft (600 mm to 1.0 m) buffer strip between the curb and sidewalk. For sidewalks without a buffer strip, a minimum 6 ft (1.8 m) sidewalk width behind the curb must be provided.
- (6) Obstruction-Free Zone. Distance is measured from the face of the curb. Hazards behind curbs should be located outside of the clear zone shown for uncurbed roadways as discussed in Section 35-2.02(f).
- (7) Side Slopes. For rural cross sections, possible side slopes flattening will be determined on a case-by-case basis considering roadside development and ROW restrictions.

**GEOMETRIC DESIGN CRITERIA FOR URBAN LOCAL STREETS
 (3R Projects)**

Figure 33-3F (Metric)

Footnotes:

- (1) Design Speed. A 20 mph (30 km/h) design speed may be used where the posted speed limit is 20 mph.
- (2) Parking Lane. The minimum width of the parking includes the gutter width.
- (3) Cross Slope. Use 2% minimum for lanes away from the crown.
- (4) Gutter Width. Under restricted conditions, the gutter width adjacent to the edge of the turn lane may be considered part of the 10 ft (3.0 m) lane or included in the width of the turn lane. A valley gutter may be used in place of curb and gutter.
- (5) Obstruction-Free Zone. Distance is measured from the face of the curb. Hazards behind curbs should be located outside of the clear zone shown for uncurbed roadways as discussed in Section 35-2.02(f).
- (6) Side Slopes. For rural cross sections, possible side slope flattening will be determined on a case-by-case basis considering roadside development and ROW restrictions.

GEOMETRIC DESIGN CRITERIA FOR URBAN LOCAL STREETS
(3R Projects)**Footnotes for Figure 33-3F**

33-3.03 Horizontal Alignment

33-3.03(a) Rural and Open Roadway Conditions

An existing horizontal curve may remain in place if its design speed is not less than the design speed required by Figure 33-3B or Figure 33-3C or more than 15 mph (25 km/h) less than the regulatory speed for the highway but not less than 30 mph (50 km/h). Horizontal alignment warning signs shall be provided on horizontal curves per Chapter 2C of the [ILMUTCD](#).

Ensure that the superelevation rates for horizontal curves on rural facilities to remain-in-place are commensurate with the comfortable operating speed of the curve using a maximum rate of 8%. See [Section 29-2](#) for guidance on determining the design speed on curves to remain in place.

Through horizontal curves, the maximum “rollover” factor (algebraic difference between slopes) at the traveled way/shoulder intersection should not be greater than 10% where the proposed (or remaining) shoulder width is wider than 4 ft. (1.2 m). Where the shoulder width is 4 ft (1.2 m) or less, the maximum rollover factor may be 12%. Where 1 ft (300 mm) paved shoulders are used, the rollover factor should be applied at the edge of the paved shoulder rather than at the traveled way edge for ease of construction.

33-3.03(b) Urban Conditions

For low-speed ($V \leq 45$ mph (70 km/h)) urban arterials, use [Figure 29-4B](#) to determine the acceptability of existing horizontal curves. Where a horizontal curve will be improved (i.e., flatten the radius and/or increase the superelevation), the designer should also use [Figure 29-4B](#) for the reconstructed horizontal curve. The basic objective for improving conditions on the existing horizontal alignment of low-speed urban streets is to retain the existing alignment and to check for comfortable operating speeds. See [Section 29-4](#) for more information.

Where a considerable amount of ROW is being acquired along a significant length of a project on a collector to accommodate widening and resurfacing, the horizontal alignment should be in accord with [Chapter 32](#). For other projects the horizontal alignment should be consistent with site conditions.

33-3.04 Vertical Alignment

33-3.04(a) Crest Vertical Curves

The following will apply to rural crest vertical curves:

<u>Current ADT</u>	<u>Treatment</u>
1000 or more	<p>Existing crest curves that do not meet the criteria for the design speed in Figures 33-3B and 33-3C and are not within 15 mph (25 km/h) of the posted or regulatory speed, as determined from the available stopping sight distance (SSD), will be upgraded by one of the following options:</p> <ul style="list-style-type: none"> • flatten the crest curve within the existing ROW to desirably satisfy the design speed required by Figures 33-3B or 33-3C; or if the design speed is 50 mph or greater, to a minimum 45 mph (70 km/h) design speed; or • flatten the crest curve by obtaining additional ROW to satisfy the required design speed if the design speed is less than or equal to 50 mph (80 km/h) or to meet a 50 mph to 55 mph (80 km/h to 90 km/h) design speed if the required design speed is greater than 50 mph (80 km/h). <p>The designer should consider sight distances, intersection influences, overall safety, and the need for road closures, detours, stage construction, and especially the prevailing vertical alignment in evaluating the above alternatives. This analysis will allow designers to determine the most practical alternative for flattening crest vertical curves.</p>
Less than 1000	<p>Crest curves may be retained if the available SSD is adequate for the required design speed or for 20 mph (30 km/h) less than the posted or regulatory speed, but not less than a 30 mph (50 km/h).</p>

Unless safety indicates otherwise, existing crest vertical curves on urban streets may be retained.

33-3.04(b) Sag Vertical Curves

Sag curves generally may be retained.

33-3.04(c) Grades

On 3R projects, retaining the existing roadway grades is acceptable. Flattening grades is typically not within the scope of a 3R project.

33-3.04(d) Vertical Clearance

The minimum vertical clearance for bridges to remain in place is 14 ft (4.3 m).

33-3.05 Intersections**33-3.05(a) Superelevation Rates through Intersections**

Superelevation rates less than that specified for the design speed may be used on the major road through certain intersections where there is no stop control for the major road so that slowing or stopped vehicles do not slide across the pavement during wet or icy conditions. An appropriate advisory speed should be posted for the curve and noted in the PDR and/or the project file.

33-3.05(b) Stop-Controlled Approaches on Horizontal Curves

On curved, stop-controlled approaches to intersections, it is desirable to have as flat an alignment as practical, with lower superelevation rates, even though traffic is operating at lower speeds than on comparable non-stopped approaches. On a project-by-project basis, the benefits of higher superelevation rates for high-operating speeds (during clear conditions) versus the benefits of lower superelevation for low-operating speeds (during icy pavement conditions) should be carefully considered when selecting an appropriate superelevation rate.

33-3.05(c) Side Road Approach Grades

Where considerable amounts of additional ROW are required, geometric design criteria for side road approach grades should be in accordance with applicable new construction/reconstruction criteria where practical. Some elements may be consistent with site conditions when based on special study and analysis results.

33-3.05(d) Turning Radii

In urban areas, right-turn radii maneuvers at intersections are important for two reasons. The radius affects the speed at which the design vehicle can make a right turn from the main road onto a side street. The radius also determines how much encroachment, assuming the selected design vehicle, will occur into opposing lanes when the design vehicle makes a right turn onto the main road. For right turns at urban intersections, consider the following guidelines for 3R projects:

1. Passenger Cars. Simple radii of 15 ft to 25 ft (4.5 m to 7.5 m) are adequate for a passenger car design vehicle. These radii may be retained on existing side streets:
 - (a) where very few trucks are expected to turn into the side street,
 - (b) where encroachment by a single unit or tractor/semitrailer unit into opposing lanes of the main road is acceptable, or

- (c) where a parking lane is present and parking is restricted a sufficient distance from the intersection thereby providing a larger area for a right-turn maneuver.
2. Trucks. Where practical, use a simple radius of 30 ft (9 m) or a two-centered curve at all major intersections and at all minor intersections that have some frequency of truck turning volumes. This design will provide for the single-unit vehicle and the occasional tractor/ semitrailer unit.
 3. Tractor/Semitrailers. At intersections where tractor/semitrailer combinations and buses turn frequently, provide a simple radius at a minimum of 40 ft (12 m) or a two-centered curve.

33-3.05(e) Curb Cuts/Ramps

Ensure that curb cuts/ramps meet the accessibility criteria presented in [Section 41-6](#).

33-3.05(f) Intersection Sight Distance

At rural, public road intersections with a stop condition on the side road, the designer should strive to provide the intersection sight distance as shown in [Section 28-3](#), based on the selected design speed. However, the designer may use a maximum sight distance of 465 ft (140 m) for the stopped approach in both the left and right directions along the free-flowing highway and a 12 ft (3.5 m) distance from the edge of the traveled way to the driver's eye.

33-3.06 Diagonal Parking

Parking (existing or proposed) should generally be parallel and adjacent to the curb. Diagonal parking may be permitted to remain if an engineering analysis of the existing angle parking clearly demonstrates that there will be no adverse effect on street capacity and safety. The analysis must describe parking characteristics, crash history, and an observation of street operations and potential problems. For projects processed through IDOT a design exception shall be submitted add or to remain in place.

Proposed diagonal parking, where none previously existed and that will not interfere with the free movement of traffic in the travel lanes, may be permitted if spaces are available for entering and exiting the parking space off of the traveled way. [Section 31-1.04](#) provides the minimum criteria for this backing maneuver. Diagonal parking should be monitored after implementation to determine whether the effects on operational safety and efficiency might warrant a change to the configuration.

33-3.07 Roadside Hazards and Highway Appurtenances

33-3.07(a) General

The intent of these guidelines is to provide cost-effective design that may reduce the number and severity of run-off-the-road crashes. Remove or shield obstacles within the clear zone, including protrusions that extend greater than 4 in (100 mm) above the groundline, where cost effective.

33-3.07(b) Earth Slopes

Other than specifically described in Section 33-3.07, existing earth slopes should generally be retained. Where the existing ROW permits significant slope flattening or where grading within existing ROW is necessary, the designer should consider flattening earth slopes, particularly at horizontal curves.

33-3.07(c) Clear Zone

The roadside environment on a 3R project may include any number of natural and man-made obstacles. To remove or relocate these obstacles can present significant problems and public opposition, and it can be very costly. On the other hand, the designer cannot ignore the consequences to a run-off-the-road vehicle. Therefore, the designer must exercise considerable judgment when determining the appropriate clear zone on a 3R project. The designer should consider the following:

1. Application. The designer may consider a selective application of the roadside clear zone criteria. Along some sections of highway, it may be practical to provide the 3R clear zone criteria; along other sections, it may be impractical. In addition, some obstacles will be more hazardous than others. Judgment will be necessary for the application of the clear zone criteria.
2. Public. Public acceptance of widened clear zones can be a significant issue, especially when the removal of trees is being considered. The designer must judge the community impact and subjectively factor this into the decision-making process.
3. Rural Roads. The recommended clear zone widths, measured from the traveled way edge, are shown in Figure 33-3G. [Figure 35-2A](#) may also be used.
4. Urban Streets. Clear zones along urban streets are as follows:
 - a. Curb Streets. Where the street has curbs, an obstruction-free zone should be located from the face of the curb to 1.5 ft (500 mm) from the face of curb. This distance is not considered a clear zone but an operational offset. Where parallel parking lanes are included, a 1 ft (300 mm) clearance to the face of curb may be considered.
 - b. Streets with Shoulders. Where the street has a rural cross section, the minimum clear zone widths shall be:

- 18 ft (5.4 m) for arterials and 14 ft (4 m) for collectors, or the non-traversable ditch if less, where the regulatory speed is 50 mph (80 km/h) or greater;
 - 10 ft (3 m) where the regulatory speed is 45 mph (70 km/h); or
 - the shoulder width where the regulatory speed is 40 mph (60 km/h) or less.
 - The clear zone width in [Figure 35-2A](#) may be used in place of the above widths.
5. Crash Data. The designer should review the crash data to estimate the extent of the roadside safety problem. In particular, there may be sites where clusters of run-off-the-road crashes have occurred.
6. Safety Appurtenances. During the design of a 3R project, all existing safety appurtenances should be examined to determine if they meet IDOT's current safety performance and design criteria. This includes guardrail, sign supports, luminaire supports, etc. Normally, all existing safety appurtenances will be upgraded to meet the most recent criteria.
7. Other. For the treatment of roadsides and highway appurtenances other than described above, use the clear zone widths appropriate for the cross section.

Roadway Criteria		Cross Sections	Clear Zone
On Tangent	Regulatory Speed 50 mph (80 km/h) or greater and ADT greater than 1000	Fill or Traversable Ditch ⁽¹⁾	14 ft (4 m) or ROW Line ⁽²⁾
		Non-Traversable Ditch	14 ft (4 m) or Toe of Back Slope ⁽²⁾
	All Others	All	10 ft (3 m)
On Curve ⁽³⁾	Curve Design Speed 50 mph (80 km/h) or greater	Same as Tangent Clear Zone above	
	Curve Design Speed less than 50 mph (80 km/h)	Fill or Traversable Ditch ⁽¹⁾	20 ft (6 m) or ROW Line ⁽²⁾
		Non-Traversable Ditch	20 ft (6 m) or Toe of Back Slope ⁽²⁾

Notes:

- (1) *Traversable ditch cross sections are those with at least 1V:4H front slopes, 1V:3H back slopes, and 2 ft (600 mm) wide ditches. If any of these criteria are not satisfied, the ditch cross section is considered non-traversable.*
- (2) *Use whichever is less, except when the foreslope is 1:3 or greater, then use the Toe of Back Slope.*
- (3) *Clear zone values apply only to the outside of curve. Tangent clear zone values apply to inside of curve.*
- (4) *The clear zone values in [Figure 35-2A](#) may be used in lieu of the above values.*

**CLEAR ZONES FOR RURAL ROADS
(3R Projects)**

Figure 33-3G

33-3.07(d) Guardrail

Installing guardrail is an alternative to providing a wider clear zone. However, this can lead to lengthy runs of barrier along the roadside. The designer should realize that barrier warrants are based on the relative severity between hazard and barrier; they do not address the question of whether or not a barrier installation is cost-effective. Therefore, on 3R projects, the designer must judge whether or not barrier should be installed to shield a hazard within the clear zone.

Guardrail warrants on 3R projects can be especially difficult to resolve. The evaluation process will be:

1. Determine if guardrail is warranted. As part of this process, the designer must decide if the guardrail will create a greater hazard than the obstacle that it is shielding.
2. If an existing run of guardrail is located where none is warranted, remove the guardrail.
3. If guardrail is warranted, consider removing or relocating the hazard; reducing the hazard (e.g., flattening a slope); or making it breakaway.
4. If the hazard cannot be eliminated and guardrail is considered cost effective, then install guardrail. For existing runs of guardrail, ensure that they meet the applicable performance and design criteria, including:
 - operational acceptability (e.g., hardware, height, etc.);
 - dynamic deflection criteria;
 - length of need;
 - flare rate;
 - lateral placement;
 - placement on slopes and behind curbs;
 - terminal treatments; and
 - transitions.

[Chapter 35](#) presents the criteria for the layout of roadside barriers. The following also applies:

1. Guardrail Removal. An existing guardrail installation should be removed when the hazard can be removed at a cost less than guardrail upgrading and maintenance.
2. Guardrail Upgrading. Existing guardrail that is warranted should be upgraded per Section 49-3.07(d) - Item 2 of the *BDE Manual*.
3. Terminal Sections. Existing Breakaway Cable Terminal (BCT) end sections, regardless of the amount of flare, may remain in place if no other upgrading of the guardrail is required for the installation. Connections to bridges which are rigid to minimize deflection may also remain in place if no other upgrading of the guardrail is required. When a terminal is replaced, the new terminal must meet the [IDOT Highway Standards](#).
4. Length of Need. Use the length-of-need criteria in [Section 35-4](#) to determine the sufficiency of the existing length of guardrail based on the design speed. Upgrade existing guardrail that is deficient in length by more than 37.5 ft. (34 m) to provide a proper length of need. Other guardrail with a deficient length of need may remain in place unless crash data shows that the additional length will reduce crash severity. Also, provide the proper length of need if placement of a new terminal is required.
5. New Guardrail Installation. Install new guardrail in accordance with [Chapter 35](#). For embankments, new guardrail is warranted based on [Section 35-3.04](#) or Figure 33-3H.

For roadside obstacles, guardrail should be installed where it is cost effective to shield an obstacle.

33-3.07(e) Culverts

1. Cross Drainage Structures. Existing culverts with headwalls within the proposed shoulder widths should be addressed in accordance to the following hierarchy of preferences:
 - Preference 1. Remove or fill the structure and grade slopes to match the prevailing cross-section. This may be possible in rare instances for abandoned cattle passes, etc. Removal of culverts used as passes; a much smaller culvert may still be required for drainage. This will pose a smaller and less severe hazard.
 - Preference 2. Where existing ROW is adequate or where right-of-way acquisition would be allowed and is economical to obtain, flatten the front slope to 1V:4H or flatter. Terminate culverts 36 in (915 mm) or less by matching the culvert into the front slope and adding a standard end section with no further treatment required. Terminate culverts greater than 36 in (915 mm) with an end section and grate from the [IDOT Highway Standards](#). An example of a grading plan is shown in Figure 33-3J.
 - Preference 3. Extend the culverts to the proposed shoulder edge and: terminate culverts 36 in (915 mm) or less with a standard end section with no further treatment required; terminate culverts with diameters greater than 36 in (915 mm) and less than or equal to 54 in (1400 mm) with an end section from the [IDOT Highway Standards](#) and a standard end section grate terminate culverts with diameters greater than 54 in (1400mm) with an appropriate end section and determine if guardrail is warranted based on an analysis in [Chapter 35](#) or in lieu of analytical calculations, Figure 33-3.H may be used.
 - Preference 4. Delineate the hazard according to [ILMUTCD](#) requirements if the above options are not appropriate.

The end treatments of culvert pipes greater than 36 in (915 mm) described in Preference 3 should also be applied to proposed and existing culverts at or beyond the shoulder edge but within the clear zone. For existing culverts 36 in (915 mm) or less in diameter with headwalls at or beyond the shoulder but within the clear zone and protruding 4 in (100 mm) or higher, remove the headwall or shield the headwall by re-grading, however, flared end sections are not required for culverts 36 in (915 mm) or less.

These guidelines generally apply at locations where the size of the overall hazard approximates the size of the culvert. However, where earth cover or headwalls will remain or are proposed above the top of culverts and yields a drop-off of more than 36 in (915 mm) within the clear zone, apply the above treatments or other practical mitigating measures in accordance to the drop off.

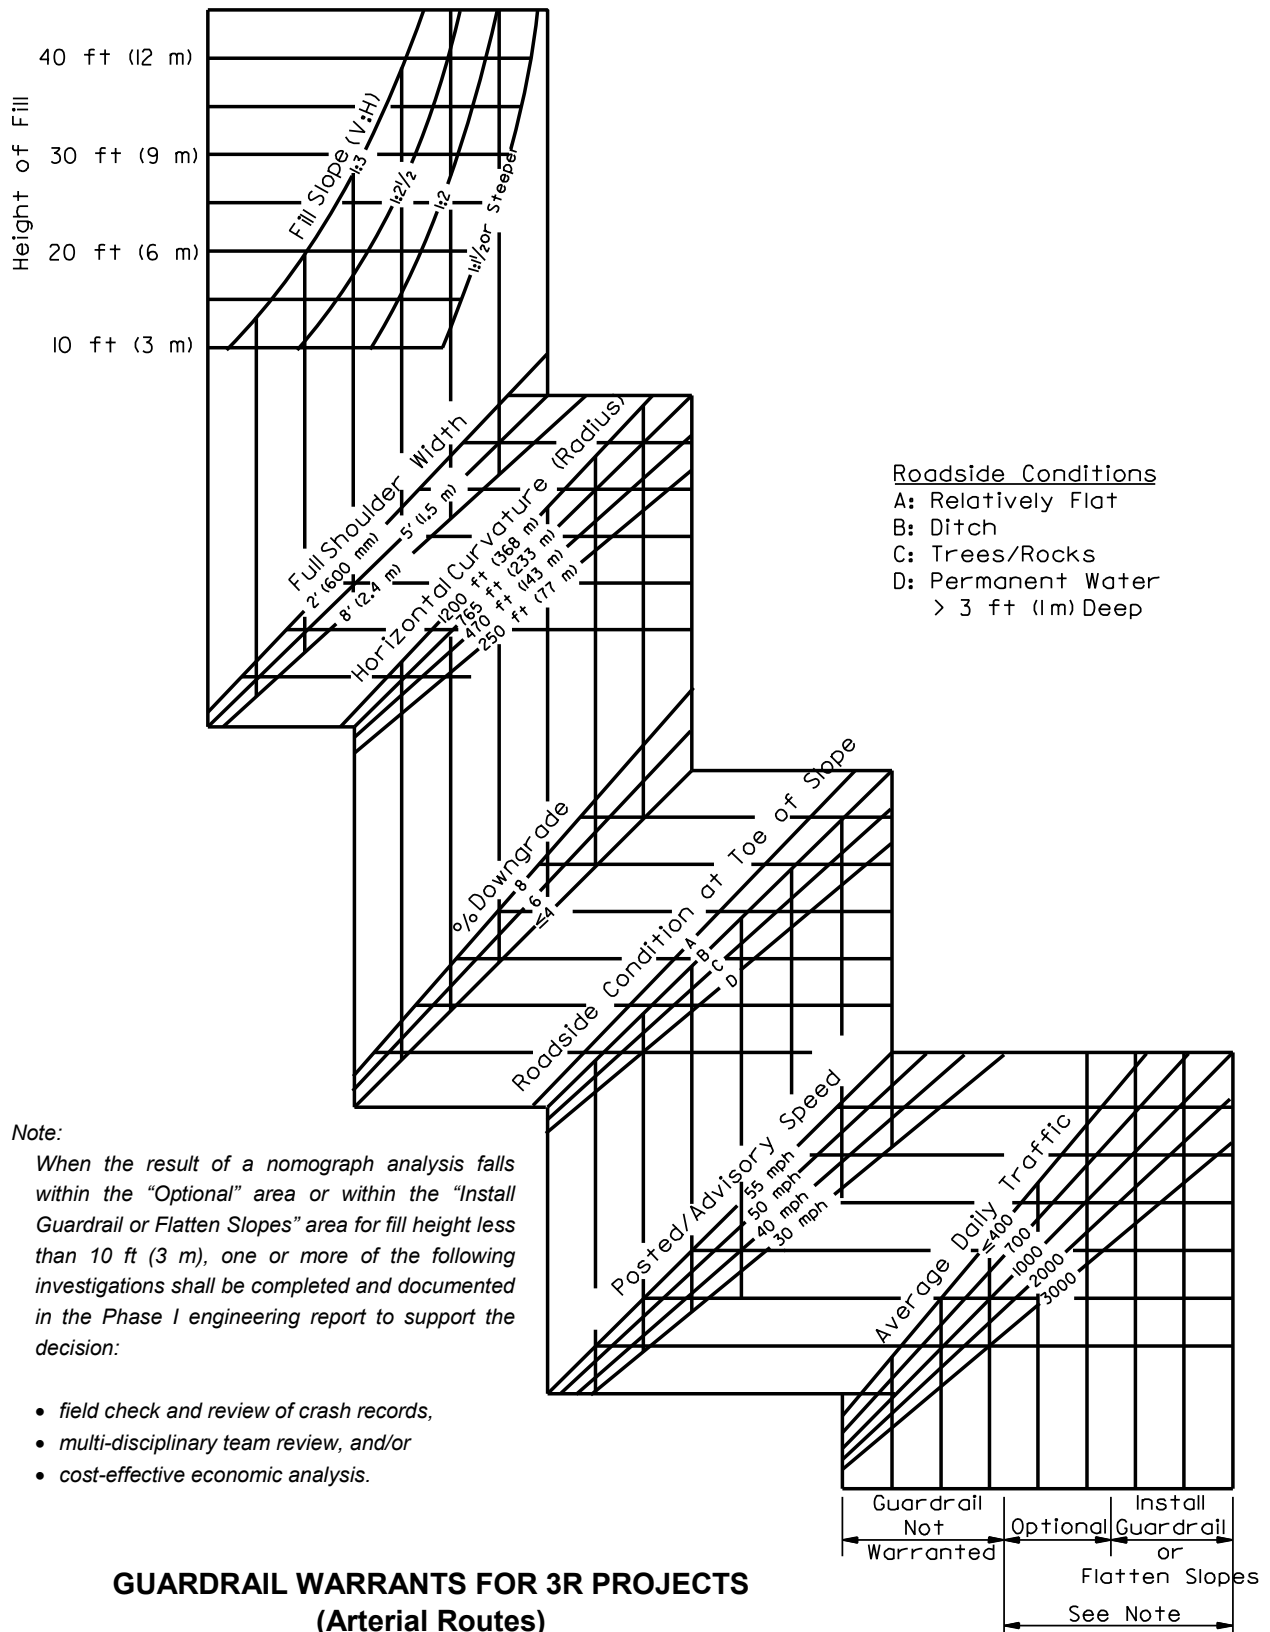

2. Parallel Drainage Structures. Remove or eliminate the entrance, and thus the culvert, there an entrance is closed or abandoned. Where culverts are replaced or extended for entrances or side roads and are still within the ROW, re-grade the transverse side slopes out to the highway ROW to conform to the design side slope of the main road. These slopes may not be steeper than 1V:4H. This requirement is not mandatory for culverts beyond the main road ROW if the work will require additional ROW.

The designer should reference Section 3-500, "Construction/Reconstruction and Maintenance of Sideroad and Street Intersections with State Highways" of the Bureau of Operations *Maintenance Policy Manual* for guidance. In addition to re-grading the transverse slope provide safety treatments for parallel culverts (entrances and side roads) in accordance to the following hierarchy of preferences subject to site conditions and economic analysis:

- Preference 1. Subject to consideration of stream drift including crop debris, tree branches, or other items, match the existing or proposed culvert end into the front slope and eliminate the hazards by making them traversable. For culverts with diameters greater than 24 in (600 mm), place a current standard end section or specifically designed end section with a grating See Figure 35-3E for design guidance and any applicable Bridge Office resources (e.g., *Culvert Manual*).
- Preference 2. Reroute the parallel ditch outside of the clear zone. This will have the effect of flattening front slopes and allowing placement of the culvert further away from the traveled way. This strategy will create a longer (and flatter) ditch profile and may affect hydraulics.

Note: Preference 3 and Preference 4 follow Figure 33-3.

- Preference 3. Shield the culvert hazard with guardrail or other approved roadside barrier. Provide grading for guardrail end-terminal locations as shown in the [IDOT Highway Standards](#).
- Preference 4. Delineate the hazard according to [ILMUTCD](#) requirements if the above options are not appropriate.

Note:
 When the result of a nomograph analysis falls within the "Optional" area or within the "Install Guardrail or Flatten Slopes" area for fill height less than 10 ft (3 m), one or more of the following investigations shall be completed and documented in the Phase I engineering report to support the decision:

- field check and review of crash records,
- multi-disciplinary team review, and/or
- cost-effective economic analysis.

**GUARDRAIL WARRANTS FOR 3R PROJECTS
 (Arterial Routes)
 Figure 33-3H**

Notes:

1. This nomograph supplements, but does not supersede Figure 49-3.F.
2. Culvert height includes the earth cover immediately above the culvert if it increases the "drop-off." Where the culvert height is 10 ft (3 m) or greater, guardrail is warranted. Follow the hierarchy of preferences in [Section 49-3.07\(e\)](#) of the BDE Manual for cross road culverts.
