3. When the result of a nomograph analysis falls within the "optional" area, one or more of the following investigations shall be completed and documented in the Phase I engineering report to support the decision:
 - field check and review of alignment and crash records,
 - multi-disciplinary team review, and/or
 - cost-effective economic analysis.

3R GUARDRAIL WARRANTS FOR CULVERTS > 54 in (1400 mm)

Figure 33-31

① Provide stable embankment cone at end of wingwall or culvert, which must be sufficient length to allow completion of the cone without encroaching into hydraulic opening of culvert.

FS = Front Slope (Recoverable)
D = Ditch Bottom
BS = Back Slope

**REGRAIDING PLAN FOR CULVERTS
(3R Rural Arterial Projects)**

Figure 33-3J

33-3.07(f) Sign and Light Supports

Posts or poles used to support signs or lights to remain within the clear zone should be made breakaway. Wood sign supports may be modified to properly reduce the cross sectional area or replaced with breakaway supports. Where pedestrian traffic is significant, do not use breakaway sign and light supports.

33-3.07(g) Trees

Unless shielded by a protective device required for other purposes, remove trees within the clear zone that will mature to a diameter greater than 4 in (100 mm). Where the removal of trees may adversely affect the roadside environment, remove these trees only where it is necessary for reasons of safety. In cases where unusual specimens are in jeopardy, guardrail or attenuator protection may be considered as an alternative to removal. Trees on backslopes that are not likely to be impacted by vehicles may generally remain in place.

33-3.07(h) Concrete Signal Bases

Remove concrete signal bases (Type B) if they are within the clear zone and extend higher than 4 in (100 mm), and install standard supports with frangible bases where appropriate. Mast arm signal supports cannot have frangible bases.

33-3.07(i) Curbs

Curbs higher than 4 in (100 mm) within the shoulder area should be removed where posted speeds are greater than 45 mph. Review the proper placement of traffic control devices before considering the removal of corner island curbs where these devices are located.

Curb removal is not intended to include intermittent center channelizing islands separating two-lane, two-way traffic and supplemented by illumination. Reflectorizing devices should be placed on these curbs in accordance with the [IDOT Highway Standards](#) to improve delineation.

33-3.07(j) Above-Ground Utilities

Utility poles are a common roadside obstacle on 3R projects. Relocation is mandatory when the utility poles physically interfere with construction. Other relocations for safety benefits must be evaluated on a project-by-project basis. When practical, above-ground utility facilities should not be allowed to remain inside the clear zone, except where protected by devices required for other purposes. Existing utility facilities may generally remain:

- where located beyond non-traversable ditch cross sections, or
- where ROW is so narrow that the maximum adjustment practical within the existing ROW is minimal and considered impractical.

Where re-grading of the back slopes is necessary for a significant length within the area of utility facilities, the utilities should be relocated in accordance with the criteria in [Section 41-11](#).

33-3.07(k) Other

There may be other objects within the desired clear zone that may be roadside obstacles. They should receive the appropriate attention.

Where appropriate, the designer should discuss the mailbox supports considered hazardous and within the clear zone with the property owners:

- to inform the owner of the potential severity of the support, such as the results of pertinent research and tests as reported in the TRR No. 769 Paper “The Rural Mailbox – A Little Known Roadside Hazard”;
- to inform the owner of the possibility of personal liability; and
- to request the owner to change the support to reduce the potential seriousness of the hazard. Changed supports will be consistent with the designs contained in Chapter 11 of the American Association of State Highway and Transportation Officials (AASHTO) publication *Roadside Design Guide*.

33-3.08 Traffic Control Devices

Ensure all traffic control devices are in conformance with the [ILMUTCD](#).

33-3.09 Mailbox Turnouts

The design and construction of mailbox turnouts should be in accordance with [Section 41-8.02](#).

33-3.10 Lighting and Landscaping

Consider installing lighting to improve operations and/or safety in accordance with [Section 41-7](#). Generally, landscaping should be directed toward replacing appropriate existing plants and turf removed or damaged by construction and, where practical, planting for safety or erosion control purposes.

33-3.11 Railroad Crossings and Signals

Railroad crossings and signals should be upgraded prior to, or concurrent with, 3R projects. When this is not possible, documentation of reasoning and railroad coordination should be included in the project file. [Section 4-2](#) discusses the Illinois Grade Crossing Protection Funds (GCPF).

Where the existing railroad crossing surface is in good condition, is of adequate width for the proposed roadway cross-section, and will remain, taper the roadway overlay to match the existing crossing profile. The crossing surface outside the traveled way should consist of bituminous or other approved material and encompass the entire improved shoulder width. If no

improved shoulder is present, the crossing surface should extend at least 2 ft beyond the edges of the traveled way. If the roadway will be widened, the LPA will be responsible for the costs and coordination necessary to allow the railroad to widen the crossing surface to encompass the new roadway width, including the shoulders, in accordance with [Subpart C of Title 92 Illinois Administrative Code \(IAC\) Part 1535](#). If the LPA desires a crossing surface type other than the railroad's standard crossing surface material ("premium surface"), the LPA should seek an agreement with the railroad for full replacement of the crossing surface, to be funded at project cost. Where the crossing surface is not in good condition, contact the Illinois Commerce Commission (ICC) Rail Safety Section (RSS) at railsafety@icc.illinois.gov for an evaluation of whether the current crossing surface conditions meet the minimum requirements of 92 IAC Part 1535. If the ICC RSS determines that the crossing fails to meet the IAC requirements, the railroad will be required to make immediate repairs and may also be required to schedule the replacement of the crossing surface with its standard material at the railroad's own cost. A non-compliance finding by the ICC RSS will not negate the LPA's need to coordinate with the railroad for payment of costs to widen the crossing surface and/or install a "premium surface".

In the case of roadway widening, the railroad will need to locate the crossing warning signal devices and control equipment in accordance with current safety requirements and upgrade if not in conformance with the guidelines discussed in [Chapter 40](#) and in the IDOT publication [Requirements for Railroad/Highway Grade Crossing Protection](#). Any other associated work performed must also meet ICC guidelines and the [ILMUTCD](#). The LPA will need to coordinate with the railroad for payment of costs associated with the railroad's relocating or replacing of warning devices due to roadway widening.

If, as an exceptional case, the relocation of railroad warning signal devices cannot be scheduled for completion in advance of the roadway widening, the widened pavement should be constructed up to the crossing. Offsets to the existing warning signal devices should temporarily consist of tapered edge lines and diagonal pavement markings, and channelization devices. If the location of the existing warning signal devices precludes this treatment, taper the widened pavement to the existing pavement width at or near the signal location and place temporary impact attenuation measures in advance of the warning devices, taking care not to obstruct the motorist's forward view of the warning devices.

Contact the ICC RSS and the railroad for coordination of required changes in railroad facilities early in the project to enable agreement negotiations to be concluded so that railroad work may proceed concurrently with that of the highway contract.

33-3.12 Pavement Design

The pavement design for 3R projects will be in accordance with the guidelines in [Chapter 46](#). In addition, all pavement surfaces in a 3R project are required to meet the IDOT's skid resistance criteria.

33-3.13 Bridges**33-3.13(a) Scope of Work**

These guidelines can be used for all work necessary for the improvement of existing rural or urban bridges to be consistent with 3R objectives for increased safety and improved operating conditions. This includes the total replacement of a bridge when other cost-effective means of meeting these criteria are not feasible. For definition and clarification purposes, a bridge constructed at a different location, or an existing bridge requiring replacement of all elements as a part of a 3R project, is designated as a replacement rather than a new bridge. New bridge designations are reserved for new construction/reconstruction projects because they are generally subject to different width requirements than replacement bridges.

Bridge work may be performed prior to, simultaneous with, or deferred from highway projects according to the guidance provided in this section. Bridges will be improved to correct operational, structural, and significant safety deficiencies, and will be subject to the following conditions:

- The roadway template is not anticipated to be widened beyond the proposed bridge cross section within the next 20 years.
- Where an existing bridge is not of sufficient width to remain in place, it may be gapped within the project limits if its future rehabilitation or replacement is committed as stage construction to be completed within 5 years of the completion of the roadway project. No bridge will be gapped for more than 1 year if the clear roadway bridge width is less than the approach traveled way width.
- Hazard panels and appropriate pavement markings will be required for all bridges that remain in place and that are narrower than the improved traveled way width.

33-3.13(b) Criteria for Rural Bridges to Remain in Place

Bridges on rural roads may remain in place provided that the clear roadway bridge width is equal to or greater than the values given in Figure 33-3K and that the structural capacity is met.

The designer should repair, retrofit, or replace any rails on bridges to remain in place that could be easily penetrated by a passenger vehicle, that show evidence of crash damage, that are in questionable condition, or that contain irregularities that could cause intolerable vehicular decelerations. If replaced, ensure rails and their connections to the deck are designed to meet current AASHTO strength and safety performance standards.

Curb sections that project horizontally more than 9 in (225 mm) but less than 3 ft (900 mm) from the face of rail shall be removed, or new rail elements installed in accordance with the standards for bridge rail retrofit.

Structurally sound bridge decks with poor riding quality that could jeopardize the safety of the motorist or cause undue discomfort should be repaired and resurfaced. However, resurfacing

may not be extended across decks without necessary repair or when the additional dead load resulting from the resurfacing would cause a load posting on the bridge.

Current ADT ⁽²⁾ Under 400	Current ADT 400 - 999	Current ADT 1000-3000	Current ADT Over 3000
Clear Roadway Bridge Width ⁽³⁾⁽⁴⁾			
20 ft (6.0 m)	22 ft (6.6 m)	24 ft (7.2 m)	28 ft (8.4 m)

Notes:

- (1) *In all cases, except as noted in (2) below, the bridge to remain in place must have a structural inventory capacity of H-15 (M-13.5) loading (Inventory Rating Factor ≥ 0.75), the structure condition ratings must be "satisfactory" or better, and the structure must be able to carry legal loads (no load posting required).*
- (2) *When the current ADT is less than 75, a bridge with a structural inventory capacity of H-10 (M-9) loading (Inventory Rating Factor ≥ 0.50), structure condition ratings of "satisfactory" or better, and able to carry legal loads (no load posting required) will be acceptable if it meets the width criteria.*
- (3) *Between rails or between curbs if the curb projects more than 9 in (225 mm) beyond the face of the rail.*
- (4) *In no case will the bridge be narrower than the approach traveled way.*

3R WIDTHS OF RURAL BRIDGES TO REMAIN IN PLACE

Figure 33-3K

33-3.13(c) Criteria for Improved Bridges

Construct all rehabilitated or replaced bridges to a minimum clear roadway width equal to the values in Figure 33-3L. The widths assume a rural type cross section approaching the bridge.

Current ADT Under 400	Current ADT 400 - 999	Current ADT 1000 - 2999	Current ADT 3000 - 5000	Current ADT Over 5000
Clear Roadway Bridge Width ⁽¹⁾				
22 ft (6.6 m)	26 ft (7.8 m)	28 ft (8.4 m)	32 ft (9.6 m)	36 ft (10.8 m)

Notes:

- (1) *The designer may use the width criteria in [Chapter 36](#) if it is less than stated above.*

3R WIDTHS OF IMPROVED RURAL BRIDGES

Figure 33-3L

33-3.13(d) Criteria for Urban Bridges to Remain in Place

Urban bridges may remain in place:

- where they meet the structural requirements for rural bridges including the requirements for decks and bridge rails;
- where the clear roadway bridge width is sufficient to accommodate the number of approach lanes; and
- where the clear roadway bridge width includes traffic lanes 10 ft (3 m) or wider.

For urban bridges, bridge deck repairs similar to those cited for rural bridges may be undertaken. Urban bridges not meeting the criteria to satisfactorily remain in place should be improved:

- to meet the structural requirements of improved rural bridges,

33-3.13(e) Criteria for Improved Urban Bridges

Urban bridges not meeting the criteria to satisfactorily remain in place should be improved:

- to meet the structural requirements of improved rural bridges,
- to accommodate the number of lanes and the median on the approach roadways, and
- to provide lane widths equal to those on the roadway approaches but not less than 11 ft (3.3 m) or as allowed in [Chapter 36](#).

Parking lanes on the approach roadways usually are not carried across urban bridges.

Chapter Thirty-four INTERSECTIONS

Intersections are an important part of the highway system. The operational efficiency, capacity, safety, and cost of the overall system are largely dependent upon its design, especially in urban areas. The primary objective of intersection design is to provide for the convenience, ease, comfort, and safety of those traversing the intersection while reducing potential conflicts between vehicles, bicycles, and pedestrians. Chapter 34 provides guidance in the design of intersections including alignment, profile, design vehicles, turning radii, right-turning roadways, left- and right-turn lanes, channelized islands, and intersections near railroads. Information that is also applicable to intersections is included in the following sources:

- Guidelines for preparing and processing intersection design studies are discussed in Chapter 10.
- Application of bicycle lanes through intersections is discussed in Chapter 42 of the *BLRS Manual* and Chapter 17 of the *BDE Manual*.
- Intersection sight distance is discussed in Chapter 28.
- The various curb types used for channelization, islands, and medians are discussed in Chapter 31.
- Two-way, left-turn lanes are discussed in Chapter 31 and Chapter 36 of the *BDE Manual*.
- Criteria for intersections on 3R projects are discussed in Chapter 33.
- Curb ramps for disabled accessibility at intersections are discussed in Chapter 41.
- Other intersection design features (e.g., intersection types, intersection spacing, turn-lane guidelines) can be found in Chapter 36 of the *BDE Manual* and the *AASHTO Policy on Geometric Design of Highways and Streets (Green Book)*.
- Where a local facility intersects with a State facility, the design of the intersection as it affects the State highway will be in accordance with Chapter 36 of the *BDE Manual*.

34-1 GENERAL DESIGN CONTROLS

34-1.01 Intersection Alignment

34-1.01(a) Angled Intersections

Highways should intersect at right angles. Intersections at acute angles are undesirable because they:

- restrict vehicular turning movements,
- require additional pavement and channelization for large trucks,

- increase the exposure time for vehicles and pedestrians crossing the main traffic flow, and
- restrict the crossroad sight distance.

Preferably, the angle of intersection should be within 15° of the perpendicular. This amount of skew can often be tolerated because the impact on sight lines and turning movements is not significant. Under restricted conditions where obtaining the right-of-way to straighten the angle of intersection would be impractical, an intersection angle up to 30° from the perpendicular may be used. Where turning movements are significantly unbalanced, the intersections may be angled to favor the predominant movement. Intersection angles beyond these ranges may warrant more positive traffic control (e.g., all stop, traffic signals) or geometric improvements (e.g., realignment, greater corner sight distance). Avoid using short-radius curves or abnormal travel paths near the intersection simply to reduce the intersection skew. Figure 34-1A illustrates various angles of intersections and potential improvements to the alignment.

34-1.01(b) Intersections on Curves

Preferably, all legs of an intersection should be on a tangent section. Where a minor road intersects a major road on a horizontal curve, the geometric design of the intersection becomes significantly more complicated, particularly for sight distance, turning movements, channelization, and superelevation. The following guidelines address horizontal alignment at intersections:

1. Realignment. If relocation of the intersection is not practical, the designer may be able to realign the minor road to intersect the major road perpendicular to a tangent on the horizontal curve; see example “E” in Figure 34-1A. Although an improvement, this arrangement may still result in difficult turning movements due to superelevation on the major road.
2. Superelevation on the Major Road. If the major road is on a horizontal curve, the major road superelevation rate must be minimized so that slowing or stopped vehicles do not slide across the pavement during wet or icy conditions. Figure 34-1B provides the criteria for the maximum superelevation rate that should be used where a crossroad intersects a superelevated highway.

Notes:

1. *Where there are high volumes of left turns from the major road, avoid using the offset intersection alignment illustrated in "C."*
2. *Revised alignments "C" and "D" are not desirable in agricultural areas with large numbers of farm vehicles crossing the major road.*

REALIGNMENT OF INTERSECTIONS

Figure 34-1A

PLAN VIEW

CROSS SECTION A-A

Type of Improvement Category	Maximum Superelevation Rate "e" for Intersections on Curve
"New Construction" at a major crossroad (> 400 ADT)	6% (4% Desirable)
To remain in place with "Reconstruction" at a major crossroad	6%
To remain in place with "Reconstruction" at a minor crossroad	8%

INTERSECTIONS AND SUPERELEVATED MAJOR ROAD

Figure 34-1B

3. Curved Approach. Where a local road is on a curved alignment and is approaching a stop condition, special consideration is required in the design of the horizontal curvature prior to the intersection. When designing this type of an approach, the designer should consider the following guidelines:
- To design the horizontal curve, assume a design speed of 20 mph (30 km/h) less than the approach speed, but not less than 30 mph (50 km/h) for design speeds less than or equal to 50 mph (80 km/h).
 - The superelevation rate on the approach curve to an intersection should be limited to a maximum superelevation rate of 6% or less. The objective is to use as flat an alignment as practical with lower superelevation. The preferred design is to maintain a normal crown section through the curve relying on the friction factor rather than superelevation. The minimum radius should not be less than that permitted for the highway classification based on the selected design of the approach curve, rural or urban location, and the superelevation rate (i.e., maximum of 6%). For additional guidance on horizontal curve designs, see Chapter 29.
 - Provide a tangent section equal to 2/3 of the superelevation transition length prior to the intersection radius returns. This will allow for the superelevation runoff to be developed outside of the intersection radius returns; see Figure 36-1F of the *BDE Manual*.

This procedure recognizes the need to accommodate a reasonable operating speed on a stop-controlled approach, while minimizing the potential for adverse operations on superelevated pavements during snow and ice conditions.

34-1.01(c) Offset Intersections

In general, 4-leg intersections should be designed so that opposing approaches line up with each other (i.e., there is no offset between opposing approaches). However, this is not always practical. Because of possible conflicts with overlapping turning vehicles, offset intersections should only be allowed to remain on low-volume approaches. Also, consider the following:

1. Maximum Offset. The maximum offset is determined from the application of a taper equal to V:1 (0.6V:1) applied to the intersection width, where V is the design speed in miles per hour (kilometers per hour); see Figure 34-1C. In restricted locations and where $V \leq 45$ mph (70 km/h), the applied taper may be $V^2/60$ ($V^2/155$). V is selected as follows:
- $V = 20$ mph (30 km/h) for stop-controlled approaches.
 - $V =$ the roadway design speed for the free-flowing approaches at a stop-controlled intersection.

- V = the roadway design speed for the offset approaches at a signalized intersection.

Notes:

1. Desirable taper rate is $V:1$ ($0.6V:1$), where V = design speed in mph (km/h).
2. See discussion in Section 34-1.01(c) for more information.

OFFSET INTERSECTION

Figure 34-1C

2. Turning Conflicts. Evaluate the entire intersection for conflicts that may result from turning vehicles at an offset intersection. For example, offsets where the “jog” is to the left may result in significant interference between simultaneous left-turning vehicles.
3. Evaluation Factors. In addition to potential vehicular conflicts, the designer should evaluate the following at existing or proposed offset intersections:
 - through and turning volumes;
 - type of traffic control;
 - impact on all turning maneuvers;
 - intersection geometrics (e.g., sight distance, curb/pavement edge radii); and
 - crash history at existing intersections.

34-1.01(d) Roundabouts

Roundabouts are circular intersections with specific design and traffic control features. These features include yield control of all entering traffic, channelized approaches, and appropriate geometric curvature to ensure that travel speeds on the circulatory roadway are typically less than 30 mph (50 km/h). Roundabouts are defined by the following two basic operational and design principles:

1. Yield-at-Entry. Yield-at-entry is also known as off-side priority or the yield-to-left rule. Yield-at-entry requires that vehicles on the circulatory roadway of the roundabout have the right-of-way and all entering vehicles on the approaches have to wait for a gap in the circulating flow. To maintain free flow and high capacity, yield signs are used as the entry control. As opposed to nonconforming traffic circles, roundabouts are not designed for weaving maneuvers, thus permitting smaller diameters. Even for multilane roundabouts, weaving maneuvers are not considered a design or capacity criterion.
2. Deflection of Entering Traffic. Entrance roadways that intersect the roundabout along a tangent to the circulatory roadway are not permitted. Instead, entering traffic is deflected to the right by the central island of the roundabout and by channelization at the entrance into an appropriate curved path along the circulating roadway. Thus, no traffic is permitted to follow a straight path through the roundabout.

Roundabouts range in size from mini-roundabouts with inscribed circle diameters as small as 50 ft (15 m), to compact roundabouts with inscribed circle diameters between 100 ft and 115 ft (30 m and 35 m), to large roundabouts, often with multilane circulating roadways and more than four entries up to 500 ft (150 m) in diameter. However, the greater speeds permitted by larger roundabouts, with inscribed circle diameters greater than 250 ft (75 m), may reduce their safety benefits.

Designing the geometry of a roundabout involves choosing the best operational and capacity performance while retaining the best safety enhancements. Roundabouts operate best when

their geometry forces traffic to enter and circulate at slow speeds. Horizontal curvature and narrow pavement widths are used to produce this reduced-speed environment. However, the capacity of roundabouts is negatively affected by these low-speed design elements. As the widths and radii of the entry and circulatory roadways are reduced, the capacity of the roundabout is also reduced. Furthermore, many of the geometric criteria used in design of roundabouts are governed by the maneuvering needs of the largest vehicles expected to travel through the intersection. Thus, designing a roundabout is a process of determining the optimal balance between safety provisions, operational performance, and the accommodation of oversized vehicles. Reasons why the designer may consider installing a roundabout include the following:

- community enhancement,
- traffic calming,
- safety improvement,
- operational improvement, and/or
- a special situation.

For detailed information on roundabouts, see FHWA's publication, *Roundabouts: An Informational Guide*.

34-1.02 Profiles

The design should avoid combinations of grade lines that make vehicular control difficult at intersections. To accomplish this, consider the profile for all roadway approaches to and through the intersection. The following criteria will apply.

34-1.02(a) Profiles at Intersections

1. Gradients. The area on approaches that will be used for storage of stopped vehicles is commonly referred to as the storage space or storage platform. Intersection gradients should be as flat as practical but not be greater than 5.0%. Note that approach gradients of 3.0% or steeper may require correction of certain design factors to produce operating conditions equivalent to those on level highways (e.g., stopping sight distances, deceleration lengths). However, any gradient through the intersection must reflect the practicalities of matching the basic profiles of the intersecting roadways and shoulders. On major side roads, the storage platform gradient should be a minimum of 1.0% and a maximum of 2.0% draining away from the mainline highway. When other local roads intersect a State highway, the maximum gradient may be 4.0% draining away from the State highway. Maintain this gradient through the expected storage distance on that leg. At a minimum, provide the storage platform gradient on the side road for a distance of 30 ft to 50 ft (9 m to 15 m) beyond the edge of the mainline travelway or to the ditch line of an arterial highway.

2. Crossover Slope. The algebraic difference between the main highway cross slope and side road gradient should not exceed the rollover guidelines described in Figure 34-1D.

3. Transitions. Where the cross section of the minor road is transitioned to meet the major road, provide a vertical curve between the side road approach gradient and the mainline pavement, especially when traffic signals may be needed; see Figures 34-1E and 34-1F. The design speed of the vertical approach alignment may be up to 20 mph (30 km/h) less than the project design, but not less than design speed of 30 mph (50 km/h). The following vertical curve options are presented in order from the most desirable to the least desirable:
 - a. Vertical Curves (SSD). The criteria for stopping sight distance as described in Section 30-2 should be used for the vertical curve. For non-stopped conditions, design the vertical curve based on the design speed of the highway. For stopped-conditions, design the vertical curve using a 30 mph (50 km/h) design speed.

 - b. Sag Vertical Curves (Minimum Comfort). Under restricted conditions where the SSD criteria is not practical, the sag vertical curves at intersection approaches may be based on the following formulas:

$$K = (0.1V)^2 \quad \text{(US Customary)}$$

$$K = (0.034V)^2 \quad \text{(Metric)}$$

$$L = KA$$

Rollover Factor Guidelines

Notes:

1. Desirably, the minor road profile should tie into the major road travel lane cross slope; however, where the minor road is stop-controlled, it will be acceptable for the minor road profile to tie into the major route shoulder cross slope.
2. See Section 34-1.02(a) for storage platform gradients.
3. Check Figure 34-1D for maximum rollover rates.

VERTICAL PROFILES OF RURAL INTERSECTING ROADS

Figure 34-1E

Notes:

1. *Desirably, the minor road profile should tie into the major road travel lane cross slope; however, where the minor road is stop-controlled, it will be acceptable for the minor road profile to tie into the major road shoulder cross slope.*
2. *See Section 34-1.02(a) for storage platform gradients.*
3. *Check Figure 34-1D for maximum rollover rates.*
4. *At signalized intersections, the most desirable cross slope option will be to transition all approach legs into a planar surface through the intersection and to limit the centerline rollover on the major road to 2% - 3%.*
5. *For a signal controlled minor road descending from the major road, maintain the travel lane cross slope of the major roadway through the length of the storage platform.*

VERTICAL PROFILES OF URBAN INTERSECTING STREETS

Figure 34-1F

Where:

K = horizontal distance needed to produce a 1% change in the gradient along the curve, ft/% (m/%)

A = algebraic difference between the two tangent grades, %

V = design speed, mph (km/h)

L = length of vertical curve, ft (m)

4. Angular Breaks. At stop-controlled intersections, angular breaks are typically provided when transitioning the cross section of the minor approach to meet the major road cross section. Figures 34-1E and 34-1F present schematics of vertical profiles through intersections for rural and urban conditions. Figure 34-1D provides the maximum rollover guidelines that are also applicable for changes in angular breaks.
5. Grade Lines. The principals for coordinating the horizontal and vertical alignment discussed in Chapter 30 are also applicable to vertical profiles through intersections. In addition, do not place intersections on or near crest vertical curves unless the vertical curve is flat enough for the intersection pavement to be seen assuming decision sight distance.

34-1.02(b) Cross-Section Transitions

One or more of the approaching legs of an intersection may need to be transitioned to meet the cross section of the two crossing roads. The following applies:

1. Stop-Controlled. Where the minor road is stop-controlled, maintain the profile and cross section of the major road through an intersection and transition the cross slope of the stop-controlled roadway to match the major road cross slope and profile.
2. Signalized Intersection. At signalized intersections, or potentially signalized intersections, transition the cross section of the minor road to meet the profile and cross slope of the major road. Where compromises are necessary between two major roadways, provide the smoother riding characteristics to the roadway with the higher traffic volumes and operating speeds.
3. Transition Rates. Where one or both intersecting roadways are transitioned, the designer must determine the length and rate of transition from the typical section to the modified section. Desirably, design the transition to meet the general principles of superelevation transition that apply to that roadway (i.e., open-roadway or low-speed urban street conditions). When these criteria are applied to intersection transition rates, the applied design speed is typically:

- 20 mph (30 km/h) below the design speed but not less than 30 mph (50 km/h) for a stop-controlled roadway,
- the highway design speed for a free-flowing roadway, or
- the highway design speed on each roadway of a signalized intersection.

At a minimum and consistent with field conditions, transition the approach pavements of an urban intersection within the curb or radius returns and for rural intersections within a distance of 50 ft (15 m).

34-1.02(c) Drainage

Evaluate the profile and transitions at all intersections for impacts on drainage. This is especially important for channelized intersections on curves and grades. This may require the designer to check superelevation transition lengths to ensure flat sections are minimized. Low points on approach roadway profiles should be beyond a raised corner island to prevent water from being trapped and causing ponding.

34-1.03 Intersection Capacity Analysis

Capacity analysis influences several geometric design features including the number of approach lanes, auxiliary lanes, lane widths, channelization, and number of departure lanes. In addition, this analysis in conjunction with the *Illinois Manual on Uniform Traffic Control Devices* (ILMUTCD) will determine whether an intersection may need to be signalized or stop-controlled.

It is important that the level of service for a signalized intersection be calculated for each lane group (a lane group may be one or more movements), each intersection approach, and the intersection as a whole. Levels of service criteria are provided in the geometric design tables in Chapter 32.

Once the minimum level of service has been selected and design traffic volumes are determined, use the *Highway Capacity Manual* (HCM) and the *Highway Capacity Software* (HCS) to perform the detailed capacity analyses. Ensure that data used in the analyses are applicable for the intersection (i.e., do not assume the program default values are automatically applicable for the intersection). Other capacity and signal analysis programs may be used provided they are approved for use by the BLRS. To be eligible for approval, the output results must be comparable to the HCS.

If the intersection is part of a traffic signal system, check the intersection design with an approved traffic progression program. These programs analyze all signalized intersections in the system to determine the overall capacity of the system. Also, see Figure 36-1C of the *BDE Manual*.

34-1.04 Design Vehicles

34-1.04(a) Types

The design vehicle affects the radius returns, left-turn radii, lane widths, median openings, turning roadways, and sight distances at an intersection. Typical design vehicles used for intersection design are:

- P — Passenger car; includes vans and pickup trucks.
- S-BUS-40 (S-BUS-12) — 84-passenger school bus.
- SU — Single-unit truck.
- WB-40 (WB-12) — Tractor/Semitrailer combination with an overall wheelbase of 40 ft (12.2 m).
- WB-50 (WB-15) — Tractor/Semitrailer combination with an overall wheelbase of 50 ft (15.2 m).
- WB-55 (WB-17) — Tractor/Semitrailer combination with an overall wheelbase of 55 ft (16.8 m).
- WB-65 (WB-20) — Tractor/Semitrailer combination with an overall wheelbase of 65 ft (19.4 m).
- P/T — Recreational vehicle, car, and camper trailer.

Chapter 36 of the *BDE Manual* and the *AASHTO Green Book* provide the vehicular dimensions and turning templates for each of the above design vehicles.

34-1.04(b) Selection

Figure 34-1G presents the recommended design vehicles at intersections based on the functional classification (see Section 27-3) of the intersecting highways from which and onto which the vehicle is turning. The design vehicles shown in Figure 34-1G are for new construction and reconstruction projects. Figure 34-1H presents the recommended truck type that should be used based on the Illinois “Designated State Truck Route System.” For 3R projects, the design vehicle will be site specific, and it may be a design vehicle with a more restrictive turning radius than those for new construction and reconstruction projects.

In addition to Figure 34-1G, consider the following guidelines when selecting a design vehicle:

1. Minimum Designs. The SU and/or school bus design vehicles are generally the smallest vehicles used in the design of local intersections. This design reflects that, even in residential areas, garbage trucks, delivery trucks, and school buses will be negotiating turns with some frequency. Rural and suburban intersections that may serve school bus traffic should, at a minimum, accommodate a turning school bus without encroachment. Urban intersections only need to accommodate design vehicles that are expected to use that intersection.
2. Recreational Areas. Recreational areas typically will be designed using the SU design vehicle. This reflects that service vehicles are typically required to maintain the

BUREAU OF LOCAL ROADS & STREETS

Aug 2007

INTERSECTIONS

34-1(15)

recreational area. Under some circumstances the passenger car with a trailer (P/T) may be the appropriate design vehicle (e.g., campground areas, boat launches).

For Turn Made		Design Vehicle ⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾⁽⁵⁾

*With encroachment, a WB-50 (WB-15) vehicle should physically be able to make the turn.

**With encroachment, the selected design vehicle should physically be able to make the turn.

Notes:

0. Use this Figure for new construction and reconstruction projects.
1. A smaller design vehicle may be considered after an investigation of conditions. Justification must be submitted for intersections with State highways.
2. For 3R projects, the design vehicle will be site specific. See Chapter 33.
3. A larger design vehicle may be required for intersections of two 80,000 lb (36,000 kg) truck routes.

**SELECTION OF DESIGN VEHICLE AT INTERSECTIONS
(Functional Classification)**

Figure 34-1G

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

34-1(16)

INTERSECTIONS

Aug 2007

Type of Truck Route	Design Vehicle	Maximum Length of Trailer Allowed (m)	Maximum Length Kingpin to Center Rear Axle (m)
Class I	WB-65 (WB-20)	53' (16.16 m)	45.5' (13.87 m)
Class II	WB-65 (WB-20)	53' (16.16 m)	45.5' (13.87 m)
Class III	WB-55 (WB-17)	53' (16.16 m)	42.5' (12.96 m)
Non-Designated State Highway	WB-55 (WB-17)	53' (16.16 m)	42.5' (12.96 m)
Non-Designated Local Highway	WB-50 (WB-15)	Not Specified	Not Specified

Illinois Statutes allow additional access off designated truck routes under different conditions. These are defined as follows:

1. *Any tractor/semitrailer vehicle operating on a Class I truck route shall have access onto any street or highway for a distance of 1 mile (1.61 km) from a Class I highway to load and unload and to allow the driver to obtain food, fuel, rest, or repairs. However, some local highway authorities may post truck restrictions altering this provision. Under this condition, the combination truck units allowed access off the Class I truck route may be up to 8 ft (2.59 m) wide with a 53 ft (16.16 m) long trailer.*
2. *Any tractor/semitrailer vehicle operating on a designated State highway (Class I, II, III, or Other State Highways) shall have access on another designated State highway for a distance of 5 mi (8.05 km) on such streets or highways to load and unload and to allow the driver to obtain food, fuel, rest, or repairs.*
3. *If local authorities designate any street or highway for the same large vehicles and the same uses as stated above, such large vehicles may also use these locally designated highways as truck routes. However, these large vehicles are prohibited from using all other streets and highways under local jurisdiction unless an exception is applicable. An exception would be applicable on a local highway where a combination truck unit is within 5 mi (8.05 km) of a designated truck route and where no restricted weight limit is posted on the local highway. In such cases, the combination truck unit may be up to 8 ft (2.59 m) wide, and can have an overall length of 65 ft (19.82 m).*

DESIGN VEHICLE SELECTION**Figure 34-1H****HARD COPIES UNCONTROLLED**

3. Mixed Use. Some portions of an intersection may be designed with one design vehicle and other portions with another vehicle. For example, it may be desirable to design physical characteristics (e.g., corner islands) for the WB-65 (WB-20) truck but provide painted channelization for the SU design vehicle.

34-1.05 Pedestrians and Bicyclists

Safe and convenient movement of pedestrians and bicyclists through the intersection needs to be considered in the design of an intersection. However, this often causes conflicting objectives in the overall design of an intersection. Wider intersection designs to accommodate the design vehicle significantly increase the crossing distance for pedestrians. At signalized intersections, longer crossing times and conflicts with turning vehicles can significantly affect the overall capacity of the intersection. To reduce these problems, the geometric layout of the intersection may need to be revised, refuge islands included within the intersection, special turn lanes added for bicyclists, or other factors included in the design.

Section 41-6 discusses the application of curb ramps at intersections for disabled individuals. The *BDE Manual* and *ILMUTCD* provide several applications for accommodating bicycle lanes and pedestrians through an intersection.

BUREAU OF LOCAL ROADS & STREETS
INTERSECTIONS

Aug 2007

HARD COPIES UNCONTROLLED

34-2 TURNING RADII

Turning radii treatments for intersections are important design elements in that they influence the operation, safety, right-of-way requirements, and construction costs of the intersection. The designer must ensure that the proposed design is compatible with the intersection design vehicle from Figure 34-1G.

34-2.01 Design for Right-Turning Vehicles

The following Sections present several basic parameters the designer needs to consider in determining the proper pavement edge/curb line for right-turning vehicles. The discussion in this Section applies to moderate to high-volume intersections. In residential urban areas and elsewhere where there are heavy pedestrian movements, provide a minimum curve radius of at least 15 ft (4.5 m). In special cases (e.g., resurfacing rehabilitation projects where widening is not involved) existing curve radii may be retained.

34-2.01(a) Design Vehicle

Section 34-1.04 discusses the selection of the applicable design vehicle for different intersections. These vehicles are used to determine the pavement edge or curb line. Note that the design vehicle will determine the turning width, vehicular path width, or swept-path width. The assumed speed of the vehicle is less than 10 mph (15 km/h).

34-2.01(b) Inside Clearance

Desirably, the selected design vehicle will make the right turn while maintaining approximately a 2 ft (600 mm) clearance from the pavement edge (with shoulders) or face of curb.

34-2.01(c) Encroachment

To determine the amount of acceptable encroachment, the designer should evaluate several factors. These would include traffic volumes, 1-way or 2-way operations, urban/rural location, and the type of traffic control. For turns made onto a collector or arterial road or street, desirably, the selected design vehicle will not encroach into the opposing travel lanes. However, this is not always practical or cost effective in urban areas. The designer must evaluate these encroachment conditions against the construction and right-of-way impacts. If these impacts are significant and if through and/or turning volumes are relatively low, the designer may consider accepting some encroachment of the design vehicle into opposing lanes.

The encroachment allowed into adjacent lanes of the road or street onto which the turn is made will depend on the following:

1. Urban. Desirably, no encroachment should be allowed into opposing lanes for a right-turning vehicle from a sideroad or street to an arterial or collector.
2. Rural. For rural intersections, the selected design vehicle should not encroach into the opposing lanes of traffic from a sideroad or street to an arterial or collector.
3. Multilane Highways. If there are two or more lanes of traffic in the same direction on the road onto which the turn is made, the selected design vehicle can occupy both travel lanes. Desirably, the right-turning vehicle will be able to make the turn while remaining entirely in the right through lane.
4. Shoulder/Parking Lanes. Under restricted conditions, the designer may take advantage of shoulder and/or parking lane to ease the problems of large vehicles turning right at intersections with small radius returns. It will be necessary to restrict the parking a significant distance from the intersection. This area should be delineated with striped pavement markings.

34-2.01(d) Pedestrian/Bicyclist Considerations

The larger the right-turning radius, the farther pedestrians must walk across the street. This is especially important to persons with disabilities. Also, large intersections may be a problem in directing bicyclists through the intersection. Therefore, the designer must consider the number and type of pedestrians using an intersection when determining the edge of pavement or curb line design. This may lead to a decision to design a right-turn corner island (small or intermediate) for use as a pedestrian and bicycle refuge.

34-2.01(e) Types of Right-Turn Designs

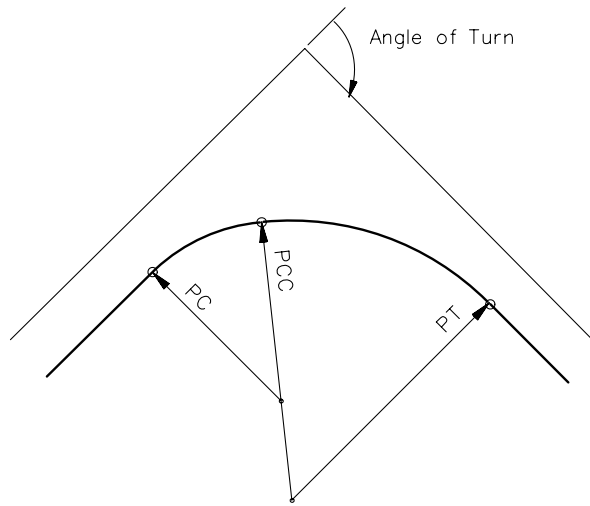

Once the designer has determined the basic right-turning parameters (e.g., design vehicle, amount of allowable encroachment, inside clearance), it will be necessary to select the type of turning design for the curb return or pavement edge that will meet these criteria and will fit the intersection constraints.

The simple radius is the easiest to design and construct. However, two-centered or three-centered curves provide a better fit to the transitional turning paths of tractor/semitrailer design vehicles. Figure 34-2A presents the corner radii for simple, two-centered, and three-centered curves. Note that using these curves may require a corner island.

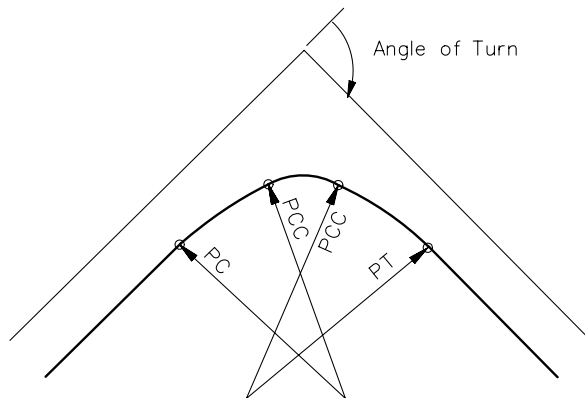

Some of the advantages of the two-centered and three-centered curves as compared to the simple radius design include:

MINIMUM SIMPLE CURVE
-A-

TWO-CENTER COMPOUND CURVE
-B-

THREE-CENTERED COMPOUND CURVE
-C-
RIGHT-TURNING DESIGN CURVES

Figure 34-2A

- When accommodating a specific design vehicle, they require less intersection pavement than a simple radius design, and especially for angles of turn greater than 90°. For large vehicles, a simple radius is often an unreasonable design unless a corner island is used and, in effect, a turning roadway is provided.
- There are less right-of-way impacts at the intersection corners.
- A simple radius results in greater distances for pedestrians to cross the intersection.

34-2.01(f) Curbing

If certain conditions (e.g., drainage requirements, restricted right-of-way, greater delineation, the desire to minimize off-tracking) warrant the use of curbing along the radius return at rural intersections, terminate the curbing at the shoulder edge and transition the curb height as indicated in Figure 34-2B. Use a mountable curb where posted speeds are 50 mph (80 km/h) or greater.

34-2.01(g) Stop Sign Locations

The edge of the stop signs are typically 12 ft (3.6 m) from the edge of the major road traveled way for a rural cross section and a minimum of 2 ft (600 mm) from the face of curb for an urban cross section. They are usually located before the beginning of the radius return, but must be no more than 50 ft (15.25 m) from the edge of the major road traveled way. Stop lines should be located at a point where a road user should stop.

Stop sign locations should be checked against the criteria in the *ILMUTCD* at wide throat intersections. This is especially important where no corner island is used.

34-2.01(h) Turning Template(s)

To determine the preliminary right-turn design, the designer should use the applicable turning template for the selected design vehicle and speed. Check the final intersection design with the applicable turning templates or with a computer simulated turning template program.

34-2.02 Left-Turn Control Radii

For left turns, the motorist generally has a guide at the beginning and end of the turn and an open intersection in the middle. Therefore, the precise alignment of a two-centered or three-centered curve is generally not applicable. Simple curves are typically used for left-turn control radii. Occasionally, a two-centered curve may be desirable to accommodate the off-tracking of large vehicles provided the second curve has a larger radius.

Figure 34-2B

The design values for left-turn control radii are usually a function of the design vehicle, angle of intersection, number of lanes, and median widths. For roadways intersecting at approximately 90°, radii of 50 ft to 80 ft (15 m to 24 m) should typically satisfy all controlling factors. If center divisional islands are present, select control radii so that the nose of each divisional island is no closer than 4 ft (1.2 m) nor greater than 10 ft (3.0 m) from the edge of the traveled way of the intersecting highway. The nose location is also affected by the selected nose radii. For additional guidance on median openings and median nose designs, see Section 36-4 of the *BDE Manual*.

Left-turn control radii for dual-lane turning movements should be larger than those indicated for the single-lane design. See Section 34-3.04 for additional design details.

34-3 AUXILIARY TURN LANES

When turning maneuvers for left- and right-turning vehicles occur from the through travel lanes, it typically disrupts the flow of through traffic. This is especially true on high-volume highways. To minimize potential conflicts and to improve the level of service and safety, the use of turn lanes may be warranted for intersections.

34-3.01 Turn Lane Guidelines

34-3.01(a) Right-Turn Lanes

The use of right-turn lanes at intersections can significantly improve operations. Consider using an exclusive right-turn lane in the following situations:

- at unsignalized intersections on a high-speed urban or rural highway where traffic operations indicate the need for right-turn lanes;
- at any intersection where a capacity analysis determines a right-turn lane is necessary to meet the level-of-service criteria;
- at any signalized intersection where the right-turning volume is greater than 150 vehicles per hour and where there is greater than 300 vehicles per hour per lane on the major road;
- for uniformity of intersection design along the highway if other intersections have right-turn lanes;
- at any intersection where the pavement is curved to the left and where the major road curve requires superelevation;
- where a railroad crossing is located close to the intersection and a right-turn lane would be desirable to efficiently move through traffic by moving turning traffic stopped for a train from the through lane.
- at any intersection where the crash experience, existing traffic operations, sight distance restrictions (e.g., intersection beyond a crest vertical curve), or engineering judgment indicates a significant conflict related to right-turning vehicles.

For further guidance, see Figures 36-3A and 36-3B of the *BDE Manual*.

34-3.01(b) Left-Turn Lanes

The accommodation of left turns is often the critical factor in proper intersection design. Left-turn lanes can significantly improve both the level of service and intersection safety. In general, use an exclusive left-turn lane at all intersections on highways with a median wide enough to accommodate a left-turn lane, regardless of traffic volumes. Consider using an exclusive left-turn lane for the following:

- at any signalized intersection where the left-turning volume is equal to or greater than 75 vehicles per hour for a single turn lane or 300 vehicles per hour for a dual turn lane;
- any intersection where a capacity analysis determines a left-turn lane or dual left-turn lanes are necessary to meet the level-of-service criteria;
- for uniformity of intersection design along the highway if other intersections have left-turn lanes (i.e., to satisfy driver expectancy); or
- any intersection where the crash experience, traffic operations, sight distance restrictions (e.g., intersection beyond a crest vertical curve), or engineering judgment indicates a significant conflict related to left-turning vehicles.

For further guidance, see Figures 36-3C through 36-3G of the *BDE Manual*.

34-3.02 Design of Turn Lanes

Figure 34-3A provides a schematic of auxiliary lanes at an intersection.

34-3.02(a) Turn Lane Widths

The width of the turn lane should be determined relative to the functional class, urban/rural location, and project scope of work (new construction, reconstruction, 3R). Chapters 32 and 33 present the applicable widths for auxiliary lanes based on these criteria. Desirably, turn-lane widths should be 12 ft (3.6 m) or a minimum of 10 ft (3.0 m). The geometric design tables in Chapters 32 and 33 also provide criteria for the applicable shoulder widths adjacent to auxiliary lanes. In general, the minimum shoulder widths adjacent to a turn lane with shoulders should be 4 ft (1.2 m). For curbed sections, the width of the gutter adjacent to the turn lane should be 6 in to 2 ft (150 mm to 600 mm).

34-3.02(b) Turn Lane Lengths

The length of auxiliary lanes will be determined by a combination of its taper length (L_T) and storage length (L_S). The following discusses the criteria for turn-lane lengths:

1. Taper. The entrance taper into the turn lane may be either a straight or a reverse curve taper. Always use the straight taper across bridges for ease of construction. Figure 34-3B provides the recommended deceleration distances for straight and reverse curve tapers.

Key: L_T = Taper length

L_D = Deceleration length (minimum length required)

L_S = Storage length

L_{AT} = Approach Taper Length — $L = WS$ for $S \geq 45$ mph, $L = \frac{WS^2}{60}$ for $S < 45$ mph (US Customary)

$L = 0.6WS$ for $S \geq 70$ km/h, $L = \frac{WS^2}{155}$ for $S \leq 60$ km/h (Metric)

W = Offset in feet (US Customary)

W = Offset in meters (Metric)

S = 85th Percentile Speed

See Section 34-3.02 for additional guidance.

Note: The schematic of the major road (free flowing) also applies to all legs of a signalized intersection.

* $L_S + L_T$ may be greater than L_D when the capacity analysis shows $L_S > L_D - L_T$ (from Figure 34-3B). The greater should be used.

(1) Average running speed assumed for calculations.

(2) Ratio from this table multiplied by the length provided above will yield the total deceleration length adjusted for grade. Adjustment factors apply to all design speeds and are added to the tangent or storage length.

DECELERATION DISTANCES FOR TURNING LANES

Figure 34-3B

BUREAU OF LOCAL ROADS & STREETS
INTERSECTIONS

Jan 2006

34-3(5)

Where the highway is on a curved alignment, the taper of the turn lane should be more pronounced than usual to ensure that the through motorists are not inadvertently directed into the turn lane. This is accomplished by shortening the taper length.

2. Storage Length (Signalized Intersections). The storage length (L_s) for turn lanes should be sufficient to store the number of vehicles likely to accumulate in a signal cycle during the design hour. The designer should consider the following in determining the recommended storage lengths for signalized intersections:

- a. Determine the distance using the criteria for signalized intersections in the *Highway Capacity Manual* or use the following formula:

$$\text{Storage Length (ft)} = \frac{(1-G/C)(\text{DHV})(1 + \frac{\% \text{trucks}}{100})(2 \times 25)}{(\# \text{ cycles per hour})(\# \text{ traffic lanes})} \quad (\text{US Customary})$$

$$\text{Storage Length (m)} = \frac{(1-G/C)(\text{DHV})(1 + \frac{\% \text{trucks}}{100})(2 \times 7.5)}{(\# \text{ cycles per hour})(\# \text{ traffic lanes})} \quad (\text{Metric})$$

Where:

G	=	green time (secs)
C	=	cycle length (secs)
DHV	=	Design Hourly Volume (vph) for turn lane

- b. Where right-turns-on-red are permitted or where separate right-turn signal phases are provided, the length of the right-turn lane may be reduced due to less accumulation of turning vehicles. The storage length (L_s) needed for a separate right-turn lane is measured from the stop bar for the right-turning roadway; see Figure 34-3A.
- c. At signalized intersections, the designer should also consider that entry into right- and left-turn lanes may be blocked by the signal storage needs of the adjacent through lanes. If this occurs, provide longer lengths of turn lanes.
3. Storage Length (Unsignalized Intersections). To determine the storage length for unsignalized intersections, assume that the intersection is signalized with a two-phase signal using a 40 to 60 second cycle length. Then use the *Highway Capacity Manual* to determine the expected storage length.
4. Minimum Storage Length. For all intersections where traffic volumes are too low to govern, the minimum storage length will be 115 ft (35 m). These minimum lengths may also apply to right-turn lanes at unsignalized intersections if there is little likelihood of the turning vehicle having to wait.

HARD COPIES UNCONTROLLED

5. Queue Length of Through Traffic. In addition to the storage for turn-lane volumes, the length of the turning lane should exceed the calculated queue length in the through travel lane adjacent to the turning lane for the design hour.
6. Clearance Distance of Opposing Left Turns. A minimum 6 ft (1.8 m) clearance between opposing left-turning vehicles shall be provided for single left-turn lanes. A desirable 10 ft (3 m) should be provided for opposing dual left-turn lanes. See Figure 36-3U of the *BDE Manual*.

34-3.03 Typical Treatments for Auxiliary Turn Lanes

The following presents typical treatments for right- and left-turn lanes:

1. Right-Turn Lanes. Figure 34-3A illustrates the typical development of an exclusive right-turn lane using a straight taper. Reverse curves may also be considered for the taper.
2. Channelized Left-Turn Lanes. On divided highways, the design presented in Figure 34-3A will apply to the development of an exclusive left-turn lane in the median. Figure 34-3C illustrates the typical development for new construction or reconstruction project of a channelized left-turn lane on a rural 2-lane highway. Figure 34-3D illustrates the typical development of channelized left-turn lane on an urban street or for a 3R or safety improvement project on a rural 2-lane highway.
3. By-Pass Area. Figure 34-3E illustrates the typical design for a by-pass area. This is a relatively inexpensive design to provide for through and left-turn movements at intersections. The by-pass area is appropriate for T-intersections (only unsignalized) where left-turning volumes are light to moderate.

The decision to use either the channelized left-turn (Figures 34-3C and 34-3D) or the by-pass area (Figure 34-3E) will be based on comparative costs, crash history, right-of-way availability, through and turning volumes, design speed, and available sight distance.

4. Offset Turn Lanes. Providing an offset design ensures that opposing left-turning motorists can see past one another to view oncoming through traffic. Offset left-turn lanes can be either a parallel or taper type. For additional guidance on offset left-turn lanes, see Section 36-3 in the *BDE Manual*.

* See Section 34-3.02(b) for storage length criteria or use the following:

US Customary		Metric	
Design Speed (mph)	Storage Length (ft)	Design Speed (km/h)	Storage Length (m)
45	185	70	50
50	215	80	60
55	240	90	70
60	265	100	85

FLUSH CHANNELING ISLAND AT AN ISOLATED, HIGH-SPEED RURAL INTERSECTION
(New Construction/Reconstruction Projects)

Figure 34-3C

Present Posted Speed (mph)	Design Speed	Approach Taper Rates		Left-Turn Lane	
		Widening on Both Sides	Widening All on One Side	Taper Rate	Minimum Storage Length*
≥ 50	50 mph (80 km/h)	50:1	40:1	15:1	115 ft (35 m)
45	45 mph (70 km/h)	45:1	35:1	13:1	115 ft (35 m)
40/35	40 mph (60 km/h)	40:1	30:1	11:1	115 ft (35 m)
≤ 30	30 mph (50 km/h)	35:1	25:1	9:1	115 ft (35 m)

* Storage lengths may be increased if necessary based on Section 34-3.02(b).

FLUSH CHANNELIZED ISLANDS AT ISOLATED RURAL OR URBAN INTERSECTIONS FOR SAFETY IMPROVEMENTS OR 3R PROJECTS

Figure 34-3D

TYPICAL BY-PASS AREA ON A TWO-LANE HIGHWAY
Figure 34-3E

34-3.04 Dual Turn Lanes

34-3.04(a) Guidelines

At intersections with high-turning volumes, dual left- and/or right-turn lanes may be considered. Dual left- and/or right-turn lanes may be considered where:

- there is insufficient space to provide the necessary length of a single turn lane because of restrictive site conditions (e.g., closely spaced intersections);
- based on a capacity analysis, the necessary time for a protected left-turn phase for a single lane becomes unattainable to meet the level-of-service criteria (average delay per vehicle); and/or
- more than 300 vehicles per hour are projected to be turning.

Dual turn lanes should only be used with signalization providing a separate turning phase.

34-3.04(b) Design

See Section 36-3 of the BDE *Manual* for dual turn lane designs.

34-4 ISLANDS

Several of the treatments described in this Chapter require islands within the intersection area. Some intersections, especially those with oblique angle crossings, result in large paved areas that may cause motorists to wander from natural or expected paths and may cause long pedestrian crossings. These movements may result in conflicts and/or unpredictable operations, but could be enhanced by incorporating channelizing islands in the design of the intersection.

At rural locations where higher speeds are prevalent, channelizing islands are used in conjunction with left-turn lanes and for turning roadways. In urban areas where speeds generally are lower, but where traffic volumes are generally higher, channelizing islands in conjunction with added lanes are used primarily to increase capacity and safety at the intersection.

34-4.01 Island Types

Islands can be grouped into the following classifications. Most island types serve at least two of these functions:

1. Corner/Directional Islands. Directional or corner triangular islands control and direct right-turn movements and guide the driver into the proper direction.
2. Channelizing Islands. Center channelizing islands separate opposing traffic flows, alert the driver to the crossroad ahead, and regulate traffic through an intersection. These islands are often introduced at intersections on undivided highways and are particularly advantageous in controlling left turns at skewed intersections.
3. Refuge Islands. Refuge islands (corner islands or center channelizing islands) may function to aid and protect pedestrians who cross a wide roadway. These islands may be required for pedestrians where complex signal phasing is used and may permit the use of two-stage crossings. This also may increase the signal efficiency by allowing the time allocated for pedestrian movements to be reduced.

34-4.02 Selection of Island Type

Islands may be some combination of flush, traversable, raised-curb, or turf, and could be triangular or elongated in shape. Selection of an appropriate type of channelizing island should be based on:

- traffic characteristics;
- cost considerations;
- urban, suburban, or rural locations;
- degree of access management desired; and

- maintenance considerations.

The following offers guidance where different types of islands are appropriate.

34-4.02(a) Flush or Traversable Islands

Flush islands, which are delineated by pavement markings (e.g., paint, thermoplastic, epoxy), or traversable islands, which are delineated by M-2 (M-5) curbs, are appropriate for the following situations:

- on highways to delineate separate left-turn lanes (flush or traversable);
- in restricted locations where delineation of vehicular path is desirable, but space for larger, raised-curb islands is not available (flush);
- in areas where better long-term visual delineation is needed at night and during inclement weather, but space for raised-curb islands is not available (traversable);
- to separate opposing traffic streams on low-speed urban streets (flush or traversable); and/or
- for temporary channelization during construction (flush).

34-4.02(b) Raised-Curb Islands

Raised-curb islands are at least 4 in (100 mm) high and are appropriate:

- on low-speed highways where the primary function is to provide positive separation for opposing traffic movements;
- at locations requiring positive delineation of vehicular paths (e.g., where a major route turns or at intersections with unusual geometry);
- where the island is intended to prohibit or prevent traffic movements (e.g., wrong-way movements or to manage access within the intersection);
- where a primary or secondary island function is to provide a location for traffic signals, signs, or other fixed objects; and/or
- where a primary function of the island is to provide a pedestrian or bicyclist refuge.

Raised-curb islands should be used at rural intersections having the following characteristics:

- on the crossroad through an interchange to delineate median crossovers and turn lanes, and to prevent wrong-way movements, and
- at unusual or complex intersection configurations where higher visibility would promote greater safety and more efficient traffic operations.

Where curb and gutter is proposed in high-speed rural areas, only use mountable curbs and consider providing supplemental intersection illumination. In addition, provide prismatic reflectors on the top of curbs to enhance delineation of the island and turn lanes at night. Section 31-1.07 provides further guidance on the types of curbing used for islands.

34-4.02(c) Divisional Islands

Figure 34-4A illustrates a typical curbed divisional island and applicable approach treatment. Guidance for standardized designs based on various design speeds, pavement widths, and island widths are provided in the IDOT publication *Transitional Approaches to Channelized Intersections*. This document can be obtained from the district or from BDE. For flush-channelizing islands, see Figures 34-3C and 34-3D.

34-4.02(d) Corner Islands

In general, the use of corner islands is discouraged. However, at some intersections, it may be desirable to provide a directional or corner island to direct drivers. This may be especially advantageous where a tractor/semi-trailer is used as the design vehicle and/or at oblique angle crossing intersections. The corner island may also be used for locating traffic control devices.

Corner islands may also function as refuge islands to aid and protect pedestrians who cross a wide roadway. Corner islands may be required for pedestrians where complex signal phasing is used, and they may permit the use of two-stage crossings. This may enhance traffic signal efficiency by allowing a reduction in the time allocated for pedestrian movements. These islands must be large enough to accommodate both the signals and pedestrians.

The type and size of triangular or corner islands will vary according to the angle of intersection, design vehicle, right-turn operation, and available right-of-way. Figure 34-4B illustrates the typical designs for corner islands. Also consider the following:

1. Island Sides. The sides of the island should not be less than 12 ft (3.6 m) and, preferably, 15 ft (4.5 m) after rounding the corners.
2. Island Size. The minimum island size for rural areas is 100 ft² (9.5 m²). For urban islands, the island area typically should be 75 ft² (7.0 m²) but not less than 50 ft² (4.7 m²). The island area includes the concrete median surface and the top of the curb.
3. Flush or Raised-Curb. For proper delineation of corner islands, under all conditions (e.g., nighttime, rain, fog, snow), the raised-curb design is preferable.

Notes:

1. For additional design details, see the IDOT publication Transitional Approaches to Channelized Intersections.
2. The length and shape of channelizing islands derived from the above sketch also may be used as a guide for determining a flush, center island design.

- M = See Chapter 32 for typical median widths
- W₁ = Undivided approach width
- W₂ = Divided approach width
- W₃ = $\frac{W_1}{2}$ or 14 ft (4.2m), which ever is larger
- W₄ = $\frac{W_3 + W_2}{2}$, desirable
- W₅ = W₂ + 1 ft (300 mm)

TYPICAL CURBED DIVISIONAL ISLAND

Figure 34-4A

LARGE ISLAND

(For Freeflow Turning Roadway Design)

Notes:

- ①, ②, ③ - designates a specific corner of island.
- Ramp the ① and ② noses of curbed corner islands unless the curb function is for the protection of pedestrians, signals, light standards, or sign truss supports.
- See the *IDOT Highway Standards* for details of ramping noses.
- All corner radii are to the face of curb at flowline.
- * These dimensions are controlled by the minimum area requirements of the island, whereas "W" is a required dimension.
- Dimensions in parentheses are in mm unless otherwise noted.

DETAILS OF CORNER ISLANDS
Figure 34-4B

4. Curbing. Only use the M-type curb on corner islands. Also consider the following:
 - Use M-6 (M-15) curb on islands that are located adjacent to a highway with speeds of 45 mph (70 km/h) or less.
 - Use M-4 (M-10) curb on islands that are located adjacent to high-speed traffic (i.e., 50 mph (80 km/h) or greater). However, use M-6 (M-15) curb on islands where traffic signal supports, sign truss supports, or any other post with a foundation generally larger than a standard highway sign are present. Note that a stop sign is a standard highway sign.
 - Use M-6.06 (M-15.15) or M-4.06 (M-10.15) CC&G on all sides of islands where the island is offset the shoulder width from the edge of the traveled way.

5. Island Offsets. On streets with outside curb and gutter, offset the corner island from the edge of the traveled way according to Figure 34-4B. In rural areas or for facilities with shoulders, the corner island is offset from the shoulder width, but not greater than 8 ft (2.4 m); see Figure 34-3C. If a right-turn deceleration lane is provided, then offset the corner island at least 8 ft (2.4 m).

6. Location of Stop Signs. The edge of the stop sign should be a minimum of 2 ft (600 mm) from the face of the curb.

34-4.02(e) Curb Ramps

See Section 41-6 for the application of ADA criteria at intersections. If the crosswalk is placed through an island, give special consideration to the treatment of curb ramps within the raised-curb island. In many cases, the crosswalk can be located directly in front of a divisional island nose without special design provisions or, the island can be shortened sufficiently to permit such location without loss of control for turning vehicles. However, where an island does encroach on the location of a crosswalk, it is usually desirable to depress the entire crosswalk through the island, rather than construct ramps. This is particularly true if the island is less than 100 ft² (10 m²) or is less than 16 ft (4.8 m) wide. The remaining portion of raised island on either side of the ramp should be of sufficient size to distinguish it as a raised island and for ease of construction.

34-4.03 Median Openings

For the design of median openings, see Section 36-4 of the *BDE Manual*.

34-5 EXTENSION OF THROUGH LANES BEYOND AN INTERSECTION

At many intersections, traffic volumes drop off considerably after passing a crossroad and, therefore, one lane can be dropped beyond the intersection. However, to fully realize capacity benefits and to provide for a safe merge, the through lanes must be extended beyond the intersection. Figure 34-5A provides preliminary design criteria for determining the distance these lanes should be extended beyond an intersection.

Notes:

1. D_E is that distance required by a vehicle to accelerate from a stop to 5 mph (10 km/h) below the design speed of the highway.

2. The taper distance is calculated using the following equations and assuming a 12 ft (3.6 m) lane width:

$L = WS$ for $S \geq 45$ mph (US Customary)

$L = WS^2/60$ for $S < 45$ mph

$L = 0.6 WS$ for $S \geq 70$ km/h, (Metric)

$L = WS^2/155$ for $S \leq 60$ km/h

US Customary			Metric		
Design Speed (mph)	D_E (ft)	Taper Length (ft)	Design Speed (km/h)	D_E (m)	Taper Length (m)
30	160	180	50	40	54
35	215	245	60	70	74
40	320	320	70	110	96
45	430	540	80	160	162
50	585	600	90	235	180
55	780	660	100	325	198
60	1010	720			

EXTENSION OF THROUGH LANE BEYOND AN INTERSECTION

Figure 34-5A

34-6 INTERSECTION DESIGN NEAR RAILROADS

34-6.01 General Design Considerations

These design guidelines apply to all highway improvement projects where the route is adjacent and parallel to a railroad. Where an at-grade railroad crossing is within 200 ft (60 m) of an intersection, the design should address efforts to keep vehicles from stopping or storing on the tracks. This applies to either signal- or stop-controlled intersections. The following factors should be identified and considered during the planning stages:

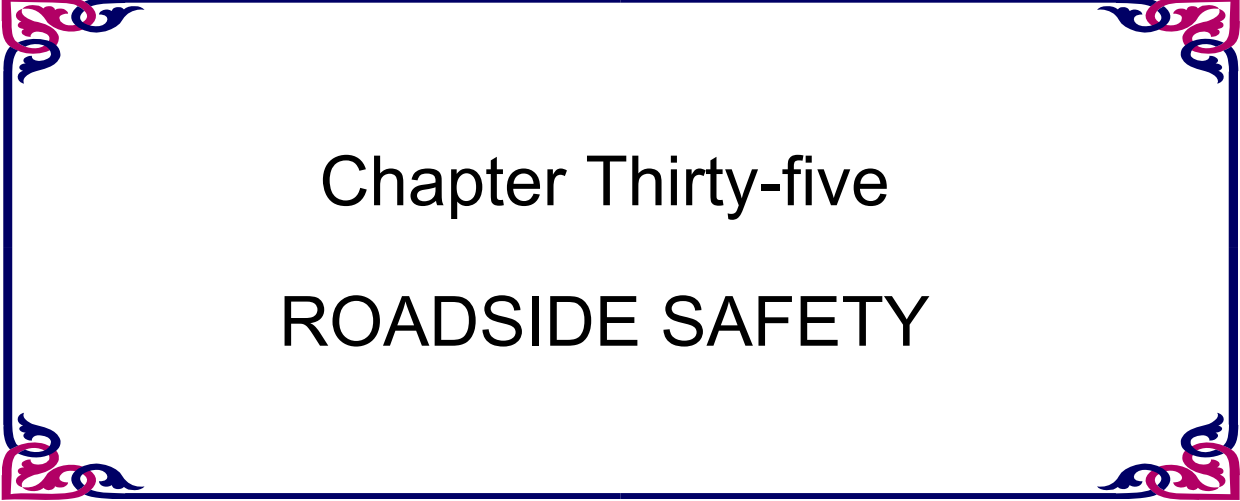

1. Clear Storage Distance. Consider alternative designs that provide a minimum distance of 75 ft (23 m) between the proposed intersection stop line and a point 6 ft (1.8 m) from the closest rail.
2. Space for Vehicular Escape. On the far side of any railroad crossing, consider providing an escape area for vehicles (e.g., shoulder with curb and gutter behind the shoulder, flush medians, flush-corner islands, right-turn acceleration lanes, improved corner radii).
3. Conflicting Commercial Access. Left-turn vehicular movements that may inhibit the clearance of queued traffic on the approaches to railroad tracks should be discouraged. If there are existing entrances on the street approach, consider using design features that would eliminate the problems (e.g., left-turn lane, raised-curb median).
4. Restricted Intersection Capacity. During periods of frequent railroad preemption of traffic signals, consider the effects of reduced traffic flow, lack of progression on the street paralleling the tracks, and traffic backups. Available computer programs should be used to analyze different capacity and operational scenarios and to recommend any countermeasures.
5. Protected Left-Turn Storage. On the street that parallels the tracks, analyze the storage length needed for left-turns into the side street and across the tracks during preemption of the traffic signals. Without the proper storage length available, this could cause backups into the through lanes.
6. Right-Turn Lanes. On the street that runs parallel to the railroad and where an actuated NO RIGHT TURN SIGN is proposed in conjunction with railroad preemption, a right-turn lane should be considered for the right-turn movement across the tracks. The auxiliary lane provides a refuge for right-turning vehicles during railroad preemption and eliminates the problem of traffic temporarily blocking the through lanes.
7. Side Street Left-Turn Lane Capacity. On streets that cross railroad tracks, provide sufficient left-turn storage lengths that will avoid the problem of left turns spilling out onto through lanes and blocking the through lanes.

34-6.02 Interconnection Traffic Signal System Design

See Section 39-4 for additional information on traffic signal design.

34-6.03 Signing

See Chapter 39-2 for additional information on traffic signs.

Chapter Thirty-five

ROADSIDE SAFETY

The ideal roadway would be entirely free of any roadside obstructions or other hazardous conditions. This is rarely practical because of natural, economic, and environmental factors. Chapter 35 presents clear zone distances that are intended to provide an adequate clear recovery area for errant vehicles that run off the road, as well as providing criteria for the selection, layout, and design of roadside barriers for all new construction/ reconstruction projects. Roadside hazards on 3R projects are addressed in Section 33-3.07.

35-1 DEFINITIONS

1. Back Slope. The side slope created by connecting the ditch bottom, shelf, or shoulder at the hinge point, upward and outward, to the natural ground line.
2. Barrier Curb. A longitudinal element placed at the edge of the traveled way to provide delineation, to control drainage, to manage access, and to minimize right-of-way acquisition. Barrier curbs range in height between 6 in and 10 in (150 mm and 250 mm) with a face steeper than 3 vertical to 1 horizontal (3V:1H).
3. Barrier Terminals. End treatments for both roadside barriers and transitions to other types of barriers (e.g., to bridge rails).
4. Barrier Warrant. A criterion that identifies an area of concern that should be shielded by a traffic barrier, if judged to be practical. The warrant may be based on IDOT/AASHTO guidelines, on a "cost-effective" assessment, or on engineering judgment.
5. Critical Parallel Slope. Fill sections with front slopes steeper than 1V:3H that are not considered to be traversable by a run-off-the-road vehicle. Depending on the encroachment conditions, a vehicle on a critical slope may overturn.
6. End Treatments. The terminal devices for roadside barriers, including both the approaching and departing ends.
7. Front Slope. The side slope created by connecting the shoulder or shelf at the hinge point, downward and outward, to the ditch bottom or natural ground line.
8. Impact Angle. For a longitudinal barrier, the angle between a tangent to the face of the barrier and a tangent to the vehicular path at impact.
9. Length of Need. Total length of a longitudinal barrier, measured with respect to the centerline of roadway, needed to shield an area of concern. The length of need is measured to the last point of full-strength rail.

BUREAU OF LOCAL ROADS & STREETS
ROADSIDE SAFETY

35-1(2)

Jan 2006

10. Mountable Curb. A longitudinal element placed at the edge of traveled way to provide delineation, to control drainage, to manage access, and to outline corner islands. Mountable curbs have a height of 6 in (150 mm) or less with a sloping face of approximately 45°.
11. Non-Recoverable Parallel Slope. Slopes that can be safely traversed, but upon which an errant vehicle is unlikely to recover before reaching the bottom of the slope. The run-off-the-road vehicle will likely continue down to the toe of the slope. For most embankment heights, if a front slope is between 1V:3H (inclusive) and 1V:4H (exclusive), it is considered a non-recoverable parallel slope.
12. Parallel Slopes. Front and back slopes for which the toe runs approximately parallel to the roadway.
13. Recoverable Parallel Slope. Slopes that can be safely traversed and upon which a motorist has a reasonable opportunity to regain control of the vehicle. Front slopes 1V:4H and flatter are considered recoverable.
14. Roadside Barrier. A longitudinal barrier (e.g., guardrail, concrete barrier) used to shield roadside hazards.
15. Roadside Clear Zone. The distance beyond the edge of traveled way that should be clear of any non-traversable hazards or fixed objects.
16. Roadside Hazards. A general term to describe roadside features that cannot be safely impacted by a run-off-the-road vehicle. Roadside hazards include both fixed objects and non-traversable roadside features (e.g., rivers).
17. Shy Distance. The distance from the edge of traveled way beyond which a roadside object will not be perceived as an immediate hazard by the typical driver, to the extent that the driver will change vehicular placement or speed.
18. Side Slope. A ratio used to express the steepness of a slope adjacent to the roadway. The ratio is expressed as vertical to horizontal (V:H).
19. Toe of Slope. The intersection of the front slope with the natural ground line or ditch bottom or the back slope with the edge of roadway or ditch bottom, before any rounding is applied.
20. Top of Slope. The intersection of the back slope with the natural ground line, before any rounding is applied.
21. Transverse Slope. Front and back slopes for which the toe runs approximately perpendicular to the flow of traffic on the major roadway. Transverse slopes are typically formed by intersections between the mainline and entrances, median crossovers, or side roads.

HARD COPIES UNCONTROLLED

35-2 ROADSIDE CLEAR ZONES

35-2.01 Background

When using the recommended clear zone distances, the designer should consider the following:

1. Project Scope of Work. The clear zone distances in Section 35-2 apply to all new construction/reconstruction projects. Chapter 33 presents the clear zone criteria for 3R projects.
2. Context. The clear zone widths presented in this *Manual* are based on limited empirical data which has been extrapolated to a wide range of conditions. Therefore, the distances imply a degree of accuracy that does not exist. They do, however, provide a basis for making decisions on providing a safe roadside area for new construction/reconstruction projects. The use of an appropriate clear zone distance is a compromise between providing maximum safety and minimizing construction costs. Each application of the clear zone distance must be evaluated individually, and the designer must exercise good judgment.
3. Boundaries. The designer should not use the clear zone distances as boundaries for introducing roadside objects (e.g., bridge piers, non-breakaway sign supports, utility poles, landscaping features). These should be placed as far from the traveled way as practical. If an obstacle lies just beyond the clear zone, it may be appropriate to remove or shield the obstacle if costs are reasonable. Conversely, the clear zone should not be achieved at all costs.
4. Right-of-Way. Even for new construction/reconstruction projects, the availability of right-of-way may be a serious project issue. The acquisition of additional right-of-way solely to provide the clear zone distance is not required. If, on the other hand, the right-of-way width exceeds the design clear zone, this offers an opportunity to increase safety by removing all hazards within the right-of-way. Specifically for reconstruction projects, BLRS policy is that the clear zone will be the values from Section 35-2 or the right-of-way line, whichever is less.
5. Level of Protection. A 30 ft clear zone is predicated on achieving a clear recovery area that will provide approximately 80% to 85% of all run-off-the-road vehicles the opportunity to recover where the design speed is 60 mph (100 km/h). For lower design speeds (but traffic volumes of over 6000 ADT), the clear zones are reduced but still provide a (theoretical) 80% to 85% level of protection. However, on facilities with ADTs less than 6000, Figure 35-2A and the AASHTO *Roadside Design Guide* present reduced clear zone values that provide a lower level of protection based on subjective cost-effective considerations. For example, with a design speed of 50 mph (80 km/h) and a flat side slope, an 18 ft (6 m) clear zone will provide the approximate 80% to 85% level of protection. A 12 ft (4 m) clear zone (as recommended for ADTs of 750-1500) will provide approximately a 65% level of protection. Therefore, the AASHTO clear zone values, which have been adopted by BLRS for use on non-State highway facilities for

new construction/reconstruction projects, inherently provide reduced protection for facilities with ADTs less than 6000.

35-2.02 Clear Zone Values

Figure 35-2A presents clear zone distances for recoverable front slopes (1V:4H or flatter) and for back slopes 1V:3H or flatter to be used in the design of new construction/reconstruction projects. The following discusses the use of the figure to determine the applicable clear zone.

35-2.02(a) Speed

The designer will use the design speed for the project determined from Chapter 32 to determine the applicable clear zone.

35-2.02(b) Traffic Volumes

For all new construction/reconstruction projects, the design traffic volume will typically be the projected traffic volume 20 years from the anticipated date of construction. For low-volume roadways with ADTs of 400 or less, current traffic volumes may be used.

Figure 35-2A is divided into ranges of traffic volumes for different design speeds. As indicated in the figure, ADT influences the clear zone value. In general, the wider clear zones apply to the higher traffic volumes.

35-2.02(c) Side Slopes

The roadway side slope will influence the recommended clear zone distance. Figure 35-2B presents a schematic of the general side slope configurations, which may include:

- a straight front slope,
- a section with a roadside ditch, or
- a section where the toe of the back slope is adjacent to the edge of shoulder.

Note: The values in Figure 35-2A for “back slopes” only apply to a section as illustrated in Figure 35-2B; they do not apply where a roadside ditch is present.

Many variables influence the selection of a clear zone distance for the various side slope configurations. Sections 35-2.03 to 35-2.05 discuss side slopes in detail.

	Over 6000	30	30	20	24	26

- Notes:**
1. The "Design Year ADT" will be the total ADT for both directions of travel for the design year. Traffic volumes will normally be based on a 20-year projection from the anticipated date of construction unless current ADT < 400. This applies to both divided and undivided facilities.
 2. For 1V:3H and 1V:2H front slopes, see Sections 35-2.03(b) and 35-2.03(c). For roads functionally classified as local with an ADT ≤ 400, see Section 35-2.02(d).
 3. The values for "back slopes" only apply to a section where the toe of the back slope is adjacent to the shoulder (see Figure 35-2B(c)). For sections with roadside ditches, see Section 35-2.05.
 4. All distances are measured from the edge of the traveled way.
 5. The values in the figure apply to tangent sections of highway. See the discussion in Section 35-2.02(e) for possible adjustments on horizontal curves.
 6. The values in the figure apply to all uncurbed sections and to curbed sections in rural areas. See Section 35-2.02(f) for curbed sections in urban areas.
 7. For roads functionally classified as local with an ADT ≤ 400, see Section 35-2.02(d).

- Notes:
1. The "Design Year ADT" will be the total ADT for both directions of travel for the design year. Traffic volumes will normally be based on a 20-year projection from the anticipated date of construction unless current ADT < 400. This applies to both divided and undivided facilities.
 2. For 1V:3H and 1V:2H front slopes, see Sections 35-2.03(b) and 35-2.03(c). For roads functionally classified as local with an ADT ≤ 400, see Section 35-2.02(d).
 3. The values for "back slopes" only apply to a section where the toe of the back slope is adjacent to the shoulder (see Figure 35-2B(c)). For sections with roadside ditches, see Section 35-2.05.
 4. All distances are measured from the edge of the traveled way.
 5. The values in the figure apply to tangent sections of highway. See the discussion in Section 35-2.02(e) for possible adjustments on horizontal curves.
 6. The values in the figure apply to all uncurbed sections and to curbed sections in rural areas. See Section 35-2.02(f) for curbed sections in urban areas.
 7. For roads functionally classified as local with an ADT ≤ 400, see Section 35-2.02(d).

**RECOMMENDED CLEAR ZONE DISTANCES (m)
(New Construction/Reconstruction)
Figure 35-2A (Metric)**

HARD COPIES UNCONTROLLED

SIDE SLOPE CONFIGURATIONS

Figure 35-2B

35-2.02(d) Low-Volume Local Roads

The clear zone for uncurbed roads functionally classified as local with an ADT ≤ 400 may be reduced to 6 ft (1.8 m).

35-2.02(e) Horizontal Curve Adjustment

The clear zone values in Figure 35-2A assume a tangent alignment. Horizontal curves may increase the angle of departure from the roadway and thus increase the distance the vehicle will need to recover. The designer should consider adjusting the tangent values to provide wider clear zones on the outside of horizontal curves on high speed roadways with significant traffic volumes where there is a significant crash potential, and the increased clear zones are cost effective and do not require additional right-of-way. Where the Horizontal Curve Adjustment is considered, see Section 38-3 of the *BDE Manual* for the adjustment factor to be used.

35-2.02(f) Curbed Sections

The values in Figure 35-2A apply to uncurbed sections of highway. Where curbs are present, the following will apply:

1. Urban/Suburban Facilities. A minimum horizontal, obstruction-free clearance of 1.5 ft (450 mm) should be provided as measured from the gutter line of the curb. This applies to both barrier and mountable curbs, except that M2 (M5) curb will be treated as an uncurbed section. Because curbs are not considered to have re-directional capabilities, it is desirable to provide obstruction-free clearances beyond the curb for a distance of at least 1.5 ft (450 mm). Hazards behind curbs preferably should be located outside of the clear zone shown for uncurbed roadways (see Figure 35-2A).

As further discussed in Section 35-3, general IDOT policy is that roadside barriers are typically not warranted to shield hazards outside of the minimum required clear zone. This also applies to hazards outside of the obstruction-free area behind curbs. However, special conditions may indicate the need for a barrier where obstacles are present outside of the obstruction-free zone.

2. Rural Facilities. For specific field conditions, it may be acceptable to use mountable curbs on rural facilities; see Chapter 31. However, the clear zone will be determined assuming that the facility is uncurbed (i.e., the clear zone criteria presented in this Chapter will apply to all rural facilities whether curbed or uncurbed).

35-2.02(g) Auxiliary Lanes

Auxiliary lanes are defined as any lanes beyond the basic through travel lanes that are intended for use by vehicular traffic for specific functions. These include turn lanes at intersections, truck-climbing lanes, etc. The clear zone for auxiliary lanes will be determined as follows:

1. Turn Lanes at Intersections. Where the intersection is uncurbed, clear zones will be measured from the edge of the through lane based on the design speed and traffic volumes associated with the through travel lanes (i.e., the presence of the turn lane is ignored when determining clear zones). Where the intersection is curbed, the criteria in Section 35-2.02(f) will apply (i.e., the minimum obstruction-free zone is 1.5 ft (450 mm) from the gutter line).
2. Auxiliary Lanes Adjacent to Mainline. Two independent clear zone determinations are necessary. First, the designer calculates the clear zone from the edge of the through traveled way based on the total traffic volume, including the auxiliary lane volume. Second, the designer calculates the clear zone from the edge of the auxiliary lane based on the traffic volume in the auxiliary lane. The clear zone distance that extends farther will apply.

35-2.03 Front Slopes

Figure 35-2B illustrates the basic configurations for front slopes. Section 35-1 presents definitions of parallel front slopes that apply to clear zone determinations. Figure 35-2C presents schematics for these definitions, and the following discusses the clear zone application in conjunction with Figure 35-2A.

35-2.03(a) Recoverable Front Slopes

For parallel front slopes 1V:4H and flatter (Figure 35-2C(a)), the recommended clear zone distance can be determined directly from Figure 35-2A.

* * * * *

Example 35-2.03(1) (Recoverable Front Slope)

Given: Front Slope = 1V:4H
Design Speed = 50 mph
Design ADT = 3000

Problem: Determine the recommended clear zone distance.

Solution: From Figure 35-2A, the clear zone distance should be 20 ft.

* * * * *

RECOVERABLE PARALLEL SLOPE

NON-RECOVERABLE PARALLEL SLOPE

CRITICAL PARALLEL SLOPE

**CLEAR ZONE APPLICATION FOR SLOPES
(Uncurbed)**

Figure 35-2C

35-2.03(b) Non-Recoverable Front Slopes

For parallel front slopes steeper than 1V:4H but 1V:3H or flatter (Figure 35-2C(b)), the recommended clear zone includes a distance beyond the toe of the slope. Use the following procedure to determine the clear zone:

1. Determine the clear zone for a 1V:6H or flatter slope from Figure 35-2A for the applicable design speed and traffic volume.
2. If the clear zone extends beyond the break for the 1V:3H slope, provide a 10 ft (3 m) clear recovery area beyond the toe of the slope if sufficient right-of-way exists. It is not necessary to acquire additional right-of-way to provide the 10 ft (3 m) recovery area.

* * * * *

Example 35-2.03(2) (Non-Recoverable Front Slope)

Given: Front Slope = 1V:3H
Shoulder Width = 6 ft
Break in slope is at the edge of shoulder
Design Speed = 50 mph
Design ADT = 3000

Problem: Determine the recommended clear zone distance.

Solution: The procedure in Section 35-2.03(b) for non-recoverable front slopes is used as follows:

1. From Figure 35-2A, the clear zone for a front slope 1V:6H or flatter is 16 ft.
2. Because the clear zone (16 ft) exceeds the shoulder width (6 ft), the recommended clear zone distance beyond the toe of the non-recoverable slope (1V:3H) is 10 ft.

* * * * *

35-2.03(c) Critical Front Slope

A critical front slope is one on which a vehicle is likely to overturn. Front slopes steeper than 1V:3H are critical (Figure 35-2C(c)). If a front slope steeper than 1V:3H begins closer to the through traveled way than the suggested clear-zone distance for that specific roadway, a barrier might be warranted if the slope cannot readily be flattened. See Section 35-3.

35-2.04 Back Slopes

For back slopes without the presence of a roadside ditch (Figure 35-2C), the recommended clear zone distance for back slopes 1V:3H or flatter can be determined directly from Figure 35-2A. Back slopes steeper than 1V:3H are critical and Section 35-2.03(c) should be used.

Example 35-2.03(1) (Back Slopes)

Given: Back Slope = 1V:3H
No Roadside Ditch
Design Speed = 50 mph
Design ADT = 3000

Problem: Determine the recommended clear zone distance.

Solution: From Figure 35-2A, the clear zone distance should be 12 ft.

CLEAR ZONE APPLICATION FOR ROADSIDE DITCHES

Figure 35-2D

35-2.05 Roadside Ditches

Ditch sections as illustrated in Figure 35-2D are typically constructed in roadside cut sections without curbs. The applicable clear zone across a ditch section will depend upon the front slope, the type of ditch, the horizontal location of the toe of the back slope, and various highway factors. The designer will use the following procedure to determine the recommended clear zone distance:

1. Check Front Slope. Use Figure 35-2A to determine the clear zone based on the front slope if the front slope is 1V:4H or flatter. For slopes steeper than 1V:4H but 1V:3H or flatter, the clear zone is beyond the toe of the front slope.
2. Check Location of the Toe of Back Slope. Based on the distance from Step 1, determine if the toe of the back slope is within the clear zone. The toe of back slope is defined as the point at which the ditch ends and the (uniform) back slope begins. If the toe is at or beyond the clear zone, then the designer usually need only consider roadside hazards within the clear zone. If the toe is within the clear zone, Step 3 will apply to ditch sections in earth cuts.
3. Determine Clear Zone on Back Slope (Earth Cuts). If the toe of the back slope is within the clear zone distance from Step 1 above, a clear zone should be provided on the back slope. This clear zone will be the lesser of the following distances beyond the toe of the backslope:
 - 5 ft (1.5 m) beyond the toe of the back slope, or
 - the clear zone distance from Figure 35-2A measured from the edge of the traveled lane.
4. Clear Zones (Rock Cuts). In rock cuts with steep back slopes, no clear zone is required beyond the toe of back slope. However, the rock cut should be relatively smooth to minimize the hazards of vehicular snagging. If the face of the rock is rough or rock debris is present, a barrier may be warranted.

* * * * *

Example 35-2.05(1) (Ditch Section)

Given: Design ADT = 3000
V = 50 mph
Front Slope = 1V:4H
Ditch Width = 0 ft
Back Slope = 1V:3H
Toe of back slope is 10 ft from edge of traveled way.
See Figure 35-2E.

Problem: Determine the clear zone application across the ditch section.

Solution: Using the procedure in Section 35-2.05:

1. Check Front Slope. Figure 35-2A yields a clear zone of 20 ft for a 1V:4H front slope.
2. Check Location of the Toe of Back Slope. The toe of back slope is within the clear zone. Therefore, Step 3 applies.

**CLEAR ZONE AT DITCH SECTIONS
(Example 35-2.05(1))**

Figure 35-2E

3. Determine Clear Zone on Back Slope (Earth Cuts). Providing a clear zone for a distance 5 ft up the 1V:3H back slope yields a clear zone 15 ft from the edge of the traveled way. This is less than the 20 ft clear zone required for the front slope. Therefore, the 15 ft clear zone applies.

Example 35-2.05(2) (Ditch Section)

Given: Design ADT = 3000
V = 50 mph
Front Slope = 1V:4H
Ditch Width = 4 ft
Back Slope = 1V:4H
Toe of back slope is 16 ft from edge of traveled way.
See Figure 35-2F.

Problem: Determine the clear zone application across the ditch section.

Solution: Using the procedure in Section 35-2.05:

1. Check Front Slope. Figure 35-2A yields a clear zone of 20 ft for a 1V:4H front slope.

**CLEAR ZONE AT DITCH SECTIONS
(Example 35-2.05(2))**

Figure 35-2F

2. Check Location of the Toe of Back Slope. The toe of back slope is within the clear zone. Therefore, step #3 applies.
3. Determine Clear Zone on Back Slope (Earth Cuts). Providing a clear zone for a distance 5 ft up the 1V:4H back slope yields a clear zone of 21 ft from the edge of the travel way. This is more than the 20 ft clear zone required for the front slope. Therefore, the 20 ft clear zone applies.

35-3 TREATMENT OF ROADSIDE HAZARDS

35-3.01 Examples of Roadside Hazards

Examples of roadside hazards include:

- non-breakaway sign supports, non-breakaway luminaire supports, traffic signal poles, and railroad signal poles;
- concrete footings, etc., extending more than 4 in (100 mm) above the ground;
- bridge piers and abutments at underpasses and bridge parapet ends;
- culverts and headwalls;
- trees with diameters greater than 4 in (100 mm) (at maturity);
- rough rock cuts;
- large boulders;
- critical parallel slopes (i.e., embankments);
- streams or permanent bodies of water (where the normal depth of water \geq 2 ft (600 mm));
- non-traversable ditches;
- utility poles or towers;
- drainage appurtenances; and
- steep transverse slopes.

35-3.02 Range of Treatments

If a roadside hazard is within the clear zone, the designer should select the treatment which is judged to be the most practical and cost-effective for the site conditions. The range of treatments include:

- eliminate the hazard (flatten embankment, etc.);
- relocate the hazard;
- where applicable, make the hazard breakaway (e.g., sign posts, luminaire supports);
- shield the hazard with a roadside barrier;
- delineate the hazard; or
- do nothing.

35-3.03 Methodologies

35-3.03(a) General

The goal of any roadway project should be to eliminate all roadside hazards within the clear zone. When the hazard cannot be eliminated, efforts should be made to provide a treatment to minimize the impact of the hazard to the motorist or to provide a barrier to protect the motorist from the hazard. Whether objectively or subjectively, the decision will be based upon the traffic volumes, roadway geometry, proximity of the hazard to the traveled way, nature of the hazard, installation costs and, where applicable, crash experience. The following briefly discusses the decision-making methods for the treatment of roadside hazards.

35-3.03(b) BLRS Policy

For specific applications, the BLRS has adopted policies on the treatment of roadside hazards including the placement of roadside barriers or, in some cases, elimination of the requirement for a barrier.

For roads functionally classified as local with design ADT ≤ 400 , it is not necessary to install a roadside barrier even if it is not practical or cost effective to remove a roadside hazard from the clear zone. However, all hazards must be removed from the shoulder and protection must be provided at bridge rails in accordance with Section 35-3.08.

Roadside barriers also do not need to be provided on urban streets functionally classified as local. However, roadside hazards need to be removed from the shoulder or for a distance of 1.5 ft (450 mm) from the gutter line of the curb where provided at the edge of pavement.

35-3.03(c) Cost-Effective Method

Where practical, the designer should use an approved cost-effective methodology to analyze site-specific alternative safety treatments of a roadside hazard. This will provide an objective means to analyze the many factors that impact roadside safety, and will in theory allow the local agency to allocate its resources to maximize the safety benefit to the traveling public. It will also promote uniformity of decision-making for roadside safety throughout the local agency. IDOT generally uses the cost-effective methodology Roadside Safety Analysis Program (RSAP) presented in Appendix A of the AASHTO *Roadside Design Guide*.

35-3.03(d) Engineering Judgment Method

Based on engineering judgment, the designer should analyze the site to determine if the hazard can be eliminated or properly treated. By a "relative severity" assessment, the designer decides which is the greater hazard, the roadside barrier or the roadside hazard. Next, the designer subjectively evaluates the site-specific parameters (e.g., traffic volumes, design speed, location

of hazard, barrier installation costs) to determine if a barrier installation is a reasonable and practical solution. If yes, a barrier should be installed; if not, the do-nothing alternative is selected. For example, it would probably not be practical to install a barrier to shield an isolated point obstacle (e.g., a large power pole) located near the edge of the clear zone. The designer must realize that a barrier is also a hazard and, if a clear decision cannot be reached, the general rule of “when in doubt, leave it out” should apply.

It is acceptable to use engineering judgment to determine if a roadside barrier should be installed under one of the following conditions:

1. If the decision is obvious for a specific site, the designer may forego the use of a cost-effectiveness method and use the designer’s judgment to install or not install a roadside barrier.
2. If extenuating circumstances exist, the designer may override BLRS policies for barrier installation or the results of a cost-effective method and not install a roadside barrier. In this case, designers must document the reasons for their decision. This documentation should include crash histories for the section of roadway, traffic volumes, posted speed, and roadway geometry, if available. Send a copy of the documentation to the district for their concurrence in the decision not to provide a barrier.

35-3.04 Embankments

A roadside barrier is not required when the roadway embankment has a parallel front slope of 1V:3H or flatter. A barrier is also not required if the ADT is under 400. However, a roadside barrier may be needed because of other hazards located on the slope. A barrier will be provided when the fill heights exceed the values in Figure 35-3A for slopes steeper than 1V:3H.

Embankment Slope	Design ADT 400-1500	Design ADT Over 1500
1V:2H	10 ft (3 m)	6 ft (1.8 m)
1V:2.5H	20 ft (6 m)	9 ft (2.7 m)

EMBANKMENT FILL HEIGHTS REQUIRING ROADSIDE BARRIERS

Figure 35-3A

35-3.05 Roadside Ditches

Roadside barriers are not required solely to shield roadside ditches. However, barriers may be warranted to shield other hazards within the clear zone.

35-3.06 Transverse Slopes

Where a road or street intersects a side road or an entrance, a slope transverse to the road will be present. See Figure 35-3B. In general, transverse slopes should be as flat as practical. Figure 35-3C presents BLRS criteria for transverse slopes within the clear zone based on the type of facility and design speed. Figure 35-3C presents both desirable (i.e., flatter) and acceptable (i.e., steeper) transverse slopes. The application at a specific site will depend upon an evaluation of many factors, including:

- height of transverse embankment,
- traffic volumes,
- design speed,
- presence of culverts and practicality of treating the culvert end (see Section 35-3.07),
- construction costs, and
- right-of-way and environmental impacts.

Although the 1V:10H or 1V:6H transverse slopes may be desirable, its practicality may be limited because of drainage structures, width restrictions, and maintenance problems associated with the long tapered ends of pipes or culverts.

If the “acceptable” criteria in Figure 35-3C cannot be met, the designer should consider the installation of a roadside barrier.

35-3.07 Roadside Drainage Features

Effective drainage is one of the most critical elements in the design of a highway or street. However, drainage features should be designed and constructed considering their consequences to run-off-the-road vehicles. Ditches, curbs, culverts, and drop inlets are common drainage system elements that should be designed, constructed, and maintained considering both hydraulic efficiency and roadside safety.

In general, the following options, listed in order of preference, are applicable to all drainage features:

1. Design or modify drainage structures so that they are traversable or present a minimal hazard to an errant vehicle.
2. If a major drainage feature cannot effectively be redesigned or relocated, shielding by a roadside barrier should be considered.

The *Illinois Drainage Manual* discusses IDOT’s practices for hydrology and hydraulics and for the physical design of roadside drainage structures. Sections 35-3.07(b) and (c) discuss the safety design of these structures.

SECTION A-A

TRANSVERSE SLOPES ON A TWO-LANE, TWO-WAY ROADWAY

Figure 35-3B

Type of Facility	Desirable (V:H)	Acceptable (V:H)
Rural Facilities ($V \geq 50$ mph (80 km/h))	1:10	1:4
Urban Facilities ($V \geq 50$ mph (80 km/h))	1:6	1:4
Urban and Rural Low-Speed Facilities ($V \leq 45$ mph (70 km/h))	1:4	See Note

Note: A specific maximum acceptable transverse slope has not been included for low-speed facilities. This will be determined on a case-by-case basis based on the factors listed in Section 35-3.06.

RECOMMENDED TRANSVERSE SLOPES

Figure 35-3C

35-3.07(a) Curbs

Curbs are typically used to control drainage or to protect erodible soils. Chapter 31 and the *IDOT Highway Standards* provide detailed information on the warrants and types of curbs used by IDOT. Curbs may pose a roadside hazard because of their potential to adversely affect a run-off-the-road vehicle. When evaluating curbs relative to roadside safety, the designer should consider the following:

1. Design Speed. Facilities with a design speed greater than 45 mph (70 km/h) should be designed without curbs. However, if necessary, a mountable curb may be used at the edge of the shoulder. Facilities with a design speed of 45 mph (70 km/h) or less may use either a mountable or barrier curb.
2. Roadside Barriers. The use of curbs with a roadside barrier is discouraged and, specifically, curbs higher than 6 in (150 mm) should not be used with a barrier. It is acceptable to use the 2 in (50 mm) high M2 (M5) curb in conjunction with a roadside barrier. See Section 35-4.04.
3. Redirection. Curbs offer no safety benefits on high-speed roadways and should not be used to redirect errant vehicles.

35-3.07(b) Cross Drainage Structures

Cross drainage structures convey water beneath the roadway. However, if not properly designed, they may present a hazard to run-off-the-road vehicles. The available roadside safety treatments for cross culverts are:

- extend the culvert opening beyond the clear zone,
- provide a traversable end section,
- shield the culvert with a roadside barrier, or
- do nothing.

The following summarizes BLRS practices on the roadside safety treatment of cross drainage structures within the clear zone that are not shielded with a roadside barrier:

1. Pipe Diameter \leq 36 in (915 mm). For these pipe sizes, provide a pipe end treatment that matches the parallel slope.
2. Pipe Diameter $>$ 36 in (915 mm) to \leq 54 in (1400 mm). For these pipe sizes, provide a precast pipe end section with grate.
3. Pipe Diameter $>$ 54 in (1400 mm). For these pipe sizes, provide a special end section with a grate designed in accordance with the *AASHTO Roadside Design Guide*, or provide a roadside barrier.

For pipe arches and elliptical pipes, the pipe rise should be used, rather than the equivalent round diameter, to determine the safety treatment. For box culverts, special designs for the end treatment will be required depending on the rise and span of the culvert. The type of treatment should be similar to that discussed above for pipe culverts.

When it is not feasible to provide grates for a culvert terminating within the clear zone, consider extending the culvert beyond the clear zone. It may be possible to flatten the front slopes for a distance through the culvert area to decrease the required clear zone. In any case, the culvert must be extended as much as feasible within right-of-way and drainage constraints, or a roadside barrier must be provided. The end of any culvert terminating within the clear zone should be delineated. Each culvert location should be analyzed individually, and the treatment selected should be based on cost effectiveness, as well as right-of-way and environmental constraints and maintenance issues.

35-3.07(c) Parallel Drainage Structures

Parallel drainage culverts are those that are oriented parallel to the main flow of traffic. They are typically used under intersecting side roads, driveways, and field entrances. Because an errant vehicle will impact the structure at approximately 90°, parallel drainage structures represent a potential hazard. Therefore, the designer must coordinate their design with that of the surrounding transverse slope (Section 35-3.06) to minimize the hazard.

The following summarizes BLRS practices on the roadside safety treatment of parallel drainage structures within the clear zone that are not shielded with a roadside barrier:

1. Pipe Diameter \leq 24 in (450 mm). For these pipe sizes, a projecting end is acceptable.
2. Pipe Diameter $>$ 24 in (600 mm). For these pipe sizes, the safety treatment will depend upon the ADT and pipe diameter. See Figure 35-3D for general guidelines; the final treatment will be based on the site-specific conditions. Figure 35-3E presents a schematic of a design for grate protection of a parallel drainage structure. The bottom bar or pipe of the grate should be 4 to 8 inches (100 mm to 200 mm) above the culvert invert. This will reduce wheel snagging if an errant vehicle impacts the pipe end. Grates are only required on the approach end to the nearest lane of traffic. Grates are desirable on the departure end and near or within curves.
3. Pipe Arches and Elliptical Pipes. The pipe rise should be used rather than the equivalent round diameter to determine the appropriate end treatment in accordance with the above practices.
4. Box Culverts. The distance from the flow line of the culvert to the top of the headwall will be used in place of the pipe diameter to determine the appropriate treatment from Figure 35-3D. If the span of the box culvert is $>$ 5 ft (1.5 m), a special end treatment must be developed regardless of the height.

ADT	Pipe Size	Treatment
ADT \leq 1000	$>$ 24 in (600 mm)	End of pipe should match surrounding transverse slope; pipe opening can remain.
1000 $<$ ADT \leq 13,000	30 in (750 mm)	End of pipe should match surrounding transverse slope; pipe opening can remain.
	\geq 36 in (915 mm)	End of pipe should match surrounding transverse slope; provide end section with grates. See Note (1)
ADT $>$ 13,000	\geq 30 in (750 mm)	End of pipe should match surrounding transverse slope; provide end section with grates.

Notes:

- (1) Grates may be omitted on tangent sections in locations where debris clogging requires substantial maintenance attention to retain the required waterway opening. Justification shall be documented and retained in the project file.

SAFETY TREATMENT FOR PARALLEL DRAINAGE STRUCTURES

Figure 35-3D

GRATE PROTECTION FOR PARALLEL DRAINAGE STRUCTURES

Figure 35-3E

5. Eliminate Exposed Ends. Parallel drainage structures may be closely spaced because of frequent driveways and intersecting roads. In these locations, it may be practical to convert the open ditch into a closed drainage system and backfill the areas between adjacent driveways. This treatment will eliminate the ditch section and the transverse embankments with pipe inlets and outlets. However, care must be used to avoid creation of open frontage that would allow uncontrolled access.
6. Barrier. When the structure is too large to be safety treated effectively, it may be necessary to shield the obstacle with a traffic barrier.

35-3.08 Bridge Rails

An approaching roadside barrier (or approved terminal section) is required for all bridge rail ends closest to the flow of traffic, unless at least one of the following applies:

- The posted speed limit is less than 25 mph on an urban curbed section.
- The ADT is less than 150; the bridge is approach roadway width; and the bridge is on tangent alignment.
- A township or road district bridge is wider than the approaching roadway and the bridge is on tangent alignment.

The above exceptions do not apply if a design speed is chosen which exceeds the design speed shown in Figures 32.2A, 32-2A, 33-3A, or 33-3B.

For bridge rail ends on the opposite side (i.e., departure ends of two-way roadways), the need for shielding the end of the bridge will be determined by whether or not the bridge end is within the clear zone (as measured from the centerline of the traveled way) for the opposing flow of traffic.

35-3.09 Other Hazards

35-3.09(a) Roadside Sign Supports

Roadside sign supports located within the clear zone should be made breakaway. See Chapter 39 for more information.

35-3.09(b) Mailbox Supports

Mailbox supports are discussed in Chapter 41.

35-3.09(c) Utility Poles

Every effort should be made to eliminate or relocate all utility poles within the clear zone. When poles cannot be moved outside of the clear zone, consider shielding selected poles.

35-3.09(d) Trees

Trees with an expected mature size greater than 4 in (100 mm) are considered fixed objects. Consider the removal of an individual tree where it is determined that the tree is both an obstruction and to be in a location where they are likely to be hit. Because tree removal can be expensive and often has adverse environmental impacts, it is important that this countermeasure be used only when it is an effective solution. When a tree is in a vulnerable location and cannot be moved, consider a traffic barrier to shield the tree. However, a roadside barrier should only be used when the severity of impacting the tree is greater than impacting the barrier.

35-4 ROADSIDE BARRIERS

35-4.01 Types

The following Sections briefly describe allowable types and usages of roadside barriers commonly used on local agency projects. Barrier terminal and end sections used in conjunction with these barriers are also described. The *IDOT Highway Standards* presents the details on each system. Chapter 35 does not discuss median barriers and impact attenuators because of their infrequent use on local agency projects. They are discussed in Chapter 38 of the *BDE Manual*.

35-4.01(a) **Steel Plate Beam Guardrail**

The steel plate beam guardrail, commonly known as the “W”-beam system, will normally be used by a local agency for a roadside barrier. The steel plate beam guardrail with strong posts is a semi-rigid system. A major objective of the strong post system is to prevent a vehicle from “snagging” on the posts. This is achieved by using blockouts to offset the posts from the longitudinal beam and by establishing 6’-3” (1905 mm) as the maximum allowable post spacing.

IDOT has developed several variations of the steel plate beam guardrail for various applications:

1. Type A. The Type A guardrail uses the typical 6’-3” (1905 mm) post spacing, and is the most commonly used barrier system in Illinois. Type A guardrail has a deflection distance of 3 ft (920 mm).
2. Type B. The Type B guardrail uses a post spacing of 3’-1½” (953 mm) and has a deflection distance of 2 ft (600 mm). It is used where the deflection distance for the Type A system is unavailable. Type B guardrail may be installed when the distance from the back of guardrail posts to the embankment hinge point is 0 to 2 ft (0 to 0.6 m). The reduction in support from the embankment will increase the potential deflection of the system, and allowance for 3 ft (920 mm) deflection should be made when this design is used.
3. Type C. The Type C guardrail is a single rail that is attached directly to rigid objects where a 2 ft (600 mm) deflection distance cannot be provided and where it is necessary or desirable to carry the guardrail across the face of a structure. Limited applications of this type are expected. Normally, guardrail will be attached to concrete structures (e.g., piers) in a manner similar to that described in Section 35-4.02(b) for attachments at bridges.
4. Attached to Headwalls. IDOT has developed an adaptation of the steel plate beam guardrail specifically for attachment to concrete headwalls near the edge of the shoulder.

The height of all guardrail should be 27 in (685 mm) from the finished ground line to the top of the guardrail.

35-4.01(b) Cable Road Guard

Cable road guard is only used where the designer needs to inhibit unwanted vehicular encroachments. It should not be used as a roadside barrier.

35-4.01(c) Other Systems

Many other roadside barrier systems are available that may have application at specific sites (e.g., the thrie beam). The designer should reference the *AASHTO Roadside Design Guide* for information on these systems. IDOT must approve the use of any system not included in the *IDOT Highway Standards*.

35-4.02 Barrier Terminal Treatments

Barrier terminal sections present a potential roadside hazard for run-off-the-road vehicles; however, they are also critical to the proper structural performance of the barrier system. Therefore, the designer must carefully consider the selection and placement of the terminal end.

On NHS routes, existing safety features should at a minimum meet NCHRP 230 standards. However, it is desirable that the bridge railings, transitions, approach guardrail, and guardrail terminals meet NCHRP Report 350 criteria. Unique designs should be compared to accepted designs and will be approved on a case-by-case basis. For acceptable bridge railings and barriers, see the FHWA safety hardware website at www.fhwa.dot.gov/bridge/bridgerail/index.cfm under Bridge Railings or under Longitudinal Barriers (keyword: bridge railings). New designs shall meet NCHRP Report 350 criteria.

Transitions may be considered acceptable if the approach rail is nested (double rail element at the connection), the post spacing is reduced, and a rubrail or curb is present to minimize wheel snagging. Acceptable Report 230 transitions are identified in two FHWA Technical Advisories (1986 and 1993), and Report 350 transitions are on the FHWA website at www.fhwa.dot.gov/bridge/bridgerail/index.cfm under Longitudinal Barriers (keyword: bridge rail transitions). Unacceptable guardrail terminals on the NHS are blunt ends, turned-down ends and breakaway cable terminals (BCTs). Others meeting NCHRP Report 230 or 350 criteria should be acceptable.

For non - NHS routes, at a minimum bridge rail should be crashworthy, the approach rail should be adequately connected to the bridge rail, and the rail post spacing should be reduced to limit deflection. Nested railing is preferred, but not required. Terminals should be crashworthy with no blunt ends. Crashworthy terminals are preferred, and existing turn-downed ends and BCTs should be eliminated when practical. However, cost-effectiveness of replacement should be considered on low volume, low speed roads.

The *IDOT Highway Standards* present the design details for several end treatments allowed by the Central BLRS. Other proprietary terminal treatments are allowed under various specifications. The following Sections briefly describe each system and, where applicable, discuss typical uses of the system.

35-4.02(a) Guardrail Ends

The following terminals are applicable to the steel plate beam guardrail:

1. Type 1. This terminal section may be used on local agency highways, except locations on the National Highway System or locations where the traffic volumes exceed 6000 ADT and design speeds are in excess of 50 mph (80 km/h). The approach end of the terminal has a 4 ft (1.2 m) flare. The shoulder in the area of the terminal must be widened. See Standard BLR 23 for details.
2. Type 1, Special (Flared). This terminal section is intended for use with steel plate beam guardrail. All approved terminals meet NCHRP 350 criteria. The designer should choose a flared terminal where practical, if no additional right-of-way must be purchased for installation. The leading portion of the terminal is normally a gating design. Because of the gating function, the area behind and beyond the terminal should be relatively free of significant fixed objects. See the *IDOT Highway Standards* for a detail of the shoulder widening at the terminal.
3. Type 1, Special (Tangent). This is a terminal section intended for use with steel plate beam guardrail. All approved terminals meet NCHRP 350 criteria. Tangent terminals should be chosen in areas where the cross section or drainage structure would require additional right-of-way to accommodate the Type 1 Special (Flared) terminal. The leading portion of the terminal is normally a gating design. Because of the gating function, the area behind and beyond the terminal should be relatively free of significant fixed objects. See the *IDOT Highway Standards* for a detail of the shoulder widening at the terminal.
4. Type 1B. This terminal should be used at the approaching or departing (where practical) end of roadside barriers where appropriate cut or artificial mound conditions exist or can reasonably be constructed.
5. Type 2. This is an unflared terminal with a cable anchor. The Type 2 terminal should be used on the departing end of steel plate beam guardrail where end-on impacts are not a consideration.

35-4.02(b) Bridge Rail Connections

Roadside barriers are often terminated with a transition into a bridge rail. The connector terminal sections should be compatible with the bridge rail. Railing for locations on NHS routes

must meet the requirements of NCHRP 230 or 350 as discussed in Section 35-4.02. For other locations, selection should be based on consideration of cost and safety. Reference information on bridge railing is contained in the IDOT Bridge Manual, Section 3.2.14. The following terminals are used as bridge rail connections, and do not comply with NCHRP 350 unless noted herein:

1. Type 5. This connector terminal should be used to connect steel plate beam guardrail to the concrete bridge parapet or end post at the departing end of a new bridge, where this end is not within the clear zone of the opposing traffic.
2. Type 5A. This connector terminal is used to connect steel plate beam guardrail to a steel bridge rail at either the approach end or departing end of the bridge. For applications where compliance with NCHRP 350 is required, use Type 6A.
3. Type 5R. This connector terminal should only be used to connect steel plate beam guardrail to the concrete bridge parapet or end post at either the approach end or departing end of an existing bridge where the clear width of the bridge cannot be reduced.
4. Type 6. This connector terminal includes a transition section, special posts, blockouts, and an end shoe. It also requires the use of a curb on the approach. Use Type 6 to attach steel plate beam guardrail to the end(s) of bridges with concrete parapet. It may also be used to connect the steel plate beam guardrail to the face of the other concrete structures where the curb can be installed. Recent modifications to the design of this terminal have achieved compliance with NCHRP 350.
5. Type 6A. This connector terminal is similar to the Type 6, except it is used for attachment of steel plate beam guardrail to either curb-mounted steel bridge rail or to side-mounted steel bridge rail (two element rail systems approved under NCHRP 350). When used with a bridge rail system that includes a curb, a curb must be used with the Type 6A, similar to the Type 6. If there is no curb used on the bridge, do not use a curb with the Type 6A.
6. Type 6B. This connector terminal is used when connecting steel plate beam guardrail to the face of a concrete structure (e.g., a pier) and where the installation of a curb is either not possible or desirable. It requires blocking out the thrie beam rail of the transition by 8 in (200 mm) at the connection point. The designer must carefully weigh the relative merits of this potential loss of horizontal clearance against the complications of adding a curb when selecting between the Type 6B terminal and the Type 6 for attachment to a structure.
7. Type 8. This connector terminal includes a transition section, special posts, blockouts, and a turned-down connection to the top of the safety curb. Only use Type 8 on existing installations.

8. Type 10. This connector terminal should be used to connect steel plate beam guardrail to the departing end of existing bridges where this end is not within the clear zone of the opposing traffic.

35-4.03 Lateral Placement

Roadside barriers should be placed as far as practical from the edge of traveled way. This placement provides an errant motorist the best chance of regaining control of the vehicle without impacting the barrier. It also provides better sight distance, particularly at nearby intersections. The following factors should be considered when determining barrier lateral placement:

1. Shoulder. Typically, the roadside barrier is located at the edge of the shoulder such that the face of the barrier is flush with the shoulder hinge point.
2. Deflection. The dynamic deflection distance of the barrier, as measured from the back of the post, should not be violated. Section 35-4.01(a) provides the deflection distances for the types of roadside barriers typically used.
3. Shoulder Stabilization. Where a barrier is placed on high fills or highly erodible soils, it may be desirable to provide shoulder stabilization in accordance with the *IDOT Highway Standards*. IDOT's District Geotechnical Engineer should be consulted for guidance.
4. Slopes. Where a barrier is placed in front of slopes, the design should provide a minimum 2 ft (600 mm) width behind the guardrail to the slope break. This provides for post support, reduces erosion, and reduces maintenance needs. If a minimum 2 ft (600 mm) width cannot be provided, Type B guardrail may be used. See Section 35-4.01(a).
5. Shy Distance. Drivers tend to "shy" away from continuous longitudinal obstacles along the roadside (e.g., guardrail). Therefore, the lateral barrier offset should desirably be based on the criteria in Figure 35-4A.

US Customary		Metric	
Design Speed (mph)	Shy Line Offset (ft)	Design Speed (km/h)	Shy Line Offset (m)
60	7.9	100	2.4
55	7.2	90	2.2
50	6.6	80	2.0
45	5.6	70	1.7
40	4.6	60	1.4
35	4.1	50	1.1
30	3.6		

SUGGESTED SHY LINE OFFSET

Figure 35-4A

35-4.04 Placement Behind Curbs

If practical, roadside barriers should not be placed in conjunction with either barrier or mountable curbs. Where this is necessary, the following will apply (see Figure 35-4B):

1. Roadside Barrier/Curb Orientation. Ideally, the face of the barrier should be in line with the face of the curb (i.e., at the gutter line). However, this is not always practical. At a maximum, the barrier face should be no more than 1 ft (300 mm) from the face of curb. The height of the guardrail must be measured from the pavement or paved shoulder surface. In addition, the designer should consider reducing the curb height to 4 in (100 mm) and stiffening the rail to reduce vaulting potential. Rail stiffening may be accomplished by using Type B guardrail, by using a double nested Type A rail, or by bolting a W-beam to the back of the posts.
2. Lateral Placement. Figure 35-4B presents criteria to determine proper barrier placement behind curbs. If a barrier must be located in the zone not recommended, the designer must use the M2 (M5) mountable curb for design speeds greater than 30 mph (50 km/h). The 2 in (50 mm) height will introduce little or no vehicular vaulting, and therefore will not interfere with the proper vehicular/barrier interaction. The M2 (M5) curb will extend upstream from the end of the roadside barrier by a distance determined as indicated in Figure 35-4C.

US Customary		Metric	
Design Speed (mph)	Curb-to-Barrier (Zone A) Distance* (ft)	Design Speed (km/h)	Curb-to-Barrier (Zone A) Distance* (m)
≤ 30	NA	≤ 50	NA
35 – 40	8	60	2.5
45	10	70	3.0
≥ 50	See Note (1)	≥ 80	See Note (1)

*Values in table represent distance beyond which it is acceptable to place a barrier.

- Notes:
1. For design speeds ≥ 50 mph (80 km/h), curbs should not be used with a barrier.
 2. Barrier should be flush with curb as shown. At a maximum, the barrier face may be placed up to 1 ft (300 mm) behind curb. When placed behind the face of the curb, reductions in curb height and rail stiffening should be considered.
 3. If barrier must be placed in Zone A above, use the M2 (M5) curb. See Figure 35-4K.

PLACEMENT OF BARRIER RELATIVE TO CURBS

Figure 35-4B

USE OF ROADSIDE BARRIER WITH M2 (M5) CURB

Figure 35-4C

35-4.05 Placement on Slopes

Slopes in front of a barrier should be 1V:10H or flatter. This also applies to the areas in front of the flared section of guardrail and to the area approaching the terminal ends.

35-4.06 Barrier Flare

Flaring a roadside barrier away from the roadway has two benefits:

- the necessary length of need is reduced, and
- the barrier is less likely to be impacted.

The disadvantage is that a flare will increase the vehicular angle of impact. Figure 35-4D presents suggested flare rates for roadside barriers, which are intended to balance the advantages and disadvantages of flares.

Design Speed		Flare Rate for Barrier Inside Shy Line*	Flare Rate for Barrier Beyond Shy Line*	
(mph)	(km/h)		Rigid (Concrete)	Semi-Rigid (GR)
60	100	1:26	1:18	1:14
55	90	1:24	1:16	1:12
50	80	1:21	1:14	1:11
45	70	1:18	1:12	1:10
40	60	1:16	1:10	1:8
30	50	1:13	1:8	1:7

*See Figure 35-4A for shy line distances.

SUGGESTED FLARE RATES FOR BARRIER DESIGN

Figure 35-4D

35-4.07 Length of Need

A roadside barrier must be extended a sufficient distance upstream and/or downstream from the hazard to safely protect a run-off-the-road vehicle. Otherwise, the vehicle could travel behind the barrier and impact the hazard.

Many factors combine to determine the appropriate length of need for a given roadside condition. These include:

- the distance to the outside limit of the hazard (L_H) or the clear zone (L_C), whichever is less;

- the distance between the edge of traveled way and the barrier (L_B);
- the runout length (L_R), which is based on the design speed (V) and the traffic volume on the facility;
- the length of hazard (L_2), as measured parallel to the roadway;
- whether or not the barrier is on a flare (see Figure 35-4D); and
- on two-way facilities, whether or not the barrier needs to be extended to provide protection for the traffic in the opposing direction.

Figures 35-4E and 35-4F illustrate the variables that will determine the barrier length of need. Figure 35-4E applies to a two-way roadway where the hazard is not within the clear zone of the opposing direction of travel. Figure 35-4F applies to a two-way facility where the roadside hazard is within the clear zone of the opposing direction of traffic.

To determine the length of need, use the nomograph in Figure 35-4H and the following procedure:

1. Construct a horizontal line at L_B on the y-axis (the lateral distance of the barrier from the edge of traveled way). This assumes that the barrier is not flared (i.e., it is parallel to the roadway).
2. Locate L_H or L_C , whichever is less, on the y-axis.
3. Determine L_R from Figure 35-4G and locate L_R on the x-axis. If barrier protection is needed for only the approaching traffic, only use the scale marked "Edge of Traveled Way Scale." If needed for both directions of travel, locate L_R on both scales marked "Edge of Traveled Way Scale" and "Centerline Scale." See Step 7 to determine the downstream end of the barrier where the hazard does not require shielding for the opposing traffic.
4. Connect the points in Steps 2 and 3 with a straight line or two straight lines.
5. Locate the intersection(s) of the lines in Steps 1 and 4. From this point(s), draw a line vertically to the L_R Scale(s).
6. Read L_1 from the L_R Scale(s). As illustrated on Figures 35-4E and 35-4F, L_1 is measured from the lateral edge of hazard to the beginning of the end terminal (i.e., it does not include the terminal).
7. If barrier protection is only warranted for one direction of travel (Figure 35-4E), use the following procedure to determine the downstream end of the length of need:
 - a. Locate the distance (L_F) from the front of the hazard to the edge of traveled way on the y-axis.

- L_b = Distance to barrier
- L_c = Clear zone
- L_h = Distance to back of hazard
- L_f = Distance to front of hazard
- L_r = Runout length (see Figure 35-4G)
- L_1 = Length needed for approach end
- L_2 = Length of hazard
- L_3 = Length to be omitted from length of need

Notes:

- ① Use appropriate crashworthy terminal; see Section 35-4.02.
- ② Use acceptable anchorage terminal; see Section 35-4.02.

BARRIER LENGTH OF NEED LAYOUT
(Hazard Not Within Clear Zone of Opposing Traffic)

Figure 35-4E

- L_B = Distance to barrier
- L_C = Clear zone
- L_H = Distance to back of hazard
- L_F = Distance to front of hazard
- L_R = Runout length (see Figure 35-4G)
- L_1 = Length needed for approach end
- L_2 = Length of hazard

Note:

- ① Use appropriate crashworthy terminal. See Section 35-4.02.

BARRIER LENGTH OF NEED LAYOUT
(Hazard Within Clear Zone of Opposing Traffic)

Figure 35-4F

Design Speed		Traffic Volume (ADT)*			
		Over 6000	2000-6000	800-2000	Under 800
		Runout Length L_R ft (m)	Runout Length L_R ft (m)	Runout Length L_R ft (m)	Runout Length L_R ft (m)
Mph	(km/h)				
60	(100)	425 (130)	400 (120)	345 (105)	330 (100)
55	(90)	360 (110)	345 (105)	315 (95)	280 (85)

**Based on a 10 year projection from the anticipated date of construction.*

RUNOUT LENGTHS FOR BARRIER DESIGN

Figure 35-4G

- b. From this point, draw a line parallel to the 25° line in Figure 35-4H until it intersects the L_B line (Step 1).
 - c. Move down vertically to the L_R "Edge of Traveled Way Scale" and read L_3 .
 - d. As illustrated on Figure 35-4E, the L_3 distance is omitted from the length of need.
8. A barrier flare may be used to reduce the barrier length of need. Example 35-4.07(3) illustrates how to use Figure 35-4B to determine L_1 when the barrier is flared.
9. The length of need determined in the above steps must be adjusted to provide full 12'-6" (3.81 m) panels of guardrail. The length of guardrail required in advance of the hazard as determined in Steps 1 through 6 is always rounded up. The length to be omitted as determined in Step 7 is always rounded down.

The various traffic terminal end treatments may allow a portion of the terminal to be included in the length of need. Include any applicable portion when determining the location of the terminal.

Note: Centerline scale assumes a 12 ft lane width. For other lane widths, appropriate adjustments must be made.

BARRIER LENGTH OF NEED CALCULATION
(US Customary)

Figure 35-4H

Note: Centerline scale assumes a 3.6 m lane width. For other lane widths, appropriate adjustments must be made.

**BARRIER LENGTH OF NEED CALCULATION
(Metric)**

Figure 35-4H

Example 35-4.07(1) (Approach Rail Only)

Given: Design ADT = 7000
V = 60 mph
Slope = 1V:4H front slope
Tangent roadway
Shoulder width = 8 ft = L_B
 L_H = 25 ft
Two-way roadway
 L_F = 15 ft
Unflared barrier (steel plate beam guardrail, Type A) located at edge of shoulder

Problem: Determine the barrier length of need.

Solution: Using the procedure in Section 35-4.07, the following steps apply (see solution in Figure 35-4I):

1. L_B = 8 ft. Figure 35-4I illustrates the horizontal line.
2. From Figure 35-2A, L_C = 30 ft. Therefore, because $L_H < L_C$, locate L_H = 25 ft on the y-axis.
3. From Figure 35-4G, L_R = 425 ft. Locate point on "Edge of Traveled Way Scale."
4. Connect the points in Steps 2 and 3.
5. Draw the vertical line down to the L_R scale.
6. Read L_1 = 285 ft.
7. Use the procedure to locate the downstream end of the barrier length of need:
 - a. Locate L_F = 15 ft on the y-axis.
 - b. Draw a line parallel to the 25° line (see Figure 35-4I).
 - c. Draw a vertical line down to the L_R scale. Read L_3 = 18 ft.
8. Not applicable (i.e., no flare).
9. Round L_1 and L_3 as discussed to ensure only full-length panels of guardrail are used.

Example 35-4.07(2) (Approach and Departure Rail Needed)

Given: Design ADT = 5000
V = 60 mph
Slope = 1V:4H front slope
Tangent roadway

BARRIER LENGTH OF NEED CALCULATION
(Example 35-4.07(1))

Figure 35-4I

BUREAU OF LOCAL ROADS & STREETS**ROADSIDE SAFETY**

Aug 2006

35-4(18)

Shoulder width = 8 ft = L_B $L_H = 15$ ft

Two-way roadway

 $L_F = 10$ ft

Unflared barrier (use steel plate beam guardrail, Type B, due to lack of deflection distance) located at edge of shoulder

Problem: Determine the barrier length of need.

Solution: Using the procedure in Section 35-4.07, the following steps apply (see solution in Figure 35-4J):

1. $L_B = 8$ ft. Figure 35-4J illustrates the horizontal line.
2. From Figure 35-2A, $L_C = 20$ ft. Therefore, because $L_H < L_C$, locate $L_H = 15$ ft on the y-axis.
3. From Figure 35-4G, $L_R = 400$ ft. Locate point on "Edge of Traveled Way Scale" and "Center Line Scale."
4. Connect the points in Steps 2 and 3.
5. Draw the vertical line down to the L_R scales.
6. Read $L_1 = 186$ ft upstream from the hazard and $L_1 = 103$ ft downstream from the hazard.
7. Not applicable.
8. Not applicable (i.e., no flare).
9. Round L_1 upstream and downstream as discussed to ensure only full-length panels of guardrail are used.

Example 35-4.07(3) (Flared Barrier)

Given: Design ADT = 7000
 $V = 60$ mph
Slope = 1V:4H front slope
Tangent roadway
Shoulder width = 8 ft = L_B
 $L_H = 25$ ft
Two-way roadway
 $L_F = 15$ ft
Barrier (steel plate beam guardrail, Type A) with 1:20 flare

BARRIER LENGTH OF NEED CALCULATION
(Example 35-4.07(2))

Figure 35-4J

Problem: Determine the barrier length of need.

Solution: Using the procedure in Section 35-4.07 (adjusted for flare), the following steps apply (see solution in Figure 35-4K):

1. Figure 35-4K illustrates the location of barrier with 1:20 flare.
2. From Figure 35-2A, $L_C = 30$ ft. Therefore, because $L_H < L_C$, locate $L_H = 25$ ft on the y-axis.
3. From Figure 35-4G, $L_R = 425$ ft. Locate point on "Edge of Traveled Way Scale."
4. Connect the points in Steps 2 and 3.
5. Draw the vertical line down to the L_R scale. Read $L_1 = 135$ ft. *Note that, for the unflared barrier in Example 35-4.07(1), $L_1 = 285$ ft.*
6. Use the procedure to locate the downstream end of the barrier length of need:
 - a. Locate $L_F = 15$ ft on the x-axis.
 - b. Draw a line parallel to the 25° line (see Figure 35-4K).
 - c. Draw a vertical line down to the L_R scale. Read $L_3 = 18$ ft.
7. Flare rate has been used.
8. Round L_1 and L_3 as discussed to ensure only full-length panels of guardrail are used.

* * * * *

35-4.08 Minimum Length/Gaps

Short runs of barrier have limited value and should be avoided unless designed especially to shield a point hazard. Generally, a barrier should have at least 100 ft (30 m) of standard guardrail section exclusive of terminal sections and/or transition sections. Likewise, short gaps between runs of barrier are undesirable. Therefore, gaps of less than 200 ft (60 m) between barrier termini should be connected into a single run. Exceptions may be necessary for access.

BARRIER LENGTH OF NEED CALCULATION
(Example 35-4.07(3))

Figure 35-4K

35-4.09 Short-Radius Guardrail

A side road or entrance within the length of need of a guardrail installation poses a challenge to the design of a safe roadside. The most common approach to this situation has been to install a short-radius Type A guardrail around one or both of the roadway radius returns. However, a vehicle impacting the Type A guardrail at a high angle and speed may penetrate the barrier, or vault over the barrier as the posts lean back, creating a ramping effect. When penetration or vaulting does not occur, the vehicle will likely decelerate rapidly.

The designer should evaluate the following alternatives to installing a Type A guardrail on a short radius at intersections or entrances.

35-4.09(a) Relocate or Close the Intersecting Roadway/Entrance

Relocation or closure of the side road or entrance is the preferred solution over short radius guardrail, and should be considered during project scoping or during the Phase I preliminary engineering. This decision will involve consideration of project scope, cost, and impacts to adjacent properties and the environment. This alternative will not always be practical, but it will provide the most positive solution to the roadside safety issue. If this alternative is selected, additional consideration should be given to flattening side slopes, widening embankments, etc., to reduce the need for the barrier.

35-4.09(b) Terminate the Guardrail in Advance of the Intersecting Roadway/Entrance

When relocating or closing the roadway/entrance is not practical and where the nominal length of need may fall within the intersecting roadway (or just beyond), the designer may choose to truncate the standard guardrail with an approved terminal section in advance of the roadway. This will eliminate placing a short-radius guardrail in the intersection corner(s). Use this alternative where judgment or analysis indicates that this is preferable (e.g., flat slopes, minimal drop off) to the additional hazard posed by a short-radius guardrail installation.

35-4.09(c) Radius Guardrail

If relocating a roadway/entrance or terminating the guardrail short of its length of need cannot be accomplished, the designer may consider radius guardrail systems. Any radius guardrail system will impose constraints on how close it can be installed to a bridge, what radius can be used, and how far it must run along the intersecting side road.

Figure 35-4L presents an acceptable short-radius guardrail design. This design employs weakened Controlled Releasing Terminal (CRT) posts in the radius area. These weakened posts break away upon impact, allowing the rail to form a deep pocket to gradually decelerate and capture the impacting vehicle.

STEEL PLATE BEAM GUARDRAIL, SHORT RADIUS

Figure 35-4L

When terminating the radius guardrail system, the guardrail on the intersecting roadway should be completed to any required length of need and terminated with an appropriate end treatment. On a very low-speed roadway (e.g., private driveway), this may be a Type 2 terminal. On most public roadways, or other roadways where higher speeds are possible, a Type 1 terminal should be used.

To allow for proper system performance, the designer should be aware of several important constraints:

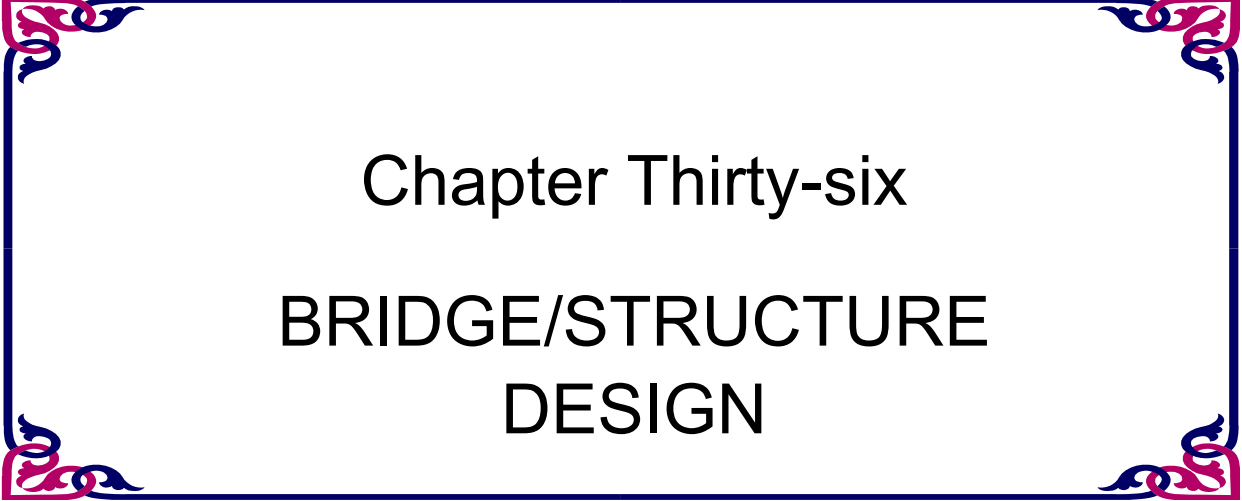

1. Intersection Angle/Radii. Use of the detail in Figure 35-4L is limited to the radii shown and to intersection angles of 85° to 95°. No extrapolations to radii shorter than 8'-6" (2.59 m) or longer than 35'-0" (10.67 m) should be attempted. Any job-specific designs for intermediate radii and/or other intersection angles should incorporate all features of posts, attachment, etc., and should use only full length guardrail panels, shop bent to the design radius in 5 ft (1.5 m) increments.
2. Deflection Distance. Because of the required deflection distance, this design requires a considerable clear area behind the radius and adjacent guardrail. This area is detailed on Figure 35-4L with the x and y coordinates.
3. Slope. The slope in front of the installation should not be steeper than 1V:15H. Before installing this detail where there is superelevation on the main roadway, perform a special analysis to determine the potential for vaulting of a vehicle.
4. Embankment. It is important to provide the 2 ft (600 mm) earth embankment behind the CRT posts to provide adequate bearing strength if hit. It is desirable that the slopes behind the guardrail not be steeper than 1V:2H.
5. Bridges. When used in close proximity to a bridge, this design should not be used unless there is room to install an approved transition to the bridge rail.
6. Debris. In crash testing, some heavy debris was observed flying about in the area behind the impact. Judgment must be used when installing these sections where people are likely to be present in the area behind the curved section.
7. Additional Protection. Because the short-radius guardrail system still represents some compromise in roadside design, the designer should attempt to shadow it from impacts. This can be done by applying a tangent run of guardrail (the minimum is two Type 1 terminals, back-to-back) on the approach side of the intersecting roadway.

If the CRT short-radius design in Figure 35-4L cannot be used at the site, the final option is to install the Type A guardrail on the required radius. Do not use the Type B guardrail. Because the use of the Type A guardrail is a compromise in roadside safety, the designer should attempt to shadow it from impacts. This can be done by applying a tangent run of guardrail (the minimum is two Type 1 terminals, back-to-back) on the approach side of the intersecting roadway.

BRIDGE/STRUCTURE DESIGN

36-1 GENERAL

36-1.01 Scope of Work Definitions

The scope of work for a bridge project may be any of the following:

1. Bridge Replacement. Replacement of the entire existing bridge (i.e., superstructure, substructure, and foundation).
2. Bridge Reconstruction. Replacement of all or most of an existing bridge with the same type, size, and location (i.e., same substructure locations, span lengths, and bridge width). The foundation may or may not be reused.
3. Existing Bridge to Remain in Place. If an existing bridge is structurally sound, meets the design loading capacity and the minimum width criteria for a structure to remain in place, and it is not a high-accident location, it is likely not cost effective to improve the geometrics of the bridge. When these conditions are met, an existing bridge can remain in place. In some cases, only the bridge substructure (e.g., abutments, piers) and/or foundation (e.g., footings, piles) may require rehabilitative work. These may also be considered existing bridges to remain in place for the application of geometric design criteria.
4. Bridge Rehabilitation. Major work on one or more of the components of an existing bridge (i.e., superstructure, substructure, and/or foundation).
5. Bridge Deck Rehabilitation. If the existing bridge deck is structurally deficient, it may be rehabilitated as part of a project. In addition, where the bridge deck is structurally sound but the width is inadequate (i.e., the bridge is functionally obsolete), the bridge deck may be rehabilitated solely to widen the bridge deck. Bridge deck widening may then require work to the superstructure and/or substructure.
6. Bridge Deck Repair. The existing bridge deck is structurally adequate and the width is adequate to remain in place, but partial and full-depth repairs are required and an overlay may be necessary to improve rideability and to maintain the integrity of the deck.
7. Bridge Rails/Transitions. For reconstructed bridges or rehabilitated bridge decks, the existing bridge rails and/or approaching guardrail-to-bridge-rail transitions may need upgrading to meet current IDOT criteria. For existing bridges to remain in place within the project limits, the local agency, Central BLRS, district, and/or Bureau of Bridges and Structures will evaluate the adequacy of the existing bridge rail to determine if it should

be upgraded. The roadway designer will evaluate the adequacy of the existing approaching bridge rail transition for needed upgrading.

36-1.02 Bridge Condition Report

A Bridge Condition Report (BCR) is used to identify deficiencies and establish scope of work necessary to rehabilitate an existing structure for all funding types, and to justify replacement of existing structures (including bridges, culverts, tunnels, viaducts, etc.) for Federal-Aid projects. A BCR is also required as justification for those structures that are to remain. When required by these criteria, submit a BCR to IDOT for review and approval prior to or with submittal of the Preliminary Bridge Design and Hydraulic Report (PBDHR). The BCR must be approved for approval of the PBDHR. For guidance on the content and preparation of the Bridge Condition Report, see Sections 10-2.03 and 22-2.06.

36-1.03 Preliminary Bridge Design and Hydraulic Report

The Preliminary Bridge Design and Hydraulic Report contain the necessary information for use by IDOT personnel to review the preliminary bridge design and to process the hydraulic reports for local agency bridge and culvert construction projects. For guidance on the content and preparation of the PBDHR, see Section 10-2.03 and 22-2.06.

36-2 STRUCTURAL DESIGN

Structures include such items as bridges, single and multiple cell culverts, retaining walls, and sign structures. Structural designs shall have the dated seal, signature, and applicable certification affixed to the first sheet of the structural plans, usually the General Plan and Elevation sheet. Exceptions to this requirement include pre-approved designs such as pipe culverts, retaining walls or other structures contained in the Standard Specifications or IDOT manuals.

36-2.01 IDOT Criteria

The Bureau of Bridges and Structures has adopted the current edition of the AASHTO *Standard Specifications for Highway Bridges* for structural design. Exceptions, clarifications, exclusions, and supplements to the AASHTO *Standard Specifications* are published in the *IDOT Bridge Manual* and its supplemental *Manuals*. The *IDOT Standard Bridge Plans* presents standardized plan sheets and designs that are commonly used for the preparation of precast concrete deck beam bridge projects. These documents and the *IDOT Standard Specifications for Road and Bridge Construction* collectively form the design controls for all structures in the State of Illinois.

36-2.02 Bridge Design for Local Agencies

It is highly recommended that the structural design of all local agency bridge projects follow the same criteria as that used for IDOT bridges. The following Sections present additional criteria applicable to local agency bridge projects.

36-2.02(a) Foundations/Substructures

The following will apply to the design of foundations and substructures for bridges on local agency projects:

1. Type. The foundation for a bridge normally consists of concrete or steel piling. Substructure piers and abutments should be steel and/or concrete. Other materials (e.g., treated timber) may be used. However, because of inferior past performance, the use of timber piles is not recommended.
2. Pile/Abutment Lengths. For information on pile and abutment lengths, see the *IDOT Geotechnical Manual*.

36-2.02(b) Bridge Deck Protection

To reduce the deterioration of bridge decks and to provide additional protection for bridge decks that are subjected to deicing agents, Figure 36-2A presents those protective measures that should be provided.

Type of Bridge Deck	Type of Protection	Without Deicing Agents	With Deicing Agents
Slab Floors (Poured-in-Place)	2 1/4 in ± 1/4 in (55 mm ± 5 mm) concrete cover over deck reinforcement	Required	Required
	Use of high-quality concrete	Required	Required
	Epoxy coated reinforcement bars in top mat of deck reinforcement	Required	Required
	Protective coat (linseed oil) on bare concrete areas	Recommended	Required
Precast Prestressed Concrete Deck Beams	Flowable, non-shrink, non-metallic grout in longitudinal keyways	Recommended	Required
	Placement of mortar fairing course and waterproofing membrane system prior to surfacing with bituminous overlay	Recommended	Required
	Bituminous Overlay	Recommended	Required
	Corrosion Inhibitor	Optional	Recommended

Note: Include a statement indicating whether or not the structure will be subjected to deicing agents in the project correspondence (see Form BLR 10210).

PROTECTIVE MEASURES FOR BRIDGE DECKS

Figure 36-2A

36-2.02(c) Seismic Design

Local agencies must use Division IA of the AASHTO *Standard Specifications for Highway Bridges*, latest edition, to evaluate the seismic design of all new and reconstructed bridges.

Preliminary earthquake analyses provide that single-span bridges included in the *Standard Plans, Precast Prestressed Concrete Deck Beam Bridges*, Illinois Department of Transportation, adopted April 4, 2005, meet the minimum requirements of the AASHTO *Standard Specifications* statewide. Multiple-span precast prestressed concrete deck beam bridges (PPCDB) utilizing the “Standard Plan” design may be used without additional analysis only in the parts of the State that fall in the SPC A. For multiple-span PPCDB located in SPC B and C, adequacy for seismic design should be evaluated on a project-by-project basis.

For more information on seismic design, see the *IDOT Bridge Manual*.

36-2.02(d) Scour Evaluation Criteria

The National Bridge Inspection Standards (NBIS) requires that bridges, exclusive of culverts, be evaluated for their potential for failure due to streambed scour. Culverts are exempted from scour evaluation requirements but should be carefully monitored if scour appears to be a problem. This scour critical evaluation must be performed in accordance with FHWA Technical Advisory 5140.23 and FHWA Hydraulic Engineering Circular No. 18 (HEC 18), both titled *Evaluating Scour at Bridges*.

The scour evaluation should include all effects of long-term stream stability, constriction of the channel by the structure, and local scour. Calculations to estimate potential scour depths will be limited to contraction and local pier scour only. The HEC 18 equations are unreliable for calculating local scour at abutments and should not be used for that purpose. The following applies:

1. Scour Design for New/Rehabilitated Bridges. New and rehabilitated bridges must be designed for scour estimated for a flood with a 100 year recurrence interval. The substructure and foundations design must ensure stability for scour as previously stated. New bridges will be designed so that coding for Item 113, Scour Critical Appraisal Rating, in the ISIS is "5", "8" or "9". Rehabilitation projects also allow a rating of "7". The bridge designer's name should be submitted to the district as the scour analyst to be recorded in the ISIS.
2. Scour Evaluation of Existing Bridges. Existing bridges must be evaluated or assessed for estimated scour from a superflood with an approximate 500 year recurrence interval. Scour estimated by the Rational Method or calculated using the equations from HEC 18 for existing bridges will be considered acceptable up to the limit of substructure failure (factor of safety equal to 1). Bridges with unknown foundations should be assessed according to existing conditions and sound engineering judgment.

Scour evaluations performed for existing bridges that are open to traffic and require an NBIS maintenance inspection will provide the basis for the coding of Item 113 in ISIS; see Section 6-4. This evaluation may be performed utilizing the "Bridge Scour Assessment Procedure (BSAP)" or the "Simplified Scour Evaluation Method (SSAM)." Information on these methods can be obtained from the Bureau of Bridges and Structures.

36-2.03 Bridge Rails**36-2.03(a) Projects on the National Highway System**

With two exceptions, bridge rails on new projects on the National Highway System (NHS) must be crash-tested and meet the performance criteria of NCHRP 350 *Recommended Procedures for the Safety Performance Evaluation of Highway Features*. The designer should note that the use of any curb or brush block in combination with a bridge rail must also meet NCHRP 350

criteria; i.e., the crash test must have been conducted on the combination curb/bridge rail configuration. Existing bridge rail shall at a minimum meet NCHRP 230 standards; however, it is still desirable to meet NCHRP 350 standards.

The following two exceptions apply to the use of NCHRP 350-approved bridge rails on NHS projects:

- bridges with a current ADT less than 1000 vehicles per day, or
- bridges in urban areas where the regulatory speed limit is less than 40 mph (60 km/h) and the bridge and roadway cross section is a parapet/curb-and-gutter design.

For these two exceptions and with approval from IDOT, local agencies may use bridge rails that have not been crash tested to NCHRP 350 criteria on a case-by-case basis. All bridge designs must meet AASHTO criteria for loading and configuration. In areas where records indicate a number of crashes have previously occurred or where unique geometric conditions create a significant potential for crashes, the designer should evaluate the need for a crash-tested rail at these sites.

36-2.03(b) Non-NHS Projects

For bridge projects on other than NHS routes, reference is made to the NCHRP 350 criteria for the designer's use. All bridge designs must meet AASHTO criteria for loading and configuration. In areas where records indicate a number of crashes have previously occurred or where unique geometric conditions create a significant potential for crashes, the designer should evaluate the need for a crash-tested rail at these sites.

36-2.04 Utility Attachments

36-2.04(a) General

Utility facilities attached to highway structures present varying degrees of hazard to the road user and to the structure. Utility attachments are not recommended if there are other practical methods to provide utility accommodation; however, the local agency may grant approval for the accommodation of utilities on bridges based on an engineering study.

Section 36-2.04 addresses the requirements, limitations, procedures, and assessment of charges for the permitted attachment of utility facilities to bridges or traffic structures on or over public highways in Illinois. The provisions of this Section are applicable to both existing and proposed bridges for the attachment of a new utility, the expanding of an existing utility attachment, or the voiding of an existing permit for a utility attachment.

The approval of an application for a utility attachment to a highway structure should be based on:

BUREAU OF LOCAL ROADS & STREETS

Aug 2009

BRIDGE/STRUCTURE DESIGN

36-2(5) |

- the type, volume, pressure, or voltage of the commodity to be transmitted and the associated risk to the road user and the structure;
- the type, length, and value of the structure and its relative importance to the transportation system;
- the alternative routings available to the utility and their relative practicality;
- the proposed method of attachment;
- the degree of interference with bridge maintenance work;
- the aesthetic impact to the structure of the utility attachment; and
- the public benefit expected from the utility service compared to the risk of structural attachment.

Utilities should not be attached to structures when alternative locations are available. Alternative locations, separate from the bridge, include:

- underground,
- under stream,
- independent poles,
- cable supports, and
- tower supports.

The utility company must include the supporting data in its request to demonstrate the impracticality of alternative routing.

When the local agency requires the removal or adjustment of any existing utility attachment due to the renovation or removal of an existing bridge, the existing permit should be automatically voided. The issuance of a new Bridge Attachment Permit will acknowledge receipt of any assessment charge and will give the necessary permission to attach, operate, and maintain the facility. For a new structure, the permit should include an agreement for the period of construction, as well as a provision to attach, operate, and maintain the facility upon completion of the construction.

Approved cut-off facilities should be required at each end of the highway structure so that service through the facilities attached to the structure can be cut off in case of a crash or other occurrence requiring such interruption.

The local agency should require plans and specifications showing the size, weight per foot (meter), and proposed method of attachment of the utility elements and stating the type of commodity to be transmitted, the proposed pressure or voltage, and the proposed location of cutoffs adjacent to the structure.

Any anticipated expansion should be included in the permit.

HARD COPIES UNCONTROLLED

36-2.04(b) Acceptable Attachment Methods

If it is determined that there is no reasonable alternative location separate from the bridge, the following attachment locations will be considered in the following order of preference: 1) diaphragms, 2) beams, and 3) deck. However, in any case, attachment to main structural members or to the deck will only be allowed when the structural integrity of the structure is not impaired.

Where utility attachment is necessary, the following general practices should be followed:

1. For existing structures, locate the attachment below the floor of the structure between beams or girders and above the lowest structural member.
2. For new structures, consider the utility conduits in the structure design.
3. Design supports and hangers to clamp or bolt without drilling to steel and prestressed or post-tensioned concrete structural elements.
4. Design inserts for hangers to be drilled into existing structures or cast into new structures in non-critical concrete areas (e.g., the floor slab). Inserts for new construction should be shown on the construction plans.

36-2.04(c) Attachment Methods Not Recommended

Utility installations transmitting volatile, flammable, corrosive, energized, or pressurized products (especially those under significant pressure) are the highest risk facilities, and attachments to bridges generally should not be permitted. In addition, the following practices or attachment methods are not allowed:

- burying conduit or cable in bridge deck slabs or sidewalks, except bridge lighting conduit may be allowed in the lower part of the parapet curb.
- drilling holes outside the middle third of the web of load-carrying structural steel elements,
- welding onto structural steel elements,
- drilling into prestressed or post-tensioned concrete supporting beams,
- casting inserts into the bottom of prestressed concrete members,
- attachments that will reduce critical clearances or freeboard,
- attachments outside the fascia of the bridge,
- gas pipelines over 4 in (100 mm) in diameter or having internal pressure exceeding 75 psig (520 kPa),
- more than one gas pipeline per structure, and

- pipelines carrying liquids or gases that are considered extraordinarily hazardous.

36-2.04(d) Additional Considerations

The following lists additional factors that should be considered for proposed utility attachments to bridges:

1. No attachment will be permitted that impairs inspection and maintenance procedures.
2. To preserve aesthetics, if a bridge is in a visible area, the utility should be attached underneath the structure, tucked in among the beams, rather than hooked to the outside.
3. To ensure a safe installation, the utility attachment should be on the downstream side of the bridge because, during floods, trees and other drift will occasionally strike the beams.
4. Because of maintenance work on bridge rails, do not allow attachments to bridge rails or the bolts used to fasten bridge rails to bridges.
5. Trenching operations that are so close to the bridge footings that there may be undercutting or sloughing must not be allowed.
6. Attachments to historic bridges should be coordinated with the applicable historic agencies (e.g., Illinois Historic Preservation Agency).
7. Seismic factors must be considered for proposed utility attachments.
8. Utility facilities may pass through free-standing abutments, but not those that move with temperature changes.
9. Installation of the utility must not interfere with the contractor constructing the bridge.
10. The following specifically applies to proposed pipelines on bridges:
 - For a pipeline installation to be approved, it must either be encased or extra strong. If the utility company proposes to meet this requirement by using higher strength pipe, the local agency should require certificates on the high-strength pipe.
 - Design the attachment to prevent discharge of the pipe product into the stream or river in case of pipe failure.
 - Using bridge members to resist forces caused by moving fluids will not be permitted.

36-2.05 Culverts

Section 38-3 discusses the structural design of culverts.

36-2.06 Retaining Walls

36-2.06(a) Preliminary Design

There are many different types of retaining wall systems (e.g., conventionally reinforced concrete, MSE, soldier pile, sheet pile) that can be used on transportation projects. The review of the preliminary design (TS&L review) is required for all walls that are a minimum of 10 ft (3 m) high, as measured from the top of the wall to the bottom of the footing or cast-in-place fascia. This submittal for review should include the configuration of the wall, type of construction, and soils borings. The number of borings and the detailed information required is described in the *IDOT Bridge Manual* and the *Geotechnical Manual*. This review submittal should be sent to the district for transmittal to the Local Bridge Unit and will be reviewed by the Foundation Unit of the Bureau of Bridges and Structures.

36-2.06(b) Final Design Plans

An Illinois licensed structural engineer shall design all retaining walls that are at least 10 ft (3 m) high, as described in Section 36-2.06(a). Pile-supported retaining walls on spread footing foundations will not require a review of the final plans because the pile type and loads have been reviewed during the initial review. Spread footing walls normally will not require a final plan review because the allowable bearing pressure is determined and shown on the TS&L during the initial design, with the understanding that the designer will later size the footing using this value. The district can generally accept these plans based on the licensed structural engineer's seal and certification.

Retaining walls other than conventionally reinforced concrete (e.g., soldier pile, sheet pile, MSE, soil nailed, gabion, bin, crib block double wall) that are 10 ft (3 m) or greater in height are less common and require the submittal of preliminary plans, and possibly final plans for review and approval for structural adequacy.

36-3 BRIDGE SIZING/GEOMETRICS

A variety of factors determine the appropriate size and cross section of a bridge under design. Section 36-3 discusses the geometric design elements pertaining to bridge design (e.g., bridges on horizontal curves, cross slopes). Section 36-4 presents typical sections for bridge overpasses and underpasses. Section 36-5 presents tables of geometric design criteria for bridges on local facilities.

The design criteria provided in Section 36-3 are applicable to all bridges on the local system located within the limits of a proposed improvement, except those bridges located within a 3R type improvement or where specific policy items are governed by other IDOT directions. Bridge widths for 3R type improvements are included in Chapter 33.

36-3.01 Bridge Width

See Sections 36-4 and 36-5 for bridge width criteria and application.

36-3.02 Bridge Length

36-3.02(a) Bridges Over Roadways

The roadway section passing beneath a bridge will determine the bridge length in combination with structural design elements (e.g., abutment type). The underpass opening will be based on the following roadway design elements:

- the underpass roadway width;
- the presence of sidewalks and/or bikeways;
- the presence of auxiliary lanes; and
- the horizontal clearance to obstructions (i.e., the roadside clear zone).

See Section 36-4 for typical underpass sections. For high unit cost bridges, the designer may consider locating abutments or piers on the right side of the roadway adjacent to the shoulder where the savings in structure cost could make the required barrier protection cost effective.

36-3.02(b) Bridges Over Waterways

Among other factors, bridge length over waterways is determined by considering local topography, hydraulic recommendations, geometric recommendations, geotechnical considerations, and structural factors. The locations and elevations of the bridge abutments are dependent on the method used to terminate the approach embankment and transition to the structure. Where a stable end slope terminates the embankment, an open abutment should be located at or near the top of the end slope. End slopes should be 1V:2H or as otherwise

established by a geotechnical stability analysis. Where the embankment is terminated at a vertical plane, a closed or earth-retaining abutment should be located at that plane. The use of an end slope to terminate the embankment results in a longer bridge than one using a closed abutment; however, overall bridge costs are generally lower with the open abutment design because of the high cost of closed abutments. Closed abutments are seldom economical where their height exceeds 10 ft (3 m) and should not be used without a detailed cost investigation.

36-3.03 Vertical Clearances

See Sections 36-4 and 36-5 for vertical clearance criteria and application.

36-3.04 Sidewalks and Bikeways

If pedestrian activity is anticipated, provide sidewalks on both sides of urban and suburban structures. The standard sidewalk width on structures is 5 ft (1.5 m). Where wider sidewalks exist on approaching roadways, sidewalk widths greater than 5 ft (1.5 m) may be considered.

If an approach roadway with a shoulder has a sidewalk that is to be carried across the bridge, a traffic barrier should be provided between the roadway and the sidewalk. For design speeds of 45 mph (70 km/h) or less, a curb may be placed at the edge of the bridge roadway and continued along the edge of the shoulder of the approach roadway. See Section 36-4 for a typical section.

Bikeways should be accommodated on the structure as described in Chapter 42.

36-3.05 Horizontal Curves

Superelevation transitions should be avoided on bridges and their approaches. Where a curve is necessary on a bridge, the desirable treatment is to place the entire bridge and its approaches on a flat horizontal curve with minimum or no superelevation. In this case, a uniform superelevation rate is provided throughout (i.e., the superelevation transition is neither on the bridge nor its approaches) or the normal crown section is maintained throughout the curve.

Where a bridge is located within a superelevated horizontal curve, the entire bridge roadway is sloped in the same direction and at the same rate across the deck (i.e., the shoulders or gutters and traveled way will be in a planar section). This also applies to the approach traveled way and the approach shoulder pavements. The approach traveled way and approach shoulders are illustrated in the *IDOT Highway Standards*. However, the high-side shoulder on a roadway section off the bridge should slope away from the traveled way at a rate such that the maximum shoulder rollover factor for the roadway classification and design traffic. To accomplish the longitudinal shoulder slope transition away from the bridge, the designer should refer to the applicable figure in Section 36-4. See Chapter 29 for more information on horizontal alignment.

If the bridge is built on tangent but the roadway is built on curve, an additional width may be necessary to provide the minimum horizontal clearance to the bridge rail.

36-3.06 Cross Slopes

The typical sections in Section 36-4 illustrate the cross slope criteria for bridges, which is typically 1.5% to 2.0% for the traveled way and 2.0% for the shoulders. This means that the shoulder cross slope (which varies from 4.0% to 8.0%) on the approaching roadway must be transitioned to meet the cross slope on the bridge. The rate of transition for the shoulder slope should be equal to a maximum relative longitudinal gradient of 0.4% between the edge of traveled way and the outside edge of shoulder.

For more information, see the *IDOT Bridge Manual*.

36-3.07 Grades

Where a bridge is not within the limits of a vertical curve and has a curb, the designer should provide a minimum longitudinal gradient of 0.5% across the bridge. Otherwise, a 0.0% gradient is acceptable for structures without curbs or those with curbs that have a superelevation.

36-4 TYPICAL SECTIONS

This Section presents typical sections for bridges on tangent or with superelevation; for roadways beneath bridges; and for highways passing over railroads. With the exception of cross slopes on bridges, the typical sections do not provide the numerical dimensions for the various cross section elements; i.e., these are nomenclature presentations. See Section 36-5 and Chapter 32 for the applicable numerical criteria.

The following typical section figures are included in this Section:

- Clear Roadway Width of Bridges for New and Reconstructed Rural Two-Lane Roads (Figure 36-4A).
- Clear Roadway Width of Superelevated Bridges on Rural Two-Lane Roads (Figure 36-4B).
- Clear Roadway Width of Bridges for New and Reconstructed Urban Streets with Raised-Curb Median (Figure 36-4C).
- Clear Roadway Width of Bridges for New and Reconstructed Roads and Streets with Bikeways (Figure 36-4D).
- Clear Roadway Width of Bridges for New and Reconstructed Two-Lane Urban Streets (Flush/Traversable Median) (Figure 36-4E).
- Clear Roadway Width of Superelevated Bridges on Urban Streets with Raised-Curb Median (Figure 36-4F).
- Clear Roadway Width of Superelevated Bridges on Urban Streets with Flush/Traversable Median (Figure 36-4G).
- Clear Roadway Width of Superelevated Bridges on Two-Lane Urban Streets (Figure 36-4H).
- Clearances for Bridges over Two-Lane Roads (Figure 36-4I).
- Highway Grade Separation over Railroad (Natural Ground Less Than 4 ft (1.2 m) Below Rail) (Figure 36-4J).
- Highway Grade Separation over Railroad (Natural Ground 4 ft (1.2 m) or More Below Rail) (Figure 36-4K).

CLEAR ROADWAY WIDTH OF BRIDGES FOR NEW AND
RECONSTRUCTED RURAL TWO-LANE ROADS

Figure 36-4A

Note:

Where a bridge lies within a horizontal curve with superelevation, the shoulder on the high side of the bridge (starting just off the end of the bridge approach shoulder pavement) will be gradually transitioned into the design slope of the shoulder on the approaching roadway. Also see the IDOT Highway Standards. This transition should be accomplished by providing a maximum relative longitudinal difference in gradient of 0.4% between the edge of the traveled way and the outside edge of the shoulder.

**CLEAR ROADWAY WIDTH OF SUPERELEVATED BRIDGES
ON RURAL TWO-LANE ROADS**

Figure 36-4B

Sidewalk — Both Sides

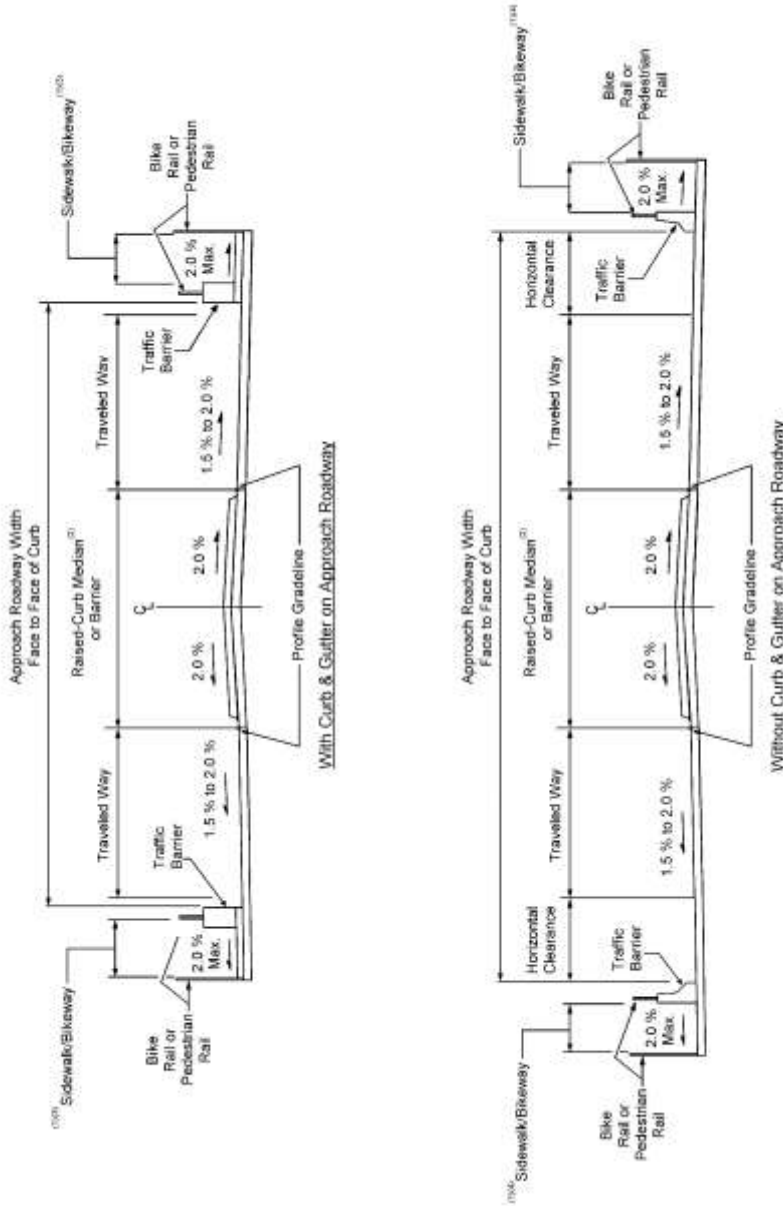

Sidewalks Not Provided

Note:

Where a flush/traversable median is used on the approach, a raised-curb median may be used across the structure where bridge decks are subject to frequent icing conditions.

**CLEAR ROADWAY WIDTH OF BRIDGES FOR NEW AND RECONSTRUCTED
URBAN STREETS WITH RAISED-CURB MEDIAN**

Figure 36-4C

Notes:

1. If bikeways are required on one side only, design the parapet, handrail, and bike rail as appropriate.
2. Where a flush/traversable median is used on the approach, a raised-curb median may be used across the structure where bridge decks are subject to frequent icing conditions.
3. Only consider this template under special warrant or conditions (e.g., vehicular posted speed limits of 45 mph or greater with high pedestrian volumes, concentration of elementary school children, designated off-road bikeways, or other demonstrated hazardous conditions).
4. Only consider this template with no curb and gutter on the approaches under special warrant or conditions (e.g., vehicular posted speed limits of 45 mph or greater with high pedestrian volumes, concentration of elementary school children, designated off-road bikeways, or other demonstrated hazardous conditions).

**CLEAR ROADWAY WIDTH OF BRIDGES FOR NEW AND RECONSTRUCTED
ROADS AND STREETS WITH BIKEWAYS**

Figure 36-4D

Note:

Where a flush/traversable median is used on the approach, a raised-curb median may be used across the structure where bridge decks are subject to frequent icing conditions.

**CLEAR ROADWAY WIDTH OF BRIDGES FOR NEW AND RECONSTRUCTED
TWO-LANE URBAN STREETS
(Flush/Traversable Median)**

Figure 36-4E

Note:

Where an urban bridge lies within a horizontal curve with superelevation, the gutter on the high side of the bridge (starting just off the end of the bridge approach pavement) is gradually transitioned into the design slope of the gutter on the approaching roadway. See the IDOT Highway Standards. This transition should be accomplished by providing a maximum relative longitudinal difference in gradient of 0.40% between the edge of the traveled way and the flow line of the gutter.

**CLEAR ROADWAY WIDTH OF SUPERELEVATED BRIDGES ON URBAN
STREETS WITH RAISED-CURB MEDIUM**

Figure 36-4F

Note:

Where an urban bridge lies within a horizontal curve with superelevation, the gutter on the high side of the bridge (starting just off the end of the bridge approach pavement) is gradually transitioned into the design slope of the gutter on the approaching roadway. See the IDOT Highway Standards. This transition should be accomplished by providing a maximum relative longitudinal difference in gradient of 0.40% between the edge of the traveled way and the flow line of the gutter.

**CLEAR ROADWAY WIDTH OF SUPERELEVATED BRIDGES
ON URBAN STREETS WITH FLUSH/TRAVERSABLE MEDIAN**

Figure 36-4G

Sidewalks - Both Sides

Sidewalks Not Provided

Note:

Where an urban bridge lies within a horizontal curve with superelevation, the gutter on the high side of the bridge (starting just off the end of the bridge approach pavement) is gradually transitioned into the design slope of the gutter on the approaching roadway. See the IDOT Highway Standards. This transition should be accomplished by providing a maximum relative longitudinal difference in gradient of 0.40% between the edge of the traveled way and the flow line of the gutter.

ON TWO-LANE URBAN STREETS**

Figure 36-4H

CONFIGURATION A

CONFIGURATION B

Functional Classification of Underpassing Highway	Current ADT or 20-Year DHV	Configuration	Minimum Vertical Clearance
Rural Arterial (New)	All ADTs	A	16'-6" (5.0 m)
Rural Arterial (Reconstruction)	All ADTs	A	16'-3" (4.9 m)
Urban Arterial	All ADTs	A	14'-9" (4.5 m)
Local Road or Collector	DHV > 200	A	14'-9" (4.5 m)
Local Road or Collector	DHV ≤ 200	B	14'-9" (4.5 m)
Local Road or Collector	ADT ≤ 400	B	14'-9" (4.5 m)

Notes:

1. Locate the upstream traffic end of a through pipe culvert outside the clear zone of the near edge of traveled way.
2. All horizontal dimensions are right-angle dimensions.
3. Locate the minimum clearance point at the least clearance point above the usable roadway under, including stabilized shoulders.

CLEARANCES FOR BRIDGES OVER TWO-LANE ROADS

Figure 36-4I

TYPICAL SECTION AT RIGHT ANGLE TO TRACK WHERE
NATURAL GROUNDLINE IS LESS THAN 4' (1.2 m) BELOW TOP
OF RAIL OR ANY ELEVATION ABOVE TOP OF RAIL (6)

Note: All horizontal dimensions are at right angles.

Notes:

1. Do not reduce without consent of the Railroad Company.
2. A vertical clearance of not less than 23 ft (7.0 m) above the top of rail shall be provided for all new or reconstructed highway bridges constructed over a railroad track. The Illinois Commerce Commission may permit a lesser clearance if it determines that the 23 ft (7.0 m) clearance standard cannot be justified based on engineering, operational, and economical conditions.
3. This dimension may be increased by up to 8 ft (2.4 m) on one side only, as may be necessary for off-track maintenance equipment when justified by the Railroad Company.
4. This dimension may be increased by up to 3 ft (1.0 m) where special conditions, such as heavy and drifting snow, are a problem.
5. Locate piers or columns so as not to encroach on drainage ditches.
6. Where natural ground is 4 ft (1.2 m) or more below top of rail, see Figure 36-4K.

HIGHWAY GRADE SEPARATION OVER RAILROAD
(Natural Ground Less Than 4 ft (1.2 m) Below Rail)

Figure 36-4J

TYPICAL SECTION AT RIGHT ANGLE TO TRACK WHERE NATURAL GROUNDLINE IS 4' (1.2 m) OR MORE BELOW TOP OF RAIL (6)

Notes:

1. Do not reduce without consent of the Railroad Company.
2. A vertical clearance of not less than 23 ft (7.0 m) above the top of rail shall be provided for all new or reconstructed highway bridges constructed over a railroad track. The Illinois Commerce Commission may permit a lesser clearance if it determines that the 23 ft (7.0 m) clearance standard cannot be justified based on engineering, operational, and economical conditions.
3. This dimension may be increased by up to 8 ft (2.4 m) on one side only, as may be necessary for off-track maintenance equipment when justified by the Railroad Company.
4. Locate piers or columns so as not to encroach on drainage ditches.
5. Intercepted drainage along railroad embankment shall be accommodated with a minimum 3 ft (900 mm) diameter culvert or carried along highway embankment.
6. Where natural ground is less than 4 ft (1.2 m) below top of rail, see Figure 36-4J.

HIGHWAY GRADE SEPARATION OVER RAILROAD
(Natural Ground 4 ft (1.2 m) or More Below Rail)

DESIGN CRITERIA FOR NEW OR RECONSTRUCTED⁽¹⁾ RURAL BRIDGES
Figure 36-5A (Metric)

Footnotes for Figure 36-5A

- (1) *Implies reconstruction of a significant length of existing highway either on new location or within existing right-of-way. For reconstruction of relatively short intermittent highway segments within a project, the design criteria used, where cost-safety effective, should be consistent with the adjacent highway design but not less than that allowed to remain in place.*
- (2) *The minimum bridge width shall not be less than the width of the approaching traveled way plus the paved portions of the shoulders.*
- (3) *Bridge widths for bridge rehabilitation projects are discussed in Chapter 33.*
- (4) *For reconstruction projects, where the minimum required shoulder widths on a structure can only be obtained with the addition of new beams and substructure, a cost-safety evaluation should be made to determine the appropriateness of providing the required width. Significant decreases of the required widths should not be considered.*
- (5) *Bridges remaining in place without a design exception approval when a safety record is satisfactory if the bridge is being gapped within a roadway section. Clear width between curbs or rails, whichever is less, should be equal to or greater than the approach traveled way width.*
- (6) *For bridges in excess of 100 ft (30 m) in length, a minimum bridge width of 30 ft (9.0 m) will be permitted.*
- (7) *For road district projects only, the bridge width may be 20 ft (6.0 m), and the design flood frequency may be 10 years for ADTs less than or equal to 150.*
- (8) *For reconstruction projects, the proposed low superstructure should not be below the existing superstructure unless 1 ft (300 mm) of clearance is achieved. Any proposed clearance less than 1 ft (300 mm) above design high-water elevation must be accompanied by a request for a design exception.*
- (9) *The minimum required vertical clearance must be available over the traveled way and any paved shoulders.*
- (10) *The design flood frequency may be 15 years for ADT under 250.*
- (11) *The design live load for bridges to remain in place only applies to minor rehabilitation and in-kind replacements (e.g. rail or joint repair, partial deck repair, individual stringer replacement, etc.). Other work, including deck replacement shall be considered new.*

Note: Traveled way width is the sum of the widths of all travel lanes. It is the larger of the value from Chapter 32 or, for existing bridges, the existing (or proposed) width of the approach traveled way.

DESIGN CRITERIA FOR NEW OR RECONSTRUCTED⁽¹⁾ URBAN COLLECTOR/LOCAL STREETS BRIDGES
Figure 36-5C (Metric)

Footnotes for Figure 36-5C

- (1) *Implies reconstruction of a significant length of existing highway either on new location or within existing ROW. For reconstruction of relatively short intermittent highway segments within a project, the design criteria used, where cost-safety effective, should be consistent with the adjacent highway design but not less than that allowed to remain in place.*
- (2) *Bridge widths for bridge rehabilitation projects are discussed in Chapter 33.*
- (3) *For urban bridges requiring sidewalks, the width of the sidewalks is 5 ft (1.5 m) unless a wider width is specified by the local agency.*
- (4) *Bridges remaining in place without a design exception approval when a safety record is satisfactory if the bridge is being gapped within a roadway section. Clear width between curbs or rails, whichever is less, should be equal to or greater than the approach traveled way width.*
- (5) *For reconstruction projects, the proposed low superstructure should not be below the existing superstructure unless 1 ft (300 mm) of clearance above design high water is achieved. Any proposed clearance less than 1 ft (300 mm) above design high water elevation must be accompanied by a request for a design exception.*
- (6) *The minimum required vertical clearance must be available over the traveled way and any paved shoulders.*
- (7) *The design live load for bridges to remain in place only applies to minor rehabilitation and in-kind replacements (e.g. rail or joint repair, partial deck repair, individual stringer replacement, etc.). Other work, including deck replacement shall be considered new.*

Note: Traveled way width is the sum of the widths of all travel lanes. It is the larger of the value from Chapter 32 or, for existing bridges, the existing (or proposed) width of the approach traveled way.

Chapter Thirty-eight

DRAINAGE DESIGN

Chapter 38 presents drainage design criteria specifically for local agency projects. For information on design procedures, the designer should reference the *IDOT Drainage Manual*. In addition, the *Illinois Drainage Code* (42 ILCS) provides the laws relative to rights of drainage, as well as those regarding the construction, maintenance, and repair of drains, ditches, and levees.

38-1 ROADSIDE DITCHES

In addition to Section 38-1, the designer should refer to the following in the *BLRS Manual*:

- Section 31-2 “Roadside Elements,” and
- Chapter 32 “Geometric Design Tables,” which presents criteria for the configuration of roadside ditches.

38-1.01 Definition

A roadside ditch is defined as an open channel paralleling the highway embankment within the limits of the highway right-of-way. Its primary function is to collect runoff from the highway and areas adjacent to the right-of-way and to transport this accumulated water to an acceptable outlet point. A secondary function of a roadside ditch is to drain the base of the roadway to prevent saturation and loss of support for the pavement.

38-1.02 Flood Frequencies

Flood frequencies for the design of ditches and ditch linings for rural roadways are given in Figure 38-1A. Figure 38-1B provides the flood frequencies for urban collector and local streets. For urban arterials, use a 30 year flood frequency for ditch designs and a 10 year flood frequency for ditch lining designs. The use of higher frequencies may be warranted in areas especially sensitive to flooding or erosion.

BUREAU OF LOCAL ROADS & STREETS

38-1(2)

DRAINAGE DESIGN

Jan 2006

Design Traffic	Flood Frequency Ditches	Flood Frequency Ditch Lining	
		Arterials	All Others
Under 400 ADT	15 years	10 years	5 years
ADT 400 - 2000	20 years	10 years	5 years
ADT over 2000	30 years	10 years	10 years

FLOOD FREQUENCIES FOR RURAL ROADWAYS

Figure 38-1A

Design Traffic	Flood Frequency Ditches	Flood Frequency Ditch Lining
Under 1000 ADT	15 years	5 years
ADT 1000 – 5000	20 years	5 years
Over 5000	30 years	10 years

Note: For all urban arterials, the flood frequency for ditches is 30 years and the flood frequency for ditch linings is 10 years.

**FLOOD FREQUENCIES FOR URBAN STEETS
(Urban Collectors and Local Streets)**

Figure 38-1B

38-1.03 Ditch Cross Section

Design features that should be considered include the following:

1. Depth. A depth of 2 ft (600 mm) for a standard trapezoidal ditch, or 1.5 ft (450 mm) for V-ditches where the ADT < 250, is recommended but not required. To provide adequate subbase drainage and to minimize the effect of freeze-thaw cycles on the pavement structure, the depth of the roadside ditch below the shoulder should be equal to the maximum depth of frost penetration for the locale.
2. Shape. Except for low-volume roads (under 250 ADT), all permanent ditches should be trapezoidal shaped with a bottom width of at least 2 ft (600 mm) or curved bottom ditches, which are ideal for hydraulic and safety purposes. Triangular ditches are highly susceptible to erosion and easily blocked by debris. When a ditch bottom width of over 4 ft (1.2 m) is used, the bottom should be sloped at 1V:20H toward the center of the

ditch. This "V"-shaped bottom will deter the forming of a meandering low-flow channel and will minimize standing water in the ditch.

3. Vegetation. Consider the difficulties associated with establishing and maintaining vegetation on steep slopes. Slopes steeper than 1V:2H may require special erosion control measures. In areas of very erosive soils, 1V:2H or even flatter slopes may require special attention.
4. Sideslopes. Sideslopes for ditches should comply with the design criteria for the road. See Chapter 31 for more detailed information.
5. Transitions. Changes between different ditch cross sections should be made with gradual transitions to avoid the creation of turbulent flow conditions and to improve the appearance of the finished project. Recommended transition rates are 25 ft per 1 ft (25 m per 1 m) change in ditch bottom width, and 100 ft (30 m) for each change in side slope from 1V:2H to 1V:3H, 1V:3H to 1V:4H, etc.

38-1.04 Ditch Gradient

To minimize ponding and silting accumulation, a grade of at least 0.3% should be provided on all roadside ditches. Grades in the range of 0.4% to 0.6% are usually more desirable. There is no upper limit on ditch gradients; however, the steeper the grade, the greater the expense may be for erosion control requirements.

38-1.05 Ditch Capacity

Analyze a proposed roadside ditch at critical locations to verify that it will provide adequate hydraulic capacity to carry the peak rate of runoff that is expected to occur with the design frequency. The Rational Method or the regression equations developed by the US Geological Survey are recommended methods for determining design discharges. See the *IDOT Drainage Manual* for guidance in determining discharges.

38-1.06 Ditch Linings

The investigation of the need for protective linings may be necessary for ditch design. If adequate protection is not provided, unsightly gullies appear, maintenance costs increase, and highway structures may be damaged. Include a lining if the side slope or bed material of the ditch will erode at the flow velocity that would occur during a storm that occurs with a flood frequency of 5 or 10 years. Use 10 years only if the design traffic is over 2000 ADT in rural areas and 5000 ADT in urban areas for collectors and local roads and streets. Use 10 years for all arterials; see Figure 38-1B. Note that ditch lining frequencies are lower than those used for other aspects of design, because the extra cost of protecting ditches against velocities of higher frequency floods almost always outweighs any resulting reduction in maintenance costs.

BUREAU OF LOCAL ROADS & STREETS

38-1(4)

DRAINAGE DESIGN

Jan 2006

A lining is recommended when the design velocity is above the values for bare soil as shown in Figure 38-1C.

Soil Type	Bare Soil ft/sec (m/sec)	With Grass ft/sec (m/sec)
Fine Sand (Non-Colloidal)	2.0 (0.6)	4.0 (1.2)
Sandy Loam (Non-Colloidal)	2.0 (0.6)	5.0 (1.5)
Silt Loam (Non-Colloidal)	2.5 (0.75)	6.0 (1.8)
Alluvial Silts (Non-Colloidal)	3.0 (0.9)	6.0 (1.8)
Ordinary Firm Loam	3.0 (0.9)	6.0 (1.8)
Fine Gravel	4.0 (1.2)	—
Alluvial Silts (Colloidal)	4.0 (1.2)	7.0 (2.1)
Stiff Clay (Non-Colloidal)	4.5 (1.4)	8.0 (2.4)
Graded Loam to Cobbles (Non-Colloidal)	4.5 (1.4)	8.0 (2.4)
Graded Silt to Cobbles (Colloidal)	5.0 (1.5)	8.0 (2.4)
Coarse Gravel (Non-Colloidal)	6.0 (1.8)	—
Cobbles and Shingles	7.0 (2.1)	—
Shale and Hard Pans	8.0 (2.4)	—

AVERAGE MAXIMUM PERMISSIBLE VELOCITIES

Figure 38-1C

If the design velocity for a grass-lined ditch is below the maximum permissible velocity for the soil with a grass surface, the ditch should be lined with sod, or it should be seeded and lined with a fibrous material (e.g., jute mat, other suitable measures) to protect the earth surface until the vegetation becomes established. If greater protection is required, provide a mechanical lining (e.g., riprap, bituminous material, concrete) or other suitable measures.

After the minimum limits of lining are established, each section of lining should be extended downstream a sufficient distance to allow the flow to slow down before it enters the unprotected or less protected ditch. Figure 38-1D provides the recommended lengths for this transitional lining.

Scouring Slopes*	Length of Transition
0% - 4%	25 ft (7.5 m)
4% - 6%	50 ft (15 m)
6% - 10%	75 ft (23 m)
Over 10%	100 ft (30 m)

* This is the ditch gradient at the lower end of the section of ditch where lining is required.

TRANSITIONAL DITCH LINING

Figure 38-1D

38-1.07 Outlet Treatment

The final step in designing a roadside ditch is the determination of any required special measures at the points where ditch flow is outletted onto adjacent properties. In general, if the flow conditions caused by the improvement will not cause “undue harm” to the downstream property, expensive protection measures are probably not warranted. The definition of “undue harm” must be left to the judgment of the designer.

For more detailed information, see the *IDOT Drainage Manual*.

38-2 STORM SEWERS

38-2.01 Design Procedures

Design the storm sewer system by determining the drainage area, computing the runoff using the Rational Method and computing the capacity using the Manning Equation. Other design methods may be used subject to district approval. The complete storm sewer design should meet the requirements in the following Sections. For more information, see the *IDOT Drainage Manual*.

38-2.02 Design Frequency

A 10 year flood frequency is recommended. For approved combined sewers in the city of Chicago, a 5 year frequency is permissible. A higher flood frequency may be used if consistent with the design standard of the local system.

At underpasses where the storm sewer system is the only outlet for stormwater, use a 25 year flood frequency.

38-2.03 Drainage Area

The drainage area eligible for MFT or Federal-aid funding will be the tributary area determined by the topography (natural drainage area) of the location. For interconnected systems, drainage will be determined based on conveyance through the project area from existing systems. Design the new system to accept the "Q" (discharge) of the adjacent system or the discharge needed solely for highway purposes, whichever is greater.

38-2.04 Pipe Size

The minimum size for storm sewers is 12 in (300 mm) for main lines and 8 in (200 mm) for lateral lines.

38-2.05 Location

When economically practical, locate storm sewers outside the roadway pavement. Where storm sewers are located under the pavement or within 2 ft (600 mm) of the pavement edge, provide for trench backfill and ensure the top of the pipe is at least 6 in (150 mm) below the bottom of the pavement structure. At other locations, provide a minimum cover of 3 ft (1 m).

38-2.06 Slopes

Maintain a uniform slope that provides a velocity between 3 and 10 ft/sec (0.9 and 3 m/sec). The minimum velocity allowed in storm sewer systems is 3 ft/sec (0.9 m/sec). A flatter slope that is sufficient enough to maintain a velocity of 2 ft/sec (0.6 m/sec) will be permitted only in special cases. Where it is necessary to exceed 10 ft/sec (3 m/sec), consider using drop structures.

38-2.07 Manholes

To permit the inspection, cleaning, and removal of obstructions, manholes should be located as follows:

- where two or more storm sewers converge,
- where pipe size changes,
- where an abrupt change in alignment occurs,
- where an abrupt change of the grade occurs, and
- at spacings meeting the criteria in Figure 38-2A.

Avoid placing manholes in the traveled way. Where it is necessary, do not place them in the normal wheel tracks, unless their avoidance is impractical. The designer should ensure that new or relocated manholes and inlets are not placed within accessibility routes based on the ADA criteria; see Section 41-6.

Pipe Size	Maximum Distance
8 in - 24 in (200 mm - 600 mm)	350 ft (100 m)
27 in - 36 in (675 mm - 900 mm)	400 ft (120 m)
42 in - 54 in (1050 mm - 1350 mm)	500 ft (150 m)
≥ 60 in (1500 mm)	1,000 ft (300 m)

MAXIMUM MANHOLE SPACING

Figure 38-2A

38-2.08 Catch Basins

Catch basins are designed to collect and distribute storm or surface waters. Most catch basins use an outlet pipe to disperse the water to a natural source of outlet. Some catch basins are designed with leaching chambers or pits to percolate in the soil.

The designer should check that the locations of the catch basins are located at low points of sags. The locations should also be checked to determine if conflicts exist with curb ramps, in-place utilities, approaches, or other features. For additional guidance on catch basins, see the *IDOT Drainage Manual*.

38-2.09 Inlets

Inlets should be spaced and designed so that diversion from the natural course will not occur. Inlets located at low points in the roadway grade should be designed to receive all flow presented to it. Provide two inlets at the low point of sag vertical curves. Inlets at other locations will allow overflow.

Combination curb-and-gutter grates are recommended for sump and debris-clogging locations (e.g., on a very flat grade). Gutter grates only are recommended for all remaining locations. For additional information on grate types, see the *IDOT Highway Standards*.

The following encroachment limitations are the maximum allowable for determining inlet spacing:

1. Shoulders. For sections with full shoulders (6 ft (1.8 m) or more), no encroachment is allowed in the travel lanes. The maximum spread is limited to the shoulder width.
2. Parking Lanes. For sections with permanent parking lanes, no encroachment is allowed into the travel lanes. The maximum spread is limited to the parking lane.
3. Two-Lane Streets. For sections with one lane in each direction, the maximum encroachment into the traveled way is 4 ft (1.2 m). However, where the surface width is less than 30 ft (9 m), then the maximum encroachment is 3 ft (1 m).
4. Multilane Streets. The following will apply:
 - a. Two or More Lanes in Each Direction. Maximum encroachment may be up to half of the outside travel lane.
 - b. Three or More Lanes in Each Direction. With one lane draining to the median, the maximum encroachment into the traveled way is 4 ft (1.2 m) on median side and a maximum half of the travel lane for the outside travel lane.

38-3 CULVERT DESIGN**38-3.01 General**

A culvert is a drainage structure consisting of a closed conduit that conveys water from a natural channel or waterway transversely under a roadway. General criteria for various classes of highway are outlined in Figure 38-3A. The design procedures in this Section should be followed for each design after identifying the basic criteria from Figure 38-3A.

Use the following general procedure when designing a culvert:

1. Obtain all necessary field data from survey books, USGS maps, contour maps, etc. Conduct a field inspection to verify design assumptions (e.g., effects of ponding, streambed elevations, size of existing culverts, size and volume of debris). A field reconnaissance is required for all large culverts, defined as 48 in (1200 mm) in diameter or greater.
2. Assemble the design features pertaining to the proposed roadway (e.g., profile grade, class and type of highway).
3. Assemble the design criteria for selection of the culvert (e.g., velocity; allowable headwater; design discharge; inlet and outlet conditions; slope, smoothness, and length of culvert).
4. Determine the volume of runoff from the drainage area using the *IDOT Drainage Manual*.
5. Determine the geometric proportions of the culvert required to accommodate the non-erodible runoff along the highway and abutting properties.

Maintained By	Usage (Road Class)	Kind of Drainage Structure Permitted	Minimum Permissible Diameter	Headwalls or End Sections
Local Agency	Across Road	Any one kind of pipe culvert may be specified to the exclusion of all other kinds.	24 in (600 mm) 18 in (450 mm) for Counties and Road District	Where needed
	Entrances		12 in (300 mm) 10 in (250 mm) for municipalities	

Notes:

1. *The width of roadbed for field and private entrances should not be less than 16 ft (5 m).*
2. *Multiple pipe installations that are 48 in (1.2 m) in diameter or larger should be spaced one-half diameter or 3 ft (900 mm) apart. Smaller pipe should be spaced 2 ft (600 mm) apart.*
3. *Where head room is critical, pipe arches will be permitted.*

GENERAL CULVERT DESIGN POLICIES

Figure 38-3A

38-3.02 Design Requirements

Design all across-road culverts to carry the design flood frequency discharge without property damage upstream or downstream. Culverts may be designed below head provided the property damage restriction is not violated.

Consider the following structural criteria as part of the culvert selection and design:

1. Minimum Culvert Lengths. The minimum allowable culvert length will be the roadway width (i.e., traveled way plus shoulder).
2. Clearance. Where there is too little cover above the top of culvert for circular pipes, consider the following alternatives:
 - box culverts,
 - elliptical reinforced concrete pipe,
 - corrugated structural plate pipe arches, and
 - multiple circular pipes of smaller diameter.

Select the appropriate alternative based on the hydraulic equivalent and economic analysis.

3. Earth Loads. Embankment fills up to 35 ft (10.5 m) above the top of pipe culverts are addressed in the *IDOT Standard Specifications for Road and Bridge Construction*, which specifies the class of concrete and thickness of metal to be used for various fill heights.

Fill heights in excess of 35 ft (10.5 m) require special design consideration and may result in the use of reinforced concrete box culverts installed by the "Imperfect Trench Method of Construction" or, in some cases, corrugated structural plates or pipe arches. In all cases of special design, an economic analysis of the various culvert alternatives should be made, including all acceptable methods of installation, before making a final selection.

4. Foundation Conditions. Where expensive structures will be constructed beneath high, wide fills, conduct foundation explorations to an appropriate depth (i.e., soil borings) to determine subsurface conditions and to check the uniformity of the material through the length of the culvert barrel. Consult with the District Geotechnical Engineer for guidance. See Section 36-2.02 for more information.
5. Culvert Rigidity. Structural adequacy of special non-standard design culverts should be confirmed by an Illinois licensed structural engineer.
6. Impact. For pipe culverts, provide a minimum cover of 6 in (150 mm) between the top of the pipe and the bottom of the pavement subbase. Check minimum fill height

requirements in the *IDOT Standard Specifications*. Reinforced concrete box culverts may be designed with no cover.

7. Erosion Control. Evaluate the potential for scour at the culvert outlet by determining outlet velocities. Provide channel protection if the average maximum permissible velocity for bare soil is exceeded.
8. Headwalls/End Sections. For culverts not typically requiring headwalls or end sections (see Figure 38-3A), several conditions may require their use. Headwalls and end sections may be required to:
 - reduce the length of culvert pipe,
 - meet hydraulic requirements, and/or
 - provide additional strength for the ends of corrugated metal pipes subject to crushing loads.

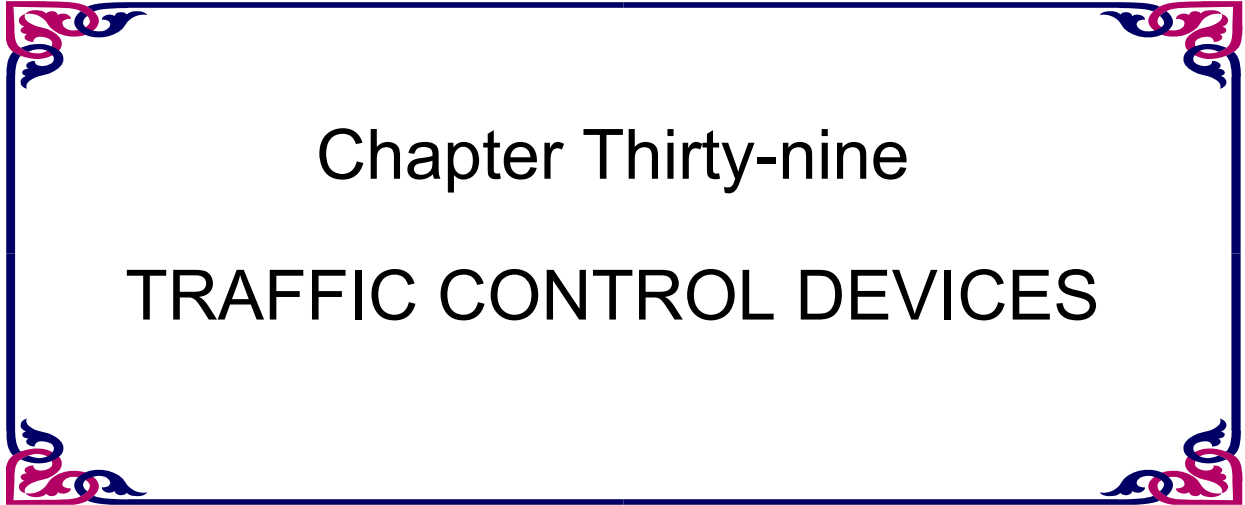

38-4 DRAINAGE AND LEGAL RESTRICTIONS

The following legal restrictions apply to drainage design:

1. Discharge of Sewage into Open Ditches. Section 605 ILCS 5/9-123 prohibits the discharge of sewage into open ditches along any public street or highway. Form BLR 38410 may be procured from the district for notifying violators of this law.

Effluent from septic tanks is not allowed to outlet within 10 ft (30 m) of the right-of-way.

2. Water Flow Interferences in Highway Ditches. Section 605 ILCS 5/9-117 prohibits encroachments by fencing, plowing, or ditching or in any other manner interfering with the flow of water in highway ditches. Written permission from a highway authority is required for changing drainage patterns by draining farmland into highway ditches that did not drain in that direction previously.

Chapter Thirty-nine

TRAFFIC CONTROL DEVICES

39-1 GENERAL

The purpose of traffic control devices, as well as the principles for their use, is to promote highway safety and efficiency by providing for the orderly movement of all road users on streets and highways throughout the nation. Traffic control devices notify road users of regulations, and provide warning and guidance needed for the safe, uniform, and efficient operation of all elements of the traffic stream. The *Illinois Vehicle Code*, 625 ILCS 5/11-303 and 5/11-304 establishes the responsibility for the erection and maintenance of traffic control devices on State highways and on local roads. Various other sections of Chapter 11 of the *Illinois Vehicle Code* deal with specific traffic regulations and control devices.

39-1.01 National Manual on Uniform Traffic Control Devices (MUTCD)

FHWA publishes *MUTCD*, which contains national design, application, and placement standards for traffic control devices. *MUTCD* is adopted in accordance with 23 U.S.C. 109(d) and 23 C.F.R. 655.603, and is approved as the national standard. This *Manual* contains the basic principles that govern the design and use of traffic control devices for all streets and highways open to public travel, regardless of type or class or the public agency having jurisdiction. All traffic control devices nationwide must conform to *MUTCD*.

39-1.02 Illinois Manual on Uniform Traffic Control Devices (ILMUTCD)

States must adopt *MUTCD*, along with any supplement that a State may require within two years of issuance by FHWA. The *Illinois Vehicle Code*, 625 ILCS 5/11-301 authorizes *ILMUTCD*. *ILMUTCD* consists of the national *MUTCD*, including subsequent official revisions, as amended by the *Illinois Supplement to MUTCD*. These publications are available on the IDOT website. In the interest of statewide uniformity, forward requests for interpretations, experimentation, and changes to *ILMUTCD* to the IDOT Central Bureau of Operations.

ILMUTCD is divided into parts covering various criteria applicable to all roads and streets. Part 5 specifically supplements and references the criteria for traffic control devices commonly used on low volume roads. A low volume road is considered to be outside built-up areas and has a traffic volume of less than 400 AADT.

39-1.03 ILMUTCD Text Headings

The *ILMUTCD* text is divided into four headings — standard, guidance, option, and support. Use the appropriate text to classify the nature of the information. *ILMUTCD* defines these headings as follows:

BUREAU OF LOCAL ROADS & STREETS
TRAFFIC CONTROL DEVICES

39-1(2)

Dec 2011

1. **Standard.** A standard is a statement of required, mandatory, or specifically prohibitive practice regarding a traffic control device. All Standard statements are labeled, and the text appears in bold type. The verb “shall” is typically used. The verbs “should” and “may” are not used in Standard statements. Standard statements are sometimes modified by Options. Standard statements shall not be modified or compromised based on engineering judgment or engineering study.
2. **Guidance.** This heading is a statement of recommended, but not mandatory, practice in typical situations, with deviations allowed if engineering judgment or engineering study indicates the deviation to be appropriate. All Guidance statements are labeled, and the text appears in unbold type. The verb “should” is typically used. The verbs “shall” and “may” are not used in Guidance statements. Guidance statements are sometimes modified by Options.
3. **Option.** This heading is a statement of practice that is a permissive condition and carries no requirement or recommendation. Option statements sometime contain allowable modifications to a Standard or Guidance statement. All Option statements are labeled, and the text appears in unbold type. The verb “may” is typically used. The verbs “shall” and “should” are not used in Option statements.
4. **Support.** This is an informational statement that does not convey any degree of mandate, recommendation, authorization, prohibition, or enforceable condition. Support statements are labeled, and the text appears in unbold type. The verbs “shall,” “should,” and “may” are not used in Support statements.

39-2 HIGHWAY SIGNING

39-2.01 Purpose and Responsibilities

The purpose of signing on local public agency (LPA) roads and streets is to ensure safety by providing for the orderly and predictable movement of motorized and non-motorized traffic throughout the local system, and to provide guidance and warnings as needed to ensure the safe and informed operation of the users of the system. Signs are essential to regulate and guide traffic over established routes, and to provide information concerning direction and destinations. Additionally, signs are used to warn of hazards that are not evident and to call attention to special regulations and restrictions. To be effective, a highway sign should meet the following minimum requirements:

- fulfill a need,
- command attention,
- convey a clear, simple meaning,
- command respect of road users, and
- provide adequate time for proper response.

Section 39-2 provides guidance regarding the use of highway signs on LPA roads and streets. The guidance provided must be used in conjunction with sound engineering judgment and *ILMUTCD*. Traffic control devices must be in compliance with *ILMUTCD* (625 ILCS 5/11-304). Placement of traffic control devices on township or road district roads is also subject to the written approval of the county engineer. Highway signing should be used only where warranted by facts and field studies. Failure to install and maintain proper signing on local highways and streets has resulted in liability suits involving municipality, county, and township employees, who are responsible for highways and highway signing. For additional information on highway signing material specifications, design, and application criteria, review the applicable publications listed in Section 39-6.

Economics frequently limit the ability to place all signs that may be needed. For this reason, it is important for roadway needs to be inventoried, identified, and prioritized so that such needs can be fulfilled. Consider the following when establishing priorities:

- safety hazards and driver and pedestrian safety,
- number, severity, and cause of crashes,
- volume of traffic, and
- availability of finances, manpower, equipment, and materials.

39-2.02 General Design Principles

39-2.02(a) Driver Expectancy

Drivers expect things to operate in certain ways. When a driver's expectancy is incorrect, either it takes longer to respond properly or the driver may respond poorly or incorrectly. Driver expectancy is affected by the type and function of road, and what the driver expects on a road is greatly influenced by what is experienced on the previous road section. The consistent use and placement of traffic control devices help ensure driver expectancy.

39-2.02(b) Positive Guidance

Positive guidance is the concept by which a driver can be given sufficient information where and when it is needed, and in a form that can be best used to avoid unsafe conditions. Positive guidance can be given to the driver through combinations of signs, hazard markers, "Safe Speed" advisory plates, and the view of the road ahead.

39-2.02(c) Consistency

Consistency relates to the "sameness" of the nature of the road from one section to another. Inconsistencies are sudden changes in the nature of the road. Physical improvements to the roadway are generally impractical. Consequently, signing is often used to warn the driver of the upcoming roadway inconsistency.

39-2.02(d) Location

Uniform placement of signs, although desirable, is not always practical, because roadway alignment and other factors often dictate a more advantageous location. When determining sign locations, consider the following:

1. Special Locations. Usually, signs should be placed on the right side of the roadway. Under certain circumstances, however, signs may be placed on channelizing islands or on the left side of the roadway along sharp, right hand curves. These signs should supplement the right hand signs.
2. Nighttime Visibility. Locate signs to optimize their nighttime visibility. Pay particular attention to the orientation angle of the sign face with respect to oncoming traffic.
3. Dual Signing. Single signing should be used unless a dual signing configuration is warranted. Consider dual signing on one way roadways (e.g., on both sides of the traveled way) for additional emphasis where a single sign may not provide adequate warning and where roadway geometry or other factors (e.g., multiple lanes, trucks, parked vehicles) may cause a single sign to be obscured.
4. Field Conditions. Adherence to desired placement is not always practical. Adjust sign locations to accommodate field conditions and try to avoid areas such as:
 - a. at short sags in the roadway,
 - b. beyond the crest of a vertical curve,
 - c. where a sign would be obscured by parked cars,
 - d. where a sign would create an obstruction for pedestrians or bicyclists,
 - e. where a sign would obscure visibility of hazardous locations,
 - f. where the visibility of a sign would be impaired by overhead illumination,

- g. where a sign would be vulnerable to roadside splatter, and/or
- h. at locations close to foliage where the sign face may be covered.

In some cases, signs can be shifted longitudinally without compromising their intended purpose, which may improve visibility.

5. Sign Groups. In general, signs are mounted on individual supports. However, it may be necessary to erect a sign grouping (e.g., route markings). Consider wind loading and breakaway post criteria when designing sign groups.
6. Advance Warning Signs. Warning signs are placed in advance of the conditions to which they apply. If the distances identified in *ILMUTCD* cannot be met, consider other measures to attract the motorist's attention to the sign (e.g., flashing beacons, distance plates).
7. Roadside Safety. Signs should have the maximum practical lateral clearance from the edge of the traveled way to provide safety of motorists who may leave the roadway and strike the sign support. Supports for ground mounted signs located within the clear zone must be made breakaway or yielding. Where practical, locate signs behind a roadside barrier that is warranted for other reasons. Provide adequate clearance to the back of the guardrail post to accommodate the barrier's dynamic deflection. Additionally, do not place breakaway sign supports in drainage ditches where erosion and freezing might affect the proper operation of the support. It is also possible that an errant vehicle entering the ditch might be inadvertently guided into a sign support.

39-2.03 Maintenance Considerations

Highway signs should be maintained in proper position and be kept clean and legible. Damaged signs should be replaced as soon as practical. Poorly maintained signs lose their effectiveness, and signs that are damaged, defaced, dirty, or missing are ineffective. To ensure adequate maintenance and reduce the potential for litigation, a schedule of inspections should be established, including nighttime inspections. Local agency personnel should also observe the signing on a daily basis as they drive the roads and streets for other purposes. Records of all signs, inspections, sign maintenance activities, and crashes should be maintained to help identify deficiencies. Pay particular attention to the following conditions:

- missing, damaged, obstructed, or hidden signs,
- absence of advanced warning signs, where needed (e.g., Stop Ahead, "T" intersection, railroads),
- signs placed at an improper height or angle, and
- sign faces that are worn or dirty with respect to reflectivity.

39-2.04 Sign Erection and Placement

Sign erection and placement criteria for highway signs are documented in *ILMUTCD*. Additional guidance may be found in the BLRS publication *Signing of Road District and Township Highways*, and the references listed in Section 39-6. The following is a summary of these criteria:

1. Height. Signs erected in rural areas should be mounted at a height of at least 5 ft (1.5 m) above the level of the pavement or roadway edge, measured to the bottom of the sign. In areas where there is parking, pedestrian traffic, or obstructions to view, the mounting height should be at least 7 ft (2.1 m) above the level of pavement or roadway edge. The height to the bottom of a secondary sign may be 1 ft (300 mm) less than these heights.
2. Lateral Clearance. The minimum offset of a sign should be 12 ft (3.6 m) from the edge of the traveled way to the near edge of the sign. If the shoulder is wider than 6 ft (3.6 m), the minimum offset should be 6 ft (1.8 m) from the edge of the shoulder. In urban areas, a lesser clearance may be used where necessary. Although 2 ft (600 mm) is the recommended minimum, in areas where sidewalk width is limited or where existing poles are close to the curb, a clearance of 1 ft (300 mm) is allowable.
3. Orientation. Signs should be vertically mounted at right angles to the direction of, and facing, the traffic that they are intended to serve. When mirror reflection from the sign face is encountered to such a degree as to reduce legibility, the sign should be turned slightly away from oncoming traffic at an angle of 2° to 5° greater than right angles. On curved alignments, the angle of placement should be determined by direction of approaching traffic rather than by the roadway edge at the point where the sign is located.
4. Posts and Mounting. Sign posts, foundations, and mountings must be constructed to hold signs in a proper and permanent position, and to resist swaying in the wind or removal by vandalism. A single post may be used for the erection of up to 24 in (600 mm) diamond shaped signs, signs with a horizontal dimension of 30 in (750 mm) or less, and individual signs with areas of 6.25 ft² (0.58 m²) or less. A double post installation should be used for signs that are larger. All posts should be breakaway. Breakaway supports for signs are designed to break or yield when struck by a vehicle. FHWA has adopted the testing parameters and criteria in the *AASHTO Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals* for determining acceptable breakaway performance. Any post design that has been evaluated and accepted by FHWA may be used. The following are acceptable types of sign posts typically used in Illinois:
 - tubular steel posts,
 - telescoping steel posts no greater than 2 ¼ in by 2 ¼ in (57 mm by 57 mm),
 - U-channel posts,
 - 4 in by 4 in (100 mm by 100 mm) wood posts, and
 - 4 in by 6 in (100 mm by 150 mm) wood post with the 6 in (150 mm) side parallel to the roadway with appropriately drilled holes to ensure that the post is breakaway.

In urban areas, it may be convenient to band or otherwise fasten signs to existing utility or light poles, with the approval of the appropriate utility company.

39-2.05 Retroreflectivity and Illumination

Regulatory, warning, and guide signs shall be retroreflective or illuminated to show the same shape and similar color by both day and night, unless specifically stated otherwise in *ILMUTCD*. The requirement for sign illumination shall not be considered to be satisfied by street or highway lighting.

Retroreflection of sign elements may be accomplished by means shown in Figure 39-2A.

Means of Retroreflection	Sign Element
Reflector buttons or similar units	Symbol Word Message Border
A material that has a smooth, sealed outer surface over a microstructure that reflects light	Symbol Word Message Border Background

RETROREFLECTION OF SIGN ELEMENTS

Figure 39-2A

Illumination of sign elements may be accomplished by means shown in Figure 39-2B.

Means of Illumination	Sign Element
Light behind the sign face	Symbol Word Message Background Symbol, word message, and background (through a translucent material)
Attached or independently mounted light source designed to direct essential uniform illumination onto the sign face	Entire sign face
Light emitting diodes (LED)	Symbol Word Message Portions of the sign border
Other devices or treatments that highlight the sign shape, color, or message: <ul style="list-style-type: none"> • luminous tubing • fiber optics • incandescent light bulbs • luminescent panels 	

ILLUMINATION OF SIGN ELEMENTS

Figure 39-2B

39-2.06 Maintaining Minimum Retroreflectivity

39-2.06(a) General

Retroreflectivity is one of a several factors associated with maintaining nighttime sign visibility. LPAs or officials having jurisdiction of regulatory, warning, and guide signs shall use an assessment or management method that is designed to maintain sign retroreflectivity at or above the established minimum levels in *ILMUTCD*.

39-2.06(b) Assessment or Management Methods

One or more of the following assessment or management methods should be used to maintain sign retroreflectivity:

1. Visual Nighttime Inspection – The retroreflectivity of an existing sign is assessed by a trained sign inspector conducting a visual inspection from a moving vehicle during nighttime conditions. Signs that are visually identified by the inspector to have retroreflectivity below the minimum levels should be replaced.
2. Measured Sign Retroreflectivity – Sign retroreflectivity is measured using a retroreflectometer. Signs with retroreflectivity below the minimum levels should be replaced.
3. Expected Sign Life – When signs are installed, the installation date is labeled or recorded so that the age of a sign is known. The age of the sign is compared to the expected sign life. The expected sign life is based on the experience of sign retroreflectivity degradation in a geographic area compared to the minimum levels. Signs older than the expected life should be replaced.
4. Blanket Replacement – All signs in an area/corridor, or of a given type, should be replaced at specified intervals. This eliminates the need to assess retroreflectivity or track the life of individual signs. The replacement interval is based on the expected sign life, compared to the minimum levels, for the shortest life material used on the affected signs.
5. Control Signs – Replacement of signs in the field is based on the performance of a sample of control signs. The control signs might be a small sample located in a maintenance yard or a sample of signs in the field. The control signs are monitored to determine the end of retroreflective life for the associated signs. All field signs represented by the control sample should be replaced before the retroreflectivity levels of the control sample reach the minimum levels.
6. Other Methods – Other methods developed based on engineering studies may be used.

The publication entitled “Methods for Maintaining Traffic Sign Retroreflectivity” (FHWA-HRT-08-026 November 2007) is available at www.fhwa.dot.gov/retro.

39-2.06(c) Exempt Signs

The following signs may be may excluded from the retroreflectivity maintenance guidelines:

- parking, standing, and stopping signs (R7 and R8 series),
- walking/hitchhiking/crossing signs (R9 series, R10-1 through R10-4b),
- Adopt-A-Highway signs,
- all signs with blue or brown backgrounds, and
- bikeway signs that are intended for exclusive use by bicyclists or pedestrians

39-2.06(d) Compliance Periods

Implementation and continued use of an assessment or management method that is designed to maintain regulatory and warning sign retroreflectivity at or above the established minimum levels in the *ILMUTCD* is required for LPAs by June 13, 2014. LPAs should consider using the same assessment and management method for replacement of street name signs and overhead guide signs that are identified as failing to meet the established minimum levels in the *ILMUTCD* by January 22, 2018.

39-2.07 Dimensions

The sign dimensions prescribed in the sign size tables in the *ILMUTCD* and in the “Standard Highway Signs and Markings” book shall be used unless engineering judgment determines other sizes are appropriate. The sizes shown in the minimum columns that are smaller than the sizes shown in the Conventional Road columns in the various sign size tables in the *ILMUTCD* shall only be used on low-speed roadways, alleys, and private roads open to public travel where the reduced legend size would be adequate for the regulation or warning, or where physical conditions preclude the use of larger sizes.

39-2.08 Regulatory Signs

39-2.08(a) General

Regulatory signs inform highway users of traffic laws or other regulations and indicate the applicability of legal requirements. These signs must be installed at or near those locations where the regulations apply and must be installed to provide adequate visibility and legibility in order to obtain compliance. All regulatory signs should be retroreflective or illuminated, consistent with current retroreflectivity standards. Signing criteria (e.g., dimensions, legend, shape, color, and placement) for various road classes and speeds are documented in *ILMUTCD* and the BLRS publication *Signing of Road District and Township Highways*.

39-2.08(b) Stop Signs

625 ILCS 5/11-302 grants local authorities and road district highway commissioners the authority to designate any street or highway under their jurisdiction as a through highway and to require all vehicles to stop or yield before entering or crossing the through highway. STOP (R1-1) signs should be used if engineering judgment indicates that one or more of the following conditions exist:

- at an intersection of a less important road with a main road where application of the normal right-of-way rule would not be expected to provide reasonable compliance with the law,
- on a street entering a through highway or street,
- at an unsignalized intersection in a signalized area, or
- at an intersection where a combination of high speed, restricted view, or crash records indicate a need for control by a STOP sign.

Where a full stop is not necessary at all times, give consideration to less restrictive measures (e.g., YIELD sign) before installing a STOP sign. Existing STOP sign locations should be reviewed periodically to determine whether, due to changed conditions, a less restrictive control could accommodate the traffic demands safely and more effectively.

STOP signs should not be used for speed control. Portable STOP signs shall not be used except for emergency situations and temporary traffic control purposes.

39-2.08(c) Multi-way Stop Signs

The decision to install multi-way stops should be based on an engineering study. The following criteria should be considered:

- as an interim measure where traffic signals are justified,
- 5 or more crashes in a 12 month period that are susceptible to correction by a multi-way stop;
- the total vehicular volume entering an intersection from both major street approaches averages at least 300 vehicles per hour for any eight hours of an average day, and the combined total vehicular, bicycle, and pedestrian volume entering from both approaches of the minor street averages at least 200 units per hour for the same eight-hour period with an average delay of at least 30 seconds per vehicle on the minor approaches (70% of the above minimum vehicular volume warrants if the 85th percentile speed exceeds 40 mph (60 km/h)).

Other criteria discussed in *ILMUTCD* may also be considered in an engineering study.

At intersections where all approaches are controlled by STOP (R1-1) signs, an ALL WAY supplemental plaque (R1-3P) shall be mounted below each STOP sign. Supplemental plaques with legends such as 2-WAY, 3-WAY, 4-WAY, or other numbers of ways shall not be used with STOP signs.

Plaques with the appropriate alternative messages of TRAFFIC FROM LEFT (RIGHT) DOES NOT STOP (W4-4aP) or ONCOMING TRAFFIC DOES NOT STOP (W4-4bP) should be used at intersections where STOP signs control all but one approach to the intersection, unless the only non-stopped approach is from a one-way street.

39-2.08(d) Yield Signs

The YIELD (R1-2) sign assigns right-of-way to traffic on certain approaches to an intersection. Vehicles controlled by a YIELD sign need to stop only when necessary to avoid interference with other traffic that is given the right-of-way. The YIELD sign may be erected at an entrance to an intersection instead of a STOP sign to give preference to traffic on a through street or highway designated in accordance with Section 625 ILCS 5/11-302. A YIELD sign may be used instead of a STOP sign if engineering judgment indicates that either of the following conditions exists:

- when the ability to see all potentially conflicting traffic is sufficient to allow a road user traveling at the regulatory speed to pass through the intersection or to stop in a reasonably safe manner, or

- at any intersection where a problem exists and where engineering judgment indicates the problem to be susceptible to correction by use of the YIELD sign.

39-2.08(e) Speed Limit Signs

The SPEED LIMIT (R2-1) signs are used to inform motorists of:

- the maximum statutory speed limit established in 625 ILCS 5/11-601, and
- altered speed limits established on the basis of an appropriate engineering and traffic investigation in accordance with 625 ILCS 5/11-604.

625 ILCS 5/11-604 empowers counties, municipalities, and park districts to establish speed limits on highways and streets for which they have maintenance responsibility. Counties also have this authority over township highways. The establishment of speed limits shall be based on an engineering and traffic investigation. The IDOT Bureau of Operations publication *Policy on Establishing and Posting Speed Limits on the State Highway System* or other established procedures may be used.

The following factors may be considered when determining speed limits:

- road surface characteristics, shoulder condition, grade, alignment, and sight distance,
- the 85th percentile speed and pace speed,
- roadside development and environment,
- parking practices and pedestrian activity, and
- reported crash experience for a recent 12 month period.

39-2.08(f) No-Passing Zones

The DO NOT PASS (R4-1) sign may be used at the beginning of, and at intervals within, a zone through which sight distance is restricted or where other conditions make overtaking and passing inappropriate. A NO PASSING ZONE (W14-3) sign may also be used on the left side of the roadway for additional emphasis. The PASS WITH CARE (R4-2) sign should be installed at the end of a no-passing zone if a DO NOT PASS (R4-1) sign has been installed.

39-2.08(g) Road Closed Signs

The ROAD CLOSED (R11-2) sign is used to mark roads closed to all traffic. A ROAD CLOSED – LOCAL TRAFFIC ONLY (R11-3) or ROAD CLOSED TO THROUGH TRAFFIC (R11-4) sign should be used where through traffic is not permitted or the closure is some distance beyond the sign, but the highway is open to local traffic up to the point of closure. These signs shall be preceded by the applicable Advanced Road Closed warning sign with the secondary legend AHEAD.

39-2.08(h) Weight Limit Signs

Weight limit signs are used on bridges and roadways where a weight restriction has been authorized. 625 ILCS 5/15-316 governs weight restrictions on roadways. A road district highway commissioner must obtain written approval from the county engineer prior to erection of weight restriction signs. 625 ILCS 5/15-317 governs weight restrictions on structures. The IDOT Local Bridge Unit establishes the numeric value of the maximum posted weight for LPA structures. See Section 2B.59 of the *ILMUTCD*.

39-2.08(i) Penalty for Dumping on Public Highways Signs

The use of the PENALTY FOR DUMPING ON PUBLIC HIGHWAYS sign is authorized by 605 ILCS 5/9-121. Consider its use only at locations where dumping is likely to occur. This sign should be located so as to provide the most efficient display of the message, either parallel or at a right angle to the pavement.

39-2.08(j) Engine Braking Signs

The use of the ENGINE BRAKING (R5-I106) sign is authorized by 625 ILCS 5/12-602.1. A county or municipality may furnish, install and maintain ENGINE BRAKING signs along streets and highways under their jurisdiction. The ENGINE BRAKING signs shall not be installed on freeways or interstate highways under the jurisdiction of the Department. With permission of the Department, the ENGINE BRAKING signs may be installed and maintained along roads or streets, other than freeways and interstates, under the jurisdiction of the Department in accordance with 625 ILCS 5/11-303(b).

39-2.08(k) Unsignalized Pedestrian Crosswalk Signs

The use of STOP HERE FOR PEDESTRIANS (R1-5b or R1-5c), IN-STREET PEDESTRIAN CROSSING (R1-6a), and OVERHEAD PEDESTRIAN CROSSING (R9-1a) signs are authorized by 625 ILCS 5/11-1002 at unsignalized pedestrian crosswalks. Therefore, signs using yield symbol or yield text (R1-5, R1-5a, R1-6, or R1-9) shall not be used at unsignalized pedestrian crosswalks.

39-2.09 Warning Signs**39-2.09(a) General**

Warning signs are used to alert traffic of existing or potentially hazardous conditions either on or adjacent to the roadway. Warning signs require caution on the part of the motorist and may call for an adjustment of speed or other maneuvers in the interest of their own safety and that of pedestrians and other motorists. The use of warning signs should be based on the results of an engineering study or engineering judgment.

Typical locations and conditions that may warrant the use of warning signs include:

- changes in horizontal alignment,
- intersections,
- advance warning of traffic control devices,

- converging traffic lanes,
- narrow roadways,
- changes in roadway design,
- steep grades,
- roadway surface conditions,
- in advance of railroad crossings,
- entrances and crossings,
- reduction in speed limits,
- no-passing zones, and
- road closures.

Because warning signs are primarily for the benefit of the driver who is unacquainted with the roadway, it is very important that care be given to the advance placement of these signs. The total time to perceive and complete a reaction to a sign is the sum of the times necessary for Perception, Identification (understanding), Emotion (decision making), and Volition (execution of decision), and is commonly referred to as the PIEV time. The PIEV time can vary from several seconds for general warning signs, to 6 seconds or more where high judgment is required. See *ILMUTCD* for the recommended minimum advance warning distances.

39-2.09(b) Horizontal Alignment Signs

The design and application of horizontal alignment warning signs to advise motorists of a change in the roadway alignment are addressed in Sections 2C.07 through 2C.15 of the *ILMUTCD*. In advance of horizontal curves on freeways, on expressways, and on roadways with more than 1,000 AADT that are functionally classified as arterials or collectors, horizontal alignment warning signs shall be used in accordance with Figure 39-2C based on the speed differential between the roadway's posted or statutory speed limit or 85th-percentile speed, whichever is higher, or the prevailing speed on the approach to the curve, and the horizontal curve's advisory speed. Horizontal Alignment Warning signs may also be used on other roadways, or on arterial and collector roadways with less than 1,000 AADT, based on engineering judgment.

A horizontal alignment Turn (W1-1) sign shall be used instead of a Curve (W1-2) sign in advance of curves that have advisory speeds of 30 mph or less. The use of an Advisory Speed Plaque (W13-1) may also be used to supplement any warning sign to indicate the advisory speed for a condition.

The Chevron Alignment (W1-8) sign is intended to provide additional emphasis and guidance to motorists as to sharp changes of horizontal alignment. Where used, locate these signs on the outside of the curve or turn, in line with and at approximately a right angle to approaching traffic. Spacing of the signs should be such that the motorist always has two in view until the change in alignment eliminates the need for the signs.

BUREAU OF LOCAL ROADS & STREETS

The One-Direction Large Arrow (W1-6) sign may be used as a supplement or alternative to the Chevron Alignment (W1-8) sign to delineate a change in horizontal alignment, or may be used to supplement a Turn (W1-1) sign or Reverse Turn (W1-3) sign to emphasize the abrupt curvature.

Type of Horizontal Alignment Sign	Difference Between Speed Limit and Advisory Speed				
	5 mph	10 mph	15 mph	20 mph	25 mph or more
Turn (W1-1), Curve (W1-2), Reverse Turn (W1-3), Reverse Curve (W1-4), Winding Road (W1-5), and Combination Horizontal Alignment/Intersection (W10-1) (see Section 2C.07 to determine which sign to use)	Recommended	Required	Required	Required	Required
Advisory Speed Plaque (W13-1P)	Recommended	Required	Required	Required	Required
Chevrons (W1-8) and/or One Direction Large Arrow (W1-6)	Optional	Recommended	Required	Required	Required
Exit Speed (W13-2) and Ramp Speed (W13-3) on exit ramp	Optional	Optional	Recommended	Required	Required

Note: Required means that the sign and/or plaque shall be used, recommended means that the sign and/or plaque should be used, and optional means that the sign and/or plaque may be used.

HORIZONTAL ALIGNMENT SIGN SELECTION

Figure 39-2C

39-2.09(c) Intersection Warning Signs

Intersection Warning (W2-1 through W2-6) signs may be used in advance of an intersection to indicate the presence of an intersection and the possibility of turning or entering traffic, and should illustrate or depict the general configuration of the intersecting roadway. Lines of different widths in the diagram may show the relative importance of the intersecting roads. The Cross Road (W2-1) and Side Road Symbol (W2-2 or W2-3) signs show side-road entering from the left and/or right and the angles of intersection. These signs should not generally be used on an approach where traffic is required to stop before entering the intersection. The “T” Symbol (W2-4) sign is intended to warn traffic approaching an intersection where the road ends at the intersection. It may be desirable to place a Two-Direction Large Arrow (W1-7) sign at the far side of the “T” in line with, and at approximately a right angle to, approaching traffic. A similar application of the “Y” Symbol sign applies to warning traffic approaching a “Y” intersection where the road continues in two directions.

39-2.09(d) Advanced Traffic Control Signs

The STOP AHEAD (W3-1), YIELD AHEAD (W3-2), or SIGNAL AHEAD (W3-3) sign shall be installed on an approach to a primary traffic control device that is not visible for sufficient distance to permit the driver to respond to the device. Obstructions causing limited visibility might include roadway alignment, structures, parked vehicles, and foliage.

STOP AHEAD signs on local roads that intersect with a State highway will usually be maintained by the local agency. If the local agency insists that IDOT maintain the signs, an agreement must be entered with the appropriate IDOT district. The agreement will allow IDOT to maintain the signs, but will require the local agency to perform all inspections and notify IDOT when maintenance is required. IDOT will not patrol the local agency's roads and streets for the purpose of inspecting the STOP AHEAD signs.

39-2.09(e) Speed Reduction Signs

In rural areas, a SPEED ZONE AHEAD (W3-5) sign should be used to inform motorists of a reduced speed zone when engineering judgment indicates the need for advanced warning to comply with the posted speed limit ahead. These signs are not usually used in urban areas due to relatively low speeds.

39-2.09(f) Road Narrows Sign

A ROAD NARROWS (W5-1) sign should be used in advance of a transition in lane width of a two lane road to a width so that vehicles might not be able to pass safely without reducing speed.

39-2.09(g) Narrow Bridge Sign

The NARROW BRIDGE (W5-2) sign should be used in advance of a bridge or culvert having a clear two way roadway width of 16 ft to 18 ft (4.9 m to 5.5 m), or any bridge or culvert having a roadway clearance less than the width of the approach pavement. Additional emphasis should be provided by the use of object markers or delineators on both sides of the approach roadway.

39-2.09(h) One Lane Bridge Sign

A ONE LANE BRIDGE (W5-3) sign should be used on two way roadways in advance of bridges or culverts having a clear roadway width of less than 16 ft (4.9 m). A ONE LANE BRIDGE sign should also be used where commercial vehicles constitute a high proportion of the traffic or the alignment limits the sight distance on the approach to a structure having a clear roadway width of 18 ft (5.5 m) or less. Object markers or delineators should also be placed on both sides of the approach roadway.

39-2.09(i) Advisory Speed Plaques

The Advisory Speed (W13-1) Plaque may be used to supplement any warning sign to indicate the advisory speed for a condition. The Advisory Speed Plaque shall be used where an engineering study indicates a need to advise users of the advisory speed for a condition. The advisory speed may be the 85th percentile speed, the speed corresponding to the 16° ball bank indicator, or a speed determined by an engineering study.

39-2.10 Special Speed Zones

39-2.10(a) School Area Signs

Use the SCHOOL SPEED LIMIT IS 20 MPH ON SCHOOL DAYS WHEN CHILDREN ARE PRESENT (S4-I100) sign to establish speed zones authorized under 625 ILCS 5/11-605. The

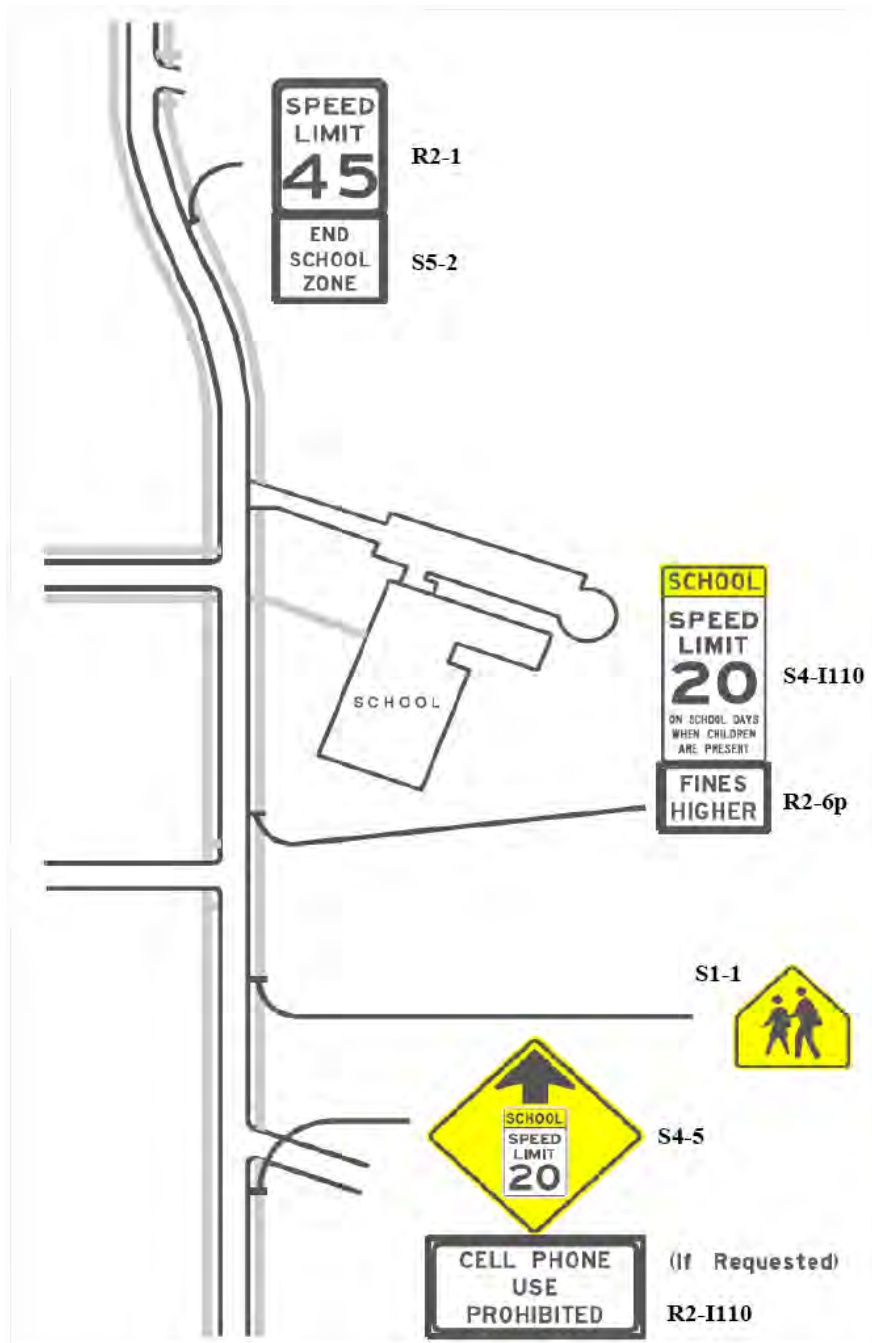

speed zone should be used where elementary through high school buildings, or grounds devoted primarily to normal school day activities, are adjacent to the highway, or where groups of children cross the highway enroute to and from a school not adjacent to the highway. Do not sign areas that are devoted primarily to athletic or other extracurricular activities as school speed zones. A SCHOOL (S1-1) sign shall be placed in advance of a school speed zone using *ILMUTCD* Table 2C-4 to determine the placement. In addition, a REDUCED SCHOOL SPEED ZONE AHEAD (S4-5, S4-5a) sign shall be placed in advance of the first school speed limit sign where the posted speed limit in the area is greater than 30 mph. This sign should be installed 500 to 600 ft (152 to 183 m) in advance of the school speed zone when practical. A FINES HIGHER (R2-6P) plaque shall be installed under the first school speed limit 20 mph sign. An END SCHOOL ZONE (S5-2) sign shall be installed at the end of the designated 20 mph school speed zone. Above this sign, a standard Speed Limit (R2-1) sign shall be installed to remind drivers of the regulatory speed limit. A CELL PHONE USE PROHIBITED (R2-I110) may be installed separately or under the SCHOOL (S1-1) sign. See Figure 39-2D for a typical application for school zone signage.

The School Crosswalk Warning assembly should be installed at marked crosswalks, including signalized locations used by students going to and from school, as determined by an engineering study. The School Crosswalk Warning assembly (S-1 with diagonal arrow) shall not be installed on approaches at crossings controlled by a STOP sign. Only crossings adjacent to schools and those on established school pedestrian routes may be signed. Where used, the sign will be erected at the crosswalk, or as close to it as practical.

The School Advance Warning assembly (S1-1 with supplemental plaque) should be used in advance of locations where school buildings or grounds are adjacent to the highway, except where a physical barrier (e.g., fencing) separates school children from the highway. The School Advance Warning assembly shall be used in advance of any installation of the School Crossing Warning assembly. If used, install the School Advance Warning assembly not less than 150 ft (45 m) nor more than 700 ft (210 m) in advance of the school grounds or school crossings.

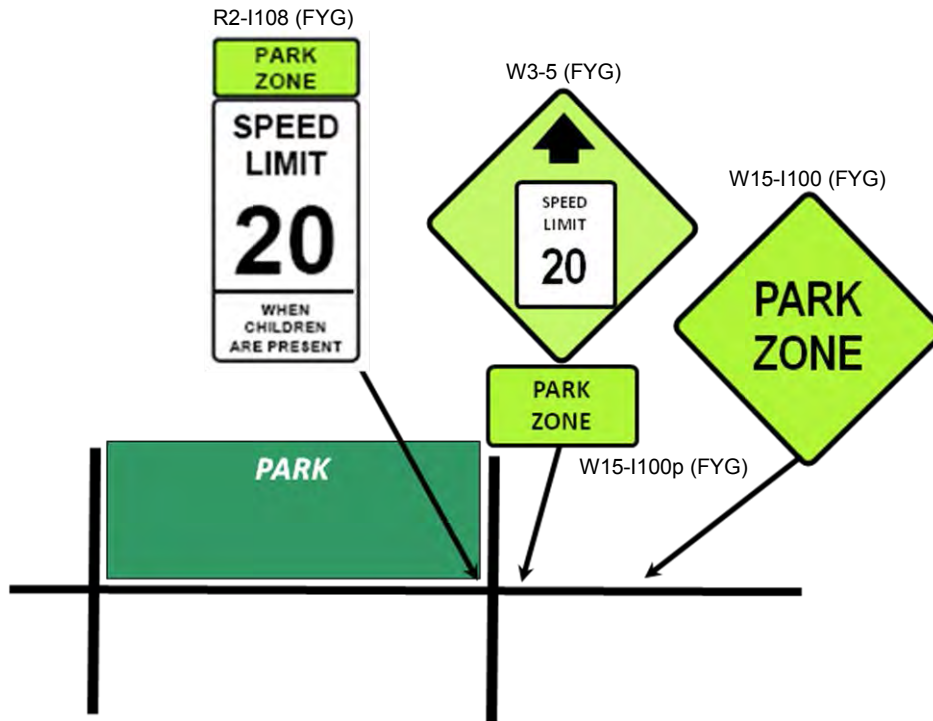

39-2.10(b) Park Zone Signs

The limited park speed zone authorized by 625 ILCS 5/11-605.3 may be established near the parks and recreation facilities and areas or any lands owned or operated by a park district that are used for recreational purposes, as well as on the portions of any street or intersection adjacent to a park zone that are under the control of a local agency and have been designated and approved by ordinance or resolution as a park zone street. If a street already has a posted speed limit lower than 20 mph, the lower limit may be used for that park zone street. Section 2B.170 and Section 2C.170 of the *ILMUTCD* establishes sign guidelines. See Figure 39-2E for a typical application for park zone signage.

TYPICAL SCHOOL ZONE SIGNAGE

Figure 39-2D

TYPICAL PARK ZONE SIGNAGE

Figure 39-2E

39-2.11 Railroad Crossing Signs

The Highway-Rail Grade Crossing Advance Warning (W10-1) sign shall be installed in advance of all at-grade railroad crossings, except:

- on low-volume, low-speed roadways crossing minor spurs or other tracks that are infrequently used and that are flagged by members of the train crews;
- in business or residential districts where active highway-rail grade crossing traffic control devices are in use, or
- where physical conditions do not permit even a partially effective display of the sign.

Additionally, if the distance between the railroad tracks and an intersection, measured from the edge of the tracks to edge of the parallel roadway, is less than 100 ft (30 m), install the Highway-Rail Crossing Advance Warning (W10-2, W10-3, or W10-4) signs on each approach of the highway that is parallel to the railroad. The purpose of these signs is to warn motorists turning at the intersection that a railroad crossing is ahead. A Railroad Crossing Advance Warning sign is not required on the approach to the crossing between the parallel highway and the tracks.

Install a XX FT BETWEEN TRACKS AND HIGHWAY Storage Distance sign on any approach to a railroad grade crossing where the distance between the rail closest to a subsequent STOP sign controlled highway intersection, and the intersection stop line is less than 81 ft (25 m). The distance shown is measured from a point 6 ft (1.8 m) from the rail closest to the intersection to the stop line or crosswalk, whichever is closest, rounded down to the nearest 5 ft (1.5 m). Where there is no stop line or crosswalk, the measurement is from a point 5 ft (1.5 m) from the edge of the closest through traveled lane. Do not use these signs at traffic signal controlled intersections except as an interim measure at any location with an intersection traffic signal, which will be changed to near-side intersections signals on the approach side of the tracks at the grade crossing at a future time.

See *ILMUTCD* and the BLRS publication *Signing of Road District and Township Highways* for design and placement details of Railroad Advance Warning signs.

39-2.12 Miscellaneous Signing

39-2.12(a) General

Guide signs are used to inform the motorist of intersecting routes, of cities, villages, or other important destinations, to identify nearby rivers and streams, parks, forests, and historical sites, and to give information that will help direct the motorist in the most simple, direct manner possible. Signs of this type, therefore, should be placed at locations where needed for driver guidance and direction. Once erected, it is essential that the guide sign be maintained.

The guide signs that are used most often on local agency roads are the destination, distance, and informational signs. These signs consist of a white message on a green background and must be retroreflective unless otherwise specified in *ILMUTCD*. Unlike most other types of signs, guide signs do not lose their effectiveness with frequent use. These signs should not contain so much information or be so close together that the driver will lose the messages.

39-2.12(b) County Route Numbering System

County highways are assigned route numbers. A county may elect to install route marking signs on this system of highways. County Route (M1-6) sign shall be used.

39-2.12(c) Rural Reference System

The Rural Reference System is a voluntary system that provides for the development of uniform reference points on rural county and township roads. Use of the Rural Reference System is recommended to provide orientation for non local travelers and can also be used as a rural address program. With this system, traffic crashes can be located with an accuracy of 0.1 of a mile (0.16 km). Signs are usually placed at each intersection and provide the location within the county. The reference system coordinates may be combined with the road name on the signs. The Street Name (D3-1) sign shall be used.

39-2.12(d) Street Name Signs

Street name signs should be installed at all street intersections in urban areas and should be installed in rural areas to identify important roads. The lettering for names of streets and highways on Street Name (D3-1) sign shall be composed of a combination of lower-case letters with initial upper-case letters. The only acceptable alternative background colors for Street Name (D3-1) sign shall be blue, brown, or white. Regardless of whether green, blue, or brown is used as the background color for Street Name (D3-1) sign, the legend (and border, if used) shall be white. For Street Name (D3-1) sign that uses a white background, the legend (and border, if used) shall be black.

39-2.12(e) Tourist Oriented Directional Signs

Pursuant and subject to 625 ILCS 5/11-304, local agencies may install signs alerting motorists of tourist oriented businesses that are on roads in rural areas under local agency jurisdiction. The decision to place or allow Tourist Oriented Directional Signing (TODS) on the local system rests with the local agency. Local agencies also have the authority to sell or lease space on these signs to the owners or operators of the businesses. TODS on highways under local agency jurisdiction must be in conformance with *ILMUTCD*.

For state maintained non-freeways that are outside the urban areas, TODS is covered by Title 92 of the Illinois Administrative Code Part 541.

39-2.12(f) Non-Highway Vehicle Signs

Pursuant and subject to 625 ILCS 5/11-1426.1, local agencies may authorize, by ordinance or resolution, the operation of non-highway vehicles to operate on highways and/or bridges under their jurisdiction if the local agency determines that the public safety will not be jeopardized. Local agencies may restrict the types of non-highway vehicles that are authorized to be used in its highways. Before permitting the operation of non-highway vehicles on its highways, local agencies must consider the volume, speed, and character of traffic on the highway and determine whether non-highway vehicles may safely travel on or cross the highway.

Non-Highway Vehicles include:

1. All-Terrain Vehicle as defined by 625 ILCS 5/1-101.8
2. Golf Carts as defined by 625 ILCS 5/1-123.9
3. Off-Highway Motorcycle as defined by 625 ILCS 5/1-153.1
4. Recreational Off-Highway Vehicle as defined by 625 ILCS 5/1-168.8

Upon determining that non-highway vehicles may safely travel on or cross the highway, and the adoption of an ordinance or resolution by local agencies, the GOLF CART CROSSING (W11-11) sign, the ALL-TERRAIN VEHICLES (W11-I100) sign, or the OFF-HIGHWAY VEHICLES (W11-I102) sign may be installed where dictated by engineering judgment.

39-2.12(g) Low-Speed Vehicle Signs

Pursuant and subject to 625 ILCS 5/11-1426.2, low-speed vehicles as defined by 625 ILCS 5/1-140.7 may be driven or operated upon any highway in Illinois where the posted speed limit is 30 miles per hour or less. Local agencies may allow, by ordinance or resolution, the operation of low-speed vehicles on any and all streets under its jurisdiction having a speed limit of more than 30 miles per hour but not greater than 35 miles per hour. Before permitting the operation of low-speed vehicles on highways having a speed limit of more than 30 miles per hour but not greater than 35 miles per hour, local agencies must consider the volume, speed, and character of traffic on the highway and determine whether non-highway vehicles may safely travel on or cross the highway. The LOW-SPEED VEHICLE (W11-I101) sign may be installed where dictated by engineering judgment.

Local agencies may prohibit, by ordinance or resolution, the operation of low-speed vehicles on any and all streets under its jurisdiction. If such a determination is made, USE PROHIBITED BY _____ (R5-I107) sign shall be posted at appropriate locations.

39-2.12(h) Community Wayfinding Signs

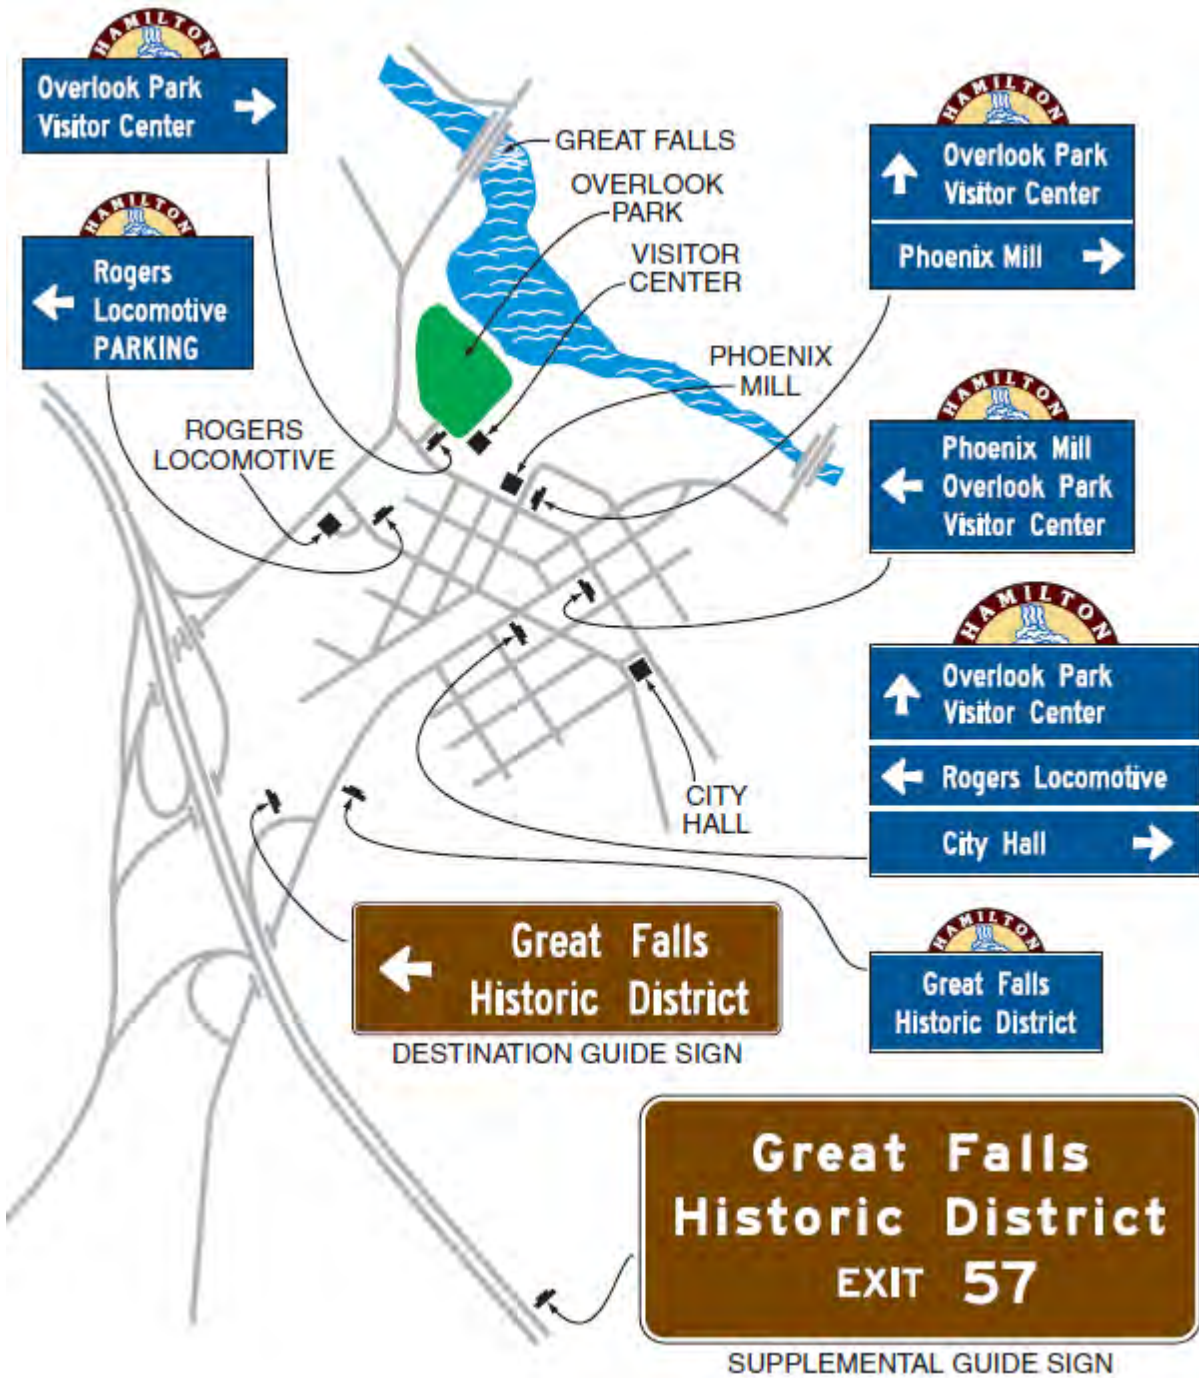

Community wayfinding guide signs (see Section 2D.50 of *ILMUTCD*) are part of a coordinated and continuous system of signs that direct tourists and other road users to key civic, cultural, visitor, and recreational attractions and other destinations within a city or a local urbanized or downtown area. Community wayfinding guide signs are a type of destination guide sign for conventional roads with a common color and/or identification enhancement marker for destinations within an overall wayfinding guide sign plan for an area.

The use of community wayfinding guide signs shall be limited to conventional roads under an agency's jurisdiction. All local agency requests to use these signs on state highways should be submitted to the District Operations Manager. Community wayfinding guide signs shall not be installed on freeway or expressway mainlines or ramps. Direction to community wayfinding destinations from a freeway or expressway shall be limited to the use of a Supplemental Guide sign (see Section 2E.35 of the *ILMUTCD*) on the mainline and a Destination sign (see Section 2D.37 of the *ILMUTCD*) on the ramp to direct road users to the area or areas within which community wayfinding guide signs are used.

Figures 39-2F and 39-2G illustrate various examples of the design and application of community wayfinding guide signs.

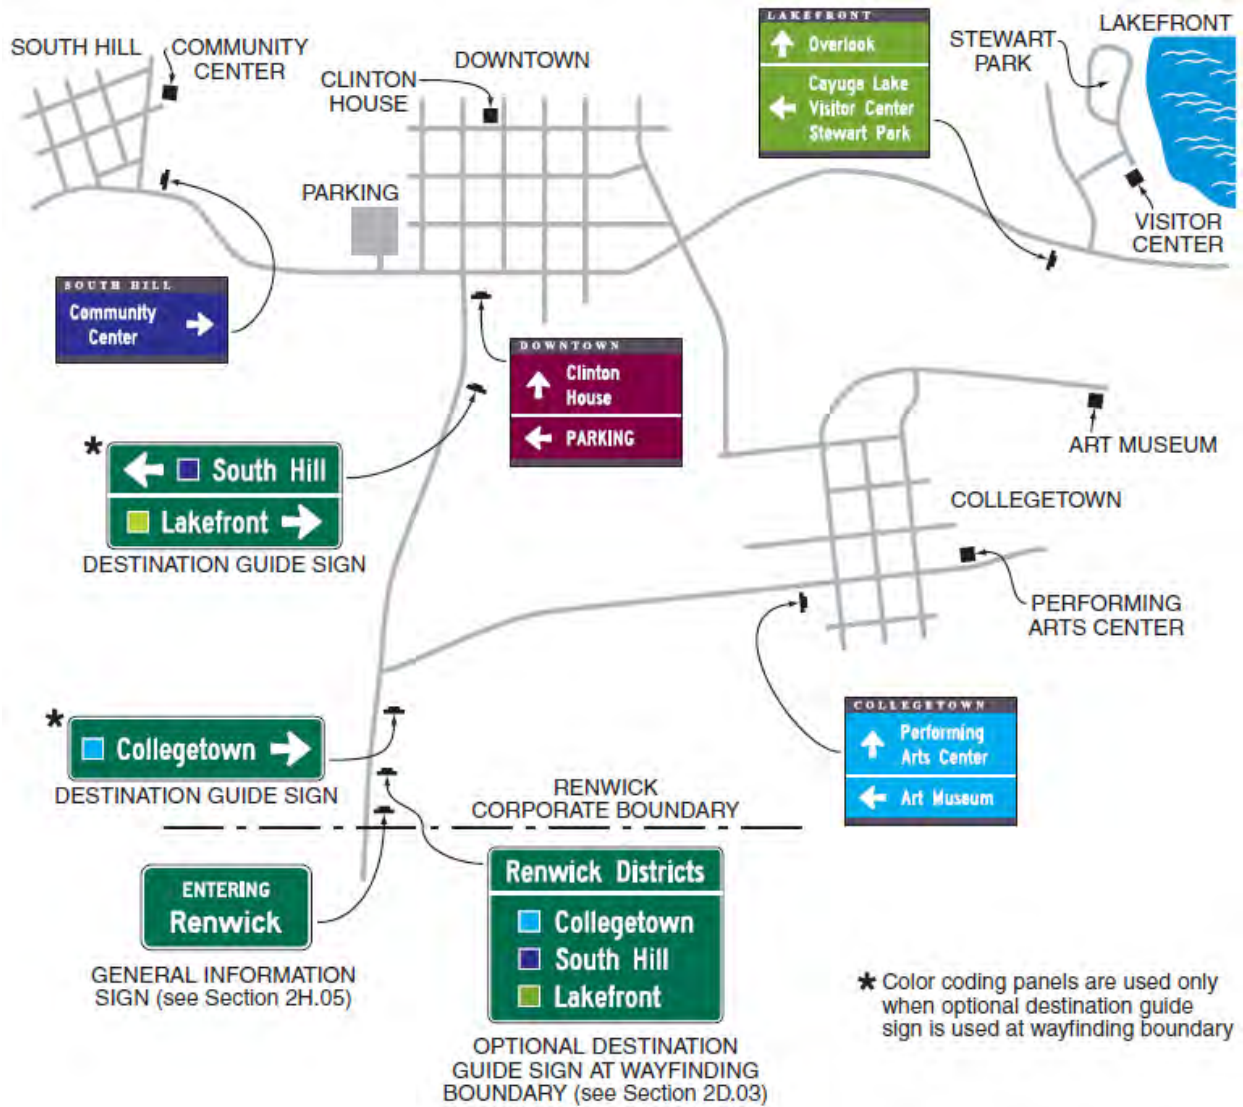

39-2.12(i) Adopt-a-Highway Signs

The sign shown in Figure 39-2H has been developed for use by local agencies for their respective Adopt-a-Highway program signs. It is not necessary for local agencies to seek IDOT approval for the logo or message to be used on this design.

39-3 MARKINGS

Markings on highways have important functions in providing guidance and information for the road user. Marking types include pavement and curb markings, object markers, delineators, barricades, and islands. Markings are used to convey regulations, guidance, or warnings in ways not obtainable by the use of other devices and to supplement other traffic control devices (e.g., signs, signals).

39-3.01 General Pavement Marking Guidelines

39-3.01(a) General

The designer is responsible for providing the initial placement of pavement markings (e.g., striping, symbols) and the development of the pavement marking detail sheets for insertion into the plans. Prior to final acceptance of a completed roadway project, all pavement markings must be in place.

See *ILMUTCD* and the publications listed in Section 39-6 for specific application criteria. The guidelines in the following sections should be considered when developing pavement marking details for roadway application.

39-3.01(b) Color

Most pavement markings will be either white or yellow conforming to the standard highway color specifications. For example, word and symbol markings, crosswalk lines, parking space lines, lines for lanes in the same direction, and the right edge lines are white. Lines separating lanes in the opposite direction, the left edge lines of divided and one-way roadways, and two-way left-turn lanes are yellow.

39-3.01(c) Orientation and Style

Pavement marking line types vary depending on their application. Line types will vary in thickness and width; they will be oriented in a longitudinal, transverse, or diagonal configuration. Longitudinal lines will be striped as either single or double lines in a solid, broken, or dotted pattern. The normal line is 4 in to 6 in (100 mm to 150 mm) wide. A wide line is at least twice the width of a normal line. A double line consists of two parallel lines separated by a discernible space and indicates maximum or special restrictions. A solid line discourages or prohibits vehicles from crossing. A broken line should consist of 10 ft (3 m) line segments and 30 ft (9 m) gaps. This indicates a permissive condition. A dotted line for line extensions may consist of 2 ft (600 mm) line segments with 2 ft (0.6m) to 6 ft (1.8 m) gaps. A dotted line for adding or dropping lanes may consist of 3 ft (1 m) line segments with 9 ft (2.7 m) gaps. A dotted line provides guidance to the driver.

39-3.01(d) Materials

Paint may be used at all locations to provide good year round visibility. Longer life permanent pavement markings may be used on rural and urban highways. Pavement markings usually will be reflectorized.

The following should be considered when selecting a permanent pavement marking material:

BUREAU OF LOCAL ROADS & STREETS
TRAFFIC CONTROL DEVICES

39-3(2)

Jan 2006

1. Epoxy. On PCC and bituminous concrete surfaces, epoxy materials may be used for longitudinal lines. This material is generally not suitable for symbols, letters, crosswalks, stop bars, and similar markings because of problems that develop with intermittent application.
2. Thermoplastic. On rural and urban highways with bituminous concrete surfaces, thermoplastic material may be used for longitudinal lines, symbols, letters, crosswalks, stop bars, and similar markings.
3. Preformed Plastic. Preformed pavement markings may be used on new surface construction under the following conditions:
 - a. Local Agency Criteria. If the local agency has a policy for the use of preformed pavement marking on a new asphalt, preformed pavement marking may be specified on any local agency project.
 - b. Construction Work Zone. Preformed pavement marking may be specified on any inlay application, so that the final pavement will be in place when construction is finished.
 - c. Concrete Surfaces. The local agency may specify the use of preformed pavement marking on a new pavement in lieu of paint, epoxy, or thermoplastic.
4. Raised Reflective Pavement Markers. Permanent raised reflective pavement markers may be used in situations where it is desirable to supplement the standard pavement markings. Locations selected for installation of raised pavement markers should either be unlighted or lighted only to the extent that it would not cause the markers to be ineffective.

39-3.02 Longitudinal Pavement Markings

The following sections present typical longitudinal pavement marking applications. Additional guidance for line size, color, and placement can be found in *ILMUTCD*.

39-3.02(a) Centerlines

Centerlines are used to delineate the separation of traffic lanes for vehicles traveling in opposite directions. When used for two-lane, two-way highways, the centerline shall consist of a normal broken yellow line in two direction passing zones. No-passing zones are discussed below. Two solid yellow lines for a centerline separation on two-way roadways with 4 or more travel lanes shall always be used.

Centerline markings should be placed on all paved streets. Centerline markings should also be placed on unpaved rural collectors 18 ft (5.4 m) or more in width with ADT of 3,000 or greater.

39-3.02(b) No-Passing Zones

A no-passing zone is a special type of centerline marking. The centerline marking consists of two normal yellow lines. Where centerline markings are used, a solid yellow line adjacent to the lanes that warrant the no-passing restriction shall be placed

Where the centerline is striped, no-passing lines shall be used on the approaches to highway-railroad crossings. Also, no passing zones should be established at vertical and horizontal curves and elsewhere on two-lane facilities where an engineering study indicates that passing should be prohibited because of limited sight distance or other special conditions. Minimum passing sight distances are provided in *ILMUTCD*. The values presented in *ILMUTCD* should not be confused with the passing sight distances presented in Chapter 28. The values presented in Chapter 28 are geometric design criteria based on an assumption that a passing vehicle will be able to complete its passing maneuver. The minimum passing sight distance criteria presented in *ILMUTCD* are sufficient to allow a passing vehicle to abort its passing maneuver. Where the distance between no-passing zones is less than 400 ft (120m), no-passing markings should connect the zones.

39-3.02(c) Lane Lines

Lane lines are used to delineate the separation of two or more lanes of traffic traveling in the same direction. When used, the lane line will usually consist of a normal broken white line. A solid white line may be used to discourage lane switching (e.g., approaches to signalized intersections).

Lane lines should be used on all paved highways with two or more traffic lanes for travel in the same direction.

39-3.02(d) Edge Lines

Edge lines are used to delineate the edge of traveled way. Left hand edge lines are median lines, except on one-way streets. If used, the right hand edge line shall consist of a solid white line. The left hand edge line of divided and one-way pavements and along medians shall consist of a solid yellow line.

Edge lines should be placed on paved highways that have ADT greater than 1,000. They may be excluded based on engineering judgment if a curb delineates the travel way.

39-3.02(e) Median Markings

If a median island separating travel in the opposite direction is formed by pavement markings, the median should be outlined by a double set of solid yellow lines on each edge of the median.

39-3.02(f) Two-Way Left Turn Lanes

The pavement edge along each side of a two-way left turn lane shall consist of a normal broken yellow line and a normal solid yellow line with the solid line adjacent to the through lane.

39-3.02(g) Transitions

Where transitions are necessary, pavement markings are used to guide the motorist through the transition area. See *ILMUTCD* for the applicable taper rate and length criteria at transitions.

39-3.03 Intersections

The following sections present typical intersection pavement marking applications. See *ILMUTCD* for line size, color, and placement guidelines.

39-3.03(a) Stop Lines

The stop line is a transverse line that is used to indicate where the desired vehicular stopping point is located. A stop line is a solid white line 12 in to 24 in (300 mm to 600 mm) wide provided across the approach lanes. The location of the stop line may be adjusted to fit field conditions. For example, where turning trucks are known to encroach into the opposing lane, the stop line should be placed outside the area of frequent encroachment. On multilane facilities that intersect the crossroad at an angle, it may be appropriate to stagger the stop line for each lane. This consideration is especially important at signalized intersections, which may have substantial clearance times. In the absence of a marked crosswalk, stop lines should not be placed more than 30 ft (9 m) or less than 4 ft (1.2 m) from the nearest edge of the of the intersecting travel way.

39-3.03(b) Crosswalks

Marked crosswalks provide guidance to pedestrians crossing roadways at intersections with traffic signal and stop signs. Marked crosswalks also serve to alert road users of a pedestrian crossing point at other locations. Crosswalks are usually marked with transverse solid white lines between 6 in and 24 in (150 mm and 600 mm) wide. The distance between the lines should not be less than 6 ft (1.8 m).

Crosswalks should be marked at all intersections where there is substantial conflict between vehicular and pedestrian movements and other appropriate points of pedestrian concentration. An engineering study should be used to determine the need for crosswalks at locations away from highway traffic signals or STOP signs (e.g., midblock locations).

39-3.03(c) Lane-Use Control Markings

At multilane approaches to intersections, it is often necessary to mark the intersection approach to designate the permitted movements through the intersection. This is especially important at intersections that have complex geometrics and multi-phase signal operations (e.g., exclusive turn lanes, drop lanes, dual left turn lanes). The markings consist of white words and/or symbols. Where through traffic lanes approaching an intersection become a mandatory turn lane, lane-use arrow markings shall be used and shall be accompanied by standard signs. Also, consider using lane-use control markings in the following locations:

- turn bays,
- approach lanes at major signalized intersections, and

- where an abnormal traffic pattern exists at an intersection approach.

39-3.03(d) Multiple Turn Lanes

At intersections that have multiple turn lanes (e.g., dual left-turn lanes), a series of single dotted lines may be used to guide the turning traffic through the intersection. These lines are white and are typically an extension of the lane line. The radius of the dotted line as extended through the intersection should be sufficient to accommodate the turning radius of the design vehicle.

39-3.04 Miscellaneous Marking Applications

39-3.04(a) School Areas

Pavement markings through school areas should be placed according to the criteria presented in *ILMUTCD*. See the publications in Section 39-6 for additional criteria. Pavement markings for school crossings should be used only with the appropriate signing. Marked crosswalks should be placed at designated school crossings. The word SCHOOL may extend to the width of two approach traffic lanes.

39-3.04(b) Highway-Rail Grade Crossings

Pavement markings in advance of highway rail grade crossings shall be placed according to the criteria presented in *ILMUTCD*. All crossing pavement markings shall be retroreflectorized white and shall consist of an X, the letters RR, and certain traverse lines. See the publications in Section 39-6 for additional design and application guidance. Pavement markings at railroad crossing approaches are not required:

- where the prevailing speed is less than 40 mph (60 km/h),
- in urban areas where an engineering study indicates that other devices can be installed to provide suitable warning and control, and
- where the pavement is a low-type material.

No passing zones at railroad crossings are discussed in Section 39-3.02(b).

39-3.04(c) On-Street Parking

Marking of parking space boundaries encourages more orderly and efficient use of parking. Where used, on street parking should be marked a sufficient distance back from an intersection so as not to obscure, or otherwise diminish, sight distance at the intersection and to minimize interference with the flow of vehicles and pedestrians. Curb markings may be used to delineate no parking areas. Local highway agencies may prescribe the color of the marking. The publications in Section 39-6 provide additional guidance for on-street parking.

39-3.04(d) Bike Facilities

All markings used on bikeways shall be retroreflectorized. Longitudinal lines should be used to define bicycle lanes on roads and streets. If the bicycle lane symbol is used, it shall be placed immediately after an intersection and at other locations as needed.

Where shared use paths are of sufficient width to designate two minimum width lanes, a solid yellow line may be used to separate the two directions of travel where passing is not permitted, and a broken yellow line may be used where passing is permitted. A solid white line may be used on shared-use paths to separate different types of users. *ILMUTCD* provides additional detail concerning the marking of bikeways.

39-3.04(e) Truck-Climbing Lanes

A solid white lane line may be placed between the normal travel lane and the truck-climbing lane. Transition the edge line to the outside edge of the climbing lane.

39-3.05 Object Markers

The use of object markers is intended to identify specific objects (e.g., bridge handrails, abutments, culvert headwalls) wherever the object is located either within or adjacent to the roadway. Obstructions within the roadway shall be marked with a Type 1 or Type 3 object marker. In addition to markers on the face of the obstruction, warning of approach to the obstruction shall be given by appropriate pavement markings. Objects not actually in the roadway are sometimes so close to the edge of the road that they need a marker. If used, the inside edge of the marker shall be in line with the inner edge of the obstruction. The Type 3 object marker is the marker most frequently used on rural roads.

39-4 TRAFFIC SIGNALS

39-4.01 General

A traffic signal is a valuable device for the control of vehicular and pedestrian traffic. Traffic signals assign the right-of-way to the various traffic movements by alternately directing which traffic is to stop and which traffic is to proceed. Traffic signals that are properly located, designed, and operated have the following advantages:

- provide for the orderly movement,
- increase traffic-handling capacity of an intersection,
- reduce frequency and severity of certain type collisions,
- coordinate the near continuous movement of traffic along a given route, and
- interrupt heavy traffic at intervals to allow other traffic to cross.

For information on traffic signal equipment and material specifications, design, and application criteria, review the applicable publications listed in Section 39-6.

39-4.02 Traffic Signal Needs Study

An engineering study of traffic conditions, pedestrian characteristics, and physical characteristics of the location must be performed to determine whether installation of a traffic signal is justified at a particular location. A traffic signal should not be installed unless an engineering study indicates that installing the device will improve the overall safety and/or operation of the intersection.

39-4.02(a) **Signal Warrants**

The investigation of the need for a traffic signal includes an analysis of the applicable factors of the traffic signal warrants contained in *ILMUTCD*. Information should be obtained by means of engineering studies and compared to the requirements of the warrants. For the purpose of comparing intersection conditions to the warrants, lanes added on major streets within 300 ft (90 m) of the intersection should not be considered as approach lanes unless a significant volume of traffic enters the streets within the added lane (e.g., ramp connection). If none of the warrants are satisfied, then a traffic signal should not be considered at the study location. Furthermore, the satisfaction of one or more of the warrants does not in itself justify the installation of a traffic signal.

39-4.02(b) **Other Factors**

Although one or more of the warrants presented in *ILMUTCD* may be satisfied, the results of a thorough engineering and traffic study of the site's physical characteristics and traffic conditions may indicate that the installation of a traffic signal is not the most prudent choice. In addition to the *ILMUTCD* traffic signal warrants, the following factors should be considered:

1. Crash Experience. Consider alternative solutions to crash related problems (e.g., improving sight distance, using advance warning signs or larger signs).

2. Geometrics. The intersection's geometric design can affect the efficiency of the traffic signal. Traffic signal installations at poorly aligned intersections may, in some cases, increase driver confusion and reduce the overall efficiency of the intersection. When practical, properly align the intersection to adequately accommodate turning lanes, through lanes, etc.
3. Costs. The installation and maintenance of traffic signals can be very expensive. A cost effectiveness analysis may be necessary to determine if the benefits from the reduction in crashes and delays will exceed the costs associated with signalization.
4. Location. Consider the intersection relative to the adjacent land use type and density (e.g., urban, suburban, rural) and the potential for future development in the study area. Also, consider the location of the intersection within the context of the overall transportation system (e.g., isolated locations, interrelated operations, functional classification). Usually, isolated locations are intersections where the distance to the nearest signalized intersection or potential future signalized intersection is greater than 0.5 mile (800 m).
5. Provisions for Future Installations. Consider the future needs of the study location. Assess the anticipated traffic growth and future operational requirements of the signalized location during planning and design, as practical, so that later modifications can be readily incorporated and total labor and material costs minimized. Traffic signal equipment should be specified with some degree of operational flexibility to accommodate future needs. This is illustrated by the following examples:
 - a. Turn Lanes. If predicted traffic growth is likely to require a left turn lane in the future, the design should accommodate this future need (e.g., equipment, phasing, circuitry, pole mounting).
 - b. Street Widening. If a street will be widened or an intersection will be reconstructed in the foreseeable future, consider either a temporary signal or, if possible, an installation that conforms to the proposed final layout.
 - c. Interconnection. If a need for signal interconnects or additional phases is foreseen, provisions for these situations should be incorporated in the initial design.

39-4.03 Existing Traffic Signals

If it is obvious that an existing traffic signal meets one or more of the traffic signal warrants, no special documentation will be required to allow the existing signals to remain or be modernized. Otherwise, the existing signals should be removed or retained based on the following, as well as other supporting information:

- percent of warrants met,
- expected development and traffic growth on intersecting streets,
- signal progression with adjacent signals, and

- crash potential due to either retention or removal of the signal.

Every reasonable effort should be made to remove unwarranted signals. However, upon presentation of evidence of strong local objections to removing existing signals and an indication, based on traffic engineering judgment, that they present no unusual safety hazards, the signal may be allowed to remain. All remaining signals will be upgraded, as needed, to comply with *ILMUTCD* requirements.

39-4.04 Pedestrian and School Crossing Signals

A pedestrian crossing signal may be necessary when the traffic volume on the major street is so heavy that pedestrians experience excessive delay in crossing the major street. A school crossing signal may be installed when the school crossing warrant is met. Before a school crossing signal is installed, consideration shall be given to implementation of other remedial measures (e.g., school speed zones, crossing guards). The pedestrian volume and school crossing warrants shall not be applied where the distance to the nearest traffic signal along the major street is less than 300 ft (90 m).

At an intersection, the traffic signal should be traffic actuated and should include pedestrian detectors. At a non-intersection crossing, the traffic signal should be pedestrian actuated.

39-4.05 Signals Near Highway Railroad Crossings

39-4.05(a) General

Where a signalized intersection is located within 200 ft (60 m) of a railroad grade crossing or where traffic frequently queues onto the tracks, the normal sequence of the traffic signals should be preempted by the approach of trains to avoid entrapment of vehicles on the crossings. The primary focus of the design of intersections where a railroad grade crossing is within 200 ft (60 m) should be to provide adequate storage area for vehicles between the track and intersection and to keep vehicles from stopping on the tracks while waiting for a green signal at the intersection. It may not be necessary to follow all of the recommendations contained in this section at crossings where train speeds are low (i.e., 10 mph (15 km/h)) or where train movements are infrequent. The railroad operations at these crossings must be confirmed in writing by the railroad before any exceptions to these guidelines are considered.

39-4.05(b) Traffic Signal Design

Locations where traffic signal and railroad flashing light signal systems are interconnected should be designed differently than the typical intersection. The two signal systems must be designed to operate together to provide a safe system for both the highway users and the railroads. Consider the following:

1. Preemption. Railroad preemption shall have priority over all other types of preemption in the traffic signal controller.
2. Clearance. When the signal is received from the railroad control equipment, the traffic signal controller shall terminate, using the normal clearance intervals, all phases that conflict with the track clear green phase. Any walk or pedestrian clearance intervals in

BUREAU OF LOCAL ROADS & STREETS
TRAFFIC CONTROL DEVICES

39-4(4)

Nov 2006

effect when preemption is initiated should be immediately terminated. The pedestrian clearance may be run concurrently with the vehicular clearance interval for the cross street. However, do not extend the time needed to the cycle for the track clear green phase.

3. Signal Heads. Four or five section signal heads should be installed to allow for a protected left turn phase on the track approach leg of the intersection during the preemption sequence.

39-4.05(c) Pre-Signal

A traffic signal may be required in advanced of the railroad crossing. The following criteria apply to this pre-signal:

1. Need. Pre-signal traffic signal heads should be placed on the near side of the rails to stop vehicular traffic before the railroad crossing at all signalized intersections if the clear storage distance, measured from the stop line to a point 6 ft (1.8 m) from the rail nearest the intersection, is 50 ft (15 m) or less. At all approaches where the crossing is on a state highway or where there are high percentages of multi-unit vehicles, the distance should be increased to 75 ft (23 m).
2. Signal Mounting. Traffic signal heads located on the near side of the tracks should be mounted on the railroad signal structure, if available, or as close to the crossing as practical without restricting visibility of the railroad signs and signals. The use of the railroad structure requires the concurrence of the railroad company and ICC.
3. Signal Phasing. Where pre-signals are used, signal phase sequencing should be designed to avoid left turning vehicles from being trapped either in the area between the intersection and the crossing, or in the intersection.
4. Timed Overlap. A timed overlap must be used to terminate the pre-signal before the far side intersection signal to clear the storage area between the tracks and the intersection with each cycle of the normal traffic signal operation. Vehicles that are required to make a mandatory stop (e.g., school buses, vehicles hauling hazardous materials) must be considered when determining the amount of time for the overlap to ensure they will not be forced to stop in the storage area.
5. Median. If pre-signals are needed on the near side of the tracks, a raised-curb median may be necessary adjacent to the tracks to provide for proper placement of signals.

39-4.05(d) Minimum Preemption Time

The minimum preemption time at the interconnected crossings consists of the following three components:

1. Right-of-Way Maximum Time. This is the maximum worst case time that it will take for the traffic signal to clear to a green light for the track approach. It is IDOT's policy to get to this green as quickly as possible by immediately terminating any pedestrian WALK indications, abbreviating the pedestrian clearance interval, and running it concurrently with the vehicular clearance phase on the cross street. Local agencies should be aware of this abbreviated time to ensure that it does not conflict with designated school routes or other conditions. This time will include a one second delay upon receiving the signal from the railroad to limit the number of false calls received, a one second minimum

HARD COPIES UNCONTROLLED

green for the through movement, the amber clearance, and any all red time included in the timing sequence.

2. Queue Clear Time. The queue clear green time is the amount of time required to clear a vehicle that is just beyond the tracks to a point either completely through the intersection, for storage areas less than 50 ft (15 m) or to a point where the rear of the vehicle is 6 ft (1.8 m) from the near rail for longer storage areas. This time should be determined by field observations.
3. Separation Time. A separation time is added to ensure that a vehicle is not just clearing the tracks as the train enters the crossing. This is important to keep both the motorist and the train engineer from taking emergency actions. This time has been fixed at 9 seconds.

For additional information on preempting, contact the IDOT Central Bureau of Operations.

39-4.05(e) Coordination

Any proposed changes involving crossings that are interconnected with nearby traffic signal will be subject to the approval of the Illinois Commerce Commission (ICC). Additionally, any new signal that will require interconnect with railroad flashing light signals will also be subject to the review and approval of ICC. Close coordination between the local agency, Central BLRS, the railroad company, and the Illinois Commerce Commission is required to ensure the railroad flashing light signals and the traffic signals are performing as a system. For intersections of two local streets, ICC will be lead agency in coordinating between all parties involved. The IDOT Central Bureau of Operations will be responsible for reviewing the traffic signal design at intersections involving State highways and will submit it to ICC for approval.

39-4.06 Traffic Detectors

The efficient operation of a traffic actuated signal installation depends greatly upon the proper design and placement of traffic detectors. The primary purpose of a traffic detector is to detect the presence of a motor vehicle, bicycle, or pedestrian. There are many types of detector devices acceptable for use on a local highway project. These include the inductive loop detector, the preformed loop detector, the video image detector, and pedestrian push button detector.

39-4.07 Signal Coordination

As traffic volumes increase, installing coordinated signal systems is an important consideration for improving traffic flow. By coordinating two or more traffic signals together, the overall capacity of the facility can be significantly increased. Generally, traffic signals that are within 0.5 mile (800 m) of each other are good coordination candidates. There are several different methodologies available to coordinate traffic signals.

39-4.08 Emergency Vehicle Preemption

An emergency vehicle preemption control may be provided to promptly display a green signal indication at signalized locations ahead of fire vehicles, law enforcement vehicles, ambulances,

and other official emergency vehicles. IDOT approval must be obtained before the preemption control is provided at an intersection with a State highway.

39-4.09 Inspection and Maintenance Considerations

Local agencies should routinely inspect painted steel mast arm poles to determine the extent of corrosion loss and presence of any defects (e.g., cracks, impact damage) that would affect adequacy or longevity. These inspections should consist of the following:

1. Visual Checks. Check for perforations for severe corrosion on the column in the splash zone area, vehicle damage cracks in welds, concrete/grout deterioration, anchor bolt/nut condition, and pole interior condition, if hand holes allow access.
2. Sounding with Hammer. Use a hammer to sound unperforated poles in the splash zone areas, especially near the weld connections. A welder's chipping hammer with round edges or a small ball peen hammer should be used. This will help prevent causing any nicks or dents on the pole that could develop stress risers.
3. Ultrasonic Testing. Use a hand held ultrasonic thickness gauge (e.g., DM-2) to determine variations in the pole's thickness.

Any significant corrosion loss or structural defects should be corrected immediately.

39-5 TEMPORARY TRAFFIC CONTROL

39-5.01 General

Traffic control in work zones will be provided in accordance with *ILMUTCD*. *ILMUTCD*, *BDE Manual*, the *Highway Standards*, and the IDOT Bureau of Operations publication, *Quality Standard for Work Zone Traffic Control Devices* contain traffic control devices and applications for work zones that are approved for use on local agency projects. For additional information on temporary traffic control material specifications, design, and application criteria, review the applicable publications listed in Section 39-6.

39-5.02 Terminology

The following definitions are used to define the time length for work zones:

1. Long-Term Stationary Work Zone. A construction, maintenance, or utility work site that requires traffic control in the same location and where the activity requires longer than 3 days.
2. Intermediate-Term Stationary Work Zone. A construction, maintenance, or utility work site that requires traffic control in the same location and occupies a location from overnight to 3 days.
3. Short-Term Stationary Work Zone. A construction, maintenance, or utility work site that requires traffic control in the same location and where the activity takes from 1 to 12 hours.
4. Short-Duration Work Zone. A construction, maintenance, or utility work site that occupies a location up to 1 hour.
5. Mobile Work Zone. A construction, maintenance, or utility work site that is continuously moving during the period when work is actively in progress.

39-5.03 Work Zone Traffic Control Strategies

39-5.03(a) Objectives

The desired objectives to consider in relocating traffic flow are:

- Remove traffic from the work site. This option usually reduces the construction costs and enhances safety. With this option, sufficient space should be available for the contractor to perform the work with reasonable economy and safety.
- Avoid unreasonable adverse travel and public inconvenience.
- Ensure that only reasonable delays will be caused for emergency vehicles, school buses, mail carriers, etc.
- Maintain reasonable access for local interests (residents, businesses, agriculture, etc.).

39-5.03(b) Work Zone Types

Except for roadway shifts, work sites that are completely off the roadway and do not disrupt traffic are not addressed because generally they will not have a major effect on traffic. The most common projects involving traffic flow through or around a work site include:

- bridge reconstruction, rehabilitation, or replacement,
- major pavement rehabilitation of existing highways,
- pavement removal and replacement,
- horizontal alignment change, and
- vertical alignment change.

The main function of a temporary traffic control is to “relocate traffic flow” so that the construction work can proceed with a minimum interruption and hazard to the workers and to the motorists.

The following presents a description for several work zone applications:

1. Lane Constriction. This work zone type is configured by reducing the width of one or more lanes to retain the number of lanes normally available to traffic. This application is the least disruptive of all work zone types, but it is generally appropriate only if the work area is mostly outside the normal traffic lanes. Note that narrow lane widths may reduce the facility’s capacity, especially where there is significant truck traffic. The use of shoulders as part of the lane width helps reduce the amount of lane width reduction that may be required; however, check the structural adequacy of the shoulders. Where this application is applied to long term work zones, it will require the removal of the current lane markings to avoid motorist confusion.
2. Lane Closure. This work zone type closes off one or more normal traffic lanes. Capacity and delay analyses may be required to determine whether serious congestion will result from lane closures. In some cases, use of the shoulder or median area as a temporary lane will help mitigate the problems arising from the loss in capacity. Upgrading or replacement of an existing pavement or shoulder, or placement of temporary pavement, may be necessary.
3. One-Lane, Two-Way Operation. This work zone type involves using one lane for both directions of traffic. This work zone type is typically used only on bridges or small, short term projects. Flaggers or traffic signals are usually used to coordinate the two directions of traffic.
4. Runaround. This work zone involves the total closure of the roadway (one or both directions) where work is being performed and the traffic is rerouted to a temporary roadway constructed within the highway right-of-way. This application may require the acquisition of a temporary construction easement and usually requires extensive preparation of the temporary roadway. Generally, temporary runarounds are designed for a posted speed reduction of no more than 5 mph to 15 mph below the existing posted speed of the route.

BUREAU OF LOCAL ROADS & STREETS
TRAFFIC CONTROL DEVICES

Jan 2006

39-5(3)

5. Intermittent Closure. This work zone type involves stopping all traffic in one or both directions for a relatively short period to allow the work to proceed. After a specific time, depending on traffic volumes, the roadway is reopened and all vehicles can travel through the area. This application is usually only appropriate on low-volume roadways or during periods where there are very low volumes (e.g., Sunday morning, nighttime).
6. Use of Shoulder or Median. This work zone type involves using the shoulder or the median as a temporary traffic lane. To use this technique for more than a short period, it will be necessary to evaluate the shoulder and subgrade to verify its adequacy to support the anticipated traffic loads. This technique may be used in combination with other work zone types or as a separate technique.
7. Detour. This work zone type involves total closure of the roadway, in one or both directions, when work is being performed, and rerouting the traffic to existing alternative facilities. This application is particularly desirable when there is unused capacity on roads running parallel to the closed roadway. When considering detours, evaluate the following:
 - a. Nearby Route Detours. A nearby local route may require upgrading (structurally and/or geometrically) or extraordinary maintenance to carry the anticipated temporary increase in traffic and to restore it subsequent to the detour. When investigating the practical use of a nearby facility as a detour route, note that the detour route will only be temporarily serving the through traffic. If the nearby route detour will be an economically reasonable alternative, make every effort to use the existing roadway width, the existing right-of-way, and to minimize any utility adjustments. Additionally, investigate the nearby route to determine the safe detour speed. Additional speed signs and warning devices may be required. Contact other agencies (e.g., State, county, municipalities) having jurisdiction over the nearby route and obtain their concurrence prior to using the route for a temporary detour. Also, contact emergency services, post offices, and public transportation agencies that may be affected by a road closure/detour.
 - b. Location. The beginning and end of all detours should coincide as near as possible with the beginning and end of the construction project. Where practical, avoid long detours that will bypass entire communities.
 - c. Pedestrians. Evaluate pedestrian traffic concerns and methods of eliminating or minimizing any other adverse effects when closing a road. Adverse effects could include inadequate access to buildings, private property, or businesses along the closed road.
 - d. Railroad Crossings. Examine railroad crossings to see if existing protective devices, sight distances, geometrics, and crossing surfaces are adequate for the detoured traffic.
 - e. Wide Load Restrictions. Determine if there will be a need to post advance signs to prohibit wide loads from using the detour.

HARD COPIES UNCONTROLLED

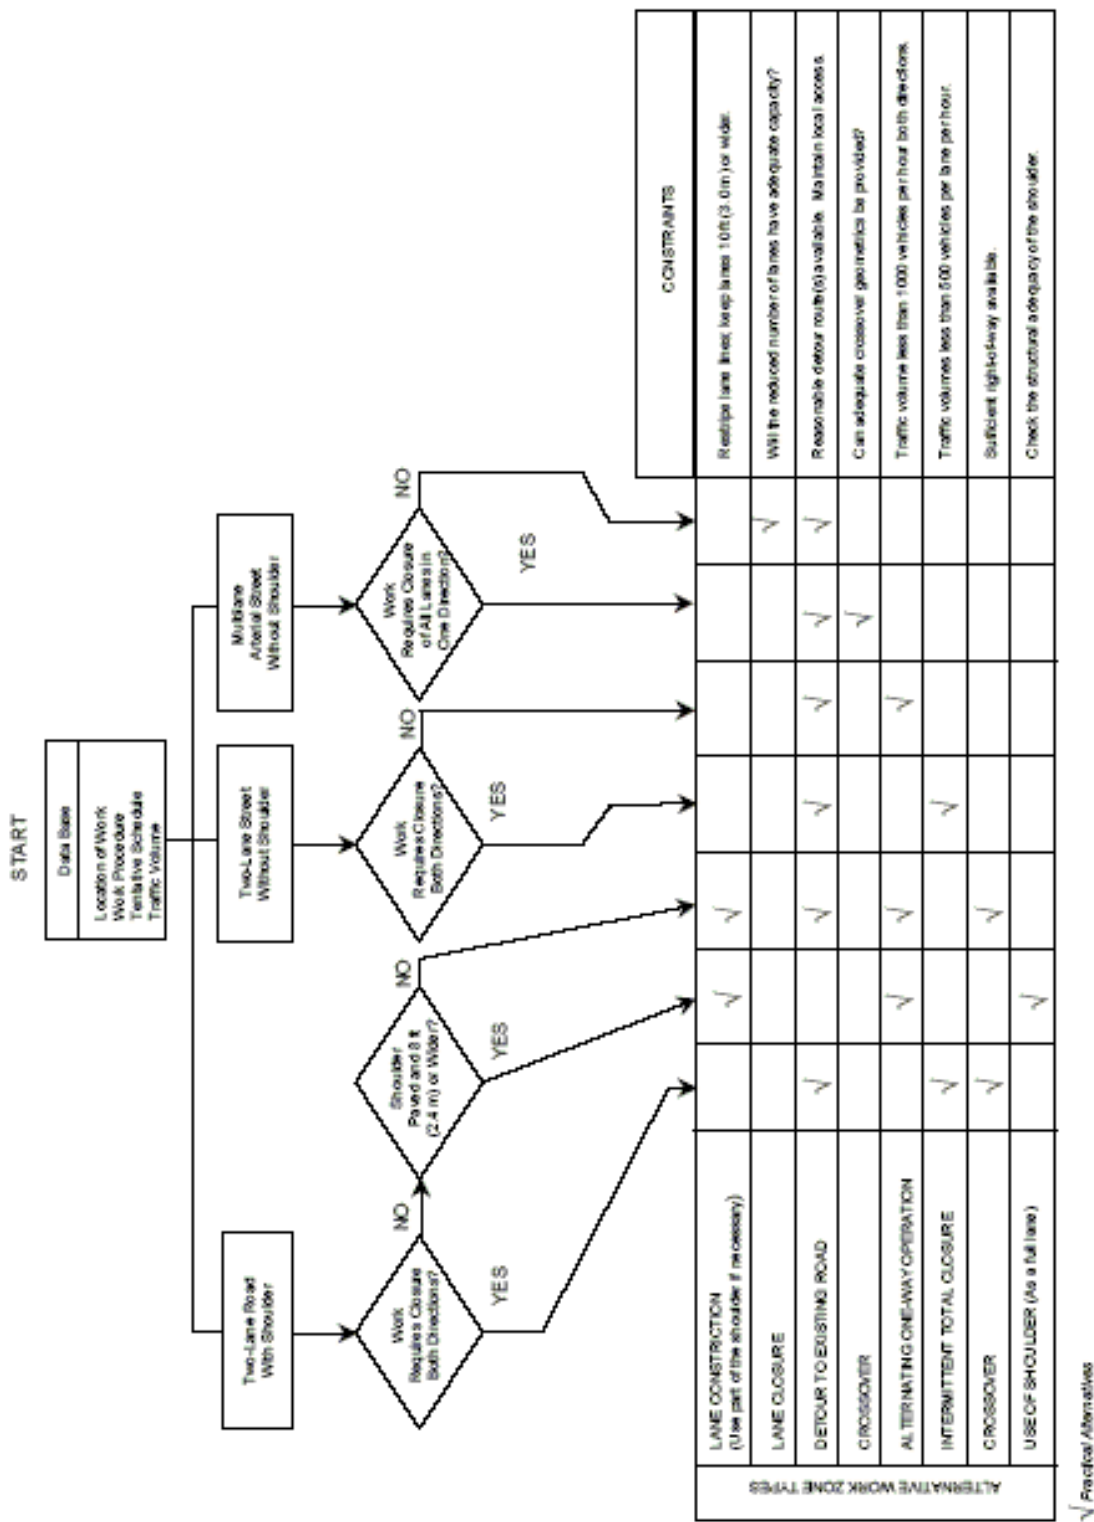

- f. Benefits. Note that improvements to nearby routes provide a permanent benefit for the public, whereas runarounds provide only temporary benefits that cease when the construction project is completed.
8. Roadway Shifts. This work zone type shifts the proposed roadway alignment laterally, (e.g., 50 ft (15 m), 100 ft (30 m)) so that the existing roadway or bridge can be used as the means to maintain traffic flow at the work site. This is an option that is usually only appropriate at horizontal curve locations, or bridge sites where the roadway profile grade line must be raised for hydraulic purposes. Note that additional right-of-way or easements will often be necessary for this work zone type.
9. Work During Non-Peak Hours. When high volume projects do not have reasonable alternatives for 3R type work, consider requiring work during non-peak hours and/or night work.

39-5.03(c) Selection

Selection of the appropriate work zone type represents one of the most significant elements of a traffic control strategy. Other elements of a control strategy that should be considered include length of the work zone, time of work, number of lanes, lane widths, traffic speeds, and right-of-way. Considering these and other factors, reasonable alternatives can be narrowed to a selected few for further review. Typically, only a small number of reasonable work zone alternatives will emerge for a particular project and, in many cases, only one may be practical. Identification of these alternatives at an early stage in the planning process can reduce significantly the analysis effort.

Figure 39-5A provides guidelines for identifying practical work zone alternatives based on roadway type, lane closure requirements, shoulder width, traffic volume, and the availability of right-of-way and detour routes. However, every work zone location will have a wide variation of conditions and an all-inclusive selection matrix is not practical. Other issues to consider include the following:

1. Local Regulations. Many jurisdictions have adopted safety regulations and public convenience policies as safeguards against the unacceptable impacts of work zones. These regulations and policies may impose additional constraints regarding the types of control strategies that can be implemented. Knowing these constraints can help eliminate impractical alternatives from consideration. The public convenience policies or local regulations may specify peak-hour restrictions, access requirements, noise level limitations, material storage and handling, excavation procedures, work zone lengths, and number of traffic lanes that must remain open.
2. Multilane Facilities. Traffic on multilane facilities is usually maintained through the use of lane constrictions or lane closures. Maintaining traffic flow on multilane facilities will generally require different criteria than those used on the rural 2-lane highway system because of the higher traffic volumes.

IDENTIFICATION OF FEASIBLE WORK ZONE TYPES

Figure 39-5A

BUREAU OF LOCAL ROADS & STREETS
TRAFFIC CONTROL DEVICES

39-5(6)

Jan 2006

3. Bridges. Traffic maintenance for bridges may consist of stage construction (e.g., partial closure), detours, runarounds, or split detours. Proposed designs may be coordinated with the Bureau of Bridges and Structures to determine their feasibility. Additionally, consider the following:
4. Stage Construction (Partial Closure). Stage construction for bridges will generally consist of lane constrictions, lane closures, or one-lane, one-way operations. However, stage construction may increase unit costs, increase the difficulty of reconstructing the bridge, have inherent hazards due to close proximity of traffic to the construction operations, and may generally involve a restricted lateral clearance for vehicles, wide loads, and farm equipment. With lateral restrictions, it is important that such restrictions be adequately marked in advance of the work site. Consider the following factors when determining the feasibility of stage construction for bridges:
 - type, length, and width of present and new structure,
 - number of beams,
 - beam spacing and location in relation to the desirable staging limits,
 - condition of existing substructure and its ability to accept stage construction,
 - lane and shoulder widths required during stage operations (this may require using the shoulder as part of the lane),
 - the use of temporary traffic signals, and
 - costs attributable to staging.

Deck repairs can usually be staged for all structure types. Superstructure and deck replacement; however, is sensitive to the type of structure involved. Existing multi-beam superstructures (e.g., steel I-beams, concrete I-beams) and culverts can usually be adapted to construction staging techniques depending on the number of beams. Other types of structures (e.g., pony trusses, relatively short span structures utilizing low trusses without cross bracing) may be staged, but with greater difficulty and expense. Some structures (e.g., through trusses, through girders) cannot be staged.
5. Runarounds. At locations where a through truss, pony truss, or steel through girder is being replaced, consider moving the truss or girder laterally to temporary abutments and using the structure as a part of the runaround.
6. Split Detours. If significant through traffic is using the road or street, it may be advantageous to provide a marked detour route around the work site and build a low water runaround across a stream for local access. This option is usually applicable only on low volume unmarked rural highways with less than 400 vehicles per day. See Chapter 7 for Section 404 permit requirements.
7. Additional Guidance. For additional guidance in analyzing and preparing a scheme to maintain traffic flow at work sites, see the *IDOT Highway Standards*, *ILMUTCD*, *IDOT Standard Specifications*, Chapter 55 of the *BDE Manual*, and Departmental Policy TRA-1 "Traffic Control Through Construction and Maintenance Areas."

39-5.04 Reduced Traffic Control for Roads Closed to Through Traffic

Where a highway or bridge is closed to through traffic, 430 ILCS 105/2 allows a local agency to specify alternative procedures, if desired, for flagging and controlling the local traffic through the

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

Jan 2006

TRAFFIC CONTROL DEVICES

39-5(7)

work zone. The designer must specify the option for reduced traffic control in the contract documents and provide the average daily local traffic in the contract; otherwise, the contractor will be required to provide the same level of traffic control within the section of road closed to through traffic as would be required for open highway conditions.

IDOT's criteria in the *IDOT Standard Specifications* for reduced traffic control are based on the expected traffic volumes through the work zone. The designer will be responsible for determining these traffic volumes and incorporating this information within the traffic control plans. The estimated traffic volumes may vary at different locations within the work zone or during separate construction phases. For these situations, list the expected traffic volumes for each location and/or phase. This will allow the contractor to adjust the traffic control accordingly. Note that if no action is taken by the designer, the contractor will be required to provide the same level of traffic control within the section of road closed to through traffic as would be required for open highway conditions.

The following alternative procedures have been approved by IDOT and may be used for local agency projects. These alternative procedures are broken into three traffic ranges through the construction zone exclusive of construction vehicles:

- less than 100 ADT,
- 100 to 400 ADT, and
- over 400 ADT.

Consider the following:

1. Flaggers. The *IDOT Standard Specifications* contains provisions for reducing the number of flaggers required where the road is closed to through traffic but only if the expected ADT is shown on the plans or in the Special Provisions to be less than 400. The *IDOT Standard Specifications* allows the contractor to use only one flagger when the ADT is between 100 and 400 and does not require a flagger when the ADT is below 100, unless the contractor's operation encroaches on the open traffic lane.
2. Traffic Control Devices. Signing within the section closed to through traffic may also be reduced from that shown on the applicable *IDOT Traffic Control Standards* when the designer has determined that reduced traffic control is appropriate. When the estimated ADT will be less than 400, only one advance warning sign will usually be necessary. This sign should display a specific message (e.g., RIGHT LANE CLOSED AHEAD), rather than a general message (e.g., MEN WORKING). The flashing light may be omitted from the advance sign. When the estimated ADT is 400 or more, signing should be provided to full open highway requirements, except that the advance signing may be reduced by omitting the first sign in the normal series (e.g., ROAD CONSTRUCTION AHEAD). Barricades, cones, and other traffic control devices should normally conform to full open highway requirements except that when the operating speed of the traffic within the section closed to through traffic will be less than 45 mph (70 km/h), the following taper rates may be used:
 - 40 mph (60 km/h) – 25:1,
 - 45 mph (70 km/h) – 20:1, or
 - 50 mph (80 km/h) – 15:1.

HARD COPIES UNCONTROLLED

Special Provisions and/or special details relating to reduced traffic control other than flaggers will have to be developed by the designer on a case-by-case basis and be included in the Traffic Control Plan or the contract plans.

39-5.05 Flaggers

Flaggers must be provided in accordance with the *IDOT Standard Specifications* and any applicable Work Zone Traffic Control Standard. All flaggers engaged in work zone traffic control operations are required to be certified by IDOT, or an agency approved by IDOT.

39-5.06 High-Visibility Safety Apparel

In accordance with OSHA regulations (29 C.F.R. 1926.651(d)) all workers exposed to public vehicular traffic are required to wear ANSI Class 2 garments. *ILMUTCD* also requires flaggers to wear safety apparel meeting the ANSI Class 2 standard. The color shall be either fluorescent orange-red or fluorescent yellow-green with retroreflective material being orange, yellow, white, silver, yellow-green, or a fluorescent version of these colors. Local agencies should be aware that OSHA has the authority to cite agencies if employees are not wearing the specified vest when exposed to vehicular traffic.

39-5.07 Highway Signs

39-5.07(a) General

In construction zones, regulatory signs are used to temporarily override an existing mandate or prohibition (e.g., reduced speed limit). Warning signs are used in advance of the construction area to indicate potentially hazardous conditions, and guide signs are used at various locations to inform drivers of detour routes, destinations, and points of interest. The *IDOT Highway Standards*, the *IDOT Standard Specifications*, and *ILMUTCD* provide the criteria for the design, application, and placement of these signs in construction zones.

39-5.07(b) Speed Limit Signing

Different posted speed limits may apply based on whether the speed limit is within the work zone or if it is within a construction site.

The work zone speed limit will be determined based on the work zone design speed, traffic volumes, construction work type, geometrics, project length, etc. Where there is no lane closure or apparent hazard, maintain the existing speed limit. The speed limit may be reduced from the existing speed limit by 10 mph if an engineering study indicates the reduced speed is necessary. The Work Zone Speed Limit Sign also may be used to reduce the existing speed limit by 10 mph if workers are close to traffic and are not protected by temporary concrete barrier. The need for this sign should be determined by an engineering investigation. The following may be reasons for using the Work Zone Speed Limit Signs:

- narrow pavement lane width,
- high-traffic volumes,

- inadequate sight distance,
- workers on the shoulder, or
- workers in a closed lane adjacent to an open lane.

Note that the work zone speed limit should not exceed the work zone design speed through the construction area.

See the *IDOT Standard Specifications* and *IDOT Highway Standards* for details on sign placement.

39-5.07(c) Guide Signs

The references in Section 39-6 provide the criteria for the design, application, and placement of guide signs. The following provides supplemental information on the use of guide signs in construction zones:

1. Detour Marking. Marked detours should be provided with temporary route markers and destination signs by the local agency in accordance with *ILMUTCD*.
2. Panel Signs. Guide signs are typically warranted in construction zones and on alternative routes where temporary route changes are necessary. For example, the designer may consider using large panel signs or changeable message signs for detours and closures.
3. Other. Standard route markings, street name signs, special information signs, directional, and detour signs may also be warranted based on the particular work on the facility.

39-5.07(d) Portable Changeable Message Signs

Portable changeable message signs (CMS) are very effective in communicating the construction zone information to the general public. The use of CMS will be determined on a project-by-project basis based on road alignment, traffic routing, or other situations requiring advance warning and information. The following are some typical applications where the CMS device may be effectively used in construction zones:

- to provide advance notice of upcoming construction,
- where significant traffic queuing and delays are expected,
- where changes in road alignment or surface conditions are present,
- to provide advance notice of lane and road closures,
- to notify or direct motorists to alternative routing, and
- to provide additional information on high-volume, urban projects.

ILMUTCD provides the design and application criteria relative to CMS.

39-5.07(e) Arrow Panels

In some construction areas, arrow panels are used to supplement conventional traffic control devices. They are used as directional information to assist in merging traffic. The *IDOT Highway Standards* and *ILMUTCD* provide the criteria for the placement, design, and application of arrow boards.

39-5.08 Channelization Devices

The *IDOT Highway Standards*, the *IDOT Standard Specifications*, and *ILMUTCD* provide the criteria for the selection, application, and placement of channelization devices. *ILMUTCD* and the *IDOT Highway Standards* also illustrate typical application diagrams for the use of these devices. There are numerous types of channelization devices available, each having its specific application in construction operations (e.g., runarounds, lane closures, road closures, two-way, two-lane (TWTL) operations). The following channelization devices are typically used in construction zones:

1. Barricades:
 - a. Type I and Type II Barricades. Type I or Type II barricades may be used for channelization. Type II barricades should be used on high speed roads.
 - b. Type III Barricades. Types III barricades are used for road and lane closures.
2. Drums. Drums are most commonly used in a linear series to channelize traffic.
3. Cones. Traffic cones are channelization devices used only during daylight hours.
4. Tubular Markers/Vertical Panels. These devices are used to channelize traffic, to divide opposing lanes of traffic at posted speeds of 40 mph or less, or in lieu of drums where space is limited and speeds are 40 mph or less. Tubular markers and vertical panels have less visible area than other devices. Therefore, only use these devices where space restrictions do not allow for the use of more visible devices.
5. Temporary Concrete Barriers (TCB). Use TCB only where positive protection is desired; do not use based on channelization needs. If used, locate TCB behind and in conjunction with other supporting channelization devices, delineators, and/or pavement markings. Delineators, reflectors, and steady-burning lamps should also be attached to TCB.
6. Delineators. Delineators provide retroreflectivity from headlights and are supplemental devices commonly used to indicate the roadway alignment and the intended path through the construction zone.

These channelization devices are used extensively in work zones to warn drivers of work activities in or near the traveled way, to protect workers in the area, and to guide drivers and pedestrians safely through and around the work zone. Because each construction project differs, the selection, application, and location of these devices should be determined on a project-by-project basis.

39-5.09 Pavement Markings

39-5.09(a) Existing Pavement Markings

Conflicting pavement markings through the work zone area must be obliterated to prevent confusion to vehicles operators. Painting over existing markings is not acceptable.

39-5.09(b) Types of Marking

The *IDOT Highway Standards* and *ILMUTCD* provide the criteria for the selection, application, and placement of pavement markings in work zones. The *IDOT Standard Specifications* provide additional information on pavement markings. The following sections provide supplemental guidelines to these sources. The following types of pavement markings are typically used in work zones:

1. Temporary Paint. Quick drying paint is a low cost, temporary pavement marking that may be used on construction projects. To improve reflectivity, glass beads are required. Generally, do not use temporary paint markings on final pavement surfaces.
2. Temporary Raised Pavement Markers. In high volume locations, the designer may consider using raised temporary pavement markers as a supplemental device to improve delineation through the work zone. Typical locations include lane lines and areas where there are changes in the alignment (e.g., lane closures, lane shifts). For lane lines, temporary raised pavement markers are placed mid-point in the gap. For tapers, lane transitions, etc., space the raised markers at 20 ft (6 m) intervals. Temporary raised pavement markers must be removed prior to placing the next pavement course.
3. Temporary Pavement Marking Tape. Temporary pavement marking tape is an appropriate material choice where there are changes to the traffic pattern during construction (e.g., lane shifts). Temporary tape can be easily and quickly installed and, when necessary, easily removed. One disadvantage is that this tape tends to move and/or breakup under heavy traffic volumes. Black tape may be used to temporarily remove lane lines.
4. Thermoplastic Markings. Thermoplastic markings are generally used in construction zones only if traffic volumes are high and the traffic pattern will continue for a long time (e.g., over one year).

39-5.09(c) Implementation

The application of pavement markings in work zones depends on facility type, project duration, project length, and anticipated traffic volume. Temporary pavement markings and no passing signs are required on all high-type surfaces (e.g. hot-mix asphalt, concrete), except for low volume roadways. Temporary pavement markings should also be considered on low volume roadways.

BUREAU OF LOCAL ROADS & STREETS

39-5(12)

TRAFFIC CONTROL DEVICES

Jan 2006

1. Lane Markings. At the end of each workday, appropriate temporary pavement marking will be installed between all lanes that are open to traffic. Temporary markings will consist of stripes 4 ft (1.2 m) in length at a maximum spacing of 40 ft (12 m) along the centerline of 2-lane highways and the lane lines on multi-lane highways. Centerlines on two lanes will be yellow and lane lines separating two or more lanes of traffic moving in the same direction will be white. All temporary markings on the final wearing surface will be removed within 5 days after the permanent markings are installed, unless otherwise noted in the plans.
2. Edge Markings. When edge lines on multi-lane highways are obliterated due to resurfacing and operation problems are anticipated or are occurring due to the roadway geometrics, volume of traffic, ambient lighting, or narrow bridge, temporary diagonal lines should be placed on the shoulders beginning at the edge of the traveled way or auxiliary lanes at intervals of 50 ft (15 m) on ramps or 200 ft (60 m) on main lines. The markings will be a minimum of 4 in (100 mm) wide and 2 ft (600 mm) long and will be angle away from the direction of traffic at approximately 45°. The color of the diagonal lines will match the color of the pavement edge lines.
3. Permanent Pavement Markings. Temporary pavement markings should be replaced with standard markings as soon as practical. Usually, it should not be necessary to leave temporary markings in place for more than two weeks after completion of any intermediate or final surface. The time restriction for installation of full standard pavement markings begins at the completion of each intermediate lift or final lift of the resurfacing project. If roto-milling obliterates the markings, the time restriction begins when the entire surface has been milled. These restrictions may be delayed by the contracting agency whenever the contractor cannot apply markings due to unanticipated inclement weather, other than a winter shutdown on the project, strike activities, or other circumstances beyond their control. The standard markings should be installed as soon as practical after construction activities are resumed. Prior to winter, standard edge lines, lane lines, centerlines, and no-passing zone markings must be installed, at a minimum, on any intermediate or final surface that will remain open to traffic during the winter shutdown period.
4. No Passing Signs. No passing zones on 2-lane and 3-lane roadways may be identified by using either the pennant NO PASSING ZONE warning sign or the DO NOT PASS, PASS WITH CARE regulatory sign rather than pavement markings for periods of time up to 3 calendar days after an intermediate or final lift is completed. Signs may also be used in lieu of pavement markings on low volume roads until it is practical and possible to install the final full standard markings.

39-5.10 Traffic Signals

39-5.10(a) Location

The use of temporary traffic signals in work zones will be determined on a project-by-project basis. Use the warrant criteria for permanent installations discussed in Section 39-4 to assist in determining if a temporary traffic signal is warranted. However, use the actual traffic volumes expected during construction for the warrant analysis. Common locations where temporary signal installations may be used include the following:

- intersections where an existing signal must be maintained;

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS
TRAFFIC CONTROL DEVICES

Jan 2006

39-5(13)

- existing non-signalized intersections and driveways where construction patterns and volumes now warrant a signal;
- at a temporary haul road or other temporary access points;
- at crossroad intersections where there is an increase in traffic or there is a decrease in capacity due to the construction; and
- at long-term, 1-lane, 2-way traffic operations (e.g., bridge lane closures).

39-5.10(b) Application

Consider the following:

1. Design. Determine the impacts that a construction activity has on existing signal operations and attempt to maximize the level of service. For example, consider:
 - re-timing or re-phasing the signal to compensate for changes in traffic volume, mix, or patterns, and for changes in lane designations or intersection approach geometrics, or
 - physically relocating poles or adjusting signal heads to maintain compliance with *ILMUTCD*.
2. Bridges. The *IDOT Highway Standards* require a temporary signal installation for a bridge lane closure. However, in some situations, the use of a flagger may be more cost effective.

Chapter Forty

RAILROAD GRADE CROSSINGS

As local highways are built and upgraded, it is inevitable that new railroad grade crossings will be required and that existing crossings will need to be modernized to meet current criteria. The geometric design of a railroad grade crossing requires consideration of the horizontal and vertical alignment, sight distance, and cross section of both the highway and the railroad. Other important design elements include the selection of an effective crossing surface that will permit smooth passage of vehicles across the tracks; the provision of signing and pavement marking to give adequate notice of the railroad crossing and visibility to motorists and train operators; and the selection of appropriate warning devices for the crossing environment.

40-1 DESIGN ELEMENTS

40-1.01 Geometric Design

40-1.01(a) General

Geometric design of a railroad grade crossing will generally be governed by the railroad profile and grade, which can be varied less easily than that of the roadway. The safety and function of the roadway, however, should not be compromised for the sake of accommodating a grade crossing in the shortest possible length or with the lowest cost. Avoid abrupt changes in roadway alignment and grade to meet the railroad. Design the grade crossing to provide as flat a roadway grade as practical through and at either side of the crossing to facilitate vehicle stops and starts if necessary.

The general geometric design requirements for the design of grade crossings are the same as those for other intersections, as described in Chapter 34.

40-1.01(b) Sight Distance

Figures 40-1A and 40-1B provide the design criteria for sight distance at railroad crossings.

FHWA publication *Railroad-Highway Grade Crossing Handbook* contains guidance on sight distance evaluations for grade crossings, as does AASHTO's *A Policy on the Geometric Design of Highways and Streets*.

The number and nature of any obstructions lying within the sight triangles of drivers using a grade crossing will aid in determining the level of warning device required for the crossing (i.e., the more numerous and the more obstructive the objects, the greater the need for advance warning signs).

where:

- d_H = sight distance leg along the highway allowing a vehicle to cross tracks safely even through a train is observed at a distance d_T from the crossing or to safely stop the vehicle without encroachment of the crossing area, ft (m)
- d_{T1} = sight distance leg along the railroad tracks for stopped vehicle, ft (m)
- d_{T2} = sight distance leg along the railroad tracks for approaching vehicle, ft (m)
- D = distance from the stop line or front of the vehicle to the nearest rail (assumed to be 15 ft (4.5 m))
- L = length of vehicle (assumed to be 65 ft (20 m))
- W = distance between outer rails; for a single track, 5 ft (1.5 m)
- De = distance from the driver to the front of the vehicle (assumed to be 10 ft (3.0 m))

See Figure 40-1B for values of d_H , d_{T1} , and d_{T2} .

Note: Values are for a 65-ft (20-m) Truck Crossing a Single Set of Tracks at 90°.

SIGHT DISTANCE AT RAILROAD CROSSING

Figure 40-1B

The intersection angle of the grade crossing should be as close to a right angle as is practical for the location so that sight distances for both the road user and the train operator will be optimized. Where practical, avoid locating driveways and other road intersections within the sight triangle. Obstructions (e.g., trees, utility poles, signs) should be removed or located so that the visibility of warning and other informational signs is not diminished. Outside of municipalities, a minimum distance of 300 ft (100 m) along the highway on either side of a grade crossing should be kept clear of all removable obstructions (605 ILCS 5/9-112).

40-1.01(c) Horizontal Alignment

Avoid locating a grade crossing on a horizontal curve of either the highway or the railroad to reduce the tendency for the driver to be distracted by having to negotiate the curve. Intersecting curves with conflicting superelevations also present maintenance difficulties. It is often not practical to achieve the intersection of two tangents. Instead, consider other design elements that would compensate for the reduced visibility and maintenance difficulties (e.g., signing, pavement marking, other warning devices, appropriate types of crossing surfaces), as discussed in later Sections of this Chapter.

40-1.01(d) Vertical Alignment

Unless the Illinois Commerce Commission (ICC) otherwise specifically orders, at a minimum, the gradeline of highway approaches to grade crossings hereafter established or substantially reconstructed must be as follows:

- from the outer rail of the outermost track coincident with a tangent to the tops of the rails for about 24 in (600 mm), then, for a distance of 25 ft (7.5 m) ascending or descending at a grade cannot deviate more than 1% from the tangent, then to the right-of-way line (and as far beyond as the ICC's control may extend in any case) at a grade not to exceed 5.0%; and
- where superelevated track or tracks make strict compliance with this Section impractical, the grade of approaches shall be constructed so as to provide the best vertical alignment under the circumstances with due regard to surface regularity.

The width, transverse contour, type of surface or pavement, and other characteristics of each approach to a grade crossing must be suitable for the highway and shall, in every case, conform to the requirements of good practice.

When the approach grades are funded with Grade Crossing Protection Funds or other State or Federal funds, the vertical alignment shall be designed in accordance with Chapter 30. At locations where it is not feasible to improve the vertical profile according to criteria in Chapter 30, IDOT will consider granting a variance to the vertical alignment.

Vertical curves should be long enough to ensure an adequate view of the crossing and meet geometric requirements for the design speed of the roadway. In order to minimize pavement drainage problems, avoid locating crossings at or near the low point of sag vertical curves. Where grade crossings are located on a significant highway downgrade, consider ways to collect or divert the surface drainage in order to avoid excessive moisture infiltration into the railroad track ballast.

Ensure that the width, transverse contour, type of surface, and other characteristics of each approach to a grade crossing are suitable for the highway and conform to the requirements of good practice.

40-1.01(e) Cross Section

Design all new grade crossings to be at least as wide as the approach roadway, including shoulders. Provide a minimum width of 20 to 22 ft (6.0 m to 6.6 m); see criteria in Chapter 32.

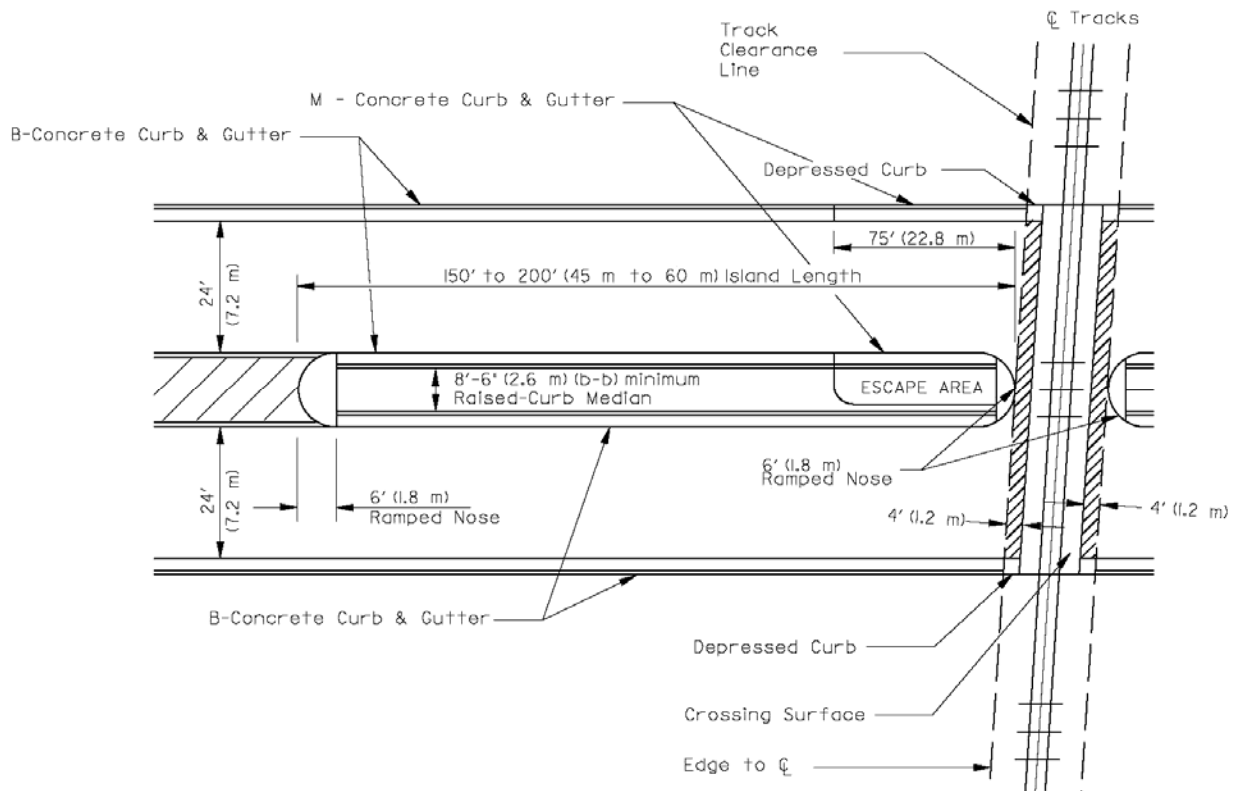

Where approach pavement to a single-track grade crossing features a barrier curb, extend the width of the grade crossing to the back of the curb. Additional width may be needed for sidewalks adjacent to the curb. Where two or more adjacent tracks are traversed by the grade crossing, extend the crossing width 3 ft (900 mm) outside the curb face.

Whatever the configuration of the pavement cross slope in the approaches to the grade crossing, the cross slope through the crossing plus 2 ft (600 mm) on either side should be as close to tangent as can reasonably be accommodated. A transversely sloping pavement surface intersecting with level railroad tracks will result in a rough crossing surface, which may divert driver attention from the safe negotiation of the crossing to finding the smoothest route through the crossing. The transition from the normal crown or superelevated pavement cross section to the level cross section should be accomplished far enough in advance that the transition is smooth, yet should be short enough to minimize the unfavorable drainage conditions created by the flat grade.

Coordinate the design of drainage features at the roadside adjacent to the grade crossing (e.g., ditches, curb inlets) with the railroad. Check that the internal drainage features of the railroad cross section as well as external drainage along the railroad right-of-way do not conflict with roadway drainage features.

40-1.01(f) Medians

Where median-mounted warning devices will be installed, and other than an earth median is adjacent to a grade crossing, the median should have a barrier curb with a minimum median width of 8.5 ft (2.6 m) [10 ft (3.0 m) desirable] back-to-back of curb. Depress all medians and curbs on approaches to the crossing to the level of the pavement edge or gutter flag within the track clearance line. The track clearance line runs parallel to the track at a distance of 8 ft (2.4 m) from the centerline of the nearest track; see Figure 40-1C.

Notes:

1. Where a raised-curb, flush, or traversable type median is used on the roadway, provide B-6 or B-9 (B-15 or B-22) raised-curb median on crossing approaches and provide M-2 or M-4 (M-5 or M-10) raised-curb median on crossing departures adjacent to each side of the railroad track(s).
2. In addition to deterring vehicular movements over the track(s) in the median area, the raised-curb median provides a space for mounting railroad warning device units, if required.
3. If the railroad tracks are located close to a cross street and lie within the left-turn lane of the intersection, this situation will require a special design and the use of barrier type curb along the median adjacent to the turn lane.
4. The median should have a minimum width of 8.5 ft (2.6 m) [10 ft (3.0 m) desirable] back-to-back of curb.

TYPICAL MID-BLOCK MEDIAN TREATMENT ADJACENT TO RAILROAD CROSSINGS
(Multilane Urban and Suburban Highways)

Figure 40-1C

In addition to deterring vehicular movements over the track(s) in the median area, the raised-curb median provides a location for mounting railroad warning device units, if required.

40-1.01(g) Sidewalk and Bicycle Grade Crossings

Sidewalks and bicycle crossings with the railroad are more sensitive to the skew angle than the main highway because of the possibility of bicycle or wheelchair wheels being trapped in the rail flangeway. See Section 42-3.04 for information on sidewalk and bicycle grade crossings.

40-1.01(h) Grade Separations

Determine whether existing or proposed grade crossings should be eliminated and/or replaced with a grade-separation structure using the following criteria:

- Provide grade separation when the expected crash frequency (ECF) for grade crossing gates exceeds 0.02 and the benefit-cost ratio exceeds 1.0. Section 40-2.03 of this Chapter provides the steps used to determine the benefit-cost ratio and ECF. The ECF must be computed for existing and future conditions to determine the benefit-cost.
- Provide grade separation where an expressway in a rural area is constructed or reconstructed across the railroad.

40-1.02 Grade Crossing Surfaces

40-1.02(a) Local Agency/Railroad Coordination

The local agency determines the alignment of the roadway portion of the crossing and determines acceptable crossing surface types when the highway authority is funding the crossing surface. The railroad must select from the IDOT-approved list of surfaces for the crossing and is responsible for maintenance of the crossing within railroad right-of-way.

For both upgrades to existing crossings and the construction of new crossings, contact the railroad early in the process of planning and design. Long approval times are typical for any work within railroad right-of-way.

40-1.02(b) Crossing Surface Types and Applications

Where a road improvement involves construction on one or both sides of an existing rail-highway grade crossing, or where the crossing is located beyond the limits of the improvement, but within the stopping sight distance for the highway design class, ensure the crossing is surfaced with material suitable for the highway traffic. Ensure the width of the crossing conforms to the traveled way surface width plus the usable shoulder. If the roadway approaches are widened, it may be necessary to relocate existing warning devices further away

from the edge of roadway. Additionally, in these situations, it may be necessary to provide longer gate arm lengths.

The available grade crossing surfaces are shown in Figure 40-1D along with the relative durability of each type. The useful service life or durability for each type shown varies with the level of both vehicular traffic and railroad traffic, as well as with other factors (e.g., frequency of maintenance, number of parallel tracks in a crossing).

The perception of acceptable performance is likely to vary with several factors, including the level of service anticipated for a particular roadway (e.g., collector versus arterial); and the roadway design speed, which affects the speed at which vehicles approach and attempt to traverse the crossing.

40-1.02(c) Crossing Surface Selection Guidelines

The installation cost of the crossing surface types listed in Figure 40-1D tends to increase with increased durability. An additional economic consideration, however, is ease of maintenance. Several high-type crossing surfaces (e.g., rubber, steel, PC concrete) are available in prefabricated panels or sections, which are easily installed and which permit easy removal and replacement for track maintenance work. The ability to re-use existing materials may offset the higher initial costs for crossings that are expected to require frequent maintenance (e.g., high volume crossings). In general, grade crossings with high vehicular traffic and/or rail traffic justify crossing surfaces with a longer design life.

In general, the following is recommended:

- Where the roadway traffic equals or exceeds 1000 ADT, use prefabricated rubber or concrete surface materials.
- For ADT less than 1000, timber and/or asphalt crossings may be used.

A more detailed method to determine an appropriate crossing surface based on life-cycle cost analysis and rail and road traffic volumes is described in NCHRP 250, *Highway-Rail Grade Crossing Surfaces*.

In addition, the Railway Progress Institute has developed selection factors for acceptable grade crossing surfaces.

Crossing surfaces that are funded with State or Federal funds must be from IDOT's approved crossing surface list. The most recently approved crossing surface list can be obtained by contacting the Central BLRS.

BUREAU OF LOCAL ROADS & STREETS
RAILROAD GRADE CROSSINGS

Nov 2006

40-1(9)

Crossing Surface	Durability	Primary Failure Mode(s)
Asphalt	Low	Poor impact performance, long-term settlement
Asphalt with Timber Flangeway Guard	Low	Wood abrasion, rot, settlement, poor asphalt impact performance
Asphalt with Rail Flangeway Guard	Low	Poor impact performance, long-term settlement
Timber Panels	Moderate	Wood abrasion, rot, fastenings loosen under impact
Rubber and Timber	Moderate	Wood rot
Metal Panels	High	Abrasion, brittle failure
Rubber: Longitudinal Shim	High	Shims splitting, snowplow damage, fastenings loosen under impact
Rubber: Lateral Shim	High	Shims splitting, snowplow damage, fastenings loosen under impact
Rubber: Full-depth	High	Abrasion, rubber separation
Concrete (cast-in-place and pre-cast)	High	Surface abrasion, cracking

GRADE CROSSING SURFACE TYPES

Figure 40-1D

40-1.02(d) Removing Bituminous Material and Foreign Objects from Rails

Where it is necessary to cross a railroad track while applying bituminous materials, ensure that bituminous material is not applied on the rails. If at all practical, notify the railroad company when the work is to be done in order to have a railroad representative present to inspect and, if necessary, assist in cleaning off the rails should some bituminous material be inadvertently sprayed on them.

Likewise, remove any road building material or objects that might drop onto the rails by the operation of road building equipment immediately from the flangeways to avoid a possible train derailment.

40-1.03 Signing and Pavement Markings

40-1.03(a) General

Advance warning signs and pavement markings should be provided by the local agency to meet the minimum requirements defined in the *ILMUTCD*.

40-1.03(b) Supplemental Signing and Pavement Markings

Supplemental signing and/or pavement markings is required where a railroad grade crossing is located less than 80 ft (25 m) before an intersection with a State or local road, as measured from the stop line at the intersection to the closest rail on the crossing. These situations are shown in the *ILMUTCD*.

40-1.03(c) Exempt Railroad Crossings

625 ILCS 5/11-1202 allows abandoned, industrial, or spur track railroad grade crossings to be designated as exempt by the Illinois Commerce Commission.

Exempt crossings must be signed according to the *ILMUTCD* before officially being considered exempt. Signs for exempt railroad crossings are intended to inform drivers of vehicles carrying passengers for hire, school buses carrying children, or vehicles carrying flammable or hazardous materials that a stop is not required at the designated grade crossing.

40-2 WARNING DEVICES

40-2.01 Protection of Railroad Crossings

Ensure that the type of protection provided at rail-highway grade crossings located within or adjacent to a highway improvement or beyond the limits of the improvement but within the stopping sight distance is placed according to the following guidelines:

1. Crossbuck Supports. The railroad will place the crossbucks' supports 8 ft-1 in (2.46 m) from the edge of the traveled surface where curb and gutter is not installed, and 4 ft-1 in (1.24 m) from the face of the curb where this type of construction is employed.
2. Railroad Crossing Signals. The railroad will install railroad crossing signals with the concrete bases essentially flush with the surface. Except where a barrier curb exists adjacent to the traveled way, the center of the signal mast must not be closer than 8 ft-1 in (2.46 m) from the edge of the final finished surface of the highway. Where a barrier curb is used, the center of the signal mast must not be closer than 4 ft-1 in (1.24 m) from the face of the curb.

40-2.02 Selection Guidelines

Warning devices are required at all highway-railroad crossings where grades are not separated. Select the type of warning device according to the following:

1. General. At a minimum, provide reflectorized crossbucks, pavement markings where possible, and advance warning signs as indicated in the *ILMUTCD* at all crossings.
2. Expected Crash Frequency. Use Equation 40-2.1 and the factors in Figure 40-2A to determine the expected crash frequency.

$$ECF = A \times B \times T \quad \text{(Equation 40-2.1)}$$

Where:

- ECF = Expected Crash Frequency
- A = Traffic factor, see Figure 40-2A
- B = Component factor, see Figure 40-2A
- T = Current number of trains per day

A Factors

VEHICLES PER DAY (10-YR ADT)	FACTOR
250	0.000347
500	0.000694
1000	0.001377
2000	0.002627
3000	0.003981
4000	0.005208
5000	0.006516
6000	0.007720
7000	0.009005
8000	0.010278
9000	0.011435
10000	0.012674
12000	0.015012
14000	0.017315
16000	0.019549
18000	0.021736
20000	0.023877
25000	0.029051
30000	0.034757

B Factors — Basic Values for Railroad Protection Devices

Components	Basic Value Adjustments
Crossbucks, traffic volume less than 500 vehicles per day	3.89
Crossbucks, urban	3.06
Crossbucks, rural	3.08
Wigwags	0.61
Flashing lights, urban	0.23
Flashing lights, rural	0.93
Gates, urban	0.08
Gates, rural	0.19

CRASH FREQUENCY FACTORS
(Highway-Railroad Grade Crossings)

Figure 40-2A

* * * * *

Example 40-2(1)

Given: Urban Area
Crossbuck Protection
Current ADT = 5000 Vehicles Per Day
Current Train Traffic = 5 Trains Per Day

Problem: Determine the appropriate warning devices that should be used at this crossing.

Solution: First determine the expected crash frequency of the existing crossbuck protection.

Expected Crash Frequency:

$$\begin{aligned} ECF &= 0.006516 \times 3.06 \times 5 && \text{(Equation 40-2.1)} \\ ECF &= 0.10 \\ ECF &= 1 \text{ crash every ten years} \end{aligned}$$

Crash frequency is greater than 0.02 indicating the need for higher type device.

* * * * *

3. Cantilevered Flashing Signals. Use cantilevered flashing signals, in addition to other warning devices, on multilane highways that qualify for active warning devices and where there is the possibility of a truck blocking the view of the roadside signals. Also, consider providing cantilever signals at high-frequency crash locations that possibly could be improved by more visible signals and to improve visibility for motorists due to certain geometric factors (e.g., crossings, horizontal curves, sag vertical curves). Cantilever signals may be considered where the vertical and/or horizontal alignment prevents the motorist from seeing the signals at an adequate distance.

4. Gates and Flashing Signals. Provide flashing signals and gates where one or more of the following conditions are met:

multiple mainline railroad tracks;

multiple tracks at or in the vicinity of the crossing, one of which may be occupied by a train or locomotive that obscures the movement of another train approaching the crossing from view;

high-speed train operation combined with limited sight distance at either single or multiple track crossings;

a combination of high speeds and moderately high volumes of highway and railroad traffic;

BUREAU OF LOCAL ROADS & STREETS
RAILROAD GRADE CROSSINGS

40-2(4)

Jan 2006

either a high volume of vehicular traffic, high number of train movements, substantial numbers of school buses or trucks carrying hazardous materials, unusually restricted sight distance, continuing crash occurrences, or any combination of these conditions;

the expected crash frequency for flashing lights exceeds 0.02 and the benefit-cost ratio equals or exceeds 1.0 (the method for determining the benefit-cost ratio is shown in Section 40-2.03); and/or

a diagnostic team recommends them.

Gates are not required in individual cases where a diagnostic team justifies that gates are not appropriate.

5. Higher-Type Warning Device. Provide a higher type of warning device than may be justified under any of the preceding criteria if there is continuing or potential crash occurrence due to:

unusual track or roadway geometrics;

restricted sight distance; and/or

other unusual conditions (e.g., where the potential exists for exceptional crash consequences to a large number of rail or highway passengers, or where there is the potential for a crash involving hazardous materials).

In other instances, a lower level device may be justified if concurred with by a diagnostic team.

Where the distance measured along the centerline of the highway between two regularly used adjacent tracks is less than 100 ft (30 m), consider the crossing as a multiple track crossing and install warning devices accordingly. Where the distance is 100 ft (30 m) or greater, consider each crossing as individual crossings and signalize each according to the preceding criteria.

40-2.03 Benefit-Cost Ratio Analysis

Use the following procedure to find the benefit-cost ratio for the installation of warning devices at railroad crossings:

Step 1. Calculate the Present ECF. Calculate the expected crash frequency for the current installation (see Equation 40-2.1).

Step 2: Calculate the Future ECF. Calculate the expected crash frequency for the proposed installation (see Equation 40-2.1).

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

Jan 2006

RAILROAD GRADE CROSSINGS

40-2(5)

Step 3: Calculate the Annual ECF Savings. Calculate the annual savings in the expected crash frequency by subtracting the future ECF from the present ECF (Step 1 - Step 2).

Step 4: Calculate the Benefit. Calculate the benefit by multiplying the annual savings by the cost of crash, Z, where Z equals the ratio of deaths and injuries per crash (average for latest 3 years in Illinois) x cost per crash (Z x Step 3). Use the National Safety Council crash cost data which are documented, periodically updated, and revised annually by BDE.

Step 5: Calculate the Annual Cost. Calculate the annual cost of the proposed installation by either of the following equations:

$$\text{Annual Cost} = U + V \quad (\text{Equation 40-2.2})$$

Where:

- U = Cost of flashing lights divided by expected life (assume 20 to 30 years)
- V = Yearly maintenance cost of flashing lights

or:

$$\text{Annual Cost} = Y + W \quad (\text{Equation 40-2.3})$$

Where:

- Y = Cost of gates divided by expected life
- W = Additional annual cost to maintain gates instead of flashing lights

or:

$$\text{Annual Cost} = L + M \quad (\text{Equation 40-2.4})$$

Where:

- L = Cost of grade separation divided by expected life
- M = Additional annual cost to maintain grade separation instead of gates

Step 6: Calculate the Benefit-Cost Ratio. Calculate the Benefit-Cost Ratio by dividing the benefit by the annual cost (Step 4/Step 5).

40-2.04 Circuitry Devices

Refinements to activation circuitry should be recommended when the credibility of the warning devices could be beneficially increased. This includes developing the signal "lead time" based

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS
RAILROAD GRADE CROSSINGS

40-2(6)

Jan 2006

on train speeds or installing motion detectors, or constant warning time devices (predictors). These are described as follows:

1. Grade Crossing Predictors. Grade crossing predictors (GCP/constant warning time) circuitry should be considered for upgrade improvements to existing active warning devices and new installations when the train speed exceeds 10 mph (16 km/h) and:
 - there are switching moves on the approach circuits,
 - where trains operate at variable speeds on the line, or
 - there is an unusual track and crossing geometry.

Grade crossing predictors also deal with trains stopping in the approach circuits and they provide uniform warning time for temporary reductions in train speed.

2. Motion Detectors. Consider motion detectors where:

Gates. Where gates are present, provide motion detectors where there:

- is stopping or other lengthy occupancy of the approach circuits,
- are new gate installations,
- is upgrading of crossings with flashing signals to gate installations, or
- are major control circuitry changes required at existing installations.

Flashing Signals. For flashing signals, provide motion detectors where there:

- is stopping or other lengthy occupancy of the approach circuits,
- are new flashing signal installations, or
- are major control circuit changes required by changes in or additions to flashing signals.

Note that the cost differential between grade crossing predictors (GCP/constant warning time) and motion detector circuitry is minor in comparison to the total installation cost. In addition, grade crossing predictor (GCP/constant warning time) circuitry can be adjusted to a wider, more variable set of train traffic conditions. When contemplating circuitry improvements, it is best to contact the railroad to make an accurate assessment of train traffic and a more informed decision on circuitry improvements.

See Chapter 39 for information on coordinating railroad and highway traffic signals.

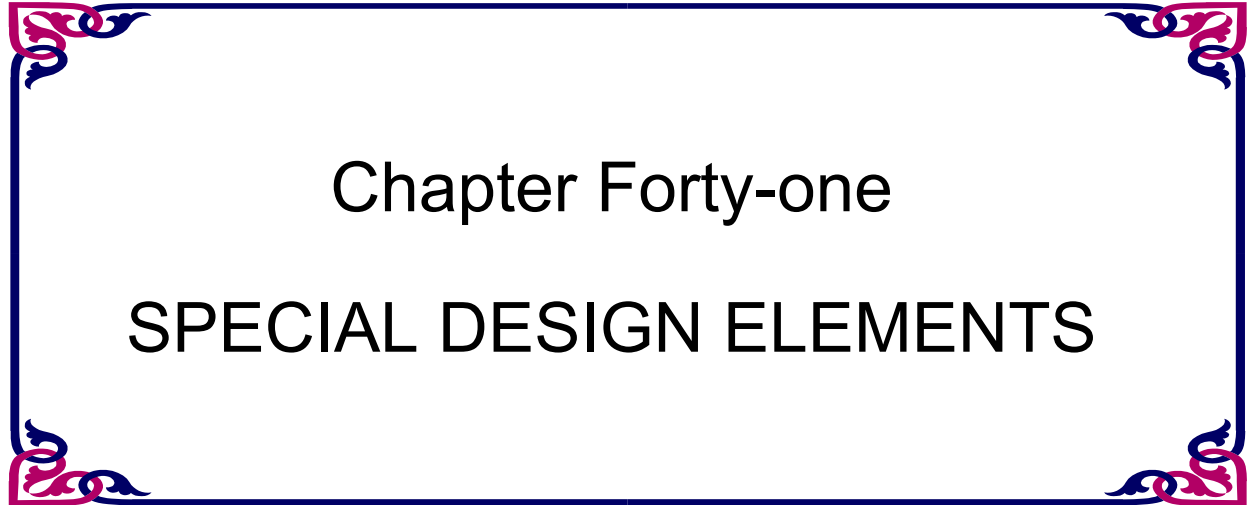

40-2.05 Barrier Systems

The following will apply to barrier systems around warning devices:

1. General. Do not provide barrier systems (e.g., guardrail, impact attenuators) at railroad grade crossings except in extraordinary circumstances. In most cases, the roadside barrier presents more of a hazard than the railroad warning device. Also, it may block a lateral escape route in advance of the signal. Extraordinary circumstances that may justify the use of a roadside barrier in the vicinity of a railroad crossing warning device include:
 - locations where the approach roadway is on a fill with side slopes steeper than 1V:3H and greater than 10 ft (3.0 m) in height,
 - locations with a high crash history involving a warning device where a benefit-cost analysis demonstrates a roadside barrier is warranted, and
 - locations where there will be a temporary delay in the relocation of warning devices for the widening of a highway.
2. Installation. See Chapter 35 of this *Manual* and the *IDOT Highway Standards* for the installation of guardrails at crossings.
3. Special Conditions. In industrial or other areas involving low-speed highway traffic and where warning devices are vulnerable to damage by turning truck traffic, ring-type guardrail may be installed to provide protection for warning devices. Substitute shielding devices (e.g., concrete, railroad ties, and railroad rails) are not permitted.
4. Signals. Do not use breakaway or frangible bases for cantilever signal supports.
5. Maintenance of Barriers. The local agency will maintain all longitudinal guardrail and impact attenuators. The railroad will be responsible for maintaining the ring-type guardrail.
6. Approval. Approval for the erection of any roadside barrier by the railroad must be obtained from the local agency having jurisdiction of the road.

Chapter Forty-one

SPECIAL DESIGN ELEMENTS

41-1 CUL-DE-SACS, TURNAROUNDS, AND ALLEYS

41-1.01 Cul-de-Sacs and Turnarounds

A local street, open at one end only, should have a special turning area at the closed end. This turning area may be an “L,” “T,” or circular shape cul-de-sac with dimensions as appropriate for the type of vehicles expected. The commonly used circular form should have a minimum outside radius of 30 ft (10 m) in residential areas and 50 ft (15 m) in commercial and industrial areas.

A dead-end street narrower than 40 ft (12 m) should be widened to enable passenger vehicles, delivery trucks, and emergency vehicles to make U-turns or at least turn around by backing only once. Typically, the design is circular pavement, symmetrical about the centerline of the street, sometimes with a central island, as shown in Figure 41-1A(a), which also shows minimum dimensions for the design vehicles. Although this type of cul-de-sac operates satisfactorily, improved operation is obtained if the design is offset so that the entrance-half of the pavement is in line with the approach-half of the street, as shown in Figure 41-1A(d). One steering reversal is avoided on this design. Where a radius of less than 50 ft (15 m) is used, provide mountable curbs on the island to permit maneuvering of an occasional oversized vehicle.

An all-paved plan, as opposed to an island configuration, with a 30 ft (10 m) outer radius, shown in Figure 41-1A(e), requires little additional paving. If the approach pavement is at least 30 ft (10 m) wide, the result is a cul-de-sac where passenger vehicles can make the customary U-turn and SU design trucks can turn by backing only once. A radius of about 40 ft (12 m) enables a WB-50 (WB-15) vehicle to turn around by maneuvering back and forth.

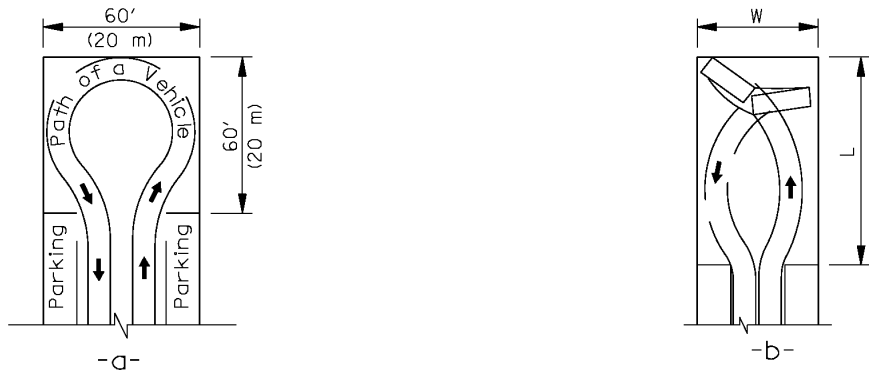

Other variations or shapes of cul-de-sacs that include right-of-way and site controls may be provided to permit vehicles to turn around by backing only once. Several types (e.g., Figures 41-1A(f), (g), and (i)) may also be suitable for alleys. The geometry of a cul-de-sac should be altered if adjoining residences also use the area for parking.

Generally, streets with cul-de-sacs should not be greater than 1,000 ft (300 m) in length.

Figure 41-1A

41-1.02 Alleys

41-1.02(a) General

Alleys can assist site designers by allowing narrower lots and enhance safety by eliminating front driveways and the associated backing movements across sidewalks and into the street.

Alleys should be aligned parallel to, or concentric with, the street property lines. It is desirable to situate alleys in a manner that both ends of the alley are connected either to streets or to other alleys. Where two alleys intersect, a triangular corner cutoff of not less than 10 ft (3 m) along each alley property line should be provided to allow for a turning vehicle and to provide sight distance. Alleys without a connection to a street or another alley should include a turning area at the end of the alley as shown in Figure 41-1B. Figure 41-1B also may be suitable for application on some very low volume roads as well.

41-1.02(b) Design Criteria

Policies for the construction and maintenance of alleys are the same as for streets with the following exceptions:

- Right-of-Way Width. The minimum right-of-way width is 16 ft (5 m).
- Surface Width. The minimum surface width is 10 ft (3 m).
- Horizontal Alignment. Use horizontal alignment criteria as necessary.
- Vertical Alignment. Alleys should have grades that meet the existing grades of the abutting land parcels to the extent practical. The longitudinal grade should not be less than 0.2%.
- Pavement Slope. Alley cross sections may be V-shaped with transverse slopes of 2.5% toward a center V-shaped gutter. Runoff is thereby directed to a catch basin in the alley or to connecting street gutters.
- Minimum Curb Radii. The radius of alley returns should be made as large as practical. Residential areas should have a minimum curb radius of 5 ft (1.5 m) and industrial and commercial areas should have a minimum radius of 10 ft (3 m).

41-2 DRIVEWAYS

41-2.01 General

Driveway design considerations that are related to access management include turning radius or flare, width, number of lanes, throat length, auxiliary turn lanes, and directional controls. Driveway location issues include the need to locate and design driveway connections so that the driver of an exiting vehicle has an unobstructed intersection sight distance and motorists on the roadway have adequate stopping sight distance.

Additional considerations relate to functional area of the intersection and corner clearance, the influence area of an adjacent driveway, and corner clearance as well as driveway offsets and alignment. The functional area extends both upstream and downstream from the physical intersection area and includes the longitudinal limits of auxiliary lanes. The influence area associated with a driveway includes:

- the impact length (e.g., the distance approaching a driveway that vehicles begin to be affected),
- the perception-reaction distance, and
- the vehicle length.

It is important to avoid locating driveways along acceleration or deceleration lanes and tapers at street intersections or interchanges to minimize the potential for vehicular weaving conflicts.

From an operational and safety perspective, the appropriate width and radius of a driveway are a function of the volume of traffic served as well as the need to provide for efficient movement of vehicles off major thoroughfares. If driveways are too narrow or have inadequate turning radius, vehicles will be unable to maneuver quickly and comfortably off of the roadway and onto the site. Excessive radii and widths could pose safety hazards for pedestrians, bicycles, and vehicles on site.

The length of driveways or “throat length” is also important to avoid on-site circulation hazards and congestion at the entrance as it handles anticipated storage of entering and exiting vehicles that could conflict with the through movement on the abutting roadway. Criteria for the throat length vary according to the projected volume of the driveway and whether it is the principal access or a secondary driveway.

Other considerations in the construction of driveways include the following:

- joint and cross access of adjacent developments,
- out parcel requirements, and
- redevelopment and change in use of property.

41-2.02 Design Criteria

Figures 41-2A and 41-2B provide the design criteria for driveways. Additionally, consider the following:

BUREAU OF LOCAL ROADS & STREETS
SPECIAL DESIGN ELEMENTS

41-2(2)

Mar 2007

1. Widths. Residential driveway widths typically should be at least 12 ft (3.6 m) and should not exceed 24 ft (7.2 m). Commercial/industrial driveway widths vary from 24 ft (7.2 m) for low volume activity to a maximum of 35 ft (10.7 m) for undivided design, high volume activity. Field entrances should be constructed wide enough to accommodate the farm equipment using the entrance.
2. Radii. A right-turn radius is on the side of a driveway exposed to enter or exit by right-turning vehicles. In many cases, a straight-line flare is constructed within the right-of-way in place of a radius, especially when a depressed curb is placed across the entrance. For high volume commercial entrances and entrances used by large trucks, use a radius which will accommodate trucks.
3. Driveway Spacing. Minimum driveway spacing is measured along the curb or edge of shoulder from the roadway end of the curb radius or flare. For individual residential properties, a suggested limitation on the number of driveways is:
 - a. 1 driveway for less than 100 ft (30 m) of frontage,
 - b. 2 driveways for 100 ft to 200 ft (30 m to 60 m) of frontage,
 - c. 3 driveways for 201 ft to 500 ft (61 m to 150 m) of frontage, and
 - d. 4 driveways for over 500 ft (150 m) of frontage.

Commercial properties should generally be limited to one driveway location.

The distance from any adjacent crossroad and from the property line should be considered in determining the location for a driveway.

Existing driveways will usually be allowed to remain at their present location.

4. Angle. For two-way driveways, the centerline should generally be at a right angle to the roadway. Angles less than 60° should only be used for one-way driveways. The minimum angle is measured from the edge of traveled way.
5. Grades. The driveway should slope away from the pavement to the edge of the shoulder.
6. Sight Distance. Driveways should be located to provide adequate sight distance.
7. LPA Access Policy. The location and design of a driveway should also meet any minimum criteria established by a LPA in an adopted entrance access policy.
8. Additional Guidance. For additional guidance on driveways, the designer should review the following publications:
 - a. *IDOT Policy on Permits for Access Driveways to State Highways*,
 - b. *ITE Guidelines for Driveway Design and Location*, and
 - c. *TRB Access Management Manual*.

41-2.03 Entrances at Bridges

When driveways are within close proximity to structures, close or relocate the entrances from within the bridge approach area to outside the length of need for the guardrail wherever practical.

- Notes:
- (1) Minimum is 16 ft (4.8 m) for field entrances.
 - (2) Maximum is 60 ft (18 m), located 6 ft (1.8 m) from edge of traveled way (ETW).
 - (3) Maximum is 85 ft (26 m) at curb.
 - (4) Located 6 ft (1.8 m) from edge of traveled way (ETW).
 - (5) Use a minimum of 45° for one-way drives and 60° for two-way drives.
 - (6) This distance is the undisturbed length of curb between driveway flare and intersecting street flare.
 - (7) Maximum breakover is 12%.
 - (8) Straight line flare may be used in place of radius.
 - (9) Measured from edge of cross-street pavement, not end of radius.

DESIGN CRITERIA FOR DRIVEWAYS
Figure 41-2A

PUBLIC ROAD

- Key:
- R = Driveway radius (flare may be used in place of radius)
 - W = Driveway width
 - PL = Property line
 - C = Corner clearance (includes corner radius)
 - A = Driveway angle of intersection
 - S = Spacing between two driveway radius points
 - P = Spacing between driveway and property line radius point

Note: To ensure that a private drive does not infringe upon the access rights of an adjacent property owner, R must not extend beyond the property line as measured perpendicular to the highway from where the property corner meets the highway line unless there is an agreement between property owners permitting a shared drive.

DRIVEWAY MEASUREMENTS

Figure 41-2B

41-3 OFF-STREET PARKING

A proposed highway project may incorporate some form of off-street parking. Typical applications may include providing off-street parking to replace on-street parking that will be removed as part of a proposed project or the construction of a park-and-ride lot for commuters. Public parking built with federal, State, or MFT funds administered by IDOT must be generally available to the public and may not contain individually reserved parking spaces.

For information regarding off-street parking for individuals with disabilities, see Section 41-6.

41-3.01 Park-and-Ride Lots

The following provide general considerations for park-and-ride lots:

1. Location. Park-and-ride lots may be located in either rural or urban areas to accommodate car pooling or to provide access to transit terminals. By locating these lots outside of the downtown area, congestion is reduced, parking lot property costs are decreased, and accessibility is improved. Determine the general location and size of the park-and-ride lots. Guidance for site selections can be found in the *AASHTO Guide for the Design of Park-and-Ride Facilities*. Some of the factors that affect the location of a parking facility include:
 - site availability,
 - accessibility,
 - visibility,
 - demand,
 - congestion,
 - capacity,
 - design, and
 - land use.
2. Layout. Consider the following when laying out a park-and-ride facility:
 - entrances and exits, including:
 1. location,
 2. spacing,
 3. traffic signals,
 4. storage, and
 5. design;
 - drop-off/pick-up zones (kiss-and-ride),
 - bus loading,
 - traffic circulation,
 - pedestrian and bicyclist considerations, and
 - accessibility for individuals with disabilities.

For more detailed information on park-and-ride lots, see Section 58-2 of the *BDE Manual*.

41-3.02 Design Elements

Consider the following elements in the design of off-street parking lots:

1. Parking Lot Dimensions. Parking stall dimensions vary with the angle at which the parking space is arranged relative to the aisle. Figure 41-3A provides the design dimensions for 9 ft x 18.5 ft (2.7 m x 5.6 m) parking stalls and shows how stalls may be combined into a parking lot. From a traffic operations standpoint, one-way aisles are desirable and should be designed to provide counterclockwise circulation. When determining parking stall widths, consider the following:
 - Typical stall widths (measured perpendicular to the vehicle when parked) range from 8.5 ft to 9.5 ft (2.6 m to 2.9 m).
 - The recommended minimum stall width for self parking of long term duration is 9.5 ft (2.9 m).
 - For higher turnover self parking, a stall width of 9 ft (2.7 m) is recommended.
 - Stall widths at parking facilities, where the loading of large packages into vehicles is prevalent, should desirably be 9.5 ft (2.9 m) or even 10 ft (3.0 m) in width.
2. Bus Loading Areas. Bus loading and unloading areas located adjacent to park-and-ride lots should be designed to provide for continuous counterclockwise circulation and for curb parking without backing maneuvers. The through traffic lanes and the curb loading area should each be 12 ft (3.6 m) wide. Section 41-4.02 provides details of bus loading areas.
3. Sidewalk Dimensions. All sidewalks should be at least 5 ft (1.5 m) wide. In loading areas, the width should be 12 ft (3.6 m) or the adjacent sidewalk width plus 7 ft (2.1 m) whichever is greater. The accessibility criteria for individuals with disabilities must be met for all new lots; see Section 41-6.
4. Cross Slope. To provide proper drainage, the minimum cross slope on a parking lot should be 1.0%. At a maximum, the cross slope should not exceed 5.0%. Desirably, design the lot to direct the drainage runoff into existing drainage systems. If water impoundment cannot be avoided along pedestrian routes, bicycle routes, and standing areas, provide drop inlets and underground drainage. In parking areas, design the drainage to avoid standing water. The detailed drainage design for the lot should be prepared using *IDOT Drainage Manual* to determine design frequency, pavement discharge, and capacity of drainage inlets.
5. Pavements. For information on pavement designs, see Chapter 44.
6. Lighting. Desirably, the lot should be lighted for pedestrian safety and lot security. Ensure provisions are considered for lighting supports and power lines. Section 41-7 provides information on the design of lighting.
7. Bicycle and Motorcycle Storage. Provide bicycle stalls that allow the use of locking devices. Bicycle stalls are typically 2 ft by 6 ft (600 mm by 1.8 m). Motorcycle stalls are 3 ft by 6 ft (1 m by 1.8 m).
8. Traffic Control Devices. Provide signs and pavement markings to direct drivers and pedestrians to appropriate loading zones, parking areas, bicycle facilities, accessibility parking, and entrances and exits.

Parking Layout Dimension for 9 ft x 18.5 ft (2.7 m x 5.6 m) Stalls at Various Lengths

Design Feature	Notation	Parking Angle							
		45° (ft)	45° (m)	60°(ft)	60° (m)	75° (ft)	75° (m)	90° (ft)	90° (m)
Stall width, parallel to aisle	A	12.7	3.9	10.4	3.2	9.3	2.8	9.0	2.7
Stall length of line	B	25.0	7.6	22.0	6.7	20.0	6.1	18.5	5.6
Stall depth to wall	C	17.5	5.3	19.0	5.8	19.5	5.9	18.5	5.6
Minimum aisle width between stall lines	D	12.0	3.7	16.0	4.9	23.0	7.0	26.0	7.9
Stall depth, interior	E	15.3	4.7	17.5	5.3	18.8	5.7	18.5	5.6
Module, wall to interior	F	44.8	13.7	52.5	16.0	61.3	18.7	63.0	19.2
Module, interior	G	42.6	13.0	51.0	15.5	61.0	18.6	63.0	19.2
Module, interior to curb face	H	42.8	13.1	50.2	15.3	58.8	17.9	60.5	18.4
Bumper overhang (typical)	I	2.0	0.6	2.3	0.7	2.5	0.8	2.5	0.8
Offset	J	6.3	1.9	2.7	0.8	0.5	0.2	0.0	0.0
Setback	K	11.0	3.4	8.3	2.5	5.0	1.5	0.0	0.0
Cross aisle, one-way	L	14.0	4.3	14.0	4.3	14.0	4.3	14.0	4.3
Cross aisle, two-way	—	24.0	7.3	24.0	7.3	24.0	7.3	24.0	7.3

- Notes:
1. See Section 41-6 for criteria on the number and dimensions of parking spaces for individuals with disabilities.
 2. If a special section is designated for subcompact vehicles, these stalls can be 8 ft x 15 ft (2.5 m x 4.6 m) for a 90° angle.
 3. Stalls should be wider for commercial parking.
 4. The designer should consider bumper overhang when placing lighting, railing, etc. Therefore, these appurtenances should be placed beyond dimension "I" in the figure.
 5. Two-way traffic in aisles may only be used with a 90° parking angle. Use an aisle width of 26 ft (7.9 m).

PARKING LOT LAYOUT DIMENSIONS
(9 ft x 18.5 ft (2.7 m x 5.6 m) Stalls)

Figure 41-3A

9. Fencing. The need for fencing around a parking lot will be determined on a case-by-case basis.
10. Landscaping. In some locations, consider landscaping to minimize the visual impact of the parking lot. This may include providing a buffer zone around the perimeter of the lot or improving the aesthetics of the lot itself. Desirably, include a 10 ft to 20 ft (3.0 m to 6.0 m) buffer zone around the lot to accommodate vegetation screens. Also, raised-curb islands and parking lot separators provide suitable locations for shrubs and trees. Landscaping should include low maintenance vegetation that does not cause visibility or security problems.
11. Accessibility. See Section 41-6 for accessibility requirements.
12. Snow Removal. To assist with snow removal and storage, the design should include a 10 ft to 20 ft (3.0 m to 6.0 m) snow shelf around the perimeter of the lot on at least two sides. This area can coincide with the buffer zone around the lot, provided that the entire area is not filled with shrubs or trees. Place any fencing outside the area of the snow shelf. Providing painted islands rather than raised-curb islands can also make it easier to plow snow from the parking lot.

41-3.03 Parking Garages

Design and layout of parking spaces in parking garages can be found in the *ITE Traffic Engineering Handbook*, *ITE Guidelines for Parking Facility Location and Design*, *American Planning Association Aesthetics of Parking*, and other documents.

41-4 PUBLIC TRANSIT FACILITIES

41-4.01 General

The requirements for public transit should be considered early in the development of an urban highway improvement program, and should not be delayed until construction has been completed. Information gathered during the planning process on the routing of transit vehicles (e.g., turns, transfer points), and the volumes of buses (e.g., average or minimum headways) should be considered in the design.

Design and operational features of the highway that are affected by public transit facilities include:

- locations of bus stops,
- design of bus stops (e.g., turnouts),
- reservation of bus lanes, and
- special traffic control measures.

Generally, the municipality or local transit authority will determine the location of the bus stop or bus turnout. However, the designer usually has some control over the best placement of a bus stop or turnout location when considering layout details, intersection design, and traffic flow patterns.

41-4.02 Bus Loading Areas

Bus loading and unloading areas are usually located adjacent to park-and-ride lots. Figure 41-4A provides criteria for the recommended lengths of bus loading areas.

41-4.03 Bus Stops

If local bus routes are located on an urban or suburban highway, the designer should consider their impact on normal traffic operations. The stop-and-go pattern of local buses will disrupt traffic flow, but certain measures can minimize the disruption. The location of bus stops is particularly important. These are determined not only by convenience to patrons, but also by the design and operational characteristics of the highway and the roadside environment. If the bus must make a left turn, for example, do not locate a bus stop in the block preceding the left turn.

There are three basic bus stop designs — far-side or near-side of an intersection, and mid-block. Consider the following:

1. Far-Side Stops. For capacity and other reasons, far-side stops are generally preferred to near-side or mid-block bus stops.
2. Near-Side Stops. Near-side stops must be used where the bus will make a right turn at the intersection.
3. Mid-Block Stops. Mid-block bus stops may be considered where right turns at an intersection are high (250 in peak hour) and far-side stops are not practical.

Figure 41-4B provides the recommended distances for the prohibition of on-street parking near bus stops. Section 41-6 provides accessibility requirements.

41-4.04 Bus Turnouts

Providing bus turnouts can reduce interference between buses and other traffic significantly. Turnouts remove stopped buses from the through lanes and provide a well defined user area for bus stops. Consider bus turnouts where the following conditions exist:

- The street provides arterial service with higher speeds (e.g., posted speeds of 35 mph or greater).
- Bus volumes are 10 or more during the peak hour.
- Passenger volumes exceed 20 to 40 boardings an hour.
- The average bus dwell time generally exceeds 30 seconds per stop.
- During peak hour traffic, there are at least 250 vehicles per hour in the curb lane.
- Buses are expected to layover at the end of the trip.
- Potential vehicular/bus conflicts warrant the separation of transit and other vehicles.
- There is a history of traffic crashes and/or crashes involving pedestrians that can be resolved by a bus turnout.
- Right-of-way width is sufficient to prevent adverse impact on sidewalk pedestrian movements.
- Curb parking is prohibited, at least during peak hours.
- Sight distances prevent traffic from stopping safely behind the bus.
- Appropriate bus signal priority treatment exists at the intersection.
- Other improvements (e.g., widening) are planned for the major roadway.

Desirably, the total length of a bus turnout will allow for an entrance taper, a deceleration length, a stopping area, an acceleration length, and an exit taper. Figure 41-4C illustrates the design details for bus turnouts. Providing separate deceleration and acceleration lengths is desirable in open suburban area and on rural arterials and may be provided wherever feasible. However, common practice is to accept deceleration and acceleration in the through lanes and only build the tapers and stopping area. Additionally, consider the following:

1. Far-Side Turnouts. Typically, far-side intersection placement is desirable. Placing turnouts after signal controlled intersections allows the signal to create gaps in traffic.
2. Near-Side Turnouts. Avoid using near-side turnouts because of conflicts with right turning vehicles, delays to transit services as buses try to re-enter the traveled way, and obstructions to traffic control devices and pedestrian activities.
3. Mid-Block Turnouts. Only use mid-block turnouts in conjunction with major traffic generators.

4. Tapers. Figure 41-4C provides information on taper lengths that may be used for entrance and exit tapers. To improve traffic operations, use short horizontal curves (100 ft (30 m) radius) on the entry end and 50 ft to 100 ft (15 m to 30 m) curves on the re-entry end. Where a turnout is located at a far-side or near-side location, the cross street area can be assumed to fulfill the need for the exit or entry area, whichever applies.

41-4.05 Bus Shelters

Generally, the municipality or the local transit authority will determine the need for and location of bus shelters. The local transit authority will determine the design of a bus shelter. The designer should ensure that the shelter does not restrict vehicular sight distance, pedestrian flow, or accessibility for individuals with disabilities. Pedestrian shelters are desirable when loading areas for buses and trains are provided. Their inclusion will be determined on a case-by-case basis. The shelter should provide approximately 5 ft² (0.5 m²) of covered area per person. At least, the shelter should provide lighting, benches, and trash receptacles. Routing information signs and a telephone should also be considered. Section 41-6 provides accessibility requirements.

PARALLEL PARKING

SHALLOW SAWTOOTH PARKING
RECOMMENDED LENGTHS FOR BUS-LOADING AREAS
(Park-and-Ride Lots)

Figure 41-4A

- Notes:**
1. Where articulated buses are expected to use these stops, add an additional 20 ft (6 m) to the bus distances.
 2. Provide an additional 50 ft (15 m) of length for each additional bus expected to stop simultaneously at any given bus stop area. This allows for the length of the extra bus (40 ft (12.2 m)) plus 10 ft (2.8 m) between buses.

ON-STREET BUS STOPS

Figure 41-4B

BUREAU OF LOCAL ROADS & STREETS
SPECIAL DESIGN ELEMENTS

41-4(6)

Jan 2006

- Notes:**
1. Stopping area length consists of 50 ft (15 m) for each standard 40 ft (12.2 m) bus and 70 ft (21 m) for each 60 ft (18.3 m) articulated bus expected to be at the stop simultaneously.
 2. Bus turnout width is desirably 12 ft (3.6 m). For posted speeds under 30 mph, a 10 ft (3.0 m) minimum bay width is acceptable. These dimensions do not include gutter width.
 3. Suggested taper lengths are listed below. A minimum taper of 5:1 may be used for an entrance taper from an arterial street for a bus turnout while the merging or re-entry taper should not be sharper than 3:1.
 4. The minimum design for a bus turnout does not include acceleration or deceleration lengths. Recommended acceleration and deceleration lengths are listed below.

Design Speed	Entering Speed*	Acceleration Lengths	Deceleration Lengths **	Suggested Taper Lengths
US CUSTOMARY				
30 mph	20 mph	50 ft	120 ft	150 ft
35 mph	25 mph	250 ft	185 ft	170 ft
40 mph	30 mph	400 ft	265 ft	190 ft
45 mph	35 mph	700 ft	360 ft	210 ft
50 mph	40 mph	975 ft	470 ft	230 ft
METRIC				
40 km/h	25 km/h	15 m	35 m	40 m
50 km/h	35 km/h	60 m	45 m	45 m
60 km/h	45 km/h	105 m	70 m	50 m
70 km/h	55 km/h	200 m	105 m	60 m
80 km/h	65 km/h	310 m	145 m	70 m

* Desirably, the bus speed at the end of taper should be within 10 mph (15 km/h) of the design speed of the traveled way.
 ** Based on a 2.5 mph/sec (4.0 km/h/s) deceleration rate.

TYPICAL BUS TURNOUT DIMENSIONS

Figure 41-4C

41-5 PEDESTRIAN ACCOMMODATIONS

41-5.01 General

Consider the travel needs of all users of a transportation corridor when planning transportation improvements. Pedestrian accommodations are an integral part of urban and suburban transportation corridors. They facilitate pedestrian travel and access to public transportation, thereby contributing to alleviation of urban traffic congestion. The most pressing need for pedestrian accommodation is at points of community development that result in pedestrian concentrations near or along the highway, (e.g., schools, public transportation stations and stops, local businesses, industrial plants, hospitals, churches, shopping centers, parking lanes). Accommodations can include sidewalks, elevated walkways, grade separated structures, stairs, curb ramps, and traffic signal devices. If during the planning phase of a project, pedestrian travel in the vicinity of the project is determined to be sufficient to warrant consideration, provide appropriate accommodations.

Pedestrian accommodations will be considered appropriate if they are not already available and any of the following conditions exist:

- there is current evidence of frequent pedestrian activity,
- there is a history of pedestrian related crashes,
- the roadway improvement will create a safety impediment to existing or anticipated pedestrian travel (e.g., adding lanes so that the improvement itself acts as a barrier to pedestrian traffic),
- there is urban or suburban development that would attract pedestrian travel along the route to be improved,
- pedestrian attracting development is expected along the route within 5 years of project completion, either as documented in a local plan or anticipated as a factor of similar development history, and/or
- the roadway provides primary access to a school, park, recreation area, or other significant destination, or across a natural or man-made barrier.

41-5.02 Design

Design criteria for sidewalks are in Section 31-2.02. Facilities intended to also accommodate bicycle travel should follow the guidance in Chapter 42. Policies and guidelines for sidewalk/curb ramps for individuals with disabilities are addressed in Section 41-6.

Project limits may be extended beyond highway improvements for reasonable distances to include necessary pedestrian facilities at nearby intersections, to provide access to public transportation facilities, or to avoid short sidewalks gaps.

41-5.03 Older Pedestrians

Older and impaired pedestrians may be affected by limitations in sensory, perceptual, cognitive, or motor skills. The following measures may be considered at the discretion of the designer to aid older and impaired pedestrian road users:

- Assume a lower walking speed. To accommodate the shorter stride and slower gait of less capable (15th percentile) pedestrians, and their exaggerated “start up” time before leaving the curb, pedestrian control-signal timing based on an assumed walking speed of 2.8 ft/s (0.85 m/s) is recommended.
- Provide median refuge islands of sufficient width at wide intersections.
- Consider the traffic control system in the context of the geometric design to ensure compatibility and to provide adequate advance warning or guide signs for situations that could surprise or adversely affect the safety of older pedestrians.
- Use properly located signals with large signal indications.
- Provide enhanced markings and delineation.
- Consider increasing sign letter size and retroreflectivity to accommodate individuals with decreased visual acuity.
- Use repetition and redundancy in design and in signing.

41-5.04 Overpasses

Because of the high costs associated with grade separated facilities, overpasses should be incorporated into the early stages of planning where new developments are intended to generate substantial volumes of pedestrians. Overpasses are considered to be the most beneficial under the following conditions:

- where there is moderate to high pedestrian demand to cross a freeway or expressway,
- where there is a large number of young children (e.g., schools) who must regularly cross a high speed or high volume roadway,
- on streets having high vehicle and high pedestrian crossing volumes and an extreme hazard for pedestrians exists (e.g., on wide streets with high speed traffic and poor sight distance), and
- where one or more have the conditions stated above in conjunction with a well-defined pedestrian origin and destination (e.g., a residential neighborhood across a busy street from a school, a parking structure affiliated with a university, an apartment complex near a shopping mall).

Overpasses and underpasses will be evaluated on a case-by-case basis considering the type of pedestrian travel, travel generators (e.g., schools, factories, stadiums, parks, transit terminals, shopping districts), the amount of anticipated non-motorized traffic, and the safety impacts of not providing the accommodations. Consider the following when evaluating and/or designing a pedestrian overpass:

BUREAU OF LOCAL ROADS & STREETS
SPECIAL DESIGN ELEMENTS

Jan 2006

41-5(3)

1. Trip Length. Anticipated pedestrian trip length to generators should be 1 mile (2 km) or less and the adverse travel distance alleviated by construction to the facility should be greater than 0.5 miles (1 km).
2. Walkways. Walkways for pedestrian separation should have a minimum width of 8 ft (2.4 m). Greater widths may be needed where there are exceptionally high volumes of pedestrian traffic (e.g., downtown areas, near sports stadiums).
3. Protective Screens. Consider including a protective screen in the design of a pedestrian overpass. The screen is intended to prevent objects dropping into the path of traffic moving under the structure. Locations where screens should be considered include the following:
 - on an overpass near a school, playground, or elsewhere where it would be expected that the overpass would be frequently used by children unaccompanied by adults,
 - on all overpasses in large urban areas used exclusively by pedestrians and not easily kept under surveillance by police, and
 - on an overpass where the history of incidents on nearby structures indicates a need for screens.
4. Accessibility Considerations. When deciding where to locate a pedestrian crossing, the highway and structure designers must coordinate their efforts to properly address the accessibility considerations. All current and future pedestrian access routes (PARs) must be identified. If existing routes are inaccessible, the designer must evaluate the likelihood that the routes will be made accessible in the future. This may be done as part of the project under design. The evaluation may lead to the decision to relocate the pedestrian overpass or underpass to another site where accessibility can be more easily provided.

The proposed design must meet the *ADA Standards* criteria for stairs, ramps, curb ramps, and PARs; see Section 41-6.

Additional guidance on pedestrian overpasses can be found in FHWA-RD-84/082 *Warrants for Pedestrian Over and Underpasses*.

41-6 REQUIREMENTS FOR ACCESSIBLE PUBLIC RIGHTS-OF-WAY

41-6.01 General

Many highway elements can affect the accessibility and mobility of individuals with disabilities. These include sidewalks, curb ramps, parking spaces, buildings at transportation facilities, overpasses or underpasses, temporary traffic control, and landscaping or streetscaping. According to the *Americans with Disabilities Act (ADA)*, 42 U.S.C. §12181 - 12189 and the *Illinois Environmental Barriers Act*, 410 ILCS 25/1 *et seq*, public highway right-of-way shall be made accessible to all users. Local Public Agencies (LPAs) are required to perform a self-assessment to determine barriers to accessibility within the public highway right-of-way.

Currently, a national uniform design guideline for public highway right-of-way has not been adopted by the United States Department of Justice and Federal Highway Administration (FHWA). However, the *Proposed Accessibility Guidelines for Pedestrian Facilities in the Public Right-of-Way (PROWAG)* has been introduced by the United States Access Board through the federal rule-making process. Furthermore, FHWA has issued guidance that PROWAG may be used in order to comply with accessibility requirements. Therefore, the Department recommends that LPAs use the latest revision of PROWAG available at www.access-board.gov, when constructing or altering facilities within the highway public right-of-way.

Figure 41-6A provides a reference to criteria contained in PROWAG unless otherwise noted. The *ADA Standards for Accessible Designs (ADAAG)*, the *Illinois Accessibility Code (IAC)*, the *Uniform Federal Accessibility Standards (UFAS)*, the *ILMUTCD*, and the *American National Standards Institute (ANSI)* should also be consulted as needed. Where LPA policies or local codes require criteria that exceed PROWAG, then the local criteria should be used.

41-6.02 Equivalent Facilitation

The use of alternative designs, products, or technologies, that result in substantially equivalent or greater accessibility and usability than the requirements in PROWAG, is permitted. However, the LPA should document how the equivalent facilitation was determined.

41-6.03 Application

All newly constructed facilities, altered portions of existing facilities, and elements added to existing facilities for pedestrian circulation and use located in the public right-of-way shall comply with the requirements in this Section.

Figure 41-6A

41-6.04 Alterations

41-6.04(a) General

Where existing elements, spaces, or facilities are altered, each altered element, space, or facility within the scope of the project shall comply with the applicable requirements for new construction unless existing physical constraints exist. The alteration of multiple elements or spaces within a facility may provide a cost-effective opportunity to make the entire facility or a significant portion of the facility accessible.

Figure 41-6B provides a summary of some common alterations.

BUREAU OF LOCAL ROADS & STREETS
SPECIAL DESIGN ELEMENTS

Oct 2013

41-6(3)

Type of Work	Alteration Required
Resurfacing (includes, but not limited to, addition of a new layer of asphalt, reconstruction, concrete pavement rehabilitation and reconstruction, open-graded surface course, microsurfacing and thin lift overlays, cape seals, and in-place asphalt recycling)	Correct non-compliant curb ramps and crosswalks
Remove and Replace Sidewalk (sidewalk patch, relocate poles or posts, etc.)	Replace with compliant (includes transition to non-compliant)
Curb & Gutter Replacement	Install curb ramps if replaced curb and gutter is at a pedestrian crossing with adjacent sidewalk
Pedestrian Signal (signal controller and software altered, or signal head replaced)	Installed Accessible Pedestrian Signals and accessible pushbutton
Restriping Parking Markings	Provide accessible spaces

ALTERATION REQUIRED BY TYPE OF WORK

Figure 41-6B

41-6.04(b) Existing Physical Constraints.

Where existing physical constraints make it impracticable for altered elements, spaces, or facilities to fully comply with the requirements for new construction, compliance is required to the extent practicable within the scope of the project. Existing physical constraints include, but are not limited to, underlying terrain, right-of-way availability, underground structures, adjacent developed facilities, drainage, or the presence of a notable natural or historic feature.

The LPA should document the various options considered, reasons for selecting, and any public comments received concerning an alteration to the extent practicable. Furthermore, the facility shall continue to be listed as a barrier in the LPA's self-evaluation.

41-6.04(c) Transitional Segments.

Transitional segments of an altered PARs shall connect to existing unaltered segments of pedestrian circulation paths. The transitional segment shall be removed when the existing unaltered section is altered in the future.

41-6.04(d) Reduction in Access Prohibited.

An alteration shall not decrease or have the effect of decreasing the accessibility of a facility or an accessible connection to an adjacent building or site below the requirements for new construction in effect at the time of the alteration. Sidewalk improvements that correct existing excessive cross slope should be carefully planned to avoid creating excessive slope in curb ramps or adding a step at existing building entrances. Solutions may include:

1. Split sidewalks that serve building entrances and street or highway at separate levels;

2. Sidewalks with greater cross slope along the curb and PARs with lesser cross slope along building fronts;
3. PARs along the curb and ramped entrances to buildings.

41-6.04(e) Alterations to Qualified Historic Facilities.

Where the State Historic Preservation Officer or Advisory Council on Historic Preservation determines that compliance with a requirement would threaten or destroy historically significant features of a qualified historic facility, compliance shall be required to the extent that it does not threaten or destroy historically significant features of the facility.

Where there is a federal agency “undertaking”, as defined in 36 CFR 800.16 (y), the requirements in section 106 of the National Historic Preservation Act (16 U.S.C. 470f) and 36 CFR part 800 apply. Location of a facility within an historic district by itself does not excuse compliance with the requirements in this document. The State Historic Preservation Officer or Advisory Council on Historic Preservation must determine that compliance would threaten or destroy historically significant features of the facility. Reproductions or replications of historic facilities are not qualified historic facilities.

41-6.05 Pedestrian Access Route

A PAR shall be provided within sidewalks and other pedestrian circulation paths located in the public right-of-way. The pedestrian access route shall connect to accessible elements, spaces, facilities, and to other accessible routes not within the public right-of-way.

PARs shall consist of one or more of the following: sidewalks and other pedestrian circulation paths, or a portion of sidewalks and other pedestrian circulation paths; pedestrian street crossings and at-grade rail crossings; pedestrian overpasses and underpasses and similar structures; curb ramps and blended transitions; ramps; elevators and limited use/limited application elevators; platform lifts; and doors, doorways, and gates.

41-6.06 Alternate Pedestrian Access Route

When a pedestrian circulation path is temporarily closed by construction, alterations, maintenance operations, or other conditions, an alternate PAR shall be marked and/or provided. Any pedestrian barricades and channelizing devices shall comply with the *ILMUTCD*.

The *ILMUTCD* recommends that whenever possible, work should be done in a manner that does not create a need to detour pedestrians from existing pedestrian routes. Extra distance and additional pedestrian street crossings add complexity to a trip and increase exposure of risk to accidents.

41-6.07 Curb Ramps and Blended Transitions

A curb ramp, blended transition, or a combination of curb ramps and blended transitions shall be installed to allow pedestrians to continue through pedestrian street crossings, alleys, or driveways. The curb ramp (excluding any flared sides) or blended transition shall be contained wholly within the width of the crossing served. In alterations where existing physical constraints prevent a curb ramp at each crossing, a single diagonal curb ramp shall be permitted to serve both pedestrian street crossings.

There are two types of curb ramps:

- Perpendicular curb ramps have a running slope that cuts through or is built up to the curb at right angles, or meets the gutter break at right angles where the curb is curved. On large corner radiuses, it will be necessary to indent the gutter break on one side of the curb ramp in order for the curb ramp to meet the gutter break at right angles.
- Parallel curb ramps have a running slope that is in-line with the direction of sidewalk travel and lower the sidewalk to a level turning space where a turn is made to enter the pedestrian street crossing.
- Parallel and perpendicular curb ramps may be combined. A parallel curb ramp is used to lower the sidewalk to a mid-landing and a short perpendicular curb ramp connects the landing to the street.

Blended transitions are similar to curb ramps. However, blended transitions have a less severe running slope and some other differences from curb ramp design. Raised pedestrian street crossings are considered blended transitions. Blended transitions are suitable for a range of sidewalk conditions and should be considered at level intersections.

The Department has developed a series of highway standards that provide the requirements for curb ramp and/or blended transition construction. However, these standards may not provide the contractor and LPA construction supervisor with enough information to ensure accessibility compliance at locations with severe slopes, existing site constraints, or other unique situations. Therefore, the LPA should consider providing plan details for each corner where curb ramps or blended transitions are being constructed.

41-6.08 Detectable Warning Surfaces

41-6.08(a) General

Detectable warning surfaces indicate the boundary between pedestrian and vehicular routes where there is a flush rather than a curbed connection and shall be provided at the following locations on the PAR and at transit stops:

- Curb ramps and blended transitions at pedestrian street crossings;
- Pedestrian refuge islands (minimum width 6 ft);
- Pedestrian at-grade rail crossings not located within a street or highway;
- Boarding platforms at transit stops for buses and rail vehicles where the edges of the boarding platform are not protected by screens or guards; and

- Boarding and alighting areas at sidewalk or street level transit stops for rail vehicles where the side of the boarding and alighting areas facing the rail vehicles is not protected by screens or guards.

Detectable warning surfaces should not be provided at crossings of residential driveways, since the pedestrian right-of-way continues across residential driveway aprons. However, where commercial driveways are provided with yield or stop control, detectable warning surfaces should be provided at the junction between the pedestrian route and the vehicular route.

41-6.09 Pedestrian Street Crossing

All pedestrian street crossings shall be accessible to pedestrians with disabilities. Where pedestrian signals are provided at pedestrian street crossings, they should consider accessible pedestrian signals

41-6.10 Protruding Objects

Objects along or overhanging any portion of a pedestrian circulation path shall not reduce the clear width required for the PAR.

41-6.11 Signs

Where audible sign systems and other technologies are used to provide information equivalent to the information contained on pedestrian signs and transit signs, the signs are not required to comply with accessibility requirements.

Audible sign systems and other technologies that provide information equivalent to the information contained on signs are more usable by pedestrians who are blind or have low vision. Remote infrared audible signs that transmit information to portable devices that are carried by and audible only to the user are an example of audible sign systems and other technologies.

41-6.12 Transit Stops and Transit Shelters

Where provided (regardless of who provides), transit stops and transit shelters shall comply with accessibility requirements.

Transit stops in the public right-of-way typically serve fixed route bus systems, including bus rapid transit systems, and light rail transit systems. Signs that identify the routes served by the transit stop shall comply with the technical requirements for visual characters on signs unless audible sign systems or other technologies are used to provide the information. The FHWA has issued guidance on the obligations of state transportation departments, metropolitan planning organizations, and transit agencies to coordinate the planning and funding of accessibility improvements to transit systems and facilities.

41-6.13 On-Street Parking

41-6.13(a) General

Where on-street parking is provided on the block perimeter and the parking is marked or metered (including pay stations), accessible parking spaces shall be provided. Where parking pay stations are provided and the parking is not marked, each 20.0 ft (6.1 m) of block perimeter where parking is permitted shall be counted as one parking space. Figure 41-6C specifies how many accessible parking spaces shall be provided on the block perimeter where on-street parking is marked or metered.

Accessible parking spaces shall be identified by signs complying with the *ILMUTCD*. Accessible parking spaces should be located where the street has the least crown and grade and close to key destinations.

Total Number of Marked or Metered Parking Spaces on the Block Perimeter	Minimum Required Number of Accessible Parking Spaces
1 to 25	1
26 to 50	2
51 to 75	3
76 to 100	4
101 to 150	5
151 to 200	6
201 and over	4 percent of total

ON-STREET PARKING SPACES

Figure 41-6C

41-6.13(b) Signage

Accessible parking spaces shall be designated with a ground-mounted RESERVED PARKING for persons with disabilities (R7-8) sign with the \$____ FINE (R7-I101) supplemental plaque. The amount of the fine shall be as established by 625 ILCS 5/11-1301.3(c). Signs shall be 7 ft (2.0 m) minimum above the finish floor or ground surface measured to the bottom of the sign, and no more than 2 ft (0.6 m) horizontally from the face of curb. Signs shall be located at the head or foot of the parking space so as not to interfere with the operation of a side lift or a passenger side transfer.

41-6.13(c) Pavement Marking

1. Color. Accessible parking spaces and access aisles shall be designated with white pavement marking and may be supplemented with blue pavement markings.
2. Width. Pavement marking shall be 3 in (75 mm) to 6 in (150 mm) wide.

3. Access Aisle. When required, the access aisle shall be marked with 45 degree diagonal lines. The diagonal lines should be 3 in (75 mm) to 6 in (150 mm) wide and separated by gaps of 12 in (300 mm) to 36 in (900 mm). The gap between the lines should not exceed 6 times the width of the diagonal lines.
4. Symbol. The international symbol of accessibility should be used to provide additional emphasis. See Figure 41-6D.

Note: Blue background and white border are optional

INTERNATIONAL SYMBOL OF ACCESSIBILITY FOR PAVEMENT MARKING

Figure 41-6D

41-6.13(d) Dimensions

Where parking spaces are marked with lines, width measurements of parking spaces and access aisles shall be made from the centerline of the markings. The required size of parking spaces and access aisles shall be determine by the type of parking space.

41-6.13(e) Curb Ramps or Blended Transitions

Curb ramps or blended transitions complying with Section 41-6.07 shall connect the access aisle to the PAR. Curb ramps shall not be located within the access aisle. At parallel parking spaces, curb ramps and blended transitions should be located so that a van side-lift or ramp can be deployed to the sidewalk and the vehicle occupant can transfer to a wheelchair or scooter. Parking spaces at the end of the block face may be served by curb ramps or blended transitions at the pedestrian street crossing, provided that the curb ramp is not accessed from a travel lane.

Detectable warning surfaces are not required on curb ramps and blended transitions that connect the access aisle to the sidewalk, including where the sidewalk is at the same level as the parking spaces, unless the curb ramps and blended transitions also serve pedestrian street crossings.

41-6.14 Off-Street Parking

41-6.14(a) General

Accessible parking spaces for individuals with disabilities and accessible passenger loading zones that serve a particular building shall be the spaces or zones closest to the nearest accessible entrance on a PAR. In separate parking facilities that do not serve a particular building, locate parking spaces for individuals with disabilities on the shortest possible circulation route to an accessible pedestrian entrance of the parking facility. In buildings with multiple access entrances with adjacent parking, accessible parking spaces may be dispersed and located closest to the accessible entrances. The total number of accessible parking spaces may be distributed among parking facilities, if greater accessibility is achieved in consideration of such factors as anticipated usage, number and location of entrances and level parking areas. Figure 41-6E specifies how many accessible parking spaces shall be provided.

Each parking space shall have its own access aisle and all access aisles shall blend to a common level with an accessible route. Parking spaces and access aisles shall be level with surface slopes not exceeding 1:50 (2.0%) in all directions. Minimum vertical clearance of 98 in (2490 mm) at the parking space and along at least one vehicle access route to such spaces from site entrance(s) and exit(s) shall be provided.

OFF-STREET PARKING SPACES

Figure 41-6E

41-6.14(b) Signage

See Section 41-6.13(b).

41-6.14(c) Pavement Marking

1. Color. Accessible parking spaces and access aisles shall be designated with yellow pavement marking.
2. Width. See Section 41-6.13(c).
3. Access Aisle. See Section 41-6.13(c).
4. Symbol. See Section 41-6.13(c).

41-6.14(d) Dimensions

An accessible parking space shall consist of a 16 ft (4.9 m) wide parking space, which includes an 8 ft (2.4 m) wide access aisle (See Figure 41-6F). In the alternative, an accessible space may be 16 ft (4.9 m) wide, including a space 11 ft (3.4 m) wide with a 5 ft (1.5 m) access aisle (See Figure 41-6G).

A common access aisle shall not be shared between adjacent parking spaces. Access aisles shall be permitted to be placed on either side of the parking space except for angled parking spaces, which shall have access aisles located on the passenger side of the parking space.

STANDARD OFF-STREET ACCESSIBLE PARKING SPACES

Figure 41-6F

UNIVERSAL PARKING DESIGN OFF-STREET ACCESSIBLE PARKING SPACES

Figure 41-6G

41-6.15 Passenger Loading Zones

Where passenger loading zones other than transit stops are provided, at least one accessible passenger loading zone shall be provided for each 100.0 ft (30 m) of continuous loading zone space or fraction thereof. Accessible passenger loading zones must be identified by signs displaying the International Symbol of Accessibility.

41-6.16 Other

Where provided on pedestrian circulation paths, Stairways and Escalators (shall not be part of a PAR), Handrails, Doors, Doorways, and Gates; and Ramps shall comply with accessibility requirements.

41-7 HIGHWAY LIGHTING

41-7.01 Guidelines for Justifying Highway Lighting

Providing lighting for all highway facilities is neither practical nor cost effective. It is generally only practical to provide highway lighting where justified based on sound engineering judgment and on the criteria, recommendations, and principles presented in the AASHTO publication *Guidelines for Highway Lighting*.

For a highway facility to be considered for lighting, the lighting system must be both economically feasible and justified based on the applicable criteria presented in the following Sections. The impacts of local conditions (e.g., frequent fog, ice, snow, roadway geometry, ambient lighting, sight distance, signing) also should be considered when analyzing highway lighting needs.

41-7.01(a) Analyzing Highway Lighting Needs

The AASHTO publication *Guidelines for Highway Lighting* presents an empirical approach to analyzing highway lighting needs with primary application to freeway-type facilities. The principal considerations are vehicular traffic volume, land development, and artificial lighting conditions in the area surrounding the roadway, and the night-to-day crash ratio. The affect of these factors on driver visibility should be considered in the lighting needs analysis.

A supplemental approach to analyzing highway lighting needs, based primarily on an analytical evaluation of driver information, is published in NCHRP Report No. 152 *Warrants for Highway Lighting*. This publication has application to both urban-type facilities (e.g., streets, arterials, intersections). In urban areas where the analyst may find difficulty in applying the AASHTO empirical approach, Report No. 152 offers an alternative approach for analyzing highway lighting needs.

41-7.01(b) Lighting of Streets and Highways

Urban and rural conditions, traffic volumes (both vehicular and pedestrian), intersections, turning movements, signalization, channelization, and varying geometrics are factors that should be considered when determining the lighting needs of streets and highways. Consider the following:

1. Facilities with Raised Medians. Consider highway lighting along sections of facilities that have raised medians.
2. Major Urban Arterials. Consider highway lighting along all major arterials that are located in urban areas.
3. Intersections. Consider intersection lighting at rural intersections that meet any one of the following conditions:
 - there are 2.4 or more crashes per million vehicles in each of 3 consecutive years;

BUREAU OF LOCAL ROADS & STREETS
SPECIAL DESIGN ELEMENTS

41-7(2)

Jan 2006

- there are 2.0 or more crashes per million vehicles per year and 4 or more crashes per year in each of 3 consecutive years;
- there are 3.0 or more crashes per million vehicles per year and 7 or more crashes per year in each of 2 consecutive years;
- the intersection is signalized and there have been, in the past year, 5 or more reported nighttime crashes and a day-to-night crash ratio of less than 2.0;
- substantial nighttime pedestrian volume exists;
- less than desirable alignment exists on any of the intersection approaches;
- the intersection is an unusual type requiring complex turning maneuvers;
- commercial development exists in the vicinity that causes high nighttime traffic peaks;
- distracting illumination exists from adjacent land development; and/or
- recurrent fog or industrial smog exists in the area.

Isolated intersections located within the fringe of corporate limits that are suburban or rural in character may be illuminated provided they meet the above criteria.

4. High Conflict Locations. Consider providing lighting along roadway sections with high vehicle-to-vehicle interactions (e.g., sections with numerous driveways, significant commercial or residential development, and high percentage of trucks). Lighting generally improves traffic safety and efficiency at these locations.
5. Complex Roadway Geometry. Consider providing lighting at spot locations in rural areas where the driver is required to pass through a roadway section with complex geometry.
6. Night-To-Day Crash Ratio. Lighting should be considered at locations or sections of streets and highways where the night-to-day ratio of crash rates is higher than the statewide average for similar locations, and a study indicates that lighting may be expected to significantly reduce the night crash rate. The number of nighttime crashes also should be evaluated.
7. LPA Needs. Lighting should be provided where the LPA finds sufficient benefit in the forms of convenience, safety, policing, community promotion, public relations, etc., to pay the installation, maintenance, and operation of the lighting facilities.

41-7.01(c) Lighting of Bridge Structures and Underpasses

Because of their typical configuration and length-to-height ratio, underpasses generally have good daylight penetration and do not require supplemental daytime lighting. Underpass lighting generally is installed to enhance driver visibility after daylight hours. When the length-to-height ratio of the underpass exceeds approximately 10:1, it usually is necessary to analyze specific geometry and roadway conditions, including vehicular and pedestrian activity, to determine the need for supplemental daytime lighting.

On highways that are not continuously lighted, consider providing underpass lighting where frequent nighttime pedestrian traffic exists through the underpass or where unusual or critical geometry exists within or on an approach to the underpass.

Provide underpass lighting on all highways that are continuously lighted. Favorable positioning of conventional highway luminaires adjacent to a relatively short underpass often can provide adequate illumination within the underpass without a need to provide supplemental lighting. If this action is considered, ensure that shadows cast by the conventional luminaires do not become a visibility problem within the underpass.

41-7.01(d) Other Locations

Provide lighting for all pedestrian underpass and pedestrian tunnel facilities. In addition, the need to provide lighting for the following facilities will be determined on a case-by-case basis:

- commuter park-and-ride lots,
- bike paths,
- pedestrian walkways, and
- pedestrian overpasses.

41-7.01(e) Roadway Reconstruction

During roadway reconstruction projects, existing highway lighting should be evaluated and upgraded or removed, if necessary, to meet current highway lighting criteria.

41-7.01(f) Ornamental Lighting

Ornamental lighting is lighting provided along the roadway for purposes other than highway lighting. There are some ornamental lighting luminaires with distribution patterns that will control the light and meet AASHTO requirements. A LPA may provide ornamental lighting if the minimum requirements are met.

41-7.02 Highway Lighting Procedures

Consider street lighting at all intersections and continuous street lighting heavily built up areas, particularly on collector and arterial streets. Determinations on lighting should be coordinated with crime protection and other community needs.

Use the following guidelines in the design and submittal of street lighting projects to be maintained by a LPA. The design of street lighting systems should be as recommended in the AASHTO publication, *Guidelines for Highway Lighting*. ANSI/IESNA *American National Standard Practice for Roadway Lighting* also presents guidelines for highway lighting.

BUREAU OF LOCAL ROADS & STREETS
SPECIAL DESIGN ELEMENTS

41-7(4)

Jan 2006

Previous design criteria may be used if the proposed work is a part of an overall street lighting improvement already begun. Traffic safety should be given consideration in the physical design of lighting systems. In additions, certain characteristics (e.g., traffic speed, type of parking, type of curb, location of sidewalk) should govern the pole type and setback.

It is important to analyze charges for energy consumed by various lighting types (i.e., high-pressure sodium, low-pressure sodium, metal halide). Note that 55% to 75% of maintenance and operational costs are for electricity.

Generally, breakaway or frangible supports are recommended whenever the support is exposed to traffic. An exception would be a situation where a falling support would create a greater hazard than that of a vehicle striking a non-breakaway support. Selection of the proper light support to be used is discussed in AASHTO's *Standard Specifications for Structural Supports for Highway Signs, Luminaires, and Traffic Signals*.

Street lighting projects to be maintained by the State shall be designed in accordance with Chapter 56 of the *BDE Manual*.

41-8 MAIL DELIVERY

Mailboxes and newspaper tubes served by carriers in vehicles may constitute a safety hazard, depending upon the placement of the mailbox and the width of the turnout. Therefore, the designer should make every reasonable effort to replace all non-conforming mailboxes and turnouts with designs that meet the criteria in the *BLRS Highway Standards*, 605 ILCS 5/5-411, 605 ILCS 5/6-412, and the *AASHTO A Guide for Erecting Mailboxes on Highways*.

41-8.01 Location

Mailboxes and turnouts should be placed for maximum convenience to the patron, consistent with safety considerations for highway traffic, the carrier, and the patron. Consider the following:

1. Intersections. Placing a mail stop near an intersection will have an effect on the operation of the intersection (e.g., reduction of intersection sight distance, blocked lanes). The nature and magnitude of this impact depends on traffic speeds, volumes on each of the intersecting roadways, the number of mailboxes at the stop, type of traffic control, how the stop is located relative to the traffic control, and the distance the stop is located from the intersection. Figure 41-8A provides the recommended minimum clearance distances to mailbox stops near intersections.
2. Near-Side/Far-Side at Driveways. On rural two-lane highways where a single mailbox installation is required, the near-side turnout is preferable because this design allows the postal patron to pull up to the mailbox and then to turn into the driveway without backing up. If there is a need for multiple mailbox installations at one location, the far-side turnout is preferable because all postal patrons except for one can pull into the turnout and then drive out and proceed to their homes.
3. Right or Left Side. Only place boxes on the right-hand side of the highway in the direction of travel of the carrier, except on one-way streets where they may be placed on the left-hand side.
4. Guardrail. Where a mailbox is installed in the vicinity of an existing guardrail and where practical, place the mailbox support behind the guardrail. Allow for deflection of the guardrail.

BUREAU OF LOCAL ROADS & STREETS
SPECIAL DESIGN ELEMENTS

41-8(2)

Jan 2006

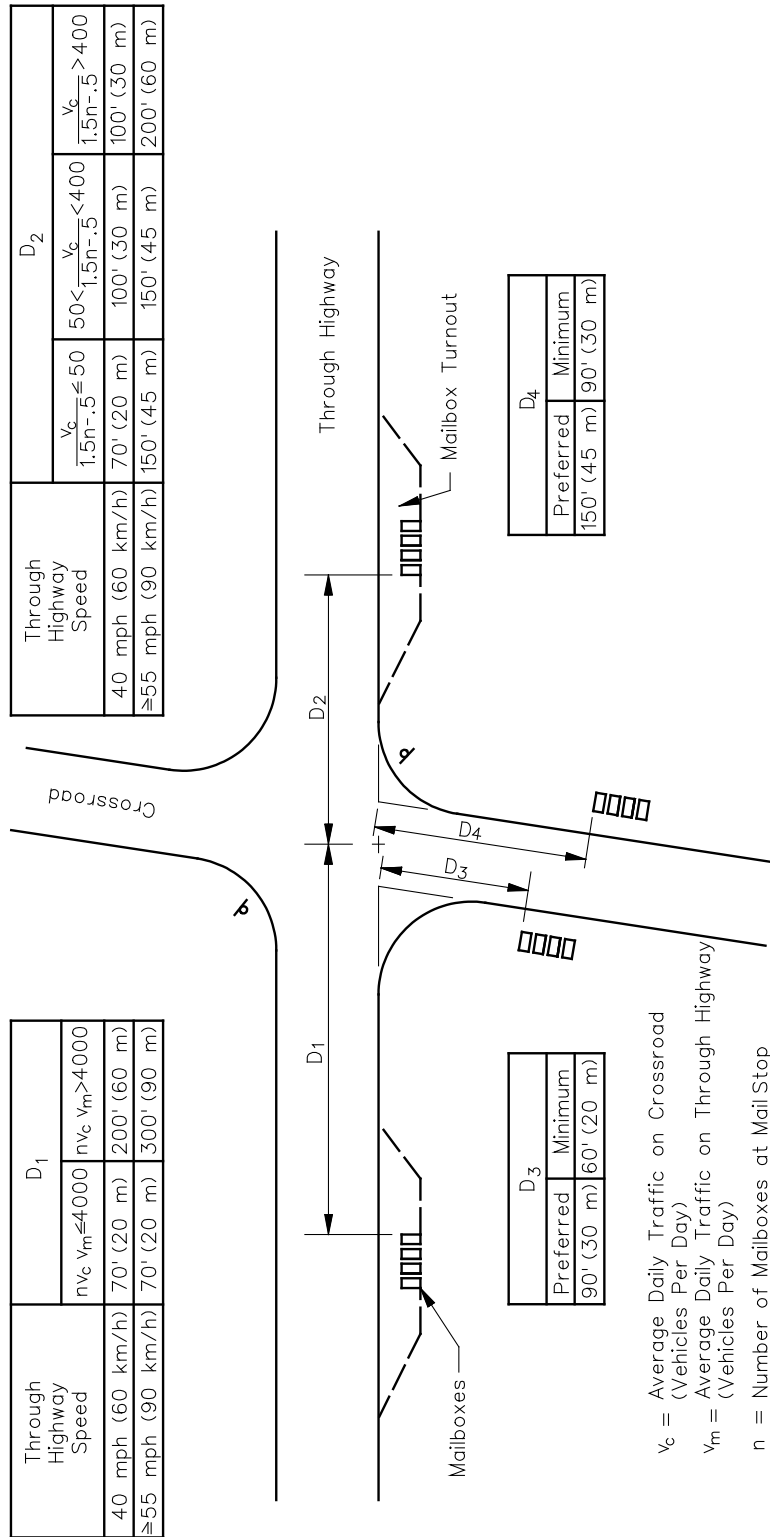

5. Suburban/Urban Areas. A potential problem frequently occurs where a roadway section with shoulder originally existed and where the roadway is reconstructed to a curb and gutter cross section. Previously, the mail carrier would have delivered mail from a vehicle by driving along the shoulder. With the reconstruction to a curb and gutter section, the mail now has to be delivered by driving on the pavement adjacent to the curb and gutter. A curb and gutter section 30 ft (9 m) wide provides adequate width for a vehicle to pass a stopped mail carrier in a vehicle. Under certain conditions, mail delivery along a curb and gutter roadway has the potential to be hazardous. The factors that could contribute to a potential problem along the street are high-operating speeds, the number of through and turning lanes, and the amount of congestion due to traffic volumes. To alleviate the potential for mail delivery problems where a curb and gutter cross section is proposed, the LPA should work closely with local postmaster during the development of the project. In many cases, after coordination with a postmaster is completed, the designer will determine that the potential for mail delivery problems is minor and no special design features are needed. However, where the potential for mail delivery problems is determined to be significant, it may be possible to modify rural type delivery on streets with curb and gutter by considering the following:
 - a. Grouping. Where there are a number of closely spaced houses located along a highway, it may be desirable to group 2, 4, or 6 mailboxes at one location as shown on Figures 41-8B and 41-8C.
 - b. Neighborhood Delivery and Collection Box Unit (NDCBU). NDCBU is a cluster of 8 to 16 locked boxes mounted on a pedestal or within a framework. These clusters can weigh between 100 lbs to 200 lbs (45 kg to 90 kg) and may be a roadside hazard. Therefore, they should be located outside the clear zone in rural areas and preferably on a side street in urban areas. Usually, NDCBU is located in trailer parks, apartment complexes, and new residential subdivisions. However, note that postal patrons usually do not like this solution in older established neighborhoods.
 - c. Park and Loop Routes. Request the mail carrier to park his/her vehicle on a side street, walk the block, and return to the vehicle.
 - d. Paved Shoulder. Provide a continuous 6 ft (1.8 m) paved shoulder with curb and gutter located behind the shoulder. This alternative is expensive and right-of-way may not be available in many cases. However, this design allows for mail carriers, garbage trucks, and delivery trucks to avoid parking in the traffic lane.
 - e. Construction. If during the preparation of the plans it is determined that temporary locations will be required for mail delivery during construction, provide the necessary details in the plans and special provisions.

Where a satisfactory mail delivery solution cannot be reached between all parties involved, contact the Delivery Programs Support Analysts at one of the US Postal Services' district offices at the following locations:

- For northern Illinois, contact the postal official at (630) 260-5260.
- For central Illinois, contact the postal official at (708) 563-7360.

HARD COPIES UNCONTROLLED

- For southern Illinois, contact the Midwest Area Office in St. Louis at (314) 692-5426.

RECOMMENDED MINIMUM CLEARANCE DISTANCES TO MAILBOX STOPS NEAR INTERSECTIONS

Figure 41-8A

Section A-A

Section B-B

*Note: Farside turnouts are preferable from a traffic operations standpoint. Nearside locations may be considered after discussions with homeowners and the local postmaster.

**URBAN MAILBOX TURNOUTS
(Two or Four Mailboxes Grouped Together)**

Figure 41-8B

URBAN MAILBOX TURNOUTS
(Six Mailboxes Grouped Together)

Figure 41-8C

41-8.02 Mailbox Turnout Designs

The *IDOT Highway Standards* provide the geometric design criteria for rural mailbox turnouts. The designer should also consider the following:

1. Stopping Sight Distance. Ensure that there is sufficient stopping sight distance in advance of the mailbox turnout.
2. Width. The minimum width of a mailbox turnout should be in accordance with the BLR Standard for Mailbox Turnouts on Local Roads.
3. Narrow Shoulders. Widening and/or resurfacing of highways may result in shoulder widths that are too narrow for mailbox turnouts. In these cases, it will be necessary to widen out the shoulder at the mailbox location to provide the minimum width and, in some cases, installing a sufficient length of pipe culvert to provide for roadside drainage.
4. Surface. The following will apply:
 - a. County Roads. For turnouts along county roads with all weather surfaces, provide an all-weather surface (605 ILCS 5/5-411).
 - b. Township and Road District Roads. For township and road district roads that have an all-weather surface, also provide this surface to the mailbox if funds are available (605 ILCS 5/6-412).
5. Special Designs. Due to the multitude of different conditions, the standard mailbox turnout designs may not always be practical and a special design must be used. This is especially true in urban and suburban areas.

41-8.03 Mailbox Supports

41-8.03(a) Removal of Hazardous Supports

Removal and replacement of mailboxes can be a sensitive issue and should be reviewed with the local postal authorities and the postal patron. The process for evaluating the removal and replacement of these supports discussed in Section 22-2 as required for Federal-funded projects and may be used for other projects.

41-8.03(b) Mailbox Designs

In determining acceptable mailbox designs, consider the following:

1. Heights. Mailbox heights are usually located so that the bottom of the box is 3 ft (1.0 m) to 4 ft (1.2 m) above the mail stop surface.

BUREAU OF LOCAL ROADS & STREETS
SPECIAL DESIGN ELEMENTS

41-8(8)

Jan 2006

2. Mailbox Supports and Attachment Design. The post-to-box attachment details should be of sufficient strength to prevent the box from separating from the post top if a vehicle strikes the installation. For guidance on mailbox posts, supports, and attachments, see the AASHTO *A Guide for Erecting Mailboxes on Highways*.
3. Multiple Mailboxes. Due to the possibility of spearing of windshields by the horizontal support, it is desirable to individually mount each mailbox on a separate support. However, it may be acceptable to mount multiple mailboxes on one support if it meets the criteria in the AASHTO *A Guide for Erecting Mailboxes on Highways*. No more than two mailboxes may be mounted on a support structure unless the support structure and mailbox arrangement have been shown to be safe by crash testing. However, lightweight newspaper boxes may be mounted below the mailbox on the side of the mailbox support. To reduce the possibility of ramping, multiple mailbox supports should be separated by a distance at least equal to three-fourths of their height above ground.
4. Foundations. Do not set mailbox supports in concrete unless the support design has been shown to be safe by crash tests when so installed. Do not embed the post more than 2 ft (600 mm) into the ground. Do not fit a metal post with an anchor plate; however, it may have an anti-twist device that extends no more than (10 in) 250 mm below the ground surface.
5. Post Sizes. The following posts sizes are generally considered to be acceptable:
 - a single 4 in x 4 in (100 mm x 100 mm) square wooden post,
 - a 4 in (100 mm) diameter wooden post, or
 - a metal post with strength no greater than a 2 in (50 mm) diameter standard strength steel pipe.

HARD COPIES UNCONTROLLED

41-9 NOISE BARRIERS

41-9.01 General

Properly constructed noise barriers (e.g., earth berms, structural walls) in combination with landscaping, whether within or outside the highway right-of-way, can reduce excessive noise levels. Thick dense wooded areas with no visual path between the highway and the affected site can also reduce noise levels. However, trees by themselves do not prove to be a good noise barrier unless they have a very dense mass. Rows of buildings and houses can reduce noise impacts on subsequent rows of buildings and houses.

41-9.02 Design Considerations

The FHWA's *Highway Traffic Noise Analysis and Abatement Policy and Guidance* provides guidelines and design considerations for noise barriers.

41-9.03 Roadside Safety

Chapter 35 provides the design criteria for clear zones. If practical, noise barrier walls should be placed outside of the applicable clear zone value. Otherwise, guard rail should be considered to shield the wall from run-off-the-road vehicles. The designer must ensure that adequate deflection distance is available between the guard rail and noise barrier. Chapter 35 discusses the design of guardrail in detail.

If the noise barrier is a mound of dirt, the toe of the barrier should be traversable by a run-off-the-road vehicle.

41-9.04 Sight Distance

For at-grade intersections, noise barriers should not be located in the triangle required for corner sight distance. Section 28-3 provides the criteria to determine the required sight distance triangle.

Noise barriers can also impact sight distance along horizontal curves. Section 29-5 provides the detailed criteria to determine the middle ordinate value that will yield the necessary sight distance. The location of the noise barrier must be outside of this value.

41-9.05 Right-of-Way

The noise barrier must be located within the highway right-of-way.

41-9.06 Interference with Roadside Appurtenances

A noise barrier may be constructed on a new or on an existing highway. Its proposed location could interfere with proposed or existing roadside features, including signs, sign supports, utilities, and illumination facilities. The designer must determine if the noise barrier impacts these features.

41-10 LANDSCAPING AND EROSION CONTROL

41-10.01 Landscape Plantings General Information

Highway landscape plantings are the living component of the highway design and, through the use of native and non-native materials, provide the means to fully integrate the highway with the surrounding environment. Landscape plantings will serve as functional elements (e.g., erosion control, screening, sound abatement, snow control) in the highway environment.

41-10.01(a) Plant Selection

The plants selected generally should be characteristic, native, or indigenous to the specific locality. Consider the following guidelines:

1. Native Plants. Native plants are effective in perpetuating a self-sustaining roadside landscape. They are adapted to regional environmental conditions and can survive extreme temperatures, wind, and rainfall without additional irrigation or fertilizer.
2. Non-Native Plants. Non-native plants may be selected to achieve special effects (e.g., color, texture, growth habit) for emphasis. For example, non-native plants could be used in urban areas to accentuate an artificial manmade environment. Another example would be to use non-native material to screen the unsightly view of a junkyard.
3. Plant Maintenance. Maintenance is a major consideration in landscape plant selection. Strive to choose those plants that require a minimum of maintenance.

41-10.01(b) Prohibited Plants

The following plants are banned from use on highway projects in Illinois:

1. Ash Tree (*Fraxinus spp.*). Due to federal Emerald Ash Borer quarantine established by the United States Department of Agriculture, highway plans should not include any species of ash tree (*Fraxinus spp.*).

41-10.01(c) Hardiness

Select plants for a particular section of roadway based on their climatic and soil requirements. In Illinois, climatic conditions and soil types are favorable to both southern and northern plant groups. Conduct a study of soils, climate, and existing plant growth in the area when planning each planting project. Plant hardiness zones will be as stated in the *IDOT Standard Specifications*. Use the USDA Plant Hardiness Zone Map, latest edition, when selecting plant material for any project.

41-10.01(d) Size

The size at which a plant matures will determine the number of plants that will be required in a group planting. Consider the following guidelines:

BUREAU OF LOCAL ROADS & STREETS

41-10(2)

SPECIAL DESIGN ELEMENTS

Oct 2009

1. Younger Plants. Younger plants generally establish themselves faster than older plants. As a general practice, specify the smallest size of plants that is consistent with the requirements of the environment.
2. “Balled and Burlapped” Planting. Specify all deciduous trees larger than 1.5 in (40 mm) in diameter or 5 ft (1.5 m) in height as “balled and burlapped” at the time of planting. Also, specify this method of planting for plants that, according to good horticultural practice, require a ball of earth. It is acceptable to specify container-grown material in lieu of “balled or burlapped” plants as an alternative. The relationship of the plant size to the soil ball size or the container size will be as stated in the *IDOT Standard Specifications*.
3. Perennial Plants. Perennial plants can be planted as bulbs, tubers, or container plants. Bulbs and tubers should be of a size large enough to produce a healthy plant and to flower the first year. Container plants should be well rooted in the container. A quart sized container is usually the smallest size that should be planted on highway projects.
4. Prairie Forbs and Grasses. Prairie forbs and prairie grasses can be planted as root plugs or as seed. The minimum size plug should be 1.25 in (30 mm) in diameter by 4.25 in (110 mm) deep.

41-10.01(e) Considerations for Plantings

Consider the following:

1. Fertilizing and Mulching. For survivability and lack of future maintenance, give consideration to fertilizing and mulching all plantings.
2. Roadside Safety. Do not locate woody plants with diameters at maturity greater than 4 in (100 mm) in the clear zone, as defined for new construction. These plants should not be planted on the front slope or in ditches even if outside the clear zone.
3. Existing Soil. Where practical, use the existing soil in the planting operation. In cases where highway construction has made the condition of the existing soil unsuitable, consider the use of soil amendments or new topsoil. When soil conditions require topsoil placement to ensure adequate growth, specify 8 in (200 mm) where extensive plantings of woody or perennial plants are proposed.
4. Impacts of Salt. Due to the adverse effect of salt upon plants, give special consideration to the type and location of plants and their proximity to the roadway in those areas of the State where there is extensive snow and ice control.
5. Agricultural Areas. Do not plant large trees or evergreens on the right-of-way where there is adjacent agricultural land use due to their shading characteristics and their impact on farm machinery mobility.
6. Signage. Do not place plants in a location that will block the view of legally placed advertising signs.

HARD COPIES UNCONTROLLED

7. Screening. Landscape plantings are used to screen adjacent properties that have undesirable land usage; to reduce highway noise, dust, etc., reaching adjacent properties; and/or to screen the highway from a residential area or park.
8. Sight Distance. When planting in urban areas, consider potential sight distance problems and the problems of obstructing traffic signals, signs, lighting, etc.
9. Snow Drifting. Do not plant dense continuous hedges within 40 ft (12 m) of the edge of pavement where they may cause snow to drift onto the pavement.

41-10.02 Classification

Consider the following groups for planting:

1. Shade Trees. A single-stem, high-headed, deciduous plant that generally grows to a height in excess of 30 ft (9 m).
2. Intermediate Trees. Generally, a multi-stem, deciduous, low, round-headed plant that matures at 30 ft (9 m) or less in height.
3. Shrubs. Low-growing multiple stemmed plants that are either deciduous or evergreen.
4. Evergreen Trees. Tall-growing evergreen plants.
5. Ground Cover and Vines. A colony forming plant less than 1.5 ft (0.5 m) high that has the ability to spread and root itself.
6. Seedlings. Small shade trees, intermediate trees, shrubs, and evergreens that are usually less than 2 years old.

41-10.03 Turf Grasses

Non-native grass, grains, legumes, and native grasses form the backbone of highway vegetation cover. The large number of species and varieties of vegetative cover may be used for many applications. Consider the following guidelines:

1. Temporary Erosion Control. Use temporary vegetative cover for temporary erosion control at locations where the duration of the turf cover is short term and is expected to prevent loss of soil.
2. Permanent Erosion Control. Permanent vegetative cover is used for permanent erosion control in most highway applications. To achieve a cost-effective permanent cover, select a type of turf grass appropriate to the landscape conditions and planned maintenance.

BUREAU OF LOCAL ROADS & STREETS

SPECIAL DESIGN ELEMENTS

41-10(4)

Oct 2009

3. Weed Control. Good turf establishment will minimize weed growth, thereby reducing pesticide requirements.
4. Groomed Appearance. Provide a vegetative cover that can be mowed into a park-like appearance. In urban settings, use a lawn-type mixture to blend in with the urban landscape.
5. Wildlife. Provide a vegetative cover that will enhance and encourage wildlife.
6. Sodding. Seed mixtures are most commonly used; however, some instances may call for the use of sodding to provide for the rapid establishment of turf.
7. Applications. The turf grasses specified in the *Standard Specifications* are used for specific applications as follows:
 - a. Lawn Mixtures. Lawn mixtures are used in urban settings to create a park-like appearance and require a relatively high degree of maintenance.
 - b. Salt Tolerant Mixtures. Salt tolerant mixtures are used along road segments where de-icing salts are heavily used.
 - c. Roadside Mixtures. Roadside mixtures are used in more rural settings where a tougher, lower maintenance turf is desired.
 - d. Slope Mixtures. Slope mixtures are used on slopes usually 1V:3H or greater.
 - e. Native Grass and Forb (Wildflower) Mixtures. Native grass and forb (wildflower) mixtures can be planted to create specific turf conditions; see Section 59-7.05 of the *BDE Manual*.
 - f. Conservation Mixtures. Conservation mixtures are used for wildlife nesting cover. These are usually planted at the request of resource agencies.
 - g. Temporary Erosion Control Mixtures. Temporary erosion control mixtures are seeded to prevent soil from being displaced on a construction project that will be exposing soil. The mixture is spread over all exposed earth to provide a quick cover of the turf that will interrupt the force of rain on the soil and prevent soil from moving. The temporary erosion seed mixture may need to be spread on construction sites numerous times during construction activities. The temporary erosion control mixture also can be combined with a permanent erosion control mixture to provide a nurse crop while the permanent seed is establishing.

41-10.03(a) Seeding

The seeding operation that is conducted in the field occurs in a series of steps. The most important aspects of seeding are seed mixture selection, site preparation, and placement of mulch. Select the class of seed mixtures that are appropriate to the specific roadside environment. Consider the following:

1. Class 1 (Lawn Mixture). Use Class 1 seeding in an urban setting.

HARD COPIES UNCONTROLLED

- a. Class 1A (Salt Tolerant Lawn Mixture). Use Class 1A seeding for:
 - urban projects not covered in Class 1B, and/or
 - all projects where the entire right-of-way is not torn up and Bluegrass is the primary existing cover.
 - b. Class 1B (Low Maintenance Lawn Mixture). Use Class 1B in the southern half of the State for urban projects.
2. Class 2 (Roadside Mixture). Class 2 seeding is a hardy roadside turf and should be used where reduced mowing will occur. Use Class 2A seeding (Salt Tolerant Roadside Mixture) for:
 - all rural reconstruction projects where the entire right-of-way is to be seeded or any situation where grasses other than Bluegrass are the primary existing cover, and/or
 - areas adjacent to roads subject to salt spray and/or disposition.
 3. Class 3 (Slope Mixture). Use Class 3 seeding in rural areas for slopes 1V:3H or steeper.
 4. Class 4, 4A, 4B, 5, 5A, 5B (Native Grass and Forbs Mixture). See Section 59-7.05 of the *BDE Manual* for additional discussion.
 5. Class 6 and 6A (Conservation Mixture). Class 6 seeding is used for wildlife cover in the east central part of Illinois. Class 6A seeding is a Class 6 which includes salt tolerant grass. Use caution when considering this class with other seeding classes.
 6. Class 7 (Temporary Turf Cover). Class 7 seeding is used as a temporary cover for areas to be regraded more than a year from the time of seeding. Use Class 7 for winter shut down. Provide temporary mulch or erosion control blanket with Class 7 seeding.

Use the Temporary Erosion Control Seeding System weekly for shorter-term temporary cover.

41-10.03(b) Sodding

Appropriate uses of sodding are as follows:

- urban areas with residential or commercial development (e.g., in front of homes, businesses, parks, adjacent to paved shoulders or edges of paved ditches);
- in front of maintained parks and cemeteries;
- erosion control in ditch bottoms and around culverts; and
- special areas (e.g., channelized medians, around inlets in grassed areas). Small areas which would normally be seeded should be sodded where a large majority of the remainder of the project (90% +/-) is to be sodded.

Specify salt tolerant sod in those areas where large quantities of deicing salt are used by maintenance forces (e.g., highly urbanized areas).

41-10.04 Planting in Urban Areas

Use the following criteria for planting in urban areas:

1. Minimum Distance from Intersections, Alleys, and Driveways. The following criteria relates to distances as measured from the property line and along the property lines:
 - a. Intersections. Do not locate trees within 50 ft (15 m) on the near side and 20 ft (6 m) on the far side of the intersection; see Figure 41-10A. Trees on medians should be located a minimum of 50 ft (15 m) from intersections.
 - b. Alleys. Do not locate trees within 20 ft (6 m) on the near side and 10 ft (3 m) on the far side.
 - c. Commercial Driveways. Do not locate trees within 20 ft (6 m) on the near side and 10 ft (3 m) on the far side.
 - d. Residential Driveways. Do not locate trees within 10 ft (3 m).

MINIMUM PLANTING DISTANCES FROM INTERSECTIONS

Figure 41-10A

BUREAU OF LOCAL ROADS & STREETS
SPECIAL DESIGN ELEMENTS

41-10(8)

Oct 2009

2. Minimum Distances from Walks, Curbs, Utilities, and Structures. The following criteria applies from face of curb or center of utility to edge of tree, as measured horizontally:
- sidewalks and carriage walks — 3 ft (900 mm),
 - access of courtesy walks — 5 ft (1.5 m),
 - face of curb — 4 ft (1.2 m),
 - manholes and catch basins — 10 ft (3 m),
 - fire hydrants — 10 ft (3 m),
 - underground utility mains and services — 5 ft (1.5 m),
 - street lights — see Item 3,
 - existing trees — see spacing criteria below,
 - overhead wires — do not plant ascending shade trees under overhead wires,
 - railroad crossings — 100 ft (30 m), written approval from railroad is required to plant within 100 ft (30 m), and
 - other structures — 30 ft (9 m) or as directed.

These requirements are for reduced speed urban areas and must be adjusted for higher speeds so that clear zone and sight distance requirements are met.

3. Minimum Basal Clearance Between Trees and Structures. Basal clearance is defined as the distance from the center of the tree to the structure or object involved. Minimum basal clearance between trees and between trees and structures located on parkways, medians, or other areas of the right-of-way are as follows:
- Trees with spreading crowns must have a minimum basal clearance of 15 ft (4.5 m).
 - Trees with global or pyramidal crowns must have a minimum basal clearance of 12 ft (3.6 m).
 - Trees with fastigiated or columnar crowns must have a minimum basal clearance of 10 ft (3 m).
 - Do not plant trees in areas where basal clearance is less than 10 ft (3 m).
 - Select tree species from the approved tree list of the district Landscape Architect or from a municipal tree list if it is applicable to the project site.
4. Spacing of Trees Within Parkways. Use the following criteria for spacing of trees within parkways:
- Space trees with spreading crowns at a minimum of 30 ft (9 m).
 - Space trees with global or pyramidal crowns at a minimum of 25 ft (7.5 m).
 - Space trees with fastigiate or columnar crowns at a minimum distance of 20 ft (6 m).

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

Oct 2009

SPECIAL DESIGN ELEMENTS

41-10(9)

5. Spacing Between Trees Within Median or Other Right-of-Way Areas. Spacing will follow the same criteria given for spacing between trees within parkways.
6. Width of Parkway, Medians, and Other Public Ways. Landscape designs must be so arranged to provide a sufficiently wide, clear, and safe pedestrian walkway. The required width will in no case be less than 6 ft (1.8 m) wide, measured from a line 1 ft (300 mm) within the right-of-way. Use the following criteria:
 - a. Minimum Width of Parkways. Use the following criteria for minimum width of parkways:
 - Do not plant trees on any parkway that is less than 6 ft (1.8 m) in width.
 - Do not plant trees on any commercial or industrial sidewalk or cut-out in a sidewalk that is less than 16 ft (4.8 m) in width.
 - b. Minimum Width of Medians. Do not plant trees on any median that is less than 10 ft (3 m) in width.

41-10.05 Erosion and Sediment Control

41-10.05(a) Background

Appropriate implementation of erosion and sediment is necessary on highway construction projects as necessary to protect the roadway and associated rights-of-way, adjacent properties, and sensitive environmental resources (e.g., endangered and threatened species, wetlands, water bodies, and other resources for which the LPA commits to the implementation of erosion and sediment control measures). The policies documented in this Section are for use to comply with FHWA regulations on erosion and sediment control which are detailed in 23 C.F.R. 650, Subpart B. They also ensure fulfillment of commitments for erosion and sediment control associated with Section 404 permits issued by the U.S. Army Corps of Engineers, or such commitments made to the Illinois Environmental Protection Agency (IEPA), and other regulatory and natural resource agencies during project development.

The National Pollutant Discharge Elimination System (NPDES) program under Section 402 of the *Federal Clean Water Act* currently imposes erosion and sediment control requirements on construction projects that involve disturbance of 1 acre (4047 m²) or more of total land area.

41-10.05(b) Policy

Provide erosion and sediment control on all projects that will expose areas of soil to potential displacement by storm events such that sediment could adversely affect operations on the highway or associated rights-of-way, could be introduced into receiving waters, or could affect adjacent properties, sensitive environmental resources, or other resources for which a commitment was made to protect from sedimentation impacts. The nature and extent of the control measures should be appropriate to address the specific conditions involved and the measures will be properly maintained to ensure continued effective operation.

HARD COPIES UNCONTROLLED

Projects that involve no clearing and grubbing, excavation, stockpiling of topsoil, borrow, or construction of embankment normally will not require erosion and sediment control measures. Projects that involve only isolated excavation for installation of lighting, signing, traffic signals, guardrail, or woody plant materials likewise normally will not require erosion and sediment control measures. The following are examples of actions that normally will not require erosion and sediment control measures:

- installation of lighting, signing, traffic signals, or guardrail,
- weed spraying,
- pavement marking,
- seal coating,
- bituminous resurfacing,
- pavement patching, and
- planting of woody landscaping materials.

Evaluate the need for erosion and sediment control, and any additional right-of-way necessary to accommodate their implementation, prior to the preparation of design plans and include the appropriate information to address the identified needs in the plans. Erosion and sediment control needs should be evaluated and addressed for construction of both roadway and bridge/culvert components of proposed projects. The selection and application of erosion and sediment control measures should reflect use of the best temporary and permanent devices and practices appropriate for the site and project conditions.

41-10.05(c) Temporary Erosion Control Systems

Temporary erosion control systems are meant to control erosion and sediment damages to the roadway, adjacent properties, and water resources during the construction phase and before the final erosion control measures can be placed. Temporary practices include the use of sedimentation basins, temporary ditch checks, perimeter erosion barriers, temporary seeding, and other erosion control devices and methods. The designer must ensure that the temporary erosion control system is fully coordinated with the permanent erosion control measures. The following are the various available types of erosion and sediment control systems and the applications to which each is best suited:

1. Temporary Ditch Checks. When used, this system acts as a dam and slows the velocity of water through the project. Temporary ditch checks should be used at the outfall of existing ditches to collect silt. Straw bales, rolled excelsior, or urethane foam/geotextile ditch checks should be used for newly seeded ditch lines that have a velocity of less than 8 ft/sec (2.4 m/sec). Aggregate ditch checks should be used for ditch lines with a velocity of 8 ft/sec (2.4 m/sec) or greater.

BUREAU OF LOCAL ROADS & STREETS

Oct 2009

SPECIAL DESIGN ELEMENTS

41-10(11)

2. Perimeter Erosion Barrier. This system is used to prevent exposed soil along the perimeter of the project from leaving the job site and can prevent exposed soil adjacent to the project from entering the job site. The NPDES Permit requires the perimeter erosion barrier to be in place prior to any earth disturbing activities. The designer should specify this system at the limits of the construction site where sediment in sheet flow will run off from the area under construction and can be captured.
3. Inlet and Pipe Protection. This system protects inlets that will receive runoff from areas within the limits of construction and inlets along access streets where material will be tracked by construction vehicles. Inlet and pipe protection for initial sediment control should be specified for existing inlets.
4. Sedimentation Basins. Sedimentation basins are settling ponds constructed to trap waters carrying sediment. The basins detain sediment laden runoff from larger drainage areas long enough for most of the sediment to settle out. Sedimentation basins have a maximum designed depth of 2.5 ft (750 mm) and a maximum designed allowed drainage area of 5 acres (2 ha). Guidance for use of sediment basins can be found in the *Illinois Urban Manual*.
5. Temporary Ditches. This system is constructed to divert and/or intercept water borne silt and runoff at designated locations. Temporary ditches are also used to divert clean water around construction sites and to stop the mixing of clean waters with silt-laden waters. It may be necessary to line the temporary ditch with a fabric barrier to stop sediment introduction into the waterway. Ditches can create safety hazards on construction sites that should be considered and adequately protected. Guidance for use of temporary ditches can be found in the *Illinois Urban Manual*.
6. Temporary Erosion Control Seeding. This system should be used on a weekly basis to cover those areas of exposed soil due to contractor operations. The designer should specify temporary erosion control seeding on all projects where grading or soil stockpiling is involved. Erosion control blanket should be specified for use with temporary erosion control seeding for exposed areas adjacent to bodies of water, for lining ditches, and for slopes 1V:3H or steeper.
7. Temporary Mulch. This system should be specified for temporary cover when grading will occur on a project after September 30th or in the winter when temporary seed will not germinate and provide erosion protection until the following spring. Mulch, Method 1; Mulch, Method 2; and Erosion Control Blanket are the various methods used for temporary mulch.
8. Aggregate (Erosion Control). This system can be used as an erosion control method to prevent soil displacement. Various uses would include aggregate ditch checks, aggregate lined ditches, or aggregate for temporary construction entrances. The designer should specify the proper aggregate gradation. Guidance for use of aggregate for erosion control can be found in the *Illinois Urban Manual*.

Additional information can be found in Section 59-8 of the *BDE Manual*.

HARD COPIES UNCONTROLLED

HARD COPIES UNCONTROLLED

41-11 DESIGN CONSIDERATIONS FOR UTILITIES

The designer should consider the following in designing utility placements:

1. Utility Locations. Utility installations should be located as follows:
 - a. General. Consider the following:
 - Locate above-ground utilities as far from the traveled way as practical. Desirably, locate the utility within 1 ft (300 mm) from the right-of-way line.
 - New utilities installed under paved or shoulder areas must be constructed of long life materials that are expected to be maintenance free.
 - Locate ground-mounted appurtenances for underground facilities within 1 ft (300 mm) or as near as practical to the right-of-way line.
 - Install suitable markers at the right-of-way line for any high-pressure gas or liquid fuel line that crosses a roadway.
 - No utility appurtenances (e.g., pumping stations, transformers) will be allowed within interchange right-of-way.
 - Special restrictions may be placed on utility companies where visual quality is an important consideration. See the *IDOT Accommodation of Utilities on Right-of-Way of the Illinois Highway System* for more information.
 - b. Longitudinal Utilities. Consider the following:
 - No new above-ground longitudinal utilities, including any above-ground appurtenances for underground installations, should be placed within the clear zone. Where it is necessary to locate installations within the clear zone, give consideration to locating the installation where there is low probability it can be struck by a vehicle, make it breakaway, or provide a barrier or crash cushion; see Chapter 35.
 - Locate longitudinal utilities parallel and as near as practical to the right-of-way line but not more than 8 ft (2.4 m) from the right-of-way line.
 - No new longitudinal utility installations should be permitted under the paved portion of streets and highways unless there is no other practicable location available.
 - c. Manholes. Consider the following:
 - New manholes should not be permitted in the traveled way or shoulders of rural highways. Existing manholes may remain in place.
 - Manholes may be permitted in city streets where existing utilities have been permitted to remain in place under existing or proposed roadways.
 - New manholes should not be permitted at intersections.
 - d. Utility Crossings. Consider the following:
 - Utility crossings should be approximately 90° to the highway centerline as practical.
 - Utility crossings should be installed by trenching except under paved roads.
 - Install utility crossings under paved roads by boring or jacking. Trenching may be acceptable in special cases if approved by the proper highway authorities.
 - Utilities should not be permitted to cross under highways in cattle passes, culverts, or other drainage facilities.

BUREAU OF LOCAL ROADS & STREETS

41-11(2)

SPECIAL DESIGN ELEMENTS

Jan 2006

2. Cover. The following cover criteria, below the pavement surface, will be required for underground installations:
 - a. Power. These installations will require a minimum cover of 2.5 ft (750 mm).
 - b. Communication. Where these installations are installed by the plowed method, the minimum cover will be 2 ft (600 mm).
 - c. Gas Pipelines. Gas installations must have a minimum cover of 2.5 ft (750 mm) at all locations within the highway right-of-way.
 - d. Water Lines. To prevent freezing, place water lines below the frost line.
 - e. Sewers and Drain Lines. Storm sewers, sanitary sewers, and drain lines must have a minimum clearance of 2.5 ft (750 mm) to the top of pipe to prevent freezing.
3. Casings. Where casings are used for underground utilities, the following criteria is required:
 - Install at least one vent located on the high side and extend to the right-of-way line.
 - Place vents above the pipeline to serve as markers for a crossing utility.
4. Aerial. The following will apply to power lines and/or communication lines:
 - a. Guy Wires and Brace Posts. These devices should not be allowed within the right-of-way.
 - b. Overhead Clearances. For overhead power and communication lines crossing the highway or street, the minimum vertical clearance is 18 ft (5.5 m).
 - c. Location. In general, aerial utility poles should be located as close to the right-of-way line as practical. However, for urban areas the following will apply:
 - Curbed. For curbed sections, the placement distance of poles behind the face of the curb shall be at least 1.5 ft (500 mm), measured to the closest face of the pole.
 - Curb and Gutter. For curb and gutter sections, place the poles a minimum of 2 ft (600 mm) from the face of curb. In addition, the clear zone distance must be checked.
 - Shoulder with Curb and Gutter at Shoulder Edge. The minimum pole placement is 4 ft (1.2 m) beyond the outside of the shoulder to the closest face of the pole. In addition, the clear zone distance must be checked.
 - Sidewalks. Where there are sidewalks, provide a minimum of 3 ft (1 m) of "obstacle free sidewalk," where feasible.
5. Attachments to Structures. If it is determined that there is no reasonable alternative means of attachment except to the main structural member or to the deck, the following locations may be considered in the listed order of preference:
 - diaphragms,
 - beams, and
 - deck.

The structural integrity of the structure must be checked. See Section 36-2.04 for additional information.

HARD COPIES UNCONTROLLED

6. Light Standards. Place light standards and power poles in accordance with the criteria presented in Section 56-5 of the *BDE Manual*.
7. Detours. Awareness of potential utility conflicts is extremely important when constructing detours near the right-of-way line or on temporary right-of-way.

41-12 SPEED HUMPS AND TABLES

41-12.01 Speed Humps

41-12.01(a) General

Speed humps are raised sections of pavement that are placed across the entire width of a highway to reduce vehicle speeds and enhance pedestrian safety. Speed humps have a more gradual slope than traditional speed bumps. Therefore, speed humps are more effective at slowing traffic to a desired design speed. In addition, speed humps are a low cost tool. However, speed humps may be controversial in some localities due to their appearance, jarring effects on vehicles and passengers, and impact to emergency response vehicles.

Speed humps shall not be installed if highway drainage is not considered or in the path of a pedestrian crossing or curb ramp.

41-12.01(b) Design

The best speed hump designs employ a very gradual slope. Traditional designs include a 3 - 4 in (75 - 100 mm) vertical elevation change, with the width varying based on the design speed, although many LPAs limit the height of speed humps to 3 to 3 ½ in (75 to 83 mm). Figure 41-12A provides the typical speed hump length and design speed.

Length of Speed Hump	Typical Design Speed
12 ft (3.7 m)	15 mph (25 km/h)
14 ft (4.3 m)	20 mph (30 km/h)
22 ft (6.8 m)	25 - 30 mph (40 - 50 km/h)

SPEED HUMP LENGTH AND DESIGN SPEED

Figure 41-12A

The *ILMUTCD* provides marking and signing requirements.

41-12.01(c) Impact on Pedestrian Access

In general, speed humps enhance pedestrian safety by effectively slowing traffic. However, people with mobility impairments may experience problems on speed humps. For example, people with back or neck problems may experience pain or discomfort caused by the jarring effect when traveling over speed humps in an automobile. This is further complicated if the person relies on para or public transit and does not have control over the speed of the vehicle.

41-12.02 Speed Tables

41-12.02(a) General

Speed tables are speed humps with a flat section on top. Speed tables may be used as raised crosswalks to serve as a pedestrian crossing. Speed tables are preferred over speed humps by emergency response vehicles.

Speed tables shall not be installed if highway drainage is not considered.

41-12.02(b) Design

The length of speed tables should accommodate the entire wheel base of a passenger vehicle to rest on the flat section. The flat section is typically 10 ft (3.1 m) long. Combined with gently sloped ramps, speed tables permit slightly higher motorist speeds and smoother transitions than speed humps. Traditional designs include a 3 - 4 in (75 - 100 mm) vertical elevation change with the width varying based on the design speed. However, if used as a raised crosswalk, the height should match the curb height. Figure 41-12B provides the typical speed table length and design speed.

Length of Speed Table (including 10 ft flat section)	Typical Design Speed
22 ft (6.8 m)	20 mph (30 km/h) ¹
24 ft (7.4 m)	25 mph (40 km/h) ¹
32 ft (9.8 m)	30 mph (50 km/h) ¹

Note: 1. Reduce design speed by 5 mph (10 km/h) or use longer speed table if the height of the speed table is greater than 4 in (100 mm).

SPEED TABLE LENGTH AND DESIGN SPEED

Figure 41-12B

The *ILMUTCD* provides marking and signing requirements.

41-12.02(c) Impact on Pedestrian Access

Speed tables have the same pedestrian safety impact as speed humps by effectively slowing traffic. However, when used as a pedestrian crossing, an added safety impact is the increased visibility of pedestrians crossing the highway. Speed tables resolve some of the access problems for people with mobility impairments. However, when used as a pedestrian crossing, detectable warnings shall be installed (See Section 41-6).

Chapter Forty-two

BICYCLE FACILITIES

42-1 BICYCLE ACCOMMODATIONS

42-1.01 Definitions

1. Bicycle. Every vehicle propelled solely by human power upon which any person may ride, having two tandem wheels, except scooters and similar devices. The term “bicycle” in the context of this Chapter also refers to three- and four-wheeled human-powered vehicles, but not children’s tricycles.
2. Bicycle Route (Bike Route). A segment within a system of bikeways designated by the agency having jurisdiction of the facility with appropriate directional and informational markers, with or without a specific bicycle route number, on-pavement striping, or other markings or signage.
3. Bikeway. A generic term for any road, street, path, or traveled way which in some manner is specifically designated for bicycle travel, regardless of whether such facilities are designated for the exclusive use of bicycles or shared with other transportation modes.
4. Bike Lane. The portion of a roadway surface that is designated by pavement markings and signing for the exclusive use of bicyclists.
5. Bicycle Path/Shared-Use Trail/Sidepath. A facility physically separated from the roadway and intended for bicycle or other non-motorized transportation (e.g., pedestrians, disabled persons in wheelchairs, in-line skaters). The terms path and trail generally are describing the same facility. Sidepath refers to a path or trail closely associated with and parallel to a roadway.
6. Bicycle Facilities. A broad term which includes bikeways, shared roadways, shoulders (which may be used by bicyclists), traffic control devices, shelters, and parking facilities for bicycles.
7. Rail-Trail. A shared use path, either paved or unpaved, built within the right-of-way of an existing or former railroad.
8. Shared Lane. A lane of traveled way on any roadway upon which a separate bicycle lane is not designated and which may be legally used by bicyclists regardless of whether such facility is specifically designated as a bikeway.
9. Urbanized Area. An Urbanized Area is a statistical geographic entity designated by the Census Bureau, consisting of a central core and adjacent densely settled territory that together contain at least 50,000 people, generally with an overall population density of at least 1,000 people per square mile.

42-1.02 Policy

The local public agency (LPA) should consider the travel needs of all users of a transportation corridor when planning transportation improvements. Bicycle facilities shall be considered on all Federal-aid projects and should also be considered on MFT projects, where practical.

This chapter provides a general overview of bicycle planning and design concepts. However, the latest edition of the AASHTO Guide for the Development of Bicycle Facilities should be consulted. If the LPA desires to use another bicycle design standard, the LPA shall provide documentation that the design standard is accepted by FHWA or other national organizations. For all LPA projects that are on, impact, or cross a state route, the LPA shall follow Chapter 17 of the BDE Manual.

42-1.03 Needs Assessment

The LPA shall determine the need for bicycle accommodations based on anticipated demand, community plans, and traffic safety considerations. The following guidelines should be considered:

- The highway or street is designated as a bikeway on a regionally or locally adopted bike plan or published in a regional or locally adopted map as a recommended bike route.
- The 5-year projected two-way bicycle traffic volume after completion of the project is 25 ADT or greater during the peak three months of the bicycling season on a highway or street where the current vehicular traffic exceeds 1000 ADT. See Section 42-3.01 for information concerning bicycle demand analysis.
- The route provides primary access to a park, recreational area, school, other designated bikeways/trails, or other significant destination.
- The route provides unique access across a natural or man-made barrier (e.g., bridges over rivers, roadways, railroads) or under access-controlled facilities and roadways.
- The highway project negatively affects the recreational or transportation utility of an independent bikeway or trail. Highway projects will negatively affect at-grade bikeways, paths, and trails where they are severed, when the projected roadway traffic volumes increase to a level that prevents safe crossings, or where the widening of the roadway prohibits sufficient time for safe crossing.
- Provisions may also be necessary to safely accommodate bicycle traffic on highways where bridge decks are being replaced or rehabilitated.

The following additional guidance is provided to determine bicycle accommodation need where bicycle travel is difficult to predict:

1. Urbanized Areas. Because of the potential for bicycle travel, bicycle accommodation will likely be needed in the majority of urbanized areas, particularly at points of community development that generate, attract, or result in commercial, recreational, or institutional establishments near or along highways, at present or in the planned future.
2. Rural Towns. Bicycle accommodation may be needed in rural towns located on main highways where bicycle travel within the community and from the outlying populated areas could justify such accommodation.

BUREAU OF LOCAL ROADS & STREETS

Oct 2013

BICYCLE FACILITIES

42-1(3)

3. Rural Highway Projects. Bicycle accommodation will likely be needed on rural highway projects that provide unique access over a major barrier (e.g., river) or that connect an urbanized area to a rural attraction (e.g., park).
4. Unpopulated Rural Areas. In unpopulated rural areas, typical origins and destinations are far less frequent. Thus, bicycle accommodation may not be needed. However, when roadways provide unique access or bicycle accommodations are called for in approved or adopted plans, then bicycle accommodations should be considered.

Section 42-2 provides checklists to assist the LPA in deciding if bicycle facilities should be included. If it is determined that the volume and character of existing and future bicycle travel in the vicinity of a project justify the provision of bicycle facilities, provide the appropriate accommodations as discussed in Section 42-3.

|

42-2 CHECKLIST FOR BICYCLE ACCOMMODATIONS

Include a checklist in the Project Development Reports for Federal projects where Section 42-1.03 requires the evaluation of the potential for bicycle accommodations. If provisions for adequate bicycle accommodations are already designed, provide a descriptive statement regarding the bicycle accommodations in lieu of a checklist. A checklist may also be used as a guide for bicycle accommodations on projects constructed with other funds.

42-2.01 Bicycle Travel Generators in the Project Vicinity

Potential bicycle travel generators in the vicinity of a project should be reviewed and recorded. A checklist of the potential bicycle travel generators is provided in Figure 42-2A. Record the types of generators within 1.2 miles (2 km) of the project corridor. Attach a legible map of this area showing these generators. An example project location map is provided in Figure 42-2B. Sections of municipal or township maps are acceptable, as well as photocopies of aerial photos. Indicate where bicyclists will cross or ride along the corridor on the map. Also, indicate the absence of any of these types of destinations, therefore providing the justification for the exclusion of accommodations for bicycle travel.

CHECKLIST FOR ORGANIZATIONS AND PUBLIC COORDINATION

Figure 42-2C

42-2.03 Assessment of Bicycle Travel

Based on the indicators discussed in Section 42-2.01 and 42-2.02, the LPA should attach additional information, if appropriate. Use the following questions as a basis for including additional information.

1. Where and how would bicyclists cross the project?
2. Where and how would bicyclists need to ride parallel to the project?
3. Does the project provide access across a river, railroad, highway corridor, or other natural or man-made barrier?
4. Will the highway project negatively affect the recreational or transportation utility of an independent existing or planned bikeway or trail? Highway projects will negatively affect at-grade paths and trails when they are severed, when the projected roadway traffic volumes increase to a level that prohibits safe crossings at grade, or where the widening of the roadway prohibits sufficient time for safe crossing?
5. Does the route provide important or primary access to a park, recreational area, school, or other significant destination?
6. Is the highway or street designated as a bikeway in a regionally or locally adopted bike plan, or published in a regionally or locally adopted map, as a recommended bike route?
7. Will the projected two-way bicycle traffic volume approximate 25 ADT or more during the peak three months of the bicycling season five years after completion of the project (See Section 42-3.01).

42-3 BICYCLE FACILITY DESIGN GUIDELINES

Use the current edition of AASHTO's *Guide for the Development of Bicycle Facilities* as the primary source for planning and design guidance. In addition, FHWA has recommended the use of the National Association of City Transportation Officials' *Urban Bikeway Design Guide* and the Institute of Transportation Engineers' *Designing Urban Walkable Thoroughfares* for the development of bikeways in urban areas.

42-3.01 Bicycle Facility Design Analysis

In order to build or improve bicycle facilities, the LPA should analyze existing conditions, as well as public and stakeholder input, to determine the type and capacity of any bicycle facility. The methods described in this section provide the LPA with options to synthesize a large amount of complex data. However, the LPA should consider which method or combination of methods to use.

42-3.01(a) Data Collection and Flow Analysis

Bicycle related data collection is an important part of understanding, planning, maintaining, and operating a bicycle facility. Bicycle count and movement analysis may be used to:

- Identify Corridors
- Understand Patterns of Usage
- Forecast Bicycle Travel Demand
- Track Community-wide Bicycle Use
- Project Future Bicycle Use
- Analyze Specific Travel Patterns

If bicycle traffic volume data is not available, the LPA may estimate the bicycle traffic volume by multiplying the highway traffic volume data by the bicycle commuting percentage from census data. However, this method is most accurate in the urbanized area where census tracts or more compact.

42-3.01(b) Bicycle Level of Service

Bicycle Level of Service (Bicycle LOS) evaluates bicyclists' perceived safety and comfort with respect to motor vehicle traffic while traveling in a roadway corridor. Bicycle LOS provides a score for each roadway that indicates how comfortable a typical adult bicyclist would feel while riding along that roadway during peak travel conditions. See Section 27-6.04 and the Highway Capacity Manual for more information.

42-3.01(c) Safety Analysis

Analysis of crash data to identify intersections or corridors where most bicycle-motor vehicle crashes occur, including "dooring" type crashes, will assist identifying locations for bicycle facilities.

42-3.01(d) Bicycle Demand Analysis

Evaluating bicycle travel demand shares some similarities to motor vehicle travel demand modeling by forecasting future needs based on objective data inputs. However, bicycle travel demand should also account for latent demand (demand that is not apparent, but underlying). Therefore, bicycle travel demand methods make assumptions regarding how many people would choose to bicycle along a given corridor if bicycle accommodations are made. Types of bicycle demand analysis include:

- Comparison Study
- Sketch Plan Methods
- Market Analysis/ Land Use Models
- Discrete Choice Survey Models

For additional information on bicycle demand analysis, see Section 2.6.5 of AASHTO's Guide for the Development of Bicycle Facilities, 4th Edition.

42-3.02 Separated, Shared Use, and Sidepath Bicycle Paths

The principles for geometric design of bike paths are the same as those used in general highway design. While exclusive bicycle use of a bicycle path is often ideal, it seldom occurs. For this reason, pedestrian, in-line skaters, and other anticipated use is always considered in the design of the facility. Include separate areas to minimize the conflicts arising from the different speeds of these transportation modes, where practical. This Section provides guidance specific to the design of bike paths. Also, see the latest edition of the *AASHTO Guide for the Development of Bicycle Facilities* for more detailed information.

42-3.02(a) Bike Paths Versus Sidewalks

Sidewalks are generally not suitable for bicycle travel, primarily because of their narrow width and multiple opportunities for conflicts with driveways and commercial entrances. However, some suburban sidewalks may be preferable to on-road accommodations, particularly if they provide adequate width, do not have excessive number of driveways/conflict points, and are located on both sides of the roadway.

42-3.02(b) Width

Widths for shared use bicycle paths will vary in accordance with the conditions illustrated in Figure 42-3A. Figure 42-3B illustrates the minimum cross sections for two-way, shared-use paths.

42-3.02(c) Surface Type

Hot mix asphalt (HMA) or concrete pavement surfaces are preferred over crushed aggregate surfaces. In some situations, a bituminous surface treatment (BST) over an aggregate base may be adequate for bikeways. The LPA should consider the life cycle cost when selecting the bikeway surface type.

1. Concrete. Concrete provides the hardest surface that supports most users and is the lowest maintenance. Concrete is easy to form to site conditions and may offer advantages in wet soil conditions or in areas that may periodically flood. However, concrete is not a natural surface and has the highest initial costs. Project location may impede access for large, heavy construction equipment. Joints should be sawed rather than tooled.
2. HMA (or Warm Mix Asphalt). HMA provides for hard surface that supports most users and is low maintenance. HMA does not erode. However, HMA is not a natural surface and has higher initial costs. Project location may impede access for large, heavy construction equipment.
3. BST. BST provides a stable surface and is less expensive than HMA or Concrete. However, BST is not a natural surface and has a potential for bleeding in hot weather. Loose surface chips may also pose a safety concern.
4. Crushed Aggregate Surfaces. Crushed aggregate surfaces are the least expensive and provides a permeable surface. However, crushed aggregate surfaces provide lower level of service and require substantially increased maintenance over the life of the project. The subgrade should be properly compacted and a geotextile fabric mat used if the soil is soft or unstable. Crushed aggregate surface (i.e., FA 20 or equivalent) should be placed over a base course and properly rolled and compacted.

42-3.02(d) Separation

Where a two-way bike path is physically located within the highway right-of-way, traffic wide separation should be provided to demonstrate that the path functions as an independent facility for bicyclists and other users. This separation should be as wide as practical and still allow the bicyclist to be visible by the motorist. However, the following minimum separations are recommended:

1. Urban Cross Section. The minimum recommended distance between the path and the face of curb is 5 ft (1.5 m). See Figure 42-3C.
2. Rural Cross Section. The minimum recommended distance is based on the posted speed limit.
 - For a posted speed limit of 45 mph (km/h) or less, the minimum separation between the path and the edge of travelled way is 5 ft (1.5 m).
 - For a posted speed limit greater than 45 mph (km/h), the minimum separation between the path and the edge of travelled way is 10 ft (3.0 m).

Where a paved shoulder is present, the separation distance begins at the outside edge of the shoulder.

Where the recommended separation is not feasible, a physical barrier or railing should be provided between the path and the roadway to prevent path users from making undesirable or unintended movements and to reinforce that the path is an independent facility. Barriers or railings that not only define the edge of the path, but also prevent bicyclists from falling over the rail to a substantially lower elevation, shall be a minimum of 3.5 ft (1.1 m) high. See Section 42-3.02(h) for barrier or rail height on structures.

42-3.02(e) Design Speed

Bicycle paths should be designed for a selected speed that is at least as high as the preferred speed of the faster bicyclists. In general, use a minimum design speed of 18 mph (30 km/h). However, where the grade exceeds 4.0% or where strong prevailing tail winds exist (e.g., along a lake or river), a design speed of 30 mph (50 km/h) is advisable.

On unpaved paths, where bicyclists tend to ride slower, use a lower design speed of 14 mph (25 km/h). Similarly, where the grades or the prevailing winds dictate, a higher design speed of 25 mph (40 km/h) may be considered.

42-3.02(f) Horizontal Alignment

Unlike an automobile, a bicycle must be leaned while cornering to prevent it from falling outward due to the centrifugal force. The balance of centrifugal force due to cornering, and the bicycle's downward force due to its mass, act through the bicycle and operator's combined center of mass, which intersects a line that connects the front and rear tire contact points.

In most cases the lean angle and design speed should be used when determining the minimum radius of a horizontal curve. However, calculating the minimum radius of a horizontal curve based on the coefficient of friction and design speed may be useful on unpaved bicycle paths, where bicyclists may be hesitant to lean as much.

Consider the following factors when determining horizontal curves:

1. Lean Angle. The bicyclist leans when traveling through horizontal curves to counteract centrifugal forces tending to cause the bicycle/operator to fall outward. If the bicyclist pedals through the curve at a lean angle of 25°, the inside pedal generally strikes the ground during the downstroke. As a result, the typical maximum lean angle should be considered to be 15°-20°. Figures 42-3D and 42-3E present minimum radii and length for horizontal curves based on lean angles of 15° and 20° for paved bike paths.
2. Cross Slope/Superelevation. Shared use paths shall be accessible to people with disabilities. A pavement cross slope shall not exceed 2.0 percent (1 percent recommended). Therefore, the limiting rate of superelevation on the bike path is 2.0 percent.
3. Lateral Clearance. Bicyclists tend to ride near the middle of the bike path when the path is narrow, and tend to ride side-by-side when in groups of two or more. This increases the likelihood of head-on collisions. Account for this in the design by calculating lateral clearances on horizontal curves based on the sum of the stopping sight distances for bicyclists traveling in opposite directions. If this is impractical, consider widening the path through the curve (see Figure 42-3F), installing a centerline stripe, or installing "Curve Ahead" warning signs in accordance with the *ILMUTCD*.

42-3.02(g) Vertical Alignment

Consider the following when determining vertical alignment:

1. Grades. The maximum grade of a shared use path shall comply with the latest edition of the Public Rights of Way Accessibility Guidelines. Grades in excess of 5.0% shall be evaluated concerning the need for *ADA* compliance. In addition, grades in excess of 3.0% are impractical for unpaved paths because of increased erosion potential. Mitigate excessive grades using the following options:
 - Provide additional width to permit slower bicyclists to dismount and walk.
 - Provide signing alerting bicyclists to the maximum percent of grade, per the *ILMUTCD*.
 - Post a recommended descent speed.
 - Provide stopping sight distances that exceed the minimums.
 - Provide horizontal clearances that exceed the minimums.
 - Widen the path or include short switchbacks to contain the speed of descending bicyclists.
 - Provide extra shoulder width for riders to dismount and rest.

2. Sight Distance. For sight distance calculations, assume the bicyclist's combined perception and brake reaction time is 2.5 seconds. The height of eye for a bicyclist is 4.5 ft (1.4 m) and the height of object is 0.0 ft (0.0 m). The coefficient of friction between tire and pavement is 0.16 for wet-weather braking conditions. Use the following equations to determine the applicable sight distance for bicycle paths:

$$S = \frac{V^2}{30(f \pm G)} + 3.67V \qquad \text{Equation 42-3.1 (US Customary)}$$

$$S = \frac{V^2}{254(f \pm G)} + \frac{V}{1.4} \qquad \text{Equation (42-3.1 Metric)}$$

Where:

- S = stopping sight distance, ft (m)
- V = velocity, mph (km/h)
- f = coefficient of friction (use 0.16)
- G = grade, ft/ft (m/m) (rise/run)

3. Vertical Curve Lengths. Using the sight distance data and Equation 42-3.2, determine the vertical curve lengths. Use the following equations:

$$L = \frac{AS^2}{200(\sqrt{h_1} + \sqrt{h_2})^2} \qquad \text{(Equation 42-3.2)}$$

$$L = KA \qquad \text{(Equation 42-3.3)}$$

Where:

- L = length of vertical curve, ft (m)
- A = algebraic difference between the two tangent grades, %
- S = sight distance, ft (m)
- h₁ = height of eye above road surface, ft (m)
- h₂ = height of object above road surface, ft (m)
- K = horizontal distance needed to produce a 1.0% change in gradient, ft/% (m/%)

42-3.02(h) Bike Path Structures

Bike path structures shall comply with the Department's structure design policies. The following criteria apply to structures for bike paths:

1. Width. The clear width for a new bike path structure should be the width of the approach paved bicycle path including the width of the required shoulders. A design variance may be considered to allow the clear width to be reduced. However, a minimum clear width of at least 10 ft (3.0 m) is required to allow access for emergency, patrol, and maintenance vehicles.
2. Railings. Railings, fences, or barriers on both sides of a bicycle path structure should be a minimum of 54 in (1.4 m) high. Smooth rub rails should be attached to the barriers at handlebar height of 42 in (1.1 m).
3. Vertical Clearances. A minimum vertical clearance of 8 ft (2.4 m) should be provided for the bike path. However, vertical clearance may need to be greater to permit passage of maintenance vehicles, rescue vehicles, and ambulances. Rescue vehicles typically can exceed 9 ft (2.7 m) in width. Wherever practical, a vertical clearance of 10 ft (3.0 m) is desirable. Where the bike path crosses over highways or railroads, provide a minimum vertical clearance of 17 ft-3 in (5.3 m) over highways and 23 ft-0 in (7.0 m) over railroads. A variance for a vertical clearance over a highway will only be considered under extreme conditions where the bridge is located in an urbanized area.

Bike path structures across the navigable waters of the United States are considered obstructions to navigation, permitted only when they serve the needs of land transportation. While the public right of navigation is paramount to land transportation, it is not absolute. This right may be diminished to benefit land transportation, provided the reasonable needs of navigation are not impaired. The Coast Guard approves the location and plans of bridges and causeways and imposes any necessary conditions relating to the construction and maintenance of these bridges in the interest of public navigation. For bike path structures across waterways not considered navigable waters by the United States Coast Guard, the LPA should still consider providing vertical clearances for any watercraft currently using the waterway.

4. Tunnels. The design of bike or shared use path tunnels or underpasses should follow the same guidance for size and overhead clearance, as discussed in Section 17-2 of the *BDE Manual*, with recognition of the types of traffic that need to be accommodated (e.g., emergency vehicles). With tunnels or box culverts exceeding 100 ft (30 m) in length, the users' sense of security is enhanced with larger openings (i.e., minimum 10 ft (3 m) high and 14 ft (4.2 m) wide). The alignment of the approaching path should provide a clear view through the structure, where practical. On long structures (e.g., under multilane highways), a shaft opening at the median can provide natural light and ventilation. Lighting should be considered in areas where security is a concern. Where bike or shared use paths are routed under highway bridges, drainage from the bridge above should be routed to drain away from the path surface.
5. Additional Guidance. The *AASHTO Guide Specification for Design of Pedestrian Bridges* and the *AASHTO Standard Specifications for Highway Bridges* provides additional information applicable to the design of bike path structures.

42-3.02(i) Bike Paths/Highway Crossings

The design of shared use path and highway intersections has a significant impact on user's comfort, mobility, and safety. Shared use path crossings may be categorized as mid-block, sidepath, or grade separated crossings. A mid-block crossing is located outside of the functional area of any adjacent intersection. While a sidepath crossing occurs within the functional area of an intersection of two or more roadways. See Section 5.3 of AASHTO's *Guide for the Development of Bicycle Facilities* and AASHTO's *Guide for the Planning, Design, and Operation of Pedestrian Facilities* for more details. At these intersections, accessible curb ramps shall be provided.

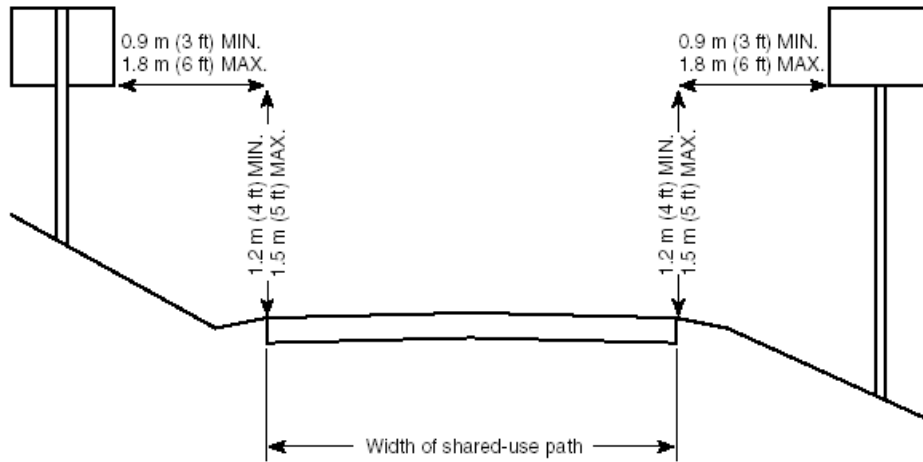

If adequate gaps in vehicular traffic are not available, some form of crossing control is generally required. This may include marked crosswalks, signage, pedestrian refuge medians, flashing lights, Rectangular Rapid Flashing Beacons (RRFB) signals, pedestrian hybrid beacons, in-roadway lights, or a grade separation. The *ILMUTCD* provides guidance on proper marking and signage. Also, consider re-routing the path to a nearby signalized intersection. However, any use of re-routing that causes excessive redundant travel may be perceived as a barrier and should not be used. At crossings of high-volume, multilane arterial highways where a signal or a grade separation is not provided, consider providing a median refuge area for bicyclists. Designers should use engineering judgment to decide where these types of safety measures are necessary and cost-effective by considering traffic volumes, motor vehicle speeds, and anticipated usage.

ANTICIPATED VOLUME	ONE-WAY⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾	TWO-WAY⁽²⁾⁽³⁾⁽⁴⁾
< 100 Users per Peak Hour	5 ft (1.5 m) ⁽⁵⁾	8 ft (2.4 m) ⁽⁵⁾
100 - 300 Users per Peak Hour	6 ft (1.8 m)	10 ft (3.0 m)
> 300 Users per Peak Hour	7 ft (2.1 m)	12 ft (3.6 m) ⁽⁶⁾

- Notes:
1. It should be recognized that one-way bicycle paths will often be used as two-way facilities unless effective measures are taken to ensure one-way operation (such measures are difficult to achieve). Without such measures, it should be assumed that bicycle paths will be used as two-way facilities and designed accordingly.
 2. Provide a minimum 2 ft (600 mm) wide graded turf or gravel area to both sides of the pavement.
 3. Desirably, provide a 3 ft (900 mm) or more clear area on each side to trees, poles, walls, fences, guardrails, and other lateral obstructions.
 4. If signs are installed along the bicycle path, provide a minimum 3 ft (900 mm) to a maximum 6 ft (1.8 m) clear area from the edge of path.
 5. Use the 5 ft (1.5 m) and 8 ft (2.4 m) width only at locations where there will be low usage, few conflicts among users, good horizontal and vertical alignment providing for safe and frequent passing opportunities, minimal maintenance vehicle traffic which would cause pavement edge damage, and/or right-of-way constraints or physical barriers.
 6. Where usage exceeds 300 users per hour during the peak periods of usage, separating bicycle and pedestrian travel may be considered. Stripe 4 ft (1.2 m) bike lanes in each direction and a 4 ft (1.2 m) width for pedestrians, as shown in Figure 42-3B. Also, consider constructing a separated pathway for pedestrians.

Figure 42-3F

42-3.03 On-Road Bicycle Accommodations

42-3.03(a) General

The type of on-road bicycle accommodation will depend on the type of the roadway (rural or urban), traffic volume, and posted speed. In addition, the surrounding land use and planned development should be considered. For recommendations for the type of bicycle accommodation, see Section 17-2 of the BDE Manual and the most recent edition of the AASHTO Guide for the Development of Bikeway Facilities.

42-3.03(b) On Rural Roadways

Bicycle accommodation on rural cross sections consists of paving a portion of the shoulder. In addition to the benefits to the bicyclist, paved shoulders offer added safety, reduced maintenance, and a hard surface off the traveled way for mail delivery and emergency vehicles.

In order to accommodate bicyclists, a minimum shoulder width of 4 ft (1.2 m) of smooth paved surface shall be provided. Additional width may be necessary in locations where:

- vehicular speeds are in excess of 45 mph (70 km/h);
- there are a significant number of trucks and recreational vehicles; or
- fixed objects (e.g., traffic signs) are located too close to the bicycle facility.

When rumble strips are desired in a paved shoulder and the width of the paved shoulder is 4 ft (1.2 m) to 6 ft (1.8 m), Highway Standard 642006 should be used to accommodate bicyclists.

If the paved shoulder is intended for bicyclists, proper pavement marking and signage may be provided. Marked bikeways should be maintained to provide a desirable riding surface and should provide protection from obstacles or barriers by means of increased bikeway width.

42-3.03(c) On Urban Roadways

Bicycle accommodation on urban cross sections consists of providing a shared lane (unmarked or marked) or providing a bike lane to carry bicycles in the same direction as traffic. Bicycle lane width should be determined by context and anticipated use. Bicycle lane width will vary depending on traffic volume and speed, adjacent parking and land uses, and types of highway vehicles.

1. Shared Lanes. On a shared lanes facility, bicyclists and motorists share the same travel lanes without a striped separation. Shared lanes have particular application where physical constraints (e.g., buildings, narrow sidewalks, environmentally sensitive areas) preclude widening a street to provide bike lanes, or on minor roads with low volumes.
 - a. No Specific Accommodation. No specific accommodation is necessary for roadways with an ADT less than 2,000 ADT and a posted speed limit of 30 mph (50 km/h) or less.
 - b. Wide Outside Lane. Wide outside lanes should be considered for a bicycle accommodation on roadways with an ADT between 2,000 - 10,000 and a posted speed limit of 30 mph (50 km/h) or less. The shared lane width shall be 14 ft (4.0 m) minimum measured from edge of the gutter pan to the center of the lane line.

Shared lanes may be unmarked. However, the shared lane marking (sharrow) shall be considered as the preferred treatment (see Section 42-3.06). In some instances, it may be advantageous to sign some shared lanes as bicycle routes when providing continuity to other bicycle facilities or when establishing a touring route. See the *ILMUTCD* for additional guidance on bicycle markings and signage.

2. Bike Lanes. Bike lanes are marked on curbed streets to delineate bicycle traffic from motor vehicle traffic. They are always one-way facilities carrying traffic in the same direction as adjacent motor vehicle traffic. The preferred operating width is 5 ft (1.5 m). However, wider lanes may be desirable under the following conditions:

BUREAU OF LOCAL ROADS & STREETS

42-3(12)

BICYCLE FACILITIES

Oct 2013

- a. Adjacent to Parking Lane. Consider a minimum width of 6 ft (1.8 m) to prevent car door/ bicyclist conflicts. If parking has high turnover and right-of-way is available, a width of 7 ft (2.1 m) is desirable. The bicycle lane should be located between the parking lane and the through traffic lane.
- b. High Bicycle Volume without Parking. Consider a minimum width of 6 ft (1.8 m) to allow bicyclists to ride side by side or for passing slower bicyclists.
- c. High Speed Highways or Heavy Trucks. Consider a minimum width of 6 ft (1.8 m) that may include an optional 2 ft (0.6 m) striped buffer zone and/or a bi-directional side path to minimize wind blast and other effects.
- d. Highways With ADT Greater than 10,000. Consider a minimum width of 6 ft (1.8 m) that may include an optional 2 ft (0.6 m) striped buffer zone and/or a bi-directional side path.

42-3.03(d) On Existing Roads and Streets

1. With Widening. Where right-of-way is adequate roadways may be widened to provide shared roadways, paved shoulders, or bicycle lanes. In areas with sidewalks, the bicycle accommodation should be balanced with the goal of maintaining a high-quality pedestrian environment. If there is no overlay planned as part of the widening, steps should be taken to ensure that there is not a rough joint where bicyclists ride.
2. Without Widening. Bicycle accommodations may also be provided on a roadway by marking or remarking the pavement to reduce the number of lanes, to increase the width of the curb lane, or to add bike lanes. This is commonly referred to as a "road diet". Consider the following:
 - a. Reduce Travel Lane Width. This option may be considered if the lane widths on an existing roadway are greater than the minimum required in Chapter 32 and 33. However, engineering judgment should be used to determine the impact to capacity and safety. Factors to consider include operating speeds, volumes, traffic mix, roadway geometrics, land use context, and parking.
 - b. Reduce Median Width. This option includes reduction or elimination of medians, especially raised curb medians. However, the safety advantages of medians, used as refuge islands for pedestrians and bicyclists, should be considered.
 - c. Reconfigure or Reduce On-Street Parking. If this option is considered, a parking study may assist in determining impact. Potential solutions include eliminating parking on one side of the street, peak-hour restrictions, or converting diagonal parking to parallel parking. Additional parking spaces may be provided for on side streets or in an off-street parking facility.
 - d. Reduce Number of Travel Lanes. Reducing the number of travel lanes ("road diet") may be used to integrate bike lanes on existing roadways. This strategy may be appropriate on:
 - highways with excess capacity;
 - two-lane roadways that are being switched to one-way roadways; or
 - multi-lane roadways being converted to less lanes (e.g.).

See Figure 42-3G for example of a road way with four through-travel lanes converted to a road way with two through-travel lanes and one two-way center left-turn lane. This reconfiguration is the most common form of a "road diet" and is feasible on road ways with an ADT \leq 20,000.

HARD COPIES UNCONTROLLED

42-3.03(e) Bike Lanes on Highway Structures

Since structures have a long life and are often far apart, structures are very important in providing non-motorized access over barriers such as highways, railways, waterways, and other barriers and natural features. Maintain a consistent bicycle lane width from the approach roadway across the structure. New highway structures should, at a minimum, equal the width of the approach roadway plus the width of approaching bicycle lanes and/or sidewalks. The bike lane should have a minimum width of 5 ft (1.5 m). Consider the possible need for future bicycle lanes when planning a new structure. Depending on vehicle speeds and volumes, striped buffer areas or barriers may be needed on structures to separate bicyclists and pedestrians from motor vehicles. Minimum cross sections for shared roadway, bicycle lanes, and bicycle paths are shown in Figure 42-3H.

Where it is necessary to include a separated bicycle path on a highway bridge, several alternatives should be considered in light of what the geometrics of the bridge will allow. One option is to carry the bicycle path across one side of the structure. This should be considered where:

- the bridge facility will connect to a bicycle path at both ends,
- sufficient width exists on that side of the bridge or can be obtained by widening or restriping lanes, and
- provisions are made to physically separate bicycle traffic from motor vehicle traffic.

Another option is to use existing sidewalks as one-way or two-way facilities. This may be advisable where:

- conflicts between bicyclists and pedestrians will not exceed tolerable limits, and
- the existing sidewalks are adequately wide.

If the facility cannot provide adequate widths, appropriately sign the facility to warn users of the deficiencies or require bicyclists to dismount and cross the structure as a pedestrian. Section 17-2 of the *BDE Manual* provides additional design guidance for bicycle or shared use paths on structures. The *AASHTO Standard Specifications for Highway Bridges* specifies a 4.5 ft (1.4 m) outside railing height. Design on-road bicycle accommodations accordingly.

Where bridge projects include bike lane or sidewalk accommodations, the approaches to the structure should ensure a usable facility by continuing the accommodation to logical termini.

42-3.04 Bicycle Railroad Crossings

Bike lane and path intersections with the railroad are more sensitive to the skew angle than the main highway because of the possibility of bicycle or wheelchair wheels being trapped in the rail flangeway. It may be possible to modify the horizontal alignment of a bikeway to provide increased crossing safety. Lower design speeds require smaller curve radii; therefore, a deviation from the general alignment can be accomplished over a relatively short distance.

Consider the following to accommodate bicycles across railroads:

1. Width. In general, the normal width of the bikeway, including shoulders, should be maintained through the grade crossing.
2. Vertical Alignment. The vertical alignment considerations that apply to mainline roadways are also applicable to bikeways.
3. Crossing Angle. Bicyclists should be able to cross railroad tracks at or near a right angle to minimize the potential for the bicycle's front wheel to be trapped in the flangeway. When the crossing angle is less than 45°, consider widening the outside lane, shoulder, or bicycle lane to improve the angle of approach (See Figure 42-31). Where this is not practical, consider using commercially available compressible flangeway fillers to provide a smooth transition over the rails (See Figure 42-31). Appropriate pavement striping in the widened area can guide users of the bike lane toward the safest alignment across the tracks.
4. Surface. The bicycle portion of the pavement surface should be at the same elevation as the top of the rails. Provide a bicycle-crossing surface that is consistent with the vehicular or bike path-crossing surface.
5. Visibility. Maximum visibility should be provided to improve the cyclist's awareness of approaching trains. Post Railroad Advance Warning signs no less than 50 ft (15 m) in advance of the tracks.
6. Signing and Protection. Crossbuck signs shall be erected at the crossing. All signing should conform to *ILMUTCD*. The LPA should coordinate with the railroad to determine the need for flashing light signals and gates.
7. Coordination. Contact the railroad early in the development of the project. The ICC may also be involved with bike crossings adjacent to roadways.

BIKE LANE RAILROAD CROSSING TREATMENTS
Figure 42-31

42-3.05 Incidental Design Factors

Consider the following additional design factors where applicable to the project.

1. Drainage Grates. Drainage grates and utility covers can be hazardous to bicyclists. All current IDOT drainage grate designs are suitable for bicycle travel. Grates and utility covers located in the cyclist's expected path should be flush with the pavement. With pavement overlay projects, replace utility covers and non-conforming drainage grates and adjust them to be flush with the new surface. A less desirable alternative is to design and construct the pavement to taper into drainage inlets to avoid creating an abrupt edge.

2. Bollards. If bollards are installed across a bike path where it intersects with a street, provide an adequate clear zone between the bollards and the street.
3. Environmental Effects. Analysis of the environmental effects of bicycle accommodations should be accomplished and documented along with the environmental analysis for the associated highway project. When not part of a roadway project, bikeway projects may be processed as a Categorical Exclusion (CE) for federally funded projects.
4. Rumble Strips. Where rumble strips are placed across the traffic lane in rural areas to warn motorists of upcoming traffic controls, provide a minimum 3 ft (1.0 m) clear paved area on the paved portion of the shoulder to allow a bicyclist an opportunity to avoid the rumble strip. When rumble strips are installed in a paved shoulder which serves as a bicycle accommodation and the width of the paved shoulder is 6 ft (1.8 m) or less, the 8 in (200 mm) rumble strip design should be used to minimize the impact to the accommodation.

42-3.06 Signing, Pavement Marking, and Traffic Control

Signing, pavement markings, and traffic control for bicycle facilities will be in accordance with the criteria presented in the ILMUTCD and applicable local ordinances. Signing and pavement markings are especially important at the approaches to intersections and at bike lane termini. Where a bike lane ends, bicyclists may be required to merge with motor vehicle traffic. Bicyclists should be encouraged with the appropriate signing and pavement markings to make lane changes in advance of the intersection.

Not all bicycle accommodations or bikeways need to be or should be marked as bike routes. Generally, only low-volume roads, bike lanes and bicycle paths should be marked as designated bicycle facilities. The absence of a marked bicycle lane or any other traffic control devices shall not be construed to mean that bicyclists are not permitted to travel on that roadway.

Bicycle routes should be marked if they meet the following criteria, are continuous, and are at least 1 mi (1.5 km) long:

- The route provides through and direct travel in bicycle-demand corridors.
- The route connects discontinuous segments of shared used paths, bike lanes, and/or other bike routes.
- An effort has been made to adjust traffic control devices (e.g., stop signs, signals) to give greater priority to bicyclists on the route, as opposed to alternative streets. This could include placement of bicycle-sensitive detectors where bicyclists are expected to stop.
- Street parking has been removed or restricted in areas of critical width to provide improved safety.

The following are some examples of what should not be marked:

- Wide curb lanes that provide intermittent access to businesses along the route, but provide no connection to another part of a bike route; and
- Any facility that does not meet minimum design criteria in the AASHTO publication Guide for the Development of Bicycle Facilities.

However, short segments of a continuous bike route that do not meet minimum criteria may be marked if the user is adequately warned of the conditions. For example, where a roadway serves as a bikeway and intermittent restrictions on width exist, such as at narrow bridges, mark these obstructions with both signing and pavement markings to warn bicyclists and motorists of the hazards.

At signalized intersections where frequent bicyclists need access to a green signal phase, a number of acceptable alternative methods are available including timed signals (where a cyclist must wait for the signal to change), traffic-actuated detectors, and push-button actuation. This opportunity (to access a green signal) should be provided where a marked bikeway crosses the project corridor. Other crossing locations to consider include potential bicycle travel from schools, parks, or other significant destinations described in Section 42-2.

Traffic-actuated detection should be sensitive to bicycles and should be located in the bicyclist's expected path, including left-turn lanes if necessary. Figure 42-3J shows three recommended loop types for bicycle detection, each with particular advantages, and a pavement-marking stencil used to designate where a bicyclist should stand to activate the detector loop. The following information on bicycle detection should be considered:

1. Quadrupole Loop Detectors. The quadrupole loop detector functions best in a bicycle path or lane situation. In such a situation, the expected position of a bicyclist can be easily predicted. This loop is less sensitive over its outer wire than over its center wires and is also relatively insensitive to motor vehicle traffic in neighboring lanes.
2. Diagonal Quadrupole Loop Detector. The diagonal quadrupole loop detector functions best in shared-roadway situations where the position of a bicycle cannot be easily predicted. This detector is equally sensitive over its entire width and is relatively insensitive to motor vehicle traffic in neighboring lanes.

Signal timing usually does not need to be lengthened to allow adequate time for bicycle crossing. The AASHTO publication *Guide for the Development of Bicycle Facilities* recommends calculating clearance intervals with a bicyclist's speed of 10 mph (16 km/h) and a perception/reaction/braking time of 1.0 second. At extremely wide intersections, however, consider providing a median refuge area that is at least 6 ft (2 m) wide if signal timing would prohibit adequate crossing time.

The shared lane marking (sharrow) shown in Figure 42-3K should be placed:

1. On highways with on-street parallel parking, at least 11 ft (3.4 m) from the face of curb, or edge of travelled way where there is no curb; or
2. On highways without on-street parallel parking, at least 4 ft (1.2 m) from the face of curb, or edge of travelled way where there is no curb.

Section 9C.07 of the *ILMUTCD* contains further guidance.

RECOMMENDED LOOP TYPES AND PAVEMENT MARKINGS FOR BICYCLE DETECTION LOOPS

Figure 42-3J

SHARED LANE MARKING

Figure 42-3K

42-4 MAINTENANCE

Responsibility for maintenance of bike lane facilities should be determined and agreed upon during the planning process and should be included in the local agency funding agreement, when applicable.

Chapter 44

PAVEMENT DESIGN

44-1 GENERAL

Within Chapter 44 there are areas with color (red, blue, or green) added to the text or the figures. The color is based on three example calculations for three different classes of pavement, which are shown through the pavement design procedure for the four types of pavements discussed. The color is only meant to assist in following the criteria used in the examples. There may be duplicate numbers in the figures within Sections 44-1 thru 44-5 to reflect these examples.

44-1.01 Pavement Design Definitions

1. Average Daily Traffic (ADT). The total volume during a given period (in whole days), greater than one day and less than one year, divided by the number of days in that time period.
2. Base Course. The layer used in a pavement system to reinforce and protect the subgrade or subbase.
3. Binder. The asphalt cement used in HMA pavements specified according to the Superpave Performance Graded system.
4. Class I Roads and Streets. Facilities with 4 or more lanes and one-way streets with a structural design traffic greater than 3500 ADT.
5. Class II Roads and Streets. Two or three lane streets with structural design traffic greater than 2000 ADT and all one-way streets with a structural design traffic less than 3500 ADT.
6. Class III Roads and Streets. Roads and streets with structural design traffic between 400 and 2000 ADT.
7. Class IV Roads and Streets. Roads and streets with structural design traffic less than 400 ADT.
8. Composite Pavement. A pavement structure consisting of HMA surface course overlaying a Portland Cement Concrete (PCC) or Roller Compacted Concrete (RCC) slab of relatively high bending resistance which serves as the principle load-distributing component.
9. Continuously Reinforced Concrete Pavement. A rigid pavement structure having continuous longitudinal reinforcement achieved by spliced longitudinal steel reinforcement.
10. Conventional Flexible Pavement. A flexible pavement structure consisting of a HMA surface course and a combination of aggregate base, granular subbase, or modified soil layers.

BUREAU OF LOCAL ROADS & STREETS

44-1-2

PAVEMENT DESIGN

June 2018

11. Design E_{Ri} . Resilient modulus is the repeated deviator stress divided by the recoverable (resilient) strain. For the fine-grained subgrade soils that predominate in Illinois, E_{Ri} is the resilient modulus for a repeated deviator-stress of approximately 6 ksi.
12. Design HMA Mixture Temperature. Design temperature of HMA mixture in the pavement based on its geographical location.
13. Design HMA Modulus (E_{HMA}). The HMA mixture modulus (E_{HMA}) in the pavement corresponding to the "Design HMA Mixture Temperature".
14. Design HMA Strain. HMA design tensile strain at the bottom of the HMA pavement layer.
15. Design Lane. The traffic lane carrying the greatest number of single and multiple unit vehicles.
16. Design Period (DP). The number of years that a pavement is to carry a specific traffic volume and retain a minimum level of service.
17. Equivalent Single Axle Loads (ESAL's). A numeric factor expressing the damage relationship of a given axle load in terms of an 18-kip single axle load.
18. Extended Lane. A monolithic paved lane, typically 1 to 2 ft wider than the marked pavement riding surface, used to reduce PCC pavement edge stresses. Lanes built with integral curb and gutter may be considered extended lanes and designed as such.
19. Heavy Commercial Vehicles (HCV's). The combination of single and multiple unit vehicles (SU's + MU's). These typically account for the majority of the 18-kip ESAL applications to the design lane anticipated during the design period.
20. Hot Mix Asphalt (HMA). A mixture consisting of coarse and fine mineral aggregate uniformly coated with asphalt binder. Used as a base, surface, or binder course.
21. Immediate Bearing Value (IBV). A measure of the support provided by the roadbed soils or by unbound granular materials. The field IBV is obtained from the Dynamic Cone Penetrometer (DCP) test, or in the lab from a penetration test (according to AASHTO T193) on a 4 in. diameter, molded sample, immediately after compaction.
22. Integral Curb and Gutter. A curb and gutter that is paved monolithically with the pavement. Used to reduce edge stresses and provide a means of surface drainage.
23. Modified Soil Layer. A subgrade soil layer treated with a modifier such as lime, fly ash, Portland cement, or slag-modified cement, and constructed according to the [IDOT Standard Specifications](#) for Soil Modification.
24. Multiple Units (MU). Truck tractor semi-trailers, full trailer combination vehicles, and other combinations of a similar nature.
25. Overloads. Loads that are anticipated to exceed the load limits from which the design TF's were developed. Typically, overloads are created from commercial, garbage, construction, and farm trucks; permit loads; buses; and some farm implements.
26. Passenger Vehicles (PV). Automobiles, pickup trucks, vans, and other similar two-axle, four-tire vehicles.

HARD COPIES UNCONTROLLED

BUREAU OF LOCAL ROADS & STREETS

June 2018

PAVEMENT DESIGN

44-1-3

27. Pavement Structure. The combination of subbase, base course, and surface course placed on a subgrade to support the traffic loads and distribute the load to the roadbed.
28. Reliability. The reliability of a pavement design-performance process is the probability that a pavement section designed using the process will perform satisfactorily for the anticipated traffic and environmental conditions for the design period. The following factors may impact the design reliability: materials; subgrade; traffic prediction accuracy; construction methods; and environmental uncertainties.
29. Single Units (SU). Trucks and buses having either 2 axles with 6 tires or 3 axles.
30. Skewed Joints. Transverse joints that are not constructed perpendicular to the centerline of pavement. The use of skewed joints is not recommended.
31. Stage Construction. The planned construction of the flexible pavement structure in two or more phases. A period of up to two years may elapse between the completion of the first stage and the scheduled construction date of the final stage.
32. Structural Design Traffic. The number of passenger vehicles, single-unit trucks, and multiple-unit trucks estimated for the year representing one-half the design period from the year of construction.
33. Subbase. The layer used in the pavement system between the subgrade and the base course.
34. Subgrade. The prepared and compacted soil immediately below the pavement system and extending to a depth that will affect the structural design.
35. Subgrade Support Rating (SSR). Rating of subgrade support used in full-depth HMA, rigid, and composite pavement designs. There are three ratings — poor, fair, and granular. These ratings are based on the silt, sand, and clay contents of the subgrade.
36. Surface Course. One or more layers of a pavement structure designed to accommodate the traffic load, the top layer of which resists skidding, traffic abrasion, and the disintegrating effects of climate. This layer is sometimes called the wearing course.
37. Three Times Nominal Maximum Aggregate Size. The minimum thickness of a HMA course in which the Nominal Maximum Aggregate Size (Superpave) is one size larger than the first sieve that retains more than 10% aggregate.
38. Tied Curb and Gutter. A PCC curb and gutter that is tied with reinforcing steel to the pavement so that some of the pavement load is transferred to the curb and gutter. Used to reduce pavement edge stresses and provide a means of surface drainage. In order to be considered a tied curb and gutter and to receive a pavement thickness adjustment for tied curb and gutter, see the [Illinois Highway Standards](#) for the proper size of reinforcement bar to tie the pavement to the curb and gutter.
39. Tied Shoulder. A PCC stabilized shoulder tied with reinforcing steel to the pavement so that some of the pavement load is transferred to the shoulder. Used to reduce pavement edge stresses. In order to be considered a tied shoulder and to receive the pavement thickness adjustment for tied shoulders, see the [Illinois Highway Standards](#) for the proper size of reinforcement bars to tie the pavement to the PCC shoulder.

HARD COPIES UNCONTROLLED

40. Traffic Factor (TF). The total number of 18-kip equivalent, single-axle load applications anticipated in the design lane during the design period, expressed in millions.
41. Untied Shoulder. Any shoulder that does not provide edge support. The shoulder may consist of earth, aggregate, or bituminous stabilized materials. PCC shoulders that are tied with smaller reinforcing steel than the size indicated in the [Illinois Highway Standards](#) are considered untied for purposes of determining pavement thickness.

44-1.02 Accessibility Requirements

All pavements constructed shall meet the accessibility requirements in [Section 41-6](#) of this manual.

44-1.03 Basic Mechanistic Design Procedures

Mechanistic pavement design procedures use the actual stresses, strains, and deflections experienced by the pavement to determine its expected fatigue life.

44-1.03(a) Mechanistic Design Factors

Factors that are considered in mechanistic designs include:

- design HMA strain;
- design pavement HMA mixture temperature;
- design HMA mixture modulus (E_{HMA});
- subgrade support rating (SSR);
- design reliability;
- degree of PCC edge support;
- degree of PCC base erosion;
- PCC joint spacing; and
- PCC stresses.

44-1.03(b) Design Period

The level of traffic and type of facility to be constructed affect the selection of the design period. Generally, it is desirable to design highway pavements to carry traffic without necessitating the need for major rehabilitation for a period of 15 to 20 years. However, it may be advantageous to design lesser roadways (e.g., frontage roads, alleys, temporary roads) for shorter periods.

For all pavement types, the minimum design period allowed is 20 years for Class I and II roads and streets. For all pavement types, the minimum design period allowed is 15 years for Class III roads and streets. For Class IV roads and streets with 48 or fewer HCV's, pavement thicknesses provided in each Section 44-2, 44-3, 44-4, and 44-5 should be satisfactory for design periods of 15 years or 20 years.

44-1.03(c) Structural Design Traffic

The structural design traffic is the estimated ADT for the year representing one-half of the design period. For example, when the design period is 20 years, the structural design traffic will be an estimate of the ADT projected to 10 years after the construction date.

1. Estimate ADT of PV, SU, and MU. Vehicular classification and traffic volume projections for structural design traffic are based on available traffic data (i.e., ADT). ADT and vehicular classification data for various roadway classes may be obtained from published IDOT traffic maps. If traffic data is unavailable or if published data is dated or does not appear to reflect known conditions or field observations (e.g., land uses, directional distributions), traffic volume and classification studies may be needed to establish a representative base of existing conditions. Factors that compound annual growth typically are used in traffic projections. It is important to consider any future land development or land use changes that may affect the volume or composition of traffic that will use the facility. If vehicular classification data is not available for Class III or Class IV facilities, use the percentages in Figure 44-1A to estimate the number of PV, SU, and MU vehicles from ADT. Also, consider the potential impacts of heavily loaded vehicles, especially in areas near mines, grain elevators, factories, and river ports. It may be necessary to specifically design for such vehicles.

2. Assign Traffic to the Design Lane. Although the sum of the PV, SU, and MU vehicular volumes determined in Step 1 represents the total ADT that will be carried by the highway facility in the year of the projection, the structural design of the pavement will be based on the lane which carries the greatest number of SU and MU vehicles (i.e., the design lane). The distribution factors in Figure 44-1B have been applied to TF equations contained in this chapter. Use the total two-way ADT for multilane facilities when calculating the structural design traffic as the distribution factors account for directional traffic and the percentage of vehicles in the design lane.

Note that the design lane distribution factors in Figure 44-1B are based on previous traffic studies under average conditions. Unusual traffic control or design features may influence lane usage (e.g., lane restrictions of commercial vehicles, directional influence of major commercial generator). Adjustments may be necessary. Contact the CBLRS for additional guidance.

Class of Road or Street	Percentage of Structural Design Traffic		
	PV (%)	SU (%)	MU (%)
III	88	7	5
IV	88	9	3

TRAFFIC PERCENTAGE
(Class III and IV)

Figure 44-1A

Number of Facility Lanes	Percent of Total Vehicular Class Volume (ADT) in Design Lane					
	Rural			Urban		
	PV	SU	MU	PV	SU	MU
2 or 3 *	50%	50%	50%	50%	50%	50%
4 or 5	32%	45%	45%	32%	45%	45%
≥ 6	20%	40%	40%	8%	37%	37%

* 2 or 3 lane facilities include all one-way roads and streets.

DESIGN LANE DISTRIBUTION FACTORS FOR STRUCTURAL DESIGN TRAFFIC

Figure 44-1B

44-1.04 Selection of Pavement Type

The local public agency (LPA) must specify pavement type on the design plans. For MFT or State funded projects, “alternative” or “type” bids may be used according to [Section 12-1](#) and for federally funded projects see [Section 24-1](#). Figure 44-1E provides a decision tree flow chart as a guide for the design of pavements.

The 1993 *AASHTO Guide for Design of Pavement Structures* lists a number of principal and secondary factors that may play a role in the pavement selection process. Some of these include the following:

1. Principal Factors. These include traffic, soil characteristics, weather, construction considerations, recycling, and cost comparison (initial, maintenance, reconstruction, etc.).
2. Secondary Factors. These may include performance of similar pavement in the area, adjacent existing pavements, conservation of materials and energy, availability of local materials or contractor capabilities, traffic safety, incorporation of experimental features, stimulation of competition, and LPA preference.

44-1.05 Minimum HMA Lift Thickness

All HMA surface, binder, and leveling binder lifts must comply with the lift thicknesses in Figure 44-1C.

BUREAU OF LOCAL ROADS & STREETS
PAVEMENT DESIGN

June 2018

44-1-7

Mixture Superpave	Typical Use ⁽¹⁾	Leveling Course Minimum Lift Thickness ⁽²⁾⁽³⁾, in. (mm)	Surface/Binder Course Minimum Lift Thickness ⁽²⁾, in. (mm)
IL-4.75	B/L	3/8 (10)	3/4 (19)
IL-9.5	S/B/L	3/4 (19) ⁽⁵⁾	1 1/4 (29)
IL-12.5	S/B/L	1 1/4 (32)	1 1/2 (38)
IL-19.0 ⁽⁴⁾	B/L	1 3/4 (44)	2 1/4 (57)
IL-25.0 ⁽⁴⁾	B	Not Allowed	3 (76)

Notes:

1. S = Surface; B = Binder; L = Leveling Binder
2. Minimum thicknesses are the nominal thickness of the lift.
3. If the leveling course is placed at or above the minimum thickness specified for surface/binder course, density will be required.
4. This mix may not be used as a surface lift.
5. If the IL-9.5mm leveling binder is being placed over crack and joint sealant, the minimum lift thickness may be 1/2 in. (13 mm).

HMA SURFACE, BINDER, AND LEVELING BINDER LIFT THICKNESSES

Figure 44-1C

44-1.06 Skid Resistance on HMA Surface Courses

Aggregates with suitable friction shall be specified for all HMA surface courses on federal-aid projects and local projects on the state letting. Figure 44-1D lists four surface course mixtures that have been developed to provide adequate skid resistance for various Average Daily Traffic (ADT) levels and number of lanes.

Designers should consider using the appropriate friction aggregate on projects funded by other sources and on a local letting.

Number of Lanes	Frictional Requirements (ADT)			
	Mixture C	Mixture D	Mixture E	Mixture F
≤ 2	≤ 5,000	> 5,000	N/A	N/A
4	≤ 5,000	5,001 to 25,000	25,001 to 100,000	> 100,000
≥ 6	N/A	5,001 to 60,000	60,001 to 100,000	> 100,000

Note: ADT levels are for the expected year of construction.

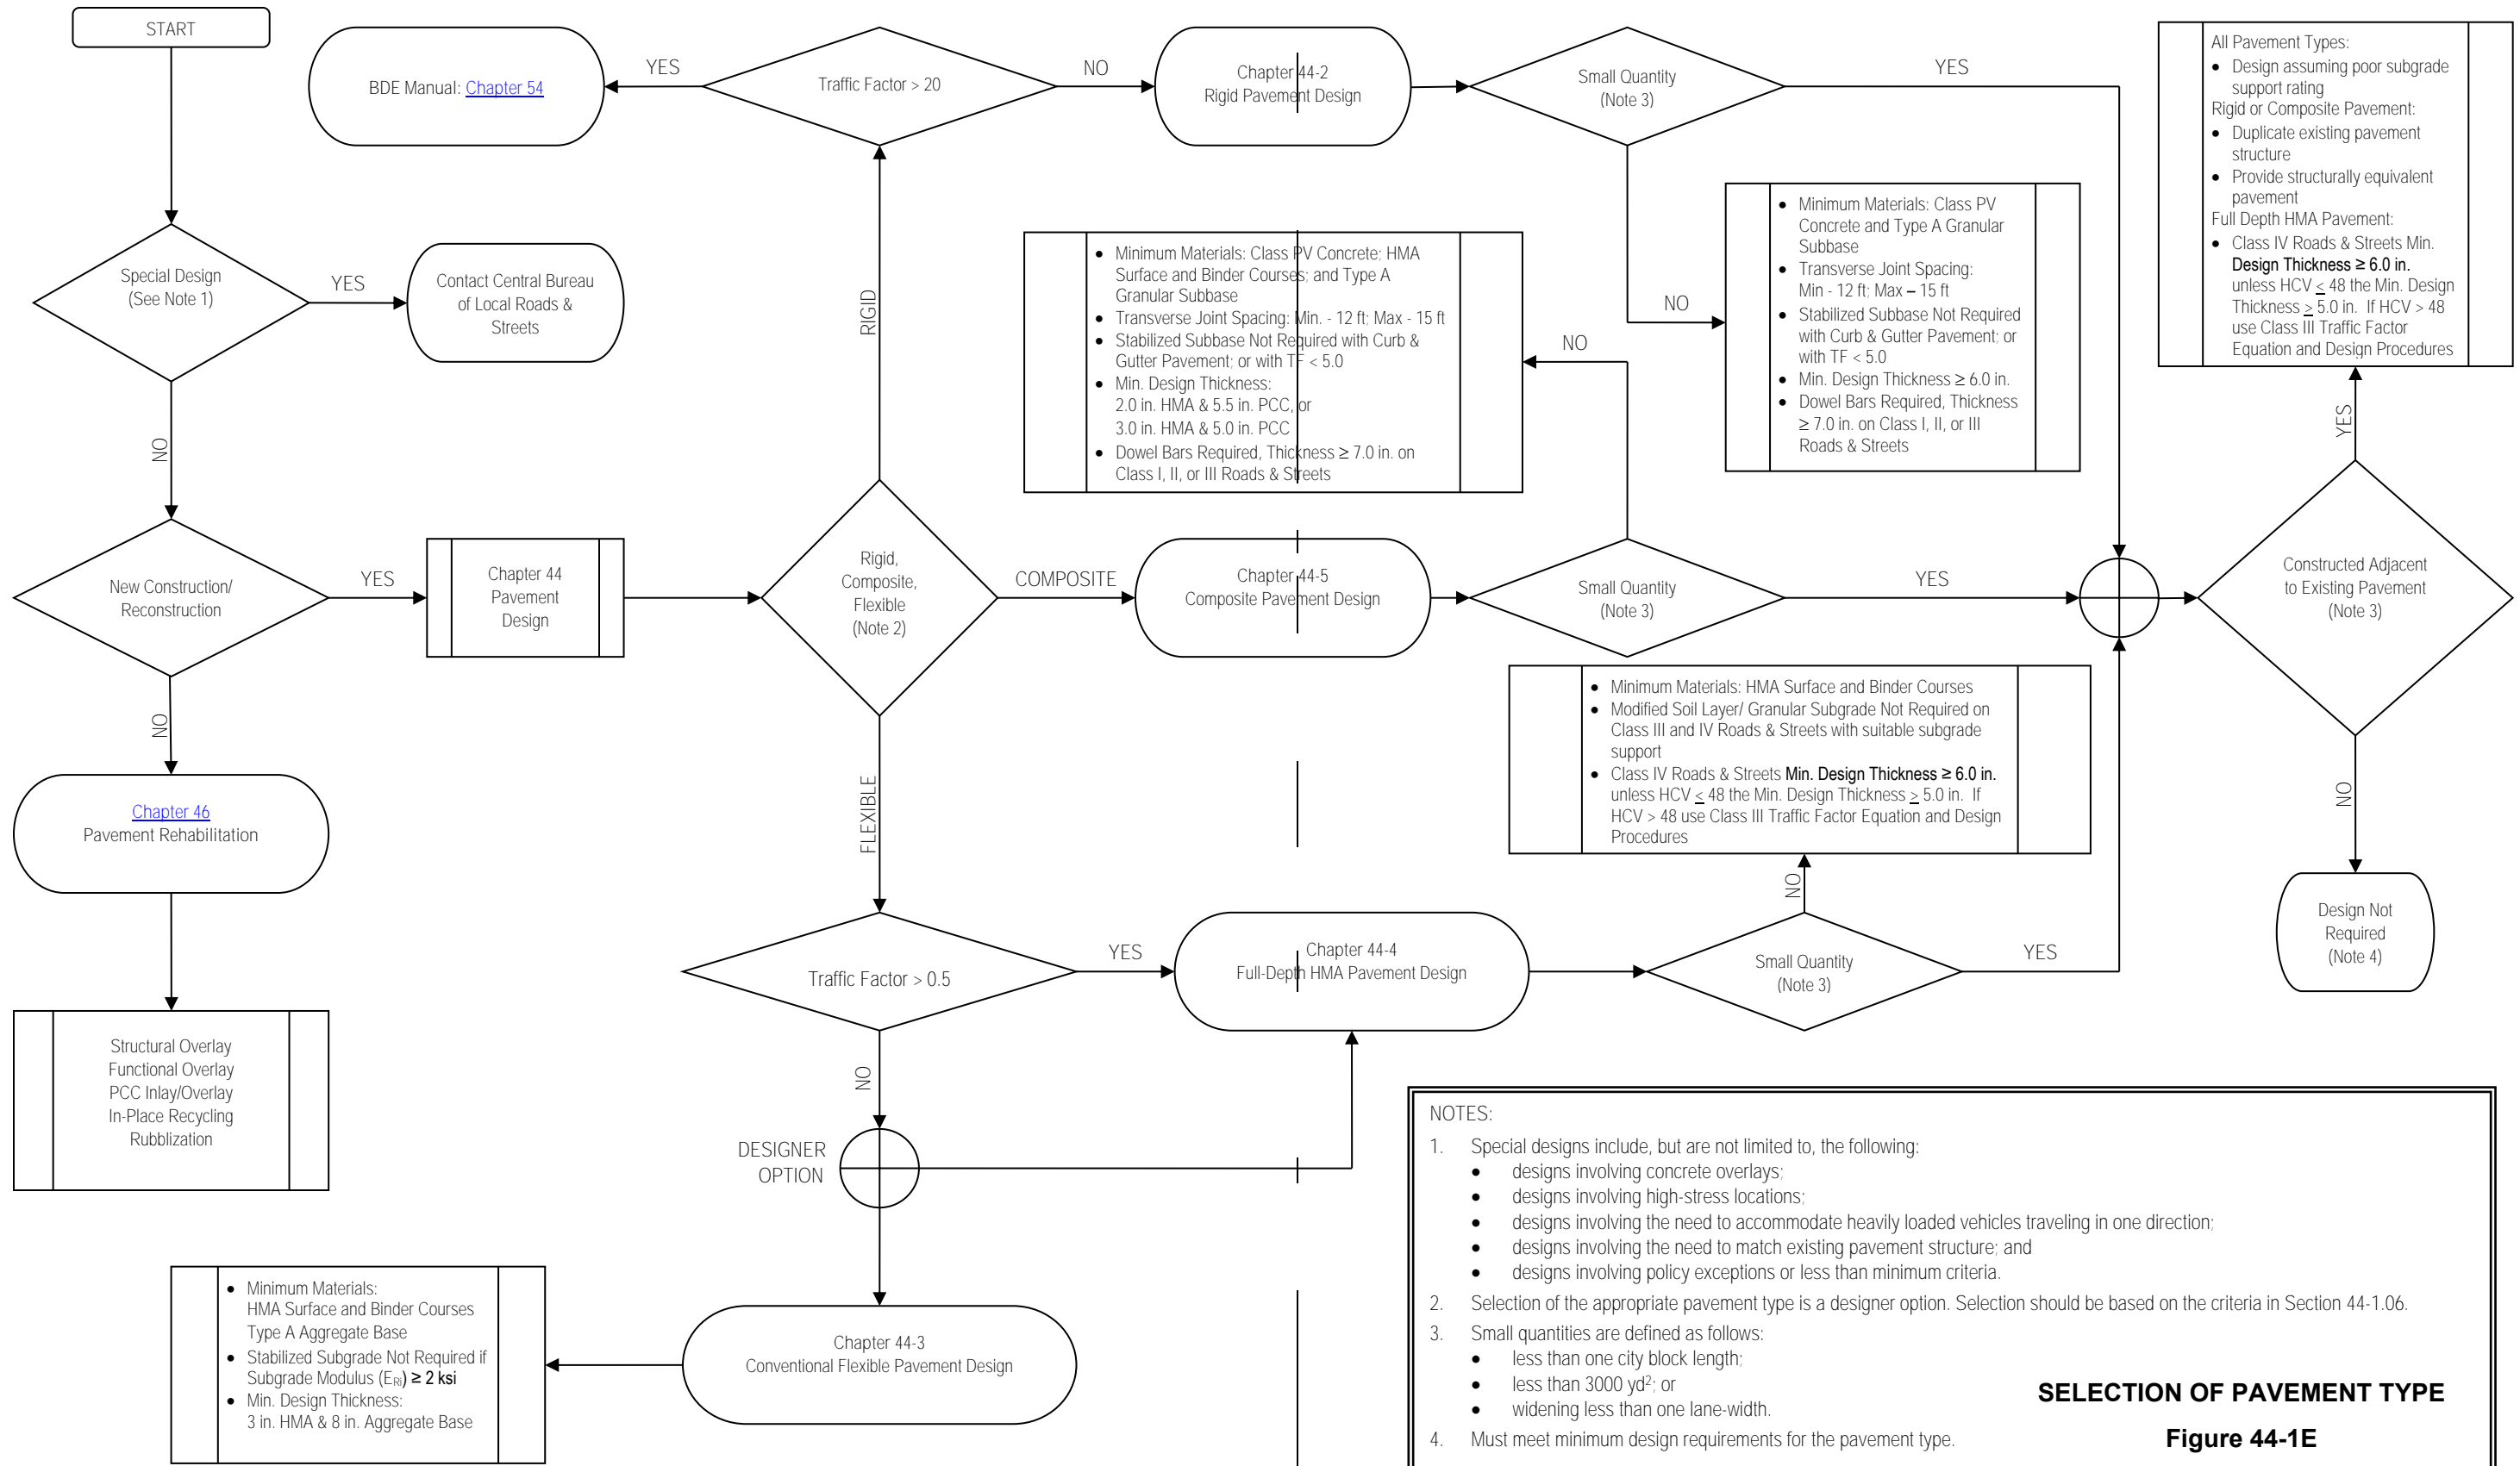

FRICIONAL REQUIREMENTS FOR SURFACE MIXES

Figure 44-1D

44-1.07 Density Testing on HMA Pavements

As the final measure of quality during construction, density is the most critical characteristic of HMA pavements to achieve durability, minimize permeability, and enhance long term resistance to raveling. The department's *Manual of Test Procedures for Materials* provides the *Standard Test Method for Correlating Nuclear Gauge Densities with Core Densities*. However, a correlated gauge is not always practical. Therefore, for HMA projects designed using [Section 46-2](#) of this manual or for less than 3,000 tons of a given HMA mixture, a nuclear-core correlation for determining density is not required. One of the following alternative methods may be used:

- Core Density Testing (Preferred Alternative);
- Growth Curve (LR1030 is required to be used); or
- Non-correlated Nuclear Gauge Testing.

HARD COPIES UNCONTROLLED

44-1.08 Example Calculations

Chapter 44 provides examples for three classes of roads and streets, showing calculations of the pavement design for rigid pavement, conventional flexible pavement, full-depth HMA pavement, and composite pavement. The same criteria are used for all pavement types. The examples are not to persuade the use of one type of pavement over another. The designer or LPA should refer to Section 44-1.04 to determine which type of pavement to construct.

As the calculations are completed for each example and pavement design, the various figures and text used in each section will be color coordinated with each example to show lines, shaded areas, etc. Section 44-9 provides clean worksheets and figures to use in the submittal of pavement designs. A design period of 20 years is used for all three examples. A design period of 15 years could be used per Section 44-1.03(b).

44-1.08(a) Example Calculation 1 (Red) – Class I Road

Given:

Class I Road, Four Lane Pavement (Urban) (Section 44-1.01)
12 ft Lanes with Concrete Curb and Gutter
Design Traffic: ADT = 14,000
PV's 86%, SU's 8%, MU's 6% (if unknown see Section 44-1.03(c))
Lake County
Design Subgrade Support Rating – Fair
Posted Speed Limit – 30 MPH with Bus Stops

44-1.08(b) Example Calculation 2 (Blue) – Class III Road

Given:

Class III Road, Two Lane Pavement (Section 44-1.01)
11 ft Lanes with Paved HMA Shoulders
Design Traffic: ADT = 1,800
PV's 90%, SU's 6%, MU's 4% (if unknown see Section 44-1.03(c))
Sangamon County
Design Subgrade Support Rating – Poor
Posted Speed Limit – 40 MPH with No Bus Stops

44-1.08(c) Example Calculation 3 (Green) – Class IV Road

Given:

Class IV Road, Two Lane Pavement (Section 44-1.01)
11 ft Lanes with Aggregate Shoulders
Design Traffic: ADT = 350
PV's 88%, SU's 7%, MU's 5% (if unknown see Section 44-1.03(c))
City of Marion, Williamson County
Design Subgrade Support Rating – Poor
Posted Speed Limit – 55 MPH with No Bus Stops

44-2 RIGID PAVEMENT DESIGN FOR LOCAL PUBLIC AGENCIES

44-2.01 Introduction

44-2.01(a) Types of Rigid Pavements

Rigid pavement is a pavement structure whose surface and principal load-distributing component is a Portland cement concrete (PCC) pavement of relatively high bending resistance. The two types of rigid pavements are as follows:

1. Non-Reinforced Jointed. Jointed pavement without longitudinal steel reinforcement that may or may not use mechanical load transfer devices (e.g., dowel bars).
2. Continuously Reinforced. Pavement with continuous longitudinal steel reinforcement and no man-made joints. It is typically used on high-volume Class I roads (e.g., Interstate routes and freeways).

The non-reinforced jointed pavement design procedure is discussed in this Section. [Chapter 54](#) of the *BDE Manual* provides the design procedures for continuously reinforced concrete pavements.

44-2.01(b) Usage of Procedure

Use the pavement design procedures provided in Section 44-2 for all local road and street projects where a rigid pavement is desired. If the LPA intends to transfer jurisdiction following pavement construction, both agencies involved in the jurisdictional transfer should agree on the design.

A pavement design is not required when small quantities of pavement are to be constructed. Small quantities are defined as follows:

- less than one city block in length,
- less than 3,000 yd² (2510 m²), or
- widening less than one lane-width.

Where small quantities are to be constructed adjacent to an existing pavement, the designer should:

- duplicate the existing total pavement structure,
- provide a structurally equivalent pavement, or
- design assuming a poor subgrade support rating.

44-2.02 Basic Design Elements

44-2.02(a) Minimum Material Requirements

The minimum requirement for Portland cement concrete is Class PV concrete, as specified in the [IDOT Standard Specifications](#). Use Type A granular subbase, according to the [IDOT Standard Specifications](#), where granular subbase is specified.

44-2.02(b) Traffic Factors

For Class I, II, and III roads and streets, the design Traffic Factor (TF) for rigid pavements is determined from the 80,000 lb load limit formulas shown in Figures 44-2A. The formulas are based on the state wide average distribution of vehicle types and axle loadings, which are directly applicable to most roads and streets. However, cases will arise in which a formula cannot be used, and a special analysis will be necessary (e.g. a highway adjacent to an industrial site with heavy commercial vehicles (HCV's) entering and leaving the site generally traveling empty in one direction and fully loaded in the other). These cases should be referred to the CBLRS for special analysis. The LPA must provide the CBLRS with the structural design traffic; the design period; traffic distribution by PV, SU, and MU; and loading distribution of HCV traffic.

For Class IV rigid pavements, thicknesses are provided in Section 44-2.03(b) based on the daily volume of HCV's; therefore, a design TF is not necessary. However, if the number of HCV's is greater than 48, use the Class III TF equations or a TF of 0.5, whichever is greater, and proceed to design the pavement according to Section 44-2.03.

For TF greater than 20.0, the designer should follow the rigid pavement mechanistic design procedure outlined in [Chapter 54](#) of the *BDE Manual*. Contact the CBLRS for additional information.

Class I Roads and Streets	
4 or 5 Lane Pavements (Rural and Urban)	$TF = DP \left[\frac{(0.047PV + 64.715SU + 313.389MU)}{1,000,000} \right]$
6 or More Lane Pavements (Rural)	$TF = DP \left[\frac{(0.029PV + 57.524SU + 278.568MU)}{1,000,000} \right]$
6 or More Lane Pavements (Urban)	$TF = DP \left[\frac{(0.012PV + 53.210SU + 257.675MU)}{1,000,000} \right]$
One-way Street Pavements (Rural and Urban)	$TF = DP \left[\frac{(0.073PV + 71.905SU + 348.210MU)}{1,000,000} \right]$
Class II Roads and Streets	
2 or 3 Lane Pavements	$TF = DP \left[\frac{(0.073PV + 67.890SU + 283.605MU)}{1,000,000} \right]$
Class III Roads and Streets	
2 or 3 Lane Pavements	$TF = DP \left[\frac{(0.073PV + 64.790SU + 281.235MU)}{1,000,000} \right]$ TF minimum = 0.5

RIGID PAVEMENT TRAFFIC FACTOR EQUATIONS (80,000 LB LOAD LIMIT)

Figure 44-2A

44-2.02(c) Transverse Pavement Joints

For Class I, II, and III pavements, Figure 44-2B provides the thickness design curve for transverse joint spacing of 12 ft, lane width of 11 ft, reliability of 90%, 4 in. granular subbase, tied concrete shoulder, and poor subgrade support. Pavement thickness for this joint spacing may be determined through the pavement design procedure in Section 44-2.03. When alternate joint spacing and pavement design features are desired, the thickness adjustment factor given in Figure 44-2C should be used. The maximum recommended transverse joint spacing for Rigid pavements are given in Figure 44-2D.

Several factors must be carefully considered when selecting transverse joint spacing. Longer joint spacing will result in higher curling and warping stresses, which when combined with load stresses could promote premature failure by fatigue. Longer joint spacing will also result in greater joint movement, which may result in increased joint distress. In urban areas where there is a higher concentration of pavement discontinuities (e.g., manholes, storm sewer outlets, traffic detector loops), longer joint spacing can be less forgiving, leading to cracking between joints. However, shorter joint spacing can result in unstable slabs that may rock and pump under repeated loadings. Shorter joint spacing also results in more joints, thereby increasing the expense of joint maintenance over the life of the pavement. The maximum transverse joint spacing allowed is 15 ft. The CBLRS will provide the thickness designs for pavements granted variances from the joint spacing in Figure 44-2D. In no case is a slab length less than 6 ft recommended except as provided in [Section 46-5](#).

Designers should not use randomized transverse joint spacing unless matching existing joint spacing of adjacent pavement. The use of skewed transverse joints is not allowed. Failure of the portion of the slab where the skewed joint forms an acute angle with the longitudinal joint has been a common occurrence nationwide and in Illinois, and has proven a difficult failure to patch and maintain.

The volume of traffic the pavement will carry determines the type of load transfer device necessary to control faulting at the joints. Mechanical load transfer devices (e.g., dowel bars) are required on pavements that have a design slab thickness of 7 in. or greater. For slab thickness less than 7 in., the designer has the option of using dowel bars or relying on aggregate interlock for load transfer. Shorter joint spacing is recommended when dowel bars are not used.

PRE-ADJUSTED RIGID PAVEMENT THICKNESS

Figure 44-2B

Example 3 – Since the HCV's per day ≤ 48 , the pre-adjusted thickness is 7.0 in. with adjustments of -0.15 in. providing a final thickness of 7.0 in. which exceeds the minimum of 6.0 in. for rigid pavements.

Adjustment Factor	Rigid Pavement Thickness Adjustment (in.)
75% Reliability	-0.50
15 ft Joint Spacing ($0.1 \leq TF \leq 5$)	+1.00
15 ft Joint Spacing ($5 < TF \leq 20$)	+1.25
Untied Shoulder	+0.35
Fair Subgrade	-0.25
Granular Subgrade	-0.50
Stabilized Subbase	-0.25
Existing Pavement as Subbase	-0.50
10 ft Lane Width	+0.25
12 ft Lane Width	-0.25

Note: Thickness adjustment is made for untied shoulders (PCC or flexible). The designer should be aware of the potential for frost heave if untied shoulders are used.

A subbase is optional for all Class III and IV pavements with a TF < 5.0, and for urban sections having curb and gutter and storm sewer systems.

THICKNESS ADJUSTMENT FACTOR

Figure 44-2C

Pavement Thickness (in.)	Maximum Transverse Joint Spacing (ft)
< 10.0	12.0* / 12.0* / 12.0*
≥ 10.0	15.0

* Appropriate for all Class IV pavements.

MAXIMUM TRANSVERSE JOINT SPACING

Figure 44-2D

44-2.02(d) Longitudinal Pavement Joints

Longitudinal joints run parallel to the pavement length and serve the dual function of separating the pavement into travel lanes and controlling longitudinal cracking. Longitudinal joints may be formed by sawing the rigid pavement early in the curing process to form a neat joint before the natural cracking occurs or by limiting the width of the slab being placed. Keyed longitudinal joints are not recommended because of their difficulty in construction and subsequent poor performance. Tied longitudinal construction joints should be used in lieu of keyed longitudinal joints.

Typical BLRS practice requires the use of a deformed tie bar at all longitudinal joints. The basic purposes of tying the longitudinal joint are to promote load transfer through tight aggregate interlock joints and prevent lane separation. However, for pavement cross-sections greater than 60 ft wide, including turn lanes, shoulders, and medians, tying the entire width together may promote longitudinal cracking, particularly if excessive steel is used. For pavement cross sections more than 60 ft, use of dowel bars in lieu of deformed tie bars at one or more longitudinal joints may be an option. In situations where curb and gutter is present on both sides of the pavement, the confining pressure exhibited may preclude the need for tie bars across all longitudinal joints. In these cases, one or more longitudinal joints should not be tied as appropriate or smaller tie bars used than specified in the [Illinois Highway Standards](#) should be used. Local experience may vary in these situations. If it can be determined that lane separation in pavements of similar thickness and cross section has not been a problem, a variance may be requested. The CBLRS should be consulted for variances to the use of tie bars across longitudinal joints.

44-2.02(e) Subgrade

Roadbed soils that are susceptible to excessive volume changes, permanent deformation, excessive deflection and rebound, frost heave, and/or non-uniform support can affect pavement performance. For Class I and II roads, the designer is required to follow the guidelines found in Section 44-7. Use of Section 44-7 is optional for all Class III and IV roadways. In situ soils that do not develop an IBV more than 6.0 when compacted at, or wet of, optimum moisture content require corrective action. The designer should consider corrective actions (e.g., undercutting, moisture density control, soil modification) in the design plans and specifications. The county soil report can be a useful source of typical soil information (e.g., standard dry density and optimum moisture content (AASHTO T 99), soil classification, percent clay, plasticity index (PI)).

Necessary corrective actions as required by Section 44-7 will be in addition to the subbase requirements of the pavement design.

44-2.02(f) Subgrade Support Rating (SSR)

The general physical characteristics of the roadbed soil affect the design thickness and performance of the pavement structure. For pavement design purposes, there are three subgrade support ratings (SSR) — poor, fair, and granular. The SSR is determined as discussed in Section 44-6. The SSR should represent the average or majority classification within the design section. The pavement thickness design curve (Figure 44-2B) is based on a SSR of poor. Adjustments in the design thickness need to be made for fair and granular subgrades are shown in Figure 44-2C.

44-2.02(g) Subbase

A subbase under a pavement serves two purposes. Initially, it provides a stable construction platform for the subsequent man-made layers. After construction, it can improve the pavement performance by alleviating pumping of fine-grained soils and providing positive drainage for the pavement system. The usage and thickness requirements for subbases are given in Figure 44-2E.

When placing a PCC pavement directly over a flexible pavement with a HMA surface, consult CBLRS for design assistance.

Road Class	Subbase Material	Usage ⁽¹⁾	Minimum Thickness (in.)
Class I and II TF ≥ 5.0 TF < 5.0	Stabilized Subbase ⁽²⁾	Required	4
	Granular ⁽³⁾	Required	4
Class III and IV TF ≥ 5.0 TF < 5.0	Granular ⁽³⁾	Required	4
	Granular ⁽³⁾	Optional / Optional	4

Notes:

1. Subbase will be optional for urban sections having curbs and gutters and storm sewer systems. A 4 in. minimum subbase may be used to serve as a working platform where poor soil conditions exist.
2. Stabilized subbase according to the requirements of the [IDOT Standard Specifications](#) or any applicable special provision.
3. Use Type A granular subbase according to the requirements of the [IDOT Standard Specifications](#).

SUBBASE REQUIREMENTS

Figure 44-2E

44-2.02(h) Design Reliability

Design reliability is considered in the design TF. A reliability of 90% is built into the PCC slab thickness design curve in Figure 44-2B. Adjustments in the design thickness need to be made for medium reliability level as shown in Figure 44-2C. The minimum reliability levels by road classes are given in Figure 44-2F.

Road Class	Minimum Reliability Levels	Reliability (%)
Class I and II	High	90
Class III	Medium	75
Class IV (Figure 44-2G)	Medium	75

RELIABILITY LEVELS

Figure 44-2F

44-2.03 Thickness Design

44-2.03(a) Minimum Design Thickness

Once all pavement thickness adjustments have been made, the final design thickness must be 6 in. (15 cm) or greater.

44-2.03(b) Pre-adjusted Rigid Pavement Thickness

The jointed pavement thickness design procedure is based on determining the pre-adjusted thickness of the rigid pavement, and then adjusting for shoulder type, subgrade support conditions, subbase type, joint spacing, reliability, and lane width. The pre-adjusted rigid pavement thicknesses were developed for pavements with tied PCC shoulders, 4 in. granular subbase, and poor subgrade support. For Class I, II, and III pavements, the pre-adjusted rigid pavement thicknesses are determined from Figure 44-2B for joint spacing of 12.0 ft. If a specific joint spacing, shoulder type, reliability, soil support, subbase, or lane width is not desired, adjustments to the slab thicknesses for alternate design features can be made based on recommendations provided in Figure 44-2C.

For Class IV PCC pavements, Figure 44-2G provides the pre-adjusted rigid pavement thickness of 7.0 in. for an 11.0 ft lane width, a 12.0 ft joint spacing, a 90% reliability, with either tied curb or concrete shoulders, and poor soil conditions. Class IV pavements can have a reduced reliability of 75%. Design rigid pavement thickness should never be less than 6.0 in.

Joint spacing of 15 ft are not recommended for Class IV pavements because their thicknesses are typically less than 10.0 in. and the maximum recommended joint spacing is 12.0 ft as shown in Figure 44-2D.

44-2.03(c) Rigid Pavement Thickness Adjustments

Adjustments to the pre-adjusted rigid pavement thickness should be made based on the shoulder type, joint spacing, subgrade support, subbase type, lane width, and reliability. The final design thickness is rounded to the next highest 0.25 in. In determining any adjustments, consider the following:

1. Shoulder Type. The pre-adjusted rigid pavement thickness is valid if the rigid pavement has one of the following shoulder types:
 - tied PCC slab, including tied PCC widening;
 - tied curb and gutter;
 - integral curb and gutter; and/or
 - extended lanes.

Tied PCC slab, tied curb and gutter, and extended lane shoulder types must be tied per the [Illinois Highway Standards](#) in order to avoid a pavement thickness adjustment. The recommended reinforcement bar shown in the [Illinois Highway Standards](#) is needed to promote load transfer through tight aggregate interlock joints between the pavement and curb/shoulder. Designers may specify smaller tie bars; however, additional pavement thickness will be required based on pavement thickness adjustment factors in Figure 44-2C, since it would be considered as untied.

2. Subgrade and Subbase Support. Rigid pavement thickness adjustments are based on the subgrade support and whether the pavement structure will have a subbase or not. Figure 44-2C provides the subgrade support adjustment factors for fair and granular subgrade. Figure 44-2B provides the slab thickness for 4 in. granular subbase (or none if applicable) with adjustment for stabilized subbase given in Figure 44-2C.
3. Joint Spacing. Joint spacing of 15 ft may be used for rigid pavement thicknesses over 10 in. (Figure 44-2D). Thickness adjustment factors for 15 ft joint spacing are given in Figure 44-2C for $TF \leq 5$ and $5 < TF \leq 20$.
4. Lane Width. The standard chart in Figure 44-2B is for an 11 ft lane width. Thickness adjustment can be made for 10 ft and 12 ft lane width as shown in Figure 44-2C.
5. Reliability. Designs for lower reliability can be completed given the criteria in Figure 44-2F and thickness adjustment factor given in Figure 44-2C.

After all necessary adjustments to the pre-adjusted rigid pavement thickness has been made, the designer should round the final design thickness to the next highest 0.25 in. The designer should compare the recommended design thicknesses to Figure 44-2D to determine which joint spacing is allowed.

44-2.03(d) Dowel Bars

The use of doweled joints will be required for rigid pavement thicknesses that are 7 in. and greater on all Class I, Class II, and Class III roads and streets. Doweled joints will not be required for Class IV roads and streets. Recommended dowel diameters are given in Figure 44-2H.

HCV's/day	Rigid Pavement Thickness for 12 ft Joint Spacing (in.)
≤ 48	7.0 ⁽¹⁾
> 48	(2)

Notes:

1. *Minimum rigid pavement thickness shall not be less than 6 in. after all adjustment factors are applied.*
2. *Use the Class III TF equations or a TF of 0.5, whichever is greater, in conjunction with Figures 44-2B.*

RIGID PAVEMENT
DESIGN CALCULATIONS FOR LOCAL PUBLIC AGENCIES
Figure 44-2L

HARD COPIES UNCONTROLLED

44-2.06 Example Calculations**44-2.06(a) Example Calculation 1 (Red) – Class I Road**Problem:

Design a jointed concrete pavement for the given conditions.

Given: (Section 44-1.08(a))

Class I Road, Four Lane Pavement (Urban) (Section 44-1.01)

12 ft Lanes with Concrete Curb and Gutter (tied)

Design Traffic: ADT = 14,000

PV's 86%, SU's 8%, MU's 6% (if unknown see Section 44-1.03(c))

Lake County

Design Subgrade Support Rating – Fair

Posted Speed Limit – 30 MPH with Bus Stops

Solution:

Use Figure 44-2A and determine the TF equation for a four-lane Class I road.

4 or 5 Lane Pavements (Rural and Urban)

$$TF = DP \left[\frac{(0.047PV + 64.715SU + 313.389MU)}{1,000,000} \right]$$

$$TF = 20 \left[\frac{(0.047 \times 12040 + 64.715 \times 1120 + 313.389 \times 840)}{1,000,000} \right]$$

$$TF = 6.73$$

Because the pavement is a Class I road with tied curb and gutter, a subbase is optional (see Figure 44-2E, Note 1). From Figure 44-2E, a stabilized subbase is may be used with a minimum thickness of 4 in.

The pre-adjusted rigid pavement thickness is determined from Figure 44-2B, gives a value of 8.12 in. Based on Figure 44-2C, the thickness adjustment factors are -0.25 in. (fair subgrade), -0.25 in. (stabilized subbase), and -0.25 in. (12 ft lane width). The pre-adjusted rigid pavement thickness is 8.12 in. with adjustments of -0.75 in. for a value of 7.37 in.; this is rounded to the next highest ¼ in. or a final thickness of 7.50 in.

A check of Figure 44-2D, a 12 ft transverse joint spacing is required. Dowels are required because the pavement thickness is greater than 7 in. [Section 44-2.03(d)]. Based on Figure 44-2H, the dowel bar diameter is 1.00 in.

EXAMPLE 1 – RIGID PAVEMENT
DESIGN CALCULATIONS FOR LOCAL PUBLIC AGENCIES

Figure 44-2L

44-2.06(b) Example Calculation 2 (Blue) – Class III RoadProblem:

Design a jointed concrete pavement for the given conditions.

Given: (Section 44-1.08(b))

Class III Road, Two Lane Pavement (Section 44-1.01)

11 ft Lanes with Paved HMA Shoulders

Design Traffic: ADT = 1,800

PV's 90%, SU's 6%, MU's 4% (if unknown see Section 44-1.03(c))

Sangamon County

Design Subgrade Support Rating – Poor

Posted Speed Limit – 40 MPH with No Bus Stops

Solution:

Use Figure 44-2A and determine the TF equation for a two-lane Class III road.

2 or 3 Lane Pavements

$$TF = DP \left[\frac{(0.073PV + 64.790SU + 281.235MU)}{1,000,000} \right]$$

$$TF = 20 \left[\frac{(0.073 \times 1620 + 64.790 \times 108 + 281.235 \times 72)}{1,000,000} \right]$$

$$TF = 0.547$$

Because the pavement is a Class III road with a TF < 5.0, a subbase is optional (see Figure 44-2E). From Figure 44-2E, if a subbase is required or desired the minimum thickness is 4 in. For this example the LPA decided to use a 4 in. granular subbase.

The required pre-adjusted rigid pavement thickness is determined from Figure 44-2B, which gives us a value of 7.4 in. Based on Figure 44-2C, the thickness adjustment factors are +0.35 in. (untied shoulders) and no adjustments for poor subgrade or using a 4 in. granular subbase. The LPA decided to use the higher reliability of 90% providing no additional adjustment. The pre-adjusted rigid pavement thickness of 7.4 in. and adjustments of +0.35 in. for a value of 7.75 in.; which does not need to be rounded to the next highest ¼ in.

A check of Figure 44-2D, a 15 ft transverse joint spacing is not allowed, therefore; a 12 ft transverse joint spacing will be used. Dowels are required because the pavement thickness required is greater than 7 in. [Section 44-2.03(d)]. Based on Figure 44-2H, the dowel bar diameter is 1.00 in.

EXAMPLE 2 – RIGID PAVEMENT
DESIGN CALCULATIONS FOR LOCAL PUBLIC AGENCIES

Figure 44-2L

44-2.06(c) Example Calculation 3 (Green) – Class IV Road

Problem:

Design a jointed concrete pavement for the given conditions.

Given: (Section 44-1.08(c))

Class IV Road, Two Lane Pavement (Section 44-1.01)

11 ft Lanes with Aggregate Shoulders

Design Traffic: ADT = 350

PV's 88%, SU's 7%, MU's 5% (if unknown see Section 44-1.03(c))

City of Marion, Williamson County

Design Subgrade Support Rating – Poor

Posted Speed Limit – 55 MPH with No Bus Stops

Solution:

Determine the HCV which is the SU (24) + MU (18) for a value of 42. With the $HCV \leq 48$, the required pre-adjusted slab thickness is determined from Figure 44-2G, which gives a value of 7.0 in. The minimum rigid pavement thickness is 6.0 in. per Section 44-2.03(a).

Based on Figure 44-2C, the thickness adjustment factors are +0.35 in. (untied shoulders) and the LPA decided to use the lower reliability of 75% providing an adjustment factor of -0.50 in. The pre-adjusted rigid pavement thickness of 7.0 in. and adjustments of -0.15 in. for a value of 6.85 in. This gives a final thickness of 7.00 in.

A check of Figure 44-2D, a 12 ft transverse joint spacing is required. Dowels are not required because it is on a Class IV Road [Section 44-2.03(d)]. If dowel bars were desired the diameter would be 1.00 in. (Figure 44-2H).

**EXAMPLE 3 – RIGID PAVEMENT
DESIGN CALCULATIONS FOR LOCAL PUBLIC AGENCIES**

Figure 44-2L

44-3 CONVENTIONAL FLEXIBLE PAVEMENT DESIGN FOR LOCAL PUBLIC AGENCIES

44-3.01 Introduction

A conventional flexible pavement is a HMA surface in combination with a granular base and, if required, additional subbase layers. Conventional flexible pavements are allowed for traffic factors (TF) up to 0.50.

The design criteria for conventional flexible pavements are HMA fatigue and subgrade stress. A Subgrade modulus (E_{RI}) is used to accommodate subgrade rutting considerations, see Section 44-3.02(e). The conventional flexible design procedure is based on 18-kip ESAL's and 80 psi tire pressure conditions.

44-3.02 Basic Design Elements

44-3.02(a) **Minimum Material Requirements**

HMA binder and surface course are required for conventional flexible pavement design. Use a minimum thickness of 3 in. of HMA.

All HMA lifts must comply with the minimum thicknesses in Section 44-1.05.

Use a minimum thickness of 8 in. of aggregate base course, Type A material. A modified soil layer (8 in. minimum) or subbase granular material, Type B (4 in. minimum) may be used at a 1:1 ratio to satisfy granular layer thickness requirements more than 8 in. For example, a 12 in. base requirement could be satisfied by using 12 in. of aggregate base course, Type A material or 8 in. of aggregate base course, Type A and 4 in. of subbase granular material, Type B.

Class IV pavements with less than 24 HCV's per day may use an aggregate base course, Type B material in place of the aggregate base course, Type A material for the entire base thickness required.

44-3.02(b) **Traffic Factors**

The maximum allowable Traffic Factor (TF) for conventional flexible pavements is 0.50. For Class I, II, and III roads and streets, the design TF for flexible pavements can be determined for various DP's from the 80,000 lb load limit formulas shown in Figure 44-3A. The formulas shown are based on the statewide average distribution of vehicle types and axle loadings, which are directly applicable to most roads and streets.

However, cases will arise in which the average formula should not be used (e.g., a highway where HCV's entering and leaving a site generally travel empty in one direction and fully loaded in the other). These cases should be referred to the CBLRS for special analysis. The LPA must provide the CBLRS with the structural design traffic; the DP; traffic distribution by PV, SU, and MU; and loading condition of HCV traffic.

BUREAU OF LOCAL ROADS & STREETS

For Class IV roads and streets, thicknesses are provided in Section 44-3.03(b) based on the daily volume of HCV's; therefore, a design TF is not necessary.

Class I Roads and Streets	
4 or 5 Lane Pavements (Rural and Urban)	$TF = DP \left[\frac{(0.047PV + 59.625SU + 217.139MU)}{1,000,000} \right]$
6 or More Lane Pavements (Rural)	$TF = DP \left[\frac{(0.029PV + 53.000SU + 193.012MU)}{1,000,000} \right]$
6 or More Lane Pavements (Urban)	$TF = DP \left[\frac{(0.012PV + 49.025SU + 178.536MU)}{1,000,000} \right]$
One-way Streets and Pavements (Rural and Urban)	$TF = DP \left[\frac{(0.073PV + 66.250SU + 241.265MU)}{1,000,000} \right]$
Class II Roads and Streets	
2 or 3 Lane Pavements	$TF = DP \left[\frac{(0.073PV + 56.030SU + 192.720MU)}{1,000,000} \right]$
Class III Roads and Streets	
2 or 3 Lane Pavements	$TF = DP \left[\frac{(0.073PV + 54.570SU + 192.175MU)}{1,000,000} \right]$

TRAFFIC FACTOR EQUATIONS (80,000 LB LOAD LIMIT)

Figure 44-3A

44-3.02(c) Stage Construction

Stage construction is the planned construction of the pavement structure in two or more stages, such as placing the lower lifts in one construction season and the surface in the next construction season. Stage construction will be allowed on conventional flexible pavements with a design TF greater than 0.1 and with the approval of the district. The maximum period that may elapse between the completion of the first stage and the scheduled construction date of the final stage is two years.

If a HMA mixture is not part of the initial stage, place an A-2 or A-3 surface treatment over the aggregate base. The aggregate base thickness will be determined according to Section 44-8.

If HMA (base or surface course) is part of the initial stage, provide a minimum HMA thickness of 3 in. The total HMA thickness resulting from the stages will be the HMA design thickness plus an additional 0.5 in.

Any evidence of fatigue cracking, raveling, or other deterioration prior to the construction of the final stage will necessitate a re-evaluation of the structural design of the pavement.

44-3.02(d) PG Binder Grade Selection

The PG binder grade may affect the performance of a HMA mixture. The conventional flexible pavement design procedure assumes that HMA rutting and thermal cracking are adequately considered in the material selection and mixture design process. Selection of the appropriate binder grade can impact the ability of the mix to resist rutting at higher temperatures and thermal cracking at lower temperatures. Both high and low temperature levels need to be considered when selecting the appropriate binder grade for conventional flexible pavements.

Conventional flexible pavements should use the grades shown in Figure 44-3B. Most conventional flexible pavements should use the grades shown for a standard traffic level. Areas of slow moving or standing traffic (e.g., intersections, bus stops, city streets) warrant the use of stiffer binders to resist rutting. PG binder grade adjustments should be made according to Figure 44-3B. PG binder grade adjustments, where applicable, should be applied to the surface and top binder lift.

The LPA must request a variance from the CBLRS to use a different PG binder than specified in Figure 44-3B.

BUREAU OF LOCAL ROADS & STREETS
PAVEMENT DESIGN

44-3-4

June 2018

PG Binder Grade Selection⁽¹⁾			
Districts 1 – 4	Traffic Loading Rate (Adjustment)		
	Standard ⁽²⁾	Slow ⁽³⁾	Standing ⁽⁴⁾
Surface ⁽⁵⁾	PG 58-28	PG 64-28 or SBS PG 64-28	SBS PG 70-28
Remaining Lifts ⁽⁵⁾	PG 64-22 or PG 58-22	PG 64-22 or PG 58-22	PG 64-22 or PG 58-22
Districts 5 – 9			
Surface ⁽⁵⁾	PG 64-22	PG 70-22 or SBS PG 70-22	SBS PG 76-22
Remaining Lifts ⁽⁵⁾	PG 64-22	PG 64-22	PG 64-22

Notes:

- 1. The binder grades provided in Figure 44-3B are based on the recommendations given in Illinois-Modified AASHTO MP-2, Table 1, "Binder Selection on the Basis of Traffic Speed and Traffic Level."*
- 2. Standard traffic is used where the average traffic speed is greater than 43 mph (70 km/h).*
- 3. Slow traffic is used where the average traffic speed ranges from 12 to 43 mph (20 to 70 km/h).*
- 4. Standing traffic is used where the average traffic speed is less than 12 mph (20 km/h).*
- 5. Surface includes the top 2 in. (50 mm) of HMA. The remaining lifts of HMA may be the same PG binder grade as surface; however, this may increase or decrease the pavement design thickness. If multiple PG Binder grades are used in a HMA design, the predominant PG Binder grade should be used for determining HMA Modulus on Figure 44-3E.*

PG BINDER GRADE SELECTION FOR CONVENTIONAL FLEXIBLE PAVEMENTS

Figure 44-3B

44-3.02(e) Subgrade Inputs

The general physical characteristics of the roadbed soils affect the design thickness and performance of the pavement structure. For full-depth HMA pavements, the thickness of the pavement structure is sufficient to reduce the subgrade vertical compression stresses to an acceptable level. An improved subgrade under a full-depth HMA pavement functions primarily as a working platform. However, in conventional flexible pavement design, the roadbed soil plays a critical role in the load-carrying capacity of the pavement. Therefore, a careful examination of the subgrade soil characteristics is necessary.

For the design of conventional flexible pavements, the critical subgrade modulus (E_{Ri}) is used. The critical E_{Ri} is the expected spring season E_{Ri} value (usually when the water table is highest and after the spring thaw). The critical E_{Ri} can be determined using one of the methods outlined in Section 44-6.

E_{Ri} values less than 2 ksi require subgrade stabilization. Subgrade soils suspected of having modulus values this low require a soils investigation.

The designer should take into consideration the susceptibility of the roadbed soil to excessive volume changes, permanent deformation, excessive deflection and rebound, frost heave, and non-uniform support. The designer should use Section 44-7 to address these types of issues by recommending corrective actions (e.g., undercutting, moisture density control, soil modification) in the design plans and specifications. "Soil Modification" should be used in lieu of the "Lime-Modified Soils" section of the [IDOT Standard Specifications](#) (Section 302). Necessary corrective measures would be in addition to the subbase requirements of the pavement design.

Pavement thickness adjustments are not necessary for sandy/granular subgrade materials, which typically have a modulus greater than 3 ksi. The designer is cautioned against assuming an E_{Ri} value greater than 3 ksi if there are no test results to support the assumption.

44-3.02(f) Base and Subbase

A subbase under a pavement serves two purposes. Initially, it provides a stable construction platform for the base and surface courses. After construction, it can improve the pavement performance by alleviating pumping of fine-grained soils and providing positive drainage for the pavement system.

1. Thickness. Use a minimum thickness of 8 in. of aggregate base course, Type A material. A modified soil layer (8 in. minimum) or subbase granular material, Type B (4 in. minimum) may be used at a 1:1 ratio to satisfy granular layer thickness requirements more than 8 in. For example, a 12 in. base requirement could be satisfied by using 12 in. of aggregate base course, Type A material or 8 in. of aggregate base course, Type A and 4 in. of subbase granular material, Type B.

Class IV pavements with less than 24 HCV's per day may use an aggregate base course, Type B material in place of the aggregate base course, Type A material for the entire base thickness required.

2. Width. Aggregate subbase and base course shall be at least 2 ft wider than the HMA surface course. If curb and gutter is used, this may be reduced to 1 ft.

44-3.02(g) Design Reliability

Design reliability is considered through traffic factor multipliers applied to the design TF. These traffic multipliers are built into the design HMA strain curve in Figure 44-3F. The minimum reliability levels by class of road for $TF \leq 0.5$ are given in Figure 44-3C.

Road Class	Minimum Reliability Level	Reliability (%)
Class I, II, III, and IV	Medium	~ 75%

Note: The estimated percent reliability is based on a representative 9-kip Falling Weight Deflectometer surface deflection coefficient of 25%.

RELIABILITY LEVEL ($TF \leq 0.5$)

Figure 44-3C

44-3.03 Thickness Design – HMA Mixtures

44-3.03(a) Class I, II, and III Roads and Streets

The following applies to facilities using HMA mixtures:

1. Design HMA Mixture Temperature. The HMA mixture temperatures are given in Figure 44-3D based on geographic locations in Illinois. The design mixture temperature should be interpolated to the nearest 0.5°F. The minimum design mixture temperature is 72°F.

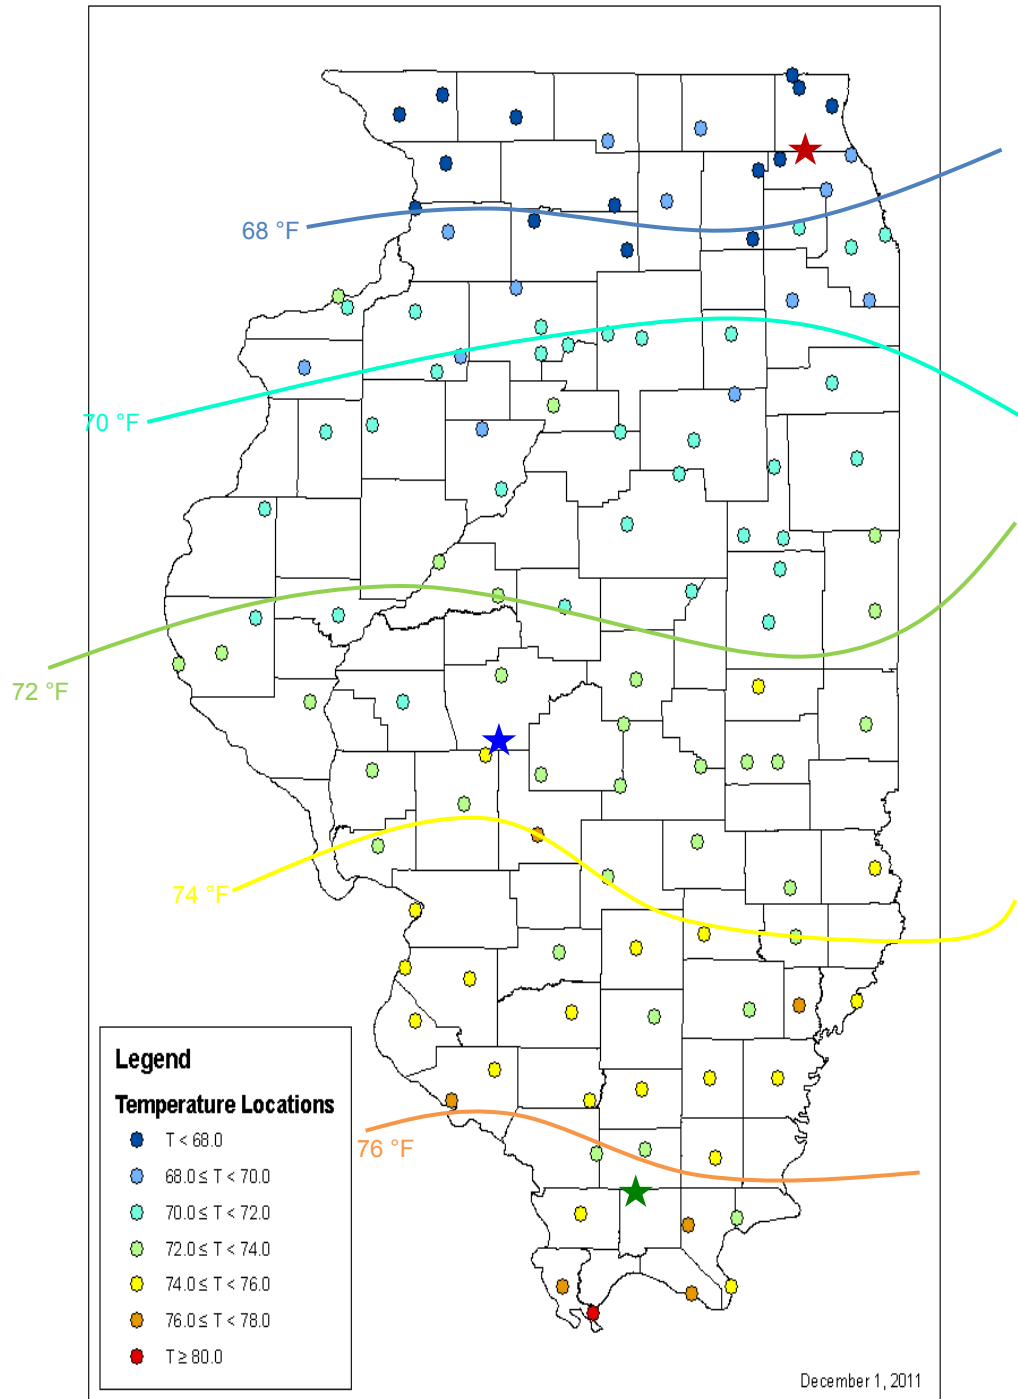

Note: The design HMA mixture temperatures for conventional flexible and full-depth HMA pavements are not the same. For the same location, the conventional flexible HMA design mixture temperature is lower than the full-depth HMA design mixture temperature, because conventional flexible design time dates occur earlier in the spring.

2. Design HMA Modulus (E_{HMA}). The design E_{HMA} is the HMA modulus that corresponds to the design mixture temperature. Determine the design E_{HMA} value from Figure 44-3E for typical Superpave mixtures with PG 58-XX, PG 64-XX, PG 70-XX, or PG 76-XX.
3. Design HMA Strain. The design HMA strain is the tensile strain at the bottom of the HMA pavement layer. Use Figure 44-3F in conjunction with the design TF to determine the design strain.
4. Thickness Requirements. Use Figure 44-3G in conjunction with the design HMA modulus from Step 2 and the design HMA strain from Step 3 to determine the thickness of HMA mixture required. The thicknesses from Figure 44-3G are based on an 8 in. minimum Type A aggregate base thickness and an E_{Ri} of 3 ksi.
5. Subbase Thickness Adjustments. The fine-grained soils that predominate in Illinois commonly have an E_{Ri} greater than 3 ksi. For pavements with an E_{Ri} of 3 ksi or greater, an 8 in. aggregate base course, Type A material is structurally adequate; therefore, no pavement structure thickness adjustment is necessary. For subgrades with an E_{Ri} value equal to or greater than 2 ksi and less than 3 ksi, Figure 44-3H should be used to determine the appropriate structure enhancement category for the pavement. Subgrades with an E_{Ri} less than 2 ksi must follow Section 44-7.

44-3.03(b) Class IV Roads and Streets Thickness Requirements

Figures 44-3I and 44-3J provide the HMA and aggregate base thicknesses for various E_{Ri} values and traffic levels. Pavements with less than 24 HCV's per day may use aggregate base course, Type B material in lieu of aggregate base course, Type A material. Pavements with greater than 48 HCV's use a Class III TF equation and design procedure.

When 4 in. or more of HMA are used, 8 in. of aggregate base course, Type A material is satisfactory for all combinations of soil types and traffic levels for all districts.

CONVENTIONAL FLEXIBLE HMA MIXTURE TEMPERATURE

**BUREAU OF LOCAL ROADS & STREETS
PAVEMENT DESIGN**

44-3-12

June 2018

Original HMA Design Thickness (in.)	Design HMA Modulus, E_{HMA} (ksi)				
	400	500	600	700	800
3.0 – 3.49	E ⁽²⁾	E ⁽²⁾	E ⁽²⁾	E ⁽¹⁾	E ⁽¹⁾
3.5 – 3.99	E ⁽²⁾	E ⁽¹⁾	E ⁽¹⁾	O	O
≥ 4.0	O	O	O	O	O

E: Enhancement of the pavement structure is required.

O: Enhancement of the pavement structure is optional. If no enhancement is desired, an 8 in. aggregate base course, Type A is required.

Notes: If the subgrade E_{Ri} is less than 2 ksi, use Section 44-7 to determine the appropriate subgrade treatment necessary.

A pavement structure consisting of an 8 in. aggregate base course, Type A based on the appropriate category from the above table, can be enhanced by one of the following alternatives:

1. E⁽¹⁾. Use one or more of the following:
 - Increase the HMA thickness by 0.5 in.
 - Increase the aggregate base course, Type A thickness by 2 in.
 - Add a 4 in. minimum granular subbase course, Type B.
 - Add an 8 in. minimum modified soil layer.

2. E⁽²⁾. Use one or more of the following:
 - Increase the HMA thickness by 1.0 in.
 - Increase the aggregate base course, Type A thickness by 4 in.
 - Add a 4 in. minimum granular subbase course, Type B.
 - Add an 8 in. minimum modified soil layer.

Given: (Section 44-1.08(a))

Class I Road, Four Lane Pavement (Urban) (Section 44-1.01)

12 ft Lanes with Concrete Curb and Gutter

Design Traffic: ADT = 14,000

PV's 86%, SU's 8%, MU's 6% (if unknown see Section 44-1.03(c))

Lake County

Design Subgrade Modulus (E_{RI}) – 5.0 ksi

Posted Speed Limit – 30 MPH with Bus Stops

Solution:

From Figure 44-3A, use the TF equation for a four-lane Class I road.

4 or 5 Lane Pavements (Rural and Urban):

$$TF = DP \left[\frac{(0.047PV + 59.625SU + 217.139MU)}{1,000,000} \right]$$

$$TF = 20 \left[\frac{(0.047 \times 12040 + 59.625 \times 1120 + 217.139 \times 840)}{1,000,000} \right]$$

$$TF = 4.99$$

Per Section 44-3.01, conventional flexible pavements are allowed for TF up to 0.50. Since the TF is 4.99 for this example, a conventional flexible pavement is not allowed.

**EXAMPLE 1 – CONVENTIONAL FLEXIBLE PAVEMENT
DESIGN CALCULATIONS FOR LOCAL PUBLIC AGENCIES**

Figure 44-3M

44-3.06(b) Example Calculation 2 (Blue) – Class III Road

Problem:

Design a conventional flexible pavement with a HMA surface for the given conditions.

Given: (Section 44-1.08(b))

Class III Road, Two Lane Pavement (Section 44-1.01)

11 ft Lanes with Paved HMA Shoulders

Design Traffic: ADT = 1,800

PV's 90%, SU's 6%, MU's 4% (if unknown see Section 44-1.03(c))

Sangamon County

Design Subgrade Modulus (E_{RI}) – 2.5 ksi

Posted Speed Limit – 40 MPH with No Bus Stops

Solution:

From Figure 44-3A, use the TF equation for a two-lane Class III road.

2 or 3-Lane Pavements:

$$TF = DP \left[\frac{(0.073PV + 54.570SU + 192.175MU)}{1,000,000} \right]$$

$$TF = 20 \left[\frac{(0.073 \times 1620 + 54.570 \times 108 + 192.175 \times 72)}{1,000,000} \right]$$

$$TF = 0.397$$

Based on a site investigation an E_{RI} value of 2.5 ksi was determined.

With a posted speed limit of 40 mph, the Traffic Loading Rate is "Slow" and from Figure 44-3B, use a PG 70-22 or SBS PG 70-22 for the surface and a PG 64-22 for the remaining lifts.

The conventional flexible HMA mixture temperature from Figure 44-3D is 73°F.

The design HMA modulus (E_{HMA}) from Figure 44-3E would be 755 ksi.

The design HMA strain from Figure 44-3F would be 197 microstrain.

HMA thickness from Figure 44-3G is 5.3 in; therefore, round the HMA thickness up to 5.50 in. Per Figure 44-3H the 4 in. granular subbase is optional, however; Section 44-3.02(a) requires an 8 in. aggregate base course, Type A.

**EXAMPLE 2 – CONVENTIONAL FLEXIBLE PAVEMENT
DESIGN CALCULATIONS FOR LOCAL PUBLIC AGENCIES**

Figure 44-3M

44-3.06(c) Example Calculation 3 (Green) – Class IV Road

Problem:

Design a conventional flexible pavement with a HMA surface assuming an E_{RI} value between 2 and 3 with the following given conditions.

Given: (Section 44-1.08(c))

Class IV Road, Two Lane Pavement (Section 44-1.01)

11 ft Lanes with Aggregate Shoulders

Design Traffic: ADT = 350

PV's 88%, SU's 7%, MU's 5% (if unknown see Section 44-1.03(c))

City of Marion, Williamson County

Design Subgrade Modulus (E_{RI}) – 2.5 ksi

Posted Speed Limit – 55 MPH with No Bus Stops

Solution:

Based on a site investigation an E_{RI} value of 2.5 ksi was determined.

Determine the HCV which is the SU (24) + MU (18) for a value of 42. With the $HCV \leq 48$, Figures 44-3I or 44-3J may be used. With an E_{RI} value between 2 and 3 and the project located in District 9, the designer has the option of:

- 1) Figure 44-3I resulting in a 3.0 in. or 3.25 in. of HMA surface over a 14 in. aggregate base, or
- 2) Figure 44-3J resulting in a 3.5 in. or 3.75 in. of HMA surface over a 12 in. aggregate base.

From Figure 44-3B with a standard traffic loading, use a PG 64-22 for the surface and a PG 64-22 for the remaining lifts.

From Section 44-3.02(a), the minimum HMA thickness is 3 in. Since the HCV is > 24 , an aggregate base course, Type A material must be used.

EXAMPLE 3 – CONVENTIONAL FLEXIBLE PAVEMENT DESIGN CALCULATIONS FOR LOCAL PUBLIC AGENCIES

Figure 44-3M

44-4 FULL-DEPTH HMA PAVEMENT DESIGN FOR LOCAL PUBLIC AGENCIES

44-4.01 Introduction

44-4.01(a) Design of Full-Depth HMA Pavements

Full-depth HMA pavements are those pavement structures whose surface and principal load-carrying component is HMA. This design procedure assumes that HMA rutting and thermal cracking are adequately considered in the material selection and mixture design process. The design procedure controls subgrade rutting by limiting the deviator stress at the HMA-subgrade interface to an acceptable level. The governing design criterion is the HMA tensile strain. Reduced strain corresponds to increased fatigue life.

44-4.01(b) Usage of Procedure

Use the pavement design procedure in this Section for all local road and street projects where a full-depth HMA pavement is desired. If the LPA intends to transfer jurisdiction following pavement construction, both agencies involved in the jurisdictional transfer should agree on the design.

The pertinent charts, tables, equations, limitations, and requirements of the policy are included in this procedure, as well as specific instructions to be followed in applying the method of design to full-depth HMA pavements for LPA projects involving MFT and Federal funds. Do not use this procedure for the design of projects on the State Highway System.

When small quantities of pavement are to be constructed, a soil investigation is not required, unless field conditions warrant. Small quantities are as follows:

- less than one city block in length,
- less than 3000 yd², or
- widening less than one lane-width.

When small quantities are to be constructed adjacent to or in extension of an existing pavement, the designer should:

- design a new section assuming a poor subgrade support rating, and
- provide a minimum thickness of 6.0 in.

44-4.02 Basic Design Elements

44-4.02(a) Minimum Material Requirements

HMA surface and binder courses are allowed. Any combination of surface course or binder course may be used to arrive at the total HMA design thickness. However, all HMA lifts must comply with the minimum thicknesses in Section 44-1.05.

44-4.02(b) Traffic Factors

For Class I, II, and III roads and streets, the design Traffic Factor (TF) for flexible pavements can be determined for various DP's and Classes of roads and streets from the 80,000 lb load limit formulas in Figure 44-4A. The formulas shown are based on the statewide average distribution of vehicle types and axle loadings, which are directly applicable to most roads and streets.

However, cases will arise in which the average formula should not be used (e.g., a highway where HCV's entering and leaving a site generally travel empty in one direction and fully loaded in the other). These cases should be referred to the CBLRS for special analysis. The LPA must provide the CBLRS with the structural design traffic, the DP, traffic distribution by PV, SU, MU, and loading conditions of HCV traffic.

For Class IV roads and streets, thicknesses are determined based on the volume of HCV's per day. A design TF is not necessary, if under 48 HCV's per day. However; if the HCV's per day is greater than 48, use a Class III TF equation and design procedure.

44-4.02(c) Subgrade Support Rating (SSR)

There are three subgrade support ratings (SSR) used in this design procedure — poor, fair, and granular. The designer should use Section 44-6 to determine the SSR. The SSR should represent the average or majority rating classification within the design section.

44-4.02(d) Subgrade Working Platform

Roadbed soils that are susceptible to excessive volume changes, permanent deformation, excessive deflection and rebound, frost heave, and/or non-uniform support can affect pavement performance. An improved subgrade layer provides a working platform and uniform support for pavement layer construction. Without the minimum required improved subgrade layer, it may be difficult to ensure adequate density in HMA. A modified soil layer or granular material may be used to satisfy the improved subgrade layer requirement. In urban areas, use of granular material may be more practical than a modified soil layer due to concerns about dust pollution. Subgrade working platform requirements are outlined in Figure 44-4B.

The improved subgrade layer will not be structurally credited in the design procedure. Its purpose is solely to provide a working platform on which to construct a quality pavement structure. A 12 in. layer is adequate for this purpose in most, but not all, cases. Use of additional improved layer thickness will not reduce the HMA pavement thickness.

BUREAU OF LOCAL ROADS & STREETS
PAVEMENT DESIGN

June 2018

44-4-3

Class I Roads and Streets	
4 or 5 Lane Pavements (Rural and Urban)	$TF = DP \left[\frac{(0.047PV + 59.625SU + 217.139MU)}{1,000,000} \right]$
6 or More Lane Pavements (Rural)	$TF = DP \left[\frac{(0.029PV + 53.000SU + 193.012MU)}{1,000,000} \right]$
6 or More Lane Pavements (Urban)	$TF = DP \left[\frac{(0.012PV + 49.025SU + 178.536MU)}{1,000,000} \right]$
One-way Streets and Pavements (Rural and Urban)	$TF = DP \left[\frac{(0.073PV + 66.250SU + 241.265MU)}{1,000,000} \right]$
Class II Roads and Streets	
2 or 3 Lane Pavements	$TF = DP \left[\frac{(0.073PV + 56.030SU + 192.720MU)}{1,000,000} \right]$
Class III Roads and Streets	
2 or 3 Lane Pavements	$TF = DP \left[\frac{(0.073PV + 54.570SU + 192.175MU)}{1,000,000} \right]$

FLEXIBLE TRAFFIC FACTOR EQUATIONS (80,000 LB LOAD LIMIT)

Figure 44-4A

BUREAU OF LOCAL ROADS & STREETS
PAVEMENT DESIGN

44-4-4

June 2018

Road Class	Improved Working Platform Material	Usage	Minimum Thickness (in.)
Class I and II	Modified Soil Layer or Granular Material	Required ⁽¹⁾	12 ⁽³⁾
Class III and IV	Modified Soil Layer or Granular Material	Optional ⁽²⁾ Optional ⁽²⁾	12 ⁽³⁾

Notes:

1. For Class I and II roads, a 12 in. minimum improved subgrade layer is required, unless the existing subgrade is granular. Where an existing granular subgrade is encountered, the LPA may obtain a waiver to the subgrade working platform requirement from CBLRS by documenting the subgrade suitability.
2. For Class III and IV roads, the 12 in. minimum improved subgrade layer is optional if documentation can be provided to the district that indicates the subgrade will provide suitable support during construction in accordance with Section 44-7. Because an improved subgrade layer should improve the constructability and possibly the performance of the pavement, its use should be considered.
3. In some cases, soft subgrades may require more than 12 in. of improved subgrade to provide a stable working platform and uniform support. The designer should review Section 44-7 in order to determine the required thickness of improved subgrade.

SUBGRADE WORKING PLATFORM REQUIREMENTS

Figure 44-4B

BUREAU OF LOCAL ROADS & STREETS
PAVEMENT DESIGN

June 2018

44-4-5

PG Binder Grade Selection ⁽¹⁾			
Districts 1 – 4	Traffic Loading Rate (Adjustment)		
	Standard Traffic ⁽²⁾	Slow Traffic ⁽³⁾	Standing Traffic ⁽⁴⁾
Surface ⁽⁵⁾	PG 58-28 ⁽⁶⁾⁽⁷⁾	PG 64-28 or SBS PG 64-28	SBS PG 70-28
Remaining Lifts ⁽⁵⁾	PG 64-22 or PG 58-22	PG 64-22 or PG 58-22	PG 64-22 or PG 58-22
Districts 5 – 9			
Surface ⁽⁵⁾	PG 64-22 ⁽⁶⁾⁽⁷⁾	PG 70-22 or SBS PG 70-22	SBS PG 76-22
Remaining Lifts ⁽⁵⁾	PG 64-22	PG 64-22	PG 64-22

Notes:

1. The binder grades provided in this table are based on the recommendations given in Illinois-Modified AASHTO MP-2, Table 1, "Binder Selection on the Basis of Traffic Speed and Traffic Level."
2. Standard traffic is used where the average traffic speed is greater than 43 mph (70 km/h).
3. Slow traffic is used where the average traffic speed ranges from 12 to 43 mph (20 to 70 km/h).
4. Standing traffic is used where the average traffic speed is less than 12 mph (20 km/h).
5. Consideration should be given to increasing the high temperature grade by one grade equivalent when $10 \leq T.F. \leq 30$. For example, if use of a PG 64-22 is specified for standard traffic, a PG 70-22 or a SBS PG 70-22 should be specified.
6. Surface includes the top 2 in. (50 mm) of HMA. The remaining lifts of HMA may be the same PG binder grade as surface; however, this may increase or decrease the pavement design thickness. If multiple PG Binder grades are used in a HMA design, the predominant PG Binder grade should be used for determining HMA Modulus on Figure 44-4H.
7. The high temperature grade should be increased by one grade equivalent when $T.F. > 30$. For example, if use of a PG 64-22 is specified for standard traffic, a PG 70-22 or a SBS PG 70-22 should be specified.

PG BINDER GRADE SELECTION FOR FULL-DEPTH HMA PAVEMENTS

Figure 44-4C

44-4.02(e) PG Binder Selection

The PG binder grade may affect the performance of a HMA mixture. The full-depth HMA pavement design procedure assumes that HMA rutting and thermal cracking are adequately considered in the material selection and mixture design process. Selection of the appropriate binder grade can impact the ability of the mix to resist rutting at higher temperatures and thermal cracking at lower temperatures. Both high and low temperature levels need to be considered when selecting the appropriate binder grade for full-depth HMA pavements.

Full-depth HMA pavements should use the PG binder grades shown in Figure 44-4C. Most full-depth HMA pavements should use the grades shown for a standard traffic level. Adjustments to the standard traffic level are made if conditions of slow moving traffic or standing traffic warrant. Areas of slow moving or standing traffic, such as intersections or bus stops, warrant the use of stiffer binders to resist rutting and shoving. Adjustments, where applicable, should be applied to the surface and top binder lift. This keeps the same PG grade in these two lifts.

Binder grade adjustments may also be warranted based on extremely high ESALs levels. The appropriate grade of binder should be reported on the plans.

Note: The PG binder grade selection tables for full-depth HMA pavements for LPA pavement design differ from the tables used for the state system. A lower level of reliability is used for LPA design than for the state system.

The LPA must request a variance from the CBLRS to use a different PG binder than that specified in Figure 44-4C.

44-4.02(f) Stage Construction

Stage construction is the planned construction of the pavement structure in two or more stages, such as placing the lower lifts in one construction season and the surface in the next construction season. Stage construction is not allowed on full-depth HMA pavements.

44-4.02(g) Design Reliability

Design reliability is considered through traffic factor multipliers applied to the design TF. These traffic multipliers are built into the design HMA strain curves in Figures 44-4F and 44-4G. The minimum reliability levels by class of road are given in Figure 44-4D.

Road Class	Minimum Reliability Level	Reliability (%)
Class I, II, III, and IV	High	90's

DESIGN RELIABILITY

Figure 44-4D

44-4.03 Thickness Design

The following processes are used to determine the design thickness:

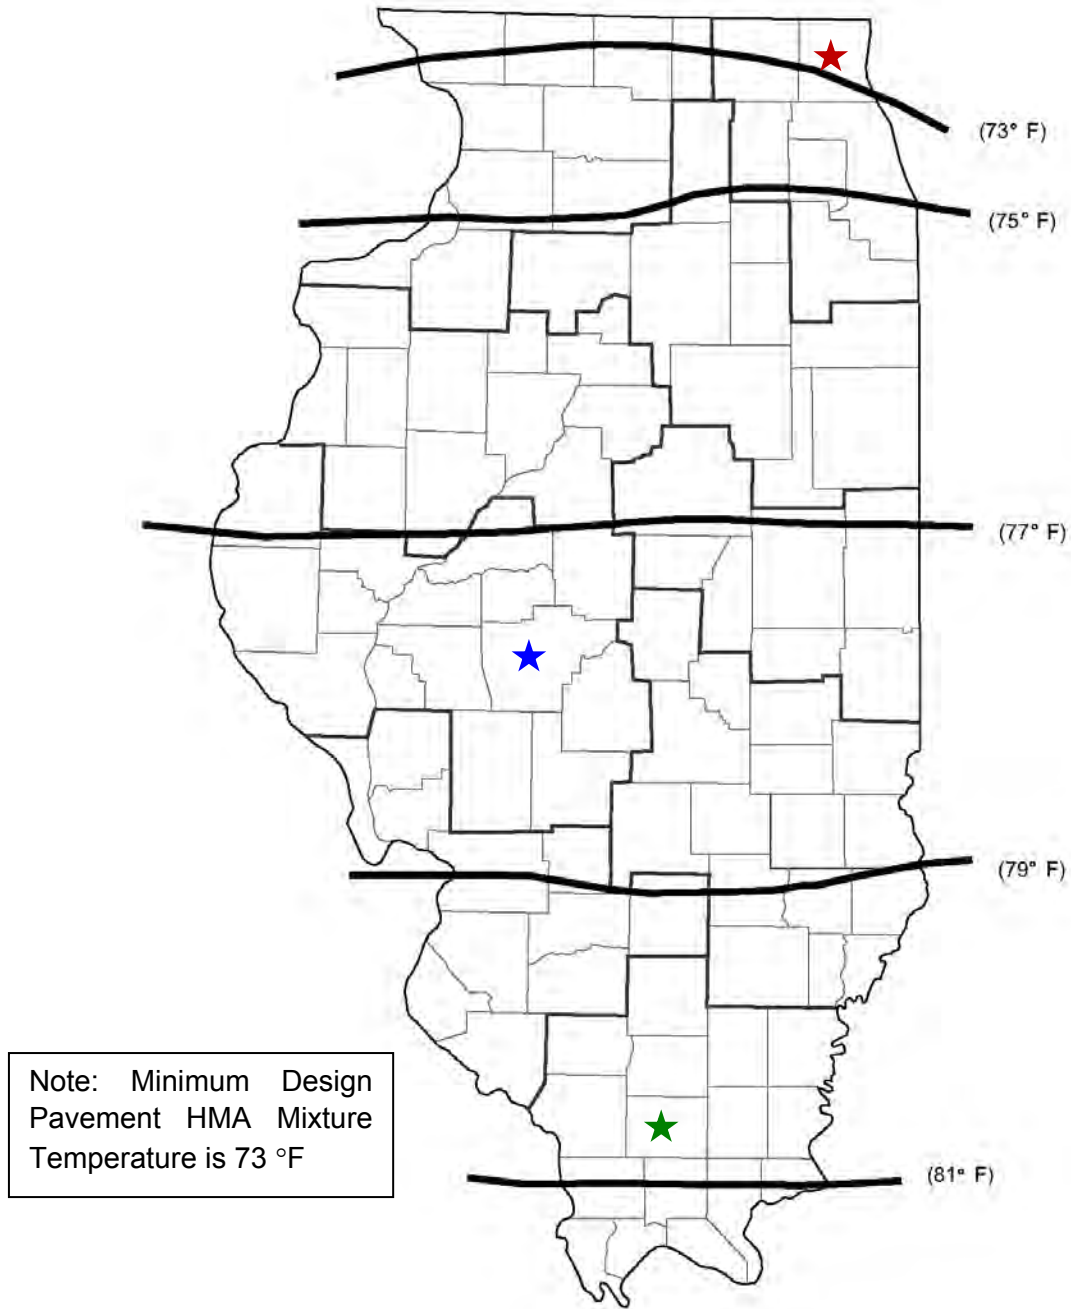

1. Class I, II and III Roads and Streets. The design procedure is as follows:
 - Calculate the TF from the appropriate equation found in Figure 44-4A.
 - Use Figure 44-6A in conjunction with the subgrade soil grain-size analysis to determine the subgrade support rating.
 - Use Figure 44-4C in conjunction with traffic speed and location to determine the PG binder grade.
 - Use Figure 44-4E to determine the HMA pavement mixture temperature. The design mixture temperature should be interpolated to the nearest 0.5°F.
Note: The design HMA mixture temperatures for conventional flexible and full-depth HMA pavements are not the same. For the same location, the conventional flexible HMA design mixture temperature is lower than the full-depth HMA design mixture temperature, because conventional flexible design time dates occur earlier in the spring.
 - Use Figure 44-4F (TF < 0.5) or Figure 44-4G (TF ≥ 0.5) to determine the design HMA strain.
 - Use Figure 44-4H to determine the design pavement HMA modulus (E_{HMA}).
 - Use Figures 44-4I, 44-4J, or 44-4K, depending on the subgrade support rating, to determine the design HMA thickness. Round the final design thickness to the next highest 0.25 in.
 - The minimum full-depth HMA design thickness is 6 in.
 - A 12 in. improved subgrade is required for Class I and II pavements and is optional for Class III pavements. Class III pavement subgrades must satisfy the requirements of Section 44-7 during construction.
2. Class IV Roads and Streets. The following procedure applies:
 - If HCV's per day ≤ 48, use a minimum 5 in. HMA pavement. A 12 in. improved subgrade layer is optional. Class IV pavement subgrades must satisfy the requirements of Section 44-7 during construction.
 - If HCV's per day > 48, use a Class III TF equation and design procedure.

44-4.04 Typical Sections

Figures 44-4L and 44-4M illustrate typical LPA full-depth HMA pavement designs.

HARD COPIES UNCONTROLLED

44-4.06 Example Calculations

44-4.06(a) Example Calculation 1 (Red) – Class I Road

Problem:

Design a full-depth HMA pavement for the given conditions.

Given: (Section 44-1.08(a))

Class I Road, Four Lane Pavement (Urban) (Section 44-1.01)

12 ft Lanes with Concrete Curb and Gutter

Design Traffic: ADT = 14,000

PV's 86%, SU's 8%, MU's 6% (if unknown see Section 44-1.03(c))

Lake County

Design Subgrade Support Rating – Fair

Posted Speed Limit – 30 MPH with Bus Stops

Solution:

From Figure 44-4A use the TF equation for a four-lane Class I road; 4 or 5 Lane Pavement (Rural and Urban):

$$TF = DP \left[\frac{(0.047PV + 59.625SU + 217.139MU)}{1,000,000} \right]$$

$$TF = 20 \left[\frac{(0.047 \times 12,040 + 59.625 \times 1,120 + 217.139 \times 840)}{1,000,000} \right]$$

$$TF = 4.99$$

From Figure 44-4B, a 12 in. improved subgrade is required for all Class I and II full-depth HMA projects unless built upon a granular subgrade.

Since the road includes bus stops a Traffic Load Rate of “Standing Traffic” and from Figure 44-4C, the surface should be SBS PG 70-28 on the surface. The remaining lifts should be PG 64-22 or PG 58-22.

From Figure 44-4E, the design pavement HMA temperature would be 73°F.

Use Figure 44-4G ($TF \geq 0.5$) in conjunction with the design TF of 4.99 to determine that the Design HMA strain is 76 microstrain.

Use Figure 44-4H in conjunction with a design pavement HMA temperature of 73°F to determine that the design HMA modulus is 600 ksi for PG 70-28.

Use Figure 44-4J (subgrade support rating is fair) in conjunction with the HMA strain of 76 microstrain and the design modulus of 600 ksi to determine a design HMA thickness of 11.0 in. This is the thickness after rounding to the next higher 0.25 in.

EXAMPLE 1 – FULL-DEPTH HMA PAVEMENT
DESIGN CALCULATIONS FOR LOCAL PUBLIC AGENCIES

Figure 44-4N

44-4.06(b) Example Calculation 2 (Blue) – Class III Road

Problem:

Design a full-depth HMA pavement for the given conditions.

Given: (Section 44-1.08(b))

Class III Road, Two Lane Pavement (Section 44-1.01)

11 ft Lanes with Paved HMA Shoulders

Design Traffic: ADT = 1,800

PV's 90%, SU's 6%, MU's 4% (if unknown see Section 44-1.03(c))

Sangamon County

Design Subgrade Support Rating – Poor

Posted Speed Limit – 40 MPH with No Bus Stops

Solution:

From Figure 44-4A use the TF equation for a two-lane Class III road:

$$TF = DP \left[\frac{(0.073PV + 54.570SU + 192.175MU)}{1,000,000} \right]$$

$$TF = 20 \left[\frac{(0.073 \times 1,620 + 54.570 \times 108 + 192.175 \times 72)}{1,000,000} \right]$$

$$TF = 0.397$$

From Figure 44-4B, a 12 in. improved subgrade is optional.

From Figure 44-4C, the surface should be PG 70-22 or SBS PG 70-22 on the surface. The remaining lifts should be PG 64-22.

From Figure 44-4E, the design pavement HMA temperature would be 77.5°F.

Use Figure 44-4F (TF < 0.5) in conjunction with the design TF of 0.397 to determine that the Design HMA strain is 197 microstrain.

Use Figure 44-4H in conjunction with a design pavement HMA temperature of 77.5°F to determine that the design HMA modulus is 621 ksi for PG 70-22 or PG 64-22.

Use Figure 44-4I (subgrade support rating is poor) in conjunction with the HMA strain of 197 microstrain and the design modulus of 621 ksi to determine a design HMA thickness of 6.30 in. After rounding to the next higher 0.25 in, the thickness is 6.5 in. Based on the microstrain of 197, a modulus 621, a poor subgrade support, and the ADT close to a Class II road, it is recommended to improve the subgrade with 12 in. of modified soil or granular layer.

EXAMPLE 2 – FULL-DEPTH HMA PAVEMENT
DESIGN CALCULATIONS FOR LOCAL PUBLIC AGENCIES

Figure 44-4N

44-4.06(c) Example Calculation 3 (Green) – Class IV Road

Problem:

Design a full-depth HMA pavement for the given conditions.

Given: (Section 44-1.08(c))

Class IV Road, Two Lane Pavement (Section 44-1.01)

11 ft Lanes with Aggregate Shoulders

Design Traffic: ADT = 350

PV's 88%, SU's 7%, MU's 5% (if unknown see Section 44-1.03(c))

City of Marion, Williamson County

Design Subgrade Support Rating – Poor

Posted Speed Limit – 55 MPH with No Bus Stops

Solution:

Since the HCV's per day is less than 48, use a minimum 5 in. HMA pavement. A 12 in. improved subgrade layer is optional. Class IV pavement subgrades must satisfy the requirements of Section 44-7 during construction. See Section 44-4.03 Item 2.

From Figure 44-4B, a 12 in. improved subgrade is shown as optional. Check the subgrade value with a dynamic cone penetrometer (DCP). If the Immediate Bearing Value (IBV) value is less than 6, an improved subgrade should be provided; see Section 44-7.02.

From Figure 44-4C, the surface should be PG 64-22 on the surface. The remaining lifts should be PG 64-22.

EXAMPLE 3 – FULL-DEPTH HMA PAVEMENT
DESIGN CALCULATIONS FOR LOCAL PUBLIC AGENCIES

Figure 44-4N

44-5 COMPOSITE PAVEMENT DESIGN FOR LOCAL PUBLIC AGENCIES

44-5.01 Introduction

44-5.01(a) Design of Composite Pavements

A composite pavement consists of a HMA surface layer over a Portland cement concrete (PCC) or roller-compacted concrete (RCC) slab. Advantages of placing the HMA layer over the concrete slab include a reduced slab thickness because of the structural contribution of the HMA, and a more uniform surface appearance if pavement patches are used to repair utility cuts, or due to widening or otherwise modifying the existing pavement. The HMA surface layer also reduces the thermal gradients through the concrete slab. These reduced thermal effects also allow for increased spacing between joints in the underlying concrete slab. RCC can only be used for structural designs with $TF \leq 3.0$ without prior approval from CBLRS.

Ultra-thin whitetopping or bonded concrete overlay of asphalt, a thin PCC overlay over an existing HMA surfaced pavement, is not considered a composite pavement, but rather is a special design covered in [Section 46-5](#).

44-5.01(b) Usage of Procedure

The composite pavement design procedure may be used for new construction, reconstruction (removal and replacement using the same alignment), or add lanes.

A pavement design is not required when small quantities of pavement are to be constructed. Small quantities are defined as follows:

- less than one city block in length, or
- less than 3000 yd², or
- widening less than one lane width.

When small quantities are to be constructed adjacent to existing pavements, the designer should:

- duplicate the existing total pavement structure, or
- provide a structurally equivalent pavement, or
- design assuming a “poor” subgrade support rating.

Stage construction is the planned construction of the pavement structure in two or more stages. If stage construction of a composite pavement is planned for separate contracts, the designer should design the concrete slab thickness and joint spacing using the rigid pavement design procedure.

44-5.02 Basic Design Elements**44-5.02(a) Minimum Material Requirements**

The Portland cement concrete must meet the requirements for Class PV concrete, as specified in the [IDOT Standard Specifications](#). All HMA lifts must comply with the minimum thicknesses in Section 44-1.05. Type A granular subbase, according to the requirements of the [IDOT Standard Specifications](#), must be used where granular subbase is specified.

44-5.02(b) Traffic Factors

For composite pavements, two Traffic Factors (TF) are required; one to determine the PCC slab thickness and the other to select the PG Binder. For Class I, II, and III roads and streets, the design TF for the PCC slab portion of the composite pavements is determined from the 80,000 lb load limit formulas shown in Figure 44-5A. Use Figure 44-5E to determine the TF for the HMA portion and to select the PG Binder.

The formulas shown are based on the statewide average distribution of vehicle types and axle loadings, which are directly applicable to most roads and streets. However, cases will arise in which a formula cannot be used, and a special analysis will be necessary (e.g., a highway adjacent to an industrial site with Heavy Commercial Vehicles (HCV's) entering and leaving the site generally traveling empty in one direction and fully loaded in the other). These cases should be referred to the CBLRS for special analysis. It will be necessary for the LPA to provide the CBLRS with the structural design traffic, the design period, and traffic distribution by PV, SU, and MU vehicles.

For Class IV composite pavements, a design TF is not necessary to determine the PCC slab thickness. A pre-adjusted PCC slab thickness of 6.5 in. with 2 in. of HMA should be used for all Class IV composite pavements. However, to select the PG Binder a design TF is required using Figure 44-5E.

44-5.02(c) Transverse Pavement Joints

For composite pavements, 12 to 15 ft transverse joint spacings are available to the designer. Joint spacing of 20 ft and greater can result in intermediate slab cracking and/or premature reflective cracking in the HMA surface layer.

The volume of traffic the pavement will carry determines the type of load transfer device necessary to control faulting at the joints. Mechanical load transfer devices (e.g., dowel bars) are required on pavements that have a PCC slab thickness ≥ 7 in. For PCC slab thickness less than 7 in., the designer has the option of using dowel bars or relying on aggregate interlock for load transfer.

Transverse joints in the concrete slab will result in reflective cracking in the HMA surface. Sawed and sealed joints in the HMA surface should be considered over all transverse concrete joints in order to facilitate future maintenance.

Class I Roads and Streets	
4 or 5 Lane Pavements (Rural and Urban)	$TF = DP \left[\frac{(0.047PV + 64.715SU + 313.389MU)}{1,000,000} \right]$
6 or More Lane Pavements (Rural)	$TF = DP \left[\frac{(0.029PV + 57.524SU + 278.568MU)}{1,000,000} \right]$
6 or More Lane Pavements (Urban)	$TF = DP \left[\frac{(0.012PV + 53.210SU + 257.675MU)}{1,000,000} \right]$
One-way Street Pavements (Rural and Urban)	$TF = DP \left[\frac{(0.073PV + 71.905SU + 348.210MU)}{1,000,000} \right]$
Class II Roads and Streets	
2 or 3 Lane Pavements	$TF = DP \left[\frac{(0.073PV + 67.890SU + 283.605MU)}{1,000,000} \right]$
Class III Roads and Streets	
2 or 3 Lane Pavements	$TF = DP \left[\frac{(0.073PV + 64.790SU + 281.235MU)}{1,000,000} \right]$ TF minimum = 0.5

PCC SLAB TRAFFIC FACTOR EQUATIONS (80,000 LB LOAD LIMIT)

Figure 44-5A

44-5.02(d) Subgrade

Roadbed soils that are susceptible to excessive volume changes, permanent deformation, excessive deflection and rebound, frost heave, and/or non-uniform support can affect pavement performance. For Class I and II roads, the designer is required to follow the guidelines found in Section 44-7. Use of Section 44-7 is optional for all Class III and IV roadways. In situ soils that do not develop an Immediate Bearing Value (IBV) more than 6.0 when compacted at, or wet of, optimum moisture content require corrective action. The designer should recommend corrective actions (e.g., undercutting, moisture density control, modified soil layer) in the design plans and specifications.

Necessary corrective actions as required by Section 44-7 will be in addition to the subbase requirements of the pavement design.

44-5.02(e) Subgrade Support Rating (SSR)

The general physical characteristics of the roadbed soil affect the design thickness and performance of the pavement structure. For pavement design purposes there are three subgrade support ratings (SSR) — poor, fair, and granular. The SSR is determined by using Section 44-6. The SSR should represent the average/majority classification within the design section. The pavement thickness design curves in Figure 44-5B are based on a poor SSR. Adjustments in the design thickness are made for the fair and granular subgrades.

44-5.02(f) Subbase

A subbase under a pavement serves two purposes. Initially, it provides a stable construction platform for the base and surface courses. After construction, it can improve the pavement performance by alleviating pumping of fine-grained soils and providing positive drainage for the pavement system. The usage and thickness requirements are shown in Figure 44-5E.

When placing a composite pavement directly over a flexible pavement with a HMA surface, consult with the CBLRS for design assistance.

PRE-ADJUSTED PCC SLAB THICKNESS

Figure 44-5B

Example 3 – The pre-adjusted slab thickness is 6.5 in. with adjustments of -0.15 in. providing a final thickness of 6.5 in. which exceeds the minimum of 5.5 in. with a 2.0 in. HMA surface for composite pavements.

Adjustment Factor	PCC Slab Thickness Adjustment (in.)
75% Reliability	-0.50
15 ft Joint Spacing	+1.00
Untied Shoulder	+0.35
Fair Subgrade	-0.25
Granular Subgrade	-0.50
Stabilized Subbase	-0.25
Existing Pavement as Subbase	-0.50
10 ft Lane Width	+0.25
12 ft Lane Width	-0.25
Surface HMA Layer Thickness	See Figure 44-5I

THICKNESS ADJUSTMENT FACTOR

Figure 44-5C

Road Class	Subbase Material	Usage ⁽¹⁾	Minimum Thickness (in.)
Class I and II TF ≥ 5.0 TF < 5.0	Stabilized Subbase ⁽²⁾	Required	4
	Granular ⁽³⁾	Required	4
Class III & IV T.F. ≥ 5.0 T.F. < 5.0	Granular ⁽³⁾	Required	4
	Granular ⁽³⁾	Optional / Optional	4

Notes:

1. *Subbase is not required for urban sections having curbs and gutters and storm sewer systems. However, at the designer's option, a 4 in. minimum subbase may be used to serve as a working platform where poor soil conditions exist.*
2. *Stabilized subbase according to the requirements of the [IDOT Standard Specifications](#) or any applicable special provision.*
3. *Use Type A granular subbase according to the requirements of the [IDOT Standard Specifications](#).*

SUBBASE REQUIREMENTS

Figure 44-5D

44-5.02(g) PG Binder Grade Selection

The PG binder grade can affect the performance of a HMA mixture. Rutting or permanent deformation of the HMA surface is a distress common to composite pavements. This design procedure assumes that HMA rutting is considered in the material selection and mixture design process. Because the binder grade can impact the ability of the mix to resist rutting, selection of the appropriate high temperature grade is important. Thermal cracking is not a failure mode for composite pavements, and so the lower temperature grade is not as critical. That is why PG XX-22 binders are specified for composite pavements rather than the PG XX-28 grades appropriate for full-depth HMA pavements, where thermal cracking is of concern.

Composite pavements should use the grades shown in Figures 44-5F and 44-5G. Areas of slow moving or standing traffic (e.g., intersections, bus stops, city streets) warrant the use of stiffer binders to resist rutting. These adjustments should be made according to Figures 44-5F and 44-5G for the corresponding N_{design} number, provided by the district, and/or design ESALs. The appropriate grade of binder should be reported on the plans.

Note that the PG binder grade selection tables for composite pavements for LPA pavement design differ from the tables used for the State system. A lower level of reliability is used for LPA design than for the State system.

The LPA must request a variance from CBLRS to use a different PG binder than specified in Figure 44-5F and Figure 44-5G.

44-5.02(h) Design Reliability

Design reliability is considered through traffic multipliers applied to the design TF. These traffic multipliers are built into the PCC slab thickness design curves in Figure 44-5B, which is for high reliability levels. The minimum reliability levels by road class are shown in 44-5H. The thickness adjustment factor for medium reliability are provided in Figure 44-4C.

Road Class	Minimum Reliability Levels	Percent Reliability
Class I and II	High	90
Class III & IV	Medium	75

44-5.03 PCC Slab Thickness Design

44-5.03(a) Minimum Design Thickness

Once all PCC slab thickness adjustments have been made, the minimum design must have at least 2 in. of HMA over 5.5 in. of PCC or at least 3 in. of HMA over 5.0 in. of PCC.

44-5.03(b) Pre-adjusted PCC Slab Thickness

The composite thickness design procedure is based on determining the thickness of the pre-adjusted PCC slab assuming a poor SSR, 2 in. of HMA surface, 12 ft joint spacing, 11 ft lane width, a 90% Reliability, 4 in. granular subbase, and a tied PCC shoulder. Using the design TF, the PCC slab thickness is determined from the design curves shown in Figure 44-5B. For Class IV pavements, the pre-adjusted PCC slab thickness is 6.5 in. Adjustments to this basic PCC slab thickness can be made for other factors (e.g., subgrade support, subbase type, joint spacing, shoulder type, reliability, and HMA thickness). The final design thickness should be rounded to the next highest 0.25 in.

44-5.03(c) PCC Slab Thickness Adjustments

In determining any adjustments, consider the following:

1. Pavement Support. PCC slab thickness adjustments are based on the subgrade rating and whether the pavement structure will have a stabilized subbase or no subbase. The subgrade support and stabilized subbase adjustments factors are shown in Figure 44-5C.
2. Shoulder Type. With tied PCC shoulders, tied curb and gutter, integral curb and gutter, or widened outer lanes, no adjustments are required. PCC slab adjustments for untied PCC shoulders should be made according to Figure 44-5C. The tied shoulders must use the proper size of reinforcement bars to tie to the pavement, see the [Illinois Highway](#)

Standards to ensure that load transfer is obtained between the pavement and the curb/shoulder. Designers may specify smaller tie bars, but in these cases, additional PCC slab thickness is required.

3. Joint Spacing. Joint spacing of 15 ft instead of 12 ft may be used for composite pavements with the PCC slab thickness adjustment factor given in Figure 44-5C.
4. Lane Width. The standard chart in Figure 44-5B is for an 11 ft lane width. Thickness adjustment can be made for 10 ft and 12 ft lane width as shown in Figure 44-5C.
5. Reliability. Designs for lower reliability can be completed given the criteria in Figure 44-5H and thickness adjustment factor given in Figure 44-5C.
6. HMA Surface Layer Thickness. The pre-adjusted PCC slab thickness is based on a HMA surface layer of 2 in. placed over the PCC slab. If the HMA layer thickness is other than 2 in., adjust the thickness using Figure 44-5I.

HMA Layer Thickness (in.)	PCC Slab Thickness Adjustment (in.)
2	No adjustment
2.5	- 0.25
3	-0.50

ADJUSTMENTS FOR HMA THICKNESS

Figure 44-5I

44-5.03(d) Dowel Bars

The use of doweled joints will be required for pavement thicknesses that are 7 in. and greater on all Class I, Class II, and Class III roads and streets. Doweled joints will not be required for Class IV roads and streets. Dowel bar diameter requirements are given in Figure 44-5J. Normal dowel spacing is 12 in. However, with approval from the CBLRS, the dowels can be placed only in the wheel path area. There is no adjustment in pavement thickness with doweled transverse joints.

PCC Slab Thickness (in.)	Dowel Diameter (in.)
≥ 10.00	1.50
> 8.00 to 9.99	1.25
≤ 8.00	1.00

COMPOSITE PAVEMENT
DESIGN CALCULATIONS FOR LOCAL PUBLIC AGENCIES

Figure 44-5N

HARD COPIES UNCONTROLLED

44-5.06 Example Calculations

44-5.06(a) Example Calculation 1 (Red) – Class I Road

Problem:

Design a composite pavement for the given conditions.

Given: (Section 44-1.08(a))

Class I Road, Four Lane Pavement (Urban) (Section 44-1.01)

12 ft Lanes with Concrete Curb and Gutter

Design Traffic: ADT = 14,000

PV's 86%, SU's 8%, MU's 6% (if unknown see Section 44-1.03(c))

Lake County

Design Subgrade Support Rating – Fair

Posted Speed Limit – 30 MPH with Bus Stops

Solution:

Use Figure 44-5A and determine the TF equation for a four-lane Class I road; 4 or 5 Lane Pavement (Rural and Urban) to determine the PCC slab thickness:

$$TF = 20 \left[\frac{(0.047 \times 12040 + 64.715 \times 1120 + 313.389 \times 840)}{1,000,000} \right]$$

$$TF = 6.73$$

Because the pavement is a Class I road with tied curb and gutter, a subbase is optional (see Figure 44-5D, Note 1).

The pre-adjusted PCC slab thickness is determined from Figure 44-5B, gives a value of 7.36 in. Based on Figure 44-2C, the thickness adjustment factors are -0.25 in. (fair subgrade) and -0.25 in. (12 ft lane width). The pre-adjusted PCC slab thickness is 7.36 in. with adjustments of -0.50 in. for a value of 6.86 in; this is rounded to the next highest ¼ in. or a final thickness of 7.0 in. Alternative designs may be made by varying the HMA surface thickness, see Figure 44-5I. For this example, a 2 in. HMA overlay is used.

Dowels are required because the PCC slab thickness required 7 in. or greater [Section 44-5.02(c)]. Based on Figure 44-5J, the dowel bar diameter is 1.00 in.

Based on Figures 44-5E and 44-5F, a TF = 4.99, and bus stops along this road; an Illinois N₇₀ will result in specifying the binder as a PG 70-22 or SBS PG 70-22.

$$TF = 20 \left[\frac{(0.047 \times 12040 + 59.625 \times 1120 + 217.139 \times 840)}{1,000,000} \right]$$

$$TF = 4.99$$

**EXAMPLE 1 – COMPOSITE PAVEMENT
DESIGN CALCULATIONS FOR LOCAL PUBLIC AGENCIES**

Figure 44-5N

HARD COPIES UNCONTROLLED

44-5.06(b) Example Calculation 2 (Blue) – Class III Road

Problem:

Design a composite pavement for the given conditions.

Given: (Section 44-1.08(b))

Class III Road, Two Lane Pavement (Section 44-1.01)

11 ft Lanes with Paved HMA Shoulders

Design Traffic: ADT = 1,800

PV's 90%, SU's 6%, MU's 4% (if unknown see Section 44-1.03(c))

Sangamon County

Design Subgrade Support Rating – Poor

Posted Speed Limit – 40 MPH with No Bus Stops

Solution:

Use Figure 44-5A and determine the TF equation for a two-lane Class III road:

$$TF = 20 \left[\frac{(0.073 \times 1620 + 64.790 \times 108 + 281.235 \times 72)}{1,000,000} \right]$$

$$TF = 0.547$$

Because the pavement is a Class III road with a TF < 5.0, a subbase is optional (see Figure 44-5D).

The pre-adjusted PCC slab thickness is determined from Figure 44-5B, gives a value of 6.61 in. Based on Figure 44-2C, the thickness adjustment factors are -0.50 (75% reliability) and +0.35 (untied shoulder). The pre-adjusted PCC slab thickness is 6.61 in. with adjustments of -0.15 in. for a value of 6.46 in; this is rounded to the next highest ¼ in. or a final thickness of 6.50 in. Alternative designs may be made by varying the HMA surface thickness, see Figure 44-5I. For this example, a 3 in. HMA overlay is used, reducing the PCC slab thickness an additional 0.5 in. to a final thickness of 6.0 in.

Dowels are not required because the PCC slab thickness required is less than 7 in [Section 44-5.02(d)].

Based on Figures 44-5E and 44-5G, a TF = 0.397, and a posted speed limit of 40 mph; an Illinois N₅₀ will result in specifying the binder as a PG 64-22.

$$TF = 20 \left[\frac{(0.073 \times 1620 + 54.570 \times 108 + 192.175 \times 72)}{1,000,000} \right]$$

$$TF = 0.397$$

EXAMPLE 2 – COMPOSITE PAVEMENT
DESIGN CALCULATIONS FOR LOCAL PUBLIC AGENCIES

Figure 44-5N

HARD COPIES UNCONTROLLED

44-5.06(c) Example Calculation 3 (Green) – Class IV Road

Problem:

Design a composite pavement for the given conditions.

Given: (Section 44-1.08(c))

Class IV Road, Two Lane Pavement (Section 44-1.01)

11 ft Lanes with Aggregate Shoulders

Design Traffic: ADT = 350

PV's 88%, SU's 7%, MU's 5% (if unknown see Section 44-1.03(c))

City of Marion, Williamson County

Design Subgrade Support Rating – Poor

Posted Speed Limit – 55 MPH with No Bus Stops

Solution:

Check the subgrade value with a dynamic cone penetrometer (DCP). If the Immediate Bearing Value (IBV) value is less than 6 an improved subgrade should be provided, see Section 44-7.02. A 4 in. granular subbase is recommended because of a poor subgrade support rating.

Per Section 44-5.02(b), Class IV composite pavements, a design TF is not necessary to determine the PCC slab thickness. A pre-adjusted PCC slab thickness of 6.5 in. should be used for all Class IV composite pavements.

Based on Figure 44-5C, the thickness adjustment factors are -0.50 in. (75% reliability) and +0.35 in. (untied shoulders). The pre-adjusted PCC slab thickness is 6.5 in. with adjustments of -0.15 in. for a value of 6.35 in; providing a final PCC slab thickness of 6.5 in. Alternative designs may be made by varying the HMA surface thickness, see Figure 44-5I. For this example, a 2 in. HMA overlay is used.

Dowels are not required because the PCC slab thickness is less than 7 in. [Section 44-5.03(d)].

Based on Figures 44-5E and 44-5G, a TF = 0.096, and a posted speed limit of 55 mph; an Illinois N₃₀ will result in specifying the binder as a PG 58-22.

$$TF = 20 \left[\frac{(0.073 \times 308 + 54.570 \times 24 + 192.175 \times 18)}{1,000,000} \right]$$

$$TF = 0.096$$

DESIGN CALCULATIONS FOR LOCAL PUBLIC AGENCIES**

Figure 44-5N

HARD COPIES UNCONTROLLED

44-6 SUBGRADE INPUTS FOR LOCAL ROAD PAVEMENT DESIGN

44-6.01 Introduction

The variability of in situ subgrade strengths can be quite large. Subgrade strength can vary with depth, distance along the roadway, or location across the pavement width. Knowledge of the soil present on the section of roadway being designed is essential to produce a satisfactory design. Flexible and rigid pavement designs require different subgrade design inputs.

44-6.01(a) Full-Depth Asphalt Concrete, Rigid, and Composite Pavements

A Subgrade Support Rating is used as the design subgrade input for full-depth HMA, Rigid, and composite pavement designs. The SSR is based on a grain size analysis of the subgrade soil. Figure 44-6A is a graphical method to determine the SSR (poor, fair, or granular) based on the percentage of clay, silt, and sand in the subgrade soil.

44-6.01(b) Conventional Flexible Pavement Design

The procedures discussed in this Section do not apply to full-depth HMA pavements.

The majority of soils found in Illinois are fine-grained soils. The subgrade resilient modulus (E_{Ri}) is used as the design subgrade input for all flexible pavement designs except full-depth HMA. The E_{Ri} is an indicator of a soil's resilient behavior under loadings. Springtime E_{Ri} , which reflects high-moisture content and a thaw-weakened condition, is used for design purposes. Design E_{Ri} values can be obtained through field testing or laboratory testing, or estimated from soil property or strength data. The County Soil Report, prepared by the U.S. Department of Agriculture (USDA) Natural Resource Conservation Service, can be an excellent source of information. The County Soil Report includes a soil report map and listings of engineering index properties and physical and chemical properties of the soils. The data are listed by soil series, which have similar profile features and characteristics wherever they are located.

1. Preliminary E_{Ri} Determination. Listed below are three methods and five procedures to determine preliminary E_{Ri} values, which are later adjusted for moisture. The methods vary in complexity from requiring field or laboratory tests to using county soil maps. The most accurate methods appear first in the listing. The results are acceptable in all cases, but are more accurate and reliable for the method involving field or laboratory tests. The five procedures are described below:
 - a. Method A. Requires obtaining soil samples to be tested in a laboratory.
 - i. Resilient Modulus Testing. The E_{Ri} of a soil may be determined by performing repeated unconfined compression testing in the laboratory. Subgrade specimens from in situ soil or laboratory-prepared specimens may be tested. Laboratory prepared specimens with a range of moisture contents and densities can be tested to simulate the variable conditions found in the field. The CBLRS may be contacted for additional information regarding a resilient modulus testing format.

Particle Size Limits

Sand	2.000 - 0.075 mm
Silt	0.075 - 0.002 mm
Clay	<0.002 mm

SUBGRADE SUPPORT RATING

Figure 44-6A

- b. Method B. Requires field testing of soils in situ.
- i. Falling Weight Deflectometer (FWD) Testing. Design E_{Ri} values can be back calculated from FWD data taken from existing pavements. County soil maps can be used to identify the major soil series found in an area. A FWD testing scheme that targets existing typical flexible pavements constructed in the major soil series of the area can be developed using this information. A county-wide FWD testing program that provides comprehensive coverage can be completed in 3 to 5 days in most cases. Springtime FWD testing is preferred, but a seasonal adjustment factor may be applied to the back calculated E_{Ri} if the FWD testing is conducted during other seasons. Contact the CBLRS if a seasonal adjustment factor is required. The average E_{Ri} back calculated from FWD testing should be used as the design E_{Ri} .

Design E_{Ri} values may be obtained from FWD testing in a cost-effective manner. Back calculated E_{Ri} values do not represent a single point location, but reflect the composite influence of a large volume of in situ soil, including the different soil horizons.

- ii. Estimating E_{Ri} from Strength Data. An E_{Ri} value can be estimated from strength data obtained with a Corps of Engineers hand-held cone penetrometer, or a dynamic cone penetrometer (DCP). Both the Corps of Engineers hand-held cone penetrometer and the DCP are field-testing devices used to rapidly evaluate the in situ strength of fine-grained and granular soils and granular base and subbase materials. The Corps of Engineers hand-held cone penetrometer is limited to an 18 in. depth of penetration and a maximum load of 150 lbs (IBV = 7.5). Data obtained from Corps of Engineers hand-held cone penetrometer and DCP testing can be used to estimate the IBV and E_{Ri} through the following equations:

$$IBV = \frac{CI}{40} \quad \text{Equation 44-6.1}$$

Where: IBV = Immediate Bearing Value
CI = Corps of Engineers Cone Index, psi

$$\text{LOG IBV} = 0.84 - 1.26 \text{ LOG (PR)} \quad \text{Equation 44-6.2}$$

Where: IBV = Immediate Bearing Value
PR = DCP penetration rate, in/blow

$$Q_u = 4.5 \text{ IBV} \quad \text{Equation 44-6.3}$$

Where: Q_u = Unconfined compressive strength, psi
IBV = Immediate Bearing Value

$$E_{Ri}^* = 0.86 + 0.307 Q_u \quad \text{Equation 44-6.4}$$

Where: E_{Ri}^* = Subgrade resilient modulus, ksi
 Q_u = Unconfined compressive strength, psi
 *Moisture adjustment is necessary.

An E_{Ri} can be established with Corps of Engineers cone penetrometer or DCP testing at the project site or on existing flexible pavement sections constructed on the same soil series as the roadway being designed. Ideally, this testing should be conducted during the spring. If testing is not conducted during the spring, the E_{Ri} value calculated from Equation 44-6.4 will need to be corrected as discussed in Section 44-6.01(b).

- iii. Estimating E_{Ri} from Soil Properties. Design E_{Ri} values can be estimated based on a soil's clay content (< 2 micron) and plasticity index (PI). These values are easily obtainable from an analysis of the project's soils or the County Soil Report. Equation 44-6.5 may be used to predict E_{Ri} at optimum water content and 95% AASHTO T-99 maximum dry density:

$$E_{Ri}(\text{OPT})^* = 4.46 + 0.098 (\% \text{ Clay}) + 0.119 (\text{PI}) \quad \text{Equation 44-6.5}$$

Where: $E_{Ri}(\text{OPT})^*$ = E_{Ri} at optimum moisture content and 95% of AASHTO T-99 maximum dry density, ksi
 % Clay = Clay content (<2 microns), %
 PI = Plastic Index

* Moisture adjustment is necessary.

Figure 44-6B is a graphical solution to Equation 44-6.5. If the County Soil Report is used to estimate the soil's clay content and PI, the designer should use the midpoint of clay content and PI values given.

- c. Method C. Requires the use of typical values based on AASHTO Soil Classification or USDA Textural Classification.

- i. Typical E_{Ri} Values. If data is not available to estimate E_{Ri} values using the previously discussed methods, Figures 44-6C or 44-6D may be used to estimate typical E_{Ri} values. If the water table and frost penetration levels are known, Figure 44-6C may be used to determine typical E_{Ri} values based on the AASHTO soil classification system.

If the frost penetration and water table levels are not known, the designer may use Figure 44-6D to estimate a typical E_{Ri} value. These E_{Ri} values were developed from resilient modulus testing of fine-grained Illinois soils, represent 95% of AASHTO T-99 maximum dry density and moisture contents 2% wet of optimum.

AVERAGE E_{RI} VALUES FOR VARIOUS SOIL CLASSIFICATIONS

Figure 44-6D

2. Moisture Adjustment Procedure. The preliminary E_{RI} determined by one of the above procedures (except for the resilient modulus laboratory or FWD methods) should be corrected to reflect the in situ moisture present under springtime conditions, if the test data reflects conditions other than those of a normal spring. The following procedure will apply:
 - a. Known MDD and OMC. If the AASHTO T-99 maximum dry density (MDD), the optimum moisture content (OMC), and the specific gravity of soil solids (G_s) are known, Equation 44-6.6 can be used to calculate the moisture content for a given degree of saturation and 95% compaction.

$$MC_{\%SR} = \left[\frac{65.7}{MDD} - \frac{1}{G_s} \right] SR \quad \text{Equation 44-6.6}$$

Where: $MC_{\%SR}$ = Moisture content for a given degree of saturation, %
 MDD = AASHTO T-99 maximum dry density, pcf
 G_s = Specific gravity of soil solids
 SR = Degree of Saturation, % *

* For very poorly, poorly, and imperfectly drained soils, the E_{Ri} estimate should be adjusted to a 100% SR. All other drainage classes should be adjusted to a 90% SR. The drainage classification for a soil series can be found in the County Soil Report.

- b. Unknown MDD and OMC. If the MDD and OMC have not been determined, they can be estimated using Equations 44-6.7 and 44-6.8 and then used to solve Equation 44-6.6.

$$OMC = 1.86 + 0.499 (LL) - 0.354 (PI) + 0.044 (P_{200}) \quad \text{Equation 44-6.7}$$

$$MDD = 138.96 - 1.10 (LL) + 0.796 (PI) - 0.062(P_{200}) \quad \text{Equation 44-6.8}$$

Where: OMC = Optimum moisture content, %
 LL = Liquid limit, %*
 PI = Plasticity index *
 P_{200} = Percent passing #200 sieve *

* These inputs can be obtained from laboratory testing or selected from the midpoint of the range of values presented for the given soil series in the County Soil Report.

- c. Adjustment. Once the moisture content for the required degree of saturation is calculated, the field moisture adjustment and design E_{Ri} can be calculated.

$$FMA = MC_{\%SR} - OMC \quad \text{Equation 44-6.9}$$

Where: FMA = Field moisture adjustment, %
 $MC_{\%SR}$ = Moisture content for a given degree of saturation, %
 OMC = Optimum moisture content, %

$$\text{Design } E_{Ri} = E_{Ri} (\text{OPT}) - ((FMA)(MAF)) \quad \text{Equation 44-6.10}$$

Where: Design E_{Ri} = E_{Ri} for flexible pavement design, corrected for in situ moisture conditions, ksi
 $E_{Ri} (\text{OPT})$ = E_{Ri} at OMC and 95% of MDD, ksi
 FMA = Field moisture adjustment, %
 MAF = Moisture adjustment factor, E_{Ri} decrease per 1% moisture increase, ksi/% *

* MAF is selected from Figure 44-6E based on USDA soil textural classification.

**E_{Ri} MOISTURE ADJUSTMENT FACTORS BASED ON
USDA TEXTURAL CLASSIFICATION**

Figure 44-6E

- d. Minimum Design E_{Ri} Values. A design E_{Ri} of 2 ksi is the lowest allowable design E_{Ri} . If the design E_{Ri} value calculated from Equation 44-6.10 is less than 2 ksi or does not reasonably compare with historical data for the soil series, other means for determining design E_{Ri} should be investigated. Soft subgrades with low E_{Ri} or IBV values may require remedial subgrade treatments as outlined in Section 44-7. Engineering judgment may also be required to decrease the design E_{Ri} to account for the effect of freeze-thaw cycles on the in situ springtime design condition.
3. Composite E_{Ri} Estimate. A soil profile (vertical sections) contains distinct soil layers, called horizons. The County Soil Report contains thicknesses and properties for each horizon in the soil series. In a typical flexible pavement, approximately 70% to 75% of the subgrade deflection occurs in the upper 60 in. of the subgrade. For this reason, a composite E_{Ri} which considers the contributing effect of the E_{Ri} values of the different soil horizons in the 60 in. zone should be calculated using Equation 44-6.11.

E_{Ri} values determined from FWD testing reflect the composite E_{Ri} value of the subgrade; therefore, no further adjustment for composite influences should be made.

$$\text{Design Composite } E_{Ri} \text{ (ksi)} = \sum_{i=1}^n (F_i)(T_i)(E_i) \quad \text{Equation 44-6.11}$$

- Where:
- i = Layer designator; i = 1 for the top layer
 - n = Number of layers
 - F_i = Deflection coefficient, see Figure 44-6F
 - T_i = Thickness of soil horizon in 60 in. depth zone, in.
 - E_i = E_{Ri} for the soil horizon, adjusted for springtime conditions, ksi

The design composite E_{Ri} value should be used as the design subgrade input in all pavement design procedures requiring the E_{Ri} input value.

Depth Zone* (in.)	F_i
1-12	0.038
12-24	0.015
24-36	0.008
36-60	0.011

*Depth measured from surface of subgrade.

DEFLECTION COEFFICIENTS AS A FUNCTION OF DEPTH

Figure 44-6F

44-6.02 Subgrade Design Input Examples

44-6.02(a) Grain Size Analysis

A grain size analysis shows that the subgrade soil contains 43% clay, 48% silt, and 9% sand. From Figure 44-6A, the Subgrade Support Rating is FAIR. An SSR value is necessary for rigid, full-depth HMA, and composite pavement design procedures.

44-6.02(b) Resilient Modulus (E_{Ri}) from Laboratory Testing

Repeated compression testing in the laboratory is performed on subgrade specimens from in situ soil sampled during the spring or on laboratory-prepared specimens. The results should be adjusted to reflect the composite influence of the soil layers. If the soil samples were not taken during the spring, moisture adjustment factors would need to be applied prior to correcting for the composite influence of the soil layers.

44-6.02(c) Estimating E_{Ri} from Strength Data

A DCP was used to evaluate the in situ strength of a subgrade soil. Average DCP penetration rates for the soil are given in Figure 44-6G. IBV, Q_u , and E_{Ri} were calculated using Equations 44-6.2, 44-6.3, and 44-6.4, respectively.

Depth (in.)	No. of Blows in the Field	DCP Penetration Rate (in/blow)	IBV	Q_u (psi)	E_{Ri} (ksi)
0 – 16	8 – 9	1.9	3.1	13.9	5.1
16 – 51	29	1.2	5.5	24.7	8.4
51 – 60	5 – 6	1.6	3.8	17.2	6.1

**FIELD DATA EXAMPLE FOR
ESTIMATING FROM STRENGTH DATA**

Figure 44-6G

Corrections for springtime conditions (if DCP testing was done other than in springtime) and the composite influence of the soil layers should be made as shown in the Estimating E_{RI} from Soil Properties in Section 44-6.02(d).

The following are example calculations for estimating subgrade strength from DCP test results. The following calculations pertain to a depth of 16 in. to 51 in., requiring a total of 29 blows in Figure 44-6G.

Equation 44-6.2 for IBV

$$\begin{aligned} \text{LOG IBV} &= 0.84 - 1.26 \times \text{LOG (penetration rate)} \\ &= 0.84 - 1.26 \times \text{LOG (1.2)} \\ &= 0.84 - 1.26 \times 0.079181 \\ &= 0.84 - 0.0998 \\ \text{LOG IBV} &= 0.74023 \end{aligned}$$

$$\text{IBV} = 10^{0.74023} = 5.5$$

Equation 44-6.3 for Unconfined Compressive Strength

$$\begin{aligned} Q_u &= 4.5 \times \text{IBV} && \text{for IBV} = 5.5 \\ &= 4.5 \times 5.5 \end{aligned}$$

$$Q_u = 24.7 \text{ psi}$$

Equation 44-6.4 for Subgrade Resilient Modulus

$$\begin{aligned} E_{RI} &= 0.86 + 0.307 \times Q_u && \text{for } Q_u = 24.7 \text{ psi} \\ &= 0.86 + 0.307 \times 24.7 \end{aligned}$$

$$E_{RI} = 8.4 \text{ ksi}$$

44-6.02(d) Estimating E_{RI} from Soil Properties

The roadway being designed passes through the MIAMI soil series. From the County Soil Report, the information shown in Figure 44-6H is obtained.

BUREAU OF LOCAL ROADS & STREETS

June 2018

PAVEMENT DESIGN

44-6-11

Soil Series	USDA Textural Class	Depth from Top of Subgrade (in.)	Clay (%)	PI	Liquid Limit	Percent Passing #200 Sieve
MIAMI*	Clay Loam, Silty Clay Loam	0 – 16	25 – 35	17 – 31	35 – 50	64 – 95
	Loam, Clay Loam, Sandy Loam	16 – 60	15 – 28	2 – 20	20 – 40	50 – 64

* Assumes that A horizon material has been stripped; remaining material is representative of B and C horizons.

ESTIMATING FROM SOIL PROPERTIES

Figure 44-6H

From Equation 44-6.5, E_{Ri} (OPT) is calculated for each of the two depths using the midpoint values from the County Soil Report:

0 in. - 16 in.: E_{Ri} (OPT) = 4.46 + 0.098 (30) + 0.119 (24)
 E_{Ri} (OPT) = 10.2 ksi

16 in. - 60 in.: E_{Ri} (OPT) = 4.46 + 0.098 (22) + 0.119 (11)
 E_{Ri} (OPT) = 7.9 ksi

These values must be corrected to reflect the springtime design condition. Figure 44-6I summarizes the moisture adjustment procedure.

The design E_{Ri} values adjusted to reflect springtime design conditions in Figure 44-6I must be combined into a composite E_{Ri} that considers the effect of the 60 in. zone under the load. This can be accomplished using Equation 44-6.11 and Figure 44-6F.

Design Composite

$$E_{Ri} = (0.038)(12)(7.6) + (0.015)(4)(7.6) + (0.015)(8)(2.0) + (0.008)(12)(2.0) + (0.011)(24)(2.0)$$

$$E_{Ri} = 4.9 \text{ ksi}$$

44-7 SUBGRADE STABILITY REQUIREMENTS FOR LOCAL ROADS

44-7.01 Introduction

This is a condensation of IDOT's [Subgrade Stability Manual](#) and has been prepared to give the designer guidance on identifying and treating unsuitable subgrade material. The designer is required to use it for all Class I and II roadways. Its use is optional for all Class III and IV roadways.

Subgrade stability plays a critical role in the construction and performance of a pavement. A pavement's performance is directly related to the physical properties of the roadbed soils as well as the materials used in the pavement structure. Subgrade stability is a function of a soil's strength and its behavior under repeated loading. Both properties significantly influence pavement construction operations and the long-term performance of the subgrade. The subgrade should be sufficiently stable to:

- prevent excessive rutting and shoving during construction,
- provide good support for placement and compaction of pavement layers,
- limit pavement resilient (rebound) deflections to acceptable limits, and
- restrict the development of excessive permanent deformation accumulation (rutting) in the subgrade during the service life of the pavement.

While the effect of less satisfactory soils can be reduced by increasing the thickness of the pavement structure, it may be necessary to take other steps to ensure adequate support for the operation of construction equipment and placement and compaction of the pavement layers.

44-7.02 Subgrade Stability Procedures

Many typical fine-grained Illinois soils do not develop an Immediate Bearing Value (IBV) more than 6.0 when compacted at, or wet of, optimum moisture content. Therefore, the designer must use one of the remedial procedures listed below when the in situ soil does not develop an IBV more than 6.0:

- undercut and backfill,
- modify soil layer, or
- moisture-density control.

Moisture-density control is the least permanent remedial procedure.

For pavement design purposes, use the in situ IBV prior to the remedial subgrade treatment.

In situ IBV may be determined by use of a Corps of Engineers hand-held cone penetrometer, or a dynamic cone penetrometer (DCP). Correlations relating Corps of Engineers cone penetrometer and DCP test results to IBV values are summarized in Figure 44-7A. CBLRS can be contacted for additional help in determining a field IBV value.

BUREAU OF LOCAL ROADS & STREETS
PAVEMENT DESIGN

44-7-2

June 2018

Static Cone Penetrometer	Dynamic Cone Penetrometer	Equivalent IBV
Corps of Engineers Cone Index (psi) ⁽¹⁾	DCP Penetration Rate (in./blow) ⁽²⁾	
40	4.6	1
80	2.7	2
120	1.9	3
160	1.5	4
200	1.3	5
240	1.1	6
280	1.0	7
320	0.9	8
360	0.8	9

Notes:

- $IBV = \frac{\text{Cone Index}}{40}, \text{ psi}$
- $LOG IBV = 0.84 - 1.26 LOG (\text{Penetration Rate, in. / blow})$

SUBGRADE STRENGTH RELATIONSHIPS

Figure 44-7A

44-7.02(a) Undercut and Backfill

Undercut and backfill involves removing the soft subgrade to a predetermined depth below the grade line and replacing it with granular material. This option is appropriate for localized area base repairs as well as for new construction. The granular material helps distribute the load over the unstable subgrade and serves as a working platform for construction equipment. The required removal and backfill depth can be determined from Figure 44-7B. The use of granular material with good shear strength is recommended. Factors that increase shear strength of a granular material are:

- using crushed materials;
- increasing top size;
- using well-graded materials, as opposed to one-size gradations;
- reducing PI of fines; and
- lowering fine content.

A geosynthetic may be used between the subgrade and the granular material to keep the subgrade layer separate from the granular layer, thereby, reducing the required granular thickness. CBLRS should be contacted for assistance in designing the appropriate granular thickness when geosynthetics are used.

IBV-BASED THICKNESS DESIGN FOR UNDERCUT AND BACKFILL AND MODIFIED SOIL LAYER REMEDIAL PROCEDURES

Figure 44-7B

44-7.02(b) Soil Modification

Unstable subgrades may be modified ([IDOT Standard Specifications](#) “Soil Modification” section) to improve subgrade stability for new construction or large reconstruction projects. The thickness requirements shown in Figure 44-7B for granular backfill may also be used to determine the thickness of the modified soil layer.

If the soil is to be modified with lime, it is necessary to perform laboratory tests according to the department’s “Laboratory Evaluation/Design Procedure for Lime Stabilized Soil Mixtures” to determine if the soil is reactive and to determine the percentage of lime necessary for the soil to develop a minimum IBV of 10.0. The design commonly requires 0.5% percent more lime than the laboratory tests indicate to account for variables in the field.

If the IBV of the modified soil layer is less than 10.0, the engineer has the option of allowing the modified soil layer to field cure to obtain an IBV of 10.0, per the department's "Laboratory Evaluation/Design Procedure for Soil Modification". If an IBV of 10.0 is not attainable with a field cure, or if the engineer decides not to wait for a field cure, addition of a granular layer will be required. Undercutting may be necessary prior to placing the granular layer in cases of grade restrictions. The thickness of the granular layer and the modified soil layer can be combined to meet the required thickness shown in Figure 44-7B. The minimum granular layer thickness should be 4 in. The minimum modified soil layer should be 10 in. Thickness adjustments may be modified to fit field conditions.

The modified soil layer should be covered with the subsequent pavement layer within the same construction season.

44-7.02(c) Moisture-Density Control

A soil wet of its optimum moisture content may not provide adequate subgrade stability when compacted to 95% of the standard laboratory density, as required by current IDOT specifications. Moisture controls as well as density controls may be required to ensure the proper compaction necessary to obtain a stable subgrade. Quantitative values of permissible compaction moisture content can be added to the compaction specifications to accomplish this. Laboratory testing, according to AASHTO T99, is required to determine appropriate compaction densities and moisture contents.

Draining the grade and drying the top portion of the subgrade by disking or tilling may control excess moisture at the time of construction, but it may be difficult to maintain that moisture condition throughout the pavement's life.

44-7.03 Treatment Guidelines

The designer should use the following guidelines to determine which of the three remedial treatments is appropriate:

Specific details for each subgrade stability alternative should be determined. The required depth of undercut and backfill; the modifier percentage and layer thickness required; and the moisture and density levels required to achieve the needed stability levels should be determined.

The alternative procedures should be compared by considering construction variability, economics, permanence of treatment, and pavement performance benefits.

The best option should be selected.

More detailed information regarding subgrade stability requirements for LPA pavement design is detailed in IDOT's [Subgrade Stability Manual](#).

44-7.04 Subgrade Stability Example

Example 44-7.1

Problem:

Determine the subgrade treatment alternatives for a soil having an in situ IBV of 4.

Solution:

Requirements. Based on Figure 44-7B and an IBV of 4, remedial procedures are required.

Treatments. The three alternative treatments available are listed below along with specific requirements:

- a. Undercut and Backfill. From Figure 44-7B, 11.5 in. of granular material is required.
- b. Modified Soil Layer. Figure 44-7B shows that 11.5 in. of a modified soil layer would be required. If the immediate IBV of the modified soil layer obtained in the field is less than 10.0, the following options are available to the engineer:
 - field-cure the modified soil layer until an IBV of 10.0 is achieved; or
 - full- or partial-depth removal and replacement with granular material. In this case, a minimum thickness of 10 in. of a modified soil layer and a minimum thickness of 4 in. of granular material would be suitable.
- c. Moisture-Density Control. Moisture and density specifications can be added to the contract documents to control compactive efforts, thereby assisting in obtaining a stable subgrade. Laboratory testing can determine the appropriate compaction densities and moisture contents. Disking or tilling may be necessary to control excess moisture.

Comparison. The designer should consider the feasibility of these three options, their relative cost, contract time frame, and construction season. The best option should be selected and specified in the project plans. The designer should still use the in situ IBV for pavement design purposes rather than the IBV after remedial treatment.

* * * * *

44-8 SURFACE TREATMENTS

A flexible pavement design procedure for bituminous surface treatments, A-2 and A-3, is not included in Chapter 44. Bituminous surface treatments, A-2 and A-3, may be constructed on roads and streets having an estimated ADT, upon completion, of 400 vehicles or less. The minimum thicknesses and widths of base courses for these treatments are as follows:

Type of Base Course	Minimum Thickness (in.)	<u><i>IDOT Standard Specifications</i></u>	Minimum Width (ft)
Lime Stabilized Soil Mixture	8	Section 350	2 ft wider than surface
Aggregate Base Course	10 ⁽¹⁾	Section 351	
Soil – Cement Base Course	8	Section 352	

Note:

(1) This may be reduced to 8 in. if located on modified soil (Section 302).

**MINIMUM THICKNESSES AND WIDTHS OF
 BITUMINOUS SURFACE TREATMENT BASE COURSE**

Figure 44-8A

These minimum thicknesses for base courses are to be supplemented with subbase courses when necessary to compensate for poor subgrade soil conditions. The requirement for subbase may be determined based on the applicable portions of Chapter 44 or some other acceptable method which has proven satisfactory in the past.

A-1, A-2, and A-3 bituminous surface treatments may not be placed on roads and streets having estimated ADT of over 400 vehicles upon completion.

44-9 WORKSHEETS AND FIGURES

The following pages contain the necessary blank pavement design worksheets and various figures from previous sections to assist in the calculation of pavement designs. The submittal of pavement designs shall include the appropriate worksheet, location map, USDA Soil Map (as needed), and completed figures (as needed).

- Section 44-9.01 – Section 44-1 General Figures
- Section 44-9.02 – Section 44-2 Rigid Pavement Design Figures
- Section 44-9.03 – Section 44-3 Conventional Flexible Pavement Design Figures
- Section 44-9.04 – Section 44-4 Full-Depth HMA Pavement Design Figures
- Section 44-9.05 – Section 44-5 Composite Pavement Design Figures

BUREAU OF LOCAL ROADS & STREETS

44-9.01 Figures from Section 44-1 (General)

The following figures are to be used as needed for the design of various pavements and submitted, as needed, with the appropriate design calculations.

Class I Roads and Streets. Facilities with 4 or more lanes and one-way streets with a structural design traffic greater than 3500 ADT.

Class II Roads and Streets. Two or three lane streets with structural design traffic greater than 2000 ADT and all one-way streets with a structural design traffic less than 3500 ADT.

Class III Roads and Streets. Roads and streets with structural design traffic between 400 and 2000 ADT.

Class IV Roads and Streets. Roads and streets with structural design traffic less than 400 ADT.

Class of Road or Street	Percentage of Structural Design Traffic		
	PV (%)	SU (%)	MU (%)
III	88	7	5
IV	88	9	3

**TRAFFIC PERCENTAGE
(Class III and IV)**

Figure 44-1A

Number of Facility Lanes	Percent of Total Vehicular Class Volume (ADT) in Design Lane					
	Rural			Urban		
	PV	SU	MU	PV	SU	MU
2 or 3 *	50%	50%	50%	50%	50%	50%
4 or 5	32%	45%	45%	32%	45%	45%

44-9-3

Mixture Superpave	Typical Use ⁽¹⁾	Leveling Course Minimum Lift Thickness ⁽²⁾⁽³⁾, in. (mm)	Surface/Binder Course Minimum Lift Thickness ⁽²⁾, in. (mm)
IL-4.75	B/L	3/8 (10)	3/4 (19)
IL-9.5	S/B/L	3/4 (19) ⁽⁵⁾	1 1/4 (29)
IL-12.5	S/B/L	1 1/4 (32)	1 1/2 (38)
IL-19.0 ⁽⁴⁾	B/L	1 3/4 (44)	2 1/4 (57)
IL-25.0 ⁽⁴⁾	B	Not Allowed	3 (76)

Notes:

1. S = Surface; B = Binder; L = Leveling Binder
2. Minimum thicknesses are the nominal thickness of the lift.
3. If the leveling course is placed at or above the minimum thickness specified for surface/binder course, density will be required.
4. This mix may not be used as a surface lift.
5. If the IL-9.5mm leveling binder is being placed over crack and joint sealant, the minimum lift thickness may be 1/2 in. (13 mm).

HMA SURFACE, BINDER, AND LEVELING BINDER LIFT THICKNESSES

Figure 44-1C

Number of Lanes	Frictional Requirements (ADT)

≤ 2	≤ 5,000	> 5,000	N/A	N/A
4	≤ 5,000	5,001 to 25,000	25,001 to 100,000	> 100,000
≥ 6	N/A	5,001 to 60,000	60,001 to 100,000	> 100,000

Note: ADT levels are for the expected year of construction.

FRICITIONAL REQUIREMENTS FOR SURFACE MIXES

Figure 44-1D

44-9.02 Figures from Section 44-2 (Rigid Pavement Design)

The following figures are to be used for the design of rigid pavements and submitted, as needed, with design calculations (Figure 44-2L).

Class I Roads and Streets	
4 or 5 Lane Pavements (Rural and Urban)	$TF = DP \left[\frac{(0.047PV + 64.715SU + 313.389MU)}{1,000,000} \right]$
6 or More Lane Pavements (Rural)	$TF = DP \left[\frac{(0.029PV + 57.524SU + 278.568MU)}{1,000,000} \right]$
6 or More Lane Pavements (Urban)	$TF = DP \left[\frac{(0.012PV + 53.210SU + 257.675MU)}{1,000,000} \right]$
One-way Street Pavements (Rural and Urban)	$TF = DP \left[\frac{(0.073PV + 71.905SU + 348.210MU)}{1,000,000} \right]$
Class II Roads and Streets	
2 or 3 Lane Pavements	$TF = DP \left[\frac{(0.073PV + 67.890SU + 283.605MU)}{1,000,000} \right]$
Class III Roads and Streets	
2 or 3 Lane Pavements	$TF = DP \left[\frac{(0.073PV + 64.790SU + 281.235MU)}{1,000,000} \right]$ TF minimum = 0.5

PAVEMENT DESIGN**

44-9-6

June 2018

Adjustment Factor	Rigid Pavement Thickness Adjustment (in.)
75% Reliability	-0.50
15 ft Joint Spacing ($0.1 \leq TF \leq 5$)	+1.00
15 ft Joint Spacing ($5 < TF \leq 20$)	+1.25
Untied Shoulder	+0.35
Fair Subgrade	-0.25
Granular Subgrade	-0.50
Stabilized Subbase	-0.25
Existing Pavement as Subbase	-0.50
10 ft Lane Width	+0.25
12 ft Lane Width	-0.25

Note: Thickness adjustment is made for untied shoulders (PCC or flexible). The designer should be aware of the potential for frost heave if untied shoulders are used

A subbase is optional for all Class III and IV pavements with a TF < 5.0, and for urban sections having curb and gutter and storm sewer systems.

THICKNESS ADJUSTMENT FACTOR

Figure 44-2C

	Maximum Transverse Joint Spacing (ft)
< 10.0	12.0*
≥ 10.0	15.0

* Appropriate for all Class IV pavements.

PG Binder Grade Selection⁽¹⁾			
Districts 1 – 4	Traffic Loading Rate (Adjustment)		
	Standard ⁽²⁾	Slow ⁽³⁾	Standing ⁽⁴⁾
Surface ⁽⁵⁾	PG 58-28	PG 64-28 or SBS PG 64-28	SBS PG 70-28
Remaining Lifts ⁽⁵⁾	PG 64-22 or PG 58-22	PG 64-22 or PG 58-22	PG 64-22 or PG 58-22
Districts 5 – 9			
Surface ⁽⁵⁾	PG 64-22	PG 70-22 or SBS PG 70-22	SBS PG 76-22
Remaining Lifts ⁽⁵⁾	PG 64-22	PG 64-22	PG 64-22

Notes:

1. The binder grades provided in Figure 44-3B are based on the recommendations given in Illinois-Modified AASHTO MP-2, Table 1, "Binder Selection on the Basis of Traffic Speed and Traffic Level."
2. Standard traffic is used where the average traffic speed is greater than 43 mph (70 km/h).
3. Slow traffic is used where the average traffic speed ranges from 12 to 43 mph (20 to 70 km/h).
4. Standing traffic is used where the average traffic speed is less than 12 mph (20 km/h).
5. Surface includes the top 2 in. (50 mm) of HMA. The remaining lifts of HMA may be the same PG binder grade as surface; however, this may increase or decrease the pavement design thickness. If multiple PG Binder grades are used in a HMA design, the predominant PG Binder grade should be used for determining HMA Modulus on Figure 44-3E.

PG BINDER GRADE SELECTION FOR CONVENTIONAL FLEXIBLE PAVEMENTS

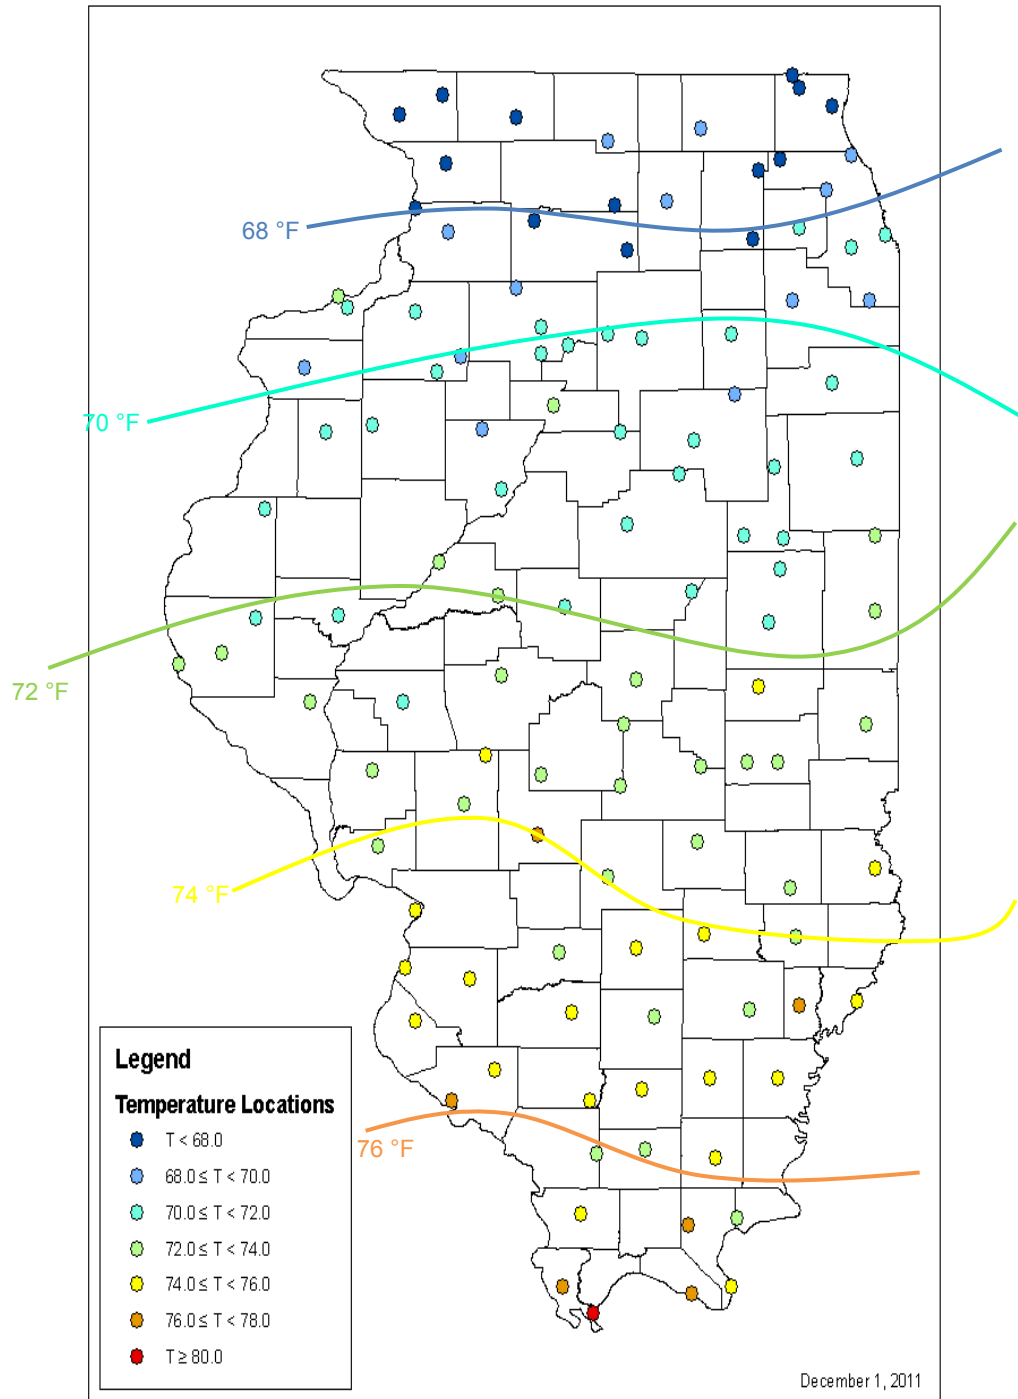

Figure 44-3B

Road Class	Minimum Reliability Level	Reliability (%)
Class I, II, III, and IV	Medium	~75%

June 2018

Original HMA Design Thickness (in.)	Design HMA Modulus, E_{HMA} (ksi)				
	400	500	600	700	800
3.0 – 3.49	E ⁽²⁾	E ⁽²⁾	E ⁽²⁾	E ⁽¹⁾	E ⁽¹⁾
3.5 – 3.99	E ⁽²⁾	E ⁽¹⁾	E ⁽¹⁾	O	O
≥ 4.0	O	O	O	O	O

E: Enhancement of the pavement structure is required.

O: Enhancement of the pavement structure is optional. If no enhancement is desired, an 8 in. aggregate base course, Type A is required.

Notes: If the subgrade E_{Ri} is less than 2 ksi, use Section 44-7 to determine the appropriate subgrade treatment necessary.

A pavement structure consisting of an 8 in. aggregate base course, Type A based on the appropriate category from the above table, can be enhanced by one of the following alternatives:

1. E⁽¹⁾. Use one or more of the following:
 - Increase the HMA thickness by 0.5 in.
 - Increase the aggregate base course, Type A thickness by 2 in.
 - Add a 4 in. minimum granular subbase course, Type B.
 - Add an 8 in. minimum modified soil layer.
2. E⁽²⁾. Use one or more of the following:
 - Increase the HMA thickness by 1.0 in.
 - Increase the aggregate base course, Type A thickness by 4 in.
 - Add a 4 in. minimum granular subbase course, Type B.
 - Add an 8 in. minimum modified soil layer.

DESIGN CALCULATIONS FOR LOCAL PUBLIC AGENCIES

Figure 44-3M

44-9.04 Figures from Section 44-4 (Full-Depth HMA Pavement Design)

The following figures are to be used for the design of full-depth HMA pavements and submitted, as needed, with design calculations (Figure 44-4N).

Class I Roads and Streets	
4 or 5 Lane Pavements (Rural and Urban)	$TF = DP \left[\frac{(0.047PV + 59.625SU + 217.139MU)}{1,000,000} \right]$
6 or More Lane Pavements (Rural)	$TF = DP \left[\frac{(0.029PV + 53.000SU + 193.012MU)}{1,000,000} \right]$
6 or More Lane Pavements (Urban)	$TF = DP \left[\frac{(0.012PV + 49.025SU + 178.536MU)}{1,000,000} \right]$
One-way Streets and Pavements (Rural and Urban)	$TF = DP \left[\frac{(0.073PV + 66.250SU + 241.265MU)}{1,000,000} \right]$
Class II Roads and Streets	
2 or 3 Lane Pavements	$TF = DP \left[\frac{(0.073PV + 56.030SU + 192.720MU)}{1,000,000} \right]$
Class III Roads and Streets	
2 or 3 Lane Pavements	$TF = DP \left[\frac{(0.073PV + 54.570SU + 192.175MU)}{1,000,000} \right]$

FLEXIBLE TRAFFIC FACTOR EQUATIONS (80,000 LB LOAD LIMIT)

Figure 44-4A

BUREAU OF LOCAL ROADS & STREETS
PAVEMENT DESIGN

44-9-20

June 2018

Road Class	Improved Working Platform Material	Usage	Minimum Thickness (in.)
Class I and II	Modified Soil Layer or Granular Material	Required ⁽¹⁾	12 ⁽³⁾
Class III and IV	Modified Soil Layer or Granular Material	Optional ⁽²⁾	12 ⁽³⁾

Notes:

- 1. For Class I and II roads, a 12 in. minimum improved subgrade layer is required, unless the existing subgrade is granular. Where an existing granular subgrade is encountered, the LPA may obtain a waiver to the subgrade working platform requirement from CBLRS by documenting the subgrade suitability.*
- 2. For Class III and IV roads, the 12 in. minimum improved subgrade layer is optional if documentation can be provided to the district that indicates the subgrade will provide suitable support during construction in accordance with Section 44-7. Because an improved subgrade layer should improve the constructability and possibly the performance of the pavement, its use should be considered.*
- 3. In some cases, soft subgrades may require more than 12 in. of improved subgrade to provide a stable working platform and uniform support. The designer should review Section 44-7 in order to determine the required thickness of improved subgrade.*

SUBGRADE WORKING PLATFORM REQUIREMENTS

Figure 44-4B

BUREAU OF LOCAL ROADS & STREETS

June 2018

PAVEMENT DESIGN

44-9-21

PG Binder Grade Selection ⁽¹⁾			
Districts 1 – 4	Traffic Loading Rate (Adjustment)		
	Standard Traffic ⁽²⁾	Slow Traffic ⁽³⁾	Standing Traffic ⁽⁴⁾
Surface ⁽⁵⁾	PG 58-28 ⁽⁶⁾⁽⁷⁾	PG 64-28 or SBS PG 64-28	SBS PG 70-28
Remaining Lifts ⁽⁵⁾	PG 64-22 or PG 58-22	PG 64-22 or PG 58-22	PG 64-22 or PG 58-22
Districts 5 – 9			
Surface ⁽⁵⁾	PG 64-22 ⁽⁶⁾⁽⁷⁾	PG 70-22 or SBS PG 70-22	SBS PG 76-22
Remaining Lifts ⁽⁵⁾	PG 64-22	PG 64-22	PG 64-22

Notes:

- The binder grades provided in this table are based on the recommendations given in Illinois-Modified AASHTO MP-2, Table 1, "Binder Selection on the Basis of Traffic Speed and Traffic Level."*
- Standard traffic is used where the average traffic speed is greater than 43 mph (70 km/h).*
- Slow traffic is used where the average traffic speed ranges from 12 to 43 mph (20 to 70 km/h).*
- Standing traffic is used where the average traffic speed is less than 12 mph (20 km/h).*
- Consideration should be given to increasing the high temperature grade by one grade equivalent when $10 \leq T.F. \leq 30$. For example, if use of a PG 64-22 is specified for standard traffic, a PG 70-22 or a SBS PG 70-22 should be specified.*
- Surface includes the top 2 in. (50 mm) of HMA. The remaining lifts of HMA may be the same PG binder grade as surface; however, this may increase or decrease the pavement design thickness. If multiple PG Binder grades are used in a HMA design, the predominant PG Binder grade should be used for determining HMA Modulus on Figure 44-4H.*
- The high temperature grade should be increased by one grade equivalent when $T.F. > 30$. For example, if use of a PG 64-22 is specified for standard traffic, a PG 70-22 or a SBS PG 70-22 should be specified.*

Illinois N_{design} Number	Flexible Design ESALs, millions ⁽¹⁾ (Flexible TF)	PG Binder Grade Selection ⁽²⁾⁽³⁾		
		Traffic Loading Rate		
		Standard ⁽⁴⁾	Slow ⁽⁵⁾	Standing ⁽⁶⁾
30	< 0.3	PG 58-22	PG 58-22 ⁽⁷⁾	PG 64-22 ⁽⁷⁾
50	0.3 to < 3	PG 58-22	PG 64-22	PG 70-22 or SBS PG 70-22
70	3 to < 10	PG 58-22	PG 64-22	PG 70-22 or SBS PG 70-22
90	10 to < 30	PG 58-22 ⁽⁷⁾	PG 64-22 ⁽⁷⁾	PG 70-22 or SBS PG 70-22

Notes:

1. Design ESALs are the anticipated project traffic level expected on the design lane over a 20 year period. Regardless of the actual design life of the roadway, determine the design ESALs for 20 years and choose the appropriate N_{design} level. For N_{design} and PG binder grade selection purposes only, the design ESALs are calculated using the flexible traffic factor equations found in the full-depth pavement design procedure. Rigid traffic factors given in Figure 44-5A and Figure 44-5B are required for the composite pavement thickness design.
2. The binder grades provided in Figure 44-5F are based on the recommendations given in Illinois-Modified AASHTO MP-2, Table 1, "Binder Selection on the Basis of Traffic Speed and Traffic Level".
3. Use these grades for composite pavements and all overlays.
4. Standard traffic is used where the average traffic speed is greater than 43 mph (70 km/h).
5. Slow traffic is used where the average traffic speed ranges from 12 to 43 mph (20 to 70 km/h).
6. Standing traffic is used where the average traffic speed is less than 12 mph (20 km/h).
7. Consideration should be given to increasing the high temperature grade by one grade equivalent.

LOCAL AGENCY PAVEMENT PRESERVATION

45-1 INTRODUCTION

This chapter provides information regarding the use of pavement preservation strategies for maintaining pavement condition. The Department's policies and procedures regarding the use of pavement preservation techniques are also presented. The use of pavement preservation is an elective policy. However, proper adherence to the preservation policy and procedures specified in this chapter can provide an agency with the opportunity to use federal funding for preservation activities.

45-1.01 Pavement Preservation Definition

Many transportation agencies are using pavement preservation programs to more cost-effectively manage their pavement assets. Pavement preservation procedures have been in use for many years, but often agencies use the same pavement preservation terminology in different manners. Therefore, the Federal Highway Administration (FHWA) Office of Asset Management provided the following guidance regarding pavement preservation definitions in a Memorandum dated September 12, 2005.

Pavement preservation represents a proactive approach in maintaining our existing highways. It enables State transportation agencies (STAs) to reduce costly, time consuming rehabilitation and reconstruction projects and the associated traffic disruptions. With timely preservation we can provide the traveling public with improved safety and mobility, reduced congestion, and smoother, longer lasting pavements. This is the true goal of pavement preservation, a goal in which the FHWA, through its partnership with the States, local agencies, industry organizations, and other interested stakeholders, is committed to achieve.

The memorandum also defined several pavement preservation related terms including: pavement preservation, preventive maintenance, minor rehabilitation (non-structural), and routine maintenance. These terms are described in more detail in the following sections.

45-1.01(a) Pavement Preservation

Pavement preservation is a program employing a network level, long-term strategy that enhances pavement performance by using an integrated, cost-effective set of practices that extend pavement service life, improve safety and meet motorist expectations (FHWA 2005). Pavement preservation includes work conducted on a pavement prior to major rehabilitation, restoration, or reconstruction. Pavements with significant structural deterioration are not candidates for pavement preservation treatments.

45-1.01(b) Preventive Maintenance

The main component of pavement preservation is preventive maintenance. As defined by the FHWA in 2005, preventive maintenance is a planned strategy of cost-effective treatments to an

existing roadway system and its appurtenances that preserves the system, retards future deterioration, and maintains or improves the functional condition of the system (without significantly increasing the structural capacity). The general philosophy of the use of preventive maintenance treatments is to *“apply the right treatment, to the right pavement, at the right time.”* These practices result in an outcome of *“keeping good roads in good condition.”*

When activities such as crack sealing and filling and the application of seal coats are placed on the pavement at the right time they are examples of preventive maintenance treatments.

45-1.01(c) Minor Rehabilitation

Minor rehabilitation consists of non-structural enhancements made to the existing pavement section to eliminate age-related, top-down surface cracking that develop in flexible pavements due to environmental exposure or to restore functionality of concrete pavements. Because of the non-structural nature of minor rehabilitation techniques, these types of rehabilitation techniques are placed in the category of pavement preservation (FHWA 2005).

The placement of thin overlays or the conduct of recycling techniques such as hot in-place or cold recycling to correct significant surface cracking can be considered minor rehabilitation activities.

45-1.02 Purpose

The intended purpose of a pavement preservation program is to maintain or restore the surface characteristics of a pavement and to extend service life of the pavement assets being managed. However, the improvements are such that there is no increase in capacity or strength but they can have a positive impact on the structural capacity. As a means of improving the functional condition of the network and reducing the overall rate of deterioration of the pavement asset, preventive maintenance treatments are used in the pavement preservation program. Since they are relatively inexpensive in comparison to resurfacing or reconstruction projects, the preventive maintenance treatments are an effective means to preserve the investment in the pavement asset.

An effective pavement preservation program has two main objectives:

- Preserve the pavement investment. *This objective involves minimizing the structural failures and extending the structural life of the pavement to preserve the investment the agency has made in the pavement asset.*
- Maintain high level of service (LOS). *This objective involves maintaining acceptable smoothness and surface friction in order to provide a high LOS for the roadway customers.*

The implementation of a pavement preservation program is good practice, as it focuses on maximizing the condition and life of a network of pavements while minimizing the network’s life-cycle cost. The noted benefits of the use of a pavement preservation program vary from agency to agency, but have been documented as including:

- Improved pavement performance—preservation activities extend the performance of the pavement and help to improve the overall condition of the network.

- Higher customer satisfaction—use of preservation activities can lead to smoother roads and fewer construction delays.
- Cost savings—less expensive treatments and the extension of service lives of pavements help to lower or stabilize operating costs.
- Increased safety—preventive maintenance treatments are designed to provide safer surfaces in terms of improved pavement texture and correction of safety related defects such as ruts and improving surface drainage.

A successful pavement preservation program relies on proper treatment selection and timing of the treatment to be successful. In order to select the right treatment for the right pavement at the right time, the following should be known (Peshkin et al. 2004):

- What is the structure and condition of the existing pavement?
- What is the expected performance of the pavement?
- How will different treatments affect their performance?
- What other factors affect how the treatments will perform?

These questions can often be answered by information that is available from a pavement management system (PMS). A pavement management system is a set of tools or methods that assist decision-makers in finding optimum strategies for providing, evaluating, and maintaining pavements in serviceable condition over a period of time (AASHTO 1993). Pavement management, in the broad sense, includes all the activities involved in the planning, programming, design, construction, maintenance, and rehabilitation of the pavement portion of a public works program (Haas et al. 1994).

In order to have an effective pavement preservation program, it is imperative to have some type of pavement management system in place, whether it is proprietary software, public domain software, or a simple spreadsheet. Details of pavement management requirements are provided in the next section.

HARD COPIES UNCONTROLLED

45-2 PAVEMENT PRESERVATION PROCESS**45-2.01 General**

The information and procedures outlined in this chapter allow agencies to conduct pavement preservation with all sources of funding (including MFT, state, or federal funds). Section 4-1 should be consulted to determine highways eligible for federal funds.

In order to understand the outlined pavement preservation processes, a general description of pavement management and some related details is provided. A pavement management system, as defined earlier, is a set of tools or methods that assist decision-makers in finding optimum strategies for providing, evaluating, and maintaining pavements in serviceable condition over a period of time (AASHTO 1993). A pavement management system can take the form of proprietary software, nonproprietary software, or a simple spreadsheet tool. Whether it is a pavement management system or a spreadsheet tool, it must contain the following information for each pavement section included in the pavement preservation program:

- Route ID
- Location designations (beginning/ending locations)
- Surface type
- Pavement surface age
- Condition rating
- Condition rating type used
- Condition survey date
- Prominent distress type
- Average Daily Traffic (ADT)

The information will be used to track the performance of the pavement sections over time and to support pavement preservation funding requests submitted to the District BLRS office.

Pavement condition surveys should be conducted at least every 3 years on all roadways included in the pavement preservation program. Ideally, all roadways maintained by the agency, not just those included in the pavement preservation program, will be included in the survey so the pavement conditions can be tracked over time and used in making treatment selections as additional sections are added to the pavement preservation program.

The highways eligible for pavement preservation and the pavement management system used by the agency shall be submitted with the agency's approval request. The following steps shall be followed for the department to approve the agency's pavement preservation program.

45-2.02 Pavement Preservation Plan Development

The agency will develop a 10-year pavement preservation plan. Agencies using a pavement management system will be able to use their software to customize a preservation plan, while those using a spreadsheet tool will need to use the available condition rating data to create the pavement preservation plan. The first 2 years of the 10-year plan should provide detail on

specific pavement preservation projects proposed for funding. The remaining 8 years of the plan should include a summary of the proposed total miles of preservation projects that are planned in each year. Because preservation projects are based upon selecting “the right treatment at the right time,” it is difficult to schedule long-range preservation projects. Therefore, it is more appropriate to note the number of miles proposed for each type of treatment during the remaining 8 years of the pavement preservation plan.

45-2.03 Pavement Preservation Plan Approval

The pavement preservation plan shall be submit to the District BLRS for approval.

1. An agency interested in participating in the pavement preservation program must submit Form BLR 45300 and Form BLR 45310 to the District BLRS.
2. The District BLRS will review the request and recommend approval to the Central BLRS. If the District BLRS does not approve the agency as a participant, the agency will be notified in writing of the reasons why they are not approved.
3. The District will forward 3 original copies of Form BLR 45300, Form BLR 45310, and all required supporting documentation to the Central BLRS for review and approval. If approved by the Central BLRS, Central BLRS will sign Form BLR 45300. Two copies of Form BLR 45300 will be returned to the District BLRS and 1 copy will be retained by Central BLRS for the file. If the request is denied, the agency will be notified in writing.

45-2.04 Pavement Preservation Plan Updates

Each year, the agency should update the list of projects included in the first 2 years of the pavement preservation project plan. On even number years, the number of miles of pavement preservation projects planned for the last 8 years of the 10-year plan should be updated. The revised plan shall be submitted to the District BLRS for approval.

1. Form BLR 45310 should be submitted to the District BLRS by October 1 of each year.
2. The District BLRS will review the revised plan. If the District BLRS does not approve, the agency will be notified in writing detailing needed revisions.
3. Upon approval by the District BLRS, funding may be allocated for use on the preservation treatments specified in the pavement preservation plan.
4. For federal day labor and federal local let projects, the approved Form BLR 45310 shall be included with the request to the Central BLRS. For state let projects, the approved Form BLR 45310 shall be included with the plans, specifications and estimates submittal to the Central BLRS

45-2.05 Pavement Preservation Treatment Project Submittal

The section number for all projects approved under the pavement preservation plan should use the PP section number.

All pavement preservation projects are considered as Categorical Exclusion Group I. Form BLR 46300, a location map, and a typical section shall be submitted for all pavement

BUREAU OF LOCAL ROADS & STREETS
LOCAL AGENCY PAVEMENT PRESERVATION

Jan 2012

45-2(3)

preservation projects regardless of funding. For pavement preservation projects that involve a structure, the Form BLR 46300 will be forwarded to the Local Bridge Unit for the approval of the Engineer of Bridges and Structures.

If the bridge cannot safely carry the additional dead load resulting from resurfacing, gap the bridge. For structures greater than 20.0 feet (6.1 m) in length that are not being gapped, Form BLR 10220 "Asbestos Determination Certification" will be required. All structure condition ratings of these structures must be a 5 or greater. The Bureau of Bridges & Structures (BBS) will evaluate the structural adequacy of the structure, and record the status of the asbestos Form BLR 10220, before approval of the pavement preservation project.

HARD COPIES UNCONTROLLED

HARD COPIES UNCONTROLLED

45-3 PAVEMENT PERFORMANCE

45-3.01 General

One of the keys to an effective pavement preservation program is to understand how pavements perform. Figure 45-3A illustrates the typical life cycle of a pavement and the categories of treatments that are appropriate at different times of the life of the pavement. The application of these treatments is also based upon the condition of the pavement, as preventive maintenance treatments are used early on in the life of a pavement while a pavement is still in relatively good condition. There is also a time when preventive maintenance is no longer appropriate (because the pavement has deteriorated to a point that more extensive cracking and other distresses are present), but it is too soon to trigger the pavement for major rehabilitation. Pavements at this condition level would receive minor rehabilitation treatments such as thin overlays or pavement recycling. Together, the use of preventive maintenance treatments and minor rehabilitation techniques along with routine maintenance provide pavement preservation options for a pavement that is still in relatively good condition.

**RELATIONSHIP BETWEEN PAVEMENT CONDITION AND
TYPICAL TYPES OF TREATMENT**

Figure 45-3A

If preventive maintenance or minor rehabilitation is not used during the life of the pavement, the pavement will deteriorate to the point that major rehabilitation (structural restoration, such as full-depth repairs or thick overlays, or even reconstruction) is necessary. When a pavement develops significant levels of distress, pavement preservation activities are no longer viable treatment options. If preventive maintenance or minor rehabilitation is used on a pavement that is highly deteriorated, the life of the chosen treatment can be greatly reduced.

Figure 45-3A depicts a generic pavement performance curve; there can be significant differences in the shape of the performance curve for different pavements due to differences such as environment, design, and construction.

The philosophy of pavement preservation is to address pavements while they are still in good condition and without any serious structural damage. A preventive maintenance treatment applied at the right time can restore the pavement almost to its original condition. Systematic, successive preservation treatments applied correctly help prolong the service life of the asset and delay the more expensive major rehabilitation treatments and reconstruction. Figure 45-3B depicts how the application of successive preventive maintenance treatments (shown as the solid line) can help maintain the pavement in good condition for a longer period of time as compared to a pavement without treatments (depicted by the dashed line performance curve). Additionally, performing a series of successive pavement preservation treatments during the life of a pavement is less disruptive to traffic than the long closures normally associated with reconstruction projects.

**PAVEMENT PERFORMANCE EXTENDED
BY PREVENTIVE MAINTENANCE**

Figure 45-3B

To apply pavement preservation techniques at the optimal time, it is imperative to understand the causes of pavement deterioration for the various types of pavements.

45-3.02 Causes of Pavement Deterioration

Understanding the distress mechanisms that cause pavement deterioration is essential in properly identifying preservation strategies and treatments for pavements. The causes of deterioration can lead to a variety of distresses. Typical pavement distresses are discussed in section 45-3.03.

45-3.02(a) Flexible Pavement Deterioration

For flexible pavements, which are hot-mix asphalt (HMA) or other bituminous surfaces, the general causes of primary deterioration include traffic, environment/aging, and material problems. A secondary cause of deterioration is due to moisture infiltration. These causes of deterioration influence the performance of the pavement in various ways.

- Traffic can lead to load-related distress such as plastic deformation that manifests as rutting, or structural fatigue cracking that occurs in the wheelpaths of the pavement. Fatigue cracking can lead to the occurrence of potholes. Additional traffic-related distress includes polishing of the pavement surface due to surface wear, which leads to friction loss.
- Environment and aging can cause oxidation of the asphalt and lead to block cracking and weathering/raveling. Environmental forces can also cause thermal cracking, which typically is seen as regularly spaced transverse cracks.
- Material problems include bleeding (contributing to loss of friction), shoving and surface deformation, and stripping.
- Moisture infiltration, while a secondary cause of deterioration, can lead to further breakdown of existing cracks and cause increased roughness. The infiltration of moisture will also soften the subgrade and can lead to the occurrence of longitudinal cracking at the edge of the pavement or potholes.

45-3.02(b) Rigid Pavement Deterioration

For rigid pavements, which are portland cement concrete (PCC) surfaced, the general causes of primary deterioration include traffic loadings, environment and material problems, and poor construction quality. Secondary causes of deterioration are due to incompressibles in joints and moisture infiltration. These causes of deterioration influence the performance of the pavement in various ways.

- Traffic can lead to load-related distress in the slab such as mid-slab cracking. Pumping, faulting, and corner breaks are also load-related distresses. Traffic-related distress includes polishing of the pavement surface due to surface wear, which leads to friction loss.
- Environment and material problems include D-cracking (durability cracking) and alkali-silica reactivity. The environment can also cause oxidation of the joint seal which will allow moisture infiltration into the pavement structure.
- Poor construction quality can cause issues such as longitudinal cracking or surface distress in the form of map cracking and scaling.
- Incompressible materials lodged in a joint a secondary cause of deterioration can cause the occurrence of joint spalls.
- Moisture infiltration to sub-surface layers, while a secondary cause of deterioration, can lead to further breakdown of existing cracks and spalls and cause increased roughness. The infiltration of moisture will also soften the subgrade and can lead to the occurrence of pumping, transverse joint faulting, and corner breaks.

45-3.03 Distress Identification

Distress is defined as pavement deterioration that reduces serviceability or leads to a reduction in serviceability. The following discussion will help users recognize the types and severity levels of some of the most common distresses in flexible and rigid pavements. A short description of each distress type is provided along with a photograph of typical light, moderate, and severe cases.

The lists of flexible and rigid distress types described in the following two sub-sections are not comprehensive. This discussion is meant to provide the user with a general understanding of some of the most common distresses, especially in regards to applying pavement preservation treatments. Additional distress types that are not as common are introduced in less detail in section 45-3.03(c).

45-3.03(a) Flexible Pavement Distresses

Flexible pavement surface distresses include a variety of pavement defects as follows:

1. Alligator/Fatigue Cracking

Alligator or fatigue cracking is a bottom-up type of cracking that indicates fatigue failure (caused by repetitive stress) and is considered a structural distress. Because the cracks generally extend through all asphalt layers, water is allowed to penetrate into the subgrade, leading to increased deterioration.

Alligator cracking is a series of cracks that, when severe, forms a pattern resembling chicken wire. This type of cracking is usually found in the wheel path or along the edge of the pavement (also sometimes called edge cracking). Cracking initially develops as a series of longitudinal cracks that become interconnected as further fatigue damage occurs.

Severity levels are defined by how interconnected the cracking pattern is and the stability of the piece as shown in Figure 45-4C.

Light Alligator Cracking - A longitudinal crack or a series of parallel longitudinal cracks with little or no interconnection.

Moderate Alligator Cracking - Cracks are interconnected and may be slightly spalled, but are stable.

Severe Alligator Cracking - Cracks are wider and pieces are spalled and show movement under traffic loads.

ALLIGATOR CRACKING SEVERITY LEVELS

Figure 45-4C

2. Bleeding

Bleeding occurs when a film of excess asphalt material pools on the pavement surface. Bituminous material saturates the aggregate voids during hot weather or traffic compaction, then expands onto the pavement surface. This can contribute to a considerable safety threat by reduction in the skid resistance of the pavement surface.

Bleeding usually creates a shiny, glass-like reflecting surface that can become sticky when hot and dry and slippery when wet. It is often found in the wheel paths. The severity of bleeding is defined by the amount and extent of asphalt binder visible at the surface of the pavement as shown in Figure 45-3D.

Light Bleeding – Small or isolated areas where asphalt material has pooled on the pavement surface.

Moderate Bleeding – Bleeding is apparent over large or continuous areas of the pavement surface.

Severe Bleeding – Bleeding covers much of the pavement surface and is relatively thick.

BLEEDING SEVERITY LEVELS

Figure 45-3D

3. Block Cracking

Block cracking is a functional distress caused by environmental conditions which lead to hardening and shrinkage of the asphalt. This is not a load-related distress. However, the cracks may allow water to enter the pavement causing further deterioration.

Block cracking occurs as a pattern of cracks that divide the pavement into approximately square (or block shaped) pieces. The blocks generally range from 1 ft by 1 ft to 10 ft by 10 ft (0.3 m by 0.3 m to 3 m by 3 m) and cover a large area. Patterns smaller than this often are a sign of alligator cracking; blocks larger than this usually are measured as longitudinal and transverse cracks.

Block cracking is measured by the area containing the block-cracking pattern. The severity of block cracking is defined by the cracks, in the same manner that severity levels for longitudinal and transverse cracking shown in Figure 45-3E.

Light Block Cracking – Tight cracks or sealed cracks with the filler in good condition.

Moderate Block Cracking – Cracks have opened up, exhibit a small amount of spalling, or have adjacent random light cracking.

Severe Block Cracking – Cracks are wide, have significant spalling, or are accompanied by adjacent moderate severity random cracking.

BLOCK CRACKING SEVERITY LEVELS

Figure 45-3E

4. Longitudinal and Transverse (L&T) Cracking

By definition, longitudinal cracks run parallel to the centerline and transverse cracks run perpendicular.

Similar to block cracking, longitudinal and transverse (L&T) cracking is caused by environmental factors (thermal expansion and contraction). These cracks may be located anywhere on the pavement surface, including along paving lane joints. L&T cracks can also form in areas with swelling or settlement because of additional strain on the pavement in these specific areas.

Joint reflective cracking in composite pavements can also be categorized as L&T cracking. In this case, the cracks form when joints in the underlying PCC reflect through to the HMA surface.

L&T cracking is not a load-related distress; however, the cracks can allow water to enter the pavement and eventually weaken the structure, leading to load-related deterioration.

Severity levels are determined based upon the width and depth of cracking, stability/movement of the pavement material adjacent to the cracks, and the extent of spalling and secondary cracking (adjacent random cracking). Some rating procedures record longitudinal and transverse cracking separately, or have a different distress for cracking due to joint reflection of composite pavements (see Figure 45-3F).

Light L&T Cracking - Tight cracks or sealed cracks with the filler in good condition.

Moderate L&T Cracking - Cracks have opened up, exhibit a small amount of spalling, or have adjacent random light cracking.

Severe L&T Cracking - Cracks are wide, have significant spalling, or are accompanied by adjacent moderate severity random cracking.

SEVERITY LEVELS

Figure 45-3F

5. Rutting

A rut is a longitudinal surface depression in the wheel path. Rutting can pose a potential safety threat when water collects in the depressed area as hydroplaning can occur. There are two types of rutting: rutting in the HMA layer, and rutting in the subgrade.

Rutting occurs in the HMA layer due to poor mix design properties (which can sometimes cause transverse material displacement) or secondary compaction of the mix under a concentration of heavy wheel loads.

Subgrade rutting occurs when the subgrade (and hence the overlying asphalt concrete) exhibits wheel path depressions due to loading. Subgrade rutting is a load-related distress, generally indicating that the pavement structure is not adequate for the applied loads.

Rutting can be measured using a transverse profiler, or simply by measuring the depth of the lowest point in the rut relative to the pavement surface. Severity levels are based on rut depth and may vary by the condition rating procedure used. The depths listed for light, moderate, and severe rutting to the right are typical, but are based on the measured depth at a given location. When rut data is collected using automated means, an average depth is often reported (see Figure 45-3G).

Light Rutting - Rut depth visible, approximately less than ½ inch (12.7 mm) in a given location.

Moderate Rutting - Rut depth approximately between ½ inch and 1 inch (12.7 mm and 25.4 mm) in a given location.

Severe Rutting - Rut depth greater than approximately 1 inch (25.4 mm) in a given location.

RUTTING SEVERITY LEVELS

Figure 45-3G

6. Weathering/Raveling

Weathering/raveling occurs when aggregate particles and asphalt binder are worn away from the HMA surface. This can occur when the surface has oxidized and hardened, or from poor mix quality. Aggregate is eroded from the surface, leaving a rough and sometimes pitted texture. Other factors that can contribute to weathering/raveling include oil spillage, which softens the asphalt and allows aggregate to become dislodged, and mechanical abrasion, such as snow-plow blades or studded tires.

Severity levels are based upon the extent of lost aggregate and visibility of aging in the pavement (see Figure 45-3H).

Light Weathering/Raveling - Some aggregate loss from the pavement surface with little or no pitting.

Moderate Weathering/Raveling - Some aggregate loss resulting in an overall rough pavement surface with some localized pitting.

Severe Weathering/Raveling - Considerable aggregate loss resulting in an overall rough pavement surface with pitted/eroded areas.

WEATHERING/RAVELING SEVERITY LEVELS

Figure 45-3H

45-3.03(b) Rigid Pavement Distresses

The most significant and commonly observed distresses in rigid pavements are as follows:

1. Corner Breaks

Corner breaks are created in PCC pavements by cracks located within a single quadrant of the slab, resulting in an approximately 45-degree angle to the direction of traffic. A corner break extends vertically through the entire depth of the slab and is caused by high corner stresses. The high corner stresses can develop from overloading and thermal curling or as a loss of support under the slab, including poor initial compaction. Corner breaks are considered a load-related distress.

The number of corner breaks is to be recorded at each severity level within each section (see Figure 45-3I).

Light Corner Breaks - Crack is hairline and unspalled; the resulting corner piece is not cracked or shows no movement under load.

Moderate Corner Breaks - Crack has some spalling and the corner piece is intact and has little or no movement under load.

Severe Corner Breaks - Crack is heavily spalled; corner is broken into two or more pieces, is faulted, or moves under load.

CORNER BREAK SEVERITY LEVELS

Figure 45-3I

2. Durability (D) Cracking

D-Cracking is a series of closely spaced, crescent-shaped hairline cracks near a joint, corner or crack. There is often dark staining around the cracks that can help distinguish this distress from others (especially other material-related distresses).

D-cracks are caused by freeze-thaw expansion of the coarse aggregate within the PCC slab. This distress requires a susceptible coarse aggregate (which can be controlled when selecting the appropriate mix design), moisture, and a climate with freeze-thaw conditions. The deterioration commonly starts from the bottom of the slab where the saturation levels are higher.

D-cracking is considered a material- and climate-related problem and is not caused by load. However, this can be a very destructive distress that eventually affects the load-carrying ability of the pavement structure.

The severity level is determined by the extent of the break-up of the pavement due to D-cracking. Also, the extent of cracking that covers the slab surface can help define the severity of D-cracking (see Figure 45-3J).

Light D-Cracking - Tight cracks with no loose or missing pieces and no patching in the affected area.

Moderate D-Cracking - Well defined cracks, with a few small loose pieces.

Severe D-Cracking - A well defined cracking pattern with a significant amount of loose or missing material.

D-CRACKING SEVERITY LEVELS

Figure 45-3J

3. Faulting

A difference in elevation across a joint (between two slabs) or crack (within a slab) is referred to as faulting.

Faulting is often an indicator of poor load transfer (especially in un-doweled jointed-plain concrete pavements). In this case, fines are pumped from beneath the far slab to beneath the near slab (in reference to the direction of travel) causing the difference in elevation. Faulting can also be caused by uneven settlement of adjacent slabs or by frost heave.

Severity levels are based upon the measured difference in surface elevation across the joint or crack and vary by the condition rating procedure used. The measurements listed for light, moderate, and severe faulting shown in the photos to the right are provided as examples. Some rating procedures do not record faulting across cracks (only across joints), incorporating faulting into the crack's severity level. Automated data collection can also be used to assess faulting (see Figure 45-3K).

Light Faulting - Faulting is visible and measures approximately less than ¼ inch (6.4 mm) at a given location.

Moderate Faulting - Faulting measures approximately ¼ inch to ½ inch (6.4 mm and 12.7 mm) at a given location.

Severe Faulting - Faulting is greater than approximately ½ inch (12.7 mm) at a given location.

FAULTING SEVERITY LEVELS
Figure 45-3K

4. Joint Seal Damage

Joint sealant in good condition keeps both incompressible material and water out of the joints. When incompressible materials collect in joints, the pavement cannot expand and contract as needed resulting in distresses such as spalling or blowups. Keeping water out of the pavement structure is important for preventing other distresses, such as faulting and pumping. To be effective, joint sealant should be intact, pliable, and bonded to both sides of the joint.

Severity levels should be determined by the ability of the joint sealant to adequately protect the joint from deterioration and keep water from entering the pavement structure. The performance of the sealant is usually judged over a large area and categorized by the overall performance (see Figure 45-3L).

Light Joint Seal Damage - Only localized areas of the sealant are damaged.

Moderate Joint Seal Damage - Portions of the sealant are missing, oxidized (no longer pliable), split, or have lost adherence.

Severe Joint Seal Damage - Sealant is mostly missing, oxidized (no longer pliable), split, or is lost all adherence; sealant is no longer performing its intended function.

JOINT SEAL DAMAGE SEVERITY LEVELS

Figure 45-3L

5. Longitudinal Cracking

Longitudinal cracking is used to describe cracks that predominately run parallel to the pavement centerline. These cracks usually extend through the entire depth of the slab.

Longitudinal cracks are the result of internal stresses caused by temperature and moisture gradients (curling and warping), late or inadequate sawcutting, excessively wide slabs, or poor base/subgrade support conditions.

Severity is defined by the deterioration along the crack (crack width and amount of spalling). Some rating procedures consider shattered slabs (slabs divided into multiple pieces) as a separate distress while others simply record the number of cracks (see Figure 45-3M).

LONGITUDINAL CRACKING SEVERITY LEVELS

Figure 45-3M

6. Map Cracking and Scaling

Map cracking and scaling develop because of material-, construction- and weather-related problems. Map cracking appears in the form of closely spaced cracks that are typically tight and shallow; scaling refers to the loss of surface material.

Over-finishing the PCC surface during construction or adding water during finishing are common causes of map cracking. Over-finishing works excess water to the surface, creating a weak layer of mortar that easily breaks off. Surface cracks can also form if the PCC surface dries out too quickly while curing; however, these are usually referred to as plastic shrinkage cracks and are generally more isolated.

Alkali silica reactivity (ASR) or other material-related problems can also cause map cracking. In some cases, the application of deicing chemicals can also cause scaling.

Severity levels are based primarily on the amount of scaling, but also consider the cracks, if present (see Figure 45-3N).

Light Surface Distress - Very clear cracking pattern on the surface, where cracks appear tight and shallow; no scaling.

Moderate Surface Distress - Cracks have opened up and/or there is some material loss (scaling) on the pavement surface.

Severe Surface Distress - Extensive material loss (scaling).

SURFACE DISTRESS SEVERITY LEVELS

Figure 45-3N

7. Pumping

Pumping occurs when fine material beneath the slab is worked up through joints and cracks under applied loads. Over time, voids can form under the corners/edges of the slabs, leading to loss of support problems. Positive load transfer, effective joint sealant, and limiting the fines in the underlying base course can minimize pavement pumping.

Pumping is likely to be occurring when stains near joints and cracks are visible. Severities of pumping are difficult to define because most of the deterioration occurs below the pavement surface (see Figure 45-30).

Light Pumping - Small areas of staining visible.

Moderate Pumping - Visible staining on the pavement surface.

Severe Pumping - Excessive amounts of staining. Additional indications may include faulting or the erosion of shoulder pavement from applied pumping forces.

PUMPING SEVERITY LEVELS

Figure 45-30

8. Spalling

Spalling is defined as cracking, breaking or chipping of joint edges. Spalling can occur along joints, in corners, or along cracks. Spalls extend diagonally from the pavement surface toward the joint or crack, in contrast to corner breaks or linear cracks which extend vertically through the slab. Spalling often occurs when incompressible material enters the joints or cracks and prevents normal expansion and contraction of the slab, eventually leading to deterioration around the joint or crack.

Severity levels should be determined based upon the amount and depth of deterioration and loss of material observed at the joint or crack (see Figure 45-3P).

Light Spalling - Slight wear along the joint or crack, with minimal loose or missing pieces.

Moderate Spalling - Shallow but discernable wear at the joint or crack, with loose pieces that can be removed easily or are missing.

Severe Spalling - Considerable wear and loss of material at the joint or crack; ride quality is affected.

SPALLING SEVERITY LEVELS

Figure 45-3P

9. Transverse Cracking

Transverse cracks run perpendicular to the centerline of a roadway. These cracks are similar to longitudinal (linear cracks) in that they typically extend vertically through the slab and are a structural distress. They are distinguished here from longitudinal cracks because some of the repair options differ.

Slabs often crack from overloading or because of poor base/subgrade support. As with longitudinal cracks, transverse cracks can form due to improper joint spacing, late or inadequate joint sawcutting, or from internal stresses caused by temperature and moisture gradients (curling and warping) in combination with loading.

Severity is defined by the deterioration along the crack (crack width and amount of spalling), presence of faulting, and the number of pieces the slab is divided into. Some rating procedures record longitudinal and transverse cracks separately, or have another distress type for shattered slabs (slabs divided into multiple pieces) (see Figure 45-3Q).

Light Transverse Cracking - Tight cracks with little or no spalling and no faulting.

Moderate Transverse Cracking - Wider cracks with some spalling or faulting.

Severe Transverse Cracking - Cracks that exhibit movement accompanied by discernable spalling or faulting.

TRANSVERSE CRACKING SEVERITY LEVELS

Figure 45-3Q

45-3.03(c) Additional Pavement Distresses

The following distress types may appear in some condition rating procedures, but are either less applicable to pavement preservation programs (which focus on treatments applied over large areas rather than localized repairs) or are somewhat less common than those previously discussed:

1. Depression. Depressions are often localized and can be built in during construction or develop in areas with poor base or subgrade compaction (see Figure 45-3R).

**DEPRESSION****Figure 45-R**

2. Blowups. Blowups occur in PCC pavements, typically during exceptionally hot weather. When PCC pavements do not have room to expand sufficiently, internal forces can become great enough to cause a localized upward movement of the slab edges resulting in buckling or shattering of the joint. If blow-ups are a common problem, some preventive activities such as regular joint resealing and, in severe cases, the installation of pressure relief joints, may be needed to control this distress.
3. Bumps and Sags. Bumps and Sags are a flexible pavement distortion that affect ride quality. Often this distress can better be classified by a more descriptive distress, such as swelling, shoving, rutting (in the HMA surface), or corrugation. This distress does appear in some distress rating procedures, though.
4. Corrugation. This distress is usually only found at intersections or areas with stopping traffic. The result is a washboard effect where there are ridges of HMA that run perpendicular to the centerline. This distress is a result of an unstable mix combined with stopping traffic, which causes the surface to slide and form ripples.

5. Lane-Shoulder Drop Off. Some condition rating procedures include a lane-shoulder drop off as a distress describing an elevation change between the edge of pavement and the adjacent shoulder, which can be a potential safety problem if a vehicle tire goes beyond the edge of pavement. In addition, pavement deterioration along a loaded edge can sometimes occur as a result of the edge not being supported (see Figure 45-3S).

LANE-SHOULDER DROP OFF

Figure 45-3S

6. Patch Deterioration. While patches are often placed to repair a pavement problem, they eventually deteriorate. To account for this, some condition rating procedures include patches as a separate distress. Alternately, the types of distress occurring within a patched area can be recorded.
7. Polished Aggregate. This distress can occur on either PCC or HMA-surfaced pavements. In both cases, frequent traffic applications (not necessarily heavy loads) can wear away the pavement surface and polish any exposed aggregate until the pavement surface is smooth. Polished aggregate results in a surface that is smooth, causing a potential safety problem. Polished aggregates can be detected using skid testing, or by visual observations (see Figure 45-3T).

POLISHED AGGREGATE

Figure 45-3T

8. Popouts. Popouts develop as a result of expansive aggregates expanding during a freeze-thaw cycle, and breaking free from the surface of a PCC pavement. This distress does not pose a safety concern, nor does it affect the structural capacity of a pavement (see Figure 45-3U).

**POPOUTS****Figure 45-3U**

9. Potholes. Potholes often occur as a result of severe weathering/raveling or severe alligator cracking. Typically pavements with excessive potholes are beyond the need for preventive maintenance activities; patching is typically used as a localized repair (see Figure 45-3V).

**POTHOLES****Figure 45-3V**

10. Punch-outs. A punch-out is a type of distress that occurs in continuously reinforced concrete pavements (CRCP). A portion of a cracked slab breaks free from the surrounding pavement and partially sinks into the base/subgrade (see Figure 45-3W).

**PUNCH-OUTS****Figure 45-3W**

11. Shoving. Shoving can refer to a couple of different distress types. First, shoving can occur at the interface between HMA and PCC pavements. In this case, the expansive forces of the PCC during hot weather can apply pressure to the HMA. As a result, the HMA along the interface will bulge or it will crack and break into pieces. Shoving also can refer to areas in an unstable HMA pavement where areas of the pavement move under a load – similar to rutting, but localized (see Figure 45-3X).

**SHOVING****Figure 45-4X**

12. Slippage Cracking. Slippage cracking occurs when the surface HMA layer is no longer bonded to the layer directly below it (another HMA layer, PCC, brick, or other non-granular material) allowing the surface layer to move when braking or turning wheel loads are applied. Often cracking appears in a crescent shaped pattern which may open into a wide crack in only the upper-most HMA lift (see Figure 45-3Y).

SLIPPAGE CRACKING

Figure 45-3Y

13. Swelling. Upward heave of a flexible pavement, typically due to frost heave or expansive soils below the surface, is referred to as swelling. Blow-ups of underlying PCC pavement are also sometimes categorized as swelling.

45-3.03(d) Use of Pavement Preservation to Maintain Pavement Performance

Pavement preservation can address many of the various distress types discussed in the previous section. Specifically, pavement preservation techniques have two main uses: 1) prevent or slow many distresses from occurring or 2) correct some minor surface distress when applied.

Some of the pavement problems that are prevented or slowed with the use of pavement preservation for flexible and rigid pavements are detailed in Figure 45-3Z. The distresses that are corrected with the use of pavement preservation are detailed in Figure 45-3AA.

HMA or Other Bituminous Surfaces Problems	PCC Problems

Stable asphalt rutting Raveling Bleeding/flushing Surface friction loss Roughness	Joint seal damage Map cracking and scaling Surface friction loss Roughness

**PAVEMENT PROBLEMS CORRECTED
WITH PAVEMENT PRESERVATION**

Figure 45-3AA

The benefits realized by the application of pavement preservation are accomplished because these techniques accomplish the following: 1) reduce water infiltration, 2) maintain drainage, 3) reduce water infiltration into cracks and joints, 4) slow aging effects of the pavement, and 5) minimize dynamic loads.

The reduction in water infiltration and the proper maintenance of drainage help protect the underlying layers of the pavement from being softened or washed away and also help reduce the effects of freeze/thaw-induced distress. The reduction of incompressible debris into the joints and cracks greatly reduces the potential for crack deterioration, joint spalling, and pavement blow-ups. The use of global preventive maintenance surface treatments can help to slow asphalt aging/hardening. The pavement preservation techniques also help preserve the pavement by reducing and/or correcting pavement roughness, which helps minimize dynamic loadings and in turn extends the life of the pavement.

There is a point in the life of the pavement when pavement preservation techniques will no longer provide an adequate treatment to the pavement. In those cases, the pavement has deteriorated to the point that preservation techniques, if used, will have shortened lives. Some indicators that the pavement section is not a viable candidate for preservation treatments are shown in Figure 45-3AB.

HMA or Other Bituminous Surfaces Problems	PCC Problems
Potholes Severely deteriorated cracks Delaminations Unstable rutting	Blow-ups Corner breaks Severely deteriorated cracks

FOR PAVEMENT PRESERVATION**

Figure 45-3AB

45-4 CONDITION RATING ASSESSMENTS

45-4.01 General

Effective pavement preservation cannot be performed without an appropriate assessment of pavement condition for the pavement sections in the network. Pavement condition data are necessary to document current condition, determine future conditions, and evaluate possible future preservation strategies.

The condition of the pavement can be determined through the use a variety of methods: 1) surface condition, 2) roughness/ride quality, 3) structural capacity, and 4) surface friction. For all condition assessment procedures, the methods that provide the highest level of accuracy often cost the most in terms of time, effort, and money. Therefore, final decisions on which data to collect and methods for data collection should be carefully considered based upon available resources. For this reason many local agencies focus on conducting a surface distress condition analysis for the pavement network, as the required data can be collected using a variety of methods. The collection of roughness/ride quality, structural capacity, and surface friction information often involves the use of specialized equipment. Therefore, this testing is often only used on a project-by-project basis or when adequate funding is available.

45-4.02 Surface Condition

Pavement surface condition surveys can vary greatly. Some procedures are simple subjective assessments of the pavement surface condition while others are more detailed determinations of types, severities, and quantities of distress that is present on the pavement surface. The simple methods, which are often a subjective rating of the surface condition from the windshield of a slow moving vehicle, are quicker to perform but provide limited information for the selection of preservation projects for specific pavement sections. Detailed distress information can be collected either manually through walking surveys which can be labor intensive or through the use of semi-automated or automated data collection vans. The use of data collection vans can reduce time in the field, but depending upon the survey methodology and level of automation used, the surveys can be as time consuming as walking surveys. Nevertheless, the detailed distress surveys provide all the details necessary to select a specific preservation project for a pavement section.

Details of four different surface condition rating procedures are provided here as potential options to be used by the agency when conducting condition surveys. There are many other survey options available to agencies. Each agency should consider the complexity of the procedure along with available time and resources when deciding on the condition survey procedure that will work best for the agency long-term. The following example procedures are presented: Pavement Surface Evaluation and Rating (PASER), Condition Rating Survey (CRS), the Pavement Condition Index (PCI), and the rating procedure associated with the Transportation Asset Management System (TAMS) developed by the Utah Local Technical Assistance Program (LTAP). Additional information regarding these condition rating procedures can be obtained from the Illinois LTAP center at <http://www.dot.state.il.us/blr/t2center.html>.

45-4.02(a) Pavement Surface Evaluation and Rating (PASER)

The PASER system was developed by the Wisconsin Transportation Information Center to evaluate pavement surface conditions using visual evaluations. Rating guides exist for both asphalt and concrete roads.

The evaluation for asphalt pavements is focused on identifying the different types of pavement distress on the roadway and grouping that distress into four major categories: surface defects, surface deformation, cracks, and patches/potholes. For rigid pavements, the four major categories of distress are the following: surface defects, joints, pavement cracks, and pavement deformation.

For both of these procedures, the condition of the pavement is assessed and based upon documented distress present a rating on a 10-point rating scale (10–excellent condition to 1–failed condition) is assigned to the pavement as shown in figure 45-4A. If an agency is using this rating procedure to determine the condition of the pavement network, it is advised that they also note the most prominent distress type present on the pavement section so it can be utilized when making final preservation treatment selection. Figure 45-4A also provides a range of PASER conditions in which pavement preservation is feasible and not feasible.

PASER Condition Ranges			
Excellent		10 – 9	10 – 5: Feasible for pavement preservation
Very Good		8	
Good		7 – 6	
Fair		5 – 4	
Poor		3	4 – 1: Not feasible for pavement preservation
Very Poor		2	
Failed		1	

**PAVEMENT PASER CONDITION
 RANGE CLASSIFICATIONS**

Figure 45-4A

45-4.02(b) Condition Rating Survey (CRS)

The CRS procedure has been used by the Department as its standard methodology of documenting pavement condition since 1974. The CRS is based upon the visual pavement condition, in which a rating between 9.0 (excellent) and 1.0 (poor) is assigned to the pavement based upon the existing surface condition. Figure 45-4B displays the CRS Condition Ratings and also provides a range of conditions in which pavement preservation is feasible and not feasible.

CRS Condition Ranges			
Excellent		9.0 – 7.6	9.0 – 6.1: Feasible for pavement preservation
Satisfactory		7.5 – 6.1	
Fair		6.0 – 4.6	6.0 – 1.0: Not feasible for pavement preservation
Poor		4.5 – 1.0	

**PAVEMENT CRS CONDITION
RANGE CLASSIFICATIONS**

Figure 45-4B

Procedures exist for calculating the CRS from automated surveys, but values can be assigned to a pavement section using the *Condition Rating Survey Manual for IDOT* as a basis. Further information regarding the CRS procedure can be obtained from the Office of Planning and Programming.

45-4.02(c) Pavement Condition Index (PCI)

The PCI is a numerical indicator that rates the surface condition of the pavement. The PCI procedure was developed by the U.S. Army Corps of Engineers (USACOE) to provide a systematic methodology for rating and reporting pavement condition. The procedure is described in the USACOE Construction Engineering Research Laboratory (CERL) Technical Report M-90/05, *Pavement Maintenance Management for Roads and Streets using the PAVER System* and the APWA PAVER *Pavement Condition Index Field Manual* and adopted by ASTM as a testing standard in D 6433, *Standard Practice for Roads and Parking Lots Pavement Condition Index Surveys*.

The output of the PCI procedure is a single number providing a numerical indication of the overall pavement condition. A PCI score encompasses components of the pavement that reflect its structural integrity, environmental damage, and other associated performance factors (e.g. safety). As shown in figure 45-4C, the final calculated PCI score is a number from 0 to 100, with 100 representing a pavement in excellent condition. Figure 45-4C also provides a range of PCI conditions in which pavement preservation is feasible and not feasible.

PCI Condition Ranges			
Excellent		100-86	100 – 65: Feasible for pavement preservation
Very Good		85-71	
Good		70-56	
Fair		55-41	64 - 0: Not feasible for pavement preservation
Poor		40-26	
Very Poor		25-11	
Failed		10-0	

**PAVEMENT PCI CONDITION
RANGE CLASSIFICATIONS**

Figure 45-4C

During the PCI survey procedure, the types of distress present on the pavement surface are quantified in terms of type, severity, and extent. This information provides valuable information on the current condition of the pavement, and is used in calculating the associated PCI value for the roadway.

45-4.02(d) Transportation Asset Management System (TAMS) Condition Rating

The Utah LTAP developed the TAMS to assist cities and counties with the management of their transportation systems. TAMS is an asset management computer program that utilizes information from a condition rating procedure to determine work strategies for the pavement network.

The distresses observed on the roadway are rated according to the Strategic Highway Research Program (SHRP) Distress Manual (Miller and Bellinger 2003). The rating forms utilize a matrix setup and classify the distresses according to low, medium, and high extents and severities. With the distress extent and severity classified, the condition information is entered into TAMS and used to determine the appropriate treatments for the pavement sections in the network.

45-4.03 Roughness/Ride Quality

Roughness information is often used to classify the ride quality of a pavement section from the users' perspective. This information can be used to characterize the condition of the roadway. Depending upon the level of detail desired for the roughness survey, data can be collected in a variety of manners. For example, if data is needed on a qualitative basis, a windshield survey where each driving lane is driven at posted speed limits and broad categories of roughness (e.g., not rough, slightly rough, moderately rough, very rough) are noted can be used. However, when detailed quantitative data is needed roughness-measuring equipment can be obtained using commercially available equipment. Further information regarding pavement roughness data is provided in section 53-1.04(b) of the IDOT *Bureau of Design Manual*.

45-4.04 Structural Capacity

Nondestructive testing can be used to measure the structural capacity of a pavement section. Often a device such as a falling weight deflectometer (FWD) is used to “backcalculate” the fundamental engineering properties of the pavement structure and underlying subgrade soil. The information can then be used to determine overly thickness for those pavements needing structural enhancement. Additional details regarding the use of the FWD are provided in Section 53-3.03 of the IDOT *Bureau of Design Manual*.

45-4.05 Surface Friction

Surface friction is another characteristic that can be used to assess the condition of the pavement. Surface friction, which is sometimes referred to as skid resistance, is directly related to the safety of the roadway. Details regarding pavement friction testing are provided in Section 53-3.04 of the IDOT *Bureau of Design Manual*.

45-5 TREATMENT SELECTION GUIDELINES

45-5.01 General

The use of pavement preservation strategies to maintain the condition of the pavement network requires that an agency address the following two questions:

- Is the pavement a good candidate for pavement preservation?
- If so, what treatment(s) can be applied?

Appropriate maintenance strategies are determined based upon a combination of the current condition of the pavement and the types of distresses present. In some cases, combinations of preservation strategies are needed to correct the combination of distress that is present on the pavement. The process of selecting the most appropriate combination of pavements and treatments for preservation activities includes the following general steps:

- Gather pavement information.
- Assess pavement condition.
- Evaluate pavement data.
- Identify feasible preservation treatments.
- Select most appropriate preservation treatment.

45-5.02 Gather Pavement Information

Selecting appropriate preservation techniques includes the collection of historical pavement information. The type of information needed to select the right projects and treatments include 1) pavement type, 2) pavement age and design life, 3) traffic, and 4) pavement cross section and materials. This is the type of information that can be housed in a pavement management system and accessed to make informed selection of the "right treatment at the right time on the right road".

The pavement type dictates the choice of treatment, as different techniques are appropriate for various surface types. In addition to pavement type, the age and design life of the pavement can provide insight into how the pavement has performed over time and how it can be expected to perform in the future. If the pavement is near the end of its design life, it may be an indication that preservation is not appropriate. The traffic level information, specifically the number of heavy trucks, is a critical detail for determining treatments that cannot provide appropriate performance for the expected traffic level. Knowing the existing pavement structure and materials properties can also be very useful to determine what treatments will work well with the current structure and how the pavement section might perform in the future.

45-5.03 Assess Pavement Condition

In addition to gathering historical pavement information, the current condition of the pavement must be assessed in order to determine feasible preservation treatments. Ideally the condition would be determined in the form of a standard condition rating procedure to include details of the types, severities, and the amounts of all distresses present on the pavement. A variety of

example condition rating procedures are described in section 45-4 for use in assessing the condition of the pavement. The agency also has the opportunity to use any other standard rating procedure or can use the general guidelines for detailing distress types that is provided in Section 45-4.02 to assess the types of distress present on their pavement network.

45-5.04 Evaluate Pavement Data

In order to determine whether a pavement section is a good candidate for pavement preservation treatments, the agency should consider the following:

- Is there excessive distress (large quantities and/or severe levels of distress) on the pavement section?
- Is there evidence of structural problems (e.g., any of the distresses listed in Figure 45-3AB)?
- Has the time for applying a pavement preservation treatment to the pavement while it is in “good” condition passed?
- Are there other known pavement problems (e.g., material problems or signs of construction problems) on the pavement section?
- Is there a history of pavement problems in this location?

If the answer to the majority of these questions is “no,” then the pavement section is likely to be a good candidate for pavement preservation techniques. For pavement sections for which the answer to most of these questions is “yes,” the agency should not consider preservation techniques and instead plan major rehabilitation or future reconstruction for the roadway.

For those sections that are good candidates for preservation treatments, figure 45-5A provides additional general guidelines for determining if the section should receive preservation treatments.

Condition Rating Procedure	Typical condition ranges for pavement preservation treatments
PASER	10 to 5
IDOT’s CRS	9.0 to 6.0
PCI	100 to 65

GENERAL GUIDELINES TO DETERMINE IF THE PAVEMENT SECTION IS ELIGIBLE FOR PAVEMENT PRESERVATION TREATMENTS

Figure 45-5A

45-5.05 Identify Feasible Preservation Treatments

The appropriate treatment strategy for those pavement sections identified as candidates for pavement preservation can be determined by looking at the type and severity of pavement distresses present on the pavement. Guidelines for determining recommended and feasible treatments are provided in figures 45-5B and 45-5C for flexible and rigid pavements. Figures 45-5B and 45-5C provide guidance for treatment selection based upon attributes such as distress levels, ride, friction, traffic levels, and relative cost. These characteristics are primarily

based on a relationship between a single treatment and a single distress. When multiple distresses exist, the appropriate treatment to address each distress type should be examined and the recommended treatments must be used in combination with engineering judgment to make final treatment decisions.

45-5.06 Select Most Appropriate Preservation Treatment

Of the feasible preservation treatments, the most appropriate treatment is one that can provide the best cost/benefit while meeting the constraints of the project. There are several methods to identify the treatment with the most benefit for the associated cost. This analysis is done internally within many pavement management systems. Ideally, the selection of the right treatment at the right time is governed by optimization (maximizing benefits for given constraints). However, treatment selection can be accomplished through a manual assessment of the benefits versus the projected project cost.

In addition to the benefits and costs of the feasible treatments, the selection of the most appropriate preservation treatment also includes considering the variety of project constraints that affect treatment selection. The types of project constraints that should be considered when selecting the most appropriate preservation treatment include:

- Availability of qualified contractors.
- Availability of quality materials.
- Agency practice or local preference.
- Time (of year) of construction.
- Initial costs.
- User preferences.
- Pavement noise.
- Facility downtime.
- Surface friction.

The effect of these constraints will vary from project to project and should be taken into consideration as the final projects are selected for inclusion in a pavement preservation program.

TREATMENT SELECTION GUIDELINES FOR FLEXIBLE PAVEMENTS

Figure 45-5B

R - Recommended treatment for the specified pavement condition. Engineer should ensure that all critical distress types are addressed by the selected treatment.

F - Feasible treatment, but depends upon other project constraints including other distresses.

NR - Treatment is not recommended to correct the specified pavement condition.

R* - Recommended treatment when used with milling prior to treatment.

R** - Used in combination with crack sealing.

1 - Preservation treatments do not correct alligator cracking. Of the included treatments, chip seals are most effective at covering the alligator cracking.

2 - If longitudinal and transverse cracking are present without other distresses, crack filling or sealing is recommended.

3 - If stable rutting is present without other distresses, microsurfacing or mill and overlay are the recommended treatment.

R - Recommended treatment for the specified pavement condition. Care must be examined in making sure that all critical distress types are addressed by the selected treatment.
R* - Recommended when used in conjunction with LTR and/or Subsealing/Undersealing.
F - Feasible treatment but depends upon other project constraints including other existing distresses.
F* - Feasible treatment if poor ride is a result of undow eled joints or faulted transverse (mid-slab) cracking.
NR - Treatment is not recommended to correct the specified pavement condition.
1 - LTR (Load Transfer Restoration) is normally used in combination with diamond grinding.

TREATMENT SELECTION GUIDELINES FOR RIGID PAVEMENTS

Figure 45-5C

HARD COPIES UNCONTROLLED

45-6 TREATMENTS

45-6.01 General

Many different pavement preservation techniques and treatments are available. These range from localized applications to treatments that are applied to the entire pavement surface. For all preservation treatments, the purpose is to minimize the effects of pavement distress or prevent them from occurring.

Commonly used preventive maintenance treatments and minor rehabilitation techniques are described in one-page summaries in this section. Further details regarding the treatments are available in the standard and supplemental specifications and the special provisions. Each treatment summary is followed by a simple pictorial representation of the major steps of the construction sequence for the treatment. The flexible and rigid pavement treatments that are presented are summarized in Figure 45-6A. Prior to the presentation of each treatment type is a *Special Considerations* section that provides details that are applicable to a variety of treatments.

Crack Filling Crack Sealing Fog Seals Sand Seals Scrub Seals Rejuvenators Slurry Seals Microsurfacing Chip Seals Cape Seals Cold In-place Recycling (CIR) Hot In-Place Recycling (HIR) Thin Asphalt Concrete Overlay Ultra-Thin Bonded Wearing Course Ultra-Thin Whitetopping (UTW) Cold Milling	Crack Sealing Joint Resealing Diamond Grinding Diamond Grooving Full-Depth Repairs Partial-Depth Repairs Load Transfer Restoration (LTR) Cross Stitching Pavement Subsealing/Undersealing
Drainage Preservation	

PAVEMENT PRESERVATION TREATMENTS FOR FLEXIBLE AND RIGID PAVEMENTS

Figure 45-6A

45-6.02 Special Considerations

There are several special considerations that must be addressed prior to the construction of various pavement preservation techniques.

45-6.02(a) Raised Pavement Markers

All pavement sections should be reviewed for the presence of raised pavement markers (RPMs) prior to treatment placement for global treatments. The thickness of the treatment should be evaluated to determine if the RPMs can remain in place. If so, the lens of the marker can be removed and tape placed over the marker during treatment placement. Following treatment placement, the tape can be removed and a new lens can be installed.

If the thickness of the treatment is such that the markers must be removed, then the hole from the removal of the markers should be repaired prior to the new treatment and the new marker should be repositioned in the new surface.

45-6.02(b) Pavement Preparation

All flexible pavement sections should be evaluated for the presence of bumps greater than 0.5 inch (12 mm) using a 16-foot straightedge. For flexible treatments that do not include milling or recycling of the pavement surface, the bumps should be ground prior to treatment placement. Special attention should be given to properly cleaning all milled materials off of the pavement surface prior to treatment placement. Cleaned surfaces are imperative prior to global flexible surface treatments in order to obtain proper bonding to the underlying pavement. Crack sealing, when needed prior to preventive maintenance treatment, should be placed at least 3 months prior to the placement of the treatment to minimize difficulties in constructing the treatment.

45-6.02(c) Pavement Markings

A minimum of seven days of good drying weather is needed prior to the placement of paint striping on various flexible pavement treatments. Temporary striping of water-based paint or foil-backed tape will be until permanent markings can be applied.

45-6.02(d) Traffic Control

Proper traffic control is needed to ensure acceptable cure times for the majority of treatments. Without proper traffic control after placement, premature failure of the preservation treatment may occur. For rigid pavements, the use of conventional patch materials is usually best for the long-term performance of the pavement but requires adequate curing which may not be available in high traffic volume areas or at certain times of the year.

45-6.02(e) Treatment Sequencing

When planning preservation work on rigid pavements, consideration should be given to the proper sequencing of treatments. For rigid pavements, an appropriate treatment sequence consists of the following: full- or partial-depth repairs, load transfer restoration, diamond grinding, and joint resealing.

45-6.03 Flexible Pavement Treatment Summaries**45-6.03(a) Crack Filling**

Crack filling is effective at reducing or delaying moisture damage, further crack deterioration, roughness, and rutting. However, crack filling can also have a negative impact on roughness and friction. (See Figure 45-6B)

Treatment Description: Crack filling is the process of placing material into non-working cracks to substantially reduce infiltration of water and to reinforce the adjacent pavement. Crack filling is characterized by minimal crack preparation and the use of lower quality bituminous filler materials.

Pavement Conditions Addressed: Adds no structural benefit, but does reduce moisture infiltration through cracks. Only practical if extent of cracking is minimal and if there is little to no structural cracking.

Application Limitations: These treatments are not recommended when structural failures exist (i.e., extensive fatigue cracking or high severity rutting) or if there is extensive pavement deterioration, or little remaining life. Crack filling is appropriate for cracks 0.125 to 1.0 inch wide (3.175 to 25.4 mm).

Non-working cracks narrower than 0.125 inches (3.175 mm) that do not exhibit spalling should not be filled. These cracks generally do not penetrate through the surface nor do they pose a source of pavement deterioration. The practice of filling this type of crack by the method of pouring filler on the pavement surface is seldom of value. A crack analysis should be performed to determine whether crack filler would be effective.

Construction Considerations: Placement should occur during cool, dry weather conditions. Application during cool weather will allow for expanded crack widths. Proper crack cleaning and a dry crack are essential to achieve good bond and maximum performance.

Traffic Considerations: Performance is not significantly affected by varying ADT or truck levels. However, improper installation can permit the filler to fail.

Special Considerations: Crack filling may have negative effects. Undesirable visual impacts may occur, which include tracking of filling material by tire action, obscuring lane markings, and adversely affecting friction/skid resistance. Crack filling may result in a rougher pavement surface when the filler material is forced out of the cracks during warm months.

Performance Period: 2 to 4 years.

Relative Cost (\$ to \$\$\$): \$

Step 1. Crack cleaning. The crack-filling process requires minimal crack preparation. This typically consists of using compressed air to clean the cracks.

Step 2. Application of crack filler. This photo shows the application of a crack filler using an "overbanded" configuration.

Step 3. Application of blotter. For hot-applied materials, a blotter coat of sand is often used to reduce "tracking" of the material by vehicle tires.

GENERAL CRACK FILLING STEPS

Figure 45-6B

45-6.03(b) Crack Sealing

Crack sealing is effective at reducing or delaying moisture damage, further crack deterioration, roughness, and rutting. However, crack sealing can also have a negative impact on roughness and friction. (See Figure 45-6C)

Treatment Description: Crack sealing is the process of placing higher-quality material into ~~working~~ cracks (i.e., those that open and close with changes in temperature) in order to reduce water infiltration into a pavement. In contrast to crack ~~filling~~, crack sealing requires more substantial crack preparation procedures and uses higher quality sealant materials. Thermosetting and thermoplastic materials are both used for crack sealing.

Pavement Conditions Addressed: Adds no structural benefit, but does reduce future intrusion of incompressible materials, water and soluble chemicals (e.g., salts and brines) into the cracks. It is only practical if extent of cracking is minimal and if there is little to no structural cracking.

Application Limitations: These treatments are not recommended when structural failures exist (i.e., extensive fatigue cracking or high severity rutting) or if there is extensive pavement deterioration, or little remaining life. Crack sealing is appropriate for cracks 0.125 to 1.0 inch (3.175 to 25.4 mm) wide.

Non-working cracks narrower than 0.125 inches (3.175 mm) that do not exhibit spalling should not be sealed. These cracks generally do not penetrate through the surface nor do they pose a source of pavement deterioration. The practice of filling this type of crack by the method of pouring sealant on the pavement surface is seldom of value.

Construction Considerations: Placement should occur during cool, dry weather conditions with moderate yearly temperatures. Proper crack preparation and cleaning is essential to good bond and maximum performance. Some agencies also use a hot compressed air lance prior to sealing.

Traffic Considerations: Performance is not significantly affected by varying ADT or truck levels. However, improper installation can permit the sealant to fail.

Special Considerations: Crack sealing may have negative effects. Undesirable visual impacts may occur, which include tracking of sealing material by tire action, obscuring lane markings, and adversely affecting skid resistance. Crack sealing may result in a rougher pavement surface when the sealant material is forced out of the cracks during warm months. Sealing is best accomplished several months in advance of any other preventive maintenance surface applications.

Performance Period: 2 to 8 years.

Relative Cost (\$ to \$\$\$): \$

Step 1. Crack refacing. A uniform sealant reservoir increases the probability of a neater, better performing sealant installation.

Step 2. Cleaning and drying. Cracks must be clean and dry to facilitate sealant bonding.

Step 3. Material application. This photo shows the application of sealant using a "simple band-aid" configuration.

Step 4. Application of blotter. For hot applied materials, a blotter coat of sand is often used to reduce "tracking" of the material by vehicle tires.

GENERAL CRACK SEALING STEPS

Figure 45-6C

45-6.03(c) Fog Seals

Fog seals are effective at sealing the pavement, inhibiting raveling, enriching the hardened/oxidized asphalt, and providing some pavement edge-shoulder delineation. However, fog seals can have a negative impact on friction and stripping in susceptible HMA pavements. (See Figure 45-6D)

Treatment Description: Fog seals are very light applications of a diluted asphalt emulsion placed directly on the pavement surface with no aggregate. Typical application rates range from 0.05 to 0.10 gal per yd² (0.23 to 0.45 liters per m²).

Pavement Conditions Addressed: Fog seals are placed primarily to seal the pavement, inhibit raveling, slightly enrich a hardened/oxidized asphalt, and provide some pavement edge-shoulder delineation. No structural benefit is added by this treatment.

Application Limitations: This treatment is not recommended when structural failures exist (e.g., significant fatigue cracking) or if there is already flushing/bleeding, friction loss, or thermal cracking.

Construction Considerations: Typically, a slow-setting emulsion (e.g., CSS-1H, SS-1H) is used, which requires time to "break." Because of this, the pavement is sometimes closed for 2 hours for curing before being re-opened to traffic.

Traffic Considerations: Increased ADT or truck levels can increase surface wear.

Special Considerations: Special consideration should be given to the raised pavement markers and bump grinding prior to treatment placement.

Performance Period: 1 to 3 years.

Relative Cost (\$ to \$\$\$\$): \$

Step 1. Surface preparation. The surface must be free of dust, dirt, and debris prior to applying the emulsion.

Step 2. Application of emulsion. The emulsion is applied using a distributor truck.

Step 3. Sand blotter and sweeping (if necessary). Sand blotters can help address a problem with delayed curing, as well as early opening to traffic. Sweeping may be required to remove excess sand.

GENERAL FOG SEAL CONSTRUCTION STEPS

Figure 45-6D

45-6.03(d) Sand Seals

Sand seals are effective at improving poor friction and reducing or preventing moisture damage, cracking, raveling, roughness, and rutting. However, they can also have a negative impact on stripping in susceptible HMA pavements. (See Figure 45-6E)

Treatment Description: A sand seal is a thin asphalt surface treatment constructed by spraying a non-diluted emulsion, spreading a thin layer of fine aggregate (i.e., sand), and rolling. Sand seals are typically 0.1 to 0.2 in (2 to 5 mm) thick. The primary purpose is to increase surface friction; however, in some cases, sand seals are used to “lock” the aggregates in a chip seal.

Pavement Conditions Addressed: Sand seals are primarily placed to improve poor friction; however, they are effective at slowing or preventing other distresses such as moisture damage, cracking, raveling, roughness, and rutting. No structural benefit is added by this treatment.

Application Limitations: This treatment is not recommended when structural failures exist (e.g., fatigue cracking or high severity rutting), or if there is extensive pavement deterioration or little remaining life.

Construction Considerations: Sand seals should be constructed when conditions are dry (i.e., the risk of rain is not likely which would hinder the proper construction of the sand seal) and when the minimum air temperature is moderate (i.e., normally 50 °F [10°C] or above). To assure good bond to the existing pavement, the surface should be clean and dry prior to emulsion placement.

Traffic Considerations: Sand seals should generally be limited to lower volume traffic conditions with a low percentage of trucks.

Special Considerations: Special consideration should be given to the raised pavement markers and bump grinding prior to treatment placement.

Performance Period: 3 to 4 years.

Relative Cost (\$ to \$\$\$\$): \$\$

Step 1. Surface preparation. The surface must be free of dust, dirt, and debris prior to applying the emulsion.

Step 2. Application of emulsion. The non-diluted emulsion is applied using a distributor truck.

Step 3. Sand application. Sand is applied with a spreader immediately after spray emulsion.

Step 4. Rolling and brooming. After the application of sand, the surface is rolled with pneumatic-tired rollers and broomed if necessary.

GENERAL SAND SEAL CONSTRUCTION STEPS

Figure 45-6E

45-6.03(e) Scrub Seals

Scrub seals are effective at filling narrow cracks (up to 0.5 in [12 mm]) wide, rejuvenating hardened/oxidized asphalt, and improving poor friction. No structural benefit is added by this treatment. (See Figure 45-6F)

Treatment Description: A scrub seal is a thin asphalt surface treatment constructed by spraying a polymer modified rejuvenating emulsion onto an existing pavement, dragging a broom across the surface to scrub the emulsified asphalt into the surface cracks, immediately spreading a thin layer of fine aggregate (i.e. sand or screenings) over the emulsified asphalt, dragging another broom over the surface to scrub the fine aggregate into the surface cracks, and rolling the surface with a pneumatic tire roller. Thicknesses generally range from 0.2 to 0.4 inches (5 to 10 mm).

Pavement Conditions Addressed: Scrub seals are primarily placed to fill narrow cracks, rejuvenate oxidized asphalt, and improve poor friction. No structural benefit is added by this treatment.

Application Limitations: This treatment is not recommended when structural failures exist (e.g., fatigue cracking) or if there is extensive pavement deterioration, or little remaining life. Scrub seals should not be applied to pavements with ruts greater than 0.25 inch (6 mm) deep.

Construction Considerations: Scrub seals should be constructed when conditions are dry (i.e., the risk of rain is not likely which would hinder the proper construction of the scrub seal) and when the minimum air temperature is moderate (i.e., normally 50 °F [10°C] or above). To assure good bond to the existing pavement, the surface should be clean and dry prior to emulsion placement.

Traffic Considerations: Scrub seals should generally be limited to lower volume traffic conditions with a low percentage of trucks.

Special Considerations: Special consideration should be given to the raised pavement markers and bump grinding prior to treatment placement. Scrub seals are susceptible to snow plow damage.

Performance Period: 2 to 5 years.

Relative Cost (\$ to \$\$\$\$): \$\$

Step 1. Surface preparation. The surface must be free of dust, dirt, and debris prior to applying the emulsion.

Step 2. Emulsion application and drag-brooming. Drag-brooming is used to work emulsion into cracks and surface voids.

Step 3. Sand application. A thin layer of sand is applied to the broomed emulsion.

Steps 4 & 5. Drag-brooming of sand and rolling. After the application of sand, the surface is drag-broomed again and rolled with pneumatic-tired rollers.

GENERAL SCRUB SEAL CONSTRUCTION STEPS

Figure 45-6F

45-6.03(f) Rejuvenators

Rejuvenators are effective at reducing the effects of raveling or roughness, and may also be used to slow down thermal cracking. (See Figure 45-6G)

Treatment Description: Rejuvenators are specialized emulsions that are sprayed on an existing asphalt surface with the intent of softening the existing binder, enriching the weathered pavement, and thereby, inhibiting raveling. The emulsions used as rejuvenators are typically mixtures of asphalt, polymer latex, and other additives. Rejuvenating emulsions can be used in a fog seal, sand seal, scrub seal, or any other surface seal applied directly to the pavement surface.

Pavement Conditions Addressed: While rejuvenators do not directly correct any distresses, they are effective at softening the existing binder; thereby, slowing the development of raveling, thermal cracking, and roughness.

Application Limitations: This treatment is not recommended when structural failures exist (e.g., fatigue cracking), where the surface has poor friction, or if there is extensive pavement deterioration or little remaining life.

Construction Considerations: Choosing an appropriate rejuvenating agent, and determining the correct application rate for the existing pavement's material characteristics and condition, are the most important construction-related considerations. Testing needs to be conducted to determine the correct application rate.

Traffic Considerations: Rejuvenators are effective on asphalt surfaces in all traffic conditions. However, traffic should not be allowed back on the surface until adequate friction is restored. This is often provided by the placement of manufactured sand prior to opening to traffic.

Special Considerations: When selecting a rejuvenator for a project, questions regarding available materials can be directed to the IDOT Bureau of Materials and Physical Research.

Performance Period: 3 to 5 years.

Relative Cost (\$ to \$\$\$\$): \$\$

Step 1. Rejuvenator application. The rejuvenating emulsion is applied to the surface using a distributor truck.

Step 2. Light sanding. After the rejuvenator has been allowed to be absorbed for the recommended amount of time, a light application of sand is often applied to improve skid resistance.

GENERAL REJUVENATOR CONSTRUCTION STEPS

Figure 45-6G

45-6.03(g) Slurry Seals

Slurry seals are effective at sealing low-severity cracks, waterproofing the surface, and restoring friction. However, they can also accelerate the development of stripping in susceptible AC pavements. (See Figure 45-6H)

Treatment Description: Mixture of crushed well-graded aggregate (fine sand and mineral filler) and asphalt emulsion that is spread over the entire pavement surface with either a squeegee or spreader box attached to the back of a truck. They are effective in sealing low-severity surface cracks, waterproofing the pavement surface, and improving skid resistance at speeds below 30 mph (64 km/h). Thickness is generally <0.5 in (13 mm).

Pavement Conditions Addressed: Low-severity cracking; raveling/weathering (loose material must be removed); asphalt oxidation and hardening; friction loss; and moisture infiltration. While slurry seals add no structural capacity, they can temporarily seal cracks (if severity is low) or fill very minor rutting (if the ruts are not severe and are stable). It is strongly recommended to complete needed patching and crack sealing before slurry seal placement.

Application Limitations: Slurry seals are not recommended when structural failures exist (e.g., significant fatigue cracking and deep rutting) or if there is high-severity thermal cracking. They also can accelerate the development of stripping in susceptible AC pavements.

Construction Considerations: Surface must be clean and areas of traffic tape, thermoplastics, or new paint striping should be removed prior to placement. Aggregates must be clean, angular, durable, well-graded, and uniform. Avoid placement in hot weather (potential flushing problems) or when freezing temperatures are expected. Slurry seals should be placed between May 1 and October 15 and when the temperature is at least 50 °F (10°C) and rising and the forecast for the next 24 hours is above 40 °F (5°C). Avoid premature opening to traffic and premature placement of pavement markers and striping. Quick setting emulsions may cure in as little as 1 hour, but others may require from 2 to 4 hours depending upon the environmental conditions. Temporary pavement markings should be used until permanent markings are applied a minimum of 7 days following slurry seal placement.

Traffic Considerations: Performance in terms of surface wear is affected by increasing ADT and truck traffic levels. Slurry mix properties (i.e., aggregate quality, gradation, modifiers, and emulsion content) can be modified to accommodate the higher traffic volumes. Areas of heavy truck turning or down grade locations are best avoided as there is a high potential for early damage.

Special Considerations: The designer should use the IDOT *Special Provision for Preventive Maintenance – Slurry Seal* as a basis for use of this treatment. Special consideration should be given to the raised pavement markers and bump grinding prior to treatment placement.

Performance Period: 3 to 6 years.

Relative Cost (\$ to \$\$\$\$): \$\$

Step 1. Repair existing distress. Any structural failures should be patched, and non-working cracks >0.25 in. (6 mm) wide should be sealed.

Step 2. Prepare surface. Surface must be clean, and striping must be removed. All other in-pavement fixtures (e.g., manholes) need to be protected prior to paving.

Step 3. Slurry placement. This photo shows the placement of material using a slurry seal spreader box.

Step 4. Hand work. Some handwork is required to smooth edges. Excessive handwork can segregate the mix as well as leave an unsatisfactory finish.

GENERAL SLURRY SEAL CONSTRUCTION STEPS

Figure 45-6H

45-6.03(h) Micro-surfacing

Micro-surfacing is effective at correcting or inhibiting raveling and oxidation of the pavement surface, improving surface friction, sealing the pavement surface, and filling minor surface irregularities and wheel ruts up to 1.25 inches (32 mm) deep. (See Figure 45-6I)

Treatment Description: Applied in a process similar to slurry seals, micro-surfacing consists of a mixture of latex-modified emulsified asphalt, mineral aggregate, mineral filler, water, and additives. Micro-surfacing material is mixed in specialized, compartmented, self-powered trucks and placed on the pavement using an augered screed box.

Pavement Conditions Addressed: Low-severity cracking; raveling/weathering (loose material must be removed); low- to medium-severity bleeding; minor roughness; friction loss; and moisture infiltration. Adds limited structural capacity. Temporarily seals fatigue cracks (if severity is low) and can serve as a rut-filler (if the existing ruts are stable). A scratch coat of the microsurfacing can be used for light profile repairs.

Application Limitations: Micro-surfacing is not recommended when the pavement contains structural failures (e.g., significant fatigue cracking), high-severity thermal cracking, or extensive pavement deterioration. This treatment can also accelerate the development of stripping in susceptible AC pavements.

Construction Considerations: Avoid placement in hot weather if there is potential for flushing problems. Placement in cool weather can lead to early raveling. Do not place when freezing temperatures are expected. Micro-surfacing should be placed between May 1 and October 15 and when the temperature is at least 50 °F (10°C) and rising and the forecast for the next 24 hours is above 40 °F (5°C). Avoid premature placement of pavement markers and striping. A minimum of 7 days of good drying weather should be allowed before placement of new markers or striping with temporary markers used prior to permanent placement. Micro-surfacing typically breaks within a few minutes of placement and can carry traffic after approximately an hour.

Traffic Considerations: Very successful on both low and high volume roadways. However, areas of heavy truck turning or down grade locations are best avoided as there is a high potential for early damage. The dusting of a blotter material can be used to allow for earlier opening of intersections and turning lanes.

Special Considerations: The designer should use the IDOT *Special Provision for Preventive Maintenance – Micro-surfacing* as a basis for use of this treatment. If micro-surfacing is being used to fill ruts, this must be specified on the plans along with appropriate gradation and application rate. Special consideration should be given to the raised pavement markers and bump grinding prior to treatment placement.

Performance Period: 4 to 7 years.

Relative Cost (\$ to \$\$\$\$): \$\$

Step 1. Repair existing distress. Any structural failures should be patched, and non-working cracks >0.25 in. (6 mm) wide should be sealed.

Step 2. Prepare surface. Surface must be clean, and striping must be removed. All other in-pavement fixtures (e.g., manholes) need to be protected prior to paving.

Step 3. Microsurfacing placement. This photo shows the placement of material using a microsurfacing spreader box.

Step 4. Hand work. Some handwork may be required to smooth edges. Excessive handwork can segregate the mix as well as leave an unsatisfactory finish.

GENERAL MICRO-SURFACING CONSTRUCTION STEPS

Figure 45-6I

45-6.03(i) Bituminous Surface Treatments (BST)

BST, also known as chip seals, are effective at improving poor friction, inhibiting raveling, correcting minor roughness and bleeding, and sealing the pavement surface. (See Figure 45-6J)

Treatment Description: Asphalt (commonly an emulsion) is applied directly to the pavement surface (0.26 to 0.46 gal/yd² [1.2 to 2.1 l/m²]) followed by the application of aggregate chips (16 to 30 lb/yd² [9 to 16 kg/m²]), which are then immediately rolled to imbed chips (50 to 70 percent). Application rates depend upon aggregate gradation and maximum size. This treatment can be applied in multiple layers (e.g., double chip seals) and in combination with other surface treatments.

Pavement Conditions Addressed: Longitudinal, transverse, and block cracking; raveling/weathering (loose material must be removed); friction loss; minor roughness; low-severity bleeding; and moisture infiltration. Adds almost no structural capacity. The flexible impermeable AC surface helps reduce cracking and is somewhat effective at sealing medium-severity fatigue cracks in comparison with other treatments.

Application Limitations: Not recommended for pavements with the following conditions: structural deficiency; cracks > 0.25 in (6 mm) wide; medium- to high-severity alligator cracking; many potholes; rutting > 1 in (25 mm) deep; very rough surface. BST can also accelerate the development of stripping in susceptible AC pavements.

Construction Considerations: Surface must be clean. Treatment should be placed during warm weather with chip spreader immediately behind asphalt distributor and rollers close behind the spreader. BST are placed from May 1 to August 31 and when the temperature in the shade is above 55 °F (13°C). Approximately 2 hours of cure time are required before roadway may be re-opened to normal speed traffic. Brooming is usually required to remove loose chips. Pilot vehicles should be used to make sure traffic does not damage the fresh surface and to reduce windshield breakage and other vehicle damage. Lightweight aggregate can be used to help minimize claims. Flaggers may be needed at crossing intersections to control traffic. Avoid premature placement of pavement markers and striping.

Traffic Considerations: With special design and proper placement, BST can perform well on high-volume roads. However, use is sometimes limited to lower-speed, lower-volume roads because of the propensity for loose chips to crack windshields.

Special Considerations: The designer should use IDOT's *Special Provision for Preventive Maintenance-- Chip Seals* as a basis for use of the treatment and must specify the gradation for the chip seal on the developed plans. The provision also includes details for extending the construction season. Special consideration should be given to the raised pavement markers and bump grinding prior to treatment placement. Additional information is available from the BLRS Technology Transfer Center (T²) Report, *Seal Coats (Oil & Chipping)* (IDOT 2006).

Performance Period: Single seals: 4 to 6 years; double seals; 5 to 7 years.

Relative Cost (\$ to \$\$\$): \$\$

Step 1. Surface preparation. Surface must be clean and dry to ensure good bond with the asphalt.

Step 2. Binder application. The asphalt binder is applied to the surface with a distributor truck.

Step 3. Aggregate application. A self-propelled, pneumatic-tired, motorized unit has a hopper on the front where the chips are dumped.

Steps 4 & 5. Rolling and brooming. After the application of the aggregate, the surface is rolled with pneumatic-tired rollers and broomed to remove excess aggregate.

GENERAL BST CONSTRUCTION STEPS

Figure 45-6J

45-6.03(j) Cape Seals

A cape seal combines a BST with slurry or micro-surfacing to provide a smooth wearing quiet surface at a lower cost than a full asphalt concrete overlay. (See Figure 45-6K)

Treatment Description: The treatment consists of a BST, followed within a few days by a micro-surfacing treatment to cover the chips and seal them in.

Pavement Conditions Addressed: Longitudinal, transverse, and block cracking; raveling/weathering (loose material must be removed); friction loss; minor roughness; low- to medium-severity bleeding; and moisture infiltration. Adds limited structural capacity. Somewhat effective at sealing medium-severity fatigue cracks in comparison with other treatments.

Application Limitations: Not recommended for pavements with the following conditions: structural deficiency; cracks > 0.25 in (6 mm) wide; medium- to high-severity alligator cracking; many potholes; rutting > 1 in (25 mm) deep; very rough surface. This treatment can also accelerate the development of stripping in susceptible AC pavements.

Construction Considerations: Construction should be done in summer months, and the micro-surfacing should follow the BST by no more than 12 days. Temperature and placement time of year details for chip seals and micro-surfacing apply to the use of this treatment. The existing surface should be cleaned and any areas requiring pavement repairs should be corrected using partial depth repairs prior to application of the BST.

Traffic Considerations: No traffic concerns, since the application of the micro-surfacing removes the hazard of loose chips on high-volume or high-speed roadways.

Special Considerations: The designer should use IDOT's *Special Provision for Preventive Maintenance – Cape Seals* as a basis for use of the treatment and must specify the gradation for the BST on the developed plans. The provision also includes details for extending the construction season of the BST. Special consideration should be given to raised pavement markers and bump grinding prior to treatment placement.

Performance Period: 4 to 7 years.

Relative Cost (\$ to \$\$\$\$): \$\$

Step 1. Surface preparation. Surface must be clean and dry to ensure good bond with the asphalt.

Steps 2 & 3. Binder and aggregate application. The asphalt binder is applied to the surface with a distributor truck. A self-propelled, pneumatic-tired, motorized unit has a hopper on the front where the chips are dumped.

Steps 4 & 5. Rolling and brooming. After the application of the aggregate, the surface is rolled with pneumatic-tired rollers and broomed to remove excess aggregate.

Step 6. Slurry placement. This photo shows the placement of material using a microsurfacing spreader box. This material should be placed within 12 days of the placement of the chip seal.

GENERAL CAPE SEAL CONSTRUCTION STEPS

Figure 45-6K

45-6.03(k) Cold In-Place Recycling (CIR)

CIR is very effective at correcting distresses contained in the top 2 to 4 in (50 to 100 mm) of the pavement surface. Examples include poor friction and roughness, bleeding, raveling, rutting, and poor cross slope. (See Figure 45-6L)

Treatment Description: Cold in-place recycling (CIR) is an in situ process used to recycle the top 2 to 4 in (50 to 100 mm) of an existing asphalt concrete pavement to construct a new asphalt concrete layer. As the name suggests, the recycling process is conducted without the addition of heat. During the CIR process, the reclaimed asphalt pavement (RAP) is sized, mixed with additives (e.g., asphalt binder, emulsion, rejuvenator, and/or virgin aggregate), and relaid. The recycled pavement is then typically resurfaced with a surface treatment or an AC overlay.

Pavement Conditions Addressed: Cracking limited to the surface layers; profile, crown, and cross slope problems; poor ride quality and surface friction; rutting, corrugations, and bumps; raveling; and bleeding.

Application Limitations: CIR is not an appropriate treatment for pavements with major or extensive structural deficiencies (severe alligator cracking and severe structural rutting), or distresses deeper than the CIR depth. CIR may also be difficult to conduct on steep grades, tightly curved roads, or on roads with many utility appurtenances.

Construction Considerations: The CIR process uses a number of pieces of equipment including tanker trucks, milling machines, crushing and screening units, mixers, pavers, and rollers. CIR should not be performed at temperatures below 50 °F (10 °C) or when it is raining. It takes 1 to 2 weeks of good weather for the CIR material to cure.

Traffic Considerations: CIR is most often used on secondary and low volume roads.

Special Considerations: Areas of weak material should be removed and replaced with suitable patching material prior to recycling to reduce the risk of the cold planing machine or other CIR equipment breaking through the pavement.

Performance Period: 5 to 13 years.

Relative Cost (\$ to \$\$\$\$): \$\$\$

Step 1. Pulverization. In a multi-unit train, the pavement material is first milled and placed in a windrow.

Step 2. Mix recycling. Next, the milled material is crushed, sized, mixed with recycling additives.

Step 3. Laydown. Conventional paving equipment is used to place the recycled material.

Steps 4. Rolling. Steel-wheeled rollers are used for final compaction.

GENERAL COLD IN-PLACE RECYCLING CONSTRUCTION STEPS

Figure 45-6L

45-6.03(I) Hot In-Place Recycling (HIR)

HIR is effective at correcting surface distresses that are limited to the top 1 to 2 in (25 to 50 mm). Examples include rutting, corrugations, raveling, flushing, loss of surface friction, minor thermal cracking, and minor load-associated cracking. (See Figure 45-6M)

Treatment Description: A process of correcting asphalt pavement surface distress by softening the existing surface with heat, mechanically loosening the pavement surface, mixing the loosened surface material with recycling agent, aggregate, rejuvenators, or hot-mix asphalt, and relaying the recycled material without removing it from the site. Different HIR processes include: *surface recycling (heater scarification)*, *repaving*, and *remixing*.

Pavement Conditions Addressed: HIR is effective at correcting surface distresses that are limited to the top 1 to 2 in (25 to 50 mm). Examples include rutting, corrugations, raveling, flushing, loss of surface friction, minor thermal cracking, and minor load-associated cracking.

Application Limitations: Good HIR candidates have no structural failures; limited variation in the existing AC mix; no paving fabrics or interlayers in the anticipated treatment depth plus 25 percent; no deep ruts greater than one-half of the anticipated HIR treatment depth; no large stone mixes. The presence of rubber in the surface lift, rubberized seal coats, and some crack fillers require special attention in the mix design process.

Construction Considerations: As the HIR equipment is relatively wide and long, short road sections, particularly in urban settings, are not suitable for HIR treatment. HIR should not be performed at temperatures below 50 °F (10 °C) or when it is raining.

Traffic Considerations: HIR is appropriate for Very Low to High traffic conditions. *The heater-scarification* process should be used only for low volume traffic. The *remixing* and *repaving* processes can be used on high traffic volume roads.

Special Considerations: Crack sealant should be removed prior to the HIR operation to reduce flash fires or excessive blue smoke from the treatment placement.

Performance Period: 6 to 15 years.

Relative Cost (\$ to \$\$\$\$): \$\$\$

Step 1. Heating the surface. The surface is heated to soften the existing material.

Step 2. Surface scarification. The surface is loosened with scarifying teeth.

Step 3. Addition of Rejuvenator. A rejuvenating agent is sprayed onto the loosened material and mixed.

Step 4. Laydown. Mixed material is placed with conventional equipment.

Step 5. Rolling. Steel-wheeled rollers are used to compact the final surface.

GENERAL HOT IN-PLACE RECYCLING CONSTRUCTION STEPS

Figure 45-6M

45-6.03(m) Thin HMA Overlay

The combination of cold milling and the application of a thin HMA overlay is a viable option for improving rideability and surface friction, reducing hydroplaning and tire splash (using an open graded friction course), and improving the profile, crown, and cross slope. (See Figure 45-6N)

Treatment Description: Plant-mixed combinations of asphalt cement and aggregate applied to the pavement in thicknesses between about 0.75 and 1.50 in (19 and 38 mm). Dense-graded, open-graded, and stone matrix mixes are all used. The SMART program (Surface Maintenance At the Right Time) consists of placing a 1.5 inch (38 mm) single-pass overlay on a previously resurfaced pavement that is not in need of significant repair and is in good condition. If the SMART overlay is applied at the correct time, it can delay serious distresses, extend the life of the pavement, and decrease the overall cost. A Half-SMART overlay is another treatment option, which consists of 0.75 in (19 mm) HMA level binder with a BST on top.

Pavement Conditions Addressed: Low-severity cracking; raveling/weathering (loose material must be removed); friction loss; roughness; low-severity bleeding; low-severity block cracking (may perform better with additional milling). Thin overlays may also be used to correct rutting (requires use of separate rut-fill application).

Application Limitations: Thin HMA overlays are not recommended where there are structural failures (e.g., fatigue cracking), extensive pavement deterioration, or if there is high-severity thermal cracking. Surface should be uniform to ensure uniform compaction.

Construction Considerations: Surface must be clean. A tack coat prior to overlay placement will help improve the bond to the existing surface. Thin HMA overlays dissipate heat rapidly and, therefore, depend upon minimum specified mix placement temperatures and timely compaction.

Traffic Considerations: Performance is not affected by different ADT or percent trucks. Thin AC overlays are not structural layers and as such should not be subjected to strain from loadings. Such layers may be subject to top-down cracking under certain combinations of loadings, environmental conditions, and pavement structures.

Special Considerations: The minimum lift thickness information provided in Figure 37-1A of the BLRS Manual should be followed when using a thin overlay as a treatment. Localized distressed areas should be repaired prior to the placement of the overlay. If milling is not used in conjunction with the thin HMA overlay, special consideration should be given to bump grinding prior to treatment placement.

Performance Period: 5 to 10 years depending upon thickness.

Relative Cost (\$ to \$\$\$\$): \$\$\$

Step 1. Pre-overlay repair & surface preparation. Localized areas of distress are repaired prior to overlay placement and milling may be used.

Step 2. Tack coat. A tack coat is used to promote bonding between the overlay and the existing pavement.

Step 3. AC Overlay. Material is placed with conventional equipment.

Step 4. Compaction. Steel-wheeled rollers are used to compact the overlay.

GENERAL THIN HMA OVERLAY CONSTRUCTION STEPS

Figure 45-6N

45-6.03(n) Ultra-Thin Bonded Wearing Courses

An ultra-thin bonded wearing course is an alternative to BST, micro-surfacing, or thin HMA overlays as it effectively addresses minor surface distresses and increases surface friction. (See Figure 45-6O)

Treatment Description: The treatment is formed in one pass with the application of a heavy, polymer-modified asphalt emulsion tack coat and a gap-graded, polymer-modified 0.4 to 0.8 in (10 to 20 mm) HMA layer.

Pavement Conditions Addressed: Low-severity cracking (high-severity can be addressed with cold milling); raveling/weathering (loose material must be removed); high-severity friction loss; low-severity roughness; and low-severity bleeding. Provides some increased capacity and retards fatigue cracking but is not suited for rutted pavements.

Application Limitations: Ultra-thin bonded wearing courses are not recommended when structural failures exist (e.g., significant fatigue cracking and deep rutting) or if there is high-severity thermal cracking. They also are not appropriate where there is extensive pavement deterioration or little remaining life.

Construction Considerations: Requires special paving equipment to place the mix. Localized structural problems should be repaired prior to overlay application.

Traffic Considerations: Capable of withstanding high ADT volumes and truck traffic better than other thin treatments.

Special Considerations: Special consideration should be given to bump grinding prior to treatment placement.

Performance Period: 7 to 12 years.

Relative Cost (\$ to \$\$\$\$): \$\$\$

Step 1. Pre-overlay repair & surface preparation. Localized areas of distress are repaired prior to overlay placement.

Step 2. Milling. If necessary, milling is used to remove distress and promote bonding with the existing surface.

Step 3. Tack coat and overlay placement. Special equipment is used to apply the polymer modified emulsion and AC overlay in one pass.

Step 4. Rolling. Steel-wheeled rollers are used to compact the overlay.

GENERAL ULTRA-THIN FRICTION COURSES CONSTRUCTION STEPS

Figure 45-60

45-6.03(o) Ultra-Thin Whitetopping (UTW)

Ultra-thin whitetopping is very effective at correcting many surface-related distresses. (See Figure 45-6P)

Treatment Description: UTW is a thin portland cement concrete (PCC) layer that is applied over an existing AC pavement. UTW is primarily characterized by its very thin slabs (2 to 4 in. [50 to 100 mm]) and short joint spacing (2 to 6 ft [0.6 to 1.8 m]). The UTW layer is bonded to the existing AC to increase load-carrying capacity.

Pavement Conditions Addressed: UTW is very effective at addressing many surface-related distresses such as rutting, washboarding, raveling, roughness, poor friction, shoving, and potholes.

Application Limitations: The existing AC must not be excessively deteriorated and must still have some load-carrying capacity. Severely deteriorated AC pavements with significant structural deterioration, inadequate base/subbase support, poor drainage conditions, or stripping of the AC layers are not candidates for UTW overlays).

Construction Considerations: Because milling is performed prior to the UTW placement, vertical overhead clearances, matching of adjacent shoulder/traffic lane elevations, and the maintenance of curb reveals is generally not a problem; however, this should be verified during the design process. Construction considerations are similar to those associated with traditional PCC paving.

Traffic Considerations: UTW performs well in all traffic conditions.

Special Considerations: This treatment is highly effective at correcting the noted distresses but is also significantly more expensive than other preventive maintenance treatments for AC pavements.

Performance Period: 5 to 15 years.

Relative Cost (\$ to \$\$\$\$): \$\$\$\$

Step 1 & 2. Pre-overlay repair & milling and cleaning. Localized areas of distress are repaired prior to overlay placement. The surface is milled to remove rutting and restore profile prior to PCC placement.

Step 3. PCC placement. PCC is placed using conventional methods.

Step 4. Finishing & texturing. The PCC is finished and textured using conventional methods.

Step 5. Joint sawing & curing. Timely joint sawing is required to establish the contraction joints in the PCC pavement. Curing is important for UTW overlays due to the high surface-area-to-volume ratio.

ULTRA-THIN WHITETOPPING GENERAL CONSTRUCTION STEPS

Figure 45-6P

45-6.03(p) Cold Milling

Cold milling is effective at removing distresses in the top of the pavement, providing a smoother surface by removing vertical deformations, and improving surface friction. (See Figure 45-6Q)

Treatment Description: Cold milling involves the removal of part or all of an existing asphalt concrete surface. This treatment is frequently used to prepare an asphalt surface for an asphalt concrete overlay. It is not generally suggested as a stand alone treatment.

Pavement Conditions Addressed: Adds no structural benefit, but removes surface cracking and roughness, and restores friction. It can also be used to restore proper grades and cross-slopes on existing pavement.

Application Limitations: This treatment is not recommended for structurally deficient pavements.

Construction Considerations: The following are keys to obtaining a quality milled surface:

- Use a good working milling machine with a 12-ft (3.7-m) recommended width
- Control milling speed to achieve a smooth uniform surface (30 ft/min [9.14 m/min] or slower for deep cuts)
- Use a 30-ft (9.1-m) ski to control grade and a stringline for longitudinal guidance
- Perform pavement patching prior to milling
- Remove pavement castings and cover holes prior to milling
- Adjust casting after milling to meet final surface elevation
- If this treatment is used as a stand alone treatment, a fine-toothed milling drum is needed to improve the smoothness and safety of the milled surface

Traffic Considerations: Cold milling can be used at all traffic levels.

Special Considerations: While not generally suggested as a stand alone treatment if the district bureaus review and agree upon the implementation plan, cold milling without applying another treatment to the milled surface may be considered. In order for the milled surface to be used as stand alone treatment, the pavement must be structurally sound with at least 3 inches of the existing asphalt concrete remaining in place and the removed material must be equal to an existing lift (at least 1 to 1.5 in [25 to 38 mm] of binder course remains). Also, the existing mixture must have a high fines content and low air voids content to avoid raveling.

Performance Period: Remaining life of the pavement (doesn't extend life).

Relative Cost (\$ to \$\$\$\$): \$

Step 1. Prepare surface. Patching should be completed before milling. All other in-pavement fixtures (e.g., manholes) need to be protected prior to cold milling.

Step 2. Milling. Milling is used to remove distresses such as segregation, rutting, raveling, or block cracking.

COLD MILLING GENERAL CONSTRUCTION STEPS

Figure 45-6Q

45-6.04 Rigid Pavement Treatment Summaries

45-6.04(a) Crack Sealing

Crack sealing is effective at reducing or delaying moisture damage, as well as crack deterioration and associated roughness. However, roughness can also be increased as a result of the sealing process itself, particularly if placed in an overband configuration. (See Figure 45-6R)

Treatment Description: Crack sealing is an operation involving thorough crack preparation and placement of high-quality materials into or over candidate cracks to significantly reduce moisture infiltration and to retard the rate of crack deterioration. Sealed cracks in PCC pavements deteriorate less and contribute less to the overall deterioration of the pavement. PCC cracks are typically sealed with thermosetting bituminous materials.

Pavement Conditions Addressed: Crack sealing is effective at sealing low- or medium-severity transverse or longitudinal cracks where the crack width is ≤ 0.5 in (13 mm). Full-depth working transverse cracks typically experience the same range of movement as transverse joints; therefore, it is recommended that these cracks be sealed to reduce water and incompressible infiltration.

Application Limitations: Crack sealing is most effective when performed on PCC pavements that exhibit minimal structural deterioration and in which the cracks are not showing other significant distress such as faulting or spalling.

Construction Considerations: Sealant performance is dependent on many construction factors, including material type and placement geometry, and application in a clean and dry substrate.

Traffic Considerations: Performance is not significantly affected by varying ADT or truck levels but should be allowed to cure before opening to traffic. However, improper installation can permit the sealant to fail.

Special Considerations: Crack sealing may have negative effects. Undesirable visual impacts may occur, which include tracking of sealing material by tire action, obscuring lane markings, and adversely affecting skid resistance. Crack sealing may result in a rougher pavement surface when the sealant material is forced out of the cracks during warm months.

Performance Period: 4 to 8 years.

Relative Cost (\$ to \$\$\$\$): \$

Step 1. Crack refacing. Small crack saws are used to reface cracks and create a reservoir for the sealant.

Step 2. Cleaning. Cracks must be clean and dry to enhance sealant bonding.

Step 3. Backer rod installation. Backer rod can be used to control the depth of the sealant in the crack.

Step 4. Application of sealant. The last step is to place the sealant in the refaced crack per governing specifications.

CRACK SEALING

Figure 45-6R

45-6.04(b) Joint Resealing

Joint resealing helps keep moisture out of the pavement layers and incompressibles out of joints, which reduces faulting, pumping, and spalling. (See Figure 45-6S)

Treatment Description: Resealing transverse joints in PCC pavements is intended to minimize the infiltration of surface water into the underlying pavement structure and to prevent the intrusion of incompressibles into the joint. A range of materials from bituminous to silicone are used in various configurations.

Pavement Conditions Addressed: Joint resealing is effective at keeping moisture out of the pavement layers, and incompressibles out of joints, which can result in less faulting, pumping, and spalling.

Application Limitations: Joint resealing is most effective when performed on PCC pavements that exhibit minimal structural deterioration. Material selection should be based on the expected time until next treatment.

Construction Considerations: Sealant performance is dependent on many construction factors, including material type and placement geometry, and application in a clean and dry substrate.

Traffic Considerations: Performance is not affected by different ADT or percent trucks. Silicone sealants which are not properly recessed are more likely to fail in the wheelpath.

Special Considerations: Joint resealing is necessary when the existing sealant has deteriorated to the point that it readily allows water and incompressibles to enter the joint. The primary cause of sealant failure is improper installation (e.g., not preparing joint sidewalls and getting bonding).

Performance Period: 4 to 8 years for hot-poured asphalt sealant; ~8 years for silicone sealant.

Relative Cost (\$ to \$\$\$\$): \$

Steps 1 & 2. Sealant removal & joint refacing. This photo shows the removal of existing sealant. Joints are refaced to create a uniform reservoir for the sealant.

Step 2. Cleaning. Joints must be clean and dry to enhance sealant bonding.

Step 3. Backer rod installation. Backer rod can be used to control the depth of the sealant in the joint.

Step 4. Application of sealant. The last step is to place the sealant in the refaced joint per governing specifications.

JOINT RESEALING GENERAL JOINT RESEALING STEPS

Figure 45-6S

45-6.04(c) Diamond Grinding

Diamond grinding is effective at removing joint faulting and other surface irregularities to restore a smooth-riding surface and increase pavement surface friction. (See Figure 45-6T)

Treatment Description: Diamond grinding is the removal of a thin layer of concrete (generally up to about 0.25 in [6.4 mm]) from the surface of the pavement, using special equipment outfitted with a series of closely spaced, diamond saw blades.

Pavement Conditions Addressed: Diamond grinding is used to remove joint faulting and other surface irregularities to restore a smooth-riding surface and increase pavement surface friction.

Application Limitations: If significant faulting is present, or other signs of structural failure (such as mid-panel cracks or corner breaks), diamond grinding is not appropriate. The presence of materials-related distresses may also preclude the use of diamond grinding. Soft aggregate will wear much quicker and require more frequent grinding.

Construction Considerations: Typically constructed with a moving lane closure with traffic operating in the adjacent lanes. Diamond grinding should be used in conjunction with all restoration techniques including load-transfer restoration, full- and partial depth repair, cross stitching, and subsealing/undersealing.

Traffic Considerations: Grinding may be used to remove faulting, which if the mechanism is not addressed can reoccur due to the continued application of truck traffic. If used to restore friction to a polished pavement (due to vehicle traffic), heavy volumes of traffic may cause the problem to reoccur.

Special Considerations: Note that diamond grinding is a surface repair method because it corrects the existing faulting and wear of PCC pavements. It does nothing to correct pavement distress mechanisms. Therefore, grinding usually is performed in combination with other rehabilitation methods to both repair certain pavement distresses and prevent their recurrence.

Performance Period: 8 to 15 years.

Relative Cost (\$ to \$\$\$\$): \$\$

Diamond grinding process. Multiple passes of the grinding equipment are used to remove material from the pavement surface.

Diamond grinding depth. Generally up to about 0.25 in. (6.4 mm) of the surface is removed in a single pass.

DIAMOND GRINDING CONSTRUCTION

Figure 45-6T

45-6.04(d) Diamond Grooving

Diamond grooving is effective at increasing wet-pavement friction and reducing splash and spray in identified problem areas. (See Figure 45-6U)

Treatment Description: Diamond grooving is the process of cutting narrow, discrete grooves in the PCC surface to reduce hydroplaning and wet-pavement crashes in localized areas. Grooving can be performed in both the longitudinal and transverse directions, but is more commonly performed longitudinally.

Pavement Conditions Addressed: Grooving is conducted to increase wet-pavement friction and reduce splash and spray. Diamond grooving is conducted in localized areas of a project where wet-pavement crashes have historically been a problem (e.g., curves and intersections).

Application Limitations: In general, candidate pavements for grooving should be structurally and functionally sound.

Construction Considerations: Areas to be grooved should be clearly indicated on project plans. The grooves should be cut in accordance with recommendations of the International Grinding and Grooving Association (IGGA), which specify 0.75 in (19mm) spacing with 0.125 in (3mm) depth and width. The entire lane area should be grooved; however, allowance should be made for small areas that were not grooved because of pavement surface irregularities. Grooving is most commonly performed longitudinally due to ease of construction.

Traffic Considerations: Performance is not affected by varying ADT or truck levels.

Performance Period: Information on performance is not readily available; however, lives are expected to be greater than the 8 to 15 years.

Relative Cost (\$ to \$\$\$\$): \$\$

**DIAMOND GROOVING GENERAL CONSTRUCTION STEPS**

Figure 45-6U

45-6.04(e) Full-Depth Repairs

Full-depth repairs are effective at correcting slab distress that extend beyond one-third the pavement depth such as longitudinal and transverse cracking, corner breaks, and joint spalling. (See Figure 45-6V)

Treatment Description: Full-depth repairs are cast-in-place concrete repairs that extend through the full thickness of the existing PCC slab. The technique involves the full-depth removal and replacement of full or half lane-width areas of an existing deteriorated PCC pavement. The minimum specified repair length is typically 6 ft (1.8 m); however, for jointed PCC pavements, in many cases it may be more cost effective and reliable to replace an entire slab.

Pavement Conditions Addressed: Full-depth repairs are used to repair localized distresses and to prepare distressed PCC pavements for a structural overlay to avoid premature failure of the overlay.

Application Limitations: Full-depth repairs are not cost effective if deterioration is widespread within a project. If the existing pavement is structurally deficient, or is nearing the end of its fatigue life, a structural enhancement (such as an overlay) is needed to prevent continued cracking of the original pavement.

Construction Considerations: During construction, it is very important to properly prepare the base, restore joint load-transfer, and finish, texture, and cure the new material per governing specifications.

Traffic Considerations: Because full-depth repairs have typically been completed using conventional PCC materials, curing time may be an issue in urban areas. High early strength concretes are used in cases where it is not desirable to close a lane overnight.

Special Considerations: It is not desirable to create the large number of closely spaced joints in a pavement that would result from placing a large number of closely spaced patches.

Performance Period: 10 to 15 years.

Relative Cost (\$ to \$\$\$\$): \$\$\$\$

	
<p>Step 1. Concrete sawing. Repair boundaries are cut with full-depth, diamond-bladed sawing.</p>	<p>Step 2. Concrete removal. Removal of slab material is best accomplished using the lift-out method or by breakout.</p>
	
<p>Step 3. Repair area preparation. It is important that the repair area be dry and properly compacted.</p>	<p>Step 4. Load transfer provision. Proper restoration of load transfer should be considered.</p>
	
<p>Step 5. Material placement. Conventional PCC material is most common for full-depth repairs.</p>	<p>Steps 6 & 7. Texturing & Curing. The final steps include texturing and providing adequate curing.</p>

FULL-DEPTH REPAIRS

Figure 45-6V

45-6.04(f) Partial-Depth Repairs

Partial-depth repairs are primarily used to correct joint spalling. They can also be used to correct localized areas of distress that are limited to the upper 1/3 of the slab thickness. (See Figure 45-6W)

Treatment Description: Partial-depth repairs are defined as the removal of small, shallow areas of deteriorated PCC that are then replaced with a suitable repair material. These repairs restore structural integrity and improve ride quality, thereby extending the service life of pavements that have spalled or distressed joints.

Pavement Conditions Addressed: Partial-depth repairs are primarily used to correct joint spalling caused by 1) the intrusion of incompressible materials into the joints, 2) localized areas of scaling, weak concrete, clay balls, or high steel, and 3) the use of joint inserts.

Application Limitations: This treatment is not applicable for pavements with cracking and joint spalling caused by compressive stress buildup in long-jointed pavements; spalling caused by dowel bar misalignment or lockup; cracking caused by improper joint construction techniques (late sawing, inadequate saw cut depth, or inadequate insert placement depth); working cracks caused by shrinkage, fatigue, or foundation movement; and spalls caused by D-cracking or reactive aggregate.

Construction Considerations: During construction, it is very important to properly determine repair boundaries, prepare the patch area, and finish, texture, and cure the new material per governing specifications. If distress is found to extend below the upper 1/3 of the slab, or if steel is exposed, a full-depth repair is required.

Traffic Considerations: Partial-depth repairs perform under all traffic conditions. High early strength concretes are used in cases in which early opening to traffic is required or when it is not desirable to close a lane overnight.

Special Considerations: Partial-depth patches should be a minimum of 4 in (10 cm) by 12 in (30 m).

Performance Period: 5 to 15 years.

Relative Cost (\$ to \$\$\$\$): \$\$\$

Step 1. Repair boundary marking. Determine extent of unsound material, and mark repair boundaries.

Step 2. Concrete removal. Sawing the boundaries and removing deteriorated PCC.

Step 3. Repair area preparation. The repair area should be sandblasted and cleaned to promote good bonding.

Step 4. Joint preparation. It is important to maintain the existing joint reservoir during construction.

Steps 5 & 6. Bonding agent & material placement. Follow manufacturer's recommendations when placing material.

Steps 7 & 8. Curing & joint sealing. The final steps include texturing and providing adequate curing.

PARTIAL-DEPTH REPAIRS

Figure 45-6W

45-6.04(g) Load Transfer Restoration (LTR)

LTR is effective at restoring load transfer at joints and/or transverse cracks on pavements that have significant remaining structural life. (See Figure 45-6X)

Treatment Description: Load transfer restoration (LTR) is the placement of load transfer devices across joints or cracks in an existing jointed PCC pavement to restore load transfer at these locations. Poor load transfer can lead to pumping, joint faulting, and corner breaks.

Pavement Conditions Addressed: Most effective on jointed concrete pavements that have poor load transfer at joints and/or transverse cracks but also have significant remaining structural life. The optimum time to apply this technique is when the pavement is just beginning to show signs of structural distress, such as pumping and the onset of faulting.

Application Limitations: LTR is not applicable when the pavement contains significant faulting, or other signs of structural failure (such as pumping or corner breaks). Pavements with little remaining life or materials-related distresses are also not good candidates.

Construction Considerations: There are different dowel bar retrofit patterns, but three to four bars per wheelpath is typical. Careful consideration must be given in the selection of the patch material and isolation of the joint. Often performed in conjunction with diamond grinding.

Traffic Considerations: The higher the ADT and percent trucks, the greater the potential need for LTR. Low-volume jointed concrete pavements that are not doweled may not need LTR.

Performance Period: A minimum expected life is typically 10 to 15 years; however, many load-transfer restoration projects have been in place for more than 20 years with little or no signs of distress.

Relative Cost (\$ to \$\$\$): \$\$\$

Step 1 & 2. Slot creation and material removal. Slots are cut and concrete material is removed.

Step 3 & 4. Sandblasting and cleaning. Slots are sandblasted and cleaned in preparation for dowel bars.

Step 5. Caulking the joint/crack. The joint/crack edges are caulked to stop the flow of material from the slot.

Step 6. Dowel bar placement. Dowels are placed parallel to the direction of traffic and at mid-slab.

Step 7. Repair material placement. Material should be placed per governing specifications.

Steps 8 & 9. Diamond grinding & joint sealing. Final steps often consist of diamond grinding and joint sealing.

LOAD TRANSFER RESTORATION GENERAL CONSTRUCTION STEPS

Figure 45-6X

Cross Stitching

Cross stitching is effective at strengthening non-working longitudinal cracks. Preventing these crack movements helps prevent roughness and potential safety problems associated with such cracks. (See Figure 45-6Y)

Treatment Description: Cross stitching is a longitudinal crack and joint repair technique that consists of grouting tiebars in holes drilled across non-working longitudinal cracks/joints at an angle to the pavement surface. Cross stitching prevents horizontal and vertical crack movements.

Pavement Conditions Addressed: Cross stitching is effective at strengthening longitudinal cracks and preventing slab migration, mitigating the issue of tiebars being omitted from longitudinal contraction joints, tying roadway lanes or shoulders that are separating and causing a maintenance problem, and tying centerlane joints that are starting to fault.

Application Limitations: Cross stitching is not an appropriate treatment for slabs that have multiple cracks or are shattered into more than 4 to 5 pieces.

Construction Considerations: Holes should be drilled to intersect the slab/joint at mid-depth. Follow the American Concrete Pavement Association (ACPA) construction recommendations.

Traffic Considerations: Performance is not significantly affected by varying ADT or truck levels.

Special Considerations: The treatment is not recommended on transverse cracks.

Performance Period: 15 years.

Relative Cost (\$ to \$\$\$\$): \$\$\$

Step 1. Drilling of holes. Drill holes at a 35° to 45° angle to the surface so they intersect the crack/joint at mid-depth.

Step 2. Epoxy grout insertion. Clean holes with compressed air, and then insert epoxy to promote bonding.

Step 3. Bar insertion. Drive bars into holes containing epoxy.

Step 4. Final grouting. Remove excess material and finish surface of epoxy so that it is flush with the pavement surface.

CROSS STITCHING GENERAL CONSTRUCTION STEPS

Figure 45-6Y

45-6.04(h) Pavement Subsealing/Undersealing

Undersealing fills voids under slabs, thereby reducing deflections and minimizing the development of pumping, corner breaks, faulting, and roughness associated with those distresses. (See Figure 45-6Z)

Treatment Description: Undersealing is the pressure insertion of a flowable material beneath a PCC slab to fill voids between the slab and base, thereby reducing deflections and, consequently, deflection-related distresses such as pumping or faulting. It is most often performed at areas where pumping and loss of support occur, such as beneath transverse joints and deteriorated cracks. The voids being filled by this technique are generally less than 0.12 in (3 mm) thick.

Pavement Conditions Addressed: Undersealing fills voids that, if left unfilled, will lead to pumping, faulting, and other structural deterioration. This treatment performs best if performed before faulting starts to develop.

Application Limitations: Undersealing is not appropriate on pavements with significant faulting, or other signs of structural failure (such as pumping, mid-panel cracking, or corner breaks). Such distresses suggest structural failures that require more costly rehabilitation. Additional strategies, such as dowel bar retrofitting, may be required for pavements without load transfer.

Construction Considerations: Cement-fly ash grout is the most commonly used material, although asphalt and polyurethane also have been used. Slab lift must be closely monitored to avoid damaging slabs. Overfilling voids can contribute to more severe problems than leaving them unfilled.

Traffic Considerations: Performance is not known to be affected by different levels of ADT or percent trucks.

Special Considerations: Pumping (indicated by the presence of holes, depressions, and/or ejected material) is almost certain evidence of voids. If areas do not exhibit physical evidence of voids but are suspect, request nondestructive testing assistance from the Bureau of Materials and Physical Research. Pavement sections that contain voids often occur only on a portion of a project. Blanket subsealing rarely is justified. If subsealing is used on any portion of a project, bridge approaches within the project limits also should be subsealed. The use of this method requires Bureau of Design and Environment approval.

Performance Period: Performance has been variable.

Relative Cost (\$ to \$\$\$): \$\$

Step 1. Locating voids. Many methods are used to locate voids, including FWD testing (shown here).

Step 2. Drilling injection holes. Holes are drilled in a selected pattern at void locations. The drill should be connected to a compressor but it is not in this photo.

Step 3. Injection of material. This photo shows an "expandable grout packer" used to inject cement grout material. Slab lift must be closely monitored during this process to avoid slab damage.

Step 4. Plugging holes. The next step is to plug each of the holes to keep grout material from flowing out through the holes. Then the plugs are removed after the grout is set and the holes are filled with mortar, and the pavement is cleaned prior to opening the road to traffic.

UNDERSEALING GENERAL CONSTRUCTION STEPS

Figure 45-6Z

45-6.05 Drainage Preservation

45-6.05(a) Drainage Preservation

Improvement of subsurface drainage characteristics for pavement systems that show water-related damage or distresses can significantly increase the serviceability and life of the pavement. (See Figure 45-AA)

Treatment Description: The improvement of subsurface drainage characteristics through the use of 1) ditch maintenance to prevent obstructed flow and provide proper cross section, 2) maintenance of existing drainage systems, or 3) the installation of localized drainage, specifically in low-lying areas.

Pavement Conditions Addressed: Stripping and structural distresses (such as fatigue cracking and rutting) related to loss of support under the bound layers.

Application Limitations: Use of drainage preservation will not restore structurally inadequate pavements or repair existing distresses, but should reduce worsening or appearance of new distresses. The installation of new drainage is only helpful if the existing pavement has a horizontally drainable layer. Otherwise, only the water between the shoulder and the pavement will be removed, instead of removing the water between the base and the bound layers.

Construction Considerations: Underdrain installation should occur prior to patching, unless there is a valid reason to do otherwise.

Traffic Considerations: Since the use of drainage preservation will improve the base and subgrade engineering properties, the treatment might help improve the load-carrying capacity of the pavement.

Special Considerations: Drainage preservation is a very worthwhile preservation activity. However, the conduct of ditch maintenance is often considered routine maintenance instead of preventive maintenance. Special justification for the use of federal funds for ditch maintenance is necessary including District and Central BLRS approval.

Performance Period: Varies.

Relative Cost (\$ to \$\$\$\$): Varies

Drainage Preservation. This photo shows an example of a ditch with obstructed flow.

DRAINAGE PRESERVATION GENERAL CONSTRUCTION STEPS

Chapter Forty-six PAVEMENT REHABILITATION

46-1 GENERAL

46-1.01 Pavement Rehabilitation Definitions

See Section 44-1.01 of this manual

46-1.02 Minimum HMA Lift Thickness

All Hot Mix Asphalt (HMA) surface, binder, and leveling binder lifts must comply with the lift thicknesses in Figure 44-1A.

46-1.03 Skid Resistance on HMA Surface Courses

See Section 44-1.03 of this manual.

46-1.04 Density Testing on HMA Pavements

See Section 44-1.04 of this manual.

46-1.05 Selection of Rehabilitation Technique

The most important part of rehabilitation process is the proper selection of technique or techniques process to be used. Designers should consider the following criteria when selecting the appropriate rehabilitation technique:

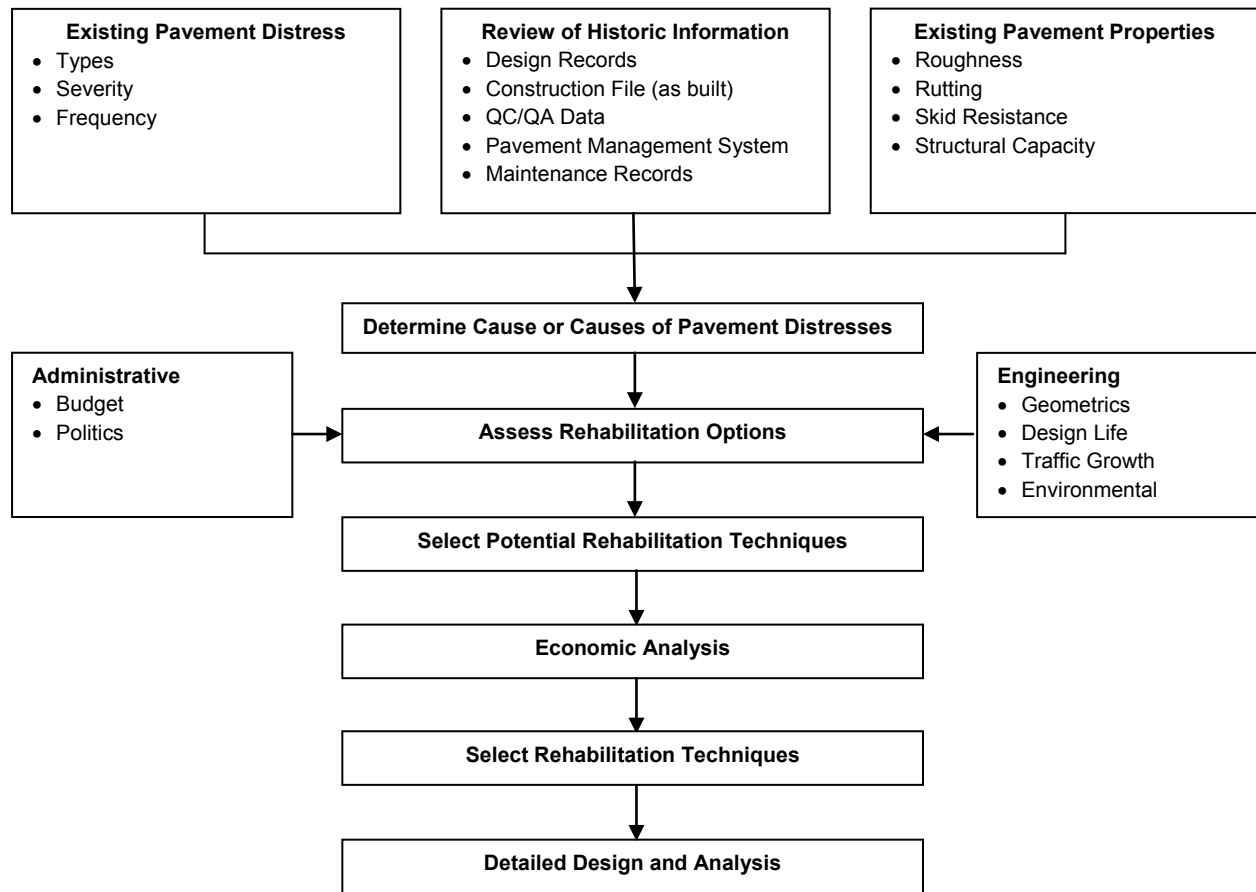

- Pavement Condition
- Construction and Maintenance Records
- Structural Capacity
- Existing Materials In-Place
- Identify Cause of Distresses
- Highway Geometrics
- Economic Analysis

Factors such as design traffic, pavement cross section, in situ materials and climate should be investigated using historic information and pavement assessments. A detailed review of construction/maintenance history and pavement management system will assist in determining:

- Age, type, and thickness of various layers
- Quality of construction material

- Subgrade Stability
- Pavement condition and remaining service life
- Type, severity, and frequency of pavement distresses
- Location and type of patches

If construction records are not available or complete, the designer should consider pulling cores to determine layer thicknesses and test subgrade. The designer should select the most cost effective process.

REHABILITATION TECHNIQUE SELECTION PROCESS

Figure 46-1A

46-1.06 Accessibility Requirement

The rehabilitation policies contained in this chapter are considered alterations for compliance with the Americans with Disabilities Act. Cross walks shall be addressed and work shall be extended beyond the face of curb to install new curb ramps or upgrade existing curb ramps.

46-2 HMA OVERLAYS

46-2.01 Introduction

HMA overlays are used to correct functional and structural deficiencies. Existing pavement conditions and estimates of future traffic dictate the thicknesses of these overlays.

Functional deficiency arises from any conditions that adversely affect the highway user. These include poor surface friction and texture, hydroplaning and splash from wheel path rutting, and excessive weathering, raveling, and block cracking.

Structural deficiency arises from any conditions that adversely affect the load-carrying capability of the pavement structure. These include inadequate thickness, loss of base or subgrade support, and moisture damage. It should be noted that several types of distress (e.g., distresses caused by poor construction techniques, low temperature cracking, base failure) are not initially caused by traffic loads but do become more severe under traffic to the point that they also detract from the load-carrying capability of the pavement.

It is important that the designer consider the type of deterioration present when determining whether the pavement has functional or structural deficiencies. For pavements with adequate existing structure, the overlay thickness is the thickness needed to correct the functional problem. Pavements that are structurally deficient require an overlay designed to upgrade the structural capacity.

46-2.02 Evaluation of Structures Being Resurfaced

All structures greater than 20.0 feet (6.1 m) in length within the limits of a resurfacing project that are not gapped should be evaluated for structural adequacy with the proposed resurfacing. This includes structures with zero increase in surfacing depth, such as those involving removal of surfacing with replacement with of equal thickness. These structures should be evaluated for structural adequacy and submitted to the Bureau of Bridges and Structures (BBS) for approval during the preliminary design phase. All structure condition ratings of these structures must be a "5" or greater. For such structures that are not being gapped, a Form BLR 10220 "Asbestos Determination Certification" will be required. The BBS will evaluate the adequacy of the structure, and record the status of the asbestos Form BLR 10220, before approval.

46-2.03 Reflective Crack Control

On pavements where existing cracks may propagate as reflective cracks, a reflective crack control treatment should be performed prior to the application of the HMA overlay. Such treatment should incorporate approved materials and follow recommended construction practices. Figure 46-2A summarizes the use of reflective crack control treatments.

46-2.03(a) Materials

The following materials have been developed for the control of reflective cracking in HMA overlays. Complete specifications are included in the *Standard Specifications for Road and Bridge Construction*.

BUREAU OF LOCAL ROADS & STREETS

PAVEMENT REHABILITATION

Apr 2012

46-2(2)

1. System A: Non-woven polypropylene or other approved plastic reinforcing fabric.
2. System B: High strength fabric embedded in a layer of self-adhesive plasticized bitumen.
3. System C: Asphalt rubber membrane interlayer.
4. System D: Composite three layer stress relief membrane.

46-2.03(b) Applications

Reflective crack control treatments are classified into two types of applications. Complete specifications are included the *Standard Specifications for Road and Bridge Construction*.

1. Strip Treatment – Suitable for use on rigid or flexible bases and should be considered for all projects that involve resurfacing of proposed or existing widening joints or where longitudinal reflective cracks would conflict with final traffic control markings thus causing confusion to the motorist. The pavement/ paved shoulder joint should only be considered if tied with an effective load-transfer device.
2. Area Treatment – Suitable for use only on flexible bases. System B or D should not be used for area reflective crack control treatment.

Type of Treatment	Flexible Base	Rigid Base
Strip	System A, B, C or D	System A, B, C or D
Area	System A or C	Not Approved

**USE OF REFLECTIVE CRACK CONTROL TREATMENTS
Figure 46-2A**

46-2.04 Maintenance with Hot Mix Asphalt (HMA) or Warm Mix Asphalt (WMA)

Maintenance projects are intended to correct surface defects. Maintenance projects are eligible for MFT funding. See Section 14-1.02(i) of this Manual for more details.

46-2.05 Local Agency Functional Overlay (LAFO) Policy

Local Agency Functional Overlay Policy (LAFO) is intended to repair and resurface existing urban and rural roadways on the local agency system as an “interim” improvement until rehabilitation or reconstruction improvement can be funded. LAFO projects are eligible for MFT, State and/or Federal funding. See Section 46-3 of this manual for more details.

46-2.06 Local Agency Structural Overlay (LASO) Policy

Local Agency Structural Overlay (LASO) policy is intended to upgrade the structural capacity of urban and rural roadways on the local system to allow heavier or permitted trucks to travel. LASO projects are eligible for MFT, State and/or Federal funding. See Section 46-4 of this manual for more details.

46-3 LOCAL AGENCY FUNCTIONAL OVERLAY (LAFO) POLICY

46-3.01 Eligibility

The following guidelines should be used when determining a project's eligibility for the LAFO Policy.

46-3.01(a) Length

A project should be a part of a route that extends between logical termini. Rural segments of a project should be at least 1 mile (1.6 km) in length. Urban segments of a project should be at least one block in length with geometric continuity for contiguous blocks.

46-3.01(b) Existing Design Criteria with Construction History

All highways must have met IDOT's design requirements at the time of initial construction. Ensure all design plans are on file and available to IDOT for review upon request. The districts will review projects to verify that all requirements are met. If the highway has been resurfaced since initial construction, verify the design meets the criteria for Section 46-3.01(c)3 and Section 46-3.01(c)4 below in existing design criteria without construction history.

46-3.01(c) Existing Design Criteria without Construction History

Highways and/or streets constructed under a local agency's supervision, where the design plans and construction records are not available to IDOT, will require the following:

1. A typical cross section showing existing and proposed work.
2. A certification from the Local Public Agency's (LPA) engineer that the existing pavement is structurally sound, has adequate pavement design thickness, and is maintained properly. It is recommended that pavement thickness and any widening thickness be verified by coring or other means, at maximum 750 ft (230 m) intervals, alternating left and right of the centerline.
3. A determination that the horizontal and vertical alignments do not deviate more than 15 mph (25 km/h) less than the design speed required under current policy for existing highways; however, the design speed shall not be less than 30 mph (50 km/h). Sag vertical curves generally may be retained
4. A statement from the LPA's design engineer that adequate drainage exists and the proposed work will not negatively impact the pavement drainage capabilities.

46-3.01(d) Geometric Upgrades

Projects involving geometric revisions (other than minor superelevation corrections) will not be eligible under this program.

46-3.01(e) Pavement Widening

Pavement widening, and/or acquisition of right-of-way will not be allowed.

46-3.01(f) Crash History

High crash locations will not be allowed to be improved under the LAFO policy unless a resurfacing or superelevation improvement can be considered an effective countermeasure to prevent future crashes. Highways on the state 5% Safety Report or other locations experiencing higher than expected fatal and serious injury crashes for the traffic volume, geometric characteristics, and/or posted speed limit should be improved according to Chapter 32 or Chapter 33 of the BLRS Manual.

46-3.02 Application

The following requirements will apply to LAFO projects.

46-3.02(a) Construction Limits

Construction limits for rural type cross sections are from the outside edge of the shoulder to the outside edge of shoulder. Protect the surface edges by building up the shoulders with material equal or superior to the existing shoulder material. Construction limits for urban type cross sections will be from face-of-curb to face-of-curb except for where curb ramp are required according to Section 46-1.06.

46-3.02(b) Pavement Repairs

The project shall not have extensive load-related distresses. A maximum of 10% of the pavement area will be allowed to be patched for rigid, composite, and full-depth pavements. A maximum of 20% of the pavement area will be allowed for base repair of conventional flexible pavements.

46-3.02(c) Lane Widths

Projects shall have minimum travel lane widths of 9 ft (2.7 m) for rural sections and 10 ft (3.0 m) for urban sections, centerline to edge of travel lane where there is no parking lane. The minimum parking lane width allowed is 8 ft (2.4 m) including gutter flag.

46-3.02(d) Crown and Cross Slope Adjustment

The use of milling, leveling course, heat scarifying, planing, cold in-place recycling, hot in-place recycling, or other methods of re-establishing the base cross slope and/or crown is highly recommended for LAFO projects.

46-3.02(e) Overlay Thickness

A HMA overlay up to 3.75 in (95 mm), including leveling binder to fill depressions and to correct crown deficiencies, may be placed upon the existing pavement surface. The milling of a HMA pavement to any depth and replacing this material with HMA up to the same thickness as milling operation plus 2 in (50 mm) may be performed under LAFO policy.

For pavements with an existing Average Daily Traffic (ADT) of 400 or less, the use of cold-mix material or aggregate base course will be allowed to improve the existing base. The minimum cold-mix or aggregate base course thickness allowed will be 4 in (100 mm). An A-1 or A-2 surface treatment over the cold-mix material is required. An A-2 or A-3 surface treatment is required for the aggregate base material.

46-3.02(f) Rollover Factor

By thickening the pavement structure, the shoulder cross slopes for rural type cross sections will increase. Through horizontal curves, the maximum rollover factor (algebraic difference between traveled way and shoulder slopes) should not be greater than 10% where the shoulder width is 6 ft (1.8 m) or wider. Where the shoulder width is less than 6 ft (1.8 m), the maximum rollover factor will be 12%.

46-3.02(g) Structures

Structures with structural capacity less than H-15 (M-13.5) on highways functionally classified as local, or HS-15 (MS-13.5) on highways functionally classified as collectors or arterials may be gapped if they are included in the Multi-Year Improvement Program. Gapping is where the resurfacing is terminated prior to the bridge approach guardrail instead of adjacent to the bridge. For structures that have a structural capacity greater than H-15 (M-13.5) on highways functionally classified as local, or HS-15 (MS-13.5) on highways functionally classified as collectors or arterials resurfacing is optional. The existing rail or curb height, condition and adequacy of the bridge to accept the surfacing must be considered.

Structurally sound bridge decks with poor riding quality or worn bituminous surfaces that would jeopardize the safety of the motorist or cause undue discomfort should be repaired and resurfaced. Resurfacing may be extended across decks with appropriate repairs (waterproofing recommended). If the bridge cannot safely carry the additional dead load resulting from resurfacing, gap the bridge.

For structures greater than 20.0 feet (6.1 m) in length that are not being gapped, Form BLR 10220 "Asbestos Determination Certification" will be required. All structure condition ratings of these structures must be a "5" or greater. The Bureau of Bridges & Structures (BBS) will evaluate the structural adequacy of the structure, and record the status of the asbestos Form BLR 10220, before approval of the LAFO project.

Projects with narrow bridges will not be allowed. A bridge width cannot be less than the pavement width of the typical section included in the LAFO project. The local agency has the option of addressing bridge curbs and retrofitting bridge rails.

46-3.02(h) Drainage

Only drainage corrections to restore the road cross section or to correct drainage problems within the eligible segments shall be allowed. This includes replacement/repair of crossroad culverts beneath the roadway and into the foreslopes, damaged curb and gutter, inlets, catch basins, and manholes. Minimal ditch work at the crossroad pipe culverts will be allowed to ensure adequate drainage. Efforts should be made on curb and gutter sections to retain the flow line of the gutter and adequate curb height.

46-3.02(i) Clear Zones

Roadside hazards, such as bridge ends, guardrail, mail boxes, and others, located between the outer edge of shoulders shall be addressed.

46-3.02(j) Documentation

All LAFO projects are considered as Categorical Exclusion Group I. Form BLR 46300, a location map, and a typical section shall be submitted for all LAFO candidate projects regardless of funding. For LAFO projects that involve a structure, the Form BLR 46300 will be forwarded to the Local Bridge Unit for the approval of the Engineer of Bridges and Structures.

46-4 LOCAL AGENCY STRUCTURAL OVERLAY (LASO) POLICY

When it is proposed to place a HMA surface on an existing rigid or full depth HMA pavement, and upgrade the structure of the pavement, the thickness of the overlay may be determined by one of the following procedures. The District BLRS must approve any modifications or different design method.

46-4.01 Structural Pavement Design Procedures

46-4.01(a) AASHTO Guide for Design of Pavement Structure (1993)

Part III, Chapter 5 provides the designer with overlay thickness design procedures to address structural deficiencies in various types of existing pavements (flexible and rigid bases).

46-4.01(b) Modified AASHTO

This method may be used when designing an overlay on existing flexible pavements or flexible base (see Section 46-4.02) or on existing rigid or composite pavements (see Section 46-4.03) by estimating the structural number value of the existing material and determining the IBV of the subgrade. The designer may then select the surface thickness and any additional base thickness required to satisfy the design structural number.

46-4.01(c) Asphalt Institute's "Asphalt Overlays for Highway and Street Rehabilitation" (MS-17) Deflection Analysis

Deflection is the amount of downward vertical movement of a pavement surface due to the application of a load. The magnitude of the pavement deflection is an indicator of the pavement's ability to withstand traffic loading. Research has established correlations between the wheel load, pavement deflections, and repetitions of the load.

Bituminous overlays on existing flexible pavements/bases may be designed by deflection analysis in accordance with the following procedure:

1. Take an appropriate number of deflection readings on the existing roadway to be resurfaced. Obtain pavement deflections at a minimum rate of 20 per mile.
2. Convert the deflection readings to spring (critical period) deflections. Conversions may be based on historical data, the Asphalt Institute's recommended procedure, or engineering judgment.
3. Tabulate the deflections and compute a standard deviation.
4. Deflections that fall outside the mean deflection plus 2 standard deviations should be set aside for special consideration. These areas will require additional treatment and/or additional structure.
5. Compute a traffic factor for the project.
6. Using the mean deflection plus 2 standard deviations, perform the Asphalt Institute's deflection based HMA overlay design procedures.

46-4.02 Modified AASHTO Design for Overlays on Existing Flexible Pavement/Bases

46-4.02(a) Application of Design Method

The modified AASHTO design procedures for flexible pavements enable the designer to determine the material types and thicknesses for the various layers of a flexible pavement that are required to carry a specified volume and composition of traffic for a designated period of time while retaining a serviceability level at or above a selected minimum value. Application of this design method involves the following steps:

1. Determine Traffic Factor. Use the following procedures to determine the traffic factor:
 - a. Determine the facility class (e.g., Class I, II, III, or IV) and the design period; see Sections 46-4.02(b) and 46-4.02(c).
 - b. Determine the actual structural design traffic as described in Section 46-4.02(d).
 - c. Based on the facility class, select the appropriate traffic factor equation from Figure 46-4B; see Section 46-4.02(e).
 - d. Calculate the actual traffic factor for use in design.
2. Determine the Immediate Bearing Value. Determine the Immediate Bearing Value of the roadbed soil; see Section 46-4.02(f).
3. Determine the Required Structural Number (SN_F). Determine the required flexible pavement structural number (SN_F) using the appropriate design nomograph for the facility class (i.e., Figure 46-4D for Class I facilities or Figure 46-4E for Class II, III, and IV facilities); see Section 46-4.02(g).
4. Determine the Existing Structural Number (SN_{F,e}). Determine the existing flexible pavement structural number (SN_{F,e}) using the appropriate coefficients from Figure 46-4F, the thicknesses of the existing pavement structure, and Equation 46-4.1 in Section 46-4.02(h).
5. Determine Structural Overlay Thickness. Determine the overlay thickness using equation 46-4.2 in Section 46-4.02(i).
6. Compare with Minimum Criteria. Compare the selected design with the minimum requirements presented in Figure 46-4G to ensure that the minimum design requirements have been met; see Section 46-4.02(j).

46-4.02(b) Classes of Roads and Streets

The class of the road or street for which the bituminous overlay design is being determined is dependent upon the structural design traffic. These road classifications are defined in Section 44-1.01.

46-4.02(c) Design Period

The design period DP is the length of time in years that the bituminous overlay is being designed to serve the structural design traffic. For bituminous overlays, the minimum DP allowed is 15 years for Class I, II, III, and IV roads and streets. However, designers are encouraged to determine thicknesses for both 15 year and 20 year DP's prior to selecting the final design thickness.

46-4.02(d) Structural Design Traffic

The structural design traffic is the estimated ADT for the year representing one-half of the design period. For example, when the design period is 20 years, the structural design traffic will be an estimate of the ADT projected to 10 years after the construction date.

The structural design traffic is estimated from current traffic count data obtained either by manual counts or from traffic maps published by IDOT. If PV, SU, and MU counts are not available for Class III and IV roads and streets, Figure 46-4A provides an estimate of counts that can be made from the component percentages of the total traffic.

Class of Road or Street	Percentage of Structural Design Traffic		
	PV (%)	SU (%)	MU (%)
III	88	7	5
IV	88	9	3

**PERCENTAGE OF STRUCTURAL DESIGN TRAFFIC
(Class III or IV)**

Figure 46-4A

46-4.02(e) Traffic Factors

For Class I, II, III, and IV roads and streets, the design TF for flexible pavements is determined from the 80,000 pound load limit formulas shown in Figure 46-4B. The formulas are based on the Statewide average distribution of vehicle types and axle loadings, which are directly applicable to most roads and streets.

However, cases will arise in which the average formula should not be used (e.g., a highway where HCV's entering and leaving a site generally travel empty in one direction and fully loaded in the other). These cases should be referred to Central BLRS for special analysis. The local agency must provide Central BLRS with the structural design traffic, the DP, and traffic distribution by PV's, SU's, and MU's.

46-4.02(f) Subgrade

The following material specifically relates to the modified AASHTO design methodology. The Immediate Bearing Value (IBV) plays a critical role in the modified AASHTO design methodology. However, other soil strength test procedures can be used provided that the test results can be directly correlated with those obtained by the IBV test procedure.

The IBV selected for use in design should represent a minimum value for the soil to be used. Preferably, testing should be performed on samples of the soils to be used in construction. It is recommended that a soil survey be made prior to all construction; however, when test data are not available, use the values presented in Figure 46-4C.

See the Bureau of Materials and Physical Research's *Subgrade Stability Manual* for further guidance and information on obtaining field test data.

Class I Roads and Streets	
4 or 5 Lane Pavements (Rural and Urban)	$TF = DP \frac{(0.047 PV + 59.625 SU + 217.139 MU)}{1,000,000}$
6 or More Lane Pavements (Rural)	$TF = DP \frac{(0.029 PV + 53.000 SU + 193.012 MU)}{1,000,000}$
6 or More Lane Pavements (Urban)	$TF = DP \frac{(0.012 PV + 49.025 SU + 178.536 MU)}{1,000,000}$
One-way Streets and Pavements (Rural and Urban)	$TF = DP \frac{(0.073 PV + 66.25 SU + 241.265 MU)}{1,000,000}$
Class II Roads and Streets	
2 or 3 Lane Pavements	$TF = DP \frac{(0.073 PV + 56.03 SU + 192.72 MU)}{1,000,000}$
Class III Roads and Streets	
2 or 3 Lane Pavements	$TF = DP \frac{(0.073 PV + 54.57 SU + 192.175 MU)}{1,000,000}$
Class IV Roads and Streets	
2 Lane Pavement	$TF = DP \frac{(0.073 PV + 4.93 SU + 39.42 MU)}{1,000,000}$

**HMA OVERLAY ON FLEXIBLE PAVEMENT TRAFFIC FACTOR EQUATIONS
(80,000 Pound Load Limit)**

Figure 46-4B

A-2-6, A-2-7	12
A-3	10
A-4, A-5, A-6	3
A-7-5, A-7-6	2

SUGGESTED IBV VALUES FOR VARIOUS SOIL CLASSIFICATIONS

Figure 46-4C

46-4.02(g) Required Structural Number

Having calculated the traffic factor, only the IBV of the roadbed soil is needed to determine the required structural number of the flexible pavement. The flexible pavement required structural number (SN_F) is obtained by projecting a line through the traffic factor and the IBV on the appropriate design nomograph, either Figure 46-4D for Class I facilities or Figure 46-4E for Class II, III, and IV facilities.

46-4.02(h) Existing Structural Number

The existing structural number ($SN_{F,e}$), an abstract number related to the strength of the total existing pavement structure, is the summation of the existing layer thicknesses multiplied by their corresponding strength coefficients from Figure 46-4F. Use the following equation to determine the existing structural number:

$$SN_{F,e} = a_1'D_1 + a_2'D_2 + a_3'D_3 \quad \text{Equation 46-4.1}$$

Where:

- $SN_{F,e}$ = existing flexible pavement structural number
- $a_1', a_2',$ and a_3' = coefficients of relative strength of the surface, base, and subbase materials, respectively
- $D_1, D_2,$ and D_3 = thickness of the surface, base, and subbase layers, respectively, in

46-4.02(i) Overlay Thickness Design

In determining the structural overlay thickness, the existing structural number is subtracted from the required structural number of the pavement. This needed structural number is then divided by the resurfacing coefficient to determine the resurfacing thickness. Use the following equation to determine the required overlay thickness:

$$D_O = \frac{(SN_F - SN_{F,e})}{a_O} \quad \text{Equation 46-4.2}$$

- Where:
- D_O = thickness of new HMA overlay, in
 - SN_F = required flexible pavement structural number
 - $SN_{F,e}$ = existing flexible pavement structural number
 - a_O = coefficients of relative strength of the overlay material

Typical overlays using a 19.0 mm HMA binder course and a 9.5 mm or 12.5 mm HMA surface course the coefficient of relative strength (a_O) should be 0.36. If HMA surface course mixes are use the entire depth of the overlay, a_O may be increased to 0.40. Contact the Central Bureau of Local Roads and Streets for other special designs.

46-4.02(j) Minimum Thickness and Material Requirements

To ensure practical and adequate designs, the minimum design requirements presented in Figure 46-4G have been established. Final pavement thicknesses must comply with this table.

Granular Material, Type A, Crushed		80			0.11	0.09
Lime Stabilized Soil			100		0.10	0.08

Notes:

1. Marshall Stability (MS) index or equivalent.
2. Compressive strength (CS) in pounds per square in (psi). For cement stabilized soils and granular materials, use the 7 day compressive strength that can be reasonably expected under field conditions. For lime stabilized soils, use the accelerated curing compressive strength at 120°F for 48 hours. For Pozzolanic, Type A, use the compressive strength after a 14 day curing period at 72°F.
3. Other approved materials of similar strengths may be substituted for those listed in this table.
4. These coefficients may only be used for pavement designs contained in Section 46-6 and 46-7.

**COEFFICIENTS FOR HMA OVERLAY ON FLEXIBLE PAVEMENT OR RECYCLED BASE
(Modified AASTHO Design)**

Figure 46-4F

Structural Number (SN _F)		Minimum Thickness (in)	Minimum Material ^{1, 2}
From	To	Surface & Binder	Surface & Binder
< 2.50		2	HMA (N _{Design} = 30)
2.50	2.99	3	HMA (N _{Design} = 30)
3.00	3.49	3	HMA (N _{Design} = 50)
≥ 3.50		4	HMA (N _{Design} = 50)

Note:

1. Use Figure 44-4E to determine the appropriate PG Binder Grade.
2. Since polymer modified PG Binders may reduce the amount and rate of reflective cracks, polymer modified PG binders should be considered in all HMA overlay/lifts.

MINIMUM THICKNESS AND MATERIAL REQUIREMENTS FOR HMA OVERLAYS ON FLEXIBLE PAVEMENT/BASE (Modified AASHTO Design)

Figure 46-4G

46-4.03 Modified AASHTO Design for Overlays on Existing Rigid/Composite Pavements

46-4.03(a) Application of Design Method

The design procedures for HMA overlay on rigid/composite pavements enable the designer to select: the thickness of bituminous surface needed to structurally rehabilitate an existing rigid or composite pavement. The resulting composite pavement will be capable of carrying a specified volume and composition of traffic for a designated period of time while retaining a serviceability level at or above a selected minimum value. The composite design method assumes that the existing rigid or composite pavement has reached the end of its design life and is in need of structural rehabilitation. If the existing pavement has not reached the end of its design life, as may be the case when a resurfacing is being designed in conjunction with a lane addition, higher strength coefficients than those discussed in Section 46-4.03(f) may be appropriate. Such cases should be referred to the Central BLRS. Application of the composite design method involves the following steps:

1. Determine Traffic Factor. Use the following procedures to determine the traffic factor:
 - a. Determine the facility class (e.g., Class I, II, III, or IV) and the design period; see Sections 46-4.03(b) and 46-4.03(c).
 - b. Determine the actual structural design traffic as described in Section 46-4.02(d).
 - c. Based on the facility class, select the appropriate traffic factor equation from Figure 46-4H; see Section 46-4.03(d).
 - d. Calculate the actual traffic factor for use in design.
2. Determine the Immediate Bearing Value. Determine the Immediate Bearing Value of the roadbed soil; see Section 46-4.02(f).

3. Determine the Structural Number (SN_C). Determine the required composite pavement structural number (SN_C) using the appropriate design nomograph for the facility class (i.e., Figure 46-4I for Class I facilities or Figure 46-4J for Class II, III, and IV facilities); see Section 46-4.03(e).
4. Determine Thickness. Select the appropriate equation from Section 46-4.03(f) as follows:
 - First Resurfacing: use Equation 46-4.3
 - Second Resurfacing: use Equation 46-4.4

Using the appropriate equation calculate the thickness of the HMA overlay and round the thickness up to the nearest 0.25 in.

Note that these equations do not include provisions for a third resurfacing. Pavements that are in need of a third resurfacing for structural reasons often are badly deteriorated and may no longer be functioning as a rigid pavement. Contact the Central BLRS for guidance in selecting the appropriate strength coefficients for such pavements.

5. Compare with Minimum Criteria. Compare the calculated thickness with the minimum requirements presented in Figure 46-4K; see Section 46-4.03(g). Use the larger of the values for design.

46-4.03(b) Classes of Roads and Streets

The class of the road or street for which the bituminous overlay design is being determined is dependent upon the structural design traffic. These road classifications are defined in Section 44-4.01.

46-4.03(c) Design Period

The design period DP is the length of time in years that the bituminous overlay is being designed to serve the structural design traffic. For bituminous overlays, the minimum DP allowed is 15 years for Class I, II, III, and IV roads and streets. However, designers are encouraged to determine thicknesses for both 15 year and 20 year DP's prior to selecting the final design thickness.

46-4.03(d) Traffic Factors

For Class I, II, III, and IV roads and streets, the design TF for rigid pavements is determined from the 80,000 pound load limit formulas shown in Figure 46-4H. The formulas are based on the Statewide average distribution of vehicle types and axle loadings, which are directly applicable to most roads and streets.

However, cases will arise in which the average formula should not be used (e.g., a highway where HCV's entering and leaving a site generally travel empty in one direction and fully loaded in the other). These cases should be referred to Central BLRS for special analysis. The local agency must provide Central BLRS with the structural design traffic, the DP, and traffic distribution by PV's, SU's, and MU's.

HMA OVERLAY ON RIGID/COMPOSITE PAVEMENT TRAFFIC FACTOR EQUATIONS
(80,000 Pound Load Limit)

Figure 46-4H

46-4.03(e) Required Composite Pavement Structural Number

Having calculated the traffic factor, only the IBV of the roadbed soil is needed to determine the required structural number of the composite pavement. The composite pavement required structural number (SN_C) is obtained by projecting a line through the traffic factor and the IBV on the appropriate design nomograph, either Figure 46-4I for Class I facilities or Figure 46-4J for Class II, III, and IV facilities.

HMA OVERLAY OVER RIGID/COMPOSITE PAVEMENT/BASE DESIGN NOMOGRAPH
(Modified AASHTO Design: Class I Facilities)

Figure 46-4I

HMA OVERLAY OVER RIGID/COMPOSITE PAVEMENT/BASE DESIGN NOMOGRAPH
(Modified AASHTO Design: Class II, III, and IV Facilities)

Figure 46-4J

46-4.03(f) Thickness Design Equations

The composite pavement structural number (SN_C), an abstract number related to the strength required of the total pavement structure, is a summation of layer thicknesses multiplied by their corresponding strength coefficients. Three design equations incorporate the composite pavement structural number as follows:

$$D_o = \frac{SN_C - 0.26D_c}{0.40} \quad \text{Equation 46-4.3}$$

$$D_o = \frac{SN_C - 0.25D_E - 0.17D_c}{0.40} \quad \text{Equation 46-4.4}$$

- Where: SN_C = composite pavement structural number
 D_o = thickness of new HMA overlay (in)
 D_c = equivalent thickness of existing PCC slab (in)
 D_E = thickness of existing HMA surface (in)

In the case of existing jointed reinforced and non-reinforced PCC pavements of uniform thickness, the equivalent thickness of the PCC slab (D_c) is the actual slab thickness. For a CRC pavement, D_c is the slab thickness multiplied by 1.25.

46-4.03(g) Minimum Thickness and Material Requirements

To ensure practical and adequate designs, the minimum design requirements presented in Figure 46-4K have been established. Final pavement thicknesses must comply with this table.

Structural Number (SN_C)		Minimum Thickness (in)	Minimum Material
From	To	Surface & Binder	Surface & Binder
< 2.50		2	HMA with Low ESAL's
2.50	2.99	3	HMA with Low ESAL's
3.00	3.49	3	HMA (4% voids)
≥ 3.50		4	HMA (4% voids)

MINIMUM THICKNESS AND MATERIAL REQUIREMENTS FOR HMA OVERLAYS ON RIGID/COMPOSITE PAVEMENT (Modified AASHTO Design)

Figure 46-4K

46-4.04 Design Example

* * * * *

Example 46-4.1

Given: Existing 73,280 pound Class I Urban One-way flexible pavement in District 6 with Slow Traffic.

The existing cross section is composed of:

- 3.0 in of Class I HMA surface,
- 12 in of Lime Stabilized Soil base, and
- 4 in of Granular Material, Type A, Crushed.

Design Traffic:

- ADT: 8900
- 94% PV (8366), 5% SU (445), 1% MU (89)

Subgrade Support Rating: Poor IBV = 4

Problem: Design an HMA overlay to upgrade the route to 80,000 pounds.

Solution:

1. This is a structural overlay; therefore, a pavement design procedure must be used. The designer may choose FWD testing, modified AASHTO, or other approved design methods. This example shows the modified AASHTO approach.
2. Using Figure 46-4B, determine the TF equation for a one-way Class I pavement for a design period of 15 years and 20 years.

One-way Streets and Pavements (Rural and Urban)

$$TF = DP \left[\frac{(0.073PV + 66.250SU + 241.265MU)}{1,000,000} \right]$$

$$TF_{20} = 20 \left[\frac{(0.073 \times 8,366 + 66.250 \times 445 + 241.265 \times 89)}{1,000,000} \right]$$

$$TF_{20} = 1.03$$

$$TF_{15} = 15 \left[\frac{(0.073 \times 8,366 + 66.250 \times 445 + 241.265 \times 89)}{1,000,000} \right]$$

$$TF_{15} = 0.77$$

3. Using Figure 46-4D and the given IBV of 4, the required flexible structural number (SN_F) is 3.9 for the 20-year DP and 3.8 for the 15-year DP.

BUREAU OF LOCAL ROADS & STREETS

46-4(16)

GEOMETRIC DESIGN OF EXISTING HIGHWAYS

Apr 2012

4. Using Figure 46-4F and equation 46-4.1, determine the existing flexible structural number ($SN_{F,e}$):

$$SN_{F,e} = a_1'D_1 + a_2'D_2 + a_3'D_3$$

$$SN_{F,e} = .30(3) + 0.09(12) + .11(4)$$

$$SN_{F,e} = 2.42$$

5. Using equation 46-4.2, determine the overlay thickness:

$$D_O = \frac{(SN_F - SN_{F,e})}{a_O}$$

$$D_{O,20} = \frac{(3.9 - 2.4)}{.36} \qquad D_{O,15} = \frac{(3.8 - 2.4)}{.36}$$

$$D_{O,20} = 4.17$$

$$D_{O,15} = 3.89$$

These thicknesses should be rounded to the nearest 0.25 in:

$$D_{O,20} = 4.25 \text{ in; and}$$

$$D_{O,15} = 4.00 \text{ in.}$$

6. The minimum overlay thickness (D_O) for $SN_F \geq 3.50$ is 4.0 in (Figure 46-4G). Therefore, either the 15-year or 20-year DP will provide the minimum thickness. The designer should consider using the 20-year DP since this will only increase the pavement thickness by 0.25 in. Based on Figure 44-4D, a PG 70-22 or SBS PG 70-22 binder may be used. Use of polymer modified binders may decrease the amount and rate of reflective cracks; therefore, the SBS PG 70-22 should be used.

Example 46-4.2

Given: Existing 73,280 pound Class I Urban One-way rigid pavement in District 6 with Slow Traffic.

The existing cross section is composed of -

- 8 in of jointed non-reinforced PCC pavement, and
- 4 in of Granular Material, Type A, Crushed.

Design Traffic:

- ADT: 8900
- 94% PV (8366), 5% SU (445), 1% MU (89)

Subgrade Support Rating: Poor IBV = 2

Problem: Design an HMA overlay to upgrade the route to 80,000 pounds.

Solution:

1. This is a structural overlay; therefore, a pavement design must be used. The designer may use modified AASHTO or other approved design methods. This example shows the modified AASHTO approach.
2. Use Figure 46-4H and determine the TF equation for a one-way Class I pavement for a design period of 15 years and 20 years.

One-way Streets and Pavements (Rural and Urban)

$$TF = DP \left[\frac{(0.073PV + 71.905SU + 348.210MU)}{1,000,000} \right]$$

$$TF_{20} = 20 \left[\frac{(0.073 \times 8,366 + 71.905 \times 445 + 348.210 \times 89)}{1,000,000} \right]$$

$$TF_{20} = 1.27$$

$$TF_{15} = 15 \left[\frac{(0.073 \times 8,366 + 71.905 \times 445 + 348.210 \times 89)}{1,000,000} \right]$$

$$TF_{15} = 0.95$$

3. Using Figure 46-4I and the given IBV of 2, the required flexible structural number (SN_c) is 3.3 for the 20-year DP and 3.2 for the 15-year DP.

BUREAU OF LOCAL ROADS & STREETS

GEOMETRIC DESIGN OF EXISTING HIGHWAYS

46-4(18)

Apr 2012

3. Using equation 46-4.3, determine the overlay thickness:

$$D_o = \frac{(SN_c - 0.26D_c)}{0.40}$$

$$D_{o,20} = \frac{(3.3 - 0.26(8))}{0.40}$$

$$D_{o,20} = 3.05$$

$$D_{o,15} = \frac{(3.2 - .026(8))}{0.40}$$

$$D_{o,15} = 2.80$$

These thicknesses should be rounded to the nearest 0.25 in: $D_{o,20} = 3.25$ in and $D_{o,15} = 3.00$ in.

4. The minimum overlay thickness (D_o) for $3.00 \leq SN_F < 3.50$ is 3.0 in (Figure 46-4K). Therefore, either the 15-year or 20-year DP will provide the minimum thickness. The designer should consider using the 20-year DP since this will only increase the pavement thickness by 0.25 in. Based on Figure 44-5F, a PG 70-22 or SBS PG 70-22 binder may be used. Use of polymer modified binders may decrease the amount and rate of reflective cracks; therefore, the SBS PG 70-22 should be used.

* * * * *

46-5 PCC INLAY/OVERLAY ON EXISTING ON HMA SURFACES

46-5.01 Introduction

The stopping, starting, standing, and turning actions of vehicles at intersections or other locations may create rutting and other severe conditions for pavement structures with HMA surfaces. The volume and type of vehicles may also distress HMA surfaces. Standing water in ruts (e.g., from rain events) may create a hydroplaning hazard. In addition, snow and ice left in the ruts after snowplowing may be hazardous to the traveling public. Therefore, a PCC inlay/overlay may be a better alternative than HMA. The PCC inlay/overlay has no risk for rutting and a longer service life may be achieved.

A PCC inlay/overlay consists of placing a thin concrete layer on an existing HMA surface. Construction of an inlay/overlay includes milling the existing rutted HMA to correct longitudinal profile and cross-slope irregularities and providing a surface for bonding of the overlay. A PCC inlay/overlay may be considered as an alternative at intersections or other locations where HMA overlays have shown a tendency to rut or have shortened performance lives.

Synthetic fibers are required where the inlay/overlay is 4.0 in. or less, and optional where it exceeds 4.0 in. The synthetic fibers currently used are much different from the fibers originally used in inlay/overlay projects. The original fibers used were mainly to prevent plastic shrinkage cracks. The new fibers will provide structural reinforcement, which will increase flexural toughness and cracking resistance.

These procedures do not apply to a thickness greater than 6.0 in. which is considered an unbonded concrete inlay/overlay.

46-5.01(a) Applicability

These guidelines have been prepared for a rehabilitation strategy that involves a 3.0 in. to 6.0 in. PCC inlay/overlay bonded to a pavement structure that has an HMA surface. This rehabilitation strategy has been previously known as ultrathin whitetopping.

These guidelines may be used to evaluate pavement at an existing intersection or other locations to determine if use of a PCC inlay/overlay is feasible and constructible. These guidelines also contain design steps needed to successfully complete this option. A PCC inlay/overlay requires a thorough review of the existing pavement structure, as well as close attention to utility, profile, and elevation adjustments. This technique requires a bonding action to the underlying HMA surface and multiple joints at an early age to control cracking and curling stresses within the inlay/overlay.

These guidelines are to be followed to review the existing pavement structure, identify design considerations, and prepare a request for review and approval of a PCC inlay/overlay system.

46-5.01(b) Limitations

Performance of PCC inlay/overlay sections can be variable because of the underlying pavement structure. The designer should consider the general constructability of a PCC inlay/overlay at the selected location. The existing HMA layer that is to remain in place shall be a minimum of 2.5 in. thick. If a portion of the PCC inlay/overlay in excess of 5% will be bonded directly to bare concrete, brick, or other old slabs of concrete, this rehabilitation method shall not be used. The 5% limitation is to allow for existing concrete patches or other existing pavement features. Construction is also hindered by complicated geometrics, utility obstructions, traffic demand, and condition of the existing pavement.

The term PCC inlay can be defined as a very minor or no change in grade; and, as such, could limit its use in areas where profile adjustments would be limited (e.g., with existing curb and gutter sections). A PCC overlay would be used where profile grade adjustments are feasible.

This alternative rehabilitation strategy shall apply to Class I, II, III, and IV pavements, but shall not be used for Federal-aid Interstates or when the traffic factor (based on the rigid pavement equations) exceeds 5.0.

46-5.02 Review of Existing Pavement Structure

A thorough investigation of the existing pavement structure should be conducted. The purpose of this investigation is to determine if the section in question is suitable for a PCC inlay/overlay. It is essential that only appropriate sections be selected for this rehabilitation option.

46-5.02(a) Preliminary Pavement Investigation

The designer should research past rehabilitation attempts as well as future plans for the area that surrounds the intersection/roadway. Research of past rehabilitation attempts will provide information on why past rehabilitation methods have not performed as designed. Insight into future plans for the pavement and area surrounding the project may influence the design of the rehabilitation. The designer should check to see if any of the limitations of this application apply.

If it appears that a PCC inlay/overlay can be constructed, then a detailed pavement investigation is necessary to verify the constructability of the inlay/overlay.

46-5.02(b) Detailed Pavement Investigation

Upon completion of the preliminary investigation, a detailed pavement coring plan should be developed and administered. In general, cores will be taken to represent the majority of pavement cross sections and locations within the project. A document with guidelines for material sampling entitled "Guidelines for Material Sampling and Testing of Existing Hot Mix Asphalt Pavements and Overlays," is available through the Bureau of Materials and Physical Research. The coring plan should be completed to specifically address the following points:

- Total pavement thickness and thickness of each layer of concrete and HMA detected.
- Condition and presence of stripping for each HMA layer.

- Condition, compressive strength (optional), presence of D-cracking, and presence of alkali-silica reaction for each concrete layer.
- Identification of locations where patching or alternative rehabilitations methods are recommended.

In addition to the coring plan a general inspection of the project limits should be completed. The inspection should address the following items:

- Intersection of pavement crowns (multi-leg intersections)
- Location of drop inlets
- Location of loop detectors for traffic signals
- Location of sewer manholes, water valves, and all other utility obstructions
- Location of existing surface patches
- Location of high severity distresses
- Location of HMA rutting exceeding 0.35 in (9 mm)
- Clearance for overheads

46-5.02(c) Existing and Projected Average Daily Traffic

An accurate count of the existing Average Daily Traffic (ADT) with a breakdown of percentages for passenger vehicles, single unit, and multiple unit trucks should be performed. In addition, estimates for the projected ADT and classification breakdown should be developed for the design period.

46-5.02(d) Existing Pavement Structure Report

Upon completion of coring and inspection procedures, and collection of traffic data, a report should be created to document this information.

46-5.03 Thickness Design Procedure

46-5.03(a) Classes of Roads and Streets

The class of the road or street for which the concrete inlay or overlay design is being determined is dependent upon the structural design traffic. These road classifications are defined in Section 44-1.01.

46-5.03(b) Design Period

The design period DP is the length of time in years that the concrete inlay or overlay is being designed to serve the structural design traffic. The design period for this pavement type is 15 years.

46-5.03(c) Structural Design Traffic

The structural design traffic is the estimated ADT for the year representing one-half of the design period. For example, when the design period is 15 years, the structural design traffic will be an estimate of the ADT projected to 7.5 years after the construction date.

The structural design traffic is estimated from current traffic count data obtained either by manual counts or from traffic maps published by IDOT. If PV, SU, and MU counts are not available for Class III and IV roads and streets, Figure 46-5A provides an estimate of counts that can be made from the component percentages of the total traffic.

Class of Road or Street	Percentage of Structural Design Traffic		
	PV (%)	SU (%)	MU (%)
III	88	7	5
IV	88	9	3

**PERCENTAGE OF STRUCTURAL DESIGN TRAFFIC
(Class III or IV)**

Figure 46-5A

46-5.03(d) Traffic Factor

For Class I, II, III, and IV roads and streets, the design TF for rigid pavements is determined from the 80,000 pound load limit formulas shown in Figure 46-5B. The formulas are based on the Statewide average distribution of vehicle types and axle loadings, which are directly applicable to most roads and streets.

However, cases will arise in which the average formula should not be used (e.g., a highway where HCV's entering and leaving a site generally travel empty in one direction and fully loaded in the other). These cases should be referred to Central BLRS for special analysis. The local agency must provide Central BLRS with the structural design traffic, the DP, and traffic distribution by PV's, SU's, and MU's.

46-5.03(e) Joint Spacing

A key to the success of a PCC inlay or overlay is proper timing and placement of longitudinal and transverse joints. These joints are hand tooled into plastic concrete or sawed into hardened concrete to provide stress relief induced by drying shrinkage and curing of concrete. Hand tooled joints shall not be used on mainline pavement with a posted speed limit greater than 40 mph because they may not be as smooth as sawed joints, resulting in rougher ride. The joints should be laid out on a regular pattern for both longitudinal and transverse directions (to form squares) based on the spacing used to determine thickness. No skewed joints shall be allowed.

Transverse and longitudinal joints should be laid out to match joints, utility obstructions, and geometrics of the existing pavement including utility cuts as much as possible in advance, recognizing that field adjustments will be required. When feasible, longitudinal joints should be laid out to avoid the wheel path areas of the traveling lanes. The layout of all transverse and longitudinal joints should be detailed on the plan sheets.

BUREAU OF LOCAL ROADS & STREETS
PAVEMENT REHABILITATION

Apr 2012

46-5(5)

The cost of sawing may significantly influence the cost of a PCC inlay/overlay. A thicker PCC inlay/overlay may be more economical than a thinner one because the greater thickness may allow increased joint spacing, resulting in less sawing. In addition, the use of synthetic fibers for PCC inlays/overlays greater than 4.0 in may be more economical than PCC inlays/overlays without synthetic fibers because the synthetic fibers may allow an increased joint spacing. Again, the amount of sawing is reduced.

Class I Roads and Streets	
4 or 5 Lane Pavements (Rural and Urban)	$TF = DP \frac{(0.047 PV + 64.715 SU + 313.389 MU)}{1,000,000}$
6 or More Lane Pavements (Rural)	$TF = DP \frac{(0.029 PV + 57.524 SU + 278.568 MU)}{1,000,000}$
6 or More Lane Pavements (Urban)	$TF = DP \frac{(0.012 PV + 53.210 SU + 257.675 MU)}{1,000,000}$
One-way Street Pavements (Rural and Urban)	$TF = DP \frac{(0.073 PV + 71.905 SU + 348.210 MU)}{1,000,000}$

2 or 3 Lane Pavements	$TF = DP \frac{(0.073 PV + 67.890 SU + 283.605 MU)}{1,000,000}$
Class III Roads and Streets	
2 or 3 Lane Pavements	$TF = DP \frac{(0.073 PV + 64.790 SU + 281.235 MU)}{1,000,000}$ TF minimum = 0.5
Class IV Roads and Streets	
2 or 3 Lane Pavements	$TF = DP \frac{(0.073 PV + 63.875 SU + 277.950 MU)}{1,000,000}$

TRAFFIC FACTOR EQUATIONS (80,000 LB LOAD LIMIT)

Figure 46-5B

46-5.03(f) Thickness Design

Based on the traffic factor, the thickness of the underlying HMA material, panel size, and fibers/no fibers, the PCC inlay/overlay thickness may be determined either from Figures 46-5C through 46-5J or by using a computer program which is available from BDE: www.dot.il.gov/desenv/pdp.html. The inlay/overlay thickness shall be 3.0 in to 6.0 in, with 0.5 in increments allowed.

BUREAU OF LOCAL ROADS & STREETS
PAVEMENT REHABILITATION

46-5(6)

Apr 2012

The thicknesses shown in Figures 46-5C through 46-5J were calculated using the computer program with the following default values as design inputs:

- Elastic Modulus of HMA Layer (E_{AC}) = 350,000 psi
- Elastic Modulus of PCC Overlay or Inlay (E_C) = 3,600,000 psi
- Modulus of Rupture (MOR) = 750 psi
- Modulus of Subgrade (k) = 100 pci
- Coefficient of Thermal Expansion (CTE) = 5.5×10^{-6} in./in./°F
- Percent of Panels with Cracking (P_{cr}) = 20%
- Reliability Factor (R) = 85%
- Temperature Gradient (ΔT) = -1.4 °F/in.
- Occurrence of Temperature Gradient ($\% Time$) = 58%

The following list defines the variables shown in Figures 46-5C through 46-5J:

- $R_{150,3}$ = Residual Strength Ratio (percent); where the net deflection is calculated as $L/150$ (L = span length) and is limited to 3 mm
- h_{AC} = Thickness of existing hot-mix asphalt remaining after milling
- h_C = Thickness of new PCC inlay/overlay
- L = Joint spacing for longitudinal and transverse directions

<i>With Synthetic Fibers ($R_{150,3} = 20\%$)</i>		
Design Parameters		Inlay/Overlay Thickness, h_c (in.)
Traffic Factor $L = 48$ in.	Traffic Factor $L = 72$ in.	
---	---	3
≤ 0.065	---	3.5
≤ 0.7	---	4
≤ 5	≤ 0.05	4.5
≤ 5	≤ 0.27	5
≤ 5	≤ 1.2	5.5
≤ 5	≤ 4.5	6

<i>Without Synthetic Fibers ($R_{150,3} = 0\%$)</i>

46-5.04 Other Design Considerations

46-5.04(a) Drainage Considerations

Maintaining proper drainage through the design and during construction is important. During construction, maintaining drainage is especially critical for projects that include an inlay.

46-5.04(b) Pavement Preparation and Profile

The existing pavement surface shall be milled to correct profile irregularities, remove any foreign materials, and remove oxidized HMA from the surface. Milling will also increase the surface area for bonding of the PCC inlay/overlay. If patching will be required on the project, the designer needs to keep in mind that if a portion of the PCC inlay/overlay in excess of 5% will be bonded directly to bare concrete or brick, this pavement type shall not be used.

46-5.04(c) Final Finish

Locations with a posted speed limit greater than 40 mph shall use a Type A final finish. All other locations shall use a rough broom final finish struck perpendicular to the direction of traffic flow in lieu of a Type B final finish. The rough broom finish shall be used across the entire surface area of the inlay/overlay including any hand-tooled joints.

46-5.04(d) Traffic Control

The control of traffic through the project must be considered and well established prior to the time of construction. The best alternative for traffic control is to completely close the project to traffic. This alternative may be difficult for urban projects. If closure to traffic is not possible, traffic control must be established that will effectively move traffic through the project with minimal disruption to construction operations and traffic flow. Traffic control that can be left unattended overnight must be anticipated for each stage of construction.

46-5.04(e) Construction Staging

Construction staging for a PCC inlay/overlay project must be considered with respect to the construction timeframe and traffic flow through the project. The project must be staged in such a way that continuous traffic flow will be maintained. Construction staging must also consider the geometrics of the project and any lane to lane drop off restrictions that may be present with the overlay thickness.

PCC inlays/overlays have a traffic opening strength of 550 psi flexural or 3,000 psi compressive. The current PCC mix design specified may obtain the opening strength in as little as three days if properly proportioned. If the inlay/overlay must be opened to traffic in a shorter time frame, consult the District Materials Office for an acceptable high-early-strength PCC mixture.

46-5.05 Example Calculations

Example 46-5.1

Given: Existing two-way, two-lane Class III flexible pavement.

The existing cross section has a remaining HMA layer thickness of 4.0 inches.

Design Traffic:

- ADT = 1200
- 88% PV (1056); 7% SU (84); 5% MU (60)

Problem: Design a concrete overlay with and without fibers in the concrete, and with 48-inch and 72-inch panel (4 designs).

Solution:

1. Using Figure 46-5B, determine the TF for a two-way, two-lane Class III pavement for a design period of 15 years.

$$TF = DP \left[\frac{(0.073PV + 64.790SU + 281.235 MU)}{1,000,000} \right]$$

$$TF = 15 \left[\frac{(0.073 \times 1056 + 64.790 \times 84 + 281.235 \times 60)}{1,000,000} \right]$$

$$TF = 0.336$$

2. Analysis:

Figure 46-5F is used and the following thicknesses of concrete are obtained:

For 48" panel with fibers, concrete thickness = 3.0 inches;

For 72" panel with fibers, concrete thickness = 4.5 inches;

For 48" panel without fibers, concrete thickness = 4.5 inches; and

For 72" panel without fibers, concrete thickness = not feasible (The traffic factor exceeds the capacity of 6.0-inch maximum design;

3. Costs for concrete, fibers, and saw cutting should be obtained to determine which combination of fibers/no fibers and panel size gives the most economical design

46-6 FLEXIBLE PAVEMENT IN-PLACE RECYCLING

46-6.01 Introduction

Flexible pavements may be recycled using a variety of equipment, recycling agents, and processes. There are three general categories: Hot In-Place Recycling (HIR), Cold In-Place Recycling (CIR), and Full Depth Reclamation (FDR).

A thorough investigation of the existing pavement structure should be conducted. The purpose of this investigation is to determine if the section in question is suitable for an in-place recycling project. It is essential that only appropriate sections be selected for this rehabilitation option. If existing pavement structure is adequate further material investigation will be needed to select recycling technique and design. Pavements with deteriorations or distresses due to subgrade or drainage problems should only be considered for in-place recycling if additional work is undertaken to correct the subgrade and drainage deficiencies. Figure 46-1A shows appropriate distresses that may be addressed using an in-place recycling treatment.

Pavement Distress	In-Place Recycling Process		
	HIR	CIR	FDR
Raveling	Green	Yellow	Red
Potholes	Yellow	Green	Orange
Bleeding	Yellow	Yellow	Yellow
Skid Resistance	Yellow	Yellow	Orange
Rutting	Yellow	Green	Orange
Corrugations	Yellow	Green	Orange
Shoving	Yellow	Green	Orange
Fatigue Cracking	Red	Green	Green
Edge Cracking	Red	Orange	Green
Slippage Cracking	Yellow	Green	Yellow
Block Cracking	Red	Green	Green
Longitudinal Cracking	Yellow	Green	Yellow
Traverse Cracking	Yellow	Green	Green
Reflective Cracking	Yellow	Green	Green
Discontinuity Cracking	Red	Green	Green
Ride Quality	Green	Green	Red
Structural Improvement	Orange	Yellow	Green

IN-PLACE RECYCLING PAVEMENT DISTRESS SELECTION

Figure 46-6A

Projects developed in accordance with this section will be eligible for MFT, State, and/or Federal funding.

46-6.02 Hot In-Place Recycling (HIR)

HIR is an on-site, in-place rehabilitation method which consists of heating, softening, scarifying, mixing, placing, and compacting 0.75 in (19 mm) to 2 in (50 mm) of the existing bituminous pavement. The following pavement distresses may be treated by HIR:

- Surface Defects (Raveling, Potholes, Bleeding, Skid Resistance)
- Permanent Deformation (Rutting, Corrugations, and Shoving)
- Slippage, Longitudinal, Transverse, and Reflective Cracking
- Ride Quality

HIR may be divided into Surface Recycling, Remixing, and Repaving sub-categories.

46-6.02(a) HIR - Surface Recycling

HIR - Surface Recycling should be considered when pavement distresses are contained in the top 1 in (25 mm). Drying and heating of the existing asphalt pavement surface is performed with pre-heating units that are followed behind by a heating/scarification unit. After scarification, an asphalt modifier is applied to the scarified pavement prior to mixing, placing, and compacting the recycled pavement.

After completing the HIR – Surface Recycling process, a maximum 2.0 in (50 mm) HMA surface course shall be placed. LR400-3 should be used for this work.

46-6.02(b) HIR - Remixing

HIR – Remixing should be considered when significant modification of the existing asphalt pavement is needed to correct specific pavement distresses and/or the recycled mix is to function as the wearing course. HIR – Remixing will require more in-depth investigation and mix design. HIR – Remixing may be performed as a single stage or multiple stages.

Since design procedures and specifications have not been developed, HIR – Remixing needs to follow the experimental feature requirement in Section 11-3.06 of this manual.

46-6.02(c) HIR - Repaving

HIR – Repaving should be considered when other HIR processes will not restore the pavement profile or surface requirements and/or a thin HMA or specialty mix is required as a surface course. HIR – Repaving will require more in-depth investigation and mix design. HIR – Repaving may be performed as a single pass or multiple pass; however, the recycled lift and the new HMA surface course are compacted as one lift.

Since design procedures and specifications have not been developed, HIR – Repaving needs to follow the experimental feature requirement in Section 11-3.06 of this manual.

46-6.03 Cold In-Place Recycling (CIR)

46-6.03(a) General

CIR is an on-site, in-place rehabilitation method which consists of cold milling or pulverizing, mixing with emulsified asphalt or foamed asphalt, placing, and compacting 2 in (50 mm) to 6 in (150 mm) of the existing bituminous pavement. The following pavement distresses may be treated by CIR:

- Surface Defects (Raveling, Potholes, Bleeding, Skid Resistance)
- Permanent Deformation (Rutting, Corrugations, and Shoving)
- Fatigue, Edge, and Block Cracking
- Slippage, Longitudinal, Transverse, and Reflective Cracking
- Stripping
- Ride Quality

CIR of composite pavements (HMA overlays of rigid pavements) may be a more economical option than removing all HMA overlays down to bare concrete and then putting back a thick HMA overlay. However, this option is only feasible if the underlying concrete is in fairly good condition. Evidence of extensive slab movements such as pumping or differential settlement in a composite pavement may indicate potentially unstable or non-uniform subgrade support or material-related distress such as alkali-silica reactivity or D-cracking in the underlying concrete.

Contact the Central Bureau of Local Roads and Streets for assistance if CIR of a composite pavement is desired.

46-6.04 Full Depth Reclamation (FDR)

46-6.04(a) General

FDR is an on-site, in-place rehabilitation method which consists of uniformly pulverizing, mixing with emulsified asphalt or foamed asphalt, placing, and compacting the full thickness of the existing bituminous pavement and/or underlying materials (base and/or subbase) at the maximum depth of 10 in (250 mm). The following pavement distresses may be treated by FDR:

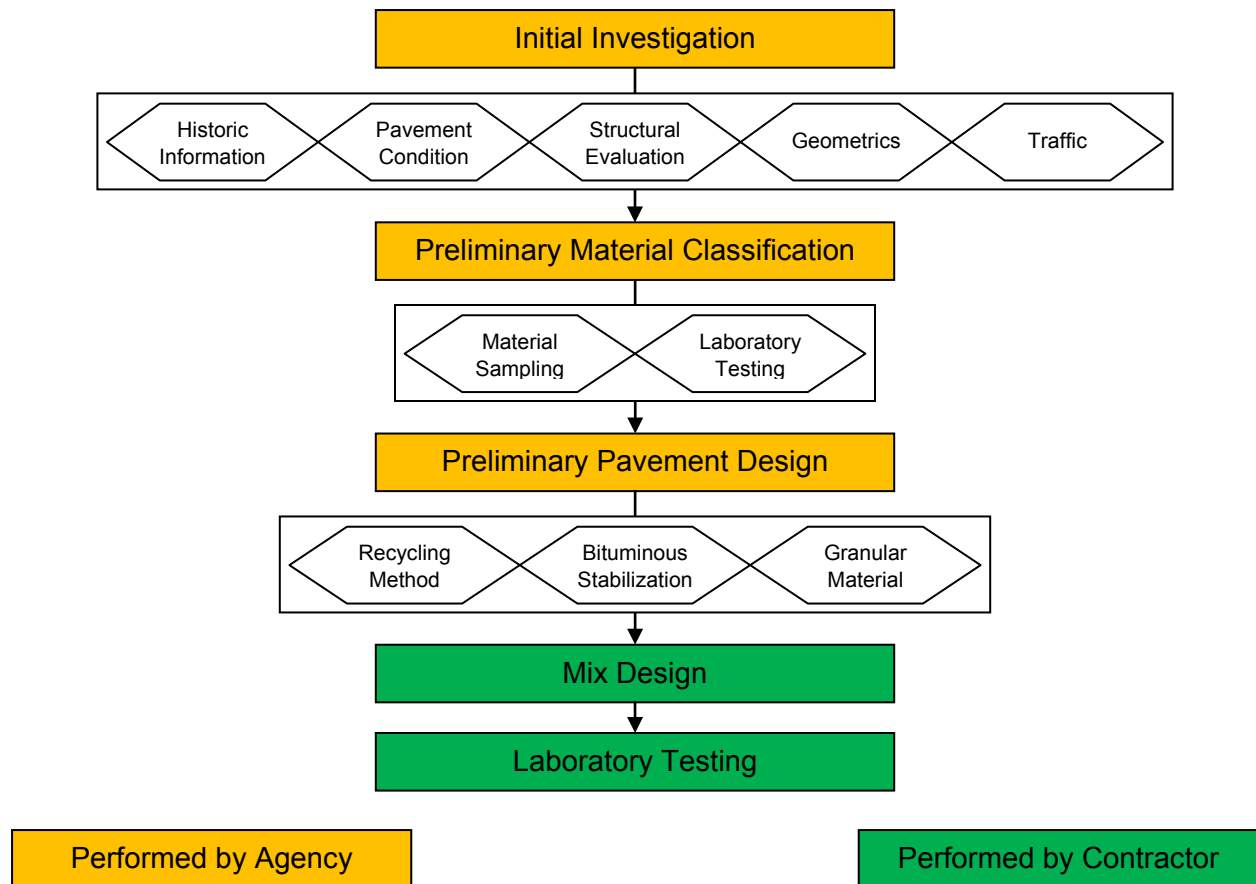

- Surface Defects (Raveling, Potholes, Bleeding, Skid Resistance)
- Permanent Deformation (Rutting, Corrugations, and Shoving)
- Fatigue, Edge, and Block Cracking
- Slippage, Longitudinal, Transverse, and Reflective Cracking
- Stripping
- Ride Quality

46-6.05 CIR and FDR Design Procedures

The designer will evaluate if CIR or FDR is an appropriate rehabilitation technique by conducting an initial investigation of historic information, pavement condition, structural capacity, highway geometrics, and traffic. Utilizing information from the initial investigation, the designer divides the project into segments of similar materials and/or performance for material classification, development of a pavement design, and cost estimate. This information may be used to compare CIR/FDR rehabilitation to other rehabilitation techniques to determine the best project.

If CIR or FDR is selected as the preferred alternative, the contractor shall conduct a more detailed analysis of the current pavement. The contractor shall develop a CIR or FDR mix design for approval by the designer based on additional sampling and testing. If the mix design does not perform adequately, the specified recycling parameters may need revised. The designer should anticipate 6 weeks from the notice to proceed for the contractor to submit a mix design. Therefore, working days will not start until the designer has approved the contractor mix design. Completion date contracts are discouraged.

Figure 46-6A outlines the CIR or FDR design procedures.

CIR/FDR PROJECT SELECTION AND EVALUATION

Figure 46-6B

46-6.05(a) Initial Investigation

An investigation into the design traffic, the available materials, the pavement structure and the climate should be performed. This initial investigation of the existing conditions will determine if the existing pavement conditions are suitable for the CIR/FDR since it is essential that only appropriate sections be selected for these rehabilitation options. Construction and maintenance records should be reviewed to determine variations in materials and typical pavement section.

1. Historic Information. The designer should review construction and maintenance records to determine:
 - Age of highway;
 - Thickness, age, and type of bituminous material used for each layer/treatment;
 - Top size and quality of aggregates for each layer/treatment;
 - Presence of any paving fabrics, interlayers, or unique mixes;
 - Patching location, age, and material used; and
 - Crack sealing location, age, and material used.
2. Pavement Condition. The existing pavement condition and the type, frequency, and severity of the distresses will indicate the depth and/or type of recycling needed.
 - CIR/FDR is best suited for pavements that are structurally sound and have well drained bases. The CIR/FDR process destroys the existing crack pattern; however, the Designer should consider crack depth and potential for reflective cracking when determining CIR thickness.
 - The presence of large or frequent patches increases the variability of the existing materials. Large full-depth patches may require a unique mix design. Furthermore, patches may indicate locations with thinner pavement structures, poor subgrade or higher groundwater which may need corrected as part of the highway rehabilitation.
 - Rutting may also be corrected with CIR/FDR if the appropriate stabilizing agent(s) and/or granular materials are used and the cause of the rutting is within the recycled thickness. If rutting is the result of a weak subgrade, CIR may not be a viable option; however, FDR may still be possible if subgrade stabilization is performed after pulverization and before reclamation.
3. Structural Evaluation. The designer should evaluate the pavement to ensure the CIR/FDR project will provide sufficient structural capacity and to verify that the underlying subgrade will provide sufficient support for construction equipment and adequate compaction of recycled mixture. Criteria for CIR/FDR pavement design is discussed in Section 46-6.05(c).
4. Geometrics. The designer should perform a detailed geometric assessment.
 - Major realignments or drainage corrections may be difficult using CIR. The designer may want to consider FDR or other rehabilitation techniques in these situations.
 - Granular shoulders that have sufficient granular material and good subgrade may be incorporated into the CIR/FDR process to provide a uniform base course for selected surface wearing course.

- The location and elevation of utility covers (manholes and valves) should be identified. Manholes and valves should be lowered at least 4 in (100 mm) below the CIR/FDR treatment depth. Upgrading of existing underground utilities should be completed prior to the CIR/FDR project.
 - Existing pavement on structures should not be treated with the CIR/FDR process; however, structures' condition rating and capacity should be evaluated to determine if the structures will support the CIR/FDR construction equipment.
 - Most transverse or longitudinal slope corrections may be corrected by cold planning, adding new granular or RAP material, and/or using a leveling binder under the surface wearing course.
6. Traffic. The designer should determine existing and forecasted traffic patterns and volumes to determine proper traffic control during the CIR/FDR project and for developing a pavement design.

46-6.05(b) Preliminary Material Classification

The designer should use historic information and pavement condition survey to divide project into area/segments of similar material and/or performance. The frequency of sampling to ensure representative samples varies with the size of the project, the variation in pavement structure, and the variability of existing material. However, at least one sample should be taken every 1600 to 2500 ft (500 to 760 m).

The laboratory testing of the in situ materials includes testing of surface, base course, subbase, and subgrade by using core sampling and/or test pits. Coring may be done using either wet or dry coring usually 6 in (150 mm) in diameter; however, coring may not allow a representative sample of aggregate subbase to be collected. Therefore, coring is not recommended if the recycling depth includes a granular layer. Test pits may also be used by means of sawing and then excavating the pavement to expose, sample and test underlying materials; however, test pits are usually more expensive, take longer, and have a significant impact on traffic than coring. Test pits do provide a larger, more representative sample than coring.

Core samples should be examined to confirm historic information including pavement layers, surface treatments, specialty mixes, or geotextile paving fabrics and to identify evidence of distresses such as stripping or rutting. If test pits are used, the visual inspection should be performed using the vertical edges of the test pits. After visual inspection, samples are crushed for further testing.

Representative samples from the bituminous layers being recycled will be tested to determine:

- Moisture content (if dry sampling has been used);
- Asphalt binder content (ignition or extraction); and
- Aggregate properties of bituminous layer including gradation and angularity (natural or crushed, crushed faces).

Representative samples from the granular layers being recycled will be tested to determine:

- Moisture content (if dry sampling has been used);
- Gradation and angularity (natural or crushed, crushed faces);

- Plastic index; and
- Sand equivalent value.

Figure 46-6B and Figure 46-6C provide information concerning gradations suitable for CIR and FDR using emulsified asphalt and foamed asphalt.

Sieve Size		Percent Passing			
		CIR/FDR with Emulsified Asphalt		CIR/FDR with Foamed Asphalt	
		Ideal	Less Suitable	Ideal	Less Suitable
2 in	50 mm	100		100	
1 1/2 in	37.5 mm	87 – 100		87 – 100

Note: Adapted from the 2010 Wirtgen Cold Recycling Technology guide.

GRADATION SUITABLE FOR CIR/FDR TREATMENT

Figure 46-6B

46-6.05(c) Pavement Design

A structural pavement design is not needed if a CIR/FDR project meets one of the following criteria.

- The project meets the eligibility requirements the Local Agency Functional Overlay policy as defined in Section 46-3.01. The designer should follow the HMA thickness requirements in Section 46-3.02 or the designer will require a surface treatment (such as seal coat, micro-surfacing, or cape seal);
- The project is included in a Local Agency Pavement Preservation program as defined in Chapter 45. The designer will require a surface treatment (such as seal coat, micro-surfacing, or cape seal) or HMA surface course; or
- The project is included in an annual maintenance program defined in Chapter 14. The designer will require a surface treatment (such as seal coat, micro-surfacing, or cape seal) or HMA surface course.

For all other CIR/FDR projects, the modified AASHTO design procedure for FDR or CIR pavements will enable the designer to determine the HMA overlay thickness required to carry specified volume and composition of traffic for a designated period of time while retaining serviceability level at or above a selected minimum value.

1. Determine Traffic Factor. Determine the traffic factor (TF) according to Sections 46-4.02(b), (c), (d), and (e).
2. Determine the Immediate Bearing Value. Determine the Immediate Bearing Value (IBV) of the road bed soil according to Section 46-4.02(f).
3. Required Final Structural Number. Determine the required structural number (SN_F) according to Section 46-4.02(g)
4. FDR or CIR Pavement Structural Number. The FDR or CIR pavement structural number (SN_R) is the FDR or CIR pavement thickness multiplied by its corresponding strength coefficient from Figure 46-4F. For CIR pavements, the summation of the remaining layers multiplied by their coefficients from Figure 46-4F must be added to the CIR layer product (see equation 46-6.1). For FDR, the FDR layer product is equal to SN_R (see equation 46-6.2).

Use the following equations to determine the structural number for FDR or CIR:

$$SN_R = a_1 D_R + a_1'' D_1 + a_2'' D_2 + a_3'' D_3 \quad \text{Equation 46-6.1}$$

$$SN_R = a_1 D_R \quad \text{Equation 46-6.2}$$

Where: SN_R = FDR or CIR recycling pavement structural number
 $a_1, a_1'', a_2'',$ and a_3'' = coefficient of relative strength of the FDR or CIR layer, and remaining surface, base, and subbase materials
 D_R, D_1, D_2, D_3 = depth of the FDR or CIR pavement, and thickness of remaining surface, base, and subbase layers

5. Overlay Thickness Design. If $SN_R \geq SN_F$, a HMA overlay is not required; however, the pavement shall be covered with a surface treatment such as seal coat, micro-surfacing, or cape seal.

If $SN_R < SN_F$, a HMA overlay thickness (D_O) is required. In determining the HMA overlay thickness, the in-place recycling pavement structural number is subtracted from the required structural number of the pavement. This needed structural number is then divided by the resurfacing coefficient to determine the resurfacing thickness.

Use the following equation to determine the required HMA overlay thickness:

$$D_O = \frac{(SN_F - SN_R)}{a_O} \quad \text{Equation 46-4.2}$$

Where:

- D_O = thickness of new HMA overlay, in
- SN_F = required flexible pavement structural number
- SN_R = FDR pavement structural number
- a_O = coefficients of relative strength of the overlay material

For typical overlays using a 19.0 mm HMA binder course and a 9.5 mm or 12.5 mm HMA surface course, the coefficient of relative strength of the overlay material (a_O) should be 0.36. If HMA surface course mixes are use the entire depth of the overlay, a_O may be increased to 0.40. Contact the Central Bureau of Local Roads and Streets for other special designs.

46-6.05(d) Determination of Project Criteria

The designer will use the initial investigation, preliminary material classification, and pavement design to establish project segments and depth of recycling; to select the type of recycling process (CIR or FDR) and bituminous stabilization agent (foamed asphalt or emulsified asphalt); and to determine if additional granular material is needed. The designer will use LR400-4, LR400-5, LR400-6, or LR400-7 as the contract special provision and included copies of the material testing in the contract documents.

46-6.05(e) Mix Design

The designer will require the contractor to submit a mix design meeting the performance criteria for asphalt emulsion (see Figure 46-6D) or foamed asphalt (see Figure 46-6E) stabilization. The designer will provide at least six weeks from the notice to proceed date for the contractor to perform the mix design. Depending on mix design results, the structural pavement design may need altered and/or additional laboratory testing performed.

The mix design varies somewhat depending on whether engineered asphalt emulsion or foamed asphalt is used as a stabilizing agent. Regardless of the bituminous stabilization used, the mix design should contain the following:

- Determine suitability of reclaimed material and necessary additives (coarse aggregate, fine aggregate, cement, fly ash, etc.);
- Establish optimum moisture content and optimum fluid content;
- Determine optimum bitumen content; and
- Confirm mechanical properties of the mix

BLRS PROCEDURE MEMORANDUM

NUMBER: 2005-01
SUBJECT: MOBILIZATION
ISSUED DATE: June 22, 2005
EFFECTIVE DATE: July 15, 2005

This memorandum adds Section 4.06 to Chapter 13 and Section 1.05(f) to Chapter 25 of the Bureau of Local Roads and Streets Manual dated April 2005.

Section 671 of the Standard Specifications for Road and Bridge Construction (SSRBC) contains the requirements for mobilization. The 2002 SSRBC allowed contractors to receive 3% of the contract price up front. This initial payment was then deducted from future payments. LR 671 *Mobilization* was issued to eliminate this section of the SSRBC if local agencies did not want mobilization payments.

In January 2003, Section 671 was revised to include a MOBILIZATION pay item. This allowed contractors to bid mobilization as a line item. If projects did not include the MOBILIZATION pay item, Section 671 did not apply. MOBILIZATION was an option on all local projects regardless of letting type. Therefore, the Bureau of Local Roads & Streets eliminated LR 671.

As of April 2005, the Office of the Chief Counsel requires prime contractors to pay subcontractors mobilization on state contracts. Therefore, BDE 80143 "Subcontractor Mobilization Payments" and the MOBILIZATION pay item is required for all local projects on state lettings after the effective date.

A handwritten signature in cursive script that reads "Charles J. Dingersoll".

HARD COPIES UNCONTROLLED

SUBCONTRACTOR MOBILIZATION PAYMENTS (BDE)

Effective: April 2, 2005

To account for the preparatory work and operations necessary for the movement of subcontractor personnel, equipment, supplies, and incidentals to the project site and for all other work or operations that must be performed or costs incurred when beginning work approved for subcontracting in accordance with Article 108.01 of the Standard Specifications, the Contractor shall make a mobilization payment to each subcontractor.

This mobilization payment shall be made at least 14 days prior to the subcontractor starting work. The amount paid shall be equal to 3 percent of the amount of the subcontract reported on form BC 260A submitted for the approval of the subcontractor's work.

This provision shall be incorporated directly or by reference into each subcontract approved by the Department.

80143

Illinois Department of Transportation

2300 South Dirksen Parkway / Springfield, Illinois / 62764

BLRS PROCEDURE MEMORANDUM

NUMBER: 2005-02
SUBJECT: RETAINAGE
ISSUED DATE: June 22, 2005
EFFECTIVE DATE: July 15, 2005

This memorandum supersedes Chapter 13 Section 2.04(c) and Chapter 25 Section 1.03(c) of the Bureau of Local Roads and Streets Manual dated April 2005.

Subpart B Administrative Requirements for DBE Programs for Federally-Assisted Contracting of 49 CFR 26.29(b) provides three mechanisms for retainage administration on federal-aid contracts:

1. Awarding agencies may decline withholding retainage from prime contractors and prohibit prime contractors from withholding retainage from subcontractors.
2. Awarding agencies may decline withholding retainage from prime contractors and require prime contractors to make full and prompt payment of any retainage kept from subcontractors within 30 days after the subcontractor's work is satisfactorily completed.
3. Awarding agencies may hold retainage from prime contractors and provide for prompt and regular incremental acceptances of the prime contract, pay retainage to prime contractors based on these acceptances, and require prime contractors to make full and prompt payment of any retainage kept from subcontractors within 30 days after the prime contractor receives retainage payments for that work.

605 ILCS 5/5-409 requires counties to withhold 10% of the value of the work then completed as retainage until 50% of the work has been completed. After 50% of the work is completed, the county must withhold at least 5% of the total adjusted contract price.

Therefore, if a local project contains federal funds, the local agency must comply with 49 CFR 26.29(b). If no federal funds are involved, the department will continue to apply the requirements of 605 ILCS 5/5-409 to all local projects.

HARD COPIES UNCONTROLLED

The department administers projects on the state letting using the second option by using BDE Special Provision 80029 "Disadvantaged Business Enterprise Participation" and BDE Special Provision 80116 "Partial Payments". These special provisions should be included in all local projects that are federally funded. BDE 80116 is not allowed and retainage is required for projects with no federal funds and locally let.

A handwritten signature in black ink that reads "Charles J. Dingersoll". The signature is written in a cursive style with a large initial 'C'.

§ 26.21**Subpart B—Administrative Requirements for DBE Programs for Federally-Assisted Contracting****§ 26.21 Who must have a DBE program?**

(a) If you are in one of these categories and let DOT-assisted contracts, you must have a DBE program meeting the requirements of this part:

(1) All FHWA recipients receiving funds authorized by a statute to which this part applies;

(2) FTA recipients receiving planning, capital and/or operating assistance who will award prime contracts (excluding transit vehicle purchases) exceeding \$250,000 in FTA funds in a Federal fiscal year;

(3) FAA recipients receiving grants for airport planning or development who will award prime contracts exceeding \$250,000 in FAA funds in a Federal fiscal year.

(b)(1) You must submit a DBE program conforming to this part by August 31, 1999 to the concerned operating administration (OA). Once the OA has approved your program, the approval counts for all of your DOT-assisted programs (except that goals are reviewed by the particular operating administration that provides funding for your DOT-assisted contracts).

(2) You do not have to submit regular updates of your DBE programs, as long as you remain in compliance. However, you must submit significant changes in the program for approval.

(c) You are not eligible to receive DOT financial assistance unless DOT has approved your DBE program and you are in compliance with it and this part. You must continue to carry out your program until all funds from DOT financial assistance have been expended.

[64 FR 5126, Feb. 2, 1999, as amended at 64 FR 34570, June 28, 1999; 65 FR 68951, Nov. 15, 2000]

§ 26.23 What is the requirement for a policy statement?

You must issue a signed and dated policy statement that expresses your commitment to your DBE program, states its objectives, and outlines responsibilities for its implementation.

49 CFR Subtitle A (10–1–04 Edition)

You must circulate the statement throughout your organization and to the DBE and non-DBE business communities that perform work on your DOT-assisted contracts.

§ 26.25 What is the requirement for a liaison officer?

You must have a DBE liaison officer, who shall have direct, independent access to your Chief Executive Officer concerning DBE program matters. The liaison officer shall be responsible for implementing all aspects of your DBE program. You must also have adequate staff to administer the program in compliance with this part.

§ 26.27 What efforts must recipients make concerning DBE financial institutions?

You must thoroughly investigate the full extent of services offered by financial institutions owned and controlled by socially and economically disadvantaged individuals in your community and make reasonable efforts to use these institutions. You must also encourage prime contractors to use such institutions.

§ 26.29 What prompt payment mechanisms must recipients have?

(a) You must establish, as part of your DBE program, a contract clause to require prime contractors to pay subcontractors for satisfactory performance of their contracts no later than 30 days from receipt of each payment you make to the prime contractor.

(b) You must ensure prompt and full payment of retainage from the prime contractor to the subcontractor within 30 days after the subcontractor's work is satisfactorily completed. You must use one of the following methods to comply with this requirement:

(1) You may decline to hold retainage from prime contractors and prohibit prime contractors from holding retainage from subcontractors.

(2) You may decline to hold retainage from prime contractors and require a contract clause obligating prime contractors to make prompt and full payment of any retainage kept by prime contractor to the subcontractor within

30 days after the subcontractor's work is satisfactorily completed.

(3) You may hold retainage from prime contractors and provide for prompt and regular incremental acceptances of portions of the prime contract, pay retainage to prime contractors based on these acceptances, and require a contract clause obligating the prime contractor to pay all retainage owed to the subcontractor for satisfactory completion of the accepted work within 30 days after your payment to the prime contractor.

(c) For purposes of this section, a subcontractor's work is satisfactorily completed when all the tasks called for in the subcontract have been accomplished and documented as required by the recipient. When a recipient has made an incremental acceptance of a portion of a prime contract, the work of a subcontractor covered by that acceptance is deemed to be satisfactorily completed.

(d) Your DBE program must provide appropriate means to enforce the requirements of this section. These means may include appropriate penalties for failure to comply, the terms and conditions of which you set. Your program may also provide that any delay or postponement of payment among the parties may take place only for good cause, with your prior written approval.

(e) You may also establish, as part of your DBE program, any of the following additional mechanisms to ensure prompt payment:

(1) A contract clause that requires prime contractors to include in their subcontracts language providing that prime contractors and subcontractors will use appropriate alternative dispute resolution mechanisms to resolve payment disputes. You may specify the nature of such mechanisms.

(2) A contract clause providing that the prime contractor will not be reimbursed for work performed by subcontractors unless and until the prime contractor ensures that the subcontractors are promptly paid for the work they have performed.

(3) Other mechanisms, consistent with this part and applicable state and local law, to ensure that DBEs and

other contractors are fully and promptly paid.

[68 FR 35553, June 16, 2003]

§ 26.31 What requirements pertain to the DBE directory?

You must maintain and make available to interested persons a directory identifying all firms eligible to participate as DBEs in your program. In the listing for each firm, you must include its address, phone number, and the types of work the firm has been certified to perform as a DBE. You must revise your directory at least annually and make updated information available to contractors and the public on request.

§ 26.33 What steps must a recipient take to address overconcentration of DBEs in certain types of work?

(a) If you determine that DBE firms are so overconcentrated in a certain type of work as to unduly burden the opportunity of non-DBE firms to participate in this type of work, you must devise appropriate measures to address this overconcentration.

(b) These measures may include the use of incentives, technical assistance, business development programs, mentor-protégé programs, and other appropriate measures designed to assist DBEs in performing work outside of the specific field in which you have determined that non-DBEs are unduly burdened. You may also consider varying your use of contract goals, to the extent consistent with § 26.51, to ensure that non-DBEs are not unfairly prevented from competing for subcontracts.

(c) You must obtain the approval of the concerned DOT operating administration for your determination of overconcentration and the measures you devise to address it. Once approved, the measures become part of your DBE program.

§ 26.35 What role do business development and mentor-protégé programs have in the DBE program?

(a) You may or, if an operating administration directs you to, you must establish a DBE business development program (BDP) to assist firms in gaining the ability to compete successfully

Illinois Department of Transportation

BLRS PROCEDURE MEMORANDUM

NUMBER: 2005-03
SUBJECT: REQUIREMENTS FOR RESPONSIBLE BIDDERS
ISSUED DATE: June 22, 2005
EFFECTIVE DATE: July 15, 2005

This memorandum supersedes Chapter 12 Section 3.03(a) of the Bureau of Local Roads and Streets Manual dated April 2005.

Public Act 93-0642 amended 30 ILCS 500, the *Illinois Procurement Code*, by adding section 30-22 *Construction Contracts; Responsible Bidder Requirements* effective June 1, 2004. To be a responsible bidder on a construction contract, this public act requires a bidder comply with six minimum requirements. These requirements do not apply to federally funded construction projects if such application would jeopardize the receipt or use of federal funds.

The Illinois Procurement Code does not apply to local agencies; however, the following statutes require the Illinois Department of Transportation (IDOT) to approve local agency contracts that use Motor Fuel Tax (MFT), or other funds received from the State, and are let to the lowest responsible bidder:

- 605 ILCS 5/5-402 Department approval and supervision required when certain funds are used; agreement between Department and County Highway Superintendent's Office
- 605 ILCS 5/5-403 Procedure when work is to be performed under supervision and approval of Department; resolutions; bids and letting of contracts
- 605 ILCS 5/6-701.1 Construction of roads and grades; procedure.
- 605 ILCS 5/7-203 Ordinances specifying purposes of motor fuel tax funds; Department approval for specifications and work; bidding and letting of contracts; inspection of work by Department

Therefore, IDOT's Office of Chief Counsel has determined that the department must use the requirements outlined in 30 ILCS 500/30-22 as minimum requirements when approving any local let construction projects that use MFT funds or other state funding source provided federal funds are not included. The department has defined local let construction projects to include general maintenance contracts; however, this does not include projects let as material proposals according to Chapter 12, Section 1.01(b) and Section 1.02(b), of the Bureau of Local Roads and Streets Manual.

HARD COPIES UNCONTROLLED

BLR 12220 (formerly BLR 5704) has been revised to add an apprenticeship and training certification statement. All prospective bidders must submit this completed statement with their bid. If a bidder's certification statement is not completed their bid should be discarded. This statement does not apply to federal aid projects.

A handwritten signature in black ink that reads "Charles J. Dingsoll". The signature is written in a cursive style with a large, prominent 'C' at the beginning.

Public Act 093-0642
HB3048 Re-Enrolled

LRB093 07661 JAM 07841 b

AN ACT relating to procurement.

Be it enacted by the People of the State of Illinois,
represented in the General Assembly:

Section 5. The Illinois Procurement Code is amended by
adding Section 30-22 as follows:

(30 ILCS 500/30-22 new)

Sec. 30-22. Construction contracts; responsible bidder requirements. To be considered a responsible bidder on a construction contract for purposes of this Code, a bidder must comply with all of the following requirements and must present satisfactory evidence of that compliance to the appropriate construction agency:

(1) The bidder must comply with all applicable laws concerning the bidder's entitlement to conduct business in Illinois.

(2) The bidder must comply with all applicable provisions of the Prevailing Wage Act.

(3) The bidder must comply with Subchapter VI ("Equal Employment Opportunities") of Chapter 21 of Title 42 of the United States Code (42 U.S.C. 2000e and following) and with Federal Executive Order No. 11246 as amended by Executive Order No. 11375.

(4) The bidder must have a valid Federal Employer Identification Number or, if an individual, a valid Social Security Number.

(5) The bidder must have a valid certificate of insurance showing the following coverages: general liability, professional liability, product liability, workers' compensation, completed operations, hazardous occupation, and automobile.

(6) The bidder and all bidder's subcontractors must

participate in applicable apprenticeship and training programs approved by and registered with the United States Department of Labor's Bureau of Apprenticeship and Training.

The provisions of this Section shall not apply to federally funded construction projects if such application would jeopardize the receipt or use of federal funds in support of such a project.

Bidders Instructions

1. Plans and proposal forms will be available in the office of _____
2. If prequalification is required , the 2 low bidders must file within 24 hours after the letting an "Affidavit of Availability" (Form BC 57), in triplicate, showing all uncompleted contracts awarded to them and all low bids pending award for Federal, State, County, Municipal and private work. One copy shall be filed with the Awarding Authority and 2 copies with the IDOT District Office.
3. All proposals must be accompanied by a proposal guaranty as provided in BLRS Special Provision for Bidding Requirements and Conditions for Contract Proposals contained in the "Supplemental Specifications and Recurring Special Provisions".
4. The Awarding Authority reserves the right to waive technicalities and to reject any or all proposals as provided in BLRS Special Provision for Bidding Requirements and Conditions for Contract Proposals contained in the "Supplemental Specifications and Recurring Special Provisions".
5. Bidders need not return the entire contract proposal when bids are submitted unless otherwise required. Portions of the proposal that must be returned include the following:

a. BLR 12210 - Contract Cover	d. BLR 12222 - Contract Schedule of Prices
b. BLR 12220 - Notice to Bidders	e. BLR 12223- Signatures
c. BLR 12221 - Contract Proposal	f. BLR 12230 - Proposal Bid Bond (if applicable)
6. The quantities appearing in the bid schedule are approximate and are prepared for the comparison of bids. Payment to the Contractor will be made only for the actual quantities of work performed and accepted or materials furnished according to the contract. The scheduled quantities of work to be done and materials to be furnished may be increased, decreased or omitted as hereinafter provided.

HARD COPIES UNCONTROLLED

7. Submission of a bid shall be conclusive assurance and warranty the bidder has examined the plans and understands all requirements for the performance of work. The bidder will be responsible for all errors in the proposal resulting from failure or neglect to conduct an in depth examination. The Awarding Authority will, in no case be responsible for any costs, expenses, losses or changes in anticipated profits resulting from such failure or neglect of the bidder.
8. The bidder shall take no advantage of any error or omission in the proposal and advertised contract.
9. If a special envelope is supplied by the Awarding Authority, each proposal should be submitted in that envelope furnished by the Awarding Agency and the blank spaces on the envelope shall be filled in correctly to clearly indicate its contents. When an envelope other than the special one furnished by the Awarding Authority is used, it shall be marked to clearly indicate its contents. When sent by mail, the sealed proposal shall be addressed to the Awarding Authority at the address and in care of the official in whose office the bids are to be received. All proposals shall be filed prior to the time and at the place specified in the Notice to Bidders. Proposals received after the time specified will be returned to the bidder unopened.
10. Permission will be given to a bidder to withdraw a proposal if the bidder makes the request in writing or in person before the time for opening proposals.
11. **DOES NOT APPLY TO FEDERAL AID PROJECTS.** In accordance with the provisions of Section 30-22 (6) of the Illinois Procurement Code, the bidder certifies that it is a participant, either as an individual or as part of a group program, in the approved apprenticeship and training programs applicable to each type of work or craft that the bidder will perform with its own forces. The bidder further certifies for work that will be performed by subcontract that each of its subcontractors submitted for approval either (a) is, at the time of such bid, participating in an approved, applicable apprenticeship and training program; or (b) will, prior to commencement of performance of work pursuant to this contract, begin participation in an approved apprenticeship and training program applicable to the work of the subcontract. The Department, at any time before or after award, may require the production of a copy of each applicable Certificate of Registration issued by the United States Department of Labor evidencing such participation by the contractor and any or all of its subcontractors. Applicable apprenticeship and training programs are those that have been approved and registered with the United States Department of Labor. The bidder shall list in the space below, the official name of the program sponsor holding the Certificate of Registration for all of the types of work or crafts in which the bidder is a participant and that will be performed with the bidder's forces. Types of work or craft work that will be subcontracted shall be included and listed as subcontract work. The list shall also indicate any type of work or craft job category that does not have an applicable apprenticeship or training program. **The bidder is responsible for making a complete report and shall make certain that each type of work or craft job category that will be utilized on the project is accounted for and listed.**

The requirements of this certification and disclosure are a material part of the contract, and the contractor shall require this certification provision to be included in all approved subcontracts. In order to fulfill this requirement, it shall not be necessary that an applicable program sponsor be currently taking or that it will take applications for apprenticeship, training or employment during the performance of the work of this contract.

By Order of

(Awarding Authority)

County Engineer/County Superintendent of Highways/Municipal Clerk

Note: All proposal documents, including Proposal Guaranty Checks or Proposal Bid Bonds, should be stapled together to prevent loss when bids are processed.

BDE PROCEDURE MEMORANDUM

NUMBER: 46-05

BLRS PROCEDURE MEMORANDUM

NUMBER: 2005-04

SUBJECT: FHWA Section 4(f) Policy Paper and Final Nationwide Programmatic Section 4(f) Evaluation and Determination for Federal-Aid Transportation Projects That Have a Net Benefit to a Section 4(f) Property

DATE: July 1, 2005

This memorandum clarifies and expands the previous guidance on Section 4(f). This information supersedes the current information in Chapter 26-2 of the BDE Manual and 20-3 of the LRS Manual. The attached 4(f) Policy Paper and Federal Register Notice of Net Benefit to Section 4(f) Properties will be included in future updates of the BDE Manual and the LRS Manual.

Background

The information presented in the Section 4(f) Policy Paper is FHWA's official policy on the applicability of Section 4(f) to various types of land and resources and other Section 4(f) related issues. The paper is divided into three main sections: the Introduction, Section 4(f) Evaluation, and Section 4(f) Applicability. The paper also includes Appendices, an Analysis of Case Law and the Section 4(f) Evaluation Diagram. The introduction replaces and considerably revises the former Section 4(f) Background and Section 4(f) Evaluation sections of the 1989 document. This comprehensive overview provides an organized approach to Section 4(f) and emphasizes key elements of the Section 4(f) process. The Section 4(f) Applicability section is the heart of the Policy Paper. It includes guidance, in question and answer format, on the applicability of Section 4(f) to various situations often encountered in the project development process.

The "Final Nationwide Programmatic Section 4(f) Evaluation and Determination for Federal-Aid Transportation Projects That Have a Net Benefit to a Section 4(f) Property" Notice in the Federal Register is a programmatic evaluation that provides a procedural option for demonstrating compliance with the statutory requirements of Section 4(f). It is in addition to the existing nationwide programmatic evaluations, all of which remain in effect. This action is intended to promote environmental stewardship by encouraging the development of measures that enhance Section 4(f) properties and to

streamline the Section 4(f) by reducing the time it takes to prepare, review and circulate a draft and final individual Section 4(f) Evaluation

Applicability

The procedures in this memorandum are applicable to all Federally funded State and Local Roads highway projects.

Contact the BDE at 217-782-7526 (for State projects) or BLRS at 217-782-3805 (for Local Roads projects) if there are questions concerning this information.

INTRODUCTION

Section 4(f) was created when the United States Department of Transportation (USDOT) was formed in 1966. It was initially codified at 49 U.S.C. 1653(f) (Section 4(f) of the USDOT Act of 1966) and only applies to USDOT agencies. Later that year, 23 U.S.C. 138 was added with somewhat different language, which applied only to the highway program. In 1983, Section 1653(f) was reworded without substantive change and recodified at 49 U.S.C. 303. In their final forms, these two statutes have no real practical distinction and are still commonly referred to as Section 4(f):

"It is hereby declared to be the national policy that special effort should be made to preserve the natural beauty of the countryside and public park and recreation lands, wildlife and waterfowl refuges, and historic sites. The Secretary of Transportation shall cooperate and consult with the Secretaries of the Interior, Housing and Urban Development, and Agriculture, and with the States in developing transportation plans and programs that include measures to maintain or enhance the natural beauty of the lands traversed. After the effective date of the Federal-Aid Highway Act of 1968, the Secretary shall not approve any program or project (other than any project for a park road or parkway under section 204 of this title) which requires the use of any publicly owned land from a public park, recreation area, or wildlife and waterfowl refuge of national, State, or local significance as determined by the Federal, State, or local officials having jurisdiction thereof, or any land from an historic site of national, State, or local significance as so determined by such officials unless (1) there is no feasible and prudent alternative to the use of such land, and (2) such program includes all possible planning to minimize harm to such park, recreational area, wildlife and waterfowl refuge, or historic site resulting from such use. In carrying out the national policy declared in this section the Secretary, in cooperation with the Secretary of the Interior and appropriate State and local officials, is authorized to conduct studies as to the most feasible Federal-aid routes for the movement of motor vehicular traffic through or around national parks so as to best serve the needs of the traveling public while preserving the natural beauty of these areas."

23 U.S.C. 138

The Federal Highway Administration (FHWA) originally issued the *Section 4(f) Policy Paper* in September 1987. There was a minor amendment in 1989 adding two additional questions and answers. This 2005 paper provides updated comprehensive guidance on when and how to apply the provisions of Section 4(f) on FHWA projects that propose to use 4(f) land or resources. The information presented in this paper is not regulatory, but is the official policy of FHWA on the applicability of Section 4(f) to various types of land and resources and other Section 4(f) related issues. The paper creates no private right of action and its guidance is not judicially binding on the FHWA.

Previous versions of this policy paper are no longer applicable. This issuance also rescinds the November 15, 1989, *Memorandum: Alternatives Selection Process for Projects Involving Section 4(f) of the DOT Act*, signed by Ali Sevin, Director of the Office of Environmental Policy, and by the creation of Question and Answer 24, supersedes the August 22, 1994, *Interim Guidance on Applying Section 4(f) On Transportation Enhancement Projects and National Recreation Trails*.

Purpose of this Paper

This paper explains how Section 4(f) applies generally and to specific situations where resources meeting the Section 4(f) criteria may be involved. It is based on court decisions, experience and on policies developed by FHWA and USDOT over the years. This paper serves as a guide for the applicability of Section 4(f) for common project situations often encountered by FHWA Division Offices, State Departments of Transportation and other partners.

For specific projects that do not completely fit the situations or parameters described in this paper, it is advisable to contact the FHWA Division Office. In turn, the Division Office may contact the Washington Headquarters' Office of Project Development and Environmental Review, the Resource Center Environmental Technical Service Team, and/or the Office of the Chief Counsel. For more information on Section 4(f) refer to the Environmental Guidebook (www.environment.fhwa.dot.gov/guidebook/index.htm) and the FHWA Re: NEPA Community of Practice (<http://nepa.fhwa.dot.gov>).

Important Points

At the outset, a few important points about Section 4(f) must be understood.

- **Section 4(f) Authority and Responsibility:** Section 4(f) applies only to the actions of agencies within the USDOT. While other agencies may have an interest in Section 4(f), the agencies within the USDOT are responsible for applicability determinations, evaluations, findings and overall compliance.
- **Section 4(f) Applicability:** Section 4(f) applies to any significant publicly owned public park, recreation area, or wildlife and waterfowl refuge and any land from an historic site of national, state or local significance.
- **Public Ownership and Public Access Criteria:** Section 4(f) applies to significant publicly owned public parks and recreational areas that are open to the public, and to significant publicly owned wildlife and waterfowl refuges, irrespective of whether these areas are open to the public or not, since the "major purpose" of a refuge may make it necessary for the resource manager to limit public access. When private institutions, organizations or individuals own parks, recreational areas or wildlife and waterfowl refuges, Section 4(f) does not apply to these properties, even if such areas are open to the public. If a governmental body has a permanent proprietary interest in the land (such as fee ownership or easement), it is considered "publicly owned" and thus, Section 4(f) may be applicable. Section 4(f) also applies to all historic sites of national, state or local significance, whether or not these sites are publicly owned or open to the public. Except in unusual circumstances, only historic properties on or eligible for inclusion on the National Register of Historic Places are protected under Section 4(f).
- **Significance Criteria:** A publicly owned park, recreation area or wildlife and waterfowl refuge must be a "significant" resource for Section 4(f) to apply. Pursuant to 23 C.F.R. 771.135 (c), 4(f) resources are presumed to be significant unless the official having jurisdiction over the site concludes that the entire site is not significant. Even if this is done, FHWA must make an independent evaluation to assure that the official's finding of significance or non-significance is reasonable.
- **Feasible and Prudent Criteria:** Numerous legal decisions on Section 4(f) have resulted in a USDOT policy that findings of "no feasible and prudent alternatives" and "all possible planning to minimize harm", must be well documented and supported. A feasible alternative is an alternative that is possible to engineer, design and build. The leading United States Supreme Court case, commonly known as Overton Park, (Citizens to Preserve Overton Park v. Volpe, 401 U.S. 402 (1971)), held that to find that an alternative (that avoids a 4(f) resource) is not "prudent" one must find that there are unique problems or unusual factors involved with the use of such alternatives. This means that the cost, social, economic and environmental impacts, and/or community disruption resulting from such alternatives reach extraordinary magnitudes. One can use a totality of these circumstances to establish that these unique problems, unusual factors or other impacts reach extraordinary magnitudes. FHWA has incorporated this decision into existing regulations found at 23 C.F.R. 771.135(a)(2).
- **Documentation and Coordination:** The statute does not require the preparation, distribution or circulation of any written document. The statute also does not contain a public comment element. Other than the U.S. Departments of the Interior, Housing and Urban Development and

Agriculture, the statute also does not require or establish any procedures for coordinating with either other agencies or the public. USDOT has developed departmental requirements for documenting Section 4(f) decisions. For example, the requirements of DOT Order 5610.1C and its predecessors have been incorporated into FHWA regulations. FHWA developed procedures for the preparation, circulation and coordination of Section 4(f) documents in two places; 23 Code of Federal Regulations (C.F.R.) Section 771.135, and FHWA's *Technical Advisory, Guidance for Preparing and Processing of Environmental and Section 4(f) Documents: T 6640.8A*. Both of these sources of information are available at the FHWA NEPA Project Development Website: www.environment.fhwa.dot.gov/projdev/index.htm.

Two purposes of a written Section 4(f) evaluation are to establish an administrative record and to ensure that FHWA has followed the regulatory and statutory requirements. The administrative record is the agency's written record that memorializes the basis for determining that there is no feasible and prudent alternative to the use of the 4(f) resource and demonstrates that FHWA used all possible planning and measures to minimize harm. Likewise, when circulated with the NEPA document, it permits FHWA to obtain comments on avoidance alternatives and measures to minimize harm.

If a Section 4(f) evaluation is legally challenged, it is reviewed in accordance with the Administrative Procedure Act (APA) that provides judicial deference to USDOT actions. Under the APA, the agency's action must be upheld unless it is arbitrary, capricious, an abuse of discretion or otherwise not in accordance with law (5 U.S.C. 706 (2)(A)). The court will review the administrative record to determine whether FHWA complied with the elements of Section 4(f). If an inadequate administrative record is prepared, the court will lack the required Section 4(f) elements to review and, therefore, will be unable to defer to it (this is even truer if no Section 4(f) Evaluation is prepared). While agency decisions are entitled to a presumption of regularity and courts are not empowered to substitute their judgment for that of the agency, courts will carefully review whether the agency followed the applicable requirements.

Therefore, the administrative record should contain the following essential information:

- 1) The applicability or non-applicability of Section 4(f) to a property used by a project;
- 2) The coordination efforts with the officials having jurisdiction over or administering the land (relative to significance of the land, primary use of the land, mitigation measures, etc.);
- 3) The location and design alternatives that would avoid the use altogether or minimize the use and harm to the 4(f) land;
- 4) Analysis of impacts of avoidance and Section 4(f) use alternatives; and
- 5) All measures to minimize harm, such as design variations, landscaping and other mitigation.

The Section 4(f) analysis process is diagramed in Appendix B.

- **Other Laws and Requirements:** There are often concurrent requirements of other Federal agencies when 4(f) lands are involved in highway projects.¹ It should be noted that Section 4(f) has requirements that are independent from obligations found in these other authorities. In the instance where more than one Federal law is applicable to the 4(f) resource, just because the requirements of one law have been complied with, does not necessarily mean that Section 4(f) is

¹ Examples include: Compatibility determinations for the use of lands in the National Wildlife Refuge System and the National Park System, consistency determinations for the use of public lands managed by the Bureau of Land Management, determinations of direct and adverse effects for Wild and Scenic Rivers under the jurisdiction of such agencies as the U.S. Fish and Wildlife Service, National Park Service, Bureau of Land Management, and Forest Service, and approval of land conversions covered by the Federal-aid in Fish Restoration and the Federal-Aid in Wildlife Restoration Acts (the Dingell-Johnson and Pittman-Robertson Acts), the Recreational Demonstration Projects and the Federal Property and Administrative Service (Surplus Property) Acts, and Section 6(f) of the Land and Water Conservation Fund Act.

also satisfied. FHWA must demonstrate compliance with all the different requirements of applicable law in addition to its Section 4(f) responsibility.

Project mitigation required by other substantive laws can help FHWA satisfy the requirement that a project include all possible planning to minimize harm to a 4(f) resource if it is used. A good example of this is the terms of the Memorandum of Agreement (MOA) with the State Historic Preservation Officer (SHPO) or Tribal Historic Preservation Officer (THPO) when an historic property is adversely affected (under Section 106 of the National Historic Preservation Act) by a FHWA project. Nevertheless, if more reasonable measures to minimize harm to the 4(f) resource can be taken, simply complying with another statutes mitigation measures is not enough.

SECTION 4(f) EVALUATION

When a project proposes to use resources protected by Section 4(f), a Section 4(f) evaluation must be prepared. The following information provides guidance on the key areas of a Section 4(f) evaluation.

Section 4(f) Evaluation Format and Approval

The Section 4(f) evaluation may be developed and processed as a stand-alone document, as in the case of a categorical exclusion (CE) determination, or incorporated into an environmental assessment (EA) or environmental impact statement (EIS) as a separate section of those documents. The format and content for these evaluation documents are addressed in the FHWA *Technical Advisory T 6640.8a, Guidance for Preparing and Processing of Environmental and Section 4(f) Documents, October 30, 1987* (www.environment.fhwa.dot.gov/projdev/impTA6640.htm).

The FHWA Division Office or the Federal Lands Highway Division approves all Section 4(f) evaluations. Prior to Division Office approval, all final Section 4(f) evaluations must undergo legal sufficiency review in accordance with 23 C.F.R. 771.135(k). It is advisable and strongly recommended that the Division Office provide copies of the administrative or pre-draft Section 4(f) evaluation to the appropriate legal staff for preliminary review instead of submitting only the pre-final evaluation for legal sufficiency review.

Alternatives Analysis

The intent of the Section 4(f) statute and the policy of the USDOT is to avoid the use of significant public parks, recreation areas, wildlife and waterfowl refuges and historic sites as part of a project, unless there is no feasible and prudent alternative to the use of such land.² In order to demonstrate that there is no feasible and prudent alternative to the use of 4(f) land, the evaluation must address both location alternatives and design shifts that totally avoid the 4(f) land. As noted before, supporting information must demonstrate that there are unique problems or unusual factors involved with the alternatives that avoid the use of 4(f) land, such as findings that these alternatives result in costs, environmental impacts or community disruption of extraordinary magnitudes. Likewise, design shifts that cannot totally avoid use but that minimize the impact, must also be employed unless they are not feasible and prudent.

The Section 4(f) evaluation must address the purpose and need of the project. The need must be sufficiently explained and be consistent with the need set forth in any concurrent National Environmental Policy Act (NEPA) documentation. The Section 4(f) evaluation may reference the purpose and need included in a NEPA document, without reiteration, when the evaluation is included as a chapter of the document. Any alternative that is determined to not meet the need of the project, including the no-build alternative, is not a feasible and prudent alternative³. The evaluation must include this analysis.

² "Significance" of one of these types of properties is presumed unless an official with jurisdiction determines that the entire site is not significant.

³ *Alaska Center for Environment v. Armbrister*, 131 F.3d 1285, 1288 (9th Cir. 1987); *Arizona Past and Future Foundation v. Lewis*, 722 F.2d 1423, 1428 (9th Cir. 1983); *Hickory Neighborhood Defense League v. Skinner*, 910 F.2d 159, 163 (4th Cir. 1990); *Eagle Foundation, Inc. v. Dole*, 813 F.2d 798, 804 (7th Cir. 1987); *Committee to Preserve Boomer Lake Park v. USDOT*,

It is important to point out that the standard for evaluating alternatives under NEPA and the standard for evaluating alternatives under Section 4(f) are different. In general, under NEPA, FHWA can advance to detailed study any reasonable alternative, among a range of alternatives, as long as there is sufficient information that shows a well-reasoned decision to include that alternative. However, under Section 4(f), if there is a feasible and prudent alternative that avoids the use of a 4(f) resource, among alternatives that use a 4(f) resource, the alternative that must be selected is the one that avoids the 4(f) resource.

Likewise, the test under NEPA, to eliminate a reasonable alternative is based on a number of independent factors or a totality of cumulative factors. However, simply because under NEPA an alternative (that meets the purpose and need) is determined to be unreasonable, does not by definition, mean it is imprudent under the higher substantive test of Section 4(f). Therefore, it is possible for an alternative that was examined but dismissed during the preliminary NEPA alternative screening process to still be a feasible and prudent avoidance alternative under Section 4(f). In other words, there is more room to reject alternatives as unreasonable under NEPA than there is to find those same alternatives are imprudent under Section 4(f).

Feasible and Prudent Standard

The first test under Section 4(f) is to determine which alternatives are feasible and prudent. An alternative is feasible if it is technically possible to design and build that alternative. The second part of the standard involves determining whether an alternative is prudent or not, which is more difficult to define.

An alternative may be rejected as not prudent for any of the following reasons:

- 1) It does not meet the project purpose and need,
- 2) It involves extraordinary operational or safety problems,
- 3) There are unique problems or truly unusual factors present with it,
- 4) It results in unacceptable and severe adverse social, economic or other environmental impacts,
- 5) It would cause extraordinary community disruption,
- 6) It has additional construction costs of an extraordinary magnitude, or
- 7) There is an accumulation of factors that collectively, rather than individually, have adverse impacts that present unique problems or reach extraordinary magnitudes.

Where sufficient analysis demonstrates that a particular alternative is not feasible and prudent, the analysis or consideration of that alternative as a viable alternative comes to an end. If all alternatives use land from 4(f) resources, then an analysis must be performed to determine which alternative results in the least overall harm to the 4(f) resources. If the net harm to 4(f) resources in all the alternatives is equal, then FHWA may select any one of them. In other words, if the project proposes to use similar amounts of similar 4(f) resources, there is no alternative that would cause the least overall harm. In either situation, it is essential that the agency having jurisdiction over the 4(f) resource be consulted.

It should be noted that the net harm analysis is governed by all the possible mitigation that could be done to minimize harm to the 4(f) resource. The net harm should be determined in consultation with the agency having jurisdiction over the resource or, in the case of historic sites, the State Historic Preservation Officer (SHPO) or Tribal Historic Preservation Officer (THPO), as appropriate. By including mitigation, impacts on the 4(f) property could be reduced or eliminated. The alternative that results in the least net harm must be selected.

Not all uses of 4(f) resources have the same magnitude of impact and not all 4(f) resources have the same quality. A qualitative evaluation is required. For example, evaluation of the net impact should consider whether the use of the 4(f) property involves:

4 F.3d 1543, 1550 (10th Cir. 1993); Druid Hills v. FHWA, 772 F.2d 700 (11th Cir. 1985); Ringsred v. Dole, 828 F.2d 1300, 1304 (8th Cir. 1987).

- 1) A large taking or a small taking in relation to the overall size of the resource, or
- 2) Shaving an edge of a property as opposed to cutting through its middle, or
- 3) Altering part of the land surrounding an historic building rather than removing the building itself, or
- 4) Examining the key features of the 4(f) resource, or
- 5) An unused portion of a park rather than a highly used portion.

When different alternatives propose to use different 4(f) resources, the importance of the resources must be considered. For example, three marginal acres of a large park may be less important than one acre of a smaller city park. To provide support for these complex evaluations, the officials with jurisdiction over the 4(f) resources should be consulted and their opinions memorialized in the administrative record.

As Congress gave 4(f) resources paramount importance, care should be taken to apply consistent standards throughout the length of any given project. For example, it would be inconsistent to accept a restricted roadway cross section in order to reduce the project costs or to gain a minimal safety benefit, when at other locations on the same project this restricted roadway cross section is rejected as unacceptable in order to avoid a park. This same concept should be applied between projects as well.

Examples of the Alternative Selection Process

One of the most difficult areas of analysis is the evaluation of alternatives, and their impacts on both 4(f) and non-4(f) resources, and then deciding which alternative to select. Issues such as, what role does mitigation play in selecting alternatives, what to do if there are multiple 4(f) properties used and how other important resources in the project vicinity should be considered, make this area of analysis complex. It is essential to document the reasoning for dismissing an alternative as well as the reasoning for selecting an alternative. This documentation will become a key part of the administrative record. To address some of these scenarios, consider the following three project examples. Also, refer to the summary table on Page 7, following this discussion.

On project 1, Alternatives C and D are determined not to be feasible and prudent. While these alternatives may or may not use land from a 4(f) resource, it is immaterial since they simply cannot be built. Thus, no further analysis of C or D is warranted. Since Alternatives A and B are feasible and prudent and because B does not use land from a 4(f) resource, Alternative B must be selected. It is not necessary to determine the relative harm that Alternative A has on the 4(f) resources, because B is a feasible and prudent avoidance alternative.

On project 2, Alternatives C and D are determined not to be feasible and prudent. No further consideration need be given these alternatives. Of the remaining feasible and prudent alternatives, both Alternatives A and B use land from 4(f) resources. FHWA can approve only the feasible and prudent alternative that has the least overall harm to the 4(f) resource. Here, B must be selected since the harm to 4(f) resources is the least. When there are multiple alternatives that use a 4(f) resource, it should be noted that simply because an alternative uses more acreage, that might not be the greatest Section 4(f) use. In conclusion, to determine which alternative has the least harm, one should evaluate the importance of the 4(f) resource, the potential for mitigation and confer with the official(s) with jurisdiction over the 4(f) resource.

On project 3, all the build alternatives use 4(f) resources, such that there are no feasible and prudent alternatives that avoid the 4(f) resources. As all four alternatives use 4(f) land, one needs to evaluate the impacts both to 4(f) and non-4(f) resources to select the prudent and least overall harm alternative. Among the 4 alternatives, A and B have almost equal Section 4(f) net impacts but more impacts than Alternatives C and D, so neither A nor B can be selected. However, between Alternatives C and D, C has more Section 4(f) impacts than D. Therefore, usually one must choose Alternative D as illustrated in the example in project 2 above. There are times; however, that there will be additional important non-Section 4(f) environmental impacts that must go into the equation of what is the prudent alternative. If Alternative C has slightly higher Section 4(f) impacts than Alternative D, but there are additional important environmental impacts associated with Alternative D (that Alternative C does not have), it may be more prudent to choose Alternative C. Examples of non-4(f) resources could be an endangered species or

critical habitat being taken, CERCLA or superfund site problems, the elimination of valuable wetlands, and/or major environmental justice issues. In this instance, the prudent decision is the one that causes the overall least harm to all environmental resources, both 4(f) and non-4(f) resources. Section 4(f) plays a significant role in this decision-making process but in total, the prudent choice here is not the alternative that uses the least amount of 4(f) property. Therefore, Alternative C would be advanced. The courts have accepted this totality of impacts analysis⁴.

Project	Alternative	Feasible and Prudent Alternative?	Uses 4(f) Land?	Relative Net Harm to Section 4(f) Land After Mitigation
1	A	Yes	Yes	NA ^a
	B	Yes	No	None
	C	No	Yes (NA) ^b	NA
	D	No	No (NA) ^b	NA
2	A	Yes	Yes	Greater
	B	Yes	Yes	Lesser
	C	No	Yes (NA) ^b	NA ^b
	D	No	No (NA) ^b	NA ^b
3	A	(NA) ^c	Yes	Equal to B, but more than C or D
	B		Yes	Equal to A but more than C or D
	C		Yes	Harm to 4(f) greater than alt. D, but with less overall impacts to important resources
	D		Yes	Harm to 4(f) less but with more overall impacts

^a In project 1, there is a feasible and prudent alternative, which does not use Section 4(f) protected property (Alt. B). Any alternative which uses Section 4(f) protected property must be eliminated from further consideration.

^b Since this alternative is not feasible and prudent, it should be eliminated from further consideration. Whether Section 4(f) land is used and the relative harm to Section 4(f) protected properties are no longer relevant factors.

^c Since all alternatives use 4 (f) resources, a prudent and feasible avoidance alternatives analysis is not required.

Measures to Minimize Harm and Mitigation

In addition to determining that there are no feasible and prudent alternatives to avoid the use of 4(f) resources, the project approval process requires the consideration of “all possible planning to minimize harm” on the 4(f) resource. Minimization of harm entails both alternative design modifications that lessen the impact on 4(f) resources and mitigation measures that compensate for residual impacts. Minimization and mitigation measures should be determined through consultation with the official of the agency owning or administering the resource. Neither the Section 4(f) statute nor regulation requires the replacement of 4(f) resources used for highway projects, but this option is appropriate under 23 C.F.R. 710.509 as a mitigation measure for direct project impacts.

Mitigation measures involving public parks, recreation areas, or wildlife and waterfowl refuges may involve a replacement of land and/or facilities of comparable value and function, or monetary

⁴ Hickory Neighborhood Defense League v. Skinner, 910 F.2d 159, 163 (4th Cir. 1990); Eagle Foundation, Inc. v. Dole, 813 F.2d 798, 805 (7th Cir. 1987); Louisiana Env. Society, Inc. v. Dole, 707 F.2d 116, 122 (5th Cir. 1983); Committee to Preserve Boomer Lake Park v. USDOT, 4 F.3d 1543, 1550 (10th Cir. 1993).

compensation, which could be used to enhance the remaining land. Mitigation of historic sites usually consists of those measures necessary to preserve the historic integrity of the site and agreed to in accordance with 36 C.F.R. Part 800, by FHWA, the State Historic Preservation Officer (SHPO) or the Tribal Historic Preservation Officer (THPO), and as appropriate, the Advisory Council on Historic Preservation (ACHP). In any case, the cost of mitigation should be a reasonable public expenditure in light of the severity of the impact on the 4(f) resource in accordance with 23 C.F.R. 771.105(d). Section 6(f) of the Land and Water Conservation Fund Act has its own mitigation requirements, but as noted before, these can be part of the 4(f) minimization requirement if the resource cannot be avoided⁵.

Coordination

Preliminary coordination prior to the circulation of the draft Section 4(f) evaluation should be accomplished with the official(s) of the agency owning or administering the resource, the Department of Interior (DOI) and, as appropriate, the Departments of Agriculture (USDA) and Housing and Urban Development (HUD). The preliminary coordination with DOI and HUD should be either at the appropriate field office or at the regional level. The preliminary coordination with USDA should be with the appropriate National Forest Supervisor. There should be coordination with USDA whenever a project uses land from the National Forest System. Since the Housing and Urban Rural Recovery Act of 1983 repealed the use restrictions for the Neighborhood Facilities Program authorized by Title VII of the HUD Act of 1965 and the Open Space Program authorized by Title VII of the Housing Act of 1961, the number of instances where coordination with HUD should be accomplished has been substantially reduced. Coordination with HUD should occur whenever a project uses a 4(f) resource where HUD funding (other than the above) had been utilized.

If any issues are raised by these agencies resulting from the circulation of the draft Section 4(f) evaluation, follow up coordination must be undertaken to resolve the issues. In most cases the agency's response will indicate a contact point for the follow up coordination. However, case law indicates that if reasonable efforts to resolve the issues are not successful (one of these agencies is not satisfied with the way its concerns were addressed) and the issues were disclosed and received good-faith attention from the decision maker, FHWA has met the procedural obligation under Section 4(f) to consult with and obtain the agency's comments. Section 4(f) does not require more.

Programmatic Section 4(f) Evaluations

As an alternative to preparing an individual Section 4(f) evaluation, FHWA may, in certain circumstances utilize a programmatic evaluation. Under a programmatic Section 4(f) evaluation, certain conditions are laid out such that, if a project meets the conditions it will satisfy the requirements of Section 4(f) that there is no feasible and prudent alternative and that the project includes all possible planning to minimize harm. These conditions generally relate to the type of project, the severity of impacts to 4(f) property, the evaluation of alternatives, the establishment of a procedure for minimizing harm to the 4(f) resource, adequate coordination with appropriate entities and the NEPA class of action. Programmatic Section 4(f) statements have certain elements in common; (1) they involve projects with typical and limited range of alternatives; and (2) the official having jurisdiction over the land agrees with the use evaluation and the proposed mitigation. Programmatic evaluations can be nationwide, region-wide, or statewide. The development of statewide or regional programmatic evaluations must be coordinated with the Office of Project Development and Environmental Review and the Office of Chief Counsel.

⁵ State and local governments often obtain grants through the Land and Water Conservation Fund Act to acquire or make improvements to parks and recreation areas. Section 6(f) of this Act prohibits the conversion of property acquired or developed with these grants to a non-recreational purpose without the approval of the Department of the Interior's (DOI) National Park Service. Section 6(f) directs DOI to assure that replacement lands of equal value, location and usefulness are provided as conditions to such conversions. Consequently, where conversions of Section 6(f) lands are proposed for highway projects, replacement lands will be necessary. Regardless of the mitigation proposed, the Section 4(f) evaluation should document the National Park Service's tentative position relative to Section 6(f) conversion.

There are currently four approved Nationwide Programmatic Section 4(f) Evaluations. These evaluations are found at the links provided below to the FHWA Environmental Guidebook and the Project Development Website:

- 1) Programmatic Section 4(f) Evaluation and Approval for FHWA Projects that Necessitate the Use of Historic Bridges. This evaluation sets forth the basis for approval that there are no feasible and prudent alternatives to the use of certain historic bridge structures to be replaced or rehabilitated with Federal funds and that the projects include all possible planning to minimize harm resulting from such use.
(www.environment.fhwa.dot.gov/guidebook/vol2/doc15j.pdf and www.environment.fhwa.dot.gov/projdev/4fbridge.htm)
- 2) Final Nationwide Section 4(f) Evaluation and Approval for Federally-Aided Highway Projects with Minor Involvements with Public Parks, Recreation Lands, and Wildlife and Waterfowl Refuges. This programmatic evaluation is applicable for projects that improve existing highways and use minor amounts of publicly owned public parks, recreation lands, or wildlife and waterfowl refuges that are adjacent to existing highways.
(www.environment.fhwa.dot.gov/guidebook/vol2/doc15g.pdf and www.environment.fhwa.dot.gov/projdev/4fmparks.htm)
- 3) Final Nationwide Section 4(f) Evaluation and Approval for Federally-Aided Highway Projects with Minor Involvements with Historic Sites. This programmatic evaluation has been prepared for projects that improve existing highways and use minor amounts of land (including non-historic improvements thereon) from historic sites that are adjacent to existing highways where the effect is determined not to be adverse.
(www.environment.fhwa.dot.gov/guidebook/vol2/doc15e.pdf and www.environment.fhwa.dot.gov/projdev/4fmhist.htm)
- 4) Section 4(f) Statement and Determination for Independent Bikeway or Walkway Construction Projects. This 1977 negative declaration applies to bikeway and/or walkway projects that require the use of land from Section 4(f) resources.
(www.environment.fhwa.dot.gov/guidebook/vol2/doc15m.pdf and www.environment.fhwa.dot.gov/projdev/4fbikeways.htm)

The fact that these programmatic Section 4(f) evaluations are approved does not mean that these types of projects are exempt from or automatically comply with the requirements of Section 4(f). Section 4(f) does, in fact, apply to each of the types of projects addressed by these programmatic evaluations. Furthermore, the programmatic Section 4(f) does not relax the Section 4(f) standards of feasible and prudent and minimization of harm. The FHWA Division Administrator or Division Engineer is responsible for reviewing each individual project to determine that it meets the criteria and procedures of the specific programmatic Section 4(f) evaluation. The FHWA Division Administrator's or Division Engineer's determinations will be thorough and will clearly document the items that have been reviewed. The written analysis and determinations will be combined in a single document, placed in the project record and will be made available to the public upon request. This programmatic evaluation will not change the existing procedures for project compliance with the National Environmental Policy Act (NEPA) or with public involvement requirements.

Programmatic Section 4(f) evaluations streamline the documentation and approval process and amount of interagency coordination that is required for an individual Section 4(f) evaluation. Draft and final evaluations do not need to be prepared and FHWA legal sufficiency review is not required. Interagency coordination is required only with the official(s) with jurisdiction and not with DOI, USDA, or HUD (unless the Federal agency has a specific action to take, such as DOI approval of a conversion of land acquired using Land and Water Conservation Funds).

Section 4(f) Applicability

The following questions and answers provide guidance on the applicability of Section 4(f) to various types of land, resources and project situations. The examples represent FHWA's policy on the situations most often encountered in the project development process. For advice on specific situations or issues not covered in this paper, the FHWA Division Office should be consulted, and if necessary the Division Office can contact the Washington Headquarters Office of Project Development and Environmental Review and/or the Office of the Chief Counsel. An analysis of Section 4(f) case law as it relates to many of the following situations and examples is included in Appendix A, for your information.

1. Use of Resources

Question A: What constitutes a "use" of land from a publicly owned public park, public recreation area, wildlife refuge and waterfowl refuge or historic site?

Answer A: Section 4(f) "use" is defined and addressed in the FHWA/FTA Regulations at 23 C.F.R. 771.135(p). A "use" occurs when:

- 1) Land from a 4(f) site is permanently incorporated into a transportation facility,
- 2) There is a temporary occupancy of land that is adverse in terms of the Section 4(f) statute's preservationist purposes (23 C.F.R. 771.135(p)(7)), or
- 3) When there is a constructive use of land (23 C.F.R. 771.135(p)(2)).

Land will be considered permanently incorporated into a transportation project when it has been purchased as right-of-way or sufficient property interests have been otherwise acquired for the purpose of project implementation. For example, a "permanent easement" which is required for the purpose of project construction or that grants a future right of access onto 4(f) property, such as for the purpose of routine maintenance by the transportation agency, would be considered a permanent incorporation of land into a transportation facility.

Project activities involving the restoration, rehabilitation or maintenance of highways, bridges or other eligible transportation facilities (23 C.F.R. 771.135(f)) that are on or eligible for the National Register of Historic Places will not "use" land from these 4(f) resources when the project does not adversely effect (under Section 106 of the National Historic Preservation Act) the historic qualities of the facility for which it was determined eligible for the National Register of Historic Places, and the State Historic Preservation Officer has been consulted and does not object to the finding of no historic properties adversely affected (see also Question 4).

Question B: How is "constructive use" defined and determined?

Answer B: 23 C.F.R. 771.135(p) defines what a constructive use is. FHWA has identified certain project situations where a constructive use will occur and when a constructive use will not occur (see 23 C.F.R. 771.135(p)(4) and (5)). Constructive use is only possible in the absence of permanent incorporation or temporary occupancy of the type that constitutes a use of 4(f) land by a transportation project. Constructive use only occurs in those situations where, including mitigation, the proximity impacts of a project on the 4(f) property are so severe that the activities, features or attributes that qualify the property or resource for protection under Section 4(f) are substantially impaired. Substantial impairment occurs when the activities, features or attributes of the 4(f) property are substantially diminished (23 C.F.R. 771.135(p)(2)), which means that the value of the resource in terms of its Section 4(f) significance will be meaningfully reduced or lost. The degree of impact and impairment should be determined in consultation with the officials having jurisdiction over the resource.

An example of such an impact might be the traffic noise resulting from a new or improved highway facility proposed near an amphitheater that substantially interferes with the use and enjoyment of the noise-sensitive resource, and the conditions set forth in 23 C.F.R. 771.135(p) are satisfied. For additional information on noise, please refer to FHWA noise regulations at 23 C.F.R. 772.

Constructive use determinations will be rare⁶. The impacts outlined in 23 C.F.R. 771.135(p)(4), involving projects adjacent to or in the proximity of 4(f) resources should be carefully examined. If it is determined that the proximity impacts do not cause a substantial impairment, FHWA can reasonably conclude that there is no constructive use. FHWA has determined that certain impacts constitute a constructive use and that others do not (see 23 C.F.R. 771.135(p)(4) and (5)). Environmental documents should of course contain the analysis of any potential proximity effects and consider whether or not there is substantial impairment to a 4(f) resource. Except for responding to review comments in environmental documents, which specifically address constructive use, the term "constructive use" need not be used. Where a constructive use determination is likely, the FHWA Division Office must consult with the Headquarters Office of Project Development and Environmental Review during development of the preliminary-draft Section 4(f) evaluation.

Question C: When does temporary occupancy of a 4(f) resource result in a 4(f) use?

Answer C: In general, Section 4(f) does not apply to the temporary occupancy, including those resulting from a right-of-entry, construction, other temporary easements or short-term arrangements, of a significant publicly owned public park, recreation area or wildlife and waterfowl refuge, or any significant historic site where temporary occupancy of the land is so minimal that it does not constitute a use within the meaning of Section 4(f).

A temporary occupancy will not constitute a use of 4(f) resource when all of the conditions set forth in 23 C.F.R. 771.135(p)(7) are met:

- (1) Duration (of the occupancy) must be temporary, i.e., less than the time needed for construction of the project, and there should be no change in ownership of the land;
- (2) Scope of the work must be minor, i.e., both the nature and the magnitude of the changes to the 4(f) resource are minimal;
- (3) There are no anticipated permanent adverse physical impacts, nor will there be interference with the activities or purpose of the resource, on either a temporary or permanent basis;
- (4) The land being used must be fully restored, i.e., the resource must be returned to a condition which is at least as good as that which existed prior to the project; and
- (5) There must be documented agreement of the appropriate Federal, State, or local officials having jurisdiction over the resource regarding the above conditions.

In the situation where a project does not meet all of the above criteria, the temporary occupancy will be considered a use of the 4(f) resource and the appropriate Section 4(f) analysis will be required.

2. Public Parks, Public Recreation Areas and Wildlife and Waterfowl Refuges

Question A: When is publicly owned land considered to be a park, recreation area or wildlife and waterfowl refuge and who makes this determination?

Answer A: Publicly owned land is considered to be a park, recreation area or wildlife and waterfowl refuge when the land has been officially designated as such by a Federal, State or local agency and the officials of these governmental entities, having jurisdiction over the land, determine that one of its major purposes and functions is for park, recreation or as a refuge. Incidental, secondary, occasional or dispersed park, recreational or refuge activities do not constitute a major purpose.

For the most part the "officials having jurisdiction" are the officials of the agency owning or administering the land. There may be instances where the agency owning or administering the land has delegated or

⁶ The FHWA's constructive use policy was formalized in regulation on April 1, 1991, with the addition of paragraph (p) to 23 C.F.R. 771.135. The November 12, 1985, memorandum from Mr. Ali F. Sevin, Director of the Office of Environmental Policy to the Regional Federal Highway Administrators is no longer applicable.

relinquished its authority to another agency, via an agreement on how some of its land will function or be managed. FHWA will review this agreement and determine which agency has authority on how the land functions. If the authority has been delegated or relinquished to another agency, that agency must be contacted to determine the major purpose(s) of the land. Management plans that address or officially designates the major purpose(s) of the property should be reviewed as part of this determination. After consultation, and in the absence of an official designation of purpose and function by the officials having jurisdiction, FHWA will base its decision on its own examination of the actual functions that exist.

The final decision on applicability of Section 4(f) to a particular property or type of land is made by FHWA. In reaching this decision, however, FHWA will rely on the official having jurisdiction over the resource to identify the kinds of activities and functions that take place, and that these activities constitute a major purpose. Documentation of the determination of non-applicability should be included in the environmental document or project record.

Question B: How should the significance of public parks, recreation areas and wildlife and waterfowl refuges be determined?

Answer B: "Significance" determinations, on publicly owned land considered to be parks, recreation areas or wildlife and waterfowl refuges, pursuant to Answer 2 A above, are made by the Federal, State, or local officials having jurisdiction over the land. As discussed above, the "officials having jurisdiction" are officials of the agency owning or administering the land. For certain types of 4(f) resources, more than one agency may have jurisdiction or interest in the property.

Except for certain multiple-use land holdings, discussed in Question 6, significance determinations must consider the entire property and not just the portion of the property proposed for use by the project. The meaning of the term "significance", for purposes of Section 4(f), should be explained to the officials having jurisdiction. Significance means that in comparing the availability and function of the park, recreational area or wildlife and waterfowl refuge, with the park, recreation or refuge objectives of the community or authority, the resource in question plays an important role in meeting those objectives. Management plans or other official forms of documentation regarding the land, if available and up-to-date, are important in this determination. If a determination from the official with jurisdiction cannot be obtained, and a management plan is not available or does not address significance of the 4(f) land, it will be presumed to be significant until FHWA reviews the determination and reaches a different conclusion. All determinations, whether stated or presumed, are subject to review by FHWA for reasonableness.

Question C: Are publicly owned parks and recreation areas, which are significant but not open to the public as a whole, subject to the requirements of Section 4(f)?

Answer C: The requirements of Section 4(f) would apply if the entire public park or public recreation area permits visitation by the general public at any time during the normal operating hours of the facility. Section 4(f) would not apply when visitation is permitted to only a select group and not the entire public. Examples of select groups include residents of a public housing project; military and their dependents (see also Question 11 B); students of a school; and students, faculty, and alumni of a college or university. FHWA does, however, strongly encourage the preservation of such parks and recreation areas; even though they may not be open to the general public.

It should be noted that wildlife and waterfowl refuges have not been included in this discussion. The statute uses the modifying term public to parks and recreation areas and, therefore, the "open to the public" requirement only applies to park and recreational area lands. Many wildlife and waterfowl refuges allow public access, while others may not, especially during certain times or seasons of the year. In these cases, the publicly owned resource should be examined by the FHWA Division Office to determine that the primary purpose of the property and resource is for wildlife or waterfowl refuge and not for other non-Section 4(f) activities (see also Question 20).

Question D: When does an easement or lease agreement with a governmental body constitute "public ownership"?

Answer D: Case law holds that land subject to a public easement in perpetuity can be considered publicly owned land for the purpose the easement exists. Under special circumstances, lease agreements may also constitute a permanent and proprietary interest in the land. Such lease agreements must be determined on a case-by-case basis and such factors as the term of the lease, the understanding of the parties to the lease, cancellation clauses and the like should be considered. Any questions on whether or not the leasehold or other interest constitutes public ownership should be referred to the Federal Highway Administration Division Office, and if necessary the FHWA Division Office should consult with the Washington Headquarters Office of Project Development and Environmental Review and the Office of the Chief Counsel.

3. Historic Sites

Question A: How is the significance (for Section 4(f) purposes) of historic sites determined?

Answer A: Pursuant to the National Historic Preservation Act (NHPA), the FHWA Federal Lands Highway Division (for Federal-lands projects) or FHWA Division in cooperation with the Applicant, i.e. State Department of Transportation (for Federal-aid projects) consults with the State Historic Preservation Officer (SHPO) or Tribal Historic Preservation Officer (THPO) and if appropriate, with local officials to determine whether a site is on or eligible for the National Register of Historic Places. In case of doubt or disagreement between FHWA and the SHPO or THPO, a request for a determination of eligibility may be made to the Keeper of the National Register. A third party may also seek the involvement of the Keeper through the Advisory Council on Historic Preservation (ACHP) for a determination of eligibility,

For purposes of Section 4(f), an historic site is significant only if it is on or eligible for the National Register, unless FHWA determines that the application of Section 4(f) is otherwise appropriate. If an historic site is determined not to be on or eligible for the National Register, but an official (such as the Mayor, President of the local historic society, etc.) formally provides information to indicate that the historic site is of local significance, FHWA may determine that it is appropriate to apply Section 4(f) in that case. In the event that Section 4(f) is found inapplicable, the FHWA Division Office should document the basis for not applying Section 4(f). Such documentation might include the reasons why the historic site was not eligible for the National Register.

Question B: Does Section 4(f) apply when there is an adverse effect determination under the regulations implementing Section 106 of the National Historic Preservation Act (NHPA) (36 C.F.R. 800.5)?

Answer B: FHWA's determination of adverse effect under 36 C.F.R. 800.5 (www.achp.gov/work106.html) does not mean that Section 4(f) automatically applies, nor should it be presumed that the lack of an adverse effect finding (no historic properties adversely affected) means that Section 4(f) will not apply. When a project permanently incorporates land of an historic site, with or without an adverse affect, Section 4(f) applies. However, if a project does not physically take (permanently incorporate) historic property but causes an adverse effect, one must assess the proximity impacts of the project in terms of the potential for "constructive use" (see also Question 1 B). This analysis must determine if the proximity impact(s) will substantially impair the features or attributes that contribute to the National Register eligibility of the historic site or district. If there is no substantial impairment, notwithstanding an adverse effect determination, there is no constructive use and Section 4(f) requirements do not apply. Substantial impairment should be determined in consultation with the SHPO and/or THPO and thoroughly documented in the project record. The determination of Section 4(f) applicability is ultimately FHWA's decision.

As an example of a situation in which there is a Section 106 adverse effect but no Section 4(f) use, consider a transportation enhancement project where an abandoned National Register listed bus station

will be rehabilitated. Rehabilitation for public use will require consistency with the American with Disabilities Act (ADA). The incorporation of ramps or an elevator will meet the definition of an adverse effect, however, there is no permanent incorporation of land into a transportation facility and all parties agree that the rehabilitation will not substantially impair the property. Therefore, Section 4(f) would not apply.

An example of a Section 4(f) use without a Section 106 adverse effect involves a project on existing alignment, which proposes minor improvements at an intersection. To widen the roadway sufficiently, a small amount of property from an adjacent Section 106 property will be acquired, but the significance of the Section 106 resource is such that the SHPO concurs in FHWA's determination of no adverse effect. However, the use of the property will permanently incorporate property of the historic site into a transportation facility and Section 4(f) will apply. This project situation may be evaluated using the *Nationwide Section 4(f) Evaluation and Approval for Federally-Aided Highway Projects with Minor Involvements with Historic Sites* (www.environment.fhwa.dot.gov/guidebook/vol2/doc15e.pdf), as long as the class of action is not an EIS.

Question C: How does Section 4(f) apply in historic districts on or eligible for National Register?

Answer C: Within a National Register (NR) listed or eligible historic district, Section 4(f) applies to the use of those properties that are considered contributing to the eligibility of the historic district, as well as any individually eligible property within the district. It must be noted generally, that properties within the bounds of an historic district are assumed to contribute, unless it is otherwise stated or they are determined not to be. For those properties that are not contributing elements of the district or individually significant, the property and the district as a whole must be carefully evaluated to determine whether or not it could be used without substantial impairment of the features or attributes that contribute to the NR eligibility of the historic district.

The proposed use of non-historic property within an historic district which results in an adverse effect under Section 106 of the NHPA will require further consideration to determine whether or not there may be a constructive use. If the use of a non-historic property or non-contributing element substantially impairs (see Question 2 B) the features or attributes that contribute to the NR eligibility of the historic district, then Section 4(f) would apply. In the absence of an adverse effect determination, Section 4(f) will not apply. Appropriate steps, including consultation with the SHPO and/or THPO, should be taken to establish and document that the property is not historic, that it does not contribute to the National Register eligibility of the historic district and its use would not substantially impair the historic district.

As an example, consider the situation where traffic signals are warranted in a National Register listed or eligible historic district. The locations of the mast arms and control box are severely limited because of the built-up nature of the district. Although no right-of-way will be acquired, it is consistent with the NHPA regulations that there will be an adverse effect on the historic district. However, it may be reasonably determined that no individually eligible property, contributing element, or the historic district as a whole will be substantially impaired; therefore Section 4(f) will not apply.

Question D: How should the boundaries of a property eligible for listing on the National Register be determined where a boundary has not been established?

Answer D: In this situation, FHWA makes the determination of an historic property's boundary under the regulations implementing Section 106 of the NHPA in consultation with the SHPO and/or the THPO. The identification of historic properties and the determination of boundaries should be undertaken with the assistance of qualified professionals during the very beginning stages of the NEPA process. This process requires the collection, evaluation and presentation of the information to document FHWA's determination of the property boundaries. The determination of eligibility, which would include boundaries of the site, rests with FHWA, but if SHPO, THPO, or other party disagrees with this determination it can

"appeal" FHWA's determination to the Keeper of the National Register in accordance with the provisions of the Section 106 process.

Selection of boundaries is a judgment based on the nature of the property's significance, integrity, setting and landscape features, functions and research value. Most boundary determinations will take into account the modern legal boundaries, historic boundaries (identified in tax maps, deeds, or plats), natural features, cultural features and the distribution of resources as determined by survey and testing for subsurface resources. Legal property boundaries often coincide with the proposed or eligible historic site boundaries, but not always and, therefore, should be individually reviewed for reasonableness. The type of property at issue, be it a historic building, structure, object, site or district and its location in either urban, suburban or rural areas, will require the consideration of various and differing factors. These factors are set out in the *National Park Service Bulletin Defining Boundaries for National Register Properties*. This Bulletin and other information can be found at the following website: www.cr.nps.gov/nr/publications/bulletins/boundaries.

Question E: How are National Historic Landmarks treated under Section 4(f)?

Answer E: Section 4(f) requirements related to the potential use of a National Historic Landmark (NHL) designated by the Secretary of Interior are essentially the same as they are for any historic property determined under the Section 106 process. Section 110(f) of the NHPA outlines the specific actions that an Agency must take when NHL may be directly and adversely affected by an undertaking. Agencies must, "to the maximum extent possible ... minimize harm" to the NHL affected by an undertaking. While not expressly stated in the Section 4(f) statutory language or regulations, the importance and significance of the NHL should be considered in the FHWA's Section 4(f) analysis.

4. Historic Bridges, Highways and Other Transportation Facilities

Question A: How does Section 4(f) apply to historic bridges and highways?

Answer A: The Section 4(f) statute places restrictions on the use of land from historic sites for highway improvements but makes no mention of historic bridges or highways, which are already serving as transportation facilities. The Congress clearly did not intend to restrict the rehabilitation, repair or improvement of these facilities. FHWA, therefore, determined that Section 4(f) would apply only when an historic bridge or highway is demolished, or if the historic quality for which the facility was determined to be eligible for the National Register is adversely affected by the proposed improvement. The determination of adverse effect under 36 CFR 800.5 is made by FHWA in consultation with the SHPO and/or THPO. Where FHWA determines that the facility will not be adversely affected the SHPO/THPO must concur with the determination or FHWA must seek further input from the ACHP.

Question B: Will Section 4(f) apply to the replacement of an historic bridge that is left in place?

Answer B: Section 4(f) does not apply to the replacement of an historic bridge on new location when the historic bridge is left in its original location if its historic value will be maintained, and the proximity impacts of the new bridge do not result in a substantial impairment of the historic bridge. To satisfy the first requirement, FHWA requires the establishment of a mechanism of continued maintenance to avoid the circumstance of harm to the bridge due to neglect.

Question C: How do the requirements of Section 4(f) apply to donations pursuant to 23 U.S.C. 144(o) to a State, locality, or responsible private entity?

Answer C: 23 U.S.C. 144(o) is a separate requirement related to historic bridges when demolition is proposed. 23 U.S.C. 144(o)(4) requires the State that proposes to demolish an historic bridge for a replacement project using Federal funds (i.e. Section 144 bridge funds) to first make the bridge available for donation to a State, locality or a responsible private entity. This process is commonly known as

“marketing the historic bridge”. The State, locality or responsible entity that accepts the donation must enter into an agreement to maintain the bridge and the features that give it its historic significance, and assume all future legal and financial responsibility for the bridge. Therefore, Section 4(f) will not apply to the bridges that are donated according to requirements of 23 U.S.C. 144(o) as the bridge is not used in the transportation project. The exception found in 23 C.F.R. 771.135(f) also applies, given the maintenance agreement that is required under 23 U.S.C. 144(o).

If the bridge marketing effort is unsuccessful and the bridge is to be demolished, the evaluation must include the finding that there is no feasible and prudent alternative to the use and the project includes all possible planning to minimize harm.

Note: *Programmatic Section 4(f) Evaluation and Approval for FHWA Projects that Necessitate the Use of Historic Bridges* (www.environment.fhwa.dot.gov/guidebook/vol2/doc15j.pdf) may be used for projects that require the use of an historic bridge.

Question D: Does Section 4(f) apply to other historic transportation facilities?

Answer D: Yes, but in the case of restoration, rehabilitation or maintenance of historic transportation facilities (e.g. railroad stations and terminal buildings which are on or eligible for the National Register) Section 4(f) only applies when the facility will be adversely affected (36 C.F.R. 800.5) by the proposed improvement.

5. Archaeological Resources

Question A: When does Section 4(f) apply to archaeological sites?

Answer A: Section 4(f) applies to all archaeological sites that are on or eligible for inclusion on the National Register and that warrant preservation in place. This includes those sites discovered during construction. Section 4(f) does not apply if FHWA, after consultation with the SHPO and/or THPO, determines that the archaeological resource is important chiefly because of what can be learned by data recovery (even if it is agreed not to recover the resource) and has minimal value for preservation in place (23 CFR 771.135(g)).

Question B: How are archeological sites discovered during construction of a project handled?

Answer B: For sites discovered during construction, where preservation of the resource in place is warranted, the Section 4(f) process will be expedited. In such cases, the evaluation of feasible and prudent alternatives will take into account the level of investment already made. The review process, including the consultation with other agencies should be shortened, as appropriate. An October 19, 1980, *Memorandum of Understanding with the Heritage Conservation and Recreation Service* (now part of the National Park Service) provides emergency procedures for unanticipated cultural resources discovered during construction. The MOU is available in the FHWA Environmental Guidebook (www.environment.fhwa.dot.gov/guidebook/vol2/doc10j.pdf). 36 C.F.R. 800.13 addresses the process for considering post-review discoveries under the Section 106 process.

Question C: How should the Section 4(f) requirements be applied to archaeological districts?

Answer C: Section 4(f) requirements apply to archeological districts in the same way as historic districts, but only where preservation in place is warranted. Section 4(f) would not apply if after consultation with the State Historic Preservation Officer (SHPO) or Tribal Historic Preservation Officer (THPO), FHWA determines that the project would occupy only a part of the archaeological district which is considered a non-contributing element of that district or that the project occupies only a part of the district which is important chiefly because of what can be learned by data recovery and has minimal value for

preservation in place. As with an historic district, if FHWA determines the project will result in an adverse effect on an archaeological district, which is significant for preservation in place, then FHWA must consider whether or not the project impacts will result in a "substantial impairment" and a constructive use determination is warranted.

6. Public Multiple-Use Land Holdings

Question: Are multiple-use public land holdings (e.g., National Forests, State Forests, Bureau of Land Management lands, etc.) subject to the requirements of Section 4(f)?

Answer: Section 4(f) applies to historic properties (those on or eligible for the National Register of Historic Places) located on these multiple-use land holdings and only to those portions of the lands which are designated by statute or identified in the management plans of the administering agency as being primarily for park, recreation, or wildlife and waterfowl refuge purposes, and determined to be significant for such purposes. For example, within a large multiple-use resource, like a National Forest, there can be areas that qualify as 4(f) property (e.g. a campground, picnic area, etc.) while other areas of the property function primarily for purposes other than park, recreation or refuges. Coordination with the official having jurisdiction and examination of the management plan for the area are necessary to determine Section 4(f) applicability.

For public land holdings, which do not have management plans or existing management plans are out-of-date, Section 4(f) applies to those areas that are publicly owned and function primarily for 4(f) purposes. Section 4(f) does not apply to areas of multiple-use lands which function primarily for purposes other than park, recreation or refuges such as for those areas that are used for timber sales or mineral extraction in National Forests.

7. Late Designation of 4(f) Resources

Question: Are properties in the highway right-of-way that are designated (as park and recreation lands, wildlife and waterfowl refuges, or historic sites) late in the development of a proposed project subject to the requirements of Section 4(f)?

Answer: Except for archaeological resources (including those discovered during construction), a project may proceed without consideration under Section 4(f) if that land was purchased for transportation purposes prior to the designation or prior to a change in the determination of significance and if an adequate effort was made to identify properties protected by Section 4(f) prior to the acquisition. The adequacy of effort made to identify properties protected by Section 4(f) should consider the requirements and standards of adequacy that existed at the time of the search. Archaeological resources may be subject to the requirements of Section 4(f) in accordance with Question 5.

8. Wild and Scenic Rivers

Question A: Are Wild and Scenic Rivers (WSR) subject to Section 4(f)?

Answer A: A Wild and Scenic River (WSR) is defined as "a river and the adjacent area within the boundaries of a component of the National Wild and Scenic Rivers System (National System)", pursuant to Section 3(a) and 2(a)(ii) of the National Wild and Scenic Rivers Act (WSRA) (36 C.F.R. 297.3). Significant publicly owned public parks, recreation areas, or significant wildlife and waterfowl refuges and historic sites (on or eligible of the National Register of Historic Places) in a WSR corridor are subject to Section 4(f). Privately owned lands in a WSR corridor are not subject to Section 4(f), except for historic and archeological sites (see Question 5). Publicly owned lands not open to the general public (e.g., military bases and any other areas with similar restricted access) and whose primary purpose is other than 4(f) are not subject to Section 4(f).

Lands in WSR corridors managed for multiple purposes may or may not be subject to Section 4(f) requirements, depending on the manner in which they are administered by the managing agency (see also Question 6). WSRs are managed by four different Federal agencies, including the U.S. Forest Service, the National Park Service, the Fish and Wildlife Service and the Bureau of Land Management. Close examination of the management plan (as required by the WSRA) prior to any use of these lands for transportation purposes is necessary. Section 4(f) would apply to those portions of the land designated in a management plan for recreation or other 4(f) purposes as discussed above. Where the management plan does not identify specific functions, or where there is no plan, FHWA should consult further with the river-administering agency prior to making the Section 4(f) determination.

The WSRA sets forth those rivers in the United States, which are designated as part of the Wild and Scenic River System. Within this system there are wild, scenic and recreational designations. In determining whether Section 4(f) is applicable to these rivers, one must look at how the river is designated, how the river is being used and the management plan over that reach of the river. If the river is designated a recreational river under the Act or is a recreation resource under a management plan, then it would be a 4(f) resource. A single river can be classified as having separate wild, scenic and recreation areas along the entire river. The designation of a river under the WSRA does not in itself invoke Section 4(f) in the absence of 4(f) attributes and qualities. For example, if a river is included in the System and designated as "wild" but is not being used as or designated under a management plan as a park, recreation area, wildlife and waterfowl refuge and is not an historic site, then Section 4(f) would not apply.

Aspects of the FHWA program determined to be a water resources project are subject to Section 7 of the WSRA (16 U.S.C. 1271 et seq.) This requires the river-administering agency to make a determination as to whether there are "direct and adverse effects" to the values of a WSR or congressionally authorized study river. Although Section 7 of the WSRA generally results in more stringent control, Section 4(f) may also apply to bridges that cross a designated WSR.

Question B: Are potential rivers and adjoining lands under study (pursuant to Section 5(a) of the Wild and Scenic Rivers Act) 4(f) resources?

Answer B: No, unless they are significant publicly owned public parks, recreation areas, and refuges, or significant historic sites in a potential river corridor. However, such rivers are protected under Section 12(a)⁷ of the WSRA, which directs all Federal departments and agencies to protect river values in addition to meeting their agency mission. Section 12(a) further recognizes that particular attention should be given to "timber harvesting, road construction, and similar activities, which might be contrary to the purposes of this Act."

9. Fairgrounds

Question: Are publicly owned fairgrounds subject to the requirements of Section 4(f)?

Answer: Section 4(f) is not applicable to publicly owned fairgrounds that function primarily for commercial purposes (e.g. stock car races, annual fairs, etc.), rather than recreation. When fairgrounds are open to the public and function primarily for public recreation other than an annual fair, Section 4(f) only applies to those portions of land determined significant for recreational purposes.

⁷ "The Secretary of the Interior, the Secretary of Agriculture, and the head of any other Federal department or agency having jurisdiction over any lands which include, border upon, or are adjacent to, any river included within the National Wild and Scenic Rivers System or under consideration for such inclusion, in accordance with section 2(a)(ii), 3(a), or 5(a), shall take such action respecting management policies, regulations, contracts, plans, affecting such lands, following the date of enactment of this sentence, as may be necessary to protect such rivers in accordance with the purposes of this Act."

10. School Playgrounds

Question: Are publicly owned school playgrounds subject to the requirements of Section 4(f)?

Answer: While the primary purpose of public school playgrounds is for structured physical education classes and recreation for students, these properties may also serve significant public recreational purposes and as such, may be subject to Section 4(f) requirements. When a playground serves only school activities and functions, the playground is not considered subject to Section 4(f). However, when a public school playground is open to the public and serves either organized or substantial “walk-on” recreational purposes, it is subject to the requirements of Section 4(f) if the playground is determined to be significant for recreational purposes (see also Question 2 B). In determining the significance of the playground facilities, there may be more than one official having jurisdiction over the facility. A school official is considered to be the official having jurisdiction of the land during school activities. However, the school board may have authorized the city park and recreation department or a public organization to control the facilities after school hours. The actual function of the playground is the determining factor under these circumstances. Therefore, documentation should be obtained from the officials having jurisdiction over the facility stating whether or not the playground is of local significance for recreational purposes.

11. Golf Courses

Question A: Are public golf courses subject to Section 4(f), even when fees and reservations are required?

Answer A: The applicability of Section 4(f) to a golf course depends on the ownership of the golf course. There are generally three types of golf courses:

- 1) Publicly owned and open to the general public,
- 2) Privately owned and open to the general public and
- 3) Privately owned and for the use of members only.

Section 4(f) would apply only to those golf courses that are publicly owned, open to public and determined to be significant recreational areas (see also Question 2 B). The first type of golf course mentioned above includes those that are owned, operated and managed by a city, county or state for the primary purpose of public recreation. These golf courses meet the basic applicability requirements, as long as they are determined to be significant by the city, county or state official with jurisdiction and FHWA agrees with this determination.

Section 4(f) would not apply to the two types of privately owned and operated golf courses mentioned above, even if they are open to the general public.

The fact that greens-fees or reservations (tee times) are required by the facility does not alter the Section 4(f) applicability to the resource, as long as the standards of public ownership, public access and significance are met. See Question 12 for more information on entrance or user fees.

Question B: How are “military” golf courses treated under Section 4(f)?

Answer B: Military golf courses are a special type of recreational area. They are publicly owned (by the Federal Government) but are not typically open to the general public. Because the recreational use of these facilities is generally limited to military personnel and their families they are not considered to be public recreational areas and, therefore, Section 4(f) does not apply to them (see Question 2 C).

12. User or Entrance Fees

Question: Does the charging of an entry or user fee affect Section 4(f) eligibility?

Answer: Many eligible 4(f) properties require a fee to enter or use the facility such as State Parks, National Parks, publicly owned ski areas, historic sites and public golf courses. The assessment of a user fee is generally related to the operation and maintenance of the facility and does not in and of itself negate the property's status as a 4(f) resource. Therefore, it does not matter in the determination of Section 4(f) applicability whether or not a fee is charged, as long as the other criteria are satisfied.

Consider a public golf course as an example. As discussed in Question 11, greens-fees are usually if not always required, and these resources are considered 4(f) resources when they are open to the public and determined to be significant. The same rationale should be applied to other 4(f) resources and lands in which an entrance or user fee is required.

13. Bodies of Water

Question: How does the Section 4(f) apply to publicly owned lakes and rivers?

Answer: Lakes are sometimes subject to multiple, even conflicting, activities and do not readily fit into one category or another. When lakes function for park, recreation, or refuge purposes, Section 4(f) would only apply to those portions of water which function primarily for those purposes. Section 4(f) does not apply to areas which function primarily for other purposes. In general, rivers are not subject to the requirements of Section 4(f). Rivers in the National Wild and Scenic Rivers System are subject to the requirements of Section 4(f) in accordance with Questions 8 A and 8 B. Those portions of publicly owned rivers, which are designated as recreational trails are subject to the requirements of Section 4(f). Of course Section 4(f) would also apply to lakes and rivers or portions thereof which are contained within the boundaries of parks, recreational areas, refuges, and historic sites to which Section 4(f) otherwise applies.

14. Trails

Question A: The National Trails System Act permits the designation of scenic, historic and recreational trails. Are these trails or other designated scenic or recreational trails on publicly owned land subject to the requirements of Section 4(f)?

Answer A: Public Law 95-625 provides that, no land or site located along a designated national historic trail or along the Continental Divide National Scenic Trail shall be subject to the provisions of Section 4(f) of the Department of Transportation Act (49 U.S.C. 1653(f)) unless such land or site is deemed to be of historical significance under appropriate historical site criteria, such as those for the National Register of Historic Places. Only lands or sites adjacent to historic trails that are on or eligible for the National Register of Historic Places are subject to Section 4(f). Otherwise (pursuant to Public Law 95-625), national historic trails are exempt from Section 4(f).

Question B: Are trails on privately owned land, including land under public easement and designated as scenic or recreational trails subject to the requirements of Section 4(f)?

Answer B: Section 4(f) does not apply to trails on privately owned land. Section 4(f) could apply where a public easement that permits public access for recreational purposes exists. In any case, it is FHWA's policy that every reasonable effort should be made to maintain the continuity of existing and designated trails.

Question C: Are trails on highway rights-of-way, which are designated as scenic or recreational trails subject to the requirements of Section 4(f)?

Answer C: If the trail is simply described as occupying the rights-of-way of the highway and is not limited to any specific location within the right-of-way, a use of land would not occur provided that adjustments or

changes in the alignment of the highway or the trail would not substantially impair the continuity of the trail. In this regard, it would be helpful if all future designations including those made under the National Trails System Act describe the location of the trail only as generally in the right-of-way.

It should be noted that in Title 23, Section 109(m) precludes the approval of any project, which will result in the severance, or destruction of an existing major route for non-motorized transportation traffic unless such project provides a reasonable alternative route or such a route exists.

Question D: Does Section 4(f) apply to trails funded under the Recreational Trails Program (RTP)?

Answer D: No. The Recreational Trails Program (RTP)⁸ is exempt from the requirements of 23 U.S.C. 138 and 49 U.S.C. 303. This allows the USDOT/FHWA to approve RTP projects which are located on land within publicly owned parks or recreation areas without requiring a waiver or other Section 4(f) documentation (23 U.S.C. 206 (h)(2)). The exemption is limited to Section 4(f) and does not apply to other environmental requirements, such as the National Environmental Policy Act (NEPA) or the National Historic Preservation Act (NHPA). More information on the Recreational Trails Program is available at www.fhwa.dot.gov/environment/rectrails/index.htm.

15. Bikeways

Question: Do the requirements of Section 4(f) apply to bikeways?

Answer: If the publicly owned bikeway is primarily used for transportation and is an integral part of the local transportation system, the requirements of Section 4(f) would not apply, since it is not a recreational area. Section 4(f) would apply to publicly owned bikeways (or portions thereof) designated or functioning primarily for recreation, unless the official having jurisdiction determines it is not significant for such purpose. During early consultation with the official with jurisdiction it should be determined whether or not a management plan exists that addresses the primary purpose of the bikeway in question.

However, as with recreational trails, if the bikeway is simply described as occupying the highway rights-of-way and is not limited to any specific location within that right-of-way, a use of land would not occur and Section 4(f) would not apply, provided adjustments or changes in the alignment of the highway or bikeway would not substantially impair the continuity of the bikeway. Just as with trails, Title 23 Section 109(m) precludes the approval of any project, which will result in the severance or destruction of an existing major route for non-motorized transportation traffic, unless such project provides a reasonable alternative route or such a route exists.

16. Joint Development (Park with Highway Corridor)

Question: When a public park, recreation area, or wildlife and waterfowl refuge is established and an area within the 4(f) resource is reserved for highway use prior to, or at the same time the 4(f) resource was established, do the requirements of Section 4(f) apply?

Answer: No, the requirements of Section 4(f) do not apply to the subsequent use of the reserved area for its intended highway purpose. This is because the land used for the highway project was reserved from and, therefore, has never been part of the protected 4(f) area. Nor is there a constructive use (23 C.F.R. 771.135(p)(5)(v)) of the 4(f) resource, since it was jointly planned with the highway project. The specific governmental action that must be taken to reserve a highway corridor from the 4(f) resource is a question of state law and local law, but evidence that the reservation was contemporaneous with or prior to the establishment of the 4(f) resource is always required. Subsequent statements of intent to construct a highway project within the 4(f) resource are not sufficient. All measures which have been taken to

⁸In 1998, the Transportation Equity Act for the 21st Century (TEA-21) replaced the National Recreational Trails Funding Program created by the Intermodal Surface Transportation Efficiency Act (ISTEA) with the Recreational /Trails Program (RTP).

jointly develop the highway and the park should be completely documented in the project records. To provide flexibility for the future highway project, state and local transportation agencies are advised to reserve wide corridors.

17. Planned 4(f) Resources

Question: Do the requirements of Section 4(f) apply to publicly owned properties "planned" for park, recreation area, wildlife refuge, or waterfowl refuge purposes even though they are not presently functioning as such?

Answer: Section 4(f) applies when the land is one of the enumerated types of publicly owned lands and the public agency that owns the property has formally designated and determined it to be significant for park, recreation area, wildlife and waterfowl refuge purposes. Evidence of formal designation would be the inclusion of the publicly owned land, and its function as a 4(f) resource, into a city or county Master Plan. A mere expression of interest or desire is not sufficient. When privately held properties of these types are formally designated into a Master Plan, Section 4(f) is not applicable. The key is whether the planned facility is presently publicly owned, formally designated and significant. When this is the case, Section 4(f) would apply.

18. Temporary Recreational Occupancy or Uses of Highway Rights-of-way

Question: Does Section 4(f) apply to temporary recreational uses of land owned by a State Department of Transportation or other Applicant and designated for transportation purposes?

Answer: In situations where land which is owned by a State DOT or other Applicant and designated for future transportation purposes (including highway rights-of-way) is temporarily occupied or being used for either authorized or unauthorized recreational purposes such as for a playground or a trail (bike, snowmobile, hiking, etc.) on property purchased as right-of-way, Section 4(f) does not apply. For authorized temporary occupancy of highway rights-of-way for park or recreation, it is advisable to make clear in a limited occupancy permit, with a reversionary clause that no long-term right is created and the park or recreational activity is a temporary one pending completion of the highway or transportation project.

Note: In one recent proposed transportation project, lands designated for transportation purposes and utilized for recreational uses pursuant to a revocable agreement granting temporary use, were found by a court to be 4(f) resources, but this case had unusual facts. Nevertheless, it is important to recognize this decision, even though it is contrary to FHWA policy (see Stewart Park and Reserve Coalition v. Slater, 352 F.3d 545 (2nd Cir. 2003), Appendix A, Question 18).

19. Tunneling

Question: Is tunneling under a publicly owned public park, recreation area, wildlife or waterfowl refuge, or historic site subject to the requirements of Section 4(f)?

Answer: Section 4(f) would apply only if the tunneling:

- 1) Disturbs any archaeological sites on or eligible for the National Register of Historic Places which warrant preservation in place, or
- 2) Causes disruption which would permanently harm the purposes for which the park, recreation, wildlife or waterfowl refuge was established, or
- 3) Substantially impairs the historic values of the historic site.

20. Wildlife and Waterfowl Refuges

Question A: What is a wildlife or waterfowl refuge for purposes of Section 4(f)?

Answer A: The terms “wildlife refuge” and “waterfowl refuge” are not defined in the Section 4(f) law or in FHWA's regulations. However, in 1966, the same year Section 4(f) was passed; Congress also passed the National Wildlife Refuge System Act (NWRSA). The NWRSA defines these terms broadly focusing on the preservationist intent of the refuges. The FHWA has considered this in our implementation of Section 4(f) for refuges. For purposes of Section 4(f), a wildlife and waterfowl refuge is publicly owned land (including waters) where the major purpose of such land is the conservation, restoration, or management of endangered species, their habitat, and other wildlife and waterfowl resources. In determining the major purpose of the land, consideration must be given to the following: (1) the authority under which the land was acquired; (2) lands with special national or international designations; (3) the management plan for the land; and/or (4) whether the land has been officially designated by a Federal, State, or local agency having jurisdiction over the land, as an area for which its major purpose and function is the conservation restoration, or management of endangered species, their habitat or wildlife and waterfowl resources. Recreational activities, including hunting and fishing, are consistent with the broader species preservation.

Examples of properties that may function as wildlife or waterfowl refuges include: State or Federal wildlife management areas, a wildlife reserve, preserve or sanctuary, and waterfowl production areas, including wetlands and uplands that are set aside (in a form of public ownership) for refuge purposes. The FHWA must consider the ownership, significance and major purpose of these properties in determining if Section 4(f) should apply. In making these determinations FHWA should review the existing management plans and consult with the Federal, State or local officials having jurisdiction over the property. In some cases, these types of properties will actually be multiple-use public land holdings of the type discussed in Question 6, and should be treated accordingly.

Question B: Are “conservation easements” acquired by the United States on private lands considered Section 4(f) wildlife and waterfowl refuges?

Answer B: Easements (a form of property ownership, see Question 2 D) acquired by the United States are subject to Section 4(f) as a wildlife and waterfowl refuges when they are part of the National Wildlife Refuge System. Other lands may be subject to Section 4(f) when they meet the definition and criteria specified in Answer A, above. In all cases, FHWA must consider the ownership, significance, and major purpose of these types of properties in determining if Section 4(f) should apply.

21. Air Rights

Question: Do the requirements of Section 4(f) apply to bridging over a publicly owned public park, recreation area, wildlife or waterfowl refuge, or historic site?

Answer: Section 4(f) will apply if piers or other appurtenances are physically located in the park, recreation area, wildlife and waterfowl refuge, or significant historic property. Where the bridge will span the 4(f) resource entirely, the proximity impacts of the bridge on the 4(f) resource should be evaluated to determine if the placement of the bridge will result in a constructive use (see Question 1 B).

22. Non-Transportation Use of 4(f) Resources

Question: Does the expenditure of Title 23 funds for mitigation or non-transportation activities on a 4(f) resource trigger the requirements of Section 4(f)?

Answer: No. Section 4(f) only applies where land is permanently incorporated into a transportation facility and when the primary purpose of the activity on the 4(f) resource is for transportation. If activities are proposed within a 4(f) resource solely for the protection, preservation, or enhancement of the resource and the official with jurisdiction has been consulted and concurs with this finding (in writing) then the provisions of Section 4(f) do not apply.

For example, consider the construction or improvement of any type of recreational facility in a park or recreation area (see Question 24) or the construction of a permanent structural erosion control feature, such as a detention basin. Where these activities are for the enhancement or protection of the 4(f) resource, do not permanently incorporate land into a transportation facility, do not appreciably change the use of the property and the officials having jurisdiction agree, Section 4(f) would not apply.

Another example involves the enhancement, rehabilitation or creation of wetland within a park or other 4(f) resource as part of the mitigation for a transportation project's wetland impacts. Where this work is consistent with the function of the existing park and considered an enhancement of the 4(f) resource by the official having jurisdiction, then Section 4(f) would not apply. In this case the 4(f) land is not permanently incorporated into the transportation facility, even though it is a part of the project as mitigation.

If activities funded with Title 23 funds result in a substantial change in the purpose, function or change the ownership from a 4(f) resource to transportation, then Section 4(f) will apply.

23. Scenic Byways

Question: How does Section 4(f) apply to scenic byways?

Answer: The designation of a road as a scenic byway is not intended to create a park or recreation area within the meaning of 49 U.S.C. 303 or 23 U.S.C. 138. The improvement (reconstruction, rehabilitation, or relocation) of a publicly-owned scenic byway would not come under the purview of Section 4(f) unless the improvement was to otherwise use land from a protected resource.

24. Transportation Enhancement Projects

Question A: How is Section 4(f) applied to transportation enhancement activity projects?

Answer A: A transportation enhancement activity (TEA) is one of twelve specific types of activities set forth by statute at 23 U.S.C. 101(a)(35). TEAs often involve the enhancement of, or improvement to, land that qualifies as a Section 4(f) protected resource. For a 4(f) resource to be used by a TEA, two things must occur, (1) the TEA must involve land of an existing 4(f) resource; and (2) there must be a use of that 4(f) resource as defined by 23 C.F.R. 771.135(p). Therefore, if a TEA permanently incorporates 4(f) land into a transportation facility then there is a use and Section 4(f) will apply.

The following TEAs have the greatest potential for Section 4(f) use:

- Facilities for pedestrians and bicycles
- Acquisition of scenic easements and scenic or historic sites
- Scenic or historic highway programs including tourist and welcome centers
- Historic preservation
- Rehabilitation and operation of historic transportation buildings, structures, or facilities (including historic railroad facilities and canals)
- Preservation of abandoned railway corridors (including the conversion and use thereof for pedestrian or bicycle trails)

Conversely, the TEAs below are less likely to be subject to Section 4(f):

- Safety and educational activities for pedestrians and bicyclists
- Landscaping or other scenic beautification
- Control and removal of outdoor advertising
- Archeological planning and research
- Environmental mitigation of highway runoff pollution, reduce vehicle-caused wildlife mortality, maintain habitat connectivity
- Establishment of transportation museums

In both categories above, the question of Section 4(f) use must be evaluated on a case-by-case basis.

To illustrate how Section 4(f) is applicable to a TEA, consider the following two scenarios involving a significant public park:

Scenario 1: A TEA project is proposed for the construction of a new pedestrian or bike facility within a public park. The purpose of the project is primarily to promote a mode of travel and requires a transfer of land from the officials with jurisdiction over the 4(f) resource to the State DOT or local transportation authority. Since this project would involve the “permanent incorporation of 4(f) land into a transportation facility” there is a use of 4(f) land and a Section 4(f) evaluation should be prepared. In this instance, *The Programmatic Section 4(f) Evaluation for Independent Bikeway or Walkway Construction Projects* (www.environment.fhwa.dot.gov/guidebook/vol2/doc15m.pdf) would likely apply, depending on the particular circumstances of the project.

Scenario 2: The purpose of a TEA project is to construct, rehabilitate, reconstruct or refurbish an already existing bike path or walkway within a public park. This project relates to surface transportation but the improvement is primarily intended to enhance the park. In this case there is no “permanent incorporation of 4(f) land into a transportation facility” and, therefore, no Section 4(f) use. A Section 4(f) evaluation does not need to be prepared.

Other TEA projects can involve existing transportation facilities such as highways, bridges, and buildings which are expected to have a useful life that is finite and therefore, continually require maintenance or rehabilitation. While 23 C.F.R. 771.135(f) may apply in certain instances, generally speaking, the rehabilitation of a highway, building or bridge relates to surface transportation but does not rise to the level of a Section 4(f) use (see also Question 4).

Archaeological planning and research projects that involve the potential use of a significant archeological property are covered by the provisions of 23 C.F.R. 771.135(g) (see Question 5). Other TEAs may be handled in accordance with this answer. In complex situations the FHWA Division Office should contact the Headquarters Office of Project Development and Environmental Review or the Office of the Chief Counsel for assistance.

Note: This answer supersedes the August 22, 1994; *Interim Guidance on Applying Section 4(f) On Transportation Enhancement Projects and National Recreational Trails*.

Question B: Is it possible for a TEA to create a 4(f) resource?

Answer B: To be eligible for transportation enhancement funding, a proposed activity must relate to surface transportation and not be solely for recreation or other purpose. Also, the development of parks, recreation areas, or wildlife and waterfowl refuges are not designated eligible TEAs. Thus, in most cases, the TEA by itself would not create a 4(f) resource, where one did not previously exist.

That being said, it is possible for transportation enhancement funds to enhance existing 4(f) resources, such as a bikeway or pedestrian facility that is constructed within a park. The use of TEA funds in this case would not alter the future Section 4(f) status of the park and may add Section 4(f) values that would

have to be considered in subsequent projects. See Question 22 for additional discussion of the use of transportation funds within a park or other 4(f) resource for non-transportation purposes.

For more information, see the *FHWA Final Guidance on Transportation Enhancement Activities*; December 17, 1999, and the TE Program Related Questions & Answers; August, 2002, found at the Transportation Enhancement Website (www.fhwa.dot.gov/environment/te/index.htm).

25. Museums, Aquariums and Zoos?

Question: Does Section 4(f) apply to museums, aquariums and zoos?

Answer: Publicly owned museums or aquariums will not normally be considered parks, recreational areas, or wildlife and waterfowl refuges and are, therefore, not subject to Section 4(f) unless they are significant historic properties.

Publicly owned zoos on the other hand, should be evaluated on a case-by-case basis to determine the major purpose of these resources and if they are significant park and/or recreational resources. To the extent that these resources are considered to be significant park or recreational areas, or are significant historic properties, they will be treated as 4(f) resources.

26. Tribal Lands and Indian Reservations

Question: How are lands owned by Federally Recognized Tribes, and/or Indian Reservations treated for the purposes of Section 4(f)?

Answer: Federally recognized Indian Tribes are considered sovereign nations, therefore, lands owned by them are not considered to be “publicly owned” within the meaning of Section 4(f), nor open to the general public, and Section 4(f) does not automatically apply. However, in situations where it is determined that land or resources owned by a Tribal Government or on Indian Reservation functions as a significant park, recreational area (which are open to the general public), a wildlife and waterfowl refuge, or is eligible for the National Register of Historic Places, Section 4(f) would apply.

27. Traditional Cultural Properties

Question: Are lands that are considered to be traditional cultural properties subject to the provisions of Section 4(f)?

Answer: A traditional cultural property or TCP is defined in the 1990 National Register Bulletin # 38 generally as land that may be eligible for inclusion in the National Register because of its association with cultural practices or beliefs of a living community that; (a) are rooted in that community's history, and (b) are important in maintaining the continuing cultural identity of the community. Land referred to as a TCP is not automatically considered historic property, or treated differently from other historic property. A TCP must also meet the National Register criteria as a site, structure, building, district, or object to be eligible for Section 4(f) protection.

For those TCPs related to an Indian tribe, the Tribal Historic Preservation Officer (THPO) or tribal resource administrator should be consulted in determining whether the TCP is on or eligible for the National Register. For other TCPs the State Historic Preservation Officer (SHPO) should be consulted.

28. Cemeteries

Question A: Does Section 4(f) apply to cemeteries?

Answer A: Cemeteries would only be considered 4(f) properties if they are significant historic resources, i.e., determined to be on or eligible for the National Register of Historic Places.

Question B: Does Section 4(f) apply to other lands that contain human remains?

Answer B: Lands that contain human remains, such as graveyards, family burial plots, or Native American burial sites and those sites that contain Native American grave goods associated with burials, are not in and of themselves considered to be 4(f) resources. However, these types of lands may also be historic properties included on or eligible for inclusion in the National Register. These sites should not automatically be considered only as archeological resources as many will have value beyond what can be learned by data recovery. If these sites are National Register listed or eligible and also warrant preservation in place, Section 4(f) applies (see Question 5). For more information on the subject of historic cemeteries see, National Register Bulletin #41, *Guidelines for Evaluating and Registering Cemeteries and Burial Places*; 1992.

When conducting the Section 4(f) determination for lands that may be Native American burial sites or sites with significance to a Federally Recognized Tribe, consultation with appropriate representatives from the Federally Recognized Tribes with interest in the site is essential.

29. Section 4(f) Evaluations in Tiered NEPA Documents

Question: How should Section 4(f) be handled in tiered NEPA documents?

Answer: This issue is addressed to some degree in 23 C.F.R. 771.135(o)(1). Because the project development process moves from a broad scale examination at the tier-one stage, to a more site specific evaluation in tier-two, does not relieve FHWA from its responsibility to consider feasible and prudent avoidance alternatives to the use of 4(f) resources at the tier-one stage. Where all alternatives in the second tier analysis use a 4(f) resource, it may be appropriate and necessary to reconsider the feasibility and prudence of an avoidance alternative that was eliminated during the tier-one evaluation phase.

30. Department of the Interior Handbook on Departmental Review of Section 4(f) Evaluations (2002)

Question: What is the official status of the February 2002, *Handbook on Departmental Reviews of Section 4(f) Evaluations*, issued by the Department of the Interior, Office of Environmental Policy and Compliance?

Answer: Section 4(f) legislation (23 U.S.C. 138 and 49 U.S.C. 303) identifies the Department of Interior, as well as the Departments of Agriculture and Housing and Urban Development as having a role in Section 4(f) matters. The U.S. Department of Transportation (DOT) is required to consult and cooperate with these Departments in Section 4(f) program and project related matters.

The purpose of the Handbook is to provide guidance to the National Park Service (NPS), U.S. Fish and Wildlife Service (F&WS) and other designated lead bureaus in the preparation of DOI comments on Section 4(f) evaluations prepared by the DOT, pursuant to the authority granted in Titles 23 and 49. The Handbook is an official DOI document and includes departmental opinion related to the applicability of Section 4(f) to lands for which they have jurisdiction and authority. FHWA values the DOI's opinions related to the resources under their jurisdiction, and while the Handbook provides resource information for FHWA to consider, it is not the final authority on Section 4(f) determinations.

Official FHWA policy on the applicability of Section 4(f) to lands that fall within the jurisdiction of the DOI is contained within 23 C.F.R. 771.135 and this *Policy Paper*. FHWA is not legally bound by the Handbook, or the comments provided by the DOI or lead bureaus, however, every attempt should be made to reach agreement during project consultation. In some situations one of the bureaus may be an official having jurisdiction. When unresolved conflicts arise during coordination with the NPS, F&WS or other bureaus related to the applicability of Section 4(f) to certain types of land or resources, it may be necessary for the Division Office to contact the Office of Project Development and Environmental Review for assistance.

APPENDIX A
Analysis of Case Law

The following analysis provides brief legal notes and citations to some Section 4(f) cases that relate to the subject matter discussed in the question and answer section of the Section 4(f) Policy Paper. This section is provided for informational purposes and as background to the policy addressed in the question and answers. In some instances, case law does not address the specific example in the Policy Paper. Also, there are some examples that have had no case address the subject matter of the question. When you have specific legal questions or need legal advice about Section 4(f) applicability, please contact the Legal Staff of the Office of Chief Counsel within your geographic area. FHWA reserves the right to modify and update this appendix as case law becomes applicable.

1. Use of Resources

Question A: What constitutes a “use” of land from a publicly owned public park, recreation area, wildlife refuge, and waterfowl refuge or historic site?

Legal Note: A number of cases have discussed “use” and “constructive use” and only a few are mentioned here. Several courts have held that the term “use” is to be construed broadly, not limited to the concept of physical taking, but includes areas that are significantly, adversely affected by the project. Adler v. Lewis, 675 F.2d 1085, 1092 (9th Cir. 1982); Concerned Citizens Alliance v. Slater, 176 F.3d 686 (3rd Cir. 1999). In Concerned Citizens, it was undisputed that the preferred alignment would “use” an historic district by sending through the district, resulting in visual, traffic, and noise and vibration impacts. The issue in that case was whether the preferred alternative would impose the least harm on the historic district.

In Brooks v. Volpe, 460 F.2d 1193 (9th Cir. 1972), the Court held that construction of a segment of Interstate Highway I-90 which would encircle campground areas would result in a “use” due to the indirect impacts to the campground under Section 4(f) expanding the physical use concept to what would later be called constructive use and codified in FHWA's regulations at 23 C.F.R. 771.135(p).

Question B: How is “constructive use” defined and determined?

Legal Note: Significant adverse indirect impacts, now called "substantial impairment" in FHWA's regulations, can result in a constructive use. D.C. Fed'n of Civic Ass'ns v. Volpe, 459 F.2d 1231 (D.C. Cir. 1971). At the same time, not every change within park boundaries constitutes a “use” of Section 4(f) lands. Coalition on Sensible Transp., Inc. v. Dole, 826 F.2d 60 (D.C. Cir. 1987). No “use” occurs where an action will have only an insignificant effect on the existing use of protected lands. In Geer v. FHWA, 975 F. Supp. 47, 73 (D. Mass. 1997), the court upheld the FHWA's determination of no constructive use, which concluded that the noise and visual impacts were not significant given the existing urban context of the project and existing impacts under the no-build option.

In Davis v. Mineta, 302 F.3d 1104 (10th Cir. 2002), construction of a project that would substantially impair the aesthetic attributes associated with the Jordan River Parkway was subject to Section 4(f) due to the disruption of the natural setting and feeling of the Parkway. In that case, noise levels were expected to increase at least ten decibels in the parkway. In Conservation Soc'y of S. Vt. v. Sec'y of Transp., 443 F. Supp. 1320 (D. Vt. 1978), “close proximity” of the proposed highway project to the Lye Brook Wilderness area was deemed a “use” of publicly owned recreation land subject to Section 4(f).

The effects of noise can result in a constructive use. In Allison v. DOT, 908 F.2d 1024, 1028 (D.C. Cir. 1990), the court determined that the FAA erred in considering only the effect on humans using a Section 4(f) state park. However, the court ultimately found that there was no violation of Section 4(f) because the operation of the new airport would not result in a significant increase in the noise level over the level of the current facility. There was a similar result in Sierra Club v. United States Dep't of Transp., 753 F.2d 120 (D.C. Cir. 1985), in which the increase in cumulative noise from the new facility was found not to be significant.

More recently, in City of S. Pasadena v. Slater, 56 F. Supp. 2d 1106 (C.D. Cal. 1999), the plaintiffs argued that the 710 Freeway Project would constructively use historic sites by substantially impairing the aesthetic features or attributes of the sites. They argued that the proximity of the freeway to historic properties resulted in at least two forms of constructive use. First, to the extent that the overall setting of a property is an important contributing element to the historic value of the property, this attribute would be impaired. Second, they argued, the mere proximity of the freeway to the historic properties would result in additional impairments. The Defendant argued that setting was not a major aspect of the qualities that made these specific properties eligible for the National Register. The court found that this determination was simply a conclusion for which no analysis was offered. With regard to proximity, the project would come within 15 feet of an historic district. The court noted that other courts have found that there is a constructive use in situation where there is a greater distance between the project and the section 4(f) resource. (See, for example, Coalition Against Raised Expressways, Inc. v. Dole, 835 F.2d 803 (11th Cir 1988) (on-ramp within 43 feet of Section 4(f) structure is a constructive use); Stop H-3 Ass'n v. Coleman, 533 F.2d 434 (9th Cir. 1976) construction of six-lane controlled access highway passing within 100-200 feet of Section 4(f) resource is a constructive use). In City of S. Pasadena, the court found serious questions as to whether defendants abused their discretion in finding that the 710 Freeway Project would not result in any constructive uses of eligible historic resources.

Question C: When does temporary occupancy of a 4(f) resource result in a 4(f) use?

Legal Note: In Coalition On Sensible Transp. Inc. v. Dole, 642 F. Supp. 573, (D. D.C.1986) the project in Montgomery County, Maryland, proposed to widen 16 miles of Interstate 270. Among other violations, plaintiffs argued that the projects impacts to several parklands constituted a use under Section 4(f).

The Section 4(f) statement for this project examined 7 parks and conservation areas. In 4 of the 7 resources, temporary construction easements would be granted for grading and after construction was completed, would be regraded, revegetated and then returned for use as a parkland. The court found that, "the projects temporary impact upon parkland during the construction period does not amount to 'use' within the meaning of section 4(f)." 642 F. Supp. at 596.

Further, since the narrow strips of parkland were in close proximity to the existing highway, and the administrative record established that none of the land was being actively used by park authorities, the court determined that this project would not 'substantially impair the value' of parkland in this case. *Id.* The court also found that even if the project resulted in a Section 4(f) use, Section 4(f) would not have been violated.

(On appeal in Coalition on Sensible Transp. Inc. v. Dole, 826 F.2d 60 (D.C. Cir. 1987), the Court affirmed the lower court's decision for other reasons. The Appeals Court reasoned that since there were other physical uses of other Section 4(f) resources in the project area, the question of temporary occupancy amounting to a use was not necessary).

Practitioner's note: The district court case is useful as an example where the temporary occupancy of parkland by a temporary construction easement did not result in a use under Section 4(f).

2. Public Parks, Public Recreation Areas, and Wildlife and Waterfowl Refuges

Question A: When is publicly owned land considered to be a park, recreation area, or wildlife and waterfowl refuge and who makes this determination?

Legal Note: In Kickapoo Valley Stewardship Ass'n. v. U.S. Dept. of Transp., 37 Fed. Appx. 810 (7th Cir. 2002) (unpublished), the Court held that Section 4(f) only applies to those lands formally classified as parks, recreation areas, wildlife and waterfowl refuges, or historic sites. The Kickapoo Valley Reserve property was originally planned for an Army Corps of Engineers flood-control project. The dam project was cancelled and an Act of Congress transferred the property to the State of Wisconsin. The legislation specified that the land was to "be preserved in a natural state and developed only to the extent necessary to enhance outdoor recreational and educational opportunities." The Court found that this legislative

language restricting use was not sufficient to designate the Reserve as Section 4(f) land. The Court further found that it was not arbitrary and capricious for USDOT to decide not to consider the Reserve as Section 4(f) land based on the multiple uses of the Reserve, including significant portions being used for agriculture.

In Stewart Park & Reserve Coalition v. Slater, 352 F.3d 545 (2nd Cir. 2003), the Court held that Section 4(f) contains no requirement that the public parklands to which it applies must be permanently designated as such. The Court determined that Section 4(f) applied, even though the public lands to be used in the project were originally acquired for transportation purposes (airport expansion and access). Although the land was never permanently designated as parklands, it was available to the public for use as park and recreational area for almost 30 years. (See also Legal Note in 18 of this Appendix)

Question B: How should the significance of public parks, recreation areas, and waterfowl and wildlife refuges be determined?

Legal Note: Land that is used as a public park is presumed significant for Section 4(f) purposes unless explicitly determined otherwise by the appropriate federal or local officials. Arlington Coalition on Transp. v. Volpe, 458 F.2d 1323 (4th Cir. 1972). FHWA reviews the state determination of significance of a public park for reasonableness. Concerned Citizens on I-90 v. Sec. of Transp., 641 F.2d 17 (1st Cir. 1981); Geer v. FHWA, 975 F. Supp. 47, 64 (D. Mass. 1997).

8. Wild and Scenic Rivers

Question A: Are Wild and Scenic Rivers (WSR) subject to Section 4(f)?

Legal Note: In Hells Canyon Pres. Council v. Jacoby, 9 F.Supp.2d 1216 (D. Or. 1998), the court found that a consistency determination supported FHWA's CE. Although that case did not involve a Section 4(f) analysis with respect to the river, the court's reliance on the consistency determination in concluding that there would be no significant impact on the wild and scenic river values should apply equally to a Section 4(f) constructive use analysis.

Practitioner's Note: When projects may have some arguable constructive use of publicly owned waters or on publicly-owned lands administered for Section 4(f) values, it generally will be helpful to obtain a written consistency determination from the river manager. Such consistency determination may prevent a "constructive use" determination.

10. School Playgrounds

Question: Are publicly owned school playgrounds subject to the requirements of Section 4(f)?

Legal Note: In Piedmont Env'tl. Council v. U.S. Dept. of Transp., 159 F.Supp.2d 260 (W.D. Va. 2001), aff'd in relevant part, 58 Fed. Appx. 20 (4th Cir. 2003), the court found that the taking of some land of one school for a bypass constituted Section 4(f) property but that the agency was not arbitrary and capricious in concluding that there were no other feasible and prudent alternatives than taking the land. The court further found that "[b]ecause the defendants concluded that the recreational facilities affected by the noise and visual impacts of the bypass were not noise-sensitive and that differences in elevation and the existing wood buffer would screen the bypass from view, see id. at 35, the Secretary was within the scope of his authority and did not arbitrarily and capriciously conclude that no constructive use would occur."

Practitioner's Note: There is both an actual and a constructive use of school property that should be considered. When the project will take a portion or all of school property open for recreational activity, than Section 4(f) must be considered. However, when the project simply comes near such property, the visual and auditory impacts should be analyzed. If the school property is not noise sensitive, then auditory concerns will not translate into a constructive use. If the visual impact can be shielded by vegetation or elevation differences, then visual concerns may not translate into a constructive use.

However, a thorough study of the effects on the school property provides needed support for a conclusion that there is no constructive use.

15. Bikeways

Question: Do the requirements of Section 4(f) apply to bikeways?

Legal Note: In Laguna Greenbelt, Inc. v. U.S. Dept. of Transp., 42 F.3d 517 (9th Cir. 1994) the court found that an overpass over a bike trail, a widening of an existing bridge over a bike trail, and the relocation of a bike path within the designated right-of-way for the bike path did not constitute either actual or constructive use of the respective trails.

Calio v. Pa. Dep't of Transp. (No. 00-2163, 3d Circuit, October 10, 2001). This litigation involved a Pennsylvania Department of Transportation (PennDOT) proposal to develop a stretch of abandoned railroad track in suburban Philadelphia as a bicycle and pedestrian trail, using funds from the Congestion Mitigation and Air Quality Improvement Program (CMAQ). 23 U.S.C. 104(b)(2) 217. The proposed trail is a non-National Highway System project subject to an exemption agreement entered into by FHWA and PennDOT in 1992. See 23 U.S.C. 106(b)(2) (1991).

The case involved a single issue: would the trail be used principally for transportation, rather than recreation purposes as required for projects funded from the CMAQ program? The District Court upheld FHWA's determination that the trail project would be principally for transportation, saying it was supported by the administrative record and neither arbitrary nor capricious. The appellate court, in a three-page decision, agreed. Although the Third Circuit decision may not be cited as precedent, the District Court's decision has been published. See Calio v. Pa. Dept. of Transp., 101 F.Supp. 2d 325 (E.D. Pa. 2000).

Practitioner's Note: If the project can be constructed so as to preserve the trail, then generally there will not be a "use" of the trail. Thus, an overpass or even the relocation of the trail within the trail's existing right-of-way may avoid a "use" of the trail. Regarding the use of CMAQ funds, even if a bike path has recreational purposes, that does not mean it is not principally for transportation.

16. Joint Development (Park with Highway Corridor)

Question: When a public park, recreation area, or wildlife and waterfowl refuge is established and an area within the 4(f) resource is reserved for highway use prior to, or at the same time the 4(f) resource was established, do the requirements of Section 4(f) apply?

Legal Note: In Sierra Club v. Dole, 948 F.2d 568 (9th Cir. 1991) the 9th Circuit reversed the district court's 1987 ruling that the Secretary had failed to comply with Section 4(f) by ruling that a planned bypass road constructively used the McNee Ranch Park. In 1984, the McNee Ranch State Park was transferred to the California Department of Parks and Recreation. This transfer deliberately set aside part of the land that was to form the park, due to the CalTrans belief that this set aside land might be necessary for a future bypass of an area commonly know as "Devil's Slide" on California State Highway Route 1. The Devil's Slide was a 600-foot section of Route 1 that repeatedly was closed due to landslides.

In 1986, the Secretary approved a Final Environmental Impact Statement for the Martini Creek Alternative, but this FEIS did not include a Section 4(f) evaluation for the McNee Ranch Park.

In the 9th Circuit, USDOT claimed there was extensive cooperation between CalTrans and the park planners throughout the process of park acquisition and the road alignment. The court also examined the legislative history of Section 4(f) and found Congressional reports that stood for the proposition that Congress thought that the joint planning of roads and parks was desirable.

Additionally, the court stated that,

“[w]here a park and a road are jointly planned on land which previously had neither park or road...no consensus is being upset. The community is not changing its mind about the type of park and road it would have, but is making the determination in the first instance. It is difficult to see how the road would significantly and adversely affect the park.” (948 F.2d 575)

Further, the 9th Circuit held that a road does not “constructively use” a park if the road and park were jointly planned. The court also emphasized that this is only applicable when there is constructive not actual use of a parkland.

17. Planned 4(f) Resources

Question: Do the requirements of Section 4(f) apply to publicly owned properties “planned” for park, recreation area, wildlife refuge, or waterfowl refuge purposes even though they are not presently functioning as such?

Legal Note: In Nat’l Wildlife Fed’n v. Coleman, 529 F.2d 359 (5th Cir. 1976) plaintiffs contended that FHWA violated Section 4(f) by failing to prepare a Section 4(f) statement for a section of I-10 that planned to transect the habitat of the Mississippi Sandhill Crane, bisect the eastern portion of a proposed refuge for the crane, and traverse Section 16 land held by the State of Mississippi in trust for the Jackson County School District.

The court determined that for Section 4(f) to apply to the lands at issue in this case, they must meet the following two-part test. First, the land to be used by the project must be publicly owned and second, the land must be from one of the enumerated types of publicly owned lands. The court found that the Section 16 land, although publicly owned, was never designated or administered as a wildlife refuge or any other Section 4(f) purpose notwithstanding the fact that the land was used by the Sandhill Crane as a sanctuary. In addition, the court found Section 4(f) was not applicable to the proposed wildlife refuge, because at the time the right of way for the project was acquired, and during the time the plans were approved, estimates and specifications were given, construction awards were given, and when construction began, the land was not publicly owned. A subsequent transfer of the land to the Fish and Wildlife Service did not make Section 4(f) applicable after the fact.

In Davis v. Mineta, 302 F.2d 1104 (10th Cir. 2002) two parks were planned within the area of potential effect as part of a highway project within the cities of Draper, Sandy and South Jordan in Salt Lake County, Utah. Here, the Jordan River Parkway was owned by two private landowners and partially by the Utah Department of Natural Resources, Division of Parks and Recreation. This land was designated as parkland on the South Jordan City Parks and Recreation Master Plan. The other property at issue was the Willow Creek Park. This park was planned in the Draper City Master Plan to be parkland but was owned by a private landowner. The 10th Circuit found that Willow Creek did not qualify as a Section 4(f) property, due to its private ownership, as did that portion of the Jordan River Parkway not owned by the State of Utah. However, that part which was owned by the State of Utah did qualify as Section 4(f) property due to its public holding.

18. Temporary Recreational Occupancy or Uses of Highway Rights-of-Way

Question: Does Section 4(f) apply to temporary recreational uses of land owned by a State Department of Transportation or other Applicant and designated for transportation purposes?

Legal Note: In Collin County, Tex. v. Homeowners Ass’n For Values Essential to Neighborhoods (HAVEN) 716 F. Supp. 953 (N.D. Texas 1989) HAVEN contended that certain lands should have been viewed as Section 4(f) properties in the Section 4(f) evaluation in the Final Environmental Impact Statement. In this case, the properties at issue were acquired by Dallas County from a private party in 1973 for use as highway right-of-way. Under an agreement between the City of Carrollton and Dallas County, the right-of-way was being used for recreation. Plaintiffs countered that Section 4(f) is inapplicable to temporary uses of highway rights-of-way for recreational activities.

The court concluded that FHWA did not err when the Section 4(f) evaluation determined that these properties were not Section 4(f) resources. Reasoning,

“The properties in this case were acquired from a private owner by Dallas County for right-of-way purposes; they are being used temporarily as a park. Simply because they have an interim use does not change their character: they were purchased as rights-of-way and they will be used as rights-of-way.” 716 F. Supp. at 972

A recent decision, known as the Stewart Airport Case, undercuts the position that land acquired for transportation use cannot become a Section 4(f) resource by permissive interim use. Stewart Park and Reserve Coalition Inc. v. Slater, 352 F.3d 545 (2nd Cir. 2003).

The case involves approximately 1200 acres of some approximately 8600 acres of land acquired for airport use. The proposed use of the 1200 acres was for construction for airport access and highway improvements. The land at issue was never designated as a parkland, but was managed by the state as such, until its use was required for airport and transportation purposes. The airport land was initially an Air Force base and was transferred to the state for use as a commercial airport. The state acquired the adjacent approximate 8600 acres in the 70's for use as airport expansion land and uses consistent with airport use, as per FAA regulations. These lands also included buffer lands. At issue was whether Section 4(f) applied to these adjacent lands.

The state entered into a revocable agreement with the New York State Department of Environmental Conservation to manage the land until needed for airport use. The terms of the formal revocable agreement stated that the agreement could be terminated upon 60 days notice of the land becoming necessary for airport use. The land was managed and used for recreational purposes during the entire agreement period, until the time it became necessary for transportation purposes.

The court held that 30 years of uninterrupted contiguous use of public recreational uses of this land, regardless of the revocable agreement and that fact the lands were originally acquired for transportation purposes, nonetheless, constituted Section 4(f) protected land. Further, the statutory language does not condition protection of land on being permanently designated as such. Additionally, 30 years of use entitled the land in question to Section 4(f) protection as the uninterrupted period could not be characterized as interim.

21. Air Rights

Question: Do the requirements of Section 4(f) apply to bridging over a publicly owned park, recreation area, wildlife refuge, waterfowl refuge, or historic site?

Legal Note: In Citizens for the Scenic Severn River Bridge Inc. v. Skinner, 802 F. Supp 1325 (D. Md. 1991) citizens and opponents of a bridge construction project sought to enjoin state and federal officials from proceeding with construction of a bridge across the Severn River in Anne Arundel County, Maryland. Among other contentions, plaintiffs argued that use of the Severn River was not adequately considered in the Final Section 4(f) statement. However, in the Section 4(f) statement defendants concluded there would be a use of the river, which the court found to be a Section 4(f) resource. The use entailed placement of piers and pilings in the river, possible runoff and removal of the existing bridge. Further, the statement determined that any of the proposed alternatives would have used the river.

Coalition Against A Raised Expressway Inc. v. Dole, 835 F.2d 803 (11th Cir. 1988) examined the impacts of an elevated expressway on three Section 4(f) resources in the downtown area of Mobile, Alabama. At issue were a park, a railroad terminal and the city hall. Defendants argued that in light of the location of these properties in the downtown area, the impacts from the expressway would not be substantial so as to amount to a use of these properties. However, the court reasoned that,

“In addition to the noise and air pollution, the raised highway would impact on the protected sites by impairing the view. The highway would cut off the city hall's view of the river and the docks.

Conversely, it would reduce the view from the river of the city hall's architecture. For the park and the railroad terminal, the highway would replace the view of the downtown with the sight of the seventeen-foot concrete pillars holding up the freeway. In addition, the dirt and debris from an elevated freeway would lessen the beauty of the architecture itself.

While the elimination of the view, the increase in noise and air pollution, and the close location of the highway may not individually constitute a use; cumulatively they significantly impair the utility of the properties." 835 F.2d at 812

The court found that the elevated expressway constructively used these Section 4(f) resources.

22. Non-Transportation Use of 4(f) Resources

Question: Does the expenditure of Title 23 funds for mitigation or non-transportation activities on a 4(f) resource trigger the requirements of Section 4(f)?

In National Trust for Historic Preservation v. Dole, 828 F.2d 776 (D.C. Cir. 1987), the court found that installing suicide prevention barriers on an historic bridge was not a *transportation program or project* and therefore Section 4(f) was not triggered. The court looked at the purpose of the project and found that since it was not a project to facilitate transportation - - the movement of vehicles, Section 4(f) did not apply.

Miscellaneous Section 4(f) Cases With Important Information

For general guidance on the issue of whether or not an avoidance alternative is imprudent and, therefore, may be rejected, relevant case law is below:

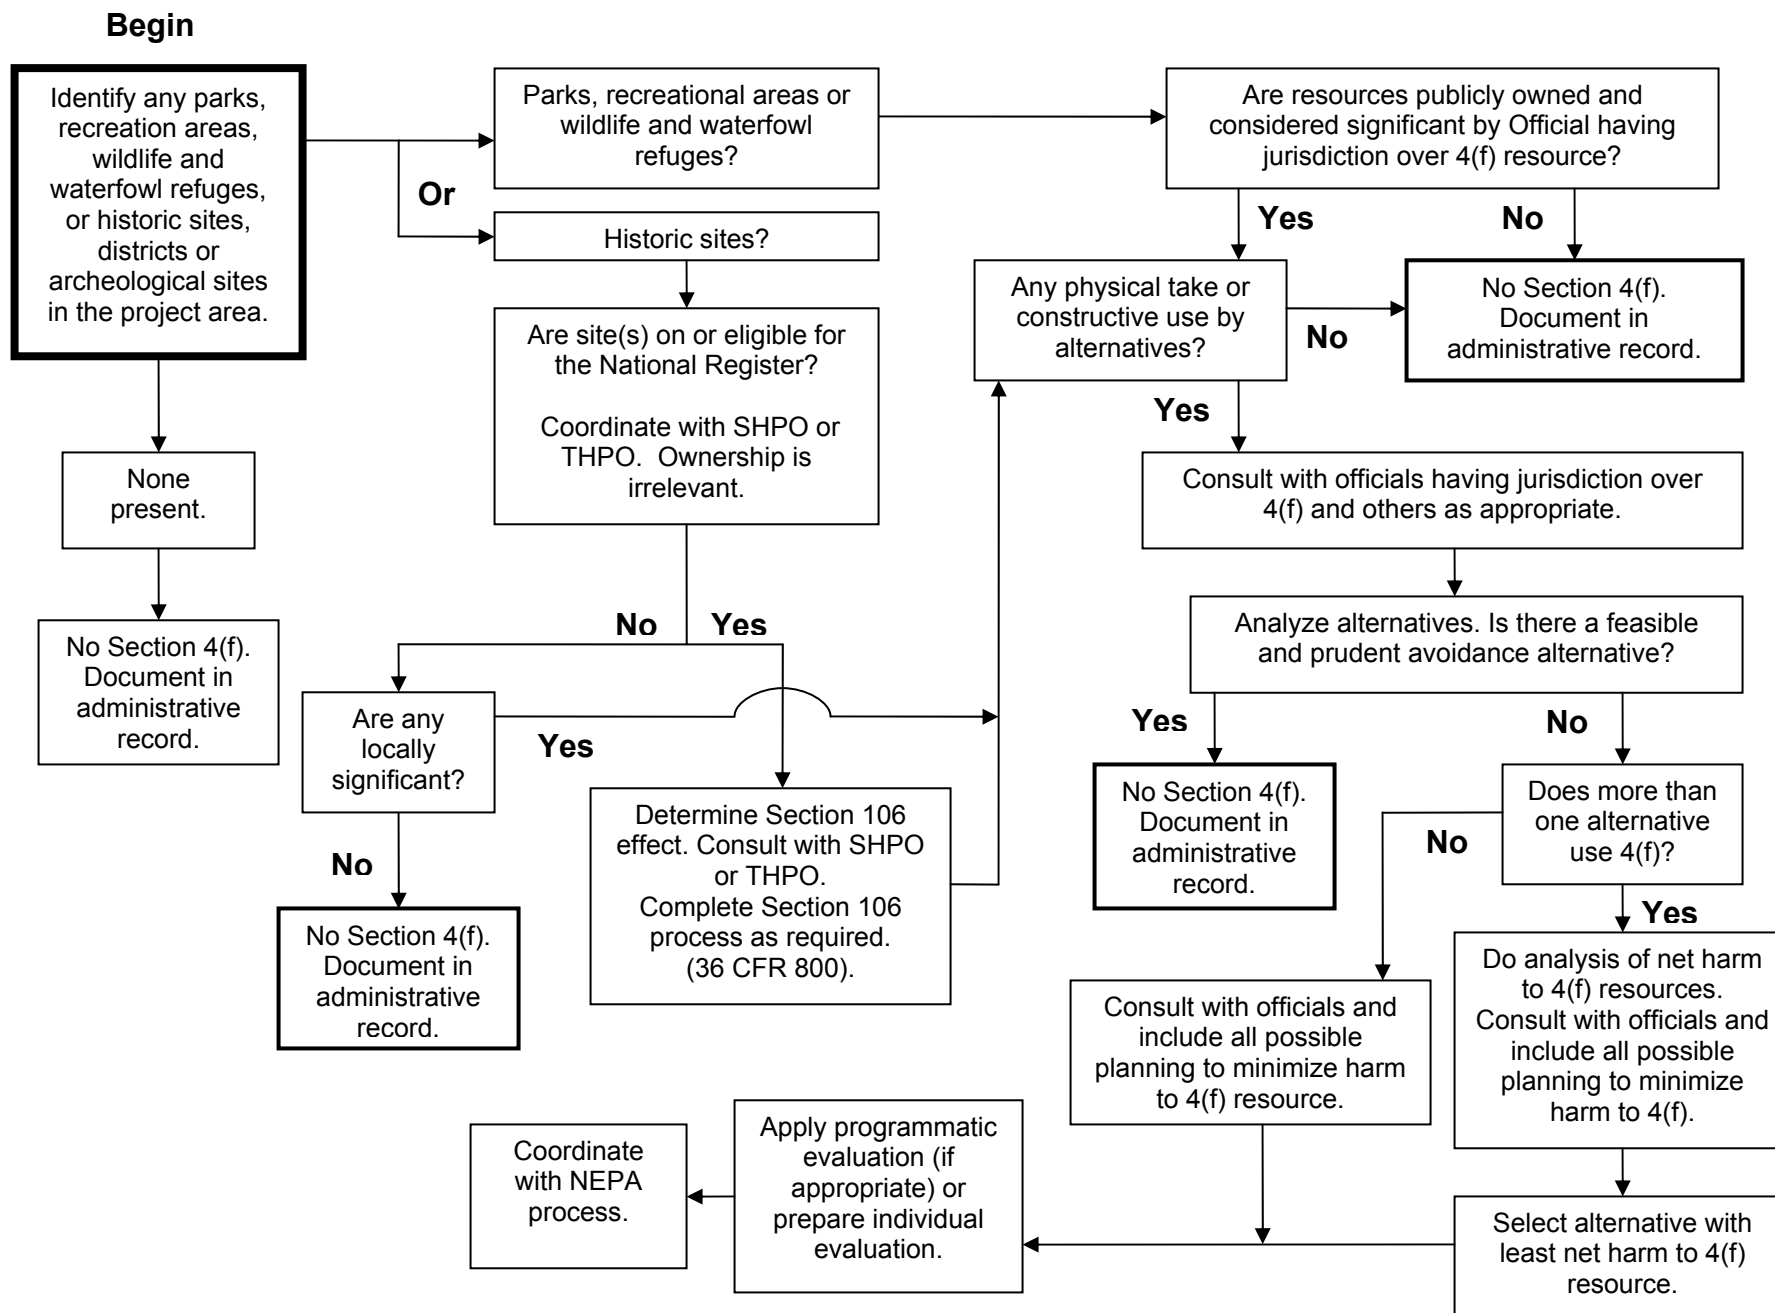

The Fifth, Ninth and Eleventh Circuit Courts of Appeals have employed a stricter standard in determining whether an alternative is imprudent than other Circuits. See, Louisiana Environmental Soviet v. Coleman, 537 F.2d 79 (5th Cir 1976); Stop H-3 Association v. Brinegar, 533 F.2d 434 (9th Cir. 1976); Druid Hills v. FHWA, 772 F.2d 700 (11th Cir. 1985).

Courts in the Fourth, Seventh and Tenth Circuits have interpreted the requirements less stringently. In these jurisdictions, a balancing test for determining whether an alternative is imprudent has been developed. Hickory Neighborhood Defense League v. Skinner, 910 F.2d 159, 163 (4th Cir. 1990); Eagle Foundation, Inc. v. Dole, 813 F.2d 798, 804 (7th Cir. 1987); Committee to Preserve Boomer Lake Park v. USDOT, 4 F.3d 1543, 1550 (10th Cir. 1993). In these jurisdictions the courts allow the Secretary to weigh the cumulative impacts of the avoidance alternative against the cumulative impacts of the non-avoidance alternative to reach a decision. The impacts to be compared in this type of analysis include other impacts in addition to the impacts on the Section 4(f) resource. The extent of harm that would be caused to the Section 4(f) resource if is not avoided would be taken into consideration under this test.

In the other Federal Circuits the case law is less clear. See Monroe County Council v. Adams, 566 F.2d 419 (2nd Cir. 1977) (employed a balancing test without stating it was doing so). The Eighth and the Third Circuits have recently adopted a more flexible standard for "prudent" but only for the limited purpose of determining whether an alternative that minimizes harm can be rejected as "imprudent." See, Bridgeton v. Slater, 212 F.3d 448 (8th Cir. 1999)(court refused to employ a rigid "least harm" test in an airport expansion case as this would conflict with Congressional mandate to facilitate airport expansion); Concerned Citizens Alliance v. Slater, 176 F.3d 686 (3rd Cir. 1999)(decision found that standard for "prudent and feasible" was not quite as high when applied to alternatives that minimized harm and granted the Secretary "slightly greater leeway" in eliminating options that minimized harm as imprudent).

When addressing the question of which standards apply in your state or district you should consult with the Office of the Chief Counsel's Legal Staff.

APPENDIX B
Section 4(f) Evaluation Diagram

Summary of Changes in the 2005 FHWA Section 4(f) Policy Paper

Revision Process Timeline and Overview

- **January to March 2004** - All FHWA Division Offices; the Office of Chief Counsel; the Headquarters Office of Planning, Environment and Realty and the Resource Center Environmental TST were given the opportunity to submit new questions, comments and identify areas of the 1987/1989 Policy Paper that needed clarification and revision.
- **March 2004** - Comments were organized for consideration and possible inclusion in the revised paper. Questions and responses from the Re: NEPA (<http://nepa.fhwa.dot.gov>) Section 4(f) discussion group were also reviewed to assist in determining subject areas to be addressed in the revision.
- **April to October 2004** - Revision of the Section 4(f) Policy Paper was undertaken by Lamar Smith, Office of Project Development and Environmental Review (HEPE), and Lance Hanf and Rima Lewis, the Office of the Chief Counsel (HCC) in San Francisco.
- **October 8, 2004** - The Draft Section 4(f) Policy Paper was circulated to FHWA Division Offices, Office of Chief Counsel, Headquarters Office of Environment, Planning and Realty, the Department of Interior (DOI), the Department of Housing and Urban Development (HUD), the Department of Agriculture, and the US DOT Office of the Secretary of Transportation (OST) (and in turn, other modal administrations) for review and comment.
- **November to February 2005** - Comments on the draft were collected by the Office of Project Development and Environmental Review. The comments were reviewed and addressed as submitted and revisions were made the Policy Paper as appropriate. In December, 2004 FHWA met with the Department of Interior to address their comments.
- **February 2005** - Final review and revisions.
- **March 2005** - 2005 Section 4(f) Policy Paper issued on March 2, 2005 (dated March 1, 2005)

The 2005 Policy Paper

The paper is organized into 3 main sections: **Introduction**, **Section 4(f) Evaluation**, and **Section 4(f) Applicability**. It also includes two new appendices: **Appendix A, Analysis of Case Law**, and **Appendix B, Section 4(f) Evaluation Diagram**.

Hyperlinks are added throughout the paper where websites are referenced for ease of use. Previous FHWA memorandums have been incorporated and rescinded.

- **Introduction.** This section considerably revises the former “Section 4(f) Background”. It provides a comprehensive overview of the history of Section 4(f) and emphasizes important key policy and procedural points.
- **Section 4(f) Evaluation.** This section expands the 1987/1989 discussion of the alternatives analysis process and “feasible and prudent” standard. It also provides an organized approach to the Section 4(f) process and includes an expanded discussion of the application of existing nationwide programmatic Section 4(f) evaluations.
- **Section 4(f) Applicability (Questions and Answers).** Since this section is the heart of the Policy Paper, material and substantive changes were made to address frequent Section 4(f) situations and issues and to provide clarity thereto. The 1987/1989 Policy Paper covered 22 subject areas with 34 questions and answers, whereas the 2005 paper covers 30 subject areas with 53 question and answers. Of the questions and answers in the 1987/1989 Policy Paper, all but 4 have been updated and changed. Former subject area 20 was eliminated due to a law being repealed and former subject areas 22 and 18 were reformatted into questions and answers 1C and 20C, respectively. Many of the former subject areas have new numbers and the majority of new subject areas have been added to the end of the question and answer section.
- **Appendices.** Appendix A includes an analysis of applicable case law and is provided for information. Appendix B presents a comprehensive diagram of the Section 4(f) evaluation process.

Outline of Changes to the Question and Answers

The following annotated Table of Contents from the 2005 Policy Paper illustrates the changes that were made and the differences between the 1987/1989 Section 4(f) Policy Paper and the updated 2005 FHWA Section 4(f) Policy Paper.

- 1) Use of Resources (subject area modified)
 - A. Use (answer modified)
 - B. Constructive Use (question and answer modified)
 - C. Temporary Occupancy (formerly 22 with modifications to question and answer)
- 2) Public Parks, Public Recreation and Wildlife and Waterfowl Refuges (subject area modified)
 - A. Publicly Owned Park, Recreation Area or Wildlife and Waterfowl Refuge (question and answer modified)
 - B. Significant Park, Recreation Are, or Wildlife and Waterfowl Refuge (question and answer modified)

- C. Public Access (question and answer modified)
 - D. Easements and Lease Agreements (question and answer modified)
- 3) Historic Site
- A. Section 4(f) Significance (question and answer modified)
 - B. Section 106 Adverse Effect and Section 4(f) Use (formerly 3C with question and answer modified)
 - C. Historic Districts (formerly 3B with question and answer modified)
 - D. Historic Property Boundary (new question and answer)
 - E. National Historic Landmarks (new question and answer)
- 4) Historic Bridges, Highways and Other Transportation Facilities (subject area modified)
- A. Historic Bridges and Highways (question and answer modified)
 - B. Historic Bridge Replacement (new question and answer)
 - C. Donations of Historic Bridges (question and answer modified)
 - D. Other Transportation Facilities (new question and answer)
- 5) Archeological Resources
- A. General Applicability (answer modified)
 - B. Sites Discovered During Construction (new question and answer)
 - C. Archeological Districts (formerly 5B with answer modified)
- 6) Public Multiple-Use Land Holdings (answer slightly modified)
- 7) Late Designation of 4(f) Resources (subject area and question and answer modified)
- 8) Wild and Scenic Rivers
- A. Designated Wild and Scenic Rivers (formerly 8B with question and answer substantially modified)
 - B. Potential Rivers and Adjoining Lands Under Study (formerly 8A with question and answer modified)
- 9) Fairgrounds (No changes)
- 10) School Playgrounds (answer slightly modified)
- 11) Golf Courses (new subject area)
- A. Public Golf Courses (new question and answer)
 - B. Military Golf Courses (new question and answer)

- 12) User or Entrance Fees (new subject area and question and answer)
- 13) Bodies of Water (formerly 11, answer slightly modified)
- 14) Trails (formerly 12)
 - A. National Trails System Act (answer modified and includes former 12D)
 - B. Trails on Private Land (answer slightly modified)
 - C. Trails on Highway Rights-of-Way (answer modified)
 - D. Recreational Trails Program (new question and answer)
- 15) Bikeways (formerly 13, answer modified)
- 16) Joint Development (Park with Highway Corridor) (formerly 14 question and answer modified)
- 17) Planned Facilities (formerly 15, answer modified)
- 18) Temporary Recreational Occupancy or Uses of Highway Rights-of-Way (formerly 16, subject area modified, question and answer modified)
- 19) Tunneling (formerly 17 and no changes)
- 20) Wildlife and Waterfowl Refuges (new subject area)
 - A. 4(f) Wildlife and Waterfowl Refuges (new question and answer)
 - B. Conservation Easements (new question and answer)
 - C. Wildlife or Waterfowl Areas (formerly subject area 18 with question and answer modified)
- 21) Air Rights (formerly 19, answer slightly modified)
- 22) Non-Transportation Use of 4(f) Resources (new subject area and new question and answer)
- 23) Scenic Byways (formerly 21 and no changes)
- 24) Transportation Enhancement Projects (new subject area)
 - A. General Applicability (new question and answer)
 - B. Creation of Future 4(f) Resources (new question and answer)
- 25) Museums, Aquariums and Zoos (new subject area and question and answer)
- 26) Tribal Lands and Indian Reservations (new subject area and question and answer)

- 27) Traditional Cultural Properties (new subject area question and answer)
- 28) Cemeteries (new subject area)
 - A. General Applicability (new question and answer)
 - B. Other Lands with Human Remains (new question and answer)
- 29) 4(f) Evaluations in Tiered NEPA Documents (new subject area and question and answer)
- 30) Department of the Interior Handbook on Departmental Review of Section 4(f) Evaluations (2002) (new subject area and question and answer)

Side by Side Comparison

1989 Policy Paper

- 1. Use of Land
 - A. What is "Use"
 - B. Substantially Impair (Constructive Use)
- 2. Public Parks, Recreation Areas, Waterfowl and Wildlife Refuges
 - A. Major Function
 - B. Significance
 - C. Not Open to Entire Public
 - D. "Public Ownership"
- 3. Historic Sites
 - A. Significance
 - B. Historic Districts
 - C. Adverse Effect versus Section 4(f)

2005 Policy Paper

- 1. Use of Resources
 - A. Use
 - B. Constructive Use
 - C. Temporary Occupancy of Resources
- 2. Public Parks, Public Recreation Areas and Wildlife and Waterfowl Refuges
 - A. Publicly Owned Park, Recreation Area or Wildlife and Waterfowl Refuges
 - B. Significant Park, Recreation Area, or Wildlife and Waterfowl Refuge
 - C. Public Access
 - D. Easements and Lease Agreements
- 3. Historic Sites
 - A. Section 4(f) Significance
 - B. Section 106 Adverse Effect and Section 4(f) Use
 - C. Historic Districts
 - D. Historic Property Boundary
 - E. National Historic Landmark

Federal Aviation Administration

[Summary Notice No. PE-2005-23]

Petitions for Exemption; Summary of Petitions Received

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Notice of petitions for exemption received and of dispositions of prior petitions.

SUMMARY: Pursuant to FAA's rulemaking provisions governing the application, processing, and disposition of petitions for exemption part 11 of Title 14, Code of Federal Regulations (14 CFR), this notice contains a summary of certain petitions seeking relief from specified requirements of 14 CFR, dispositions of certain petitions previously received, and corrections. The purpose of this notice is to improve the public's awareness of, and participation in, this aspect of FAA's regulatory activities. Neither publication of this notice nor the inclusion or omission of information in the summary is intended to affect the legal status of any petition or its final disposition.

DATES: Comments on petitions received must identify the petition docket number involved and must be received on or before May 5, 2005.

ADDRESSES: You may submit comments (identified by DOT DMS Docket Number FAA-200X-XXXXX) by any of the following methods:

- Web Site: <http://dms.dot.gov>. Follow the instructions for submitting comments on the DOT electronic docket site.

- Fax: 1-202-493-2251.
- Mail: Docket Management Facility; U.S. Department of Transportation, 400 Seventh Street, SW., Nassif Building, Room PL-401, Washington, DC 20590-001.
- Hand Delivery: Room PL-401 on the plaza level of the Nassif Building, 400 Seventh Street, SW., Washington, DC, between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays.
- Federal eRulemaking Portal: Go to <http://www.regulations.gov>. Follow the online instructions for submitting comments.

Docket: For access to the docket to read background documents or comments received, go to <http://dms.dot.gov> at any time or to Room PL-401 on the plaza level of the Nassif Building, 400 Seventh Street, SW., Washington, DC, between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays.

FOR FURTHER INFORMATION CONTACT: Tim Adams (202) 267-8033, Sandy Buchanan-Sumter (202) 267-7271, Office of Rulemaking (ARM-1), Federal Aviation Administration, 800 Independence Avenue, SW., Washington, DC 20591.

This notice is published pursuant to 14 CFR 11.85 and 11.91.

Issued in Washington, DC, on April 12, 2005.

Anthony F. Fazio,

Director, Office of Rulemaking.

Petitions for Exemption

Docket No.: FAA-2004-19468.

Petitioner: Flight Level Aviation, Inc.

Section of 14 CFR Affected: 14 CFR 61.56(i)(1).

Description of Relief Sought: To allow Flight Level Aviation, Inc., to use a flight simulator or flight training device that is not used in accordance with an approved course conducted by a training center certificated under part 142 of this chapter.

[FR Doc. 05-7825 Filed 4-19-05; 8:45 am]

BILLING CODE 4910-13-P

DEPARTMENT OF TRANSPORTATION

Federal Highway Administration

[FHWA Docket No. FHWA-2002-13290]

Final Nationwide Programmatic Section 4(f) Evaluation and Determination for Federal-Aid Transportation Projects That Have a Net Benefit to a Section 4(f) Property

AGENCY: Federal Highway Administration (FHWA), DOT.

ACTION: Notice.

SUMMARY: The FHWA is issuing this approved final nationwide programmatic Section 4(f) evaluation (programmatic evaluation) for use in certain Federal (Federal-aid or Federal Lands Highway) transportation improvement projects where the use of publicly owned property from a Section 4(f) park, recreation area, or wildlife and waterfowl refuge or property from a historic site results in a net benefit to the Section 4(f) property. The application of this programmatic evaluation is intended to promote environmental stewardship by encouraging the development of measures that enhance Section 4(f) properties and to streamline the Section 4(f) process by reducing the time it takes to prepare, review and circulate a draft and final individual Section 4(f) Evaluation (individual evaluation) that documents compliance with Section 4(f) requirements. This programmatic evaluation provides a procedural option for demonstrating compliance with the statutory requirements of Section 4(f) and is an addition to the existing nationwide programmatic evaluations, all of which remain in effect. This programmatic evaluation can be applied to specific project situations that fit the criteria contained in the *Applicability* section. To fully realize the streamlining benefits of this programmatic evaluation, the FHWA and the Applicant (defined later) are encouraged to initiate coordination with the official(s) with jurisdiction (defined later) over a Section 4(f) property as early as possible and practicable to facilitate the assessment of benefits and harm to a Section 4(f) property.

EFFECTIVE DATE: April 20, 2005.

FOR FURTHER INFORMATION CONTACT: Mr. Lamar S. Smith, Office of Project Development and Environmental Review, HEPE, (202) 366-8994 and Ms. Diane Mobley, Office of the Chief Counsel, HCC-30, (202) 366-1366. FHWA office hours are from 7:45 a.m. to 4:15 p.m. e.t., Monday through Friday, except Federal holidays. The offices are located at 400 Seventh Street, SW., Washington, DC 20590.

SUPPLEMENTARY INFORMATION:

Electronic Access

An electronic copy of this notice may be downloaded using a computer, modem, and suitable communications software from the Government Printing Office's Electronic Bulletin Board Service at (202) 512-1661. Internet users may reach the Office of the Federal Register's home page at <http://www.archives.gov> and the Government Printing Office's Web site at <http://www.gpo.gov>

www.access.gpo.gov. An electronic version of the programmatic evaluation may be downloaded at the FHWA Web site: <http://www.environment.fhwa.dot.gov/guidebook/gbwatsnew.htm>.

Background on the Nationwide Section 4(f) Evaluation and Determination

The FTA initially anticipated participating in this proposed programmatic evaluation as reflected in the draft Nationwide Section 4(f) Evaluation and Proposed Determination for Federal-Aid Transportation Projects That Have a Net Benefit to a Section 4(f) Property published at 67 FR 77551, on December 18, 2002. The FTA currently utilizes no programmatic evaluation and relies on individual evaluations to satisfy the requirements of Section 4(f) for transit projects that use Section 4(f) properties. Upon further transit program and policy review, the FTA has elected not to participate in this programmatic evaluation and will continue to perform individual Section 4(f) evaluations in all cases.

Proposed federally funded highway projects that would use property from significant publicly owned public parks, recreation areas, or wildlife and waterfowl refuges or from significant historic sites are subject to Section 4(f) of the U.S. Department of Transportation Act of 1966 (Public Law 89-670, 80 Stat. 931, October 15, 1966), a provision now codified in title 49, United States Code, Section 303. Section 4(f) prohibits such use unless the FHWA determines that: (1) There is no feasible and prudent avoidance alternative; and (2) that the project includes all possible planning to minimize harm to the Section 4(f) property. These efforts are normally documented in an individual evaluation or one of four existing nationwide programmatic evaluations. For some FHWA projects, it may be possible to utilize one or more programmatic evaluations that were developed for specific circumstances.¹

¹ Final Nationwide Section 4(f) Evaluation and Approval for Federally-Aided Highway Projects

Court decisions, particularly in the 1970s, resulted in strict interpretations of Section 4(f) requirements. Many of these early decisions resulted from large projects that impacted Section 4(f) properties during the peak of Interstate highway construction and expansion. In recent years, however, some courts have provided a more flexible interpretation, responding to the reduction in the severity of impacts and a transportation program that is currently focused more on system preservation and modernization than on expansion.

Programmatic evaluations reduce the processing time and effort necessary to document the analysis and illustrate that the Section 4(f) requirements have been met. Each of the programmatic evaluations contains specific and limiting applicability criteria and findings. For projects that do not meet the specified applicability criteria, the FHWA must prepare and circulate for comment, a draft individual evaluation, which is subject to internal legal sufficiency review prior to approval and circulation of a final individual Section 4(f) evaluation.

Description of Action

This programmatic evaluation facilitates compliance with Section 4(f) requirements for those situations in which there is agreement among the FHWA, the Applicant and the official(s) with jurisdiction over the Section 4(f) property that the transportation use of Section 4(f) property, the measures to minimize harm and the mitigation incorporated into the project will result in a net benefit to the Section 4(f) property. If an agreement on net benefit cannot be reached among the FHWA, the Applicant and the official(s) with jurisdiction over the Section 4(f) property, then this programmatic evaluation cannot be used. This programmatic evaluation may be used, when applicable, for a project of any

With Minor Involvements With Public Parks, Recreational Lands, and Wildlife and Waterfowl Refuges, Issued December 23, 1986, Published in **Federal Register**, August 19, 1987, and can be found at 52 FR 31111.

Final Nationwide Section 4(f) Evaluation and Approval for Federally-Aided Highway Projects With Minor Involvements With Historic Sites, Issued December 23, 1986, Published in **Federal Register**, August 19, 1987, and can be found at 52 FR 31118. Department of Transportation, Federal Highway Administration—Programmatic Section 4(f) Evaluation and Approval for FHWA Projects that Necessitate the Use of Historic Bridges, Issued July 5, 1983, Published in **Federal Register**, August 22, 1983, and can be found at 48 FR 38135.

Negative Declaration/Section 4(f) Statement for Independent Bikeway or Walkway Construction Projects, FHWA Memorandum, May 23, 1977, and can be found at <http://www.environment.fhwa.dot.gov/projdev/4fbikeways.htm>.

class of action as defined in 23 CFR 771.115 of the FHWA Environmental Impact and Related Procedures (National Environmental Policy Act (NEPA) regulations).

Why Issue a New Nationwide Programmatic Section 4(f) Evaluation?

Individual evaluations are approved after extensive internal review and interagency coordination. The internal process consists of a review of both a draft and final evaluation by the FHWA Division Office and, in some cases, the FHWA Headquarters Office. In addition, each final individual evaluation undergoes a separate review by the FHWA Office of Chief Counsel to ensure legal sufficiency. Interagency coordination is undertaken on all individual evaluations with the official(s) with jurisdiction over the Section 4(f) property and with the DOI. A draft individual Section 4(f) evaluation is provided for coordination and comment for a minimum of 45 days and a final individual Section 4(f) evaluation is prepared to support the FHWA Section 4(f) determination. In addition, the U.S. Departments of Agriculture (USDA) and Housing and Urban Development (HUD) are consulted on those projects involving a Section 4(f) property for which they have program responsibilities.

The process associated with individual evaluation documentation, review and consultation is time consuming. The process is appropriate for projects that have the potential to substantially impair, through use, the activities, features or attributes that qualify the property for Section 4(f) protection. For other projects, where the use of Section 4(f) property is minor and/or does not result in a substantial impairment of specific qualities that make a property eligible for Section 4(f) protection, the project is still subject to the same thorough and time-consuming process of evaluation, unless it qualifies for a simplified review under one of the existing programmatic evaluations. This programmatic evaluation is intended to address those projects where there is agreement among the FHWA, the Applicant and the official(s) with jurisdiction that, (1) a use of property does not result in a substantial impairment; (2) the project includes all possible planning to minimize harm, including mitigation; and (3) that the cumulative result is an overall improvement and enhancement of the Section 4(f) property.

An understanding of the intent of this programmatic evaluation, applicability requirements and the meaning of net benefit is a prerequisite to agreement.

Where conflict arises in reaching agreement with the official(s) with jurisdiction, the FHWA should assess the nature of the disagreement to determine whether it is procedural or substantive (related to the applicability criteria of the actual project action) before deciding not to use this programmatic evaluation. If substantive disagreement persists, then this programmatic evaluation cannot be used.

As established in this programmatic evaluation, the Administration will review the specific facts of a project, compare them to the applicability requirements of the programmatic evaluation and determine if it is applicable. When applicable, appropriate supporting documentation will be placed in the project file and/or referenced in the appropriate environmental document. Since this programmatic evaluation was reviewed and determined to be legally sufficient according to the requirements of 23 CFR 771.135(k), the utilization of this programmatic evaluation on specific projects will not require legal sufficiency review under 23 CFR 771.135(k). Similarly, interagency coordination is streamlined, as described in this programmatic evaluation, by consulting only with the official(s) with jurisdiction, and not with DOI, USDA, or HUD, except when those agencies have an official responsibility related to the property or where conversion of the 4(f) property to highway use is encumbered such that, specific subsequent agency action will be required (e.g., lands acquired with Land and Water Conservation Fund Act (LWCF) assistance, 16 U.S.C. 460l(8)(f)(3)). It is estimated that these streamlining steps will reduce processing and approval time for certain projects by 3 to 6 months. Of equal importance is the extent of internal review and interagency coordination, which will be commensurate with the severity of impacts and the potential for enhancement of the Section 4(f) property.

Actions Taken to Date

The draft Nationwide Section 4(f) Evaluation and Proposed Determination for Federal-Aid Transportation Projects That Have a Net Benefit to a Section 4(f) Property was published on December 18, 2002, at 67 FR 77551, requesting public and agency comment (FHWA Docket No. FHWA-2002-13290). The proposed programmatic evaluation was provided specifically to the DOI, the USDA, HUD and the Advisory Council on Historic Preservation (ACHP).

After careful analysis of all comments received, the FHWA has decided to finalize and approve this programmatic evaluation. Minor changes have been made in this final programmatic evaluation to add clarity and incorporate suggested improvements from insightful comments. This decision is based upon the belief that the programmatic evaluation will assure full compliance with the statute while enhancing Section 4(f) properties and reducing duplicative administrative processes for eligible projects. The decision is consistent with congressional streamlining initiatives.

Comments and Responses on the Draft Nationwide Programmatic Section 4(f) Evaluation

The following discussion is a summary of comments received on the draft programmatic evaluation. Responses are provided on how the FHWA considered and addressed the concerns and/or issues raised.

Comments were received from 18 entities, including Federal agencies, two national transportation organizations, one national environmental organization, eight State transportation agencies, one transit agency, two State resource agencies, and two private consulting firms. Commenters included the Department of the Interior (DOI), and the National Park Service (NPS), the American Highway Users Alliance (AHUA), the American Association of State Highway and Transportation Officials (AASHTO), the Sierra Club, the State of California Department of Transportation (CALTRANS), the Maryland State Highway Administration (MDSHA), the Pennsylvania Department of Transportation (PennDOT), the New York State Department of Transportation (NYSDOT), the Missouri Department of Transportation (MODOT), the Texas Department of Transportation (TXDOT), the Wisconsin Department of Transportation (WIDOT), the Washington State Department of Transportation (WSDOT), the Central Puget Sound Regional Transit Authority (Sound Transit), the State of Alabama Historical Commission (AHC), the Wyoming Game and Fish Department (WGF) through its Office of Federal Land Policy, Transportation Environmental Management Inc. (TEM) and the HR Green Company (HR Green). In addition, the FTA provided comments and recommendations for consideration prior to its decision not to be a participant in the programmatic evaluation.

Many comments were general in nature and are summarized and

addressed collectively under the following general comment headings: General Comments, Net Benefit, Official(s) with Jurisdiction, and Section 106 Integration. Many comments included recommendations related to a specific section of the programmatic evaluation which are addressed in the section-by-section analysis.

A number of the specific comments received, focused on the overall reform of Section 4(f) and suggested that this programmatic evaluation does not do enough to reform and streamline existing Section 4(f) requirements. All comments and recommendations have been read and considered by the FHWA. These concerns are beyond the scope of this effort and have not been addressed in this document.

General Comments

Comments received demonstrated a need for additional definition of terms used in the final programmatic evaluation. Definitions were added for: "Administration", "Applicant", "net-benefit" and "officials with jurisdiction."

"Administration" refers to the Federal Highway Administration, FHWA Division Administrator or Division Engineer.

"Applicant" refers to the State Highway Agency or State Department of Transportation, or local governmental agency acting through the State Highway Agency or State Department of Transportation.

A "net benefit" is achieved when the transportation use, the measures to minimize harm and the mitigation incorporated into the project results in an overall enhancement of the Section 4(f) property when compared to both the future do-nothing or avoidance alternatives and the present condition of the Section 4(f) property taking into consideration the activities, features and attributes that qualify the property for Section 4(f) protection. A project does not achieve a "net benefit" if it will result in a substantial diminishment of specific functions or values that made the property eligible for Section 4(f) protection.

"Official(s) with jurisdiction" over Section 4(f) property (typically) include: for a park, the Federal, State or local park authorities or agencies that own and/or manage the park; for a refuge, the Federal, State or local wildlife or waterfowl refuge owners and managers; and for historic sites, the State Historic Preservation Officer (SHPO) or Tribal Historic Preservation Officer (THPO), whichever has jurisdiction under Section 106 of the National Historic Preservation Act (16 U.S.C. 470f).

Many commenters expressed overall support for the programmatic evaluation. They generally recognized and noted the potential benefits of the programmatic evaluation in streamlining the procedural requirements of Section 4(f), such as reducing paperwork and internal review, while at the same time, encouraging enhancement of Section 4(f) properties and promoting environmental stewardship.

The guiding principle regarding the use of the programmatic evaluation is that there must be a "net benefit" to the Section 4(f) property. The ability of the FHWA, the Applicant and the official(s) with jurisdiction to reach agreement with respect to the impacts, measures to minimize harm, mitigation and that a net benefit will result is inherent in the decision of whether or not the programmatic evaluation is applicable. "Negotiations" in this regard, should be no more complicated or require skills other than those required for normal project development and Section 4(f) consultations related to impacts, measures to minimize harm and mitigation.

A situation where the necessary agreement or determination of applicability is substantially difficult to achieve or make may be an indication that an individual Section 4(f) evaluation is appropriate in that case. On the other hand, this situation may be an indication that one or more of the participants lack understanding of the intent of the programmatic evaluation or the individual applicability requirements. As stated above, an understanding of the intent of the applicability and net benefit requirements is a prerequisite to agreement. Where conflict arises in coordinating agreement with the officials with jurisdiction, the FHWA should assess the nature of the disagreement to see if it is procedural or substantive before deciding not to use this programmatic evaluation.

The FHWA is committed to providing additional guidance, if needed, on a case-by-case basis to ensure that misunderstanding about the intent of the programmatic evaluation is not an impediment to its use.

Although only a few comments received can be characterized as negative or in general opposition to this programmatic evaluation, many commenters requested clarification and/or refinement of the language used.

The Sierra Club generally objected to the programmatic evaluation because in its view, it contradicts judicial interpretations of Section 4(f), derails the regulatory safeguards and

circumvents the 4(f) mandate that special effort be taken to preserve the natural beauty of the countryside, public park and recreation lands, wildlife and waterfowl refuges, and historic sites. The Sierra Club also suggested that FHWA has provided no evidence that the new programmatic evaluation will result in any tangible benefits to areas currently protected under Section 4(f) and the streamlining approach may severely reduce the number of protected natural areas and historic sites.

This programmatic evaluation is not a waiver or relaxation of any of the Section 4(f) standards or judicial interpretations of the legislative requirements. All existing Section 4(f) legislative provisions remain intact. In addition, the use of the programmatic evaluation will allow an increase in environmental stewardship opportunities resulting in greater protection and enhancement of Section 4(f) protected properties.

The requirement for a documented agreement of the resulting net benefit to a Section 4(f) property will safeguard the preservation provisions of Section 4(f) law by ensuring that there will be an enhancement of the functions and values that originally qualified the property for Section 4(f) protection. There is no less protection afforded by this programmatic evaluation than with an individual evaluation and its application will allow a more efficient process of the regulatory requirements.

The DOI was neutral regarding the advantages of the programmatic evaluation and recommended that FHWA expand on and clarify what "net benefits" to a Section 4(f) property means, especially with regard to resources under its jurisdiction. The DOI also noted that that without further clarification the programmatic may not satisfy the statutory mandate to consult with DOI on Section 4(f) issues. In response to this and other similar comments, we have clarified the definition of "net benefit" in the final programmatic.

The PennDOT commented that the programmatic would provide some time savings in processes but that it would be limited. The NYSDOT and the TEM offered similar comments regarding limited benefit, suggesting that the procedure for utilizing a programmatic evaluation is the same as that required for an individual evaluation.

The intent of this programmatic evaluation is to address administrative burden when it is in the interest of all parties involved to take an action where a use of Section 4(f) property will result in an enhancement of that property.

There may be a limited history of experience with this programmatic evaluation; however, there are many examples of "missed opportunities" to benefit or enhance an existing property where a transportation use was imminent.

This programmatic evaluation constitutes an approved evaluation for which the FHWA need only to demonstrate compliance with the criteria contained in the programmatic evaluation. The independent review by the DOI and the USDA or HUD official(s) of the draft and final individual Section 4(f) evaluations and the legal sufficiency review by the FHWA necessary for an individual evaluation are not required for this or other programmatic evaluations. In many instances the time necessary to conduct these regulatory internal reviews for individual Section 4(f) evaluations are not apparent to the parties not directly involved in the evaluation process. Procedurally, the time savings may be limited to 3 to 6 months in normal project development; however, the overall benefit is enough to encourage its use and will result in efforts that enhance Section 4(f) properties while avoiding some procedural steps.

The Sierra Club commented that the proposed changes do not "streamline" the Section 4(f) procedural requirements. As an example, the Sierra Club noted that the programmatic evaluation cannot be utilized if a feasible and prudent alternative exists and when a project has no prudent and feasible alternative, the agency with jurisdiction must agree to mitigation measures to ensure the proposed action results in a net benefit. The Sierra Club further opined that under this scenario, the programmatic evaluation expands FHWA's discretion and the review process, without full consideration of benefits or losses to Section 4(f) areas.

As stated above, the programmatic evaluation does not waive any of the existing Section 4(f) requirements including the determination that there are no feasible and prudent avoidance alternatives to the Section 4(f) use of the property, and that the project includes all possible measures to minimize harm to the Section 4(f) property. The savings that are being sought through use of the programmatic evaluation come from eliminating internal reviews within the FHWA and the case-by-case coordination with the DOI and other Federal agencies currently required for individual evaluations. Coordination, consultation and agreement with the officials with jurisdiction are essential components of compliance.

There is an important distinction to be made in understanding the programmatic evaluation and how the agreement of net benefit is reached, documented, and approved by the Administration. Comments received from the Sierra Club and others appear to have interpreted the FHWA as the "official with jurisdiction." This is not the case. For clarification, the definition of "official(s) with jurisdiction" was added to the final programmatic evaluation. The Sierra Club's concerns regarding the expansion of agency discretion are unfounded, given that the FHWA must reach an agreement with the official(s) with jurisdiction over the Section 4(f) property in order for the programmatic evaluation to apply. If anything, the role of the officials with jurisdiction is enhanced due to their required participation and agreement on achieving a net benefit.

The MDSHA and the AHC commented that the official(s) with jurisdiction over Section 4(f) property may be the SHPO or THPO and recommended changes to *Applicability*, Item Number 5 to denote that official(s) with jurisdiction may include the SHPO or THPO.

The definition of "officials with jurisdiction" has been clarified as to the role of the SHPO or THPO as the official in the case of historic properties. As previously noted, there may be instances where a Section 4(f) property has more than one official with jurisdiction.

The Sierra Club expressed concern that without a coherent set of criteria to measure the impact of the project on the Section 4(f) area itself, the proposed changes alter the FHWA's role in parkland and historic site preservation by placing undue weight on external factors.

The role of the FHWA throughout the history of Section 4(f) has been to protect and preserve specific defined properties. That role or responsibility does not change with this programmatic evaluation; indeed, protection of Section 4(f) properties is enhanced, by providing an incentive to improve the property and a less cumbersome mechanism when agreement on net benefit can be reached.

The FHWA retains the responsibility for determining the applicability of Section 4(f) and of this programmatic evaluation, which is dependent on agreement of net benefit. The FHWA will give deference to the official(s) with jurisdiction to assist in determining whether the project will "substantially diminish" the function or values for which Section 4(f) was found to be applicable to the property, and all

parties involved must reach agreement as to whether a proposed project will result in a "net benefit" to the property. If agreement is not reached, this programmatic evaluation will not apply.

The programmatic evaluation also does not include impact criteria as part of the applicability standards. This was done intentionally to allow the official(s) with jurisdiction, the FHWA and the Applicant flexibility in determining the measures appropriate to each individual property necessary to generate a net benefit. Deference is given to officials with jurisdiction, who have special expertise in the property, to determine positive outcomes where there will be a use of the property by a transportation project.

Through the review of all the comments, it was noted that some questions or confusion might be attributable to the inconsistent use of the terms Section 4(f) "land", "property" and "resource" throughout Section 4(f) regulations, guidance, documents and even the statute itself. For this final programmatic evaluation, the term "property" has been used as consistently as possible, when not quoted from or directly related to the language of an existing document.

Net Benefit

Several commenters asked for further clarification on what constitutes a "net benefit" and who makes that determination.

The DOI suggested that the term "net benefits" is subjective and could potentially lead to counterproductive proposals. DOI recommended that the definition of "net benefit" to Section 4(f) property be expanded and clarified.

Both the ACH and the MDSHA questioned how and by whom the determination of "net benefit" would be made. Several commenters also recommended that criteria be developed to ensure that people with knowledge about the property have key roles in the determination of net benefit.

There is a wide range of what will constitute a net benefit, which will vary depending on the property and the project situation. In other words, net benefit determination is property and project specific, rather than generally subjective, and the development of criteria would serve to restrict the ability to develop mutually agreeable net benefits. For this reason the FHWA, the Applicant and the official(s) with jurisdiction must work collaboratively to define and agree upon what is reasonable and required to achieve a net benefit to a particular Section 4(f) property, on a case-by-case basis. Each of the participants plays an important

role in this joint determination to ensure that individual resource experts will be involved. Net benefit is a joint decision, but it is only one of the prerequisites to application of this programmatic evaluation. Consistent with the responsibilities and authorities provided by Section 4(f) itself, the FHWA will determine whether the proposed action satisfies the applicability criteria for the use of this programmatic evaluation.

The AASHTO recognized one major difference in this programmatic evaluation compared to the existing programmatic evaluations related to historic properties considered under the National Historic Preservation Act. In some cases, this programmatic evaluation could apply where a Section 106 "adverse effect" finding has been made. The AASHTO, however, expressed some concern that it would apply only if the project had a net benefit on each individual historic property affected by the project and recommended that the programmatic evaluation allow the net "benefit" finding to be made for the project as whole rather than each individual property affected by a project. Similarly the NYSDOT recommended revising the net benefit finding to apply to the project as a whole, as a change more likely to promote environmental stewardship.

As noted earlier, this programmatic evaluation does not allow for the waiver or relaxation of existing Section 4(f) standards or the judicial interpretation of the legislative requirements. As such, each Section 4(f) protected property must continue to be considered individually as is currently required for any project or Section 4(f) evaluation. Generally speaking, impacts and benefits to individual Section 4(f) properties must be considered when applying the Applicability criteria. An individual Section 4(f) property, such as an historic district or park complex, might have multiple components. The net benefit must be achieved for an individual Section 4(f) property and for the functions and values that qualified that property for Section 4(f) protection. Although a historic district may experience a net benefit and be appropriately covered by this programmatic evaluation, each property within the historic district that is individually eligible for the National Register and is used by the project must be considered separately under this programmatic evaluation, if it applies, or in an individual Section 4(f) evaluation.

There can be impacts to the functions and values of the Section 4(f) property,

but these impacts cannot reach a level of “substantial diminishment” as determined by the FHWA. This determination will be made in consultation with the official(s) with jurisdiction. For instance, there may be general agreement among the FHWA, the Applicant and the official(s) with jurisdiction that an overall enhancement to a Section 4(f) property is achievable. However, if the official with jurisdiction believes that the functions and values that made the property eligible for Section 4(f) protection will be substantially diminished upon completion of the project, then the FHWA must find that the programmatic evaluation is not applicable and that the protected property requires the preparation of an individual Section 4(f) evaluation.

The AASHTO recommended that the net benefit finding take into account the likely future condition of the historic property if the transportation project is not implemented, *e.g.*, the potential for demolition of the historic property by a private landowner.

The revised definition of net benefit included in the final programmatic evaluation addresses this comment, in part. This determination relies on a comparison of Section 4(f) functions and values of the property without the transportation project and use to determine net benefit.

The WIDOT commented that agreements on what constitutes “net benefit” could be difficult to reach among the stakeholders involved.

The WIDOT recognized the potential difficulties that may occur when working out the details sufficiently enough that all officials with jurisdiction are satisfied that a net benefit will result. Because the range of what constitutes a net benefit will vary from property to property, by the official(s) with jurisdiction, and by the policies of both the FHWA and the Applicant, creative measures used to achieve net benefits on a project level should be developed and shared with the larger environmental and transportation community in the form of “Best Practices.” The flexibility inherent within the language of the programmatic evaluation provides official(s) with jurisdiction an opportunity and incentive to participate in efforts that maintain and achieve benefits to Section 4(f) properties under their protection. The Applicant and the FHWA are encouraged to communicate the beneficial qualities of the programmatic evaluation with the official(s) with jurisdiction in order to maximize its potential benefit to the Section 4(f) property.

Several commenters noted that the use of the term “net benefit” is inconsistent throughout the programmatic evaluation. It was unclear whether there merely needs to be a net benefit, or does the project have to preserve, rehabilitate, enhance, and have a net benefit. It was further noted that in some situations, it would be difficult to argue that the project does all four even though it may have an overall net benefit.

From these comments and others, the FHWA recognizes the need to clarify the term “net benefit.” Therefore, as noted above, the definition of net benefit has been modified and simplified for consistency in the final programmatic evaluation. This definition clarifies that the resulting Section 4(f) functions and values of the property are “better,” overall, than if the project did not use the Section 4(f) property. The “net benefit” determination may be based on a number of approaches to mitigate and minimize harm as long as there is an overall enhancement or betterment from the future do-nothing or avoidance condition.

As previously discussed, further instruction has been provided in this programmatic evaluation on how the net benefit is determined and by whom it is determined.

The NPS expressed concern with the definition of “net benefit” and objected to the inclusion of the “substantial diminishment” requirement without providing standards for measuring what is or is not substantial.

The subjectivity of individual values and functions of a significant Section 4(f) property demonstrate the variability of impacts, mitigation, and net benefits, thus, providing guidance or strict criteria on this determination may be viewed as overly prescriptive. There is similar subjectivity and context in determining “substantial diminishment.” For these reasons, it is important to consider the insight of the official(s) with jurisdiction when it comes to deciding “net benefit” and/or “substantial diminishment” and the officials with jurisdiction are in the best position to assist in these determinations. Therefore, some deference should be given to the officials with jurisdiction when determining if the project will “substantially diminish” the activities, features or attributes that qualify the property for Section 4(f) protection. And this determination is essential to deciding if there is a “net benefit.” If agreement on net benefit cannot be reached, this programmatic evaluation will not apply to the property.

Officials With Jurisdiction

Addressing park, recreational, wildlife and waterfowl resources and cultural, historic, and tribal properties within a single nationwide programmatic evaluation has created some confusion when discussing coordination with appropriate individuals or official(s) with jurisdiction. Several comments were received that reflect a general concern about the definition and intended role of the official(s) with jurisdiction.

For example, the AHC asked that the programmatic evaluation clarify who has official jurisdiction over Section 4(f) property and whether it must take the SHPO’s advice into consideration.

A substantial effort has been made to clarify language in the final programmatic evaluation. Consistent with existing Section 4(f) regulations and guidance, whichever of the SHPO and/or THPO has responsibility under the Section 106 regulations is considered the official with jurisdiction over an historic property. The FHWA must seek and consider the opinion of the SHPO when determining effect under the Section 106 regulations and would likewise, under Section 4(f), seek the opinion of the SHPO as an official with jurisdiction when determining whether a net benefit will result from the Section 4(f) use of an historic site. In an example of an historic park owned by a municipality that was purchased with funding from the Land and Water Conservation Funds Act, the officials with jurisdiction would be the municipal parks department and the SHPO. All officials with jurisdiction must agree with a net benefit determination to a Section 4(f) property for this programmatic evaluation to apply. Coordination with the NPS would also be required in this case, relative to its responsibilities under the LWCFA, to assist in determining appropriate and acceptable mitigation for the project’s Section 4(f) use.

Section 106 Integration

Several commenters expressed a desire to improve the integration of Section 4(f) requirements with those of the Section 106 process. The NYSDOT commented that the programmatic evaluation would do little or nothing to streamline the Section 4(f) process with respect to an historic property. The TEM recommended that the programmatic evaluation “adopt” the conclusion of the Section 106 process such that, if a project has been found to have no effect, no adverse effect, or results in a MOU that addresses adverse effects, it should

be exempt from Section 4(f) requirements on that basis.

The current laws and regulations continue to apply. The FHWA has, to the extent consistent with both laws, combined the common elements of the two processes for this programmatic evaluation. Much of the coordination required, the assessment of impacts, and mitigation is basically the same whether intended to comply with NEPA, Section 106 or Section 4(f). An integrated approach that satisfies multiple requirements is consistent with existing FHWA policy to use the NEPA process as the "umbrella" under which all environmental and related laws and regulations are addressed. It is within the unique requirements of Section 4(f) that this programmatic evaluation will provide relief in the preparation of a single evaluation rather than a draft and a final, the elimination of certain internal FHWA reviews, and the elimination of project-by-project review by the DOI and the USDA, and the HUD, all of which are now required for an individual Section 4(f) evaluation.

Section-by-Section Analysis

Revisions were made to several sections of the programmatic evaluation based upon either suggestions or comments received. The substantive changes not discussed above are considered in this Section-by-Section Analysis.

Preamble

In response to comments, the Preamble has been revised to improve its consistency with the main body of the programmatic evaluation and to respond to the comments received.

Examples

Several comments were received on the examples provided in the draft to illustrate application and implementation of the programmatic evaluation. These examples have been rewritten to provide further clarity on the use of the programmatic evaluation.

The TXDOT commented on the example of a renovated historic railroad station with the opinion that such renovation, if completed in compliance with the Secretary of Interior's Standards and Guidelines, should result in a "no adverse effect" determination, and thus, no 4(f) analysis would be required.

In specific instances, where the purpose of a project was to improve an existing transportation facility, the observation of the TXDOT would be correct (as provided in 23 CFR 771.135(f)). However, for situations not covered by 23 CFR 771.135(f), the

FHWA's determination of "no adverse effect," as defined by the regulations implementing the NHPA, and its subsequent concurrence by the SHPO, would not necessarily eliminate the need for a Section 4(f) evaluation. The programmatic evaluation provides additional flexibility in addressing adverse impacts and Section 106 "adverse effects" to historic property, where, notwithstanding these impacts, there results an overall enhancement of the Section 4(f) property. In the example cited above, if the Applicant or the FHWA developed plans to renovate the historic railroad station in such a way that the functions and values of the station were enhanced yet the design still did not meet the Secretary of Interior's Standards and Guidelines (e.g., due to changes necessary to comply with the Americans with Disabilities Act), the project might still qualify for this programmatic evaluation. The example has been rewritten for clarity.

The MDSHA commented on the example where a Section 106 adverse effect determination was rendered; that it was not clear how the programmatic evaluation could be applied as the official with jurisdiction would be contradicting itself by agreeing that the action had a beneficial effect.

This result would depend upon the enhancement and mitigation provided and, in the end, how the officials with jurisdiction view the results of that mitigation and enhancement. The FHWA may determine that a project has an adverse effect as defined in the Section 106 regulation on a particular function or value of a Section 4(f) property, but for the programmatic evaluation to apply there cannot be a "substantial diminishment" of the activities, features, and attributes that qualify the property for Section 4(f) protection. Not every adverse effect rises to the level of substantial diminishment. For instance, the removal or moving of one contributing component of a historic district may result in an improvement to the access or continuity of the overall property. An example would be the creation of a pedestrian promenade within the historic district that recreates a lost element of the district and improves its economic vitality. Additionally, the Section 106 process does not consider the future do-nothing alternative, yet within this programmatic evaluation the future do-nothing is considered when determining net benefit. Therefore, the SHPO, without conflict, may concur with an adverse effect determination under Section 106, but may agree that the proposed project has a net benefit and

will not result in substantial diminishment of the property under this programmatic evaluation.

When the FHWA utilizes this programmatic evaluation, documentation should be requested from the official(s) with jurisdiction that a net benefit will result from implementation of the project and that there is no substantial diminishment of protected activities, features or attributes of the protected property. This agreement may be incorporated into the Section 106 Agreement or other correspondence related to the Section 106 consultation process where the Section 4(f) protected property is historic, however, it should be clear that the Section 4(f) related request is separate and distinct from Section 106 consultation. If a historic property also meets other Section 4(f) criteria (i.e., historic park) and there are multiple officials with jurisdiction, they also have a role in determining net benefit.

In response to the comments received concerning needed guidance and in recognition of the need to further clarify the intended use of this programmatic evaluation, the examples from the draft were rewritten and new examples were added.

Introduction

Referring to the last sentence of the Introduction, the NPS commented that the listing of these few programs in the proposed programmatic evaluation might lead to the incorrect interpretation that the list is all-inclusive rather than a sampling.

Not to mislead any intending user of the programmatic evaluation, the partial listing has been removed and the portion of the all-inclusive discussion stating, "any other applicable Federal environmental requirements" was retained.

Applicability

The WIDOT commented that the proposed programmatic evaluation is limited in its scope and will apply only to a small subset of projects.

Initially, utilization of the programmatic evaluation may be limited, but over time it is anticipated that it will have increased use as Applicants, the official(s) with jurisdiction, and the FHWA learn how to incorporate actions beneficial to Section 4(f) properties into transportation projects and realize the reduction in regulatory and internal review times that will result from the application of this programmatic evaluation.

The TXDOT and others requested clarification of language found in

Applicability, Item Numbers 4 and 5, which contain discussions of the roles of "all parties" and "other appropriate parties." It was suggested that this be clarified to avoid the appearance of subjectively defining these categories on a case-by-case basis and recommend referencing Section 106 language for "consulting parties."

The concern expressed in this comment is recognized and the recommendation has been adopted in part. The language has been reworded to eliminate "other appropriate parties." This change respects the distinction between Section 4(f) and 36 CFR part 800.

The NPS commented that the success of existing "minor involvement" programmatic Section 4(f) evaluations has been due to the following factors, (1) they are restricted to improvements on essentially the existing alignment, (2) the maximum acreage limitations are defined, and (3) they do not apply to projects for which an EIS is prepared.

The essence of this programmatic evaluation is distinct from the existing "minor uses" programmatic evaluations in that its application is dependent on a resulting positive outcome instead of a minor use. For this reason its application is appropriate and allowable in conjunction with both existing and new alignments. The maximum-acreage-allowable criterion was specified in the programmatic evaluation for minor uses of parks, recreation areas and wildlife and waterfowl refuges to assist in defining minor use in spatial terms. The amount of property used is not an appropriate factor in determining the net benefit and may inappropriately limit application of this evaluation in some cases. Therefore, the application of this programmatic will remain the same so as not to reduce its potential effectiveness and application.

Since this programmatic evaluation can provide the impetus necessary to develop creative measures of avoidance, minimization, and enhancement for impacts to protected Section 4(f) properties, it is appropriate for use with all environmental class of actions, including EISs, in which the applicability criteria is satisfied.

The NPS and DOI noted that the programmatic evaluation does not clearly define the role of agencies holding a contractual or real estate interest in the subject property.

We do not believe it is necessary to specify a criterion that singles out the NPS or any other agency in determining applicability of the programmatic evaluation. Such an encumbrance would not be affected by FHWA's Section 4(f) determination. Where the

NPS or another agency has the "last word", under another statute, that responsibility remains intact. A sentence was added to the final programmatic evaluation requiring coordination with the appropriate agency, where such encumbrances exist, to clarify the process.

For Section 4(f) properties, other than privately owned historic resources, the FHWA and the Applicant shall pursue with due diligence, during early stages of project development, determination of whether or not the property in question received a LWCFA grant. If the Applicant or the FHWA have concerns about whether a park area might have received a LWCF grant they should contact one of the National Park Service field offices or State Agency, as listed in the "Contact List" on the following Web site: <http://www.nps.gov/ncrc/programs/lwcf/protect.html>.

Administrators have databases of grant-assisted sites that will help them to determine whether Fund protections apply; also some States have their own grant programs that afford similar protection. Additional information and addresses for National Park Service Offices and State Liaison Officers for the Land and Water Conservation Fund can be found at the following Web site: <http://www.nps.gov/ncrc/programs/lwcf/protect.html>.

The NEPA documentation, project file or Section 4(f) documentation shall include evidence of the determination.

The DOI suggested that "National Historic Landmarks" should be explicitly identified as National Register eligible property and that additional stipulations to address situations that involve National Natural Landmarks be added.

Since there is no distinction between National Historic Landmarks and other National Register eligible properties where Section 4(f) is concerned, the draft language is retained. Also, the programmatic evaluation would apply to those National Natural Landmarks that met the statutory definition of a Section 4(f) protected property.

The NPS also expressed concern that the FHWA will have the "sole responsibility" for determining whether a public park area will receive a net benefit. The programmatic evaluation requires the FHWA to reach agreement with the officials with jurisdiction; therefore, FHWA will never have the "sole responsibility" for determining net benefit.

As stated above, the language in the final programmatic evaluation addresses the concerns of the NPS. If agreement is not reached among the FHWA, the Applicant and official(s) with

jurisdiction, then the programmatic evaluation cannot be used. If, for example, the NPS requires full replacement of federally encumbered property pursuant to LWCFA, then that obligation will continue to require at least full replacement of the impacted land as determined under that statute whether or not there is a net benefit finding. This holds true for any necessary provision, whether Federal or State, that relates to the impacts of a Section 4(f) property. This is why early consultation and input from all appropriate official(s) with jurisdiction is necessary and required.

The MDSHA commented on an apparent discrepancy between one of the examples and the *Applicability* section. The MDSHA notes that the *Applicability* section states that the programmatic evaluation may be applied if, among other things, the project does not require the demolition or major alteration of the characteristics that qualify the property for the NRHP. Yet the example of the reconstructed, deteriorated historic feature was deemed appropriate, even given the adverse effect determination.

Changes have been made to the *Applicability* section to address this concern. Additionally, the example has been rewritten for clarity. There is no discrepancy as the example is for a reconstruction of a contributing element, which the SHPO, as the official with jurisdiction, deems to be a net benefit to the property when compared to the do-nothing alternative, which leaves the wall in a deteriorated condition. Even though the FHWA could determine and the SHPO concur that the removal and reconstruction of the wall would be an adverse effect under Section 106, the SHPO or THPO could find that the project results in an overall benefit. The programmatic evaluation allows for impacts of some of the functions and/or values of the property as long as there is a collective improvement and there is no substantial diminishment to those functions and values that originally qualified the property for protection.

Relating this back to the example at hand, even though the wall is considered an important function or value in determining Section 106 significance of the historic property, the reconstruction of the wall is neither considered a substantial diminishment nor a major alteration but rather an improvement over its existing condition, the anticipated condition of the future no-build and the condition of the historic site itself, thereby qualifying as a net benefit.

The MDSHA commented on *Applicability*, Item Number 4, and identified a perceived duplication of Section 106 and Section 4(f) efforts. The MDSHA asked whether an adverse effect on an historic property is obviated by a net benefit to the resource such that, there will not be a need for a Section 106 MOA. The CALTRANS added that the SHPO's or THPO's written determination of no adverse effect under Section 106 should suffice as evidence of written agreement under *Applicability*, Item Number 5 to eliminate the need for additional efforts on the part of the SHPO or THPO.

Where required by 36 CFR part 800, an MOA or Programmatic Agreement would be a prerequisite for Section 4(f) approval under this programmatic evaluation similar to the Final Nationwide Section 4(f) Evaluation and Approval for Federally-Aided Highway Projects with Minor Involvements with Historic Sites and the Programmatic Section 4(f) Evaluation and Approval for FHWA Projects that Necessitate the Use of Historic Bridges. The conditions and measures to achieve a net benefit may be established in the MOA. However, the MOA, or any additional or separate documentation, must clearly record that agreement has been reached among the officials with jurisdiction, the FHWA and the Applicant and all appropriate documentation must be retained for the project record consistent with NEPA project documentation retention practices and policies.

In summation, any written agreement developed as part of the Section 106 process can suffice for the *Applicability* criteria of this programmatic evaluation if such agreements (typically MOAs) include an agreement by the officials with jurisdiction that the project results in a net benefit to a protected Section 4(f) property. However, all the officials with jurisdiction may not want to be party to a Section 106 agreement and other Section 106 parties not necessarily the "officials with jurisdiction."

Regarding *Applicability*, Item Number 4, the AHC commented that "such measures" are "vague and weak" and recommended that this be a stronger, more specific statement.

The language in *Applicability*, Item Number 4 is consistent with existing programmatic evaluations and is retained with minor editorial changes in the final version. The language allows for flexibility that makes the programmatic evaluation as viable a procedural option as possible while being as responsive to the expert opinions of the official(s) with jurisdiction and the varied qualities of the properties they manage.

The NYSDOT commented on the "substantial diminishment" requirement related to determining "net benefit" in the *Applicability* section. It suggested that the requirement is contrary to the concept of "net benefit", weakens the concept and narrows the opportunity to effectively benefit the resource.

Programmatic evaluations by their nature are limited to projects that meet a specific set of facts and applicability requirements. A project that will result in a substantial diminishment of any of the functions or values that originally qualified the property for Section 4(f) protection should be evaluated using an individual evaluation. The wording of this programmatic evaluation is designed to ensure that a net benefit is achieved without substantial diminishment of the functions or values (features or attributes) that make the property eligible for Section 4(f) protection. Still, there is flexibility in determining what function or values are keys to the properties' eligibility for protection and what constitutes a substantial diminishment of those functions and values.

Alternatives

The AHC commented that it is difficult to discern how the programmatic evaluation helps the FHWA when it comes to its avoidance alternatives analysis and the PennDOT recognized that the programmatic evaluation limits the alternatives that must be analyzed and documented.

The PennDOT is correct; the avoidance alternatives that must be considered are all-inclusive. This approach is consistent with the existing programmatic evaluations.

The DOI suggested that the "Do Nothing Alternative" be replaced with the term "No Action Alternative," in accordance with NEPA guidance.

To avoid confusion, the term "Do Nothing Alternative" will be retained, as it is consistent with the other programmatic evaluations.

The PennDOT recommended that the "qualitative importance or value" of each Section 4(f) resource should be considered in determining whether or not an avoidance alternative is feasible and prudent. It further recommended that for historic properties, the condition and ownership should be considered as well.

The programmatic addresses those situations where the transportation use results in an overall enhancement of the property as agreed to by the official(s) with jurisdiction, the FHWA and the Applicant. The ability to benefit the property must be factored into the

feasible and prudent determination. The consideration of the avoidance alternative comes from the Section 4(f) statutory requirements, which have not changed. The Section 4(f) legislation addresses historic properties regardless of ownership of the property.

Findings

The DOI recommended revising the first sentence to indicate that to apply the programmatic evaluation to a project, the required no-action and avoidance alternatives must be found not feasible and prudent through a written determination.

The wording has been changed to reflect the comment.

The DOI suggested inserting the phrase "jeopardize the continued existence of any endangered or threatened species or result in the destruction or adverse modification of designated critical habitat," before the phrase "substantial damage to wetlands". The suggested language has been incorporated.

The NYSDOT commented on the proposed language, "An accumulation of these kinds of problems must be of extraordinary magnitude when compared to the proposed use of the Section 4(f) land to determine that (the avoidance) alternative is not feasible and prudent." It was suggested that this approach would seem more valid in the context of a full 4(f) evaluation where there is a net negative effect to a historic property, than in a programmatic evaluation context where the "net" effect is positive.

This language is consistent with existing Section 4(f) implementation policy and has been incorporated in essence. The first condition of Section 4(f) use is the determination that no feasible and prudent avoidance alternatives exist. The programmatic evaluation must include this determination in order to facilitate compliance with the statute and regulations. This programmatic evaluation identifies the variables that must be considered when making the determination of feasible and prudent. Application of this programmatic evaluation is optional and an individual evaluation may be prepared at the discretion of the Administration in those cases where it is appropriate.

The AHC asked about how the evidence of no feasible and prudent alternative will be collected and distributed.

Appropriate evidence that no feasible and prudent alternative to the use of Section 4(f) property exists must be a part of the FHWA's administrative record for the project. This supporting

information and determination will be documented in the appropriate NEPA document or project record consistent with current Section 4(f) policy, guidance and the requirements of this programmatic evaluation.

The AHC also asked about what would constitute a "substantial increase in cost" and suggested that we include an approximate figure or at least a percentage.

The FHWA, in consultation with the Applicant, will determine what is considered a substantial increase. The language is identical to that used in previous programmatic evaluations.

The AHC commented that Findings 2(e) seem to be intended to play one resource improvement against another's adverse effect.

The statement found in Findings 2(e) is not intended to play one property against another. The purpose of the statement is to give appropriate consideration and weight to the beneficial measures of the project when determining whether an alternative is prudent and feasible.

In regard to item number 2(e), the NPS questioned whether "a missed opportunity" to benefit a Section 4(f) property has any relevance in determining whether or not an alternative is feasible and prudent.

Section 4(f) established a two-fold emphasis for the Secretary of Transportation: to protect and to enhance significant resources identified for special consideration. To date, programmatic evaluations have focused on projects with minor impacts to these protected properties. This programmatic evaluation is designed to allow the FHWA, the Applicant and official(s) with jurisdiction over the Section 4(f) properties, to look for opportunities where transportation actions can enhance Section 4(f) properties, even where there is a use of some property. Because a net benefit on a property can only be determined when all parties agree, the programmatic evaluation will only be used when it is deemed appropriate and in the best interests of the protected property. To ensure that 2(e) is not abused or equated to a low bar, we included language to clarify that for a project to qualify for 2(e) there must be a substantial missed opportunity to benefit a Section 4(f) property.

Mitigation and Measures To Minimize Harm

Several commenters indicated a confusion regarding the wording of this section and offered suggestions. The principal reason is the combination of "Measures to Minimize Harm" and

"Mitigation Measures." When put together, commenters read it as "Measures to Minimize Harm and Measures to Minimize Mitigation". Obviously this is not the intent; however, to rectify this misunderstanding the language has been changed to read: "Mitigation and Measures to Minimize Harm." Although, measures to minimize harm are considered mitigation, this language is consistent with the Section 4(f) statute.

Coordination

The NPS recommended that the programmatic evaluation require that all projects be coordinated with the appropriate DOI bureaus.

As noted earlier, for those projects where an agency or bureau of DOI is an official with jurisdiction, or where the LWCF applies, coordination will be necessary as a procedure in meeting the applicability requirements and approval of this programmatic evaluation.

Another comment questioned the statement regarding the need for the FHWA to coordinate with the United States Coast Guard (USCG) before applying the programmatic evaluation to projects requiring a Section 9 Bridge permit.

When the proposed programmatic evaluation was issued, the USCG was still a part of the USDOT and therefore it had Section 4(f) responsibilities. Since that time, the USCG has been relocated to the U.S. Department of Homeland Security, eliminating its Section 4(f) responsibility. However, the USCG still has responsibility related to issuance of Section 9 Bridge permits. Wording has been changed to remove coordination with the USCG relative to Section 4(f) compliance.

The WIDOT noted that the constructive consultation of transportation officials, the officials with jurisdiction and resource agency staff is encouraged.

Consultation is not only encouraged, it is required. For this programmatic evaluation to be successful, good coordination and consultation are imperative.

Public Involvement

There were no substantive comments regarding this section and no changes have been made.

Approval Procedure

The AHC asked, relative to the last sentence of Item Number 6, if the Advisory Council on Historic Preservation agreed to review all programmatic evaluations.

The last sentence in Item Number 6 of the *Approval Procedures* in the draft programmatic should have been a separate paragraph. The purpose of the statement in the draft was to indicate that the ACHP and other agencies had been given the opportunity to review and comment on the draft. Furthermore, the FHWA consulted with the ACHP, the DOI and the NPS prior to finalizing the programmatic evaluation. To avoid confusion, this statement has been removed from the final programmatic evaluation.

Examples of Intended Use

One example of a net benefit to a historic property would be the reconstruction of a deteriorated or lost historic feature (such as a rock wall or auxiliary building) where mitigation related to Section 106 consultation includes the reconstruction of the feature in a slightly different location because of the design requirements of a needed improvement to the adjacent transportation facility. Consultation pursuant to Section 106 of the National Historic Preservation Act (16 U.S.C. 470f) would likely result in an "adverse effect" determination. However, the SHPO, the FHWA, and the Applicant all agree that the reconstruction would enhance those qualities for which the property was determined eligible, even with the removal and replacement of the historically associated feature. In this case, the existing FHWA Final Nationwide Section 4(f) Evaluation and Approval for Federally-Aided Highway Projects with Minor Involvements with Historic Sites would not be applicable, but if SHPO, as the official with jurisdiction, agrees that the impacts do not reach a level of substantial diminishment, the FHWA may determine that this programmatic evaluation would be applicable if the evaluation finds that the use of the property is prudent.

A second example involves a partial or even total relocation of a Section 4(f) property (such as a community park) to a location within the community that would have a greater value and use to that community. In this case, the existing nationwide minor use programmatic could not be used because the take of land would exceed the limitation included in it and would impair the use of the remaining Section 4(f) land. Again, this programmatic evaluation would be applicable if the officials with jurisdiction agree that the partial (or total) relocation would be a net benefit to the park and that the relocation does not result in the substantial diminishment of the activities, feature or attributes for which

the park is protected under Section 4(f). For instance, this programmatic evaluation can apply where the officials with jurisdiction identify a net benefit due to existing inadequate or unsafe access conditions to a park which presently minimizes the use of the park and the partial relocation can provide safe access; or in a situation where a park has minimal public use due to changes in adjacent land use and where the officials with jurisdiction agree that the total relocation will be of greater park or recreational value to the community.

A final example is the rehabilitation of an historic railroad station to maintain its major historic elements and to permit its continued use as a historic transportation facility. In some cases, such rehabilitation, even with considerable sensitivity to the historic character of the resource, cannot be accomplished without a Section 106 adverse effect determination, and neither the regulatory provision at 23 CFR 771.135(f) related to historic transportation facilities nor the historic site programmatic could be used. The adverse effect may be caused, for example, by modifications to provide access for the disabled or by interior reconfiguration to provide retail space to keep the station economically viable as a transportation facility. The SHPO, as the official with jurisdiction, may concur with the FHWA determination of "adverse effect," but may also recognize the net benefits of the restoration of the station and the assurance of its continued use may greatly outweigh the adverse effect, *i.e.*, not substantially diminish the qualities for which the property was determined eligible.

There will be situations when this programmatic evaluation would not apply. For example, the owner of an individually eligible historic building has abandoned the building so that it is likely to continue to deteriorate. The transportation agency proposes to demolish the building for a transportation improvement, and agrees to record the building in accordance with the standards set by the Historic American Building Survey (HABS) prior to its demolition. In the project design year (20 years hence) without the project, the building may be effectively demolished through neglect. In the design year of the project, the building will be demolished but a record of the building will be made. Although having the record of the demolished building is an improvement over not having such a record, it is not a net benefit to the resource, as the resource will no longer exist. Therefore, this programmatic evaluation would not apply because it

requires that there be a resource to which a net benefit would result. In this case, an individual Section 4(f) evaluation would be needed. On the other hand, if the same abandoned historic building (contributing component) lies within a large commercial historic district, where the officials with jurisdiction (*i.e.*, the SHPO) concur with an "adverse effect" determination pursuant to Section 106 consultation, but determine that the removal of the building with appropriate mitigation will have a net benefit to the historic district as the use of the resource (historic district) by the transportation project will improve access or parking which will likely improve the economic viability of the majority of the historic district, thus determining that the use will not rise to the level of "substantial diminishment" of the qualities of the resource. In such a situation, this programmatic evaluation might be applied.

The FHWA recognizes and appreciates the effort of all parties who provided comments for consideration in the development and finalization of this programmatic evaluation.

Authority: 49 U.S.C. 303; 23 U.S.C. 138; 49 CFR 1.48.

Issued on: April 13, 2005.

Mary E. Peters,

Federal Highway Administrator.

The text of the FHWA Programmatic Section 4(f) Evaluation and Approval for Transportation Projects That Have a Net Benefit to a Section 4(f) Property is as follows:

U.S. Department of Transportation
Federal Highway Administration
(FHWA)
FINAL

Programmatic Section 4(f) Evaluation and Approval for Transportation Projects That Have a Net Benefit to a Section 4(f) Property

This nationwide programmatic Section 4(f) evaluation (programmatic evaluation) has been prepared for certain federally assisted transportation improvement projects on existing or new alignments that will use property of a Section 4(f) park, recreation area, wildlife or waterfowl refuge, or historic property, which in the view of the Administration and official(s) with jurisdiction over the Section 4(f) property, the use of the Section 4(f) property will result in a net benefit to the Section 4(f) property. Definitions: "Administration" refers to the Federal Highway Division Administrator or Division Engineer (as appropriate).

"Applicant" refers to a State Highway Agency or State Department of

Transportation, local governmental agency acting through the State Highway Agency or State Department of Transportation.

A "net benefit" is achieved when the transportation use, the measures to minimize harm and the mitigation incorporated into the project results in an overall enhancement of the Section 4(f) property when compared to both the future do-nothing or avoidance alternatives and the present condition of the Section 4(f) property, considering the activities, features and attributes that qualify the property for Section 4(f) protection. A project does not achieve a "net benefit" if it will result in a substantial diminishment of the function or value that made the property eligible for Section 4(f) protection.

"Official(s) with jurisdiction" over Section 4(f) property (typically) include: for a park, the Federal, State or local park authorities or agencies that own and/or manage the park; for a refuge, the Federal, State or local wildlife or waterfowl refuge owners and managers; and for historic sites, the State Historic Preservation Officer (SHPO) or Tribal Historic Preservation Officer (THPO), whichever has jurisdiction under Section 106 of the National Historic Preservation Act (16 U.S.C. 470f).

Applicability

The Administration is responsible for review of each transportation project for which this programmatic evaluation is contemplated to determine that it meets the criteria and procedures of this programmatic evaluation. The information and determination will be included in the applicable National Environmental Policy Act (NEPA) documentation and administrative record. This programmatic evaluation will not change any existing procedures for NEPA compliance, public involvement, or any other applicable Federal environmental requirement.

This programmatic evaluation satisfies the requirements of Section 4(f) for projects meeting the applicability criteria listed below. An individual Section 4(f) evaluation will not need to be prepared for such projects:

1. The proposed transportation project uses a Section 4(f) park, recreation area, wildlife or waterfowl refuge, or historic site.
2. The proposed project includes all appropriate measures to minimize harm and subsequent mitigation necessary to preserve and enhance those features and values of the property that originally qualified the property for Section 4(f) protection.
3. For historic properties, the project does not require the major alteration of

the characteristics that qualify the property for the National Register of Historic Places (NRHP) such that the property would no longer retain sufficient integrity to be considered eligible for listing. For archeological properties, the project does not require the disturbance or removal of the archaeological resources that have been determined important for preservation in-place rather than for the information that can be obtained through data recovery. The determination of a major alteration or the importance to preserve in-place will be based on consultation consistent with 36 CFR part 800.

4. For historic properties, consistent with 36 CFR part 800, there must be agreement reached amongst the SHPO and/or THPO, as appropriate, the FHWA and the Applicant on measures to minimize harm when there is a use of Section 4(f) property. Such measures must be incorporated into the project.

5. The official(s) with jurisdiction over the Section 4(f) property agree in writing with the assessment of the impacts; the proposed measures to minimize harm; and the mitigation necessary to preserve, rehabilitate and enhance those features and values of the Section 4(f) property; and that such measures will result in a net benefit to the Section 4(f) property.

6. The Administration determines that the project facts match those set forth in the Applicability, Alternatives, Findings, Mitigation and Measures to Minimize Harm, Coordination, and Public Involvement sections of this programmatic evaluation.

This programmatic evaluation can be applied to any project regardless of class of action under NEPA.

Alternatives

To demonstrate that there are no feasible and prudent alternatives to the use of Section 4(f) property, the programmatic evaluation analysis must address alternatives that avoid the Section 4(f) property. The following alternatives avoid the use of the Section 4(f) property:

1. Do nothing.
2. Improve the transportation facility in a manner that addresses the project's purpose and need without a use of the Section 4(f) property.
3. Build the transportation facility at a location that does not require use of the Section 4(f) property.

This list is intended to be all-inclusive. The programmatic evaluation does not apply if a feasible and prudent alternative is identified that is not discussed in this document. The project record must clearly demonstrate that each of the above alternatives was fully

evaluated before the Administration can conclude that the programmatic evaluation can be applied to the project.

Findings

For this programmatic evaluation to be utilized on a project there must be a finding, given the present condition of the Section 4(f) property, that the do-nothing and avoidance alternatives described in the Alternatives section above are not feasible and prudent. The findings (1, 2, and 3. below) must be supported by the circumstances, studies, consultations, and other relevant information and included in the administrative record for the project. This supporting information and determination will be documented in the appropriate NEPA document and/or project record consistent with current Section 4(f) policy and guidance.

To support the finding, adverse factors associated with the no-build and avoidance alternatives, such as environmental impacts, safety and geometric problems, decreased transportation service, increased costs, and any other factors may be considered collectively. One or an accumulation of these kinds of factors must be of extraordinary magnitude when compared to the proposed use of the Section 4(f) property to determine that an alternative is not feasible and prudent. The net impact of the do-nothing or build alternatives must also consider the function and value of the Section 4(f) property before and after project implementation as well as the physical and/or functional relationship of the Section 4(f) property to the surrounding area or community.

1. Do-Nothing Alternative.

The Do-Nothing Alternative is not feasible and prudent because it would neither address nor correct the transportation need cited as the NEPA purpose and need, which necessitated the proposed project.

2. Improve the transportation facility in a manner that addresses purpose and need without use of the Section 4(f) property.

It is not feasible and prudent to avoid Section 4(f) property by using engineering design or transportation system management techniques, such as minor location shifts, changes in engineering design standards, use of retaining walls and/or other structures and traffic diversions or other traffic management measures if implementing such measures would result in any of the following:

- (a) Substantial adverse community impacts to adjacent homes, businesses or other improved properties; or

(b) Substantially increased transportation facility or structure cost; or

(c) Unique engineering, traffic, maintenance or safety problems; or

(d) Substantial adverse social, economic or environmental impacts; or

(e) A substantial missed opportunity to benefit a Section 4(f) property; or

(f) Identified transportation needs not being met; and

(g) Impacts, costs or problems would be truly unusual, unique or of extraordinary magnitude when compared with the proposed use of Section 4(f) property after taking into account measures to minimize harm and mitigate for adverse uses, and enhance the functions and value of the Section 4(f) property.

Flexibility in the use of applicable design standards is encouraged during the analysis of these feasible and prudent alternatives.

3. Build a new facility at a new location without a use of the Section 4(f) property.

It is not feasible and prudent to avoid Section 4(f) property by constructing at a new location if:

(a) The new location would not address or correct the problems cited as the NEPA purpose and need, which necessitated the proposed project; or

(b) The new location would result in substantial adverse social, economic or environmental impacts (including such impacts as extensive severing of productive farmlands, displacement of a substantial number of families or businesses, serious disruption of community cohesion, jeopardize the continued existence of any endangered or threatened species or resulting in the destruction or adverse modification of their designated critical habitat, substantial damage to wetlands or other sensitive natural areas, or greater impacts to other Section 4(f) properties); or

(c) The new location would substantially increase costs or cause substantial engineering difficulties (such as an inability to achieve minimum design standards or to meet the requirements of various permitting agencies such as those involved with navigation, pollution, or the environment); and

(d) Such problems, impacts, costs, or difficulties would be truly unusual or unique or of extraordinary magnitude when compared with the proposed use of the Section 4(f) property after taking into account proposed measures to minimize harm, mitigation for adverse use, and the enhancement of the Section 4(f) property's functions and value.

Flexibility in the use of applicable design standards is encouraged during the analysis of feasible and prudent alternatives.

Mitigation and Measures To Minimize Harm

This programmatic evaluation and approval may be used only for projects where the Administration, in accordance with this evaluation, ensures that the proposed action includes all possible planning to minimize harm, includes appropriate mitigation measures, and that the official(s) with jurisdiction agree in writing.

Coordination

In early stages of project development, each project will require coordination with the Federal, State, and/or local agency official(s) with jurisdiction over the Section 4(f) property. For non-Federal Section 4(f) properties, *i.e.*, State or local properties, the official(s) with jurisdiction will be asked to identify any Federal encumbrances. When encumbrances exist, coordination will be required with the Federal agency responsible for such encumbrances.

Copies of the final written report required under this programmatic evaluation shall be offered to the official(s) with jurisdiction over the Section 4(f) property, to other interested parties as part of the normal NEPA project documentation distribution practices and policies or upon request.

Public Involvement

The project shall include public involvement activities that are consistent with the specific requirements of 23 CFR 771.111, Early coordination, public involvement and project development. For a project where one or more public meetings or hearings are held, information on the proposed use of the Section 4(f) property shall be communicated at the public meeting(s) or hearing(s).

Approval Procedure

This programmatic evaluation approval applies only after the Administration has:

1. Determined that the project meets the applicability criteria set forth in *Applicability* section;
2. Determined that all of the alternatives set forth in the *Findings* section have been fully evaluated;
3. Determined that the findings in the programmatic evaluation (which conclude that the alternative recommended is the only feasible and prudent alternative) result in a clear net benefit to the Section 4(f) property;

4. Determined that the project complies with the *Mitigation and Measures to Minimize Harm* section of this document;

5. Determined that the coordination and public involvement efforts required by this programmatic evaluation have been successfully completed and necessary written agreements have been obtained; and

6. Documented the information that clearly identifies the basis for the above determinations and assurances.

BILLING CODE 4910-22-P

DEPARTMENT OF TRANSPORTATION

Federal Motor Carrier Safety Administration

[Docket No. FMCSA-2005-20930 (PDA-31(F))]

Application by American Trucking Associations, Inc. for a Preemption Determination as to District of Columbia Requirements for Highway Routing of Certain Hazardous Materials

AGENCY: Federal Motor Carrier Safety Administration (FMCSA), United States Department of Transportation (DOT).

ACTION: Public notice and invitation to comment.

SUMMARY: FMCSA invites interested parties to submit comments on an application by The American Trucking Associations, Inc. for an administrative determination as to whether Federal hazardous materials transportation law preempts highway routing requirements of the District of Columbia in restricting transportation of certain hazardous materials.

DATES: Comments received on or before June 6, 2005, and rebuttal comments received on or before July 19, 2005, will be considered before an administrative ruling is issued. Rebuttal comments may discuss only those issues raised by comments received during the initial comment period and may not discuss new issues.

ADDRESSES: You may submit comments, identified by DOT DMS Docket Number FMCSA-2005-20930, by any of the following methods:

- Federal eRulemaking Portal: <http://www.regulations.gov>. Follow the instructions for submitting comments.
- Agency Web site: <http://dms.dot.gov>. Follow the instructions for submitting comments on the DOT electronic docket site.
- Fax: 1-202-493-2251.

• *Mail:* Docket Management Facility; U.S. Department of Transportation, 400 Seventh Street, SW., Nassif Building, Room PL-401, Washington, DC 20590-0001. Please submit three copies of written comments.

• *Hand Delivery:* Submit three copies of written comments to Room PL-401 on the plaza level of the Nassif Building, 400 Seventh Street, SW., Washington, DC, between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays.

Instructions: Comments must refer to Docket Number FMCSA-2005-20930. All comments received will be posted without change to <http://dms.dot.gov>, including any personal information provided. For detailed instructions on submitting comments, see the "Public Participation" heading of the **SUPPLEMENTARY INFORMATION** section of this document. For a summary of DOT's Privacy Act Statement or information on how to obtain a complete copy of DOT's Privacy Act Statement please see the "Privacy Act" heading of the **SUPPLEMENTARY INFORMATION** section.

Docket: For access to the docket to read the application or comments received, go to <http://dms.dot.gov> at any time or to Room PL-401 on the plaza level of the Nassif Building, 400 Seventh Street, SW., Washington, DC, between 9 am and 5 pm, Monday through Friday, except Federal holidays.

FOR FURTHER INFORMATION CONTACT: Mr. William Quade, Chief, Hazardous Materials Division (MC-ECH), (202) 366-2172; Federal Motor Carrier Safety Administration, U.S. Department of Transportation, 400 Seventh Street, SW., Washington, DC 20590-0001. Office hours are from 7:45 a.m. to 4:15 p.m., *e.t.*, Monday through Friday, except Federal holidays.

SUPPLEMENTARY INFORMATION:

Public Participation

A copy of each comment must also be sent to Richard Moskowitz, Assistant General Counsel, American Trucking Associations, 2200 Mill Road, Alexandria, VA 22314. Certification of sending a copy to Mr. Moskowitz must accompany your comments. (The following format is suggested: "I certify copies of this comment have been sent to Mr. Moskowitz at the address specified in the **Federal Register**.")

The DMS is available 24 hours each day, 365 days each year. You can get electronic submission and retrieval help and guidelines under the "help" section of the DMS Web site. If you want us to notify you of receiving your comments, please include a self-addressed, stamped envelope or postcard or print the acknowledgement page displaying after receipt of on-line comments.

Illinois Department of Transportation

BLRS PROCEDURE MEMORANDUM

NUMBER: 2005-05
SUBJECT: PREVAILING WAGE ACT
ISSUED DATE: August 31, 2005
EFFECTIVE DATE: August 10, 2005

This memorandum supersedes Chapter 12 Section 2.01(e) of the Bureau of Local Roads and Streets Manual dated July 2005.

On August 10, 2005, Public Act 94-0515 amended the Prevailing Wage Act by requiring the contractor and each subcontractor participating on public works projects to submit monthly a certified payroll to the public body in charge of the project. Certified payrolls have long been required on Federal-aid projects; however, certified payrolls are now required on all state and locally funded projects as well.

For projects on the state lettings or any federal-aid project, BDE Special Provision 80155 "Payrolls and Payroll Records" should be inserted into all contracts. Contractors and subcontractors should use the Bureau of Small Business Enterprises form SBE 48 or approved facsimile for submitting the certified payroll.

For local let projects using only state and local funds, LR Special Provision 107-3 "Wages of Employees on Public Works" should be inserted into all contracts. Contractors and subcontractors should submit the certification in a format approved by the local authority. The local authority is required to keep the certification records submitted for a period of not less than three years. Furthermore, these records, except an employee's address, telephone number, and social security number, shall be made available in accordance with the Freedom of Information Act.

A handwritten signature in cursive script that reads "Charles J. Dingersoll".

AN ACT concerning employment.

**Be it enacted by the People of the State of Illinois,
represented in the General Assembly:**

Section 5. The Prevailing Wage Act is amended by changing Section 5 as follows:

(820 ILCS 130/5) (from Ch. 48, par. 39s-5)

Sec. 5. Certified payroll.

(a) While participating on public works, the ~~The contractor and each subcontractor or the officer of the public body in charge of the project shall:~~

(1) make and keep, for a period of not less than 3 years, true and accurate records of all laborers, mechanics, and other workers employed by them on the project; the records shall include each worker's ~~the name, address, telephone number when available, social security number, classification or classifications, and occupation of all laborers, workers and mechanics employed by them, in connection with said public work. The records shall also show the actual hourly wages paid in each pay period, to each employee and the number of hours worked each day, and in each work week by each employee. While participating on public works, each contractor's payroll records shall include the starting and ending times of work each day; and for each employee~~

(2) submit monthly, in person, by mail, or electronically a certified payroll to the public body in charge of the project. The certified payroll shall consist of a complete copy of the records identified in paragraph (1) of this subsection (a). The certified payroll shall be accompanied by a statement signed by the contractor or subcontractor which avers that: (i) such records are true and accurate; (ii) the hourly rate paid to each worker is

not less than the general prevailing rate of hourly wages required by this Act; and (iii) the contractor or subcontractor is aware that filing a certified payroll that he or she knows to be false is a Class B misdemeanor. A general contractor is not prohibited from relying on the certification of a lower tier subcontractor, provided the general contractor does not knowingly rely upon a subcontractor's false certification. Any contractor or subcontractor subject to this Act who fails to submit a certified payroll or knowingly files a false certified payroll is in violation of this Act and guilty of a Class B misdemeanor. The public body in charge of the project shall keep the records submitted in accordance with this paragraph (2) of subsection (a) for a period of not less than 3 years. The records submitted in accordance with this paragraph (2) of subsection (a) shall be considered public records, except an employee's address, telephone number, and social security number, and made available in accordance with the Freedom of Information Act. The public body shall accept any reasonable submissions by the contractor that meet the requirements of this Section.

(b) Upon 2 business days' notice, the contractor and each subcontractor shall make available for inspection the records identified in paragraph (1) of subsection (a) of this Section. ~~The record shall be open at all reasonable hours to the inspection of the public body in charge of the project awarding the contract,~~ its officers and agents, and to the Director of Labor and his deputies and agents. Upon 2 business days' notice, the contractor and each subcontractor shall make such records available at all reasonable hours at a location within this State.

~~Any contractor or subcontractor that maintains its principal place of business outside of this State shall make the required records or accurate copies of those records available within this State at all reasonable hours for inspection.~~

Department of Transportation
Bureau of Local Roads and Streets

SPECIAL PROVISION
FOR
WAGES OF EMPLOYEES ON PUBLIC WORKS

Effective: August 10, 2005

Replace Check Sheet LRS 12 of the Recurring Special Provisions with the following:

“ All wages paid by the Contractor and each subcontractor shall be in compliance with The Prevailing Wage Act (820 ILCS 130), as amended, except where a prevailing wage violates a federal law, order, or ruling, the rate conforming to the federal law, order, or ruling shall govern. The Contractor shall be responsible to notify each subcontractor of the wage rates set forth in this contract and any revisions thereto. If the Department of Labor revises the wage rates, the revised rate as provided by the public body shall apply to this contract and the Contractor will not be allowed additional compensation on account of said revisions.

The Contractor and each subcontractor shall make and keep, for a period of not less than 3 years, records of all laborers, mechanics, and other workers employed by them on the project; the records shall include each worker's name, address, telephone number when available, social security number, classification or classifications, the hourly wages paid in each period, the number of hours worked each day, and the starting and ending times of work each day.

The Contractor and each subcontractor shall submit monthly, in person, by mail, or electronically a certified payroll to the public body in charge of the project. The certified payroll shall consist of a complete copy of the records. The certified payroll shall be accompanied by a statement signed by the contractor or subcontractor which avers that:

- (i) such records are true and accurate;
- (ii) the hourly rate paid to each worker is not less than the general prevailing rate of hourly wages required; and
- (iii) the contractor or subcontractor is aware that filing a certified payroll that he or she knows to be false is a Class B misdemeanor.

Upon 2 business days' notice, the contractor and each subcontractor shall make available for inspection the records to the public body in charge of the project, its officers and agents, and to the Director of Labor and his deputies and agents at all reasonable hours at a location within this State. The Contractor and each subcontractor shall permit his/her employees to be interviewed on the job, during working hours, by compliance investigators of the Department or the Department of Labor.”

BLRS PROCEDURE MEMORANDUM

NUMBER: 2005-06
SUBJECT: COMPETITIVE BIDDING THRESHOLD
ISSUED DATE: August 31, 2005
EFFECTIVE DATE: August 2, 2005

This memorandum supersedes Chapter 12 Section 1.02(a) and 1.02(c) of the Bureau of Local Roads and Streets Manual dated July 2005.

On August 2, 2005, Public Act 94-0435 amended the Township Code, the Illinois Municipal Code, and the Illinois Highway Code by increasing the competitive bidding threshold for townships and municipalities from \$10,000 to \$20,000. The counties' bidding threshold was already \$20,000. Therefore, all local agencies must use a competitive bid process if the estimated cost exceeds \$20,000.

AN ACT concerning libraries.

**Be it enacted by the People of the State of Illinois,
represented in the General Assembly:**

Section 3. The Township Code is amended by changing Section 85-30 as follows:

(60 ILCS 1/85-30)

Sec. 85-30. Purchases; bids. Any purchase by a township ~~having fewer than 10,000 inhabitants and located in a county with a population under 3,000,000~~ for services, materials, equipment, or supplies in excess of \$20,000 ~~\$10,000~~ (other than professional services) ~~and any purchase by a township in a county with a population of 3,000,000 or more, or by a township having 10,000 or more inhabitants and located in a county with a population of less than 3,000,000, for services, materials, equipment, or supplies in excess of \$10,000 (other than professional services)~~ shall be contracted for in one of the following ways:

(1) By a contract let to the lowest responsible bidder after advertising for bids at least once (i) in a newspaper published within the township, or (ii) if no newspaper is published within the township, then in one published within the county, or (iii) if no newspaper is published within the county, then in a newspaper having general circulation within the township.

(2) By a contract let without advertising for bids in the case of an emergency if authorized by the township board.

This Section does not apply to contracts by a township with the federal government.

(Source: P.A. 92-627, eff. 7-11-02.)

Section 4. The Illinois Municipal Code is amended by

changing Sections 4-5-11 and 8-9-1 as follows:

(65 ILCS 5/4-5-11) (from Ch. 24, par. 4-5-11)

Sec. 4-5-11. Except as otherwise provided, all contracts, of whatever character, pertaining to public improvement, or to the maintenance of the public property of a municipality involving an outlay of \$10,000 ~~\$1,500~~ or more, shall be based upon specifications to be approved by the council. Any work or other public improvement which is not to be paid for in whole or in part by special assessment or special taxation, when the expense thereof will exceed \$20,000 ~~\$10,000~~, shall be constructed as follows:

(1) By a contract let to the lowest responsible bidder after advertising for bids, in the manner prescribed by ordinance, except that any such contract may be entered into by the proper officers without advertising for bids, if authorized by a vote of 4 of the 5 council members elected; or

(2) In the following manner, if authorized by a vote of 4 of the 5 council members elected: the commissioner of public works or other proper officers to be designated by ordinance, shall superintend and cause to be carried out the construction of the work or other public improvement and shall employ exclusively for the performance of all manual labor thereon, laborers and artisans whom the city or village shall pay by the day or hour, but all material of the value of \$20,000 ~~\$10,000~~ and upward used in the construction of the work or other public improvement, shall be purchased by contract let to the lowest responsible bidder in the manner to be prescribed by ordinance.

Nothing contained in this section shall apply to any contract by a municipality with the United States of America or any agency thereof.

(Source: P.A. 86-576.)

(65 ILCS 5/8-9-1) (from Ch. 24, par. 8-9-1)

Sec. 8-9-1. In municipalities of less than 500,000 except as otherwise provided in Articles 4 and 5 any work or other

HARD COPIES UNCONTROLLED

public improvement which is not to be paid for in whole or in part by special assessment or special taxation, when the expense thereof will exceed \$20,000 ~~\$10,000~~, shall be constructed either (1) by a contract let to the lowest responsible bidder after advertising for bids, in the manner prescribed by ordinance, except that any such contract may be entered into by the proper officers without advertising for bids, if authorized by a vote of two-thirds of all the aldermen or trustees then holding office; or (2) in the following manner, if authorized by a vote of two-thirds of all the aldermen or trustees then holding office, to-wit: the commissioner of public works or other proper officers to be designated by ordinance, shall superintend and cause to be carried out the construction of the work or other public improvement and shall employ exclusively for the performance of all manual labor thereon, laborers and artisans whom the municipality shall pay by the day or hour; and all material of the value of \$20,000 ~~\$10,000~~ and upward used in the construction of the work or other public improvement, shall be purchased by contract let to the lowest responsible bidder in the manner to be prescribed by ordinance. However, nothing contained in this section shall apply to any contract by a city, village or incorporated town with the federal government or any agency thereof.

In every city which has adopted Division 1 of Article 10, every such laborer or artisan shall be certified by the civil service commission to the commissioner of public works or other proper officers, in accordance with the requirement of that division.

In municipalities of 500,000 or more population the letting of contracts for work or other public improvements of the character described in this section shall be governed by the provisions of Division 10 of this Article 8.

(Source: P.A. 86-576.)

Section 5. The Illinois Local Library Act is amended by

HARD COPIES UNCONTROLLED

changing Section 5-5 as follows:

(75 ILCS 5/5-5) (from Ch. 81, par. 5-5)

Sec. 5-5. When the directors determine to commence the construction of the building or the remodeling, repairing or improving of an existing library building or the erection of an addition thereto, the purchase of the necessary equipment for such library, or the acquisition of library materials such as books, periodicals, recordings and electronic data storage and retrieval facilities in connection with either the purchase or construction of a new library building or the expansion of an existing library building, they may then revise the plan therefor or adopt a new plan and provide estimates of the costs thereof, and shall, when the cost is in excess of \$20,000 ~~\$10,000~~, advertise for bids for the construction of the building, or the remodeling, repairing or improving of an existing library building or the erection of an addition thereto, or the purchase of the necessary equipment for such library, or the acquisition of library materials such as books, periodicals, recordings and electronic data storage and retrieval facilities in connection with either the purchase or construction of a new library building or the expansion of an existing library building, and shall let the contract or contracts for the same, when the cost is in excess of \$20,000 ~~\$10,000~~, to the lowest responsible bidder or bidders and may require from such bidders, such security for the performance of the bids as the board shall determine. The directors may let the contract or contracts to one or more bidders, as they shall determine.

(Source: P.A. 86-405.)

Section 10. The Public Library District Act of 1991 is amended by changing Section 40-45 as follows:

(75 ILCS 16/40-45)

Sec. 40-45. Bids for construction, improvements, or

HARD COPIES UNCONTROLLED

equipment purchases.

(a) When the trustees determine to commence constructing the building, purchasing a site or a building, remodeling, repairing, or improving an existing library building, erecting an addition to an existing library building, or purchasing the necessary equipment for the library, they may then revise the plan or adopt a new plan and provide estimates of the costs of the revised or new plan.

(b) The board shall, when the cost is in excess of \$20,000 ~~\$10,000~~, advertise for bids for constructing the building, remodeling, repairing, or improving of an existing library building, erecting an addition to an existing library building, or purchasing the necessary equipment for the library and shall let the contract or contracts for the project, when the cost is in excess of \$20,000 ~~\$10,000~~, to the lowest responsible bidder or bidders. The board shall require from the bidders security for the performance of the bids determined by the board pursuant to law. The trustees may let the contract or contracts to one or more bidders as they determine.

(Source: P.A. 87-1277.)

Section 15. The Illinois Highway Code is amended by changing Section 6-201.7 as follows:

(605 ILCS 5/6-201.7) (from Ch. 121, par. 6-201.7)

Sec. 6-201.7. Construct, maintain and repair and be responsible for the construction, maintenance and repair of roads within the district, let contracts, employ labor and purchase material and machinery therefor, subject to the limitations provided in this Code. Contracts, labor, machinery, disposal, and incidental expenses related to special services under Section 6-201.21 of this Code constitute maintenance, for purposes of this Section.

Except for professional services, when the cost of construction, materials, supplies, new machinery or equipment exceeds \$20,000 ~~\$10,000~~, the contract for such construction,

HARD COPIES UNCONTROLLED

materials, supplies, machinery or equipment shall be let to the lowest responsible bidder after advertising for bids at least once, and at least 10 days prior to the time set for the opening of such bids, in a newspaper published within the township or road district, or, if no newspaper is published within the township or road district then in one published within the county, or, if no newspaper is published within the county then in a newspaper having general circulation within the township or road district, but, in case of an emergency, such contract may be let without advertising for bids. For purposes of this Section "new machinery or equipment" shall be defined as that which has been previously untitled or that which shows fewer than 200 hours on its operating clock and that is accompanied by a new equipment manufacturer's warranty. (Source: P.A. 92-268, eff. 1-1-02; 93-109, eff. 7-8-03; 93-164, eff. 7-10-03; 93-610, eff. 11-18-03; revised 12-4-03.)

Section 99. Effective date. This Act takes effect upon becoming law.

HARD COPIES UNCONTROLLED

Illinois Department of Transportation

2300 South Dirksen Parkway / Springfield, Illinois / 62764

BLRS PROCEDURE MEMORANDUM

NUMBER: 2005-07

SUBJECT: NBIS RULES CHANGES - QUALIFICATIONS FOR
BRIDGE INSPECTION PERSONNEL

ISSUED DATE: October 31, 2005

EFFECTIVE DATE: January 13, 2005

This memorandum supersedes Chapter 6 Section 6-3.02 of the Bureau of Local Roads and Streets Manual dated April 2005. This information will be included in future updates of the BLRS Manual.

On January 13, 2005, new rules became effective for the National Bridge Inspection Standards (NBIS), as provided in Title 23, Code of Federal Regulations, Part 650, Subpart C, dated December 14, 2004 and are located at the Federal Highway Administration (FHWA) website at <http://www.fhwa.dot.gov/bridge/nbis.htm>. The Bureau of Bridges & Structures (BBS) has worked with the FHWA to resolve issues regarding interpretation of the new rules, particularly those involving the qualifications for bridge inspection personnel. In addition, the FHWA has provided Questions & Answers (Q&A) regarding the new NBIS rules on the above website; review of the Q&A is recommended. The Department has developed the information, guidelines and procedures contained in this memorandum, and incorporated into Section 6-3.02 of the Bureau of Local Roads and Streets (BLRS) Manual, for implementation of the new NBIS rules. Please note that for the purposes of the NBIS and this procedure memorandum, licensing as a Structural Engineer in Illinois is accepted in Illinois in lieu of licensing as a Professional Engineer for satisfying NBIS qualification requirements.

PROGRAM MANAGER

Under the new NBIS rules, all state departments of transportation must designate an individual to function as the state "Program Manager" to provide overall leadership for the bridge inspection program. For the Illinois Department of Transportation (IDOT), the FHWA has concurred that the Engineer of Structural Services of the BBS is qualified to function as the state Program Manager (PM). The state PM can delegate program manager responsibilities to qualified individuals as needed to ensure compliance with the NBIS rules. In accordance with this authority to delegate program manager responsibilities, the IDOT BBS Unit Chief of Local Bridges will function under the state PM as the Local Bridge PM to oversee bridge inspections and the reporting of inspection and inventory data for local agency structures.

HARD COPIES UNCONTROLLED

All local agencies (LAs) having responsibility for a structure in the NBIS must designate a PM to ensure compliance with the NBIS and to provide guidance and management of their bridge inventory. If a LA does not have an employee who is qualified, they may hire a consultant to serve as their PM. If IDOT District personnel perform the NBIS inspections for a LA, the District or Region Bridge Maintenance Engineer (BME) will serve as the LA's PM. The BME should ensure the qualifications and provide oversight of the inspection for such structures in the District/Region.

PROGRAM MANAGER QUALIFICATIONS

Per NBIS Section 650.309 "Qualifications of personnel" a Program Manager must, at a minimum:

1. Be a registered professional engineer, or have ten years bridge inspection experience; and
2. Successfully complete a FHWA approved comprehensive bridge inspection training course.

Persons assuming the position of PM for an agency subsequent to the effective date of the present NBIS rules, January 13, 2005, must meet the above requirements.

Prior to January 13, 2005, the NBIS rules stated that the "individual in charge" of an agency's bridge safety inspection program was qualified to do so based solely on their licensing as a Professional Engineer. The intent of the new rules is to provide a uniform interpretation of the NBIS and to ensure that a PM has sufficient training and experience to oversee the bridge safety inspections conducted to satisfy NBIS requirements. Persons who were functioning as the "individual in charge" for an agency may continue to perform in the capacity of a PM for that agency when the following conditions are met:

1. Prior to January 13, 2005, the person was a licensed Professional Engineer functioning as an "individual in charge" with responsibility for the collection of bridge inventory data, the performance of bridge inspections and the reporting of inspection information to satisfy NBIS requirements for a designated agency.
2. The person certifies that they are knowledgeable of the requirements of the NBIS and the responsibilities of a PM for ensuring compliance.
3. The person certifies that they are familiar with the Department's "Illinois Highway Information System – Structure Information and Procedure (SIP) Manual", which provides the policies and procedures established by the Department for complying with the regulatory requirements of the NBIS.

Although not mandatory at this time, all licensed Professional Engineers who were functioning as an agency's PM prior to January 13, 2005, but have not had formal training, such as that provided by the 10-day National Highway Institute (NHI) course titled Safety Inspection of In-Service Bridges, are strongly encouraged to attend the 3-day NHI course titled Bridge Inspection Refresher Training, which is a condensed version of the 10-day course.

To comply with the present NBIS rules, the Department must establish a database to track approval of PM qualifications. To assist the Department in

documenting the qualifications and experience of local agency PMs, we have attached form, *PROGRAM MANAGER QUALIFICATIONS*; this form shall be completed and returned to the BBS, Attn: Local Bridge Engineer. Please provide to the BBS by December 31, 2005 a completed form for any person proposed to serve as a local agency PM.

TEAM LEADER

One of the primary concerns with the new rules is the effect they have on the ability of local agencies to provide qualified personnel to function as a bridge inspection Team Leader (TL). The FHWA website provides information at <http://www.fhwa.dot.gov/bridge/nbis/index.htm> in the answer to Q&A question "Q309-3" that permits local agencies to field bridge inspection TLs essentially as in the past. The guidelines provided by this procedure memorandum are consistent with the FHWA's interpretation of the new NBIS rules for evaluating TL qualifications.

TEAM LEADER QUALIFICATIONS

The qualifications of a potential TL will be first reviewed by the local agency PM who has oversight responsibility for the local agency structures. All candidates should be familiar with the requirements of the NBIS and IDOT's Structure Information and Procedure (SIP) Manual. If the local agency PM deems an individual's qualifications acceptable for functioning as a Team Leader, the local agency PM must forward the documentation of the individual's licensing, training, and experience to the Local Bridge PM, who will review for concurrence. For consultants serving as a local agency TL, the submittal should be made directly to the Local Bridge PM. To assist the Department in documenting the qualifications and experience of local agency TLs, we have attached form, *TEAM LEADER QUALIFICATIONS*; this form shall be completed and returned to the BBS, Attn: Local Bridge Engineer.

Please provide a completed form to the BBS by December 31, 2005 for all personnel that the local agency PM has determined to be qualified to act as a TL for future inspections.

The new NBIS rules provide the following requirements for evaluating engineers and for technical personnel qualifications to function as a TL:

Program Manager: An individual who is approved by the state PM to function as a local agency PM is qualified to function as a Team Leader.

Professional Engineer: An individual who is licensed in Illinois as a Professional Engineer, and has successfully completed a FHWA approved comprehensive bridge inspection training course, is qualified to function as a Team Leader. Unless otherwise approved by the state PM, a comprehensive bridge inspection training course is considered to be the 10 days of training that has been routinely provided by IDOT through a course offered by the NHI. Based on evidence of professional licensing and successful completion of the 10-day training, a Professional Engineer can be accepted by the state PM to function as a TL.

Engineering Personnel: For the purpose of this procedure memorandum, Engineering Personnel are considered to be graduates of an engineering program, approved by the Accreditation Board of Engineering and

Technology, who have passed the “Fundamentals of Engineering” exam (Engineer In Training exam), but are not yet licensed as Professional Engineers. To be considered for assignment as a TL, Engineering Personnel must have successfully completed a FHWA approved bridge inspection training course. Based on the guidelines provided by the FHWA, Engineering Personnel can function as Team Leaders after the PMs have evaluated their training and experience, and determined that they are qualified. The criteria used for the evaluation of experience is the same as that provided below for Technical Personnel, except the individual is required to have a total of two years of bridge related experience accumulated over the course of their career, rather than five years, and 12 months of bridge inspection experience, rather than 30 months.

Technical Personnel: For the purpose of this memorandum, Technical Personnel are considered to be individuals functioning within the local agency as 1) “Engineering Technicians” or, 2) “Civil Engineers” who are not licensed professional engineers and have not passed the “Fundamentals of Engineering” exam (Engineer In Training exam). Technical Personnel must have successfully completed a FHWA approved bridge inspection training course to function as a Team Leader. Based on the guidelines provided by the FHWA, Technical Personnel can function as Team Leaders after the Program Managers have evaluated their training and experience and determined that they are qualified based on one of the following:

Criteria #1: An individual having accumulated at least five years of bridge related experience over the course of their career through the performance of NBIS bridge safety inspections, bridge design, bridge maintenance, or bridge construction activities, with more than 30 months of the accumulated bridge related experience obtained through the performance of NBIS bridge safety inspections, is qualified to function as a Team Leader. Technical Personnel meeting these requirements have the “desired minimum bridge inspection experience level” preferred by the FHWA for acceptance as Team Leader, and in-depth evaluation of the individual’s experience by the Program Manager to verify qualifications is not required. However, the performance of the Team Leader is subject to review by the Program Manager to ensure the quality of inspections, and assignments must be consistent with the experience of the individual.

Criteria #2: An individual having accumulated at least five years of bridge related experience over the course of their career through the performance of NBIS bridge safety inspections, bridge design, bridge maintenance, or bridge construction activities, with more than 30 months of the accumulated bridge related experience obtained through the performance of various bridge inspections activities, is qualified to function as a Team Leader, if the Program Manager has evaluated and approved the potential Team Leader’s overall experience as acceptable. A portion of the individual’s bridge inspection experience must have been acquired through the performance of NBIS bridge safety inspections with the remainder of the individual’s bridge inspection experience derived from inspections associated with bridge design, bridge construction inspections, and bridge maintenance inspections. When evaluating an individual’s experience, the Program Manager must, at a minimum, consider the factors listed under “Evaluation of Experience Criteria” provided in this memorandum.

Criteria #3: An individual having less than five years of bridge related experience accumulated over the course of their career through the performance of NBIS bridge safety inspections, bridge design, bridge maintenance, or bridge construction activities, with a portion of their accumulated bridge related experience obtained through the performance of NBIS bridge safety inspections, is qualified to function as a Team Leader only if both the state Program Manager and the FHWA concur that the individual's experience is acceptable. This criterion should only apply to special situations involving highly qualified individuals performing NBIS bridge safety inspections that require specialized knowledge or training on unusual or complex bridges.

Note that in all cases, a portion of the experience accumulated by Technical Personnel must have been derived from the performance of NBIS safety inspections in order to be considered qualified to function as a Team Leader.

Evaluation of Experience Criteria: When evaluating the experience of Technical Personnel to function as a Team Leader, the FHWA has indicated that the Program Manager must consider the following:

1. The relevance of the individual's actual experience (i.e., has the experience that was not acquired directly through the performance of NBIS safety inspections enabled the individual to develop the skills needed to properly lead a bridge safety inspection team?).
2. The individual's exposure to the problems or deficiencies common in the types of bridges being inspected by the individual.
3. The complexity of the structures being inspected in comparison to the knowledge and skills that the individual has gained through their experience.
4. The individual's understanding of specific data collection needs and requirements.
5. The individual's demonstrated ability, through a formal certification program, to lead bridge safety inspections.
6. The level of oversight and supervision under which the individual will function as Team Leader.

Item number "5" of the "Evaluation of Experience Criteria", refers to a "formal certification program". In order to track the experience level of bridge inspectors, to document the evaluation and approval of experience to function as a Program Manager or as a Team Leader and to establish categories of certification for various bridge types, the BBS will develop a database to track and document bridge inspection experience, as well as the certification process to be followed by Program Managers. The BBS will notify applicants of the determination of their application, and coordinate the development of the database and certification process with the local agencies, through the Bureau of Local Roads and Streets.

NHI CLASS SCHEDULE

To assist the local agencies and consultants in achieving the required NBIS training, the following is the schedule for the NBIS inspection course dates currently scheduled in Illinois for next year:

3 Day - Bridge Inspection Refresher Training.

January 10 – 12, 2006 in Springfield

Fracture Critical.

February 21 – 24, 2006 in Springfield

Note: This class is not required, but is recommended, for individuals performing Fracture Critical Inspections.

10 Day - Safety Inspection of In-Service Bridges (2 classes).

February 27 – March 10, 2006 in Springfield

March 20 – 31, 2006 in Schaumburg

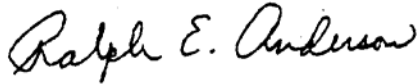

The contact at IDOT for enrollment is Brad Risinger; he may be contacted at:

Brad Risinger, Technical Training Manager
Training and Educational Development
phone: (217)782-3708; e-mail: risingerbd@dot.il.gov

We encourage interested parties to enroll as soon as possible, as space will be limited. Additional class locations in other states may be found at the following site: <http://www.nhi.fhwa.dot.gov/schedule.asp>.

If you have any questions regarding this memorandum, please contact Mr. Jayme Schiff at 217/785-8748 or schiffjf@dot.il.gov.

Very truly yours,

Ralph E. Anderson, P.E., S.E.

PROGRAM MANAGER QUALIFICATIONS

The National Bridge Inspection Standards (NBIS) defines Program Manager as "the individual in charge of the program, that has been assigned or delegated the duties and responsibilities for bridge inspection, reporting and inventory. The program manager provides overall leadership and is available to inspection team leaders to provide guidance". The person designated on this form is being presented for concurrence by the State Program Manager to function as the Program Manager for the designated organizational unit.

Name: _____ Date: _____

Present Position Classification/Title: _____

Supervising operations for compliance with NBIS requirements in (check one of the following):

____ IDOT (Region No. ____ District No. ____)

HARD COPIES UNCONTROLLED

Illinois Department of Transportation

2300 South Dirksen Parkway / Springfield, Illinois / 62764

BLRS PROCEDURE MEMORANDUM

NUMBER: 2005-08
SUBJECT: HOT MIX ASPHALT OVERLAY POLICY
ISSUED DATE: December 16, 2005
EFFECTIVE DATE: December 31, 2005

This memorandum replaces Section 37-8 of the Bureau of Local Roads and Streets Manual.

When the Bureau of Local Roads & Streets Manual was issued in April 2005, the manual did not provide local agencies with a hot mix asphalt (HMA) overlay design procedure. Therefore, local agencies still had to use the overlay design procedures contained in the Federal-Aid Procedures for Local Highway Improvements or the Administrative Policies Manual. These manual allowed the "Modified AASHTO" design procedure. This procedure assigns coefficients to the various pavement layers to determine the pavement thickness for a projected traffic volume. These coefficients have not been reviewed since the department switched to a policy overlay procedure in the mid 1980's.

The new local HMA overlay policy is separated into two types: Functional and Structural. Functional overlays are used to improve the ride, address safety, or prolong the life of the pavement. Local agencies are not required to perform an overlay design procedure for functional overlays; however, minimum lift thicknesses and required overlay thicknesses must be met. Structural overlays are used to improve the load carrying capacity of a pavement and a pavement design must be performed.

The modified AASHTO design procedure is still allowed for HMA overlays; however, the coefficients may not equate to modern materials and construction processes. Therefore, local agencies may want to use alternative design procedures; however, the District Bureau of Local Roads must approve the final design procedure and thickness.

Please contact Kevin Burke of the Bureau of Local Roads & Streets at (217) 785-5048 or BurkeK@dot.il.gov with any questions.

BLRS PROCEDURE MEMORANDUM

NUMBER: 2005-09
SUBJECT: DISADVANTAGED BUSINESS ENTERPRISE
PAYMENT REPORTING
ISSUED DATE: December 21, 2005
EFFECTIVE DATE: December 31, 2005

This memorandum revises Sections 5-6 and 24-2 of the Bureau of Local Roads and Streets Manual.

The Bureau of Local Roads and Streets has been asked to report actual DBE accomplishments to FHWA. The bureau will begin identifying the actual amount paid to each consultant/contractor associated with all federally funded engineering and locally let construction projects.

Completion of a new form will be required for all federally funded engineering and locally let construction projects which are initiated after January 1, 2006. The new form BLR 05613 for engineering and the new form BC 2115 for local lettings must be included. Form SBE 2115 will continue to be a required form for local lettings.

These forms will need to be completed by the prime consultant/contractor and submitted to the respective district office upon completion of the project. Form BLR 05613 should then be forwarded to the central bureau along with the final invoice. Central bureau staff will then enter the data into the Agreement Status Database. District personnel should process the BC 2115 and the SBE 2115 in the same manner as they have processed SBE 2115 in the past.

Attached are copies of BLR 05613, BC 2115, and SBE 2115. BC 2115 can be found under "Doing Business" on the IDOT webpage and will be available as a web form only. New references to these forms are included in the above-noted sections of the BLRS Manual.

BLRS PROCEDURE MEMORANDUM

NUMBER: 2005-10
SUBJECT: AMENDMENT TO FEDERAL-AID AGREEMENT
ISSUED DATE: December 21, 2005
EFFECTIVE DATE: December 31, 2005

This memorandum revises Section 5-3 of the Bureau of Local Roads and Streets Manual.

The bureau has created a new form BLR 05311 Local Agency Amendment for Federal Participation for cases where the original division of cost requires modification. All requirements of Chapter 5 "Joint Agreements", 5-3.01(c) and 5-3.01(d) should be addressed.

Utilization of this form will allow amending federal joint funding agreements to become uniform and accelerate the approval process. With the implementation of this new form we hope to eliminate past confusion with the amendment process.

Attached you will find a copy of the new BLR 05311. You will also find reference to this addition in the on-line BLRS Manual in the above-noted section of the manual.

A handwritten signature in cursive script that reads "Charles J. Dingersoll".

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2006-01
SUBJECT: APPRENTICESHIP AND TRAINING PROGRAM FOR
LOCAL LET MATERIAL PROPOSALS
ISSUED DATE: March 28, 2006
EFFECTIVE DATE: April 1, 2006

This memorandum replaces Chapter 12 of the Bureau of Local Roads and Streets Manual dated January 2006.

Procedure Memorandum 2005-03 issued on June 22, 2005 established responsible bidder requirements for local let contract proposals. The Office of Chief Counsel has determined that these requirements also apply to local let material proposals that require the contractor to perform work at the jobsite. Therefore, all material proposals that have not been advertised by April 1, 2006 will require all prospective bidders to complete the apprenticeship and training certification if work is to be performed by the contractor or subcontractors.

[BLR 12240](#) has been revised to add an apprenticeship and training certification statement. The awarding local agency will need to require this certification if work is being performed by the contractor on a material proposals and denote this requirement in the *Notice to Contractors Bulletin*. All prospective bidders must submit this completed statement with their bid. If a bidder's certification statement is not completed their bid should be discarded. This statement does not apply to federal aid projects.

As a general guideline, local agencies should require apprenticeship and training certification if prevailing wage rates are required. The certification is not required if material is being delivered to stockpile or the local agency is transporting the material to the jobsite. If you are unsure if the certification is required, please contact the Office of Chief Counsel at (217) 782-0692.

Handwritten signature of Charles J. Dingersoll in black ink.

Engineer of Local Roads and Streets

Handwritten signature of the Chief Counsel in black ink.

HARD COPIES UNCONTROLLED

Notice of Material Letting

- 1. Sealed proposals will be received in the office of the _____ until _____ o'clock _____ M., _____ for furnishing materials required in the construction/maintenance of Section _____ County _____ Municipality _____ Road District _____ and at that time publicly opened and read.
2. Proposals shall be submitted on forms furnished by the Local Agency which may be obtained at the office of _____ and shall be enclosed in an envelope endorsed "Material Proposal, Section _____".
3. The right is reserved to waive technicalities and to reject any or all proposals.
4. Proposal Guaranty. A proposal guaranty in the proper amount, as specified in BLRS Special Provision for Bidding Requirements and Conditions for Material Proposals, will be required. Bid bonds [] will [] will not be allowed as proposal guaranties.
5. Contract Bond. The successful bidder at the time of execution of the contract [] will [] will not be required to deposit a contract bond for the full amount of the award. When a contract bond is not required, the proposal guaranty check will be held in lieu thereof. Failure on the part of the contractor to deliver the material within the time specified or to do the work specified herein will be considered just cause to forfeit his surety as provided in Article 108.10 of the Standard Specifications.

By Order of _____ (Awarding Authority)

_____ Date _____ (County Engineer/Superintendent of Highways/Municipal Clerk)

Material Proposal

To _____ (Awarding Authority)

If this bid is accepted within 45 days from date of opening, the undersigned agrees to furnish any or all of the materials, at the quoted unit prices, subject to the following:

- 1. It is understood and agreed that the "Standard Specifications for Road and Bridge Construction" adopted _____ and the "Supplemental Specifications and Recurring Special Provisions", adopted, _____ prepared by the Department of Transportation, shall govern insofar as they may be applied and insofar as they do not conflict with the special provisions and supplemental specifications attached hereto.
2. It is understood that quantities listed are approximate only and that they may be increased or decreased as may be needed to properly complete the improvement within its present limits or extensions thereto, at the unit price stated and that bids will be compared on the basis of the total price bid for each group.
3. Delivery in total or partial shipments as ordered shall be made within the time specified in the special provisions or by the acceptance at the point and in the manner specified in the "Schedule of Prices". If delivery on the job site is specified, it shall mean any place or places on the road designated by the awarding authority or its authorized representative.
4. The contractor and/or local agency performing the actual material placement operations shall be responsible for providing work zone traffic control, unless otherwise specified in this proposal. Such devices shall meet the requirements of and be installed in accordance with applicable provisions of the "Illinois Manual on Uniform Traffic Control Devices" and any referenced Illinois Highway Standards.
5. Each pay item should have a unit price and a total price. If no total price is shown or if there is a discrepancy between the product of the unit price multiplied by the quantity, the unit price shall govern. If a unit price is omitted, the total price will be divided by the quantity in order to establish a unit price.
6. A bid will be declared unacceptable if neither a unit price nor a total price is shown.

7. **Certified Apprenticeship and Training Program.** All contractors will will not be required complete the following certification:

In accordance with the provisions of Section 30-22 (6) of the Illinois Procurement Code, the bidder certifies that it is a participant, either as an individual or as part of a group program, in the approved apprenticeship and training programs applicable to each type of work or craft that the bidder will perform with its own forces. The bidder further certifies for work that will be performed by subcontract that each of its subcontractors submitted for approval either (a) is, at the time of such bid, participating in an approved, applicable apprenticeship and training program; or (b) will, prior to commencement of performance of work pursuant to this contract, begin participation in an approved apprenticeship and training program applicable to the work of the subcontract. The Department, at any time before or after award, may require the production of a copy of each applicable Certificate of Registration issued by the United States Department of Labor evidencing such participation by the contractor and any or all of its subcontractors. Applicable apprenticeship and training programs are those that have been approved and registered with the United States Department of Labor. The bidder shall list in the space below, the official name of the program sponsor holding the Certificate of Registration for all of the types of work or crafts in which the bidder is a participant and that will be performed with the bidder's forces. Types of work or craft work that will be subcontracted shall be included and listed as subcontract work. The list shall also indicate any type of work or craft job category that does not have an applicable apprenticeship or training program. **The bidder is responsible for making a complete report and shall make certain that each type of work or craft job category that will be utilized on the project is accounted for and listed.**

The requirements of this certification and disclosure are a material part of the contract, and the contractor shall require this certification provision to be included in all approved subcontracts. In order to fulfill this requirement, it shall not be necessary that an applicable program sponsor be currently taking or that it will take applications for apprenticeship, training or employment during the performance of the work of this contract.

Discounts will be allowed for payment as follows: _____ % _____ calendar days: _____ % _____ calendar days.
Discounts will not be considered in determining the low bidder.

BDE PROCEDURE MEMORANDUM

NUMBER: 49-06

BLRS PROCEDURE MEMORANDUM

NUMBER: 2006-02

SUBJECT: Guidance for Determining *De Minimis* Impacts to Section 4(f) Resources

DATE: April 21, 2006

Section 6009(a) of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), Pub. L. 109-59, amended existing Section 4(f) legislation at Section 138 of Title 23 and Section 303 of Title 49, United States Code. This is a revision of Section 4(f) legislation that is meant to simplify the processing and approval of projects that have only *de minimis* (minimal) impacts on lands protected by Section 4(f). The changes presented below will be incorporated in a future update of the BDE Manual.

Background

This revision provides that once the consideration of Section 4(f) impact avoidance, minimization, and mitigation or enhancement measures has occurred, the U.S. Department of Transportation (DOT) may determine that a transportation use of Section 4(f) property will result in a *de minimis* impact on that property. The analysis of avoidance alternatives will not be required in order to complete the Section 4(f) evaluation process. Refer to the attached guidance for additional information.

FTA Regional Administrators

Section 6009(a) of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), Pub. L. 109-59, amended existing Section 4(f) legislation at Section 138 of Title 23 and Section 303 of Title 49, United States Code, to simplify the processing and approval of projects that have only *de minimis* impacts on lands protected by Section 4(f). This is the first substantive revision of Section 4(f) legislation since passage of the U.S. Department of Transportation Act of 1966. This revision provides that once the U.S. Department of Transportation (DOT) determines that a transportation use of Section 4(f) property, after consideration of any impact avoidance, minimization, and mitigation or enhancement measures, results in a *de minimis* impact on that property, an analysis of avoidance alternatives is not required and the Section 4(f) evaluation process is complete.

Section 6009(c) of SAFETEA-LU requires the U.S. DOT to conduct a study and issue a report on the implementation of the new Section 4(f) provisions. The study will include evaluation of: 1) the implementation processes developed and the resulting efficiencies; 2) the post-construction effectiveness of any impact mitigation and avoidance commitments adopted as part of the projects; and 3) the number of projects determined to have *de minimis* impacts, including information on the location, size, and cost of the projects. The initial study and report will address the first three years of implementation. The Federal Highway Administration (FHWA) Division and Federal Transit Administration (FTA) Regional Offices should maintain a record of the projects for which *de minimis* findings were made and track the progress of those projects in order to facilitate the future evaluation of the post construction effectiveness of any commitments of mitigation made as part of the *de minimis* finding. Additional guidance and information regarding the study and report will be provided in the future.

HARD COPIES UNCONTROLLED

Questions and Answers on the Application of the Section 4(f) *De Minimis* Impact Criteria

Introduction

The Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU) amendment to the Section 4(f) requirements allows the U.S. Department of Transportation (DOT) to determine that certain uses of Section 4(f) land will have no adverse effect on the protected resource. When this is the case, and the responsible official(s) with jurisdiction¹ over the resource agrees in writing, compliance with Section 4(f) is greatly simplified, as explained in this guidance.

The *de minimis*² impact criteria and associated determination requirements specified in Section 6009(a) of SAFETEA-LU³ are different for historic sites than for parks, recreation areas, and wildlife and waterfowl refuges. *De minimis* impacts related to historic sites are defined as the determination of either “no adverse effect” or “no historic properties affected” in compliance with Section 106 of the National Historic Preservation Act (NHPA)⁴. *De minimis* impacts on publicly owned parks, recreation areas, and wildlife and waterfowl refuges are defined as those that do not “adversely affect the activities, features and attributes” of the Section 4(f) resource.

The following questions and answers provide information and guidance on the process of determining *de minimis* impacts of highway and transit projects that propose the use of Section 4(f) property. A diagram of the determination process for parks, recreation areas, and wildlife and waterfowl refuges is included for illustration following the questions and answers.

1. General Information Regarding Application of the *De Minimis* Impact Criteria.

Question A. Are *de minimis* impact findings limited to any particular type of project or National Environmental Policy Act (NEPA) document?

Answer: No. The *de minimis* impact criteria may be applied to any project, as appropriate, regardless of the type of environmental document required by the NEPA process as described in the FHWA and FTA Environmental Impact and Related Procedures⁵.

Question B. What effect does the *de minimis* impact provision have on the application of the existing FHWA nationwide programmatic evaluations?

Answer: Existing FHWA programmatic Section 4(f) evaluations⁶ remain in effect and may be applied, as appropriate, to the use of Section 4(f) property by a highway project. However, since FTA does not have its own or share FHWA’s programmatic evaluations, the programmatic option applies only to FHWA projects and to multimodal projects in which FHWA and FTA are co-lead agencies.

¹ “Official(s) with jurisdiction” means the SHPO, THPO and ACHP, if participating in the consultation, for historic resources, and is defined in Question 3C for other Section 4(f) resources.

² Black’s Law Dictionary (8th ed. 1999) defines *de minimis* as 1. Trifling, minimal. 2. (Of a fact or thing) so insignificant that a court may overlook it in deciding an issue or case. 3. *De Minimis Non Curat Lex, The law does not concern itself with trifles.*

³ Section 6009 amends 49 U.S.C. § 303 and 23 U.S.C § 138; see specifically 49 U.S.C. § 303(d) and 23 U.S.C §138(b)

⁴ 16 U.S.C. 470f, with implementing regulation at 36 CFR part 800

⁵ 23 CFR 771.115

⁶ <http://environment.fhwa.dot.gov/projdev/4fnspeval.htm>

Question C. Is it appropriate to apply the *de minimis* impact criteria to projects that are already in the project development process?

Answer: Yes. The Section 4(f) statutory amendment was effective immediately upon enactment of SAFETEA-LU and the *de minimis* impact criteria may be applied to projects currently in the project development process, where the requirements of a *de minimis* impact finding have been or will be satisfied. The decision to apply the *de minimis* impact criteria to those projects is a matter of agency choice and professional judgment. The factors that should be considered in decisions to apply the *de minimis* impact criteria to projects in the “pipeline” include, but are not limited to: 1) the stage of the NEPA or project development process the project is in; 2) the benefits to the project delivery schedule realized by applying the *de minimis* impact criteria; 3) the impact to the project delivery schedule due to other agency (e.g., SHPO and/or THPO and park authorities) or public concern; 4) the overall benefit to the project realized by the reevaluation of a more viable alternative through a *de minimis* impact finding; 5) the degree and type of controversy and/or public scrutiny related to the project; and 6) the resulting benefits realized to a Section 4(f) resource by the *de minimis* impact finding.

While the *de minimis* impact criteria may be applied to any project meeting the specified requirements, Section 6009(a) of SAFETEA-LU does not require the U.S. DOT to re-open decisions already made concerning Section 4(f) impacts of individual projects. Project sponsors are encouraged to examine projects currently in the environmental process to see if any would benefit from application of the *de minimis* impact criteria, but the decision must be made on a case-by-case basis.

Question D. Can a *de minimis* impact finding be made for a project as a whole, where multiple Section 4(f) resources are involved?

Answer: No. Where multiple Section 4(f) resources are present in the study area and potentially used by a transportation project, *de minimis* impact findings must be made for the individual Section 4(f) resources. The impacts to Section 4(f) resources and any impact avoidance, minimization, and mitigation or enhancement measures must be considered on an individual resource basis and *de minimis* impact findings made individually for each Section 4(f) resource. However, when there are multiple resources for which *de minimis* impact findings are appropriate, the procedural requirements of Section 4(f) can and should be completed in a single process, document and circulation, so long as it is clear that distinct determinations are being made. Also in these cases, the written concurrence of the official(s) with jurisdiction may be provided for the project as a whole, so as long as the *de minimis* impacts findings have been made on an individual resource basis.

Question E. What role does mitigation play in the *de minimis* impact finding?

Answer: The *de minimis* impact finding is based on the degree or level of impact including any avoidance, minimization, and mitigation or enhancement measures that are included in the project to address the Section 4(f) use. The expected positive effects of any measures included in a project to mitigate the adverse effects of a Section 4(f) resource must be taken into account when determining whether the impact to the Section 4(f) resource is *de minimis*. The purpose of taking such measures into account is to encourage the incorporation of Section 4(f) protective measures as part of the project⁷. *De minimis* impact findings must be expressly conditioned upon the implementation of any measures that were relied upon to reduce the impact to a *de minimis* level. The implementation of such measures will become the responsibility of the project sponsor, with FHWA or FTA oversight⁸.

⁷ Conference Report of the Committee of Conference on H.R. 3, Report 109-203, page 1057.

⁸ 23 CFR 771.109(b)

Question F. How should the *de minimis* impacts to Section 4(f) resources be considered in the alternative selection process when all feasible and prudent alternatives result in Section 4(f) use?

Answer: For those situations in which multiple Section 4(f) resources will be used by a project and it has been determined that no feasible and prudent avoidance alternatives exist, the *de minimis* impacts of Section 4(f) resources must be factored into the analysis to determine which alternative results in the least overall harm as described in the FHWA Section 4(f) Policy Paper⁹.

In most cases, the *de minimis* impacts will have little or no influence on the determination of overall harm because the activities, features and attributes of the Section 4(f) resources will not be adversely affected. Also, because potential adverse impacts to the Section 4(f) resources will be completely mitigated or enhanced by inclusion of such measures as part of the project in making *de minimis* impact findings, the Section 4(f) benefit should be included in the least harm analysis. Where it is not clear which alternative results in the least overall harm, consultation with the FHWA or FTA Headquarters or the FHWA or FTA Office of the Chief Counsel is recommended.

Question G. Can a *de minimis* impact finding be made for a “constructive use” of Section 4(f) property?

Answer: No. A *de minimis* impact finding can only be made where the transportation use would not adversely affect the activities, features, and attributes that qualify a property for protection under Section 4(f). Constructive use, by definition, involves impacts to a Section 4(f) resource such that the protected activities, features, and attributes would be substantially impaired¹⁰. Therefore, a *de minimis* impact finding would not be appropriate where there is a constructive use. Furthermore, if a potential constructive use can be reduced below a substantial impairment, with the inclusion of mitigation measures, then Section 4(f) would not apply.

Question H. Can a *de minimis* impact finding be made for a “temporary occupancy” of Section 4(f) property?

Answer: Yes. As long as the *de minimis* impact criteria are met, the impacts associated with a temporary occupancy of a Section 4(f) resource could be determined to be *de minimis*. It should be noted, however, that Section 4(f) does not apply to the temporary occupancy of Section 4(f) property when the conditions set forth in the FHWA and FTA Environmental Impact and Related Procedures¹¹ are satisfied. Therefore, application of the *de minimis* impact provision for these situations should only be considered when the project does not meet the temporary occupancy exception criteria.

Question I. Who makes the *de minimis* impact findings?

Answer: The FHWA Division Administrator or FTA Regional Administrator makes the *de minimis* impact findings. In the determination, FHWA or FTA shall consider any impact avoidance, minimization, and mitigation or enhancement measures that are included in the project to address the impacts and adverse effects on the Section 4(f) resource. The FHWA Division Administrator or FTA Regional Administrator must consider the facts supporting the determination of a *de minimis* impact, the record that was compiled in the coordination that must precede the determination of *de minimis* impact, the concurrence of the official(s) with jurisdiction, and use his or her own best judgment in making the *de minimis* impact finding. It is ultimately the

⁹ March 1, 2005, pages 6, 7; <http://www.environment.fhwa.dot.gov/projdev/4fpolicy.htm>

¹⁰ 23 CFR 771.135(p)(2)

¹¹ 23 CFR 771.135(p)(7)

responsibility of the FHWA or FTA to ensure that *de minimis* impact findings and required concurrences are reasonable.

Coordination with the FHWA or FTA Headquarters or the FHWA or FTA Office of the Chief Counsel is not required for routine *de minimis* impact findings but is recommended for controversial projects and complex situations.

2. *De Minimis* Impact Findings for Section 4(f) Uses of Historic Properties.

Question A. What are the requirements for a finding of *de minimis* impact on a historic site?

Answer: A finding of *de minimis* impact on a historic site may be made when:

- 1) The process required by Section 106 of the National Historic Preservation Act¹² results in the determination of "no adverse effect" or "no historic properties affected" with the concurrence of the SHPO and/or THPO, and ACHP if participating in the Section 106 consultation;
- 2) The SHPO and/or THPO, and ACHP if participating in the Section 106 consultation, is informed of FHWA's or FTA's intent to make a *de minimis* impact finding based on their written concurrence in the Section 106 determination; and
- 3) FHWA or FTA has considered the views of any consulting parties participating in the Section 106 consultation.

Question B. How should the concurrence of the SHPO and/or THPO, and ACHP if participating in the Section 106 determination, be documented when the concurrence will be the basis for a *de minimis* finding?

Answer: Section 4(f)¹³ requires that the SHPO and /or THPO, and ACHP if participating, must concur in writing in the Section 106 determination of "no adverse effect" or "no historic properties affected." The request for concurrence in the Section 106 determination should include a statement informing the SHPO or THPO, and ACHP if participating, that the FHWA or FTA intends to make a *de minimis* finding based upon their concurrence in the Section 106 determination.

Under the Section 106 regulation, concurrence by a SHPO and/or THPO may be assumed if they do not respond within a specified timeframe, but Section 4(f) explicitly requires their written concurrence. It is recommended that transportation officials share this guidance with the SHPOs and THPOs in their States so that these officials fully understand the implication of their concurrence in the Section 106 determinations and the reason for requesting written concurrence.

Question C. Certain Section 106 programmatic agreements (PAs) allow the lead agency to assume the concurrence of the SHPO and/or THPO in the determination of "no adverse affect" or "no historic properties affected" if response to a request for concurrence is not received within a period of time specified in the PA. Does such concurrence through non-response, in accordance with a written and signed Section 106 PA, constitute the "written concurrence" needed to make a *de minimis* finding?

Answer: In accordance with the provisions of a written and signed programmatic agreement, if the SHPO and/or THPO does not respond to a request for concurrence in the Section 106

¹² 16 U.S.C. 470f, with implementing regulation at 36 CFR part 800

¹³ 49 U.S.C 303(d)(2)

determination within the specified time, the non-response together with the written agreement, will be considered written concurrence in the Section 106 determination that will be the basis of the *de minimis* finding by FHWA or FTA.

FHWA or FTA must inform the SHPOs and THPOs who are parties to such PAs, in writing, that a non-response that would be treated as a concurrence in a “no adverse effect” or “no historic properties affected” determination will also be treated as the written concurrence for purposes of the FHWA or FTA *de minimis* impact finding. It is recommended that this understanding of the parties be documented by either appending the written notice to the existing PA, or by amending the PA itself.

Question D. For historic properties, will a separate public review process be necessary for the determination of a *de minimis* impact?

Answer: No. Section 6009(a) of SAFETEA-LU requires the U.S. DOT to consult with the parties participating in the Section 106 process but does not require additional public notice or opportunity for review and comment. Documentation of consulting party involvement is recommended. For projects requiring the preparation and distribution of a NEPA document, the information supporting a *de minimis* impact finding will be included in the NEPA documentation and the public will be afforded an opportunity to review and comment during the formal NEPA process.

3. De Minimis Impact Findings for Parks, Recreation Areas, and Wildlife and Waterfowl Refuges

Question A. What constitutes a *de minimis* impact with respect to a park, recreation area, or wildlife and waterfowl refuge?

Answer: An impact to a park, recreation area, or wildlife and waterfowl refuge may be determined to be *de minimis* if the transportation use of the Section 4(f) resource, including consideration of impact avoidance, minimization, and mitigation or enhancement measures, does not adversely affect the activities, features, and attributes that qualify the resource for protection under Section 4(f). Language included in the SAFETEA-LU Conference Report¹⁴ provides additional insight on the meaning of *de minimis* impact.

“The purpose of the language is to clarify that the portions of the resource important to protect, such as playground equipment at a public park, should be distinguished from areas such as parking facilities. While a minor but adverse effect on the use of playground equipment should not be considered a *de minimis* impact under section 4(f), encroachment on the parking lot may be deemed *de minimis*, as long as the public's ability to access and use the site is not reduced.”

This simple example helps to distinguish the activities, features, and attributes of a Section 4(f) resource that are important to protect from those which can be used without resulting adverse effects. Playground equipment in a public park may be central to the recreational value of the park that Section 4(f) is designed to protect. When impacts are proposed to playground equipment or other essential feature, a *de minimis* impact finding will, at a minimum, require a commitment to replace the equipment with similar or better equipment at a time and in a location that results in no adverse effect to the recreational activity. A parking lot encroachment or other similar type of land use, on the other hand, could result in a *de minimis* impact with minimal mitigation, as long as there are no adverse effects on public access and the official(s) with jurisdiction agree.

¹⁴ Conference Report of the Committee of Conference on H.R. 3, Report 109-203, page 1057.

Question B. What are the requirements for a finding of *de minimis* impact with respect to a park, recreation area, or wildlife and waterfowl refuge?

Answer: The impacts of a transportation project on a park, recreation area, or wildlife and waterfowl refuge that qualifies for Section 4(f) protection may be determined to be *de minimis* if:

- 1) The transportation use of the Section 4(f) resource, together with any impact avoidance, minimization, and mitigation or enhancement measures incorporated into the project, does not adversely affect the activities, features, and attributes that qualify the resource for protection under Section 4(f);
- 2) The official(s) with jurisdiction over the property are informed of FHWA's or FTA's intent to make the *de minimis* impact finding based on their written concurrence that the project will not adversely affect the activities, features, and attributes that qualify the property for protection under Section 4(f); and
- 3) The public has been afforded an opportunity to review and comment on the effects of the project on the protected activities, features, and attributes of the Section 4(f) resource.

Question C. What officials are considered to be "officials with jurisdiction" over a park, recreation area, or wildlife or waterfowl refuge for the purposes of the *de minimis* impact finding?

Answer: The officials with jurisdiction are the officials of an agency or agencies that own or administer a Section 4(f) property and who are empowered to represent that agency on related matters. In some cases, the agency that owns or administers the land has either delegated or relinquished its authority to another agency. In those cases, FHWA or FTA should review the applicable agreements to determine which agency or agencies have the authority to concur in the assessment of impacts to the property.

Question D. How should Section 6(f) of the Land and Water Conservation Fund Act (LWCFA) or other U.S. Department of Interior (DOI) grants-in-aid programs be treated in *de minimis* impact findings?

Answer: *De minimis* impact findings will satisfy Section 4(f) requirements only. For projects that propose the use of land from a property or site purchased or improved with funds under the LWCFA, the Federal Aid in Fish Restoration Act (Dingell-Johnson Act), the Federal Aid in Wildlife Act (Pittman-Robertson Act), or other similar law, or the lands are otherwise encumbered with a Federal interest, coordination with the appropriate Federal agency is required to ascertain the agency's position on the land conversion or transfer. Other federal requirements that may apply to the Section 4(f) land should be determined through consultation with the officials with jurisdiction or appropriate DOI or other federal official. These federal agencies may have regulatory or other requirements for converting land to a different use. These requirements are independent of the *de minimis* impact finding and must be satisfied.

Question E. Is consultation with DOI routinely required for *de minimis* impact findings?

Answer: No. As a routine matter, FHWA and FTA do not need to consult with the DOI on *de minimis* impact findings. Where the Section 4(f) resource involved is owned or administered by the DOI, FHWA or FTA will need the written concurrence of the appropriate DOI official as the official with jurisdiction. If the Section 4(f) resource is encumbered with a Federal interest as a result of a DOI grant, then the answer to Question D applies.

Question F. Does the concurrence of the official(s) with jurisdiction over the Section 4(f) resource need to be in writing?

Answer: Yes. The concurrence of the official(s) with jurisdiction that the protected activities, features, and attributes of the resource are not adversely affected must be in writing. The written

concurrence can be in the form of a signed letter on agency letterhead, signatures in concurrence blocks on transportation agency documents, agreements provided via e-mail or other method deemed acceptable by the FHWA Division Administrator or FTA Regional Administrator. Obtaining these agreements in writing is consistent with effective practices related to preparing project administrative records.

Question G. What constitutes compliance with the public notice, review and comment requirements related to *de minimis* impact findings?

Answer: Information supporting a *de minimis* impact finding should be included in the appropriate NEPA document prepared for the project. This information includes, at a minimum, a description of the involved Section 4(f) resource(s), the impact(s) to the resources and any impact avoidance, minimization, and mitigation or enhancement measures that are included in the project as part of the *de minimis* impact finding. The public involvement requirements related to the specific NEPA document and process will, in most cases, be sufficient to satisfy the public notice and comment requirements for the *de minimis* impact finding.

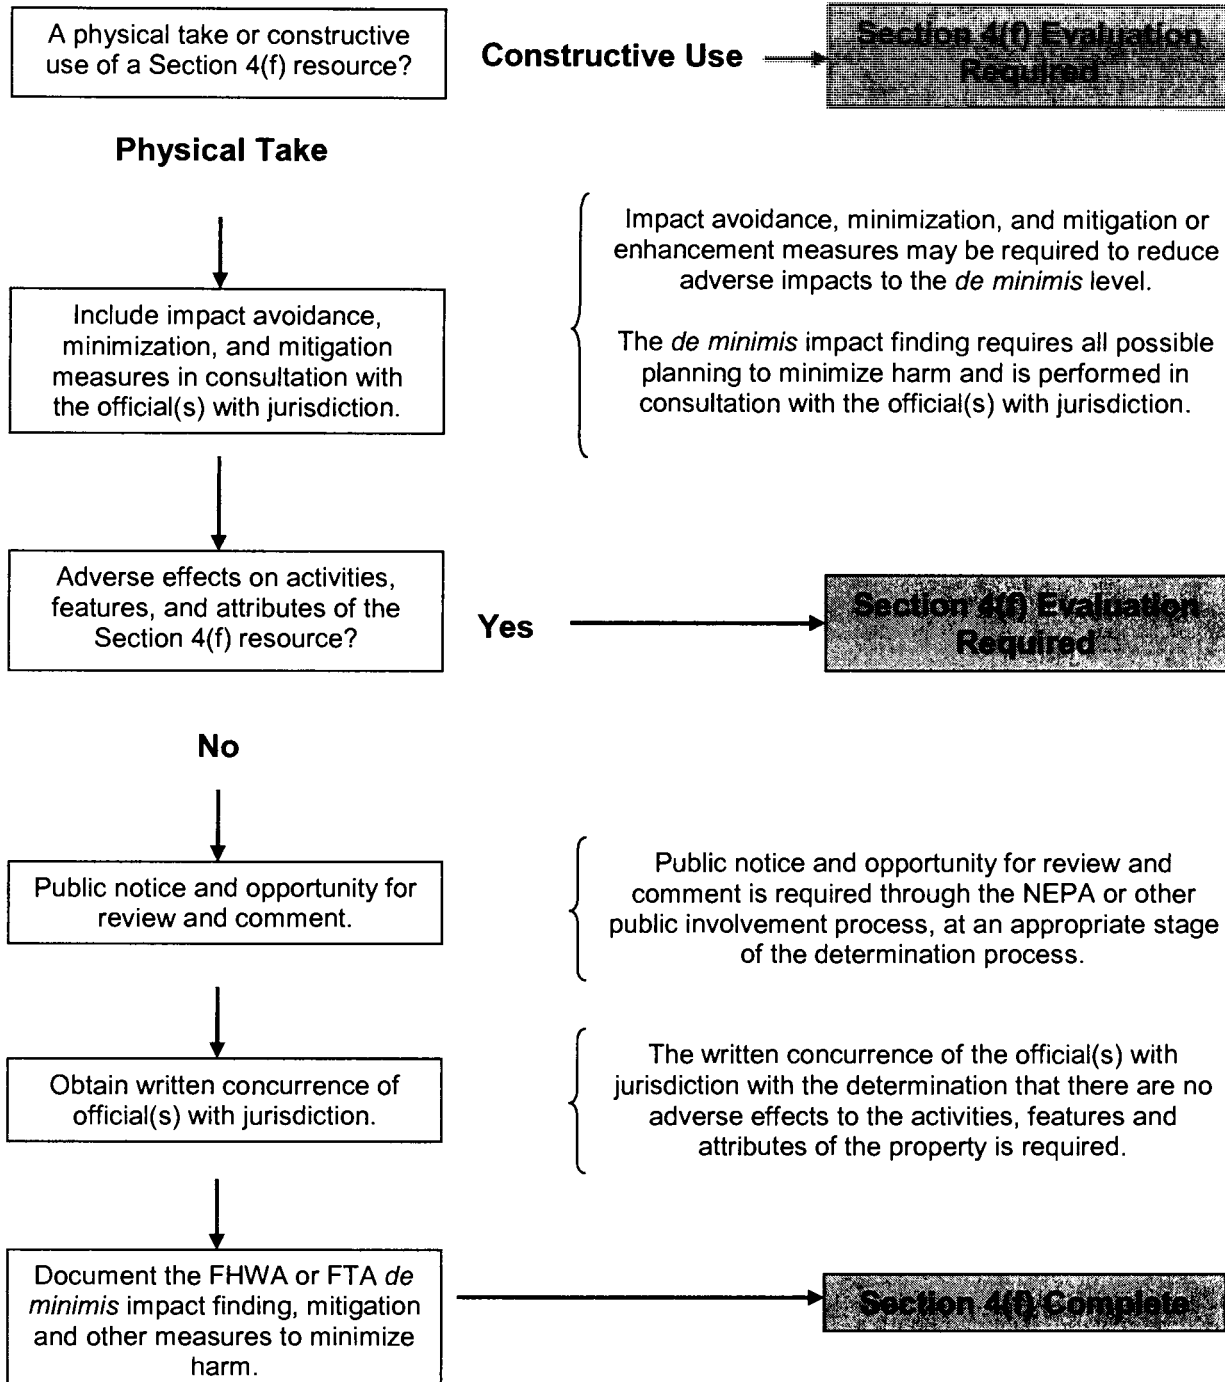

In general, for highway projects, the public notice and comment process related to *de minimis* impact findings will be accomplished through the State DOT's approved public involvement process¹⁵.

For those actions that do not routinely require public review and comment (e.g., certain categorical exclusions and reevaluations) but for which a *de minimis* impact finding will be made, a separate public notice and opportunity for review and comment will be necessary. In these cases, appropriate public involvement should be based on the specifics of the situation and commensurate with the type and location of the Section 4(f) resource(s), impacts and public interest.

All comments received and responses thereto, shall be documented in the same manner that other comments on the proposed action would be handled. Where public involvement was initiated solely for the purpose of a *de minimis* impact finding, responses or replies to the public comments may not be required, depending on the substantive nature of the comments. All comments and responses shall be documented in the administrative record.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2006-03
SUBJECT: PLAN APPROVAL AND RELEASE SIGNATURE BLOCK
ISSUED DATE: July 12, 2006
EFFECTIVE DATE: September 22, 2006

This memorandum adds Chapter 11 Section 2.04 and Chapter 23 Section 2.04 to the Bureau of Local Roads and Streets Manual dated January 2006.

In order to ensure consistency between the districts, the department has created a uniform signature block for all local agency plans that require department review and approval. The signature block should be used on any plans that have not been submitted to the district for review; however, as of the September 22, 2006 letting, it will be required for all local agency projects requiring department review and approval.

A handwritten signature in cursive script that reads "Charles J. Dingersoll".

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2006-04
SUBJECT: ELIMINATION OF DIRECT LABOR MULTIPLIER ON
FEDERALLY FUNDED PROJECTS
ISSUED DATE: July 12, 2006
EFFECTIVE DATE: September 1, 2006

This memorandum replaces Chapter 5 Section 5 and Section 6 of the Bureau of Local Roads and Streets Manual dated January 2006.

The Illinois Division of the Federal Highway Administration (IL-FHWA) notified the department that the numeric multiplier used in the Direct Labor Multiplier (DLM) compensation method is no longer allowed as a result of recent changes to 23 U.S.C. § 112(b)(2). Accordingly the DLM compensation method will no longer be an option for federally funded engineering projects. The IL-FHWA will allow local agencies that had previously discussed or negotiated specific projects using DLM prior to December 1, 2005 to finalize the agreement using DLM. As of September 1, 2006, DLM agreements will no longer be accepted regardless of when negotiations began.

Please note that details concerning consultant compensation formulas have been moved to section 5-5.06 (Engineering Agreements – MFT and State Funds). Allowable formulas for federally funded projects, section 5-6.01(d), will now refer back to the appropriate formula details in section 5-5.06.

If you have any questions concerning consultant payment methods, please contact Greg Lupton at Greg.Lupton@illinois.gov or 217/785-1670.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2006-05

SUBJECT: PARK ZONE SIGNS

ISSUED DATE: November 1, 2006

EFFECTIVE DATE: November 26, 2006

This memorandum adds Chapter 39 Section 2.08(b) to the Bureau of Local Roads and Streets Manual dated January 2006.

Public Act 94-0808, effective May 26, 2006 adds a Section 11-605.3 to the Illinois Vehicle Code allowing local agencies to establish Park Zones and Park Zone Street speed limits of 20 mph on designated streets or intersections posted and controlled by local agencies. It also charges the Department with the responsibility of designing a set of standardized traffic signs for park zones and park zone streets.

In order to designate a park zone and park zone streets, and establish a park zone speed limit, local agencies need to pass an ordinance or resolution. If a local agency establishes a park zone, the traveling public shall not exceed the posted reduced speed limit on any day when children are present and within 50 feet of motorized traffic on such designated zone streets.

Chapter 39, Section 2.08(b) establishes a set of signs to be posted and maintained by local agencies in such designated areas as defined by 625 ILCS 5/11-605.3.

A handwritten signature in cursive script that reads "Charles J. Dingsell".

Public Act 094-0808

SB0509 Enrolled

LRB094 07627 DRH 37799 b

AN ACT concerning transportation.

WHEREAS, The Illinois General Assembly finds that laws protecting school-age children with legislation limiting speed limits near schools has successfully protected Illinois children for decades, and a considerable number of recreational facilities in Illinois often border or are in close proximity to educational facilities and do not have the same protections afforded to educational facilities; and

WHEREAS, The Illinois General Assembly finds that ensuring Safe Streets near educational and recreational facilities is a goal requiring the full attention of this General Assembly and the full cooperation of the federal, State, and local units of government and their respective executive departments and agencies; therefore

Be it enacted by the People of the State of Illinois, represented in the General Assembly:

Section 5. The Illinois Vehicle Code is amended by adding Section 11-605.3 as follows:

(625 ILCS 5/11-605.3 new)

Sec. 11-605.3. Special traffic protections while passing parks and recreation facilities and areas.

(a) As used in this Section:

(1) "Park district" means the following entities:

(A) any park district organized under the Park District Code;

(B) any park district organized under the Chicago Park District Act; and

(C) any municipality, county, forest district, school district, township, or other unit of local government that operates a public recreation department or public recreation facilities that has recreation facilities that are not on land owned by any park district listed in subparagraphs (A) and (B) of this subdivision (a)(1).

(2) "Park zone" means the recreation facilities and areas on any land owned or operated by a park district that are used for recreational purposes, including but not limited to: parks; playgrounds; swimming pools; hiking trails; bicycle paths; picnic areas; roads and streets; and parking lots.

(3) "Park zone street" means that portion of any street or intersection under the control of a local unit of government, adjacent to a park zone, where the local unit of government has, by ordinance or resolution, designated and approved the street or intersection as a park zone street. If, before the effective date of this amendatory

HARD COPIES UNCONTROLLED

Act of the 94th General Assembly, a street already had a posted speed limit lower than 20 miles per hour, then the lower limit may be used for that park zone street.

(4) "Safety purposes" means the costs associated with: park zone safety education; the purchase, installation, and maintenance of signs, roadway painting, and caution lights mounted on park zone signs; and any other expense associated with park zones and park zone streets.

(b) On any day when children are present and within 50 feet of motorized traffic, a person may not drive a motor vehicle at a speed in excess of 20 miles per hour or any lower posted speed while traveling on a park zone street that has been designated for the posted reduced speed.

(c) On any day when children are present and within 50 feet of motorized traffic, any driver traveling on a park zone street who fails to come to a complete stop at a stop sign or red light, including a driver who fails to come to a complete stop at a red light before turning right onto a park zone street, is in violation of this Section.

(d) This Section does not apply unless appropriate signs are posted upon park zone streets maintained by the Department or by the unit of local government in which the park zone is located. With regard to the special speed limit on park zone streets, the signs must give proper due warning that a park zone is being approached and must indicate the maximum speed limit on the park zone street.

(e) A first violation of this Section is a petty offense with a minimum fine of \$250. A second or subsequent violation of this Section is a petty offense with a minimum fine of \$500.

(f) When a fine for a violation of this Section is imposed, the person who violates this Section shall be charged an additional \$50, to be paid to the park district for safety purposes.

(g) The Department shall, within 6 months of the effective date of this amendatory Act of the 94th General Assembly, design a set of standardized traffic signs for park zones and park zone streets, including but not limited to: "park zone", "park zone speed limit", and "warning: approaching a park zone". The design of these signs shall be made available to all units of local government or manufacturers at no charge, except for reproduction and postage.

Section 99. Effective date. This Act takes effect upon becoming law.

Effective Date: 5/26/2006

Floor Actions

Date	Action
5/26/2006	Public Act094-0808

HARD COPIES UNCONTROLLED

TYPICAL PARK ZONE SIGNING

If the local ordinance or resolution establishing a Park Zone Speed limit includes the hours the limit is in effect, the hours may be included on lower portion of the PARK ZONE SPEED LIMIT sign (R2-I108) such as "8 AM - 8 PM WHEN CHILDREN ARE PRESENT."

The advance PARK ZONE sign (W15-I100) may be used alone where a Park Zone Speed Limit is not established.

Standard Speed Limit signs shall not be placed within a Park Speed Zone. The end of the Park Speed Zone shall be designated with a standard speed limit sign.

ILLINOIS STANDARD

R2-I108

Federal Standard S4-2 shall be used on lower portion of sign. If local ordinance or resolution includes hours those may be included as well and placed on lower portion. Example: (8 AM - 8 PM)

BDE PROCEDURE MEMORANDUM

NUMBER: 53-06

BLRS PROCEDURE MEMORANDUM

NUMBER: 2006-06

SUBJECT: Design Guidance for Median and Curb Treatments at Railroad Grade Crossings

DATE: November 15, 2006

This memorandum revises information in Sections 7-3.02 and 34-2.04 of the BDE Manual and Section 40-1.01(f) of the LRS Manual. The changes presented below will be incorporated in future updates of the BDE Manual and LRS Manual.

Background

The Department and the Illinois Commerce Commission collaborated to develop revised details for median and curb treatments at railroad grade crossings. The revision entails providing mountable curb on the departure side of at-grade railroad crossings instead of barrier curb. This change will provide escape areas for vehicles that may be trapped on the railroad tracks.

Applicability

The procedures in this memorandum are applicable to State Highway projects with median and curb treatments at railroad grade crossings.

Procedures

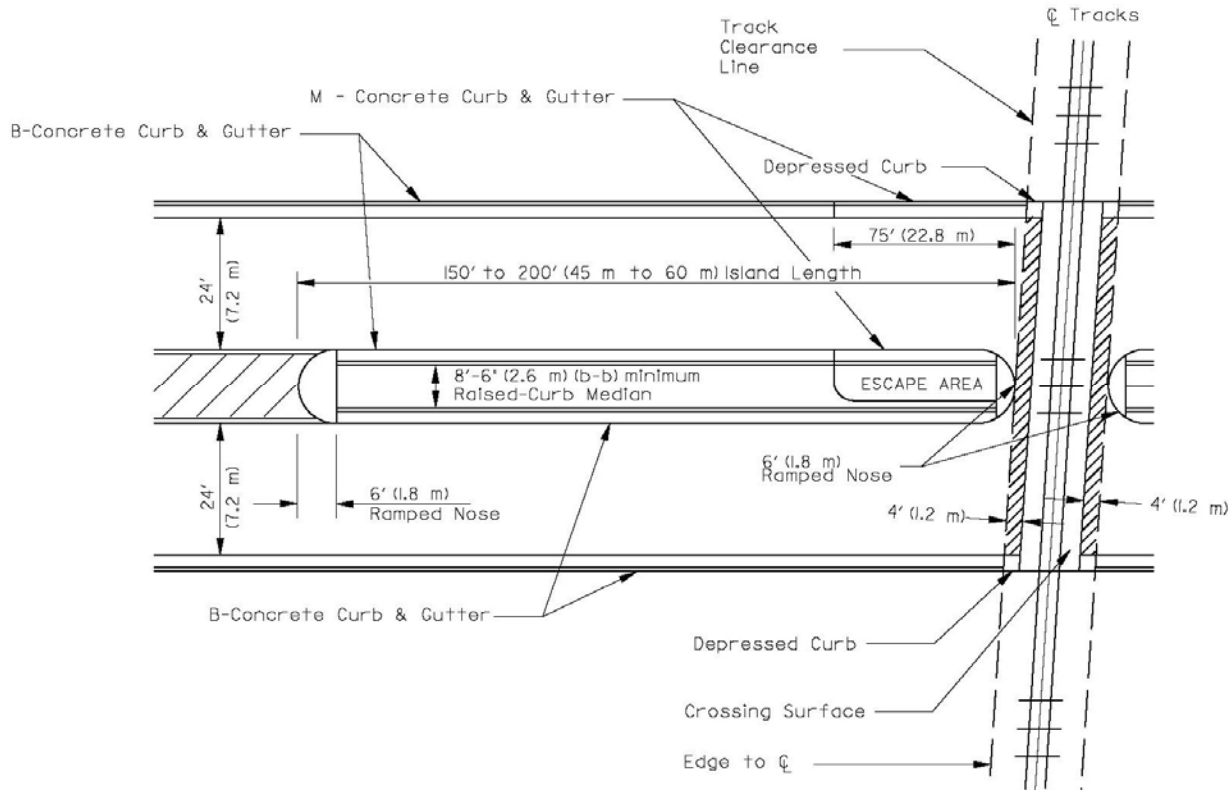

7-3.02(f) Design Considerations [40-1.01(f) of LRS Manual]

Revise subsection 1.b. of this Section to read:

Medians. Where median-mounted warning devices will be installed and other than an earth median is adjacent to a grade crossing, the median should have a minimum median width of 8.5 ft (2.6 m) (10 ft (3.0 m) desirable) back-to-back of curb. Depress all medians and curbs on approaches to the crossing to the level of the pavement edge or gutter flag within the track clearance line which is parallel to and 8 ft (2.4 m) from the centerline of the nearest track. See Figure 7-3E.

HARD COPIES UNCONTROLLED

Revise Figure 7-3E (LRS Figure 40-1C) as follows:

Notes:

1. Where a raised-curb, flush, or traversable type median is used on the roadway, provide B-6 or B-9 (B-15 or B-22) raised-curb median on crossing approaches and provide M-2 or M-4 (M-5 or M-10) raised-curb median on crossing departures adjacent to each side of the railroad track(s); see Section 34-2.04.
2. In addition to deterring vehicular movements over the track(s) in the median area, the raised-curb median provides a space for mounting railroad warning device units, if required. Also, see Section 36-8.
3. If the railroad tracks are located close to a cross street and lie within the left-turn lane of the intersection, this section will require a special design and the use of barrier type curb along the median adjacent to the turn lane.
4. The median should have a minimum width of 8.5 ft (2.6 m) (10 ft (3.0 m) desirable) back-to-back of curb.

TYPICAL MID-BLOCK MEDIAN TREATMENT ADJACENT TO RAILROAD CROSSINGS
(Multilane Urban and Suburban Highways)

Figure 7-3E (LRS Figure 40-1C)

34-2.04(c) Curb Type Selection

Add the following after the first paragraph of subsection 9.a., Special Median Conditions for Railroads:

Where a highway departs an at-grade railroad crossing and the design speed is 45 mph or less, provide M-4 (M-10) CC&G along the median edges for a short distance adjacent to the crossing. When the design speed is 50 mph or greater, provide M-2 (M-5) CC&G. These mountable curb types will provide an escape area for vehicles. See Figure 7-3E.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2006-07
SUBJECT: LOCAL LETTING PROTESTS - APPRENTICESHIP
AND TRAINING CERTIFICATION
ISSUED DATE: December 6, 2006
EFFECTIVE DATE: January 1, 2007

This memorandum adds Section 4 to Chapter 12 of the Bureau of Local Roads and Streets Manual dated April 2006.

Procedure Memorandums 2005-03 and 2006-01 established responsible bidder requirement for local let contract and material proposals.

Chapter 12, Section 4 establishes a uniform protest acceptance and handling procedure previously outlined in Circular letter 2006-01 that the department has implemented to handle responsible bidder protests on local let projects funded with motor fuel tax or other state funds administered by the department. The protest procedure outlined in Section 4 may be utilized to protest a lack of participation in the approved apprenticeship and training program only.

All other protests, as outlined in the same Section 4, should be handled and resolved based on the local authority's procurement practices. If the local authority does not have protest procedures, Special Provision LR 102 may be inserted into the contract or material proposal in order to establish protest guidelines on local lettings.

A handwritten signature in cursive script that reads "Charles J. Dingersoll".

SPECIAL PROVISION
FOR
PROTESTS ON LOCAL LETTINGS

Effective: January 1, 2006

All protests will be handled according to Subpart F of Subtitle B of Title 44 of the Illinois Administrative Code except for apprenticeship and training certification issues. The Chief Procurement Officer will be a representative of the awarding authority.

Illinois Department of Transportation

2300 South Dirksen Parkway / Springfield, Illinois / 62764

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2006-08
SUBJECT: ENGINE BRAKING SIGNS
ISSUED DATE: December 6, 2006
EFFECTIVE DATE: January 1, 2007

This memorandum adds Section 39-2.06(j) to the Bureau of Local Roads and Streets Manual dated November 2006.

Effective January 1, 2007, Public Act 94-0756 adds a Section 12-602.1 to the Illinois Vehicle Code allowing a county or municipality to post signs prohibiting the use of engine braking systems emitting excessive noise. The act prescribes a specific content of the signs, such as "EXCESSIVE ENGINE BRAKING NOISE PROHIBITED". Additionally, it requires the department to promulgate rules concerning the signs. Finally, the Act provides that the provision does not apply to the use of an engine braking system that has an adequate sound muffling system in proper working order that prevents excessive noise.

92 Illinois Administrative Code 547, Engine Braking Signs, was adopted by IDOT. The rules provide that counties and municipalities may furnish, install and maintain signs on streets and highways under their jurisdiction and with permission of the Department, on state roads and streets within their corporate limits. The signs are not to be used on freeways or interstate highways.

Chapter 39, Section 2.06(j) establishes a Engine Braking (R5-I106) sign to be furnished, posted and maintained by a county or municipality as defined by 625 ILCS 5/12-602.1. Because the Public Act is very specific as to the wording of the sign, existing non-conforming signs on state highways should be removed and replaced with the new design.

A handwritten signature in cursive script, reading "Charles J. Dingsworth".

Public Act 094-0756

HB2497 Enrolled

LRB094 09720 DRH 39976 b

AN ACT concerning transportation.

**Be it enacted by the People of the State of Illinois,
represented in the General Assembly:**

Section 5. The Illinois Vehicle Code is amended by adding Section 12-602.1 as follows:

(625 ILCS 5/12-602.1 new)

Sec. 12-602.1. Excessive engine braking noise signs.

(a) A county or municipality may post signs that prohibit the driver of a commercial vehicle, as defined in Section 1-111.8 of this Code, from operating or actuating any engine braking system that emits excessive noise.

(b) The sign shall state, "EXCESSIVE ENGINE BRAKING NOISE PROHIBITED". The Department of Transportation shall adopt rules providing for the erection and placement of these signs.

(c) This Section does not apply to the use of an engine braking system that has an adequate sound muffling system in proper working order that prevents excessive noise.

(d) It is a defense to this Section that the driver used an engine braking system that emits excessive noise in an emergency to avoid a collision with a person or another vehicle on the highway.

(e) A violation of this Section is an equipment violation punishable by a fine of \$75.

Effective Date: 1/1/2007

ENGINE BRAKING SIGN

R5-I106

The standard size sign shall be 30" wide by 36" high with 3"D letters. The plaque size will vary with the message.

For high-speed locations or multi-lane highways, a larger sized 48" by 60" sign with 5" D letters may be used.

The sign shall be black on white and shall be retroreflective.

The message on the sign is prescribed by statute.*

The sign and plaque may be combined into a single panel.

A plaque should be used to define the extent of the prohibition such as NEXT X MILES, ON VILLAGE STREETS, NEXT X BLOCKS, etc. and may indicate a time such as 8 PM - 7 AM.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2006-09
SUBJECT: DESIGNATION OF TRUCK ROUTES
ISSUED DATE: December 28, 2006
EFFECTIVE DATE: January 1, 2007

This memorandum revises Chapter 3 Section 2.02(d) to the Bureau of Local Roads and Streets Manual dated December 2006.

Public Act 94-0763 was signed into law on May 12, 2006, and will become effective on January 1, 2007. This law requires the Department of Transportation to maintain and provide a listing of all Class I, Class II, and Class III designated highways and streets defined by 625 ILCS 5/1-126.1. Additionally, this law includes local streets and highways that have been designated as Class II or Class III highways by local agencies. It is the responsibility of local agencies with jurisdiction over a Class II or III designated highway to report its location to the department.

Chapter 3, Section 2.02(d) establishes local agencies' reporting requirements of their designated Class II and Class III streets and highways, reference names, and telephone numbers to the Department. Local agencies should use BLR 03210 to designate Class II or III highways or streets.

(SEAL)

DESCRIPTION

This form should be used by local agencies to designate Class II or Class III truck routes on highways and streets under their jurisdiction.

COMPANION FORMS

BLR 05321 and BLR 05322, if necessary.

DEFINITIONS

Local Agency is a municipality, road district/township and county.

Clerk is a person charged with a record keeping duty for a local agency.

INSTRUCTIONS

Body of the Resolution:

In all fields following "Local Agency," a full name of a municipality, road district/township or county should be inserted.

In the fields for "Name," "Title" and "Signature," appropriate terms should be inserted by mayor/village president, highway commissioner or chairman of a county board.

Clerk Certification:

A name of the clerk, full name of a municipality, road district/township or county, and a date should be inserted into the fields, respectively. A signature of a clerk should appear in a field above the "Clerk" line.

SUBMITTAL

Local Agency must submit 2 (two) copies of this form and a location map to their District Engineer. The District will distribute the forms and location maps as follows:

- 1 copy to the District files
- 1 copy to the Central Bureau of Operations.

BDE PROCEDURE MEMORANDUM

NUMBER: 54-07

BLRS PROCEDURE MEMORANDUM

NUMBER: 2007-01

SUBJECT: Categorical Exclusion Group II Approval Documentation

DATE: January 8, 2007

This memorandum revises information in Section 23-1.05(d) of the BDE Manual and Section 19-1.04(c) of the LRS Manual.

Background

The Department and the Federal Highway Administration (FHWA) conducted a process review of Categorical Exclusions. An observation in the review noted that districts document CE determination decisions in the minutes of the coordination meetings and it is also documented in the project report. When decisions are made via phone call, e-mails, or special meetings, CE determination decisions are documented in the project files. The process review team recommended a clear, concise statement that should be used for documentation.

Applicability

The procedures in this memorandum are applicable to all projects utilizing federal funds.

Procedures

23-1.05(d) Group II Actions [19-1.04(c) of LRS Manual]

Replace the last sentence of the first paragraph [last sentence of the third paragraph of LRS manual] with the following:

“Minutes of the meeting or a memorandum to the file, as appropriate, shall document the discussions and concurrence by stating ‘The FHWA approves the designation of this project as a Categorical Exclusion Group II on [DATE].’”

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2007-02

SUBJECT: LETTING AND CONTRACT AWARD – MFT AND STATE FUNDS

ISSUED DATE: April 26, 2007

EFFECTIVE DATE: May 1, 2007

This memorandum supersedes Section 12-1 dated April 2006 and Sections 12-1 and 12-3 dated December 2006 of the Bureau of Local Roads and Streets Manual.

In order to clarify the apprenticeship or training certification applicability in locally let projects, the department created a new type of proposal - Deliver and Install Proposal.

A deliver and install proposal is similar to a material proposal in that the cost and delivery of material for the work operation is the substantial or principal cost of the contract. A deliver and install proposal, however, includes work performed at the site. Section 12-1.01(c) describes when a deliver and install proposal may be used. The apprenticeship or training program certification is required for all deliver and install proposals. BLR 12325 shall be inserted in all deliver and install proposals and has to be completed appropriately by every bidder.

When the on site work included in a contract or deliver and install proposal is performed solely by individual owners, partners, or members and not by employees to whom the payment of prevailing wages would be required, the certification is not required. BLR 12325 provides an appropriate section to indicate that.

A material proposal shall be used for furnishing material to the job site, stockpile, or other location. A material proposal may also be used when the supplier is tailgating and distributing the material. The apprenticeship or training certification is not required for a material proposal.

Material proposals and deliver and install proposals shall utilize the same invitation for bid documents, as outlined in Section 12-2.01(b). Prequalification of bidders is optional for all material proposals and deliver and install proposals regardless of the estimated cost.

Chief Counsel

Apprenticeship or Training Program Certification

Return with Bid

Route _____
County _____
Local Agency _____
Section _____

All contractors are required to complete the following certification:

- For this contract proposal or for all groups in this deliver and install proposal.
For the following deliver and install groups in this material proposal:

Illinois Department of Transportation policy, adopted in accordance with the provisions of the Illinois Highway Code, requires this contract to be awarded to the lowest responsive and responsible bidder. The award decision is subject to approval by the Department. In addition to all other responsibility factors, this contract or deliver and install proposal requires all bidders and all bidders' subcontractors to disclose participation in apprenticeship or training programs that are (1) approved by and registered with the United States Department of Labor's Bureau of Apprenticeship and Training, and (2) applicable to the work of the above indicated proposals or groups. Therefore, all bidders are required to complete the following certification:

- I. Except as provided in paragraph IV below, the undersigned bidder certifies that it is a participant, either as an individual or as part of a group program, in an approved apprenticeship or training program applicable to each type of work or craft that the bidder will perform with its own employees.
II. The undersigned bidder further certifies for work to be performed by subcontract that each of its subcontractors submitted for approval either (A) is, at the time of such bid, participating in an approved, applicable apprenticeship or training program; or (B) will, prior to commencement of performance of work pursuant to this contract, establish participation in an approved apprenticeship or training program applicable to the work of the subcontract.
III. The undersigned bidder, by inclusion in the list in the space below, certifies the official name of each program sponsor holding the Certificate of Registration for all of the types of work or crafts in which the bidder is a participant and that will be performed with the bidder's employees. Types of work or craft that will be subcontracted shall be included and listed as subcontract work. The list shall also indicate any type of work or craft job category for which there is no applicable apprenticeship or training program available.

IV. Except for any work identified above, any bidder or subcontractor that shall perform all or part of the work of the contract or deliver and install proposal solely by individual owners, partners or members and not by employees to whom the payment of prevailing rates of wages would be required, check the following box, and identify the owner/operator workforce and positions of ownership.

The requirements of this certification and disclosure are a material part of the contract, and the contractor shall require this certification provision to be included in all approved subcontracts. The bidder is responsible for making a complete report and shall make certain that each type of work or craft job category that will be utilized on the project is accounted for and listed. The Department at any time before or after award may require the production of a copy of each applicable Certificate of Registration issued by the United States Department of Labor evidencing such participation by the contractor and any or all of its subcontractors. In order to fulfill the participation requirement, it shall not be necessary that any applicable program sponsor be currently talking or that it will take applications for apprenticeship, training or employment during the performance of the work of this contract, material or deliver and install proposal.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2007-03
SUBJECT: CONTEXT SENSITIVE SOLUTIONS
ISSUED DATE: May 18, 2007
EFFECTIVE DATE: June 1, 2007

This memorandum adds Section 10-5 and Section 21-7 to the Bureau of Local Roads & Streets Manual.

Public Act 093-0545, which became effective January 1, 2004, provides that the Illinois Department of Transportation "...shall embrace principles of context sensitive design and context sensitive solutions in its policies and procedures for the planning, design, construction, and operation of its projects for new construction, reconstruction, or major expansion of existing transportation facilities." This is to ensure that the Department's projects "...adequately meet the State's transportation needs, exist in harmony with their surroundings, and add lasting value to the communities they serve." Departmental Policy D&E 21, issued on August 1, 2005, formally codified Context Sensitive Solutions (CSS) as the official policy of the Department for projects utilizing CSS principles.

If local agencies chose to implement CSS on local highway projects funded with federal, State, or Motor Fuel Tax, the procedures outlined in [BDE Procedure Memorandum 48-06](#) should be used. Under certain circumstances the department may require CSS to be used on local projects in order to comply with PA 093-0545.

For more information about CSS, go to www.dot.il.gov/css/home.html. Please contact Kevin Burke at kevin.burkeiii@illinois.gov with any questions.

A handwritten signature in cursive script that reads "Charles J. Dingsell".

BDE PROCEDURE MEMORANDUM

NUMBER: 5-07

BLRS PROCEDURE MEMORANDUM

NUMBER: 2007- 04

SUBJECT: Value Engineering Program

DATE: June 18, 2007

This memorandum supersedes and replaces BDE Procedure Memorandum 5-00, dated April 3, 2000. The changes clarify and expand the previous guidance and will be incorporated in future updates of the BDE Manual and into Section 4-1.15 of the LRS Manual.

Background

Under 23 CFR, Part 627, the FHWA requires a program be established to improve project quality, reduce project costs, foster innovations, eliminate unnecessary and costly design elements, and to ensure efficient investments through the use of Value Engineering (VE).

Applicability

The procedures in this memorandum are applicable to all federal-aid highway projects with an estimated cost of \$25 million or more and all federal-aid bridge projects with an estimated cost of \$20 million or more.

Definitions

Highway Project - Projects with an estimated cost of \$25 million or more and bridge projects with an estimated cost of \$20 million or more. Such projects may encompass multiple construction contracts.

Value Engineering (VE) - The systematic application of recognized techniques by a multi-disciplinary team to identify the function of a product or service, establish a worth for that function, generate alternatives through the use of creative thinking, and provide the needed functions to accomplish the original purpose of the project, reliably and at the lowest life-cycle cost without sacrificing safety, necessary quality, and environmental attributes of the project.

HARD COPIES UNCONTROLLED

Procedures

(a) **Project Selection.** Each district identifies applicable projects during the preparation of the multi-year program. Due to the complexity and scope of large projects, more than one VE study may be desirable. Other projects not meeting the definition may be selected for this program. The District shall notify the central office and FHWA of the identified projects as part of the multi-year plan development.

(b) **Project Cost.** Costs associated with environmental studies, preliminary engineering, final design, land acquisition and construction should be used in determining the selected project's cost. The project cost includes state, local agency, and federal-aid highway funds.

(c) **Scope of Studies.**

(1) Initiation of VE Study. Schedule VE studies in such a manner so as not to cause delay of the project. For a Phase I report with multiple construction contracts, develop a plan for conducting the VE study(s) based on the Phase I considerations and the nature and complexity of the work type, (e.g., one VE study may cover alike construction projects). A single VE study should cover as many construction contracts under the single Phase I report as practicable and beneficial. The VE study should be initiated as close to the completion of the Phase I report as possible. Initiate the VE study no later than the time the construction plans are 30% complete and to allow for the implementation of the recommendations without delaying the project. The VE study should be, at the least, scheduled when the Phase I report is completed.

(2) Team Makeup. The VE team, selected by the district, consists of individuals not personally involved in the design of the project. The team leader should have attended the NHI course on Value Engineering or have equivalent experience in the preparation of VE studies. When making up the team, take into account the following:

- Draw team members from either the district or central office;
- Consider individuals from specialty areas depending on the project scope;
- Assign personnel from construction, maintenance, and studies and plans (as applicable);
- Include representatives from environment, operations, and land acquisition as necessary;
- Include individuals from the public and other agencies when in the public interest;
- Participation by FHWA members is encouraged where feasible;
- Participation by the central office is encouraged; and
- Invitation of IDOT personnel from nearby districts should be considered.

Qualified consultants may be retained to conduct VE studies provided the consultant has not worked on the subject project or the consultant maintains an independent VE study team.

(3) Process. To best accomplish the goals of Value Engineering, the districts have considerable latitude in determining the type, size, and complexity of a VE study. Value engineering studies should follow widely recognized problem solving principles.

(4) Final Report. Each Study concludes with a formal VE report, which outlines the decisions and recommendations and is presented to the Deputy Director/Regional Engineer or his/her representative. Each district establishes a procedure for prompt review and implementation of the approved recommendations. When any recommendation is a major change to an approved Design Report or is a design exception to policy, the recommended change is coordinated through the appropriate central bureau.

(5) Monitoring. Each district appoints a VE coordinator who is knowledgeable in VE studies and trained in VE procedures. The VE coordinator's responsibilities include monitoring each VE study from initiation through the final report, reviewing the report, and assisting in the implementation of the findings. As there may be local projects meeting this threshold, the district VE coordinator will be responsible for coordinating both state and local roads administered projects. During the month of October, each year, the district VE coordinator sends the Bureau of Design and Environment's VE coordinator a list, which itemizes the total number of VE studies conducted over the past year and the estimated cost savings for each study. BDE will summarize the information and forward it to the FHWA. The central office BDE VE coordinator will compile an annual list of approved recommendations from all VE studies completed within that year. This report shall be compiled and highlights presented at the fall project development meeting.

Constructability Reviews

Constructability reviews are a useful tool for complex or unusual projects and are encouraged as a cost or time saving measure. These reviews may include the use of IDOT personnel, unassociated with the project, or consultant/contractor teams that would not be bidding on the project. These reviews would not typically be making complex design change recommendations as would be expected in a full VE study. The constructability review would focus upon staging issues, work staging areas, field expedient procedures or methods, and similar activities focused upon accelerating or enhancing the proposed design.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2007-05
SUBJECT: HIGHWAY BRIDGE PROGRAM (HBP) APPROACH LIMITS
ISSUED DATE: October 1, 2007
EFFECTIVE DATE: October 1, 2007

This memorandum modifies Sections 4-1, Section 32-2 and Section 35-3 to the Bureau of Local Roads and Streets Manual.

The Illinois Department of Transportation formed a task force comprised of staff from the Federal Highway Administration, Department of Transportation and local government highway officials to review and specify the eligible approach and touchdown limits for federally-funded projects; to clarify requirements for use of a design speed greater than the minimum design speed in appropriate situations; and to increase funding opportunities for bridge approaches, thereby reducing the effects of immediate functional obsolescence that could result from constructing "perched" bridges.

Extended eligible approach limits allow local governments with limited funds to fully construct bridge projects in a safe and functionally adequate manner. The design engineer may decide to use a higher design speed for given bridges in order to provide an operating speed commensurate with the use of the highway. The design speed shall be applied consistently throughout the project.

Please contact Darrell Lewis at (217)782-3827 or Jim Klein at (217)782-5928 with any questions.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2008-01
SUBJECT: FINAL RULE ON MAINTAINING SIGN
RETROREFLECTIVITY
ISSUED DATE: February 28, 2008
EFFECTIVE DATE: January 22, 2008

This memorandum and PM2008-02 supersede Chapter 39 Section 2 of the BLRS Manual dated August 2007.

Revision 2 of the 2003 Manual on Uniform Traffic Control Devices (MUTCD) was published in the Federal Register on December 21, 2007, and became effective on January 22, 2008. The final rule provides additional requirements, guidance, and clarification in maintaining traffic sign retroreflectivity that is already required by the MUTCD. The minimum retroreflectivity levels and maintenance methods consider changes in the composition of the vehicle population, vehicle headlamp design, and the demographics of drivers. The FHWA expects that the levels and maintenance methods will help to promote safety and mobility on the nation's streets and highways

The final rule establishes the following compliance periods from the effective date:

- 4 years for implementation and continued use of an assessment or management method that is designed to maintain traffic sign retroreflectivity at or above the established minimum levels;
- 7 years for replacement of regulatory, warning, and ground-mounted guide (except street name) signs that are identified using the assessment or management method as failing to meet the established minimum levels; and
- 10 years for replacement of street name signs and overhead guide signs that are identified using the assessment or management method as failing to meet the established minimum levels.

Resource guides and other information are available from the Federal Highway Administration's (FHWA) website at www.fhwa.dot.gov/retro.

The Bureau of Local Roads & Streets' Illinois Technology Transfer (ILT2) Center in partnership with FHWA IL Division is holding several training courses to assist local highway agencies comply with the final rule. Please go to www.dot.il.gov/blr/training.asp for a complete list of training courses.

HARD COPIES UNCONTROLLED

The ILT2 Center has also partnered with the Utah Local Technical Assistance Program (UT LTAP) to provide Geographic Information System (GIS) based sign inventory. This software will be made available to local highway agencies over the upcoming months and training will be provided. However, agencies may elect to maintain a sign inventory and inspection records using a field book, other paper documentation, in-house developed software, or purchased software.

If you have any questions, please contact Kevin Burke of this bureau at kevin.burkeiii@illinois.gov.

A handwritten signature in black ink that reads "Charles J. Dingersoll". The signature is written in a cursive style with a large, prominent initial "C".

RETROREFLECTIVITY REQUIREMENTS

Traffic signs provide important information to drivers at all times, both day and night. To be effective, their visibility must be maintained. The 2003 *Manual on Uniform Traffic Control Devices* (MUTCD) addresses sign visibility in several places, including Sections 1A.03, 1A.04, 1A.05, 2A.06, 2A.08, and 2A.22. These sections address factors such as uniformity, design, placement, operation, and maintenance. Previously, the MUTCD did not specify minimum retroreflectivity levels.

The second revision of the 2003 MUTCD introduces new language establishing minimum retroreflectivity levels that must be maintained for traffic signs. **Agencies have until January 2012, to establish and implement a sign assessment or management method to maintain minimum levels of sign retroreflectivity.**

The compliance date for regulatory, warning, and ground-mounted guide signs is January 2015. For overhead guide signs and street name signs, the compliance date is January 2018. The new MUTCD language is shown on page 2 and 3 of this document.

The new standard in Section 2A.09 requires that agencies maintain traffic signs to a minimum level of retroreflectivity outlined in Table 2A-3 of the MUTCD. The Federal Highway Administration (FHWA) believes that this proposed change will promote safety while providing sufficient flexibility for agencies to choose a maintenance method that best matches their specific conditions.

Including Table 2A-3 in the MUTCD does not imply that an agency must measure the retroreflectivity of every sign. Rather, the new MUTCD language describes five methods that agencies can use to maintain traffic sign retroreflectivity at or above the minimum levels. Agencies can choose from these methods or combine them. Agencies are allowed to develop other appropriate methods based on engineering studies. However, agencies should adopt a consistent method that produces results that correspond to the values in Table 2A-3.

The new MUTCD language recognizes that there may be some

individual signs that do not meet the minimum retroreflectivity levels at a particular point in time. As long as the agency with jurisdiction is maintaining signs in accordance with Section 2A.09 of the MUTCD, the agency will be considered to be in compliance. This document describes methods that can be used to maintain sign retroreflectivity at or above the MUTCD's minimum maintained retroreflectivity levels.

RETROREFLECTIVITY MAINTENANCE

The MUTCD describes two basic types of methods that agencies can use to maintain sign retroreflectivity at or above the MUTCD minimum maintained retroreflectivity levels — assessment methods and management methods. The FHWA has identified and listed assessment and management methods for maintaining sign retroreflectivity in accordance with Section 2A.09. These methods are described on page four. A full report on these methods can be found at www.fhwa.dot.gov/retro.

New MUTCD Minimum Retroreflectivity Compliance Periods

- Four years for implementation and continued use of an assessment or management method that is designed to maintain traffic sign retroreflectivity at or above the established minimum levels;
- Seven years for replacement of regulatory, warning, and ground-mounted guide (except street name) signs that are identified using the assessment or management methods as failing to meet the established minimum levels; and
- Ten years for replacement of street name signs and overhead guide signs that are identified using the assessment or management method as failing to meet the established minimum levels.

New MUTCD Section 2A.09 Maintaining Minimum Retroreflectivity

Support:

Retroreflectivity is one of several factors associated with maintaining nighttime sign visibility (see Section 2A.22).

Standard:

Public agencies or officials having jurisdiction shall use an assessment or management method that is designed to maintain sign retroreflectivity at or above the minimum levels in Table 2A-3.

Support:

Compliance with the above Standard is achieved by having a method in place and using the method to maintain the minimum levels established in Table 2A-3. Provided that an assessment or management method is being used, an agency or official having jurisdiction would be in compliance with the above Standard even if there are some individual signs that do not meet the minimum retroreflectivity levels at a particular point in time.

Guidance:

Except for those signs specifically identified in the Option portion of this Section, one or more of the following assessment or management methods should be used to maintain sign retroreflectivity:

- Visual Nighttime Inspection** – The retroreflectivity of an existing sign is assessed by a trained sign inspector conducting a visual inspection from a moving vehicle during nighttime conditions. Signs that are visually identified by the inspector to have retroreflectivity below the minimum levels should be replaced.
- Measured Sign Retroreflectivity** – Retroreflectivity is measured using a retroreflectometer. Signs with retroreflectivity below the minimum levels should be replaced.
- Expected Sign Life** – When signs are installed, the installation date is labeled or recorded so that the age of a sign is known. The age of the sign is compared to the expected sign life. The expected sign life is based on the experience of sign retroreflectivity degradation in a geographic area compared to the minimum levels. Signs older than the expected life should be replaced.

- Blanket Replacement** – All signs in an area/corridor, or of a given type, should be replaced at specified intervals. This eliminates the need to assess retroreflectivity or track the life of individual signs. The replacement interval is based on the expected sign life, compared to the minimum levels, for the shortest-life material used on the affected signs.
- Control Signs** – Replacement of signs in the field is based on the performance of a sample of control signs. The control signs might be a small sample located in a maintenance yard or a sample of signs in the field. The control signs are monitored to determine the end of retroreflective life for the associated signs. All field signs represented by the control sample should be replaced before the retroreflectivity levels of the control sample reach the minimum levels.
- Other Methods** – Other methods developed based on engineering studies can be used.

Support:

Additional information about these methods is contained in the 2007 Edition of FHWA's "Maintaining Traffic Sign Retroreflectivity" (see Section 1A.11).

Option:

Highway agencies may exclude the following signs from the retroreflectivity maintenance guidelines described in this Section:

- Parking, Standing, and Stopping signs (R7 and R8 series)
- Walking/Hitchhiking/Crossing signs (R9 series, R10-1 through R10-4b)
- Adopt-A-Highway signs
- All signs with blue or brown backgrounds
- Bikeway signs that are intended for exclusive use by bicyclists or pedestrians

New MUTCD Table 2A-3. Minimum Maintained Retroreflectivity Levels ①

SIGN COLOR	SHEETING TYPE (ASTM D4956-04)				ADDITIONAL CRITERIA
	Beaded Sheeting			Prismatic Sheeting	
	I	II	III	III, IV, VI, VII, VIII, IX, X	
White on Green	W*; G ≥ 7	W*; G ≥ 15	W*; G ≥ 25	W ≥ 250; G ≥ 25	Overhead
	W*; G ≥ 7	W ≥ 120; G ≥ 15			Ground-mounted
Black on Yellow or Black on Orange	Y*; O*	Y ≥ 50; O ≥ 50			②
	Y*; O*	Y ≥ 75; O ≥ 75			③
White on Red	W ≥ 35; R ≥ 7				④
Black on White	W ≥ 50				—

- ① The minimum maintained retroreflectivity levels shown in this table are in units of cd/lx/m² measured at an observation angle of 0.2° and an entrance angle of -4.0°.
- ② For text and fine symbol signs measuring at least 1200 mm (48 in) and for all sizes of bold symbol signs
- ③ For text and fine symbol signs measuring less than 1200 mm (48 in)
- ④ Minimum Sign Contrast Ratio ≥ 3:1 (white retroreflectivity ÷ red retroreflectivity)
- * This sheeting type should not be used for this color for this application.

BOLD SYMBOL SIGNS

- W1-1, -2 – Turn and Curve
- W1-3, -4 – Reverse Turn and Curve
- W1-5 – Winding Road
- W1-6, -7 – Large Arrow
- W1-8 – Chevron
- W1-10 – Intersection in Curve
- W1-15 – 270 Degree Loop
- W2-1 – Cross Road
- W2-2, -3 – Side Road
- W2-4, -5 – T and Y Intersection
- W2-6 – Circular Intersection
- W3-1 – Stop Ahead
- W3-2 – Yield Ahead
- W3-3 – Signal Ahead
- W4-1 – Merge
- W4-2 – Lane Ends
- W4-3 – Added Lane
- W4-6 – Entering Roadway Added Lane
- W6-1, -2 – Divided Highway Begins and Ends
- W6-3 – Two-Way Traffic
- W10-1, -2, -3, -4, -11, -12 – Highway-Railroad Advance Warning
- W11-2 – Pedestrian Crossing
- W11-3 – Deer Crossing
- W11-4 – Cattle Crossing
- W11-5 – Farm Equipment
- W11-6 – Snowmobile Crossing
- W11-7 – Equestrian Crossing
- W11-8 – Fire Station
- W11-10 – Truck Crossing
- W12-1 – Double Arrow
- W16-5p, -6p, -7p – Pointing Arrow Plaques
- W20-7a – Flagger
- W21-1a – Worker

FINE SYMBOL SIGNS – Symbol Signs Not Listed As Bold Symbol Signs

SPECIAL CASES

- W3-1 – Stop Ahead: Red retroreflectivity ≥ 7
- W3-2 – Yield Ahead: Red retroreflectivity ≥ 7; White retroreflectivity ≥ 35
- W3-3 – Signal Ahead: Red retroreflectivity ≥ 7; Green retroreflectivity ≥ 7
- W3-5 – Speed Reduction: White retroreflectivity ≥ 50
- For non-diamond shaped signs such as W14-3 (No Passing Zone), W4-4p (Cross Traffic Does Not Stop), or W13-1, -2, -3, -5 (Speed Advisory Plaques), use largest sign dimension to determine proper minimum retroreflectivity level.

ASSESSMENT METHODS

Assessment methods require evaluation of individual signs within an agency's jurisdiction. There are two basic assessment methods — visual assessment and measured sign retroreflectivity.

1. VISUAL ASSESSMENT

Nighttime Inspection

In the visual nighttime inspection method, on-the-fly assessments of retroreflectivity are made by an inspector during nighttime conditions. The following recommendations provide general guidance for the inspections:

- Develop guidelines and procedures for inspectors to use in conducting the nighttime inspections and train inspectors in the use of these procedures.
- Conduct inspections at normal speed from the travel lane(s).
- Conduct inspections using low-beam headlights while minimizing interior vehicle lighting.
- Evaluate signs at typical viewing distances so that adequate time is available for an appropriate driving response.

One or more of the following procedures should be used to support visual inspections.

Calibration Signs Procedure

In this procedure, an inspector views a “calibration sign” prior to conducting the nighttime inspection described above. Calibration signs have known retroreflectivity levels at or above minimum levels. These signs are set up where the inspector can view the calibration signs in a manner similar to nighttime field inspections. The inspector uses the visual appearance of the calibration sign to establish the evaluation threshold for that night's inspection activities. The following factors provide additional information on the use of this procedure:

- Calibration signs are needed for each color of sign in Table 2A-3.
- Calibration signs are viewed at typical viewing distances using the inspection vehicle.
- Calibration signs need to be properly stored between inspections so that their retroreflectivity does not deteriorate over time.
- Calibration sign retroreflectivity should be verified periodically.

Comparison Panels Procedure

Comparison panels are used to assess signs that have marginal retroreflectivity. The comparison panels are fabricated at retroreflectivity levels at or above the minimum levels. When the visual inspection identifies the retroreflectivity of a sign as marginal, a comparison panel is attached to the sign and the sign/panel combination is viewed and compared by the inspector.

Consistent Parameters Procedure

Nighttime inspections are conducted under similar factors that were used in the research to develop the minimum retroreflectivity levels. These factors include:

- Using a sport utility vehicle or pick-up truck to conduct the inspection.
- Using a model year 2000 or newer vehicle for the inspection.
- Using an inspector who is at least 60 years old.

2. MEASURED SIGN RETROREFLECTIVITY

In this method the retroreflectivity of a sign is measured and directly compared to the minimum level appropriate for that sign. ASTM E1709, Standard Test Method for Measurement of Retroreflective Signs Using a Portable Retroreflectometer, provides a standard method for measuring sign retroreflectivity.

An agency can choose to use either an assessment method or a management method, or a combination of the two. Agencies may develop other methods as long as they are documented in an engineering study and correspond to the values in Table 2A.3.

MANAGEMENT METHODS

Management methods provide an agency with the ability to maintain sign retroreflectivity without having to assess individual signs. There are three basic management methods — sign replacement based on expected sign life, blanket replacement of large numbers of signs at appropriate intervals, and use of control signs.

1. EXPECTED SIGN LIFE

In this method, individual signs are replaced before they reach the end of their expected service life, which is the time anticipated for the retroreflective material to degrade to the appropriate minimum level. Expected service life can be based on sign sheeting warranties, weathering deck results, measurements of field signs, or other criteria.

This method requires a system for tracking sign age. A common approach for identifying the age of individual signs uses a label on the sign to mark the year of fabrication or installation. Sign management systems can also be used to track the age of individual signs.

2. BLANKET REPLACEMENT

With this method, an agency replaces all signs in an area, or of a given type, at specified time intervals based on the relevant expected sign life. This method typically requires that all of the designated signs within a replacement area, or of the particular sign type, be replaced even if a sign was recently installed.

3. CONTROL SIGNS

In this method, a control sample of signs is used to represent all of an agency's signs. The retroreflectivity of the control signs is monitored and sign replacement is based on the performance of the control signs.

- Agencies should develop a sampling plan to determine the appropriate number and type of control signs needed to represent the agency's signs.
- Control signs may be actual signs in the field or signs in a maintenance yard (for convenience).
- The retroreflectivity of the control signs should be monitored using an assessment method.

MUTCD Revision 2

Introduction

Add the following new entry in the compliance date list that begins on Page I-3:

Section 2A.09 Maintaining Minimum Retroreflectivity—new section—from the effective date of the Final Rule for Revision 2 of the 2003 MUTCD:

- 4 years for implementation and continued use of an assessment or management method that is designed to maintain traffic sign retroreflectivity at or above the established minimum levels;
- 7 years for replacement of regulatory, warning, and ground-mounted guide (except street name) signs that are identified using the assessment or management method as failing to meet the established minimum levels; and
- 10 years for replacement of street name signs and overhead guide signs that are identified using the assessment or management method as failing to meet the established minimum levels.

Section 1A.11 Relation to Other Publications

Add the following new paragraph just prior to the paragraph that begins with "Other publications that are useful sources...":

The publication entitled "Maintaining Traffic Sign Retroreflectivity" (2007 Edition) is available at www.fhwa.dot.gov/retro, or write to the FHWA, 1200 New Jersey Avenue, SE, HSA-1, Washington, DC 20590.

Section 2A.09 Maintaining Minimum Retroreflectivity

Replace the previous title and parenthetical note that reserved this section for future rulemaking with the title shown above and the text shown below:

Support:

Retroreflectivity is one of several factors associated with maintaining nighttime sign visibility (see Section 2A.22).

Standard:

Public agencies or officials having jurisdiction shall use an assessment or management method that is designed to maintain sign retroreflectivity at or above the minimum levels in Table 2A-3.

Support:

Compliance with the above Standard is achieved by having a method in place and using the method to maintain the minimum levels established in Table 2A-3. Provided that an assessment or management method is being used, an agency or official having jurisdiction would be in compliance with the above Standard even if there are some individual signs that do not meet the minimum retroreflectivity levels at a particular point in time.

Guidance:

Except for those signs specifically identified in the Option in this Section, one or more of the following assessment or management methods should be used to maintain sign retroreflectivity:

- Visual Nighttime Inspection – The retroreflectivity of an existing sign is assessed by a trained sign inspector conducting a visual inspection from a moving vehicle during nighttime conditions. Signs that are visually identified by the inspector to have retroreflectivity below the minimum levels should be replaced.
- Measured Sign Retroreflectivity – Sign retroreflectivity is measured using a retroreflectometer. Signs with retroreflectivity below the minimum levels should be replaced.
- Expected Sign Life – When signs are installed, the installation date is labeled or recorded so that the age of a sign is known. The age of the sign is compared to the expected sign life. The expected sign life is based on the experience of sign retroreflectivity degradation in a geographic area compared to the minimum levels. Signs older than the expected life should be replaced.
- Blanket Replacement – All signs in an area/corridor, or of a given type, should be replaced at specified intervals. This eliminates the need to assess retroreflectivity or track the life of individual signs. The replacement interval is based on the expected sign life, compared to the minimum levels, for the shortest-life material used on the affected signs.
- Control Signs – Replacement of signs in the field is based on the performance of a sample of control signs. The control signs might be a small sample located in a maintenance yard or a sample of signs in the field. The control signs are monitored to determine the end of retroreflective life for the associated signs. All field signs represented by the control sample should be replaced before the retroreflectivity levels of the control sample reach the minimum levels.
- Other Methods – Other methods developed based on engineering studies can be used.

Support:

HARD COPIES UNCONTROLLED

Additional information about these methods is contained in the 2007 Edition of FHWA's "Maintaining Traffic Sign Retroreflectivity" (see Section 1A.11).

Option:

Highway agencies may exclude the following signs from the retroreflectivity maintenance guidelines described in this Section:

- A. Parking, Standing, and Stopping signs (R7 and R8 series)
- B. Walking/Hitchhiking/Crossing signs (R9 series, R10-1 through R10-4b)
- C. Adopt-A-Highway signs
- D. All signs with blue or brown backgrounds
- E. Bikeway signs that are intended for exclusive use by bicyclists or pedestrians

Table 2A-3 Minimum Maintained Retroreflectivity Levels

Add the following new table:

Table 2A-3. Minimum Maintained Retroreflectivity Levels^①

Sign Color	Sheeting Type (ASTM D4956-04)				Additional Criteria
	Beaded Sheeting			Prismatic Sheeting	
	I	II	III	III, IV, VI, VII, VIII, IX, X	
White on Green	W*; G ≥ 7	W*; G ≥ 15	W*; G ≥ 25	W ≥ 250; G ≥ 25	Overhead
	W*; G ≥ 7	W ≥ 120; G ≥ 15			Ground-mounted
Black on Yellow or Black on Orange	Y*; O*	Y ≥ 50; O ≥ 50			②
	Y*; O*	Y ≥ 75; O ≥ 75			③
White on Red	W ≥ 35; R ≥ 7				④
Black on White	W ≥ 50				—

[FHWA Docket No. FHWA-2003-15149]

RIN 2125-AE98

National Standards for Traffic Control Devices; the Manual on Uniform Traffic Control Devices for Streets and Highways; Maintaining Traffic Sign Retroreflectivity

AGENCY: Federal Highway Administration (FHWA), DOT.

ACTION: Final rule.

SUMMARY: The Manual on Uniform Traffic Control Devices (MUTCD) is incorporated by reference in 23 CFR part 655, subpart F, approved by the Federal Highway Administration, and recognized as the national standard for traffic control devices used on all public roads. The purpose of this final rule is to revise standards, guidance, options, and supporting information relating to maintaining minimum levels of retroreflectivity for traffic signs on all roads open to public travel.

EFFECTIVE DATE: This final rule is effective January 22, 2008. The incorporation by reference of the publication listed in this regulation is

approved by the Director of the Office of the Federal Register as of January 22, 2008.

FOR FURTHER INFORMATION CONTACT: Ms. Mary McDonough, Office of Safety Design, (202) 366-2175, or Mr. Raymond W. Cuprill, Office of the Chief Counsel, (202) 366-0791, U.S. Department of Transportation, Federal Highway Administration, 1200 New Jersey Ave., SE., Washington, DC 20590. Office hours are from 7:45 a.m. to 4:15 p.m., E.T., Monday through Friday, except Federal holidays.

SUPPLEMENTARY INFORMATION:**Electronic Access**

This document, the notice of proposed amendments (NPA), the supplemental notice of proposed amendments (SNPA), and all comments received may be viewed online through the Federal eRulemaking portal at <http://www.regulations.gov>. Electronic submission and retrieval help and guidelines are available under the help section of the Web site.

An electronic copy of this document may also be downloaded from the Office of the **Federal Register's** home page at: <http://www.archives.gov> and the Government Printing Office's Web page at: <http://www.access.gpo.gov/nara>.

Background

On July 30, 2004, at 69 FR 45623, the FHWA published in the **Federal Register** a NPA proposing to amend the MUTCD to include methods to maintain traffic sign retroreflectivity. The NPA was issued in response to section 406 of the Department of Transportation and Related Agencies Appropriations Act, 1993 (Pub. L. 102-388; October 6, 1992). Section 406 of this Act directed the Secretary of Transportation to revise the MUTCD to include a standard for minimum levels of retroreflectivity that must be maintained for traffic signs and pavement markings, which apply to all roads open to public travel. The FHWA is currently conducting research to develop a standard for minimum levels of pavement marking retroreflectivity. The FHWA expects to initiate the pavement marking retroreflectivity rulemaking process once the research is concluded and the results are analyzed and considered.

The FHWA has led a significant effort toward establishing minimum-maintained levels of sign retroreflectivity since the statute was issued in 1993. Three national workshops were held in 1995 to educate State and local highway agency personnel and solicit their input regarding an initial set of minimum

maintained sign retroreflectivity levels. In 1998, FHWA published revisions to initial research recommendations on minimum sign retroreflectivity levels¹ noting that additional work would be needed because the National Highway Traffic Safety Administration was also revising the Federal Motor Vehicle Safety Standard Number 108 Lamps, Reflective Devices, and Associated Equipment (FMVSS 108). The additional research was completed in 2003, at which time FHWA began preparing the NPA for traffic sign retroreflectivity for the MUTCD, which was published in 2004.

After considering and analyzing the comments on the NPA for minimum levels of retroreflectivity for traffic signs, FHWA decided to publish a supplemental notice of proposed amendments (SNPA). In particular, the SNPA was developed to address comments to the docket that: (1) Expressed concern that the NPA proposal did not meet the intent of the 1993 statute, (2) suggested that the table of minimum retroreflectivity levels should be placed in the MUTCD, (3) requested clarification of the compliance period, and (4) expressed concern about the resource requirements for complying with the rulemaking. The proposed MUTCD text in the SNPA included a STANDARD statement that required that a method be used to manage and maintain retroreflectivity and required that sign retroreflectivity be maintained at minimum levels. It also included the table of minimum retroreflectivity levels in the MUTCD. These changes were significant enough to warrant an SNPA to allow FHWA to obtain and assess additional public comments. The SNPA was published on May 8, 2006, at 71 FR 26711. The comment period for the SNPA ended on November 6, 2006.

Based on the comments received and its own experience, FHWA is issuing this final rule establishing the minimum levels of retroreflectivity that must be maintained for traffic signs. The FHWA is designating the MUTCD, with these changes incorporated, as Revision 2 of the 2003 Edition of the MUTCD.

The text of this Revision No. 2 and the text of the 2003 Edition of the MUTCD with Revision No. 2 final text incorporated are available for inspection and copying as prescribed in 49 CFR

¹ A copy of "An Implementation Guide For Minimum Retroreflectivity Requirements for Traffic Signs," dated April 1, 1998, can be found on the Docket Management System (FHWA-2003-15149-229) for this ruling at the following Web address: <http://dms.dot.gov/search/document.cfm?documentid=467771&docketid=15149>.

part 7 at the FHWA Office of Transportation Operations. Furthermore, final Revision No. 2 changes are available on the official MUTCD Web site at <http://mutcd.fhwa.dot.gov>. The entire MUTCD text with final Revision No. 2 text incorporated is also available on this Web site.

Summary of Comments

The FHWA received 121 letters submitted to the docket in response to the SNPA containing approximately 550 individual comments. The FHWA received comments from the National Committee on Uniform Traffic Control Devices (NCUTCD), the American Association of State Highway and Transportation Officials (AASHTO) and 20 State Departments of Transportation (DOT) members of AASHTO, the National Association of County Engineers (NACE) and seven county association members of NACE, city and county governmental agencies, consulting firms, private industry, associations, other organizations, and individual private citizens. The FHWA has considered all these comments. Docket comments and summaries of FHWA's analyses and determinations are discussed below. General comments are discussed first, followed by discussion of major issues and adopted changes, and finally, discussion of other comments.

Discussion of General Comments

Many respondents agreed with the intent and the concepts proposed in both the NPA and the SNPA. In analyzing the comments to the SNPA, FHWA decided that additional clarification should be provided in the MUTCD text and in the explanations provided in the final rule in order to address the following five major issues:

- (1) Clarification of compliance period;
- (2) Resource burdens on public agencies;
- (3) Statutory requirements;
- (4) Table of minimum retroreflectivity levels in the MUTCD; and
- (5) Impacts of sign retroreflectivity on safety.

Discussion of Major Issues

This section provides a discussion of each of the five major issues raised by commenters in response to the SNPA, along with FHWA's analysis and resolution.

- (1) Clarification of the compliance period.

Several county associations and many county and local officials requested an extension from 2 to 4 years for the compliance period for the establishment

and implementation of a method to maintain sign retroreflectivity, in order to accommodate their programs within their 2-year budget cycles. There were also a few requests to extend the 7 and 10 year compliance periods for the signs themselves.

Considering the comments regarding budget cycles, particularly budget cycles for local agencies, FHWA has extended to 4 years the compliance period for establishing and implementing a sign assessment or management method to maintain minimum levels of sign retroreflectivity. This extended compliance period will allow transportation agencies to make allowances for budgets (including working with the States or regional organizations) to access funds and/or partnerships to achieve the minimum levels of sign retroreflectivity.

The 7 and 10 year compliance dates for minimum levels for sign retroreflectivity will remain 7 years for regulatory, warning, and ground-mounted guide signs and 10 years for street name and overhead guide signs, because these compliance target dates correspond to the normal expected service life of sign sheeting and will allow highway agencies to make the proper accommodations in their efforts to maintain minimum retroreflectivity levels. The 7 and 10 year compliance dates are counted from the effective date of this rule and are not in addition to the 4-year period for establishing the methods.

- (2) Resource burdens on public agencies.

While the Minnesota DOT (MNDOT) recognized that the proposed language would impose additional time and resource burdens on public agencies, it did not perceive this rule as an "unmanageable burden." Several sign manufacturers and some private citizens appreciated the FHWA's effort to point out that Federal funds are available for up to 100 percent funding of "replacement of signs in this program." In addition, the American Traffic Safety Services Association (ATSSA), the American Automobile Association (AAA), the American Association of Retired People (AARP), the American Highway Users Alliance (AHUA), and several private citizens agree that the benefits from this rulemaking will outweigh the costs that agencies may experience. However, AASHTO, NACE, and several State and local DOTs believe that the requirements, as proposed in the SNPA, are an unfunded mandate with serious financial implications to their agencies.

The FHWA conducted a study to determine if unfunded mandates, as

defined by the Unfunded Mandates Reform Act of 1995 (Pub. L. 104-4, 109 Stat. 48, March 22, 1995), would be imposed by including requirements in the MUTCD for minimum maintained traffic sign retroreflectivity levels.² Based on the analysis, this rulemaking effort does not impose an unfunded mandate. Additionally, because Federal-aid highway dollars are often provided to States to use for these types of sign replacements, this requirement does not rise to the level of an unfunded mandate.

One commenter reviewed the FHWA's report "Maintaining Traffic Sign Retroreflectivity: Impacts on State and Local Agencies (DRAFT)" (1994-15149-06), and suggested that perhaps there was a mathematical error in that report that would mean that the costs incurred by agencies when replacing signs would be above those that can be required from agencies without funding. The FHWA has updated the 1994 draft report with a 2007 version (see footnote # 2). The updated report now includes the costs of overhead and street name signs, which the 1994 version excluded. The updated report concludes that the national impact of including the minimum maintained traffic sign retroreflectivity levels in the MUTCD is approximately \$37.5 million over a 10-year implementation period, with a maximum annual impact of \$4.5 million in years 1 through 7. This is below the annual \$128.1 million unfunded mandate level.

The FHWA has also provided ample phase-in time for agencies to comply. Agencies are already required to have a highway safety program that includes provisions for the upgrading of substandard traffic control devices and installations to achieve conformity with the MUTCD, so this rulemaking does not create additional burdens.

While many counties believe that FHWA should consider a funding stream directly to local jurisdictions for rulemaking activities such as minimum retroreflectivity standards, such funding stream discussions are outside the scope of this rulemaking. Signing programs remain eligible for Federal-aid highway dollars.

- (3) Statutory requirements:

Several organizations representing highway users from a safety perspective agree that the language proposed in the SNPA satisfied the statutory requirements to establish a standard for the minimum levels of sign

² "Maintaining Traffic Sign Retroreflectivity: Impacts on State and Local Agencies," Publication No. FHWA-HRT-07-042, dated April 2007, is available at the following Web address: <http://www.tfhrc.gov/safety/pubs/07042/index.htm>.

retroreflectivity; however, AASHTO, and several States, commented that Congress did not explicitly indicate that the minimum values for maintaining sign retroreflectivity had to be included in the MUTCD as a Standard.

Alternatively, the Advocates for Highway and Auto Safety (AHAS) believe that the language proposed in the SNPA still did not fully satisfy the statutory requirements, which AHAS interprets as requiring the establishment of specific and mandatory minimum levels of retroreflectivity for signs and pavement markings in the MUTCD and an obligation on State and local authorities to maintain those specific minimum values of retroreflectivity. AHAS stated that the intent can only be met by including such requirements in a "standard" statement in the MUTCD, which is defined as one of the "required, mandatory, or specifically prohibitive practice regarding a traffic control device."

The FHWA includes the reference to minimum levels for sign retroreflectivity in a Standard statement because the statute requires the Secretary to revise the MUTCD to include a standard for minimum levels of retroreflectivity that must be maintained for traffic signs. Under the MUTCD's current organization, the best way to do this is by including it in a STANDARD statement, because Standards represent requirements.³ In addition, the

³In the context of this final rule, the definitions of STANDARD and GUIDANCE are identical to the definitions provided in the Introduction of the MUTCD (<http://mutcd.fhwa.dot.gov>). Specifically, a STANDARD is a statement of required, mandatory or specifically prohibitive practice regarding a traffic control device, while a GUIDANCE is a statement of recommended, but not mandatory, practice in typical situations, with deviations

congressional reference to a standard did not exclude the use of GUIDANCE, OPTION, and SUPPORT statements to help clarify the STANDARD statement of required minimum levels of retroreflectivity that must be maintained, similar to the other sections of the MUTCD.

The FHWA also received comments from the city of Plano, Texas, and the Illinois County Engineers expressing a concern and/or confusion that the language proposed in the SNPA "imbedded" a GUIDANCE statement within a STANDARD, because the STANDARD statement referenced the GUIDANCE statement for minimum retroreflectivity levels.

Based on this concern, and to clarify FHWA's intent, FHWA revises the STANDARD statement to explicitly reference Table 2A-3 Minimum Maintained Retroreflectivity Levels, which contains minimum-maintained retroreflectivity levels for various sign color combinations and types of sign sheeting.

The National Association of Counties (NACo) and NACE suggested adding "recommended" before "minimum level" in describing the retroreflectivity levels shown in Table 2A-3. The FHWA retains the wording "minimum level" in describing the levels shown in Table 2A-3, because the word "recommended" is not appropriate when referencing a Standard.

(4) Table of minimum retroreflectivity levels in the MUTCD.

The ATSSA, AAA, AARP, AHUA, Minnesota and Virginia DOTs, the city of Plano, Texas, sign manufacturers, and many private citizens were in favor of

allowed if engineering judgment or engineering study indicates the deviation to be appropriate.

including the table of minimum retroreflectivity levels in the MUTCD. However, many organizations, such as AASHTO, NACo, NACE, and numerous State DOTs, as well as county and local agencies were opposed to the inclusion of the table. Those who opposed including the table in the MUTCD expressed concern over potential litigation that could be brought against public agencies if an individual sign within their jurisdiction was to fall below the minimum maintained levels in the table. The NCUTCD also commented that before any table is inserted into the MUTCD, FHWA should provide substantial clarification regarding the process and frequency for updating or changing the table of retroreflectivity values.

The FHWA believes that including this table in the MUTCD is necessary to satisfy the statutory requirement that the MUTCD be amended to include minimum retroreflectivity levels. Therefore, the FHWA includes Table 2A-3, titled "Minimum Maintained Retroreflectivity Levels" in the MUTCD. The FHWA also believes inclusion of the table will provide clarity and convenience to the users of the MUTCD. In response to the request by the NCUTCD that FHWA clarify the process for updating or changing values in the table, we note that updates or changes to the table would be subject to a public rulemaking process before FHWA could adopt changes to the values of the table in the MUTCD. This process will include notice and opportunity for comment by the public.

Table 2A-3 will be included in the MUTCD as follows (note that the values in this table have not changed during the rulemaking process):

Table 2A-3. Minimum Maintained Retroreflectivity Levels^①

Sign Color	Sheeting Type (ASTM D4956-04)				Additional Criteria
	Beaded Sheeting		Prismatic Sheeting		
	I	II	III	III, IV, VI, VII, VIII, IX, X	
White on Green	W*; G ≥ 7	W*; G ≥ 15	W*; G ≥ 25	W ≥ 250; G ≥ 25	Overhead
	W*; G ≥ 7	W ≥ 120; G ≥ 15			Ground-mounted
Black on Yellow or Black on Orange	Y*; O*	Y ≥ 50; O ≥ 50			②
	Y*; O*	Y ≥ 75; O ≥ 75			③
White on Red	W ≥ 35; R ≥ 7				④
Black on White	W ≥ 50				—
<p>① The minimum maintained retroreflectivity levels shown in this table are in units of cd/lx/m² measured at an observation angle of 0.2° and an entrance angle of -4.0°.</p> <p>② For text and fine symbol signs measuring at least 1200 mm (48 in) and for all sizes of bold symbol signs</p> <p>③ For text and fine symbol signs measuring less than 1200 mm (48 in)</p> <p>④ Minimum Sign Contrast Ratio ≥ 3:1 (white retroreflectivity ÷ red retroreflectivity)</p> <p>* This sheeting type should not be used for this color for this application.</p>					
Bold Symbol Signs					
<ul style="list-style-type: none"> • W1-1, -2 – Turn and Curve • W1-3, -4 – Reverse Turn and Curve • W1-5 – Winding Road • W1-6, -7 – Large Arrow • W1-8 – Chevron • W1-10 – Intersection in Curve • W1-11 – Hairpin Curve • W1-15 – 270 Degree Loop • W2-1 – Cross Road • W2-2, -3 – Side Road • W2-4, -5 – T and Y Intersection • W2-6 – Circular Intersection • W3-1 – Stop Ahead • W3-2 – Yield Ahead • W3-3 – Signal Ahead • W4-1 – Merge • W4-2 – Lane Ends • W4-3 – Added Lane • W4-5 – Entering Roadway Merge • W4-6 – Entering Roadway Added Lane • W6-1, -2 – Divided Highway Begins and Ends • W6-3 – Two-Way Traffic • W10-1, -2, -3, -4, -11, -12 – Highway-Railroad Advance Warning • W11-2 – Pedestrian Crossing • W11-3 – Deer Crossing • W11-4 – Cattle Crossing • W11-5 – Farm Equipment • W11-6 – Snowmobile Crossing • W11-7 – Equestrian Crossing • W11-8 – Fire Station • W11-10 – Truck Crossing • W12-1 – Double Arrow • W16-5p, -6p, -7p – Pointing Arrow Plaques • W20-7a – Flagger • W21-1a – Worker 					
Fine Symbol Signs – Symbol signs not listed as Bold Symbol Signs.					
Special Cases					
<ul style="list-style-type: none"> • W3-1 – Stop Ahead: Red retroreflectivity ≥ 7 • W3-2 – Yield Ahead: Red retroreflectivity ≥ 7; White retroreflectivity ≥ 35 • W3-3 – Signal Ahead: Red retroreflectivity ≥ 7; Green retroreflectivity ≥ 7 • W3-5 – Speed Reduction: White retroreflectivity ≥ 50 • For non-diamond shaped signs such W14-3 (No Passing Zone), W4-4p (Cross Traffic Does Not Stop), or W13-1, -2, -3, -5 (Speed Advisory Plaques), use largest sign dimension to determine proper minimum retroreflectivity level. 					

The FHWA received comments from NACo, NACE and several local agencies that suggested adding a statement clarifying that all signs need not meet the minimum retroreflectivity values at every point in time.

Considering these comments in conjunction with FHWA's understanding that there will be cases where vandalism, weather, or damage due to a crash influences the visibility of a sign, the FHWA clarified the SUPPORT statement in Section 2A.09. The revised statement clarifies that an agency or an official having jurisdiction would be in compliance with the Standard even if there are some individual signs that do not meet the minimum retroreflectivity levels at a particular point in time, provided that an assessment or management method implemented in accordance with Section 2A.09 of the MUTCD is being used.

The FHWA also received comments from NACo, NACE and several local agencies stating specific concerns that the establishment of specific retroreflectivity values within Table 2A-3 will become "the de-facto standard" that will be used against highway agencies in tort claims and lawsuits.

The FHWA believes that the selection of a reasonable method for maintaining sign retroreflectivity and strict adherence to the same might serve to defend highway agencies in tort liability claims and litigation. Public agencies and officials that implement and follow a reasonable method in conformance with the national MUTCD would appear to be in a better position to successfully defend tort litigation involving claims of improper sign retroreflectivity than jurisdictions that lack any method. In addition, as a result of adding clarifying language to the Support statement indicating that once an assessment or management method is used by an agency or official having jurisdiction, agencies would be in compliance with the STANDARD even if some individual signs do not meet the minimum retroreflectivity levels at a point in time.

Including Table 2A-3 in the MUTCD does not imply that an agency needs to measure the retroreflectivity of every sign in its jurisdiction. Instead, agencies must implement methods designed to provide options on how to maintain the minimum retroreflectivity levels, using the criteria in Table 2A-3.

(5) Impacts of sign retroreflectivity on safety.

The ATSSA and several sign manufacturers believe there is a proven link between maintained sign retroreflectivity and safety, especially as

it relates to older drivers. In addition, several citizens believe that improved retroreflectivity will lead to safer roads. One citizen who worked for several years in the field of nighttime visibility stated that his research with actual drivers on the road showed conclusive results that greater levels of retroreflectivity increase a driver's ability to be warned well in advance of a traffic situation or pedestrian encounter. The North Carolina DOT (NCDOT) and the AHAS, however, recommend that further FHWA studies be done to demonstrate that retroreflective improvements translate into safety improvements.

The FHWA believes that improving sign retroreflectivity will be a benefit to all drivers, including older drivers. All drivers need legible signs in order to make important decisions at key locations, such as intersections and exit ramps on high speed facilities. This is particularly true for regulatory and warning signs. This is fundamental to safe driving, and the lack of uniform retroreflectivity standards has led to wide variations in maintenance levels of these critical signs. As discussed in the SNPA, there have been some investigations that demonstrate potential safety benefits of upgrading sign materials.⁴ More importantly, maintaining sign retroreflectivity is consistent with one of FHWA's primary goals, which is to improve safety on the Nation's streets and highways. Improvements in sign visibility will also support FHWA's efforts to be responsive to the needs of older drivers, which is important because the number of older drivers is expected to increase significantly in the next 30 years.

Discussion of Other Comments

In addition to the five major issues discussed in the previous section, FHWA also received comments that can be grouped into the following three topics:

- (6) Assessment methods;
- (7) Blue and brown signs; and
- (8) Minimum retroreflectivity levels.

This section contains a discussion of each of these topics.

- (6) Assessment methods:

The FHWA received comments from the AASHTO, NCUTCD, ATSSA, AHAS, AAA, AARP, AHUA, ARTBA, Maryland and Wisconsin DOTs, and several counties in Illinois regarding the

⁴Supplemental Notice of Proposed Amendments, page 26717. The SNPA was published on May 8, 2006, at 71 FR 26711. This notice can be found at: <http://www.gpoaccess.gov/fr/retrieve.html> and on the Docket Management System (FHWA-2003-15149-229) for this ruling at the following Internet Web site: <http://dms.dot.gov>.

assessment and management methods for maintaining sign retroreflectivity as proposed in the GUIDANCE statement of the SNPA. The AASHTO and several State DOTs did not support actual measurement of signs as one of the methods, but supported visual nighttime inspections, blanket replacement, control signs, and expected sign life methods.

The city of Plano, Texas and a private citizen suggested that the numerical values in Table 2A-3 should only apply to Method B: Measured Sign Retroreflectivity. Those commenters suggested that for all other methods where subjective judgment is used, such as visual nighttime inspection, the table should serve as guidance for local offices to reject and accept signs.

Finally, the NCUTCD, the Illinois Association of County Engineers, and the DeWitt County, Illinois Highway Department suggested adding additional language to the GUIDANCE statement to explicitly, rather than implicitly, state that other assessment methods based on engineering study can be used to assess sign retroreflectivity.

The FHWA believes that the final rule provides several assessment or management methods that agencies can choose from, based on the method that best fits the agencies' resources and needs. An agency can choose to use either assessment methods or management methods, or a combination; however, agencies should develop a method in such a way that it corresponds to the values in Table 2A-3. The methods have been developed to provide flexibility for agencies for addressing their local conditions. To address the comments received regarding the types of assessment methods that should be used, FHWA clarifies the GUIDANCE statement by adding a sixth method to the list of assessment or management methods titled "Other Methods," which explicitly states that other methods developed based on engineering studies can be used.⁵

- (7) Blue and brown signs:

In the SNPA, FHWA asked for comments on the need for retroreflectivity levels to be developed for signs with blue and brown

⁵ As defined in the MUTCD, an engineering study shall be performed by an engineer, or by an individual working under the supervision of an engineer, through the application of procedures and criteria established by the engineer. An engineering study shall be documented. In accordance with the text heading GUIDANCE in the MUTCD, deviations to a recommended practice are allowed if engineering study indicates the deviation to be appropriate.

backgrounds.⁶ The Maryland State Highway Administration suggested that recommended minimum retroreflectivity levels be established for blue-background signs and that those levels apply to certain signs such as Hospital, EMS, Ambulance Station, and Emergency Medical Care signs, whose nighttime readability can be important. The combined letter from a representative of AAA, AARP, and AHUA, and one comment letter from a sign manufacturer stated that blue and brown signs are intended for use both day and night, and that motorist safety, particularly for older drivers, would be enhanced by including minimum retroreflectivity levels for blue and brown signs. The commenters acknowledged that if blue and brown signs are being excluded because there is a lack of data on which to base a requirement, a "placeholder" could be included in the MUTCD until more data is available and the table of minimum levels can be updated.

The FHWA is currently studying blue and brown minimum sign retroreflectivity levels. Because the study has not been finalized and FHWA did not analyze the costs associated with the sign retroreflectivity of blue and brown signs in the economic impacts study, minimum retroreflectivity levels for blue and brown signs are not included in the MUTCD at this time. At the conclusion of FHWA's study on this topic, the results may indicate a need to pursue such a requirement. If so, updates or changes to Table 2A-3 would be subject to the public rulemaking process before FHWA could add blue and brown minimum retroreflectivity levels.

(8) Minimum retroreflectivity levels:

Several of the commenters, including AASHTO, NACE, the Illinois and Indiana Associations of County Engineers, DeWitt County, Illinois Highway Department, the North Carolina DOT and the Maryland State Highway Administration suggested that the data within the table were not precise, and reflected data that were developed based on assumptions and varying characteristics.

The FHWA acknowledges that the data are based on some assumptions and varying characteristics; however, they are based on the latest science and empirical-based research emphasizing

older drivers.⁷ The supporting research reflects the best information at this time. One of the key aspects to the research supporting the minimum retroreflectivity levels is that it was based on field studies under conditions on a closed course facility that represented real roadway scenarios to the maximum extent possible without jeopardizing safety. Research subjects were recruited and participated in the research, which ultimately developed cumulative distribution profiles for luminance levels needed to accommodate the legibility of older drivers. These luminance levels were then used in conjunction with computer modeling to determine the retroreflectivity needed under a variety of roadway conditions. The computer modeling allows analyses of an infinite set of roadway scenarios, but is based on the luminance levels derived through the human factors research supported by FHWA.

After the research was completed, FHWA held national workshops, which included nighttime inspections of signs at various retroreflectivity levels. The participants of the workshops evaluated the signs at night using a visual inspection technique. The results of this effort helped confirm that the minimum retroreflectivity levels in Table 2A-3 are appropriate.

The NCDOT suggested that a tiered system be applied to the retroreflectivity levels, similar to the tiered system used for letter heights and sign sizes based on roadway classification.⁸ The NCDOT commented that retroreflective sign applications for lower speed, lower volume roads should be coordinated with lower retroreflectivity values.

The FHWA believes that the values shown in the table are applicable to all classifications of roads, including lower volume and slower speed roadways. The retroreflectivity levels are based on the legibility design threshold level as specified in Section 2A.14 of the MUTCD (40 feet of legibility per inch of letter height). Therefore, the size of the sign, and the message on the sign, play a key role in the retroreflectivity levels. Smaller signs have smaller messages, which mean drivers need to be closer to

the signs to read them. As the distance between the sign and the vehicle decreases, the efficiency of retroreflectivity materials generally decreases, meaning that more retroreflectivity is needed. This often outweighs the increased illumination available from the vehicle headlamps. The minimum retroreflectivity levels were designed to be easy to implement, without added complexities such as a tiered system based on letter heights and sign sizes. However, with the proper support (i.e., an engineering study), and using the values in Table 2A-3 as minimum maintained retroreflectivity levels, there is flexibility in this final rule and the associated MUTCD language that allows for an agency to develop a more complex set of minimum retroreflectivity levels, if it chooses to do so. Such levels cannot be below the minimums in Table 2A-3.

As mentioned in item 3 under Major Issues, a few commenters such as NACE, the NCUTCD and others, believed that Table 2A-3 and its title should be referred to as "Recommended." The FHWA believes that it is inappropriate to include "Recommended" in the title of a table that is referenced in a STANDARD statement of the MUTCD. In addition, the word "Recommended" implies guidance, rather than a standard, and would therefore be confusing.

ATSSA, the AHAS and the MNDOT agreed with eliminating Type I material for ground-mounted signs, and they also agreed with eliminating Types I, II, and III for overhead guide sign legends. These commenters felt that prohibiting the use of these less efficient retroreflective materials would substantially improve the nighttime driving environments, especially for older drivers with a variety of visual impairments. ATSSA also supported including Type X materials so that all currently defined American Society of Testing Materials (ASTM) Type designations that are used for traffic signs will be included in the MUTCD.

The NCDOT disagrees with any retroreflective requirement for illuminated signs. Their reasoning is that the assessment and management methods used to maintain retroreflectivity do not address signs with illumination and that Section 2A.08 does not require retroreflectivity for illuminated signs.

Illuminated signs do need to meet the minimum retroreflectivity requirements because there are times that the signs may not be illuminated due to power failure. Previous research has shown that overhead signs can be effective

⁶ Blue signs are generally described as informational signs, and include evacuation route and road user signs. Examples include hospital, specific service signs (food, gas, lodging, camping, and attraction) and tourist-oriented directional signs. Brown signs, which are also informational signs, are primarily recreational and cultural interest area signs.

⁷ Carlson, P.J. and H.G. Hawkins. Minimum Retroreflectivity Levels for Overhead Guide Signs and Street-Name Signs. FHWA-RD-03-082. U.S. Department of Transportation, Federal Highway Administration, Washington, DC. This document is available at the following Web address: <http://www.tfhrc.gov/safety/pubs/03082/index.htm>.

⁸ Part 2 of the MUTCD includes a table titled, "Table 2B-1 Regulatory Sign Sizes" that includes sign sizes for conventional roads, expressways, freeways, and oversized as well as minimum sign sizes. Generally, sign sizes for conventional roads are smaller than those for expressways or freeways.

without lighting, as long as the appropriate retroreflective sheeting materials are used to fabricate the sign.⁹ With this knowledge, many agencies have elected to use more efficient retroreflective sheeting on overhead guide signs without sign lighting, citing adequate visibility and concerns about energy use and light pollution (although sign lighting may continue to be used in areas of complex surroundings and/or roadway geometries). The minimum retroreflectivity levels in Table 2A-3 in the MUTCD prohibit the use of less efficient reflective materials for overhead signs so that agencies do not use them. As a result, agencies are more likely to select appropriate materials to meet nighttime driving requirements.

One supplier of overhead sign lighting systems and 22 citizens suggested that lighting of overhead signs should be mandatory. This final rule does not change the existing MUTCD language recommending lighting for overhead signs. Mandating lighting for overhead signs is outside the scope of this rulemaking.

One sign manufacturer suggested that retroreflectivity levels measured at 0.5 degree observation angle be included. As discussed in item #12 of the SNPA, research has been completed that supports moving toward the 0.5-degree concept and the ASTM has started working toward a revision to its specifications to describe 0.5-degree measurements.¹⁰ The FHWA believes that it is not practical to implement minimum retroreflectivity levels based on an observation angle of 0.5 degrees until measuring devices become more readily available, and the ASTM completes its work developing a standard measurement specification. At that time there may be a need for an alternative table and a transition period established while the 0.2-degree measurement geometries and devices are phased out. If so, these changes will be introduced through public rulemaking procedures described earlier for MUTCD changes or additions.

⁹ Carlson, P.J. and H.G. Hawkins. Minimum Retroreflectivity Levels for Overhead Guide Signs and Street-Name Signs. FHWA-RD-03-082. U.S. Department of Transportation, Federal Highway Administration, Washington, DC. This document is available at the following Web address: <http://www.tfhrc.gov/safety/pubs/03082/index.htm>.

¹⁰ The ASTM E12 committee is working to develop a standard measurement specification for 0.5 degree instruments. The committee is using ASTM E1709 as a template (ASTM E1709 is the standard measurement specification for 0.2 degree instruments). More information is available at <http://www.astm.org>.

Conclusion

To address the comments to the docket, the FHWA adopts the following key changes to Section 2A.09 Maintaining Minimum Retroreflectivity in the MUTCD from what was proposed in the SNPA:

(A) In the STANDARD statement, a reference to Table 2A-3 was added to clarify that the levels contained in Table 2A-3 are the minimum levels that are to be used by public agencies or officials having jurisdiction when they develop an assessment or management method that is designed to maintain sign retroreflectivity.

(B) The 2nd SUPPORT statement was clarified to indicate that once an assessment or management method is used, an agency or official having jurisdiction would be in compliance with the STANDARD even if some individual signs do not meet the minimum retroreflectivity levels at a particular point in time.

(C) The GUIDANCE statement was modified by adding a sixth method to the list of assessment or management methods that should be used to maintain sign retroreflectivity titled "Other Methods," which explicitly states that other methods developed based on engineering studies can be used.

In addition, FHWA adopts a 4-year compliance date (instead of the proposed 2-year compliance date) for implementation and continued use of an assessment or management method that is designed to maintain traffic sign retroreflectivity at or above the established minimum levels.

The final rule meets statutory requirements, provides clarity where needed, and provides flexibility for compliance.

Rulemaking Analyses and Notices

Executive Order 12866 (Regulatory Planning and Review) and U.S. DOT Regulatory Policies and Procedures

The FHWA has determined that this action is not a significant regulatory action within the meaning of Executive Order 12866 or under the regulatory policies and procedures of the U.S. Department of Transportation. While the FHWA had preliminarily designated this rulemaking as significant during the NPRM and SNPRM stages, the FHWA has determined that this rulemaking does not meet the criteria for a "significant regulatory action" under Executive Order 12866. This rule will not adversely affect, in a material way, any sector of the economy. Additionally, this rulemaking will not interfere with any action taken or

planned by another agency and will not materially alter the budgetary impact of any entitlements, grants, user fees or loan programs.

It is anticipated that the economic impact of this rulemaking would cause minimal additional expenses to public agencies. In 2007, FHWA updated its analysis of the cost impacts to State and local agencies to reflect higher material costs due to inflation, an increase in the proportion of signs that would be replaced with higher-level sign sheeting material, and changes in the overall mileage of State and local roads.¹¹ The findings of the 2007 analysis show that the costs of the proposed action to State and local agencies would be less than \$128.1 million per year.¹² The 7-year implementation period for ground-mounted signs will allow State and local agencies to delay replacement of recently installed Type I signs until they have reached their commonly accepted 7-year service life. The 10-year compliance period for overhead signs would allow an extended period of time because of the longer service life typically used for those signs. The final rule does not affect the impacts assessments described above.

Currently, the MUTCD requires that traffic signs be illuminated or retroreflective to enhance nighttime visibility. In 1993, Congress mandated that the MUTCD contain standards for maintaining minimum traffic sign and pavement marking retroreflectivity.¹³ The final rule provides additional guidance, clarification, and flexibility in maintaining traffic sign retroreflectivity that is already required by the MUTCD. The minimum retroreflectivity levels and maintenance methods consider changes in the composition of the vehicle population, vehicle headlamp design, and the demographics of drivers. The FHWA expects that the levels and maintenance methods will help to promote safety and mobility on the Nation's streets and highways.

This rulemaking addresses comments received in response to the Office of Management and Budget's (OMB's) request for regulatory reform nominations from the public. The OMB is required to submit an annual report to Congress on the costs and benefits of Federal regulations. The 2002 report included recommendations for

¹¹ "Maintaining Traffic Sign Retroreflectivity: Impacts on State and Local Agencies," Publication No. FHWA-HRT-07-042, dated April 2007, is available at the following Web address: <http://www.tfhrc.gov/safety/pubs/07042/index.htm>.

¹² Ibid.

¹³ United States Department of Transportation and Related Agencies Act of 1993, Public Law 102-388, 106 Stat. 1520, Section 406.

regulatory reform that OMB requested from the public.¹⁴ One recommendation was that the FHWA should establish standards for minimum levels of brightness of traffic signs.¹⁵ The FHWA has identified this rulemaking as responsive to that recommendation.

Regulatory Flexibility Act

In compliance with the Regulatory Flexibility Act (Pub. L. 96–354, 5 U.S.C. 601–612), the FHWA has evaluated the effects of this final rule on small entities and has determined that this final rule will not have a significant economic impact on a substantial number of small entities.

This rule would apply to State Departments of Transportation in the execution of their highway programs, specifically with respect to the retroreflectivity of traffic signs. Additionally, sign replacement is often eligible for up to 100 percent Federal-aid funding—this applies to local jurisdictions and tribal governments, pursuant to 23 U.S.C. 120(c). The implementation of this final rule would not affect the economic viability or sustenance of small entities, as States are not included in the definition of a small entity that is set forth in 5 U.S.C. 601.

Unfunded Mandates Reform Act of 1995

This rule does not impose unfunded mandates as defined by the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4, 109 Stat. 48, March 22, 1995). The impacts analysis shows that State and local agencies would be likely to incur impacts of roughly \$37.5 million. Using a 7-year implementation period for regulatory, warning, and guide signs and a 10-year implementation period for street name and overhead guide signs, the annual impacts are estimated to be approximately \$4.5 million for years 1 through 7, and \$2.1 million for years 8 through 10. The estimates are based upon the added cost of more efficient performance sign materials. The labor, equipment, and mileage costs for sign replacement were excluded under the assumption that the proposed implementation period was long enough to allow replacement of non-compliant

signs under currently planned maintenance cycles. Therefore, this final rule will not result in the expenditure by State, local, and tribal governments, in the aggregate, or by the private sector, of \$128.1 million or more in any one year. In addition, sign replacement is often eligible for up to 100 percent Federal-aid funding—this applies to local jurisdictions and tribal governments, pursuant to 23 U.S.C. 120(c). Further, the definition of “Federal Mandate” in the Unfunded Mandates Reform Act excludes financial assistance of the type in which State, local or tribal governments have authority to adjust their participation in the program in accordance with changes made in the program by the Federal Government. The Federal-aid highway program permits this type of flexibility.

Executive Order 13132 (Federalism)

The FHWA analyzed this final rule in accordance with the principles and criteria contained in Executive Order 13132, dated August 4, 1999, and FHWA has determined that this final rule will not have a substantial direct effect or sufficient federalism implications on States and local governments that would limit the policy-making discretion of the States and local governments. Nothing in the MUTCD directly preempts any State law or regulation.

The MUTCD is incorporated by reference in 23 CFR Part 655, subpart F. This final rule is in keeping with the Secretary of Transportation’s authority under 23 U.S.C. 109(d), 315, and 402(a) to promulgate uniform guidelines to promote the safe and efficient use of the Nation’s streets and highways.

Executive Order 13175 (Tribal Consultation)

The FHWA has analyzed this action under Executive Order 13175, dated November 6, 2000, and believes that it will not have substantial direct effects on one or more Indian tribes, will not impose substantial direct compliance costs on Indian tribal governments, and will not preempt tribal law. Therefore, a tribal summary impact statement is not required.

Executive Order 13211 (Energy Effects)

The FHWA has analyzed this final rule under Executive Order 13211, Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use. The FHWA has determined that this is not a significant energy action under that order because, although it is a significant regulatory action under Executive Order 12866, it is not likely to have a significant

adverse effect on the supply, distribution, or use of energy. Therefore, a Statement of Energy Effects under Executive Order 13211 is not required.

Executive Order 12372 (Intergovernmental Review)

Catalog of Federal Domestic Assistance Program Number 20.205, Highway Planning and Construction. The regulations implementing Executive Order 12372 regarding intergovernmental consultation on Federal programs and activities apply to this program.

Paperwork Reduction Act

Under the Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. 3501, *et seq.*), Federal agencies must obtain approval from OMB for each collection of information they conduct, sponsor, or require through regulations. The FHWA has determined that this action does not contain a collection of information requirement for the purposes of the PRA.

Executive Order 12988 (Civil Justice Reform)

This action meets applicable standards in Sections 3(a) and 3(b)(2) of Executive Order 12988, Civil Justice Reform, to minimize litigation, to eliminate ambiguity, and to reduce burden.

Executive Order 13045 (Protection of Children)

The FHWA has analyzed this action under Executive Order 13045, Protection of Children from Environmental Health Risks and Safety Risks. This is not an economically significant action and does not concern an environmental risk to health or safety that might disproportionately affect children.

Executive Order 12630 (Taking of Private Property)

This action would not affect a taking of private property or otherwise have taking implications under Executive Order 12630, Governmental Actions and Interference with Constitutionally Protected Property Rights.

National Environmental Policy Act

The agency has analyzed this final rule for the purpose of the National Environmental Policy Act of 1969 (42 U.S.C. 4321 *et seq.*) and has determined that it will not have any effect on the quality of the environment.

Regulation Identification Number

A regulation identification number (RIN) is assigned to each regulatory

DEPARTMENT OF THE TREASURY

Internal Revenue Service

26 CFR Part 1

[TD 9368]

RIN 1545-BG55

Reduction of Foreign Tax Credit Limitation Categories Under Section 904(d)

AGENCY: Internal Revenue Service (IRS), Treasury.

ACTION: Final and temporary regulations.

SUMMARY: This document contains final and temporary Income Tax Regulations regarding the reduction of the number of separate foreign tax credit limitation categories under section 904(d) of the Internal Revenue Code (Code). Section 404 of the American Jobs Creation Act of 2004 (AJCA) reduced the number of section 904(d) separate categories from eight to two, effective for taxable years beginning after December 31, 2006. These temporary regulations affect taxpayers claiming foreign tax credits and provide guidance needed to comply with the statutory changes made by the AJCA. The text of these temporary regulations also serves as the text of the proposed regulations (REG-114126-07) set forth in the notice of proposed rulemaking on this subject published elsewhere in this issue of the **Federal Register**.

DATES: *Effective Date:* These regulations are effective on December 21, 2007.

Applicability Dates: For dates of applicability, see §§ 1.904-2T(i)(3), 1.904-4T(n), 1.904-5T(o)(3), 1.904-7T(g)(6), and 1.904(f)-12T(h)(6). These regulations apply to taxable years of United States taxpayers beginning after December 31, 2006, and ending on or after December 21, 2007, and to taxable years of foreign corporations which end with or within taxable years of their domestic corporate shareholders beginning after December 31, 2006, and ending on or after December 21, 2007.

FOR FURTHER INFORMATION CONTACT: Jeffrey L. Parry (202) 622-3850 (not a toll-free call).

SUPPLEMENTARY INFORMATION:

Background

This document contains amendments to the regulations under section 904 relating to the application of separate foreign tax credit limitations to certain categories of income under section 904(d), as amended by the AJCA. Prior to the effective date of the AJCA amendments (that is, for taxable years

beginning before January 1, 2007 (“pre-2007 taxable years”), the foreign tax credit limitation applied separately to the following categories of income: passive income, high withholding tax interest, financial services income, shipping income, certain dividends from a DISC or former DISC, taxable income attributable to certain foreign trade income, certain distributions from a FSC or former FSC, and any other income not described in this sentence (“general limitation income”). Other provisions of the Code that subject other categories of income to separate foreign tax credit limitations were not amended by the AJCA. See, for example, sections 56(g)(4)(C)(iii)(IV), 245(a)(10), 865(h), 901(j), and 904(h)(10); see also H.R. Rep. No. 108-755, at 383 (October 7, 2004).

Effective for taxable years beginning after December 31, 2006 (“post-2006 taxable years”), the AJCA reduced the number of section 904(d) separate categories to two categories for “passive category income” and “general category income.” New section 904(d)(2)(A) defines passive category income as passive income and specified passive category income, and general category income as income other than passive category income. In addition, new section 904(d)(2)(C) and (D) provides rules concerning the treatment of financial services income and companies.

These temporary regulations modify the regulations under section 904 to reflect the new separate categories for passive category income and general category income, and provide transition rules for the treatment of earnings and profits and foreign income taxes of controlled foreign corporations and noncontrolled section 902 corporations accumulated in pre-2007 taxable years, overall foreign losses and separate limitation losses under section 904(f), and the carryover and carryback of excess foreign taxes under section 904(c).

Explanation of Provisions

I. Carryovers and Carrybacks of Excess Foreign Taxes Under Section 904(c)

Section 904(d)(2)(K)(i), as added by the AJCA, provides that excess taxes carried from a pre-2007 taxable year to a post-2006 taxable year shall be assigned to the post-2006 separate categories based on where the related income would have been assigned had such taxes been paid or accrued in a post-2006 taxable year.

Consistent with this statutory amendment, § 1.904-2T(i)(1)(i) provides that if a taxpayer carries over to a post-2006 taxable year any excess taxes that

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2008-02
SUBJECT: GOLF CARTS AND NEIGHBORHOOD VEHICLES
ISSUED DATE: February 28, 2008
EFFECTIVE DATE: February 28, 2008

This memorandum and PM2008-01 supersede Chapter 39 Section 2 of the BLRS Manual dated August 2007.

According to 625 ILCS 5/11-1426.1 and 625 ILCS 5/11-1428 a municipality, township, county, or other unit of local government may authorize, by ordinance or resolution, the operation of neighborhood vehicles or golf carts on roadways under its jurisdiction if the unit of local government determines that public safety will not be jeopardized. The unit of local government must consider the volume, speed, and character of traffic on the roadway and determine whether neighborhood vehicles may safely travel on or cross the roadway. Upon determining that neighborhood vehicles or golf carts may safely operate a roadway, appropriate signs shall be posted.

A Golf Cart (W11-11) warning sign shall be posted at all locations where golf cart operation is permitted.

A Golf Cart (W11-11) warning sign and a supplemental warning plaque carrying the message NEIGHBORHOOD VEHICLE shall be posted at all locations where neighborhood vehicle operation is permitted.

If you have any questions, please contact Kevin Burke of this bureau at kevin.burkeiii@illinois.gov.

A handwritten signature in cursive script that reads "Charles J. Dingersoll".

(625 ILCS 5/11-1426.1)

(Text of Section from P.A. 95-150)

Sec. 11-1426.1. Operation of neighborhood electric vehicles on streets, roads, and highways.

(a) As used in this Section, "neighborhood electric vehicle" means a self-propelled, electronically powered four-wheeled motor vehicle which is capable of attaining in one mile a speed of more than 20 miles per hour, but not more than 25 miles per hour, and which conforms to federal regulations under Title 49 C.F.R. Part 571.500.

(b) Except as otherwise provided in this Section, it is unlawful for any person to drive or operate a neighborhood electric vehicle upon any street, highway, or roadway in this State. If the operation of a neighborhood electric vehicle is authorized under subsection (d), the neighborhood electric vehicle may be operated only on streets where the posted speed limit is 35 miles per hour or less. This subsection (b) does not prohibit a neighborhood electric vehicle from crossing a road or street at an intersection where the road or street has a posted speed limit of more than 35 miles per hour.

(b-5) A person may not operate a neighborhood electric vehicle upon any street, highway, or roadway in this State unless he or she has a valid Illinois driver's license issued in his or her name by the Secretary of State.

(c) Except as otherwise provided in subsection (c-5), no person operating a neighborhood electric vehicle shall make a direct crossing upon or across any highway under the jurisdiction of the State, tollroad, interstate highway, or controlled access highway in this State.

(c-5) A person may make a direct crossing at an intersection controlled by a traffic light or 4-way stop sign upon or across a highway under the jurisdiction of the State if the speed limit on the highway is 35 miles per hour or less at the place of crossing.

(d) A municipality, township, county, or other unit of local government may authorize, by ordinance or resolution, the operation of neighborhood electric vehicles on roadways under its jurisdiction if the unit of local government determines that the public safety will not be jeopardized. The Department may authorize the operation of neighborhood electric vehicles on the roadways under its jurisdiction if the Department determines that the public safety will not be jeopardized.

Before permitting the operation of neighborhood electric vehicles on its roadways, a municipality, township, county, other unit of local government, or the Department must consider the volume, speed, and character of traffic on the roadway and determine whether neighborhood electric vehicles may safely travel on or cross the roadway. Upon determining that neighborhood electric vehicles may safely operate on a roadway and the adoption of an ordinance or resolution by a municipality, township, county, or other unit of local government, or authorization by the Department, appropriate signs shall be posted.

If a roadway is under the jurisdiction of more than one unit of government, neighborhood electric vehicles may not be operated on the roadway unless each unit of government agrees and takes action as provided in this subsection.

(e) No neighborhood electric vehicle may be operated on a roadway unless, at a minimum, it has the following: brakes, a

HARD COPIES UNCONTROLLED

steering apparatus, tires, a rearview mirror, red reflectorized warning devices in the front and rear, a slow moving emblem (as required of other vehicles in Section 12-709 of this Code) on the rear of the neighborhood electric vehicle, a headlight that emits a white light visible from a distance of 500 feet to the front, a tail lamp that emits a red light visible from at least 100 feet from the rear, brake lights, and turn signals. When operated on a roadway, a neighborhood electric vehicle shall have its headlight and tail lamps lighted as required by Section 12-201 of this Code.

(f) A person who drives or is in actual physical control of a neighborhood electric vehicle on a roadway while under the influence is subject to Sections 11-500 through 11-502 of this Code.

(Source: P.A. 94-298, eff. 1-1-06; 95-150, eff. 8-14-07.)

(Text of Section from P.A. 95-414 and 95-575)

Sec. 11-1426.1. Operation of neighborhood vehicles on streets, roads, and highways.

(a) As used in this Section, "neighborhood vehicle" means a self-propelled, electronically powered four-wheeled motor vehicle (or a self-propelled, gasoline-powered four-wheeled motor vehicle with an engine displacement under 1,200 cubic centimeters) which is capable of attaining in one mile a speed of more than 20 miles per hour, but not more than 25 miles per hour, and which conforms to federal regulations under Title 49 C.F.R. Part 571.500.

(b) Except as otherwise provided in this Section, it is unlawful for any person to drive or operate a neighborhood vehicle upon any street, highway, or roadway in this State. If the operation of a neighborhood vehicle is authorized under subsection (d), the neighborhood vehicle may be operated only on streets where the posted speed limit is 35 miles per hour or less. This subsection (b) does not prohibit a neighborhood vehicle from crossing a road or street at an intersection where the road or street has a posted speed limit of more than 35 miles per hour.

(b-5) A person may not operate a neighborhood vehicle upon any street, highway, or roadway in this State unless he or she has a valid Illinois driver's license issued in his or her name by the Secretary of State.

(c) No person operating a neighborhood vehicle shall make a direct crossing upon or across any highway under the jurisdiction of the State, tollroad, interstate highway, or controlled access highway in this State.

(d) A municipality, township, county, or other unit of local government may authorize, by ordinance or resolution, the operation of neighborhood vehicles on roadways under its jurisdiction if the unit of local government determines that the public safety will not be jeopardized. The Department may authorize the operation of neighborhood vehicles on the roadways under its jurisdiction if the Department determines that the public safety will not be jeopardized.

Before permitting the operation of neighborhood vehicles on its roadways, a municipality, township, county, other unit of local government, or the Department must consider the volume, speed, and character of traffic on the roadway and determine whether neighborhood vehicles may safely travel on or cross the roadway. Upon determining that neighborhood vehicles may safely operate on a roadway and the adoption of

an ordinance or resolution by a municipality, township, county, or other unit of local government, or authorization by the Department, appropriate signs shall be posted.

If a roadway is under the jurisdiction of more than one unit of government, neighborhood vehicles may not be operated on the roadway unless each unit of government agrees and takes action as provided in this subsection.

(e) No neighborhood vehicle may be operated on a roadway unless, at a minimum, it has the following: brakes, a steering apparatus, tires, a rearview mirror, red reflectorized warning devices in the front and rear, a slow moving emblem (as required of other vehicles in Section 12-709 of this Code) on the rear of the neighborhood vehicle, a headlight that emits a white light visible from a distance of 500 feet to the front, a tail lamp that emits a red light visible from at least 100 feet from the rear, brake lights, and turn signals. When operated on a roadway, a neighborhood vehicle shall have its headlight and tail lamps lighted as required by Section 12-201 of this Code.

(f) A person who drives or is in actual physical control of a neighborhood vehicle on a roadway while under the influence is subject to Sections 11-500 through 11-502 of this Code.

(Source: P.A. 94-298, eff. 1-1-06; 95-414, eff. 8-24-07; 95-575, eff. 8-31-07.)

HARD COPIES UNCONTROLLED

(625 ILCS 5/11-1428) (from Ch. 95 1/2, par. 11-1428)

Sec. 11-1428. Operation of golf carts on streets, roads and highways.

(a) Except as otherwise provided in this Section, it shall be unlawful for any person to drive or operate any golf cart upon any street, highway or roadway in this State.

(b) Except as provided under subsection (c) of this Section, golf carts may make a direct crossing over a street, highway or roadway that runs through a golf course provided:

(1) The crossing is made at an interchange approved by the local unit of government and at a place where no obstruction prevents a quick and safe crossing; and

(2) The golf cart is brought to a complete stop before attempting a crossing; and

(3) The operator of the golf cart yields the right of way to all pedestrian and vehicular traffic which constitutes a hazard; and

(4) There is no tunnel or overpass ramp provided for the golf cart to cross through the golf course.

(c) No person operating a golf cart shall make a direct crossing upon or across any highway under the jurisdiction of the State, tollroad, interstate highway, or controlled access highway in this State.

(d) For purposes of this Section, "golf cart" means a vehicle specifically designed and intended for the purposes of transporting one or more persons and their golf clubs or maintenance equipment while engaged in the playing of golf, supervising the play of golf, or maintaining the condition of the grounds on a public or private golf course.

(e) Subject to subsection (b), a municipality, township, county, or other unit of local government may authorize, by ordinance or resolution, the operation of golf carts on roadways under their respective jurisdictions. The Department may authorize the operation of golf carts on the roadways under its jurisdiction.

Before permitting the operation of golf carts on its roadway, a municipality, township, county, other unit of local government, or the Department must consider the volume, speed, and character of traffic on the roadway and determine whether golf carts may safely travel on or cross the roadway. Upon determining that golf carts may safely operate on a roadway and the adoption of an ordinance or resolution by a municipality, township, county or other unit of local government, or authorization by the Department, appropriate signs shall be posted.

If a roadway is under the jurisdiction of more than one unit of government, golf carts may not be operated on the roadway unless each unit of government agrees and takes action as provided in this subsection.

No golf cart may be operated on a roadway unless, at a minimum, it has the following: brakes, a steering apparatus, tires, a rearview mirror, red reflectorized warning devices in the front and rear, a slow moving emblem (as required of other vehicles in Section 12-709) on the rear of the golf cart, a headlight that emits a white light visible from a distance of 500 feet to the front, a tail lamp that emits a red light visible from at least 100 feet from the rear, brake lights, and turn signals. When operated on a roadway, a golf cart shall have its headlight and tail lamps lighted as required by Section 12-201.

HARD COPIES UNCONTROLLED

(f) A person who drives or is in actual physical control of a golf cart on a roadway while under the influence is subject to Section 11-500 through 11-502.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2008-03
SUBJECT: DENSITY TESTING ON HOT MIX ASPHALT (HMA) PAVEMENTS
ISSUED DATE: March 6, 2008
EFFECTIVE DATE: March 1, 2008

This memorandum revises Section 37-1 of the Bureau of Local Roads and Streets Manual, dated August 2007.

Illinois Department of Transportation's Quality Control/Quality Assurance (QC/QA) procedures require correlated nuclear gauge density testing on all Hot Mix Asphalt projects. If a correlated gauge is not appropriate for the mixture (low tonnage, thin lift, etc.), core density testing is required.

For local agency HMA projects constructed under general maintenance, special maintenance, Local Agency Pavement Preservation (LAPP), functional overlay policy, or for any mixture quantity less than 3,000 tons, the preferred alternative test method is also core density testing. Core density testing assures a reliable comparison to the maximum density for the mix. If core holes are not filled properly, potholes and other pavement distresses may occur at the test location. LR 406 "Filling HMA Core Holes with Non-Shrink Grout" may be used to reduce the possibility of pot holes at the test location.

Local agencies may also use uncorrelated nuclear gauge density or growth curves; however, both of these alternative methods may lead to inaccurate results. Since an uncorrelated nuclear gauge is not adjusted to the material and pavement cross-section on the project, density errors as high as 2% are common. Likewise, growth curves are subject to numerous environmental (temperature, wind, etc.) and equipment variables (speed, frequency, etc.); therefore, growth curve density should be approached with caution. LR 1030 "Growth Curve" shall be used on all projects verifying density with growth curves. For more information about growth curve variability, see attached "Growth Curve Variables" summary.

If alternative density testing is performed, both the contractor and local agency must comply with the QC/QA testing frequency required for a given mixture.

If you have any questions, please contact Kevin Burke of this bureau at kevin.burkeiii@illinois.gov.

HARD COPIES UNCONTROLLED

Growth Curve Variables

The primary difficulty in utilizing a percentage of the growth curve is determining an “accurate” peak density. There are numerous variables to control and/or account for when performing a growth curve to ensure the peak density obtained is accurate. Listed below are a few variables that should be considered:

1. **Mix Temperature.** Too Cold; Too Hot; Temperature Gradient
2. **Ambient Conditions.** Sunshine vs. Overcast; Wind Speed; Base Temperature.
3. **Roller.** Operator Experience; Force Applied (Static or Dynamic); Speed; Amplitude; Frequency; Length of Pattern.
4. **Existing Pavement Condition.** Variability; Stiffness; Cracks; Patches; Cross Slope.
5. **Pavement Preparation for Bond.** Milled; Cleaned; Tack Coat (Type, Amount, Uniformity, Condition)
6. **Mix Thickness.** Nominal Maximum Aggregate Size; Coarse or Fine Graded.
7. **Mix Properties.** Gradation; AC Content; Voids; VMA; VFA.
8. **Segregation.**
9. **Density Gauge.** Operator Experience; Reading Time; Cleanliness; Accuracy.
10. **Peak Determination.** Stabilization; Aggregate Degradation

Controlling and/or accounting for all of these variables (at a given point in time and at a given location) is difficult. Therefore, the “peak” density in a growth curve is often questionable. If multiple growth curves are performed, variability in the peak density is often observed.

There are two basic characteristics that are sought in HMA – stability and durability. As the in-place density achieved increases, both of these characteristics are improved. Problems with just a few of the variables listed previously will often work together to provide a peak density that is too low and therefore provide a benchmark that is too low, if a percentage of the growth curve is used. The end result will be less in-place density (in terms of % G_{mm}), less stability and less durability. There are many things that can contribute to field compaction problems and the goal should be to remedy as many of these things as possible in order to achieve the most stability and durability as possible to ensure long term pavement performance.

Adapted by the Federal Highway Administration - Illinois Division, Illinois Department of Transportation Bureau of Materials & Physical Research, and Illinois Department of Transportation Bureau of Local Roads & Streets from information provided by William J. Pine, P.E., Emulsicoat, Inc. / Heritage Research Group on May 9, 2007.

State of Illinois
DEPARTMENT OF TRANSPORTATION
Bureau of Local Roads & Streets

SPECIAL PROVISION
FOR
GROWTH CURVE

Effective: March 1, 2008

All references to Sections and Articles in this Special Provision shall be construed to mean specific Sections and Articles in the Standard Specifications for Road and Bridge Construction adopted by the Department of Transportation.

The Contractor shall perform a growth curve at the beginning of placement of each type of mix and each lift. The growth curve for each type of mix and each lift shall be performed within the first 200 tons (180 metric tons). If an adjustment is made to the specific mix design, the Engineer reserves the right to request an additional growth curve and supporting tests at the Contractor's expense.

Compaction of the growth curve shall commence immediately after the course is placed and at a temperature of not less than 280 °F (140 °C). The growth curve, consisting of a plot of lb/cu m (kg/cu m) vs. number of passes with the project breakdown roller, shall be developed. Roller speed during the growth curve testing shall be the same as the normal paving operation. This curve shall be established by use of a nuclear gauge. Tests shall be taken after each pass until the highest lb/cu m (kg/cu m) is obtained. This value shall be the target density provided the HMA Gyratory air voids are within acceptable limits. If the HMA Gyratory air voids are not within the specified limits, corrective action shall be taken, and a new target density shall be established.

A new growth curve is required if the breakdown roller used on the growth curve is replaced with a new roller during production. The target density shall apply only to the specific gauge used. If additional gauges are to be used to determine density specification compliance, the Contractor shall establish a unique minimum allowable target density from the growth curve location for each gauge.

At least one core sample per day shall be taken at a location specified by the Engineer. Core densities will be determined using the Illinois-Modified AASHTO T 166 or T 275 procedure by the Department. The core density shall be according to Articles 1030.05(d)(4) and (d)(7). The QA Manager is responsible for assuring and documenting that the determined number of roller passes has been accomplished. The Engineer reserves the right to take core samples at any time to verify density from the nuclear gauge,

All lifts shall be compacted to an average nuclear gauge density of not less than 95 percent nor greater than 102 percent of the target density obtained on the growth curve. The average nuclear gauge density shall be based on tests representing one day's production.

Quality Control density tests shall be performed at randomly selected locations within 1/2 mile (800 m) intervals per lift per lane. In no case shall more than one half day's production be completed without density testing being performed.

If the Contractor is not controlling the compaction process and is making no effort to take corrective action, the operation shall stop as directed by the Engineer.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2008-04
SUBJECT: JURISDICTIONAL TRANSFER AGREEMENTS
ISSUED DATE: April 15, 2008
EFFECTIVE DATE: April 15, 2008

This memorandum revises Chapter 5, Section 5-2.04 of the Bureau of Local Roads and Streets Manual, dated December 2006.

The Bureau of Local Roads and Streets (BLRS) has revised forms BLR5210, BLR5211 and BLR5212. In addition, Section 5-2.04 of the BLRS Manual has been revised to strongly recommend that draft agreements for all proposed jurisdictional transfers be submitted to the central BLRS for review prior to execution by the local agency(ies).

Utilization of these revised forms and submission of draft agreements will minimize the need for revisions to the final agreements.

If you have any questions, please contact Steve Dwyer at (217) 782-3401.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2008-05

SUBJECT: ECOLOGICAL COMPLIANCE ASSESSMENT TOOL
(EcoCAT) AND MFT CERTIFICATION/PROJECT
STATUS FORM

ISSUED DATE: October 17, 2008

EFFECTIVE DATE: January 1, 2009

This memorandum supersedes Section 10-1 dated December 2006, and Section 20-9 dated January 2006 of the Bureau of Local Roads & Streets Manual.

The *Illinois Natural Areas Preservation Act* (525 ILCS 30/17), Section 11b of the *Illinois Endangered Species Protection Act* (520 ILCS 10/11), and the implementing rules (17 Ill. Adm. Code 1075) requires consultation with the Illinois Department of Natural Resources (IDNR) on all construction, land management, or other activities that are authorized, funded, or performed in whole or in part by agencies of State and local governments and that will result in a change to the existing environmental conditions or may affect listed threatened or endangered species or their essential habitat or Natural Areas.

The *Interagency Wetland Policy Act of 1989* (20 ILCS 830/1 et seq.) and the *Implementation Procedures for the Interagency Wetland Policy Act* (17 Ill. Admin. Code 1090) requires consultation with IDNR on all state and state pass-through funded construction projects.

For projects that are not funded with federal funds, consultation is done directly between the local agency and IDNR. IDNR has developed a web based system, Ecological Compliance Assessment Tool (EcoCAT), to streamline the consultation process. This system replaces the Agency Action Report and is available at <http://dnrecocat.state.il.us/ecopublic/>.

The EcoCAT system has four sections that need completed:

- General Information
- Applicant Information
- Project Information
- Location Information

HARD COPIES UNCONTROLLED

An instruction sheet is attached to assist applicants with completing an EcoCAT submittal.

EcoCAT will provide local agencies with an instant biological and wetland review of the project area. If no resources are in the vicinity of the project, the report will state that consultation is closed and the local agency may proceed with the project.

If the report lists T&E species or INAI sites that may be in the vicinity, the project may not proceed until consultation is complete. IDNR will contact the applicant within 30 to 45 days after the project is first submitted. At that point in the consultation, IDNR will either: close consultation because impacts are unlikely; request additional information, which could include field studies; or recommend measures to avoid, minimize, or mitigate impacts. Whenever measures are recommended, the local agency must notify IDNR that the recommendations were considered and specify which measures will be implemented. If measures will not be implemented, the agency should include an explanation. At that point, IDNR will send the agency a letter closing consultation.

If the EcoCAT report states that wetlands are within 250 feet of the project location, the local agency will need to conduct a site visit and delineate any wetlands that could be impacted by the project. While the EcoCAT report may state that an IDNR staff member will contact you about wetland compliance, IDNR will not contact applicants about wetland compliance for projects funded with Motor Fuel Tax (MFT), Township Bridge Program (TBP), or other State funds. Beyond the initial EcoCAT submission, wetland compliance should be coordinated with IDOT according to Section 10-1.05 of the BLRS Manual.

BLR 10100 should be used to document environmental review for MFT, TBP, and State Funded projects. Local agencies, including those under Agreements of Understanding, should submit the completed form to the District BLRS prior to letting for all projects except for general maintenance. Copies of the consultation termination letter or consultation closed report from EcoCAT shall be submitted to the District BLRS with BLR10100 prior to advertisement in IDOT's *Notice to Contractors Bulletin* for all projects let after January 1, 2009. The District will acknowledge receipt of BLR 10100 by signature and return the signed copy for the project file.

The department will coordinate the EcoCAT submittal on all federally funded projects.

Engineer of Local Roads and Streets

How to Use EcoCAT

General Information

The General Information section asks three multiple choice questions that you must answer to ensure that your project receives the appropriate review and is assigned to the correct IDNR staff member. If you do not answer all of the questions, the program will not allow you to proceed to the mapping tool. The questions, with explanations, are provided below.

Q1. Why are you submitting the project to EcoCAT?

- o To initiate consultation with IDNR (*Title 17 Ill. Admin. Code Part 1075*) to determine potential impacts to Illinois Natural Area Inventory sites or state-listed threatened or endangered species.
- o To obtain information on Illinois T&E species or INAI sites for **project planning**.
- o To obtain information on Illinois T&E species or INAI sites for **federal agency** actions (including NEPA compliance).

Choose “To initiate consultation.”

Q2. Indicate the government unit and type of action that has prompted consultation.

- o **Local Government**
 - o Authorization (a unit of local government must issue a permit or other authorization)
 - o Funding (a unit of local government will provide a grant, loan, or other direct support)
 - o Performance (a unit of local government is performing the action, such as construction)
- o **State Agency**
 - o Authorization (a state agency must issue a permit or other authorization)
 - o Funding (a state agency will provide a grant, loan, or other direct support)
 - o Performance (a state agency is performing the action, such as construction)

Choose “State Agency”, “Funding,” and “Illinois Department of Transportation” as the agency and “Bureau of Local Roads and Streets” as the Bureau.

Q3. Will state technical assistance or funding (including federal funding through a state agency) support the project?

- o Yes.
- o No.
- o Don't Know.

Choose “Yes.”

- Screen resolution—1024 x 768 or higher is required.
- Preferred browser—Internet Explorer 6.0 or later.
- EcoCAT data entry must be completed within 20 minutes or previously entered information will be lost and the process will not work correctly.
- EcoCAT is a public record that is subject to disclosure under the Freedom of Information Act.

Applicant and Project Information

After you answer the three general information questions, you will move on to Applicant Information. Here you will be asked to indicate the applicant category to which you belong:

Non-governmental/Individual Local Government State Agency Federal Agency

Choose “Local Government” unless a consultant is submitting the project—then “Non-governmental/Individual” should be selected. The individual or organization submitting the project to EcoCAT is considered the Applicant. Any further communication from IDNR will be directed to the Contact Person at the address listed for Applicant.

Project Information asks you to provide a project name and a brief description of the proposed action.

Next is Project Location. In addition to County, you must know the Township, Range, and Section of the site location. (The correct Meridian will come up automatically when you click the Meridian button.) You can find the TRS—also known as the Public Land Survey System (PLSS)—on standard legal descriptions of property, on USGS topographical maps, and in plat books.

If the proposed action will occur in more than one section, just enter one section number because, once you click on “Go to Map Tool”, that is enough information to get you to the general location of the project. *(If the map tool doesn't appear, check your screen resolution. It must be set at 1024 x 768 or higher.)*

When you are in the mapping tool click the “zoom out” or “zoom in” button at the top and click the map until you are at the map scale needed to encompass the project area. When you have the appropriate scale, click the “Draw” button and draw a polygon around the project area. If your project is longer than five miles, you should break it up into five-mile segments and submit them as multiple projects with an identifying name, such as Witherspoon Road, segment 1.

The last step is to click the submit button to get the EcoCAT Results Report. (If the report does not appear, turn off pop-up blockers.) To print or save the report, click the printer icon on the EcoCAT toolbar (not your browser print icon) and select print all. An Acrobat dialogue box will appear from which you can print and/or save the report.

If no T&E species or wetlands are listed on the report, it will state that consultation is closed.

If the report lists T&E species or INAI sites, an IDNR staff person will contact you to either:

- Terminate consultation because adverse effects are unlikely,
- Request additional information, or
- Recommend methods to minimize potential adverse effects.

If the EcoCAT report states that wetlands are within 250 feet of the project location, you will need to conduct a site visit and delineate any wetlands that could be impacted by the project. While the EcoCAT report may state that an IDNR staff member will contact you, IDNR will not contact applicants about wetland compliance for IDOT-funded projects. You should coordinate wetland compliance with IDOT according to Section 10-1.05 of the Bureau of Local Roads and Streets Manual.

MOTOR FUEL TAX CERTIFICATION/ PROJECT STATUS CHECKLIST – BLR10100

This form is used to track compliance with Phase I (BLRS Manual Chapter 10) and Permit (BLRS Manual Chapter 7) requirements for local let projects funded with motor fuel tax and/or other state funds. Below is a brief description of each item on the checklist. For complete details the BLRS Manual should be consulted.

ENVIRONMENTAL ISSUES (Chapter 10-1)

1. Section 6(f) procedures must be followed for all projects, regardless of project type or funding source, which involve the taking of property acquired or developed with Land and Water Conservation (LAWCON) funds. See Section 10-1.03 of the BLRS Manual for more information.
2. Compliance procedures for proposed conversion of Open Space Lands and Development (OSLAD) assisted lands are applicable to all projects proposing conversion regardless of project type or funding source. See Section 10-1.04 of the BLRS Manual for more information about OSLAD assisted lands.
3. The *Interagency Wetland Policy Act* and the Illinois Administrative Code apply to all State and IDOT pass-through funded projects involving possible wetland impacts. This includes federal, Motor Fuel Tax (MFT), and other State funded projects. A copy of the Ecological Compliance Assessment Tool (EcoCAT) termination report/letter should be submitted with this form. See Section 10-1.05 of the BLRS Manual for more information.
4. Historic Preservation/Cultural compliance applies to all State-funded and State-approved projects that do not involve Federal funds or are not regulated by a Federal agency. Projects that are funded with MFT and State funds and do not require a Federal permit must comply with this Act. See Section 10-1.06 of the BLRS Manual for more information.
5. Threatened and Endangered Species/Natural Areas compliance applies where a project funded or authorized by State and local agencies involves acquisition of additional right-of-way or easements (temporary or permanent); construction activities outside the existing right-of-way; a drainage structure runaround or any in-stream work; impacts to a recognized Illinois Natural Areas Inventory site or Illinois dedicated Nature Preserve, a wetland; or a location where a State or federal listed species is known to occur. A copy of the Ecological Compliance Assessment Tool (EcoCAT) termination report/letter should be submitted with this form if applicable. See Section 10-1.07 of the BLRS Manual for more information.
6. Coordination with the Illinois Department of Agriculture (IDOA) is required for highway and bridge projects funded in whole or in part with State funds including TBP funds and Federal-aid projects, but not MFT, and which require additional right-of-way, unless any of the following apply:
 - The project is located within the boundaries of an incorporated municipality.
 - The project is within the official 1.5 mile (2.4 km) planning area of an incorporated municipality.
 - The project is nonlinear and requires acquisition of no more than 10 acres (4 hectares) of land.
 - The project is linear; requires acquisition of no more than 3 acres of land per project mile (0.75 ha per project kilometer); and does not involve alternative alignment in which the right-of-way diverges from, and is not contiguous to, the existing right-of-way.See Section 10-1.08 of the BLRS Manual for more information.
7. Special Waste Screening applies to all local agency Federal- and State-funded projects, and is recommended for MFT-funded projects. See Section 10-1.09 of the BLRS Manual for more information.

HARD COPIES UNCONTROLLED

PROJECT STUDIES/REPORTS (Chapter 10-2)

1. Highway and bridge improvements within 2 miles (3.2 km) of publicly owned airports, within 1 mile (1.6 km) of privately owned airports open to the public, and within 0.5 miles (0.8 km) of restricted-landing areas require coordination with the IDOT Division of Aeronautics. See Section 10-2.01(e) of the BLRS Manual for more information.
2. When a project is involved with a railroad grade crossing or separation, coordination with the affected railroad should take place at an early stage to determine if any improvement is necessary to the railroad facility and to determine funding responsibilities for the improvement. Before the railroad work can begin, it will be necessary to prepare a railroad agreement or to obtain the approval of the Illinois Commerce Commission (ICC). See Section 10-2.01(f) of the BLRS Manual for more information.
3. The local agency will be required to prepare an Intersection Design Study for intersections if any of the following conditions apply. See Section 10-2.02 of the BLRS Manual for more information.
 - in a rural area when both roads have a current 30th maximum design hourly volume (DHV) of 300 vehicles or more;
 - in a rural area when a local road with a current DHV of 300 or more intersects a State marked route;
 - in an urban area when both streets have a current DHV of 400 vehicles or more;
 - in an urban area when a local street with a current DHV of 400 or more intersects a State marked route;
 - when additional lanes and/or channelization is proposed on one or both routes; or
 - when any intersection designed as a roundabout.
4. A Bridge Condition Report (BCR) is not required for total structure replacement for projects using non-Federal funding. A BCR is required for all rehabilitation and widening projects for which a Preliminary Bridge Design and Hydraulic Report (PBDHR) must be submitted for IDOT approval. See Section 10-2.03(a) of the BLRS Manual for more information.
5. Submittal of a PBDHR is required when a permit is to be issued and for all structures, including all county and road district structures having a clear span greater than 30 feet using non-MFT funding, except for the following exempt categories:
 - structures having a clear span of 10 ft (3 m) or less, or a waterway opening of 100 ft² (9 m²) or less (including over-the-road flow) for the design flood; or
 - structures for which the preliminary design has been prepared by IDOT.See Section 10-2.03(b) of the BLRS Manual for more information.
6. Submittal of the Asbestos Determination Certification for Local Highway Bridges must be submitted for all structures undergoing reconstruction or rehabilitation, even for non-MFT structures not otherwise requiring approvals from the BBS. This will enable the department to update the confirmed/unconfirmed list.
7. A drainage study containing preliminary hydrologic and hydraulic analyses should be prepared where highway drainage and/or structures will significantly affect the design or cost of a project. See the BBS Drainage Manual and Chapter 38 of the BLRS Manual for more information.
8. If soil stability problems are anticipated, a preliminary Geotechnical Report should be prepared during the preliminary study phase. See the IDOT Geotechnical Manual for more information.
9. A commitment file must be kept for all State-funded local projects and is recommended for MFT projects. See Section 10-2.06 of the BLRS Manual for more information.
10. Form BLR 22120 is used to document the justification and approval of variances that are necessary for the completion of the project. See Section 10-2.07(b) of the BLRS Manual for more information.

RIGHT-OF-WAY (Chapter 10-3)

1. Local agency projects built under the supervision of IDOT should not be advertised for letting until the necessary right-of-way has been secured. Material awards for day labor projects should not be made until the necessary right-of-way for construction has been secured. See Section 10-3 of the BLRS Manual for more information.

PERMITS (Chapter 7)

1. NPDES permits are required for construction activities involving clearing, grading, and excavation activities that disturb 1 acre (0.4 ha) or more of land area. Local agencies that are part of an MS4 will use the ILR40 permit. All other local agencies will use the ILR10. See Section 7-4.01 of the BLRS Manual for more information.
2. Section 404 permits, issued by the USACE, are required for activities that involve the discharge of dredged or fill material into waters of the United States, including wetlands. See Section 7-4.02 of the BLRS Manual for more information.
3. State certification is required in conjunction with the authorization by US Army Corps of Engineers (USACE) of any activity that may result in any discharge into waters of the United States requiring a Section 404 Permit. Water Quality Certification is also required for Section 9 Permits. See Section 7-4.03 of the BLRS Manual for more information.
4. Section 9 permits are required for the construction, modification, replacement, or removal of bridges or causeways over a navigable waterway. Construction of bridges crossing waters not presently used or susceptible to be used as a means of transporting Interstate or foreign commerce does not require a permit. Removal of an existing bridge without replacing it with another bridge also does not require a permit. See Section 7-4.04 of the BLRS Manual for more information.
5. For the burning of landscape waste in any area of the State, if open burning is conducted with the aid of an air curtain destructor or comparable device to reduce emissions substantially and does not occur within 1000 ft (300 m) of any residential or other populated area. See Section 7-3.01 of the BLRS Manual for more information.

BDE PROCEDURE MEMORANDUM

NUMBER: 57-08

BLRS PROCEDURE MEMORANDUM

NUMBER: 2008-06

**SUBJECT: Use of Commercial and Department Wetland Mitigation Bank
Site Credits**

DATE: October 1, 2008

The information herein supersedes Procedure Memorandum 57-07, dated October 15, 2007, and augments sections of Procedure Memorandum 33-03 and Section 10-1.05(i) of the Bureau of Local Roads & Streets Manual.

Background

A mitigation bank is a site where wetlands and/or other aquatic resources are restored, created, enhanced, or preserved to provide compensatory mitigation in advance of authorized impacts to similar resources. Commercial wetland mitigation bank sites are in operation in various parts of Illinois. To date, several Districts have established wetland mitigation bank sites with more being planned.

Applicability

The procedures in this memorandum apply to all transportation projects funded by or through all divisions of the Department.

Procedures

The Department's preferred method of wetland compensation involves the use of pre-existing wetland credits from a commercial or Department owned wetland mitigation bank site. This preference may be met when the project is within the service area of a bank site. Information on Department wetland mitigation bank sites and service areas may be accessed at the Department's Environment webpage (<http://www.dot.il.gov/environment.html>). For projects that are not within the service area of a mitigation bank, Section 4.B of PM 33-03 should still be followed.

Credits generated at approved commercial and Department bank sites may be used by all Department divisions to satisfy impact requirements of Section 404 of the Clean Water Act and the Illinois Interagency Wetland Policy Act of 1989.

HARD COPIES UNCONTROLLED

Coordination

All proposals for use of credits from commercial and Department owned bank sites shall be coordinated with the Bureau of Design and Environment (BDE). State transportation projects (highway, aviation, mass transit, etc.) shall be coordinated in accordance with PM 33-03. For Local Roads projects, proposals shall be coordinated in accordance with Section 10-1.05 of the Bureau of Local Roads & Streets Manual.

For proposals to draw credits from a Department bank, a Wetland Impact Evaluation (WIE), the bank site name and number or debits sought shall be coordinated with BDE. Debits will be recorded on the bank site ledger. BDE will forward a copy of the WIE to the District Environmental Coordinator and District Programming Engineer. Debits are considered pending until the project is awarded. District bank site ledger information can be obtained by contacting BDE.

District Preference for Credit Use

The District will receive priority consideration for use of credits from their own bank(s), and BDE will only approve credit withdrawals if the bank has sufficient credits available to meet the foreseeable needs of the bank owning District. Each District will have the option to object to an incoming WIE in writing within twenty working days of receipt of the WIE. The reason for the objection must be included in the letter.

Regulatory Agencies

BDE will serve as the principal point of contact with the wetland regulatory agencies for resolving issues regarding the use of bank credits on specific projects and for any required reporting to those agencies associated with the banks (e.g. concerning credit balances, credits used, etc).

Credit Surplus

A District or other transportation entity may want to purchase a block or surplus of credits from a commercial or Department owned bank site. These credits would be purchased in advance of any known impacts and used to compensate for small losses (less than 0.5-acre) from several projects. When a block of credits is purchased, a ledger for tracking debits from that block shall be created and held by the District or other entity of the Department. When coordinating with BDE, the District or other entity shall submit a copy of the ledger associated with the block purchase along with the WIE.

Billing and Reimbursement of Bank Credits

A District or transportation entity that draws credits from a commercial bank must commit program funds to cover the purchase of credits. In cases where credits are sought from a Department owned wetland bank site, the site owning District must be reimbursed.

State Transportation Projects

Billing and reimbursement will be accomplished through the re-appropriation of District program funds by the Office of Planning and Programming (OPP). Re-appropriations will occur once each year and will be based on information provided by BDE. Each District should submit their cost for bank site development to OPP to ensure the District is adequately compensated during the re-appropriation process. Cost should be the sum of land acquisition, construction and maintenance for each acre.

Local Roads & Streets Transportation Projects

The local agency is responsible for purchasing all required wetland credits either with their own funds or with federal funds. If federal funds are involved, the purchase cannot occur prior to federal authorization of the project phase or the Federal Highway Administration will not approve reimbursement for the credits to the local agency. However, the use of local funds to purchase the wetland credits will not have any impact on the timing of the federal authorization.

In addition, the funding for the wetland credits will be included on the Joint Funding Agreement for either Preliminary Engineering (PE) or construction.

Phase II is the preferred phase for including the wetland credit funding. However, since many of the downstate local agencies combine their Phase I and Phase II into one funding agreement, the joint funding agreement would then have to be amended once the wetland requirements were identified in Phase I.

If the funding is included in the construction phase, as long as there is assurance from the local agency that the credits will be purchased after the authorization and prior to the letting, the project can proceed to letting. When the plans, specifications and estimate are submitted to the central Bureau of Local Roads and Streets (BLRS), the District/local agency should provide information at that time that the necessary wetland credits will be purchased after authorization. Including the wetland funding on the construction agreement alleviates the need for amending the PE Joint Funding Agreement.

The funding for the wetland credits will be shown as a separate 'Wetland Credit' line on the Division of Cost table of the Joint Funding Agreement.

When the wetland credit is included in the Joint Funding Agreement, that funding will be programmed in the Annual Proposed Highway Improvement Program through BLRS.

Federal funds: If the wetland credit is included on a PE agreement or locally-let construction agreement, only the federal funding (80% of the wetland credit) will be required to be programmed. If the project is on a state letting, the federal funding and required matching funds will need to be programmed.

Local funds: If the local agency uses their local funds to purchase the wetland credits, this funding will still be required to be programmed to accommodate the necessary transfer of appropriation (see last bullet point below). However, the use of local funds alleviates the need for federal authorization prior to reimbursement.

Once the federal funding is authorized, the local agency will then be able to be reimbursed for the 80% of federal funding to account for their expenditure for the wetland credit. Payment for wetland credit occurs through a reduction of their federal balances and BLRS transfers the associated appropriation.

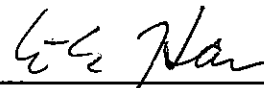

BDE will send an annual report at the end of each fiscal year to BLRS that lists the wetland credits purchased and the local agency and wetland bank involved. Based on this information, BLRS will verify that the funds for these credits were programmed and will transfer the necessary amount of appropriation to OPP for use on the state side of the program for the District from whose bank the credits were purchased.

Wetland Bank Prohibitions

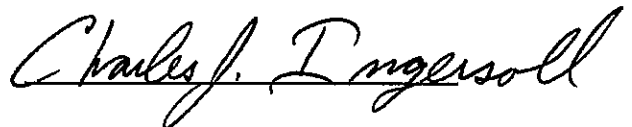

The following is prohibited for Department owned wetland banks:

- The selling of credits to private entities.
- The use of wetland banks for non-transportation related projects.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2008-07
SUBJECT: INVOICE PROCESSING
ISSUED DATE: October 31, 2008
EFFECTIVE DATE: November 3, 2008

This memorandum adds Section 5-11 concerning invoice processing to Chapter 5 of the Bureau of Local Roads & Streets Manual.

Procedures for processing local agency invoices have been added to Chapter 5 of the Bureau of Local Roads and Streets Manual. Section 5-11 outlines general submittal procedures and supporting documentation requirements. The addition of this section to Chapter 5 simply formalizes existing procedures.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2008-08
SUBJECT: DEFINITION OF MAJOR/MINOR CHANGE IN PLANS
ISSUED DATE: October 31, 2008
EFFECTIVE DATE: November 3, 2008

This memorandum revises Section 13-2 of the Bureau of Local Roads & Streets Manual dated November 2007.

The Motor Fuel Tax Streamlining workgroup composed of department staff, municipal representatives, county representatives, and consultant representatives recommended increasing the dollar amount in the definition of Major/Minor Change of plans from \$10,000 to \$20,000. The increase is reflective of the current bidding threshold of \$20,000.

In accordance with 720 ILCS 5/33E-9, all change orders or series of change orders that authorize a net increase or decrease in the cost of a local agency contract by a total of \$10,000 or more, or an increase or decrease in the time of completion by 30 days or more, still must contain one of the following written determinations depending upon the circumstances of the change:

- The undersigned has determined that the circumstances that necessitate this change were not reasonably foreseeable at the time the contract was signed.
- The undersigned has determined that the circumstances that necessitate are germane to the original contract.
- The undersigned has determined that this change is in the best interest of the local agency and is authorized by law.

Please contact Kevin Burke of this office at kevin.burkeiii@illinois.gov with any questions.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2009-01
SUBJECT: CATEGORICAL EXCLUSIONS AND DESIGN APPROVAL
ISSUED DATE: March 6, 2009
EFFECTIVE DATE: March 6, 2009

This memorandum replaces Chapter 19 dated January 2006 and revises Section 22-2 dated June 2006 of the Bureau of Local Roads and Streets Manual.

A process review team consisting of representatives of the Federal Highway Administration (FHWA) and the Illinois Department of Transportation (IDOT) recommended an effort to update IDOT's Categorical Exclusion (CE) policies and the FHWA/IDOT agreement where revisions are necessary for clarification, streamlining, or bringing consistency with each other and with current laws and regulations. Based on the results of this process review and the proposal to require design approval for all projects requiring a Project Development Report, revisions have been incorporated into the Bureau of Local Roads and Streets Manual.

CE Group I actions (actions that do not involve the possibility of unusual circumstances) have been updated in Chapter 19 as recommended by the process review team. Also updated in Chapter 19 is clarification regarding which CE Group I projects would require a Project Development Report (PDR) using form BLR 22211. If a PDR is not required for CE Group I actions use form BLR 19100. For CE Group II actions, use form BLR 22210 (formerly form BLR 22110).

All projects requiring a Project Development Report will now require design approval. The districts will have design approval authority for certain CE Group I projects and the Central Office will have design approval authority for all CE Group II projects.

Please contact Gary Galecki at 217.785.8564 or gary.galecki@illinois.gov of this office with any questions.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2009-02
SUBJECT: HIGHWAY LIGHTING PLAN REVIEW
ISSUED DATE: April 7, 2009
EFFECTIVE DATE: April 10, 2009

This memorandum revises Section 11-2 dated July 2006, Section 11-7 dated January 2006, and Section 23-7 dated January 2006 of the Bureau of Local Roads & Streets Manual.

The department recently reviewed the highway lighting plan approval for both MFT and federal projects. Based on the review, the department has made revisions to the highway lighting plan approval policy.

For both MFT and federal local projects, only highway lighting improvements that impact a State highway will require a pre-final plan review and final plan approval by the department. If requested by the local agency, the department will perform a review on any highway lighting improvement; however, the local agency must comply with any recommended changes as a result of the requested review. Region 1 District 1 will handle reviews and approvals of highway lighting plans within District 1. Central Bureau of Design & Environment's (BDE) Electrical and Mechanical Unit will handle reviews and approvals of highway lighting plans within Districts 2 – 9.

In order to ensure highway lighting plans meet existing lighting standards, all highway lighting plans will require the seal of the professional engineer responsible for the lighting plans.

Please contact the Local Policy & Technology Unit of this office at DOT.LocalPolicy@illinois.gov with any questions.

HARD COPIES UNCONTROLLED

Illinois Department of Transportation

2300 South Dirksen Parkway / Springfield, Illinois / 62764

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2009-03
SUBJECT: EMERALD ASH BORER
ISSUED DATE: September 11, 2009
EFFECTIVE DATE: October 01, 2009

This memorandum revises Section 41-10 dated January 2006 of the Bureau of Local Roads & Streets Manual.

The Emerald Ash Borer (EAB) is an exotic Asian beetle that was first found in Detroit, MI in 2002. Since its introduction, the EAB has spread to Illinois, Indiana, Ohio, Pennsylvania, Maryland, Virginia, West Virginia and Wisconsin as of November 2008. The EAB larvae feed on the inner bark and disrupt the tree's ability to transport water and nutrients resulting in mortality.

The United States Department of Agriculture (USDA) has established a quarantine zone that prohibits the moving of ash firewood across state lines and prohibits the intrastate movement of regulated articles. The Illinois Department of Agriculture (IDOA) prohibits intrastate movement of the following items:

- the emerald ash borer in any living stage of development;
- ash trees of any size;
- ash limbs and branches;
- any cut, non-coniferous firewood;
- bark from ash trees and wood chips larger than one inch from ash trees;
- ash logs and lumber with either the bark or the outer one inch of sapwood, or both, attached;
- any item made from or containing the wood of the ash tree that is capable of spreading the emerald ash borer; and
- any other article, product or means of conveyance determined by the Illinois Department of Agriculture to present a risk of spreading the beetle infestation.

Due to the federal and state EAB quarantine, agencies shall not include any species of ash tree (*Fraxinus spp.*) in highway plans. Design plans should be reviewed. Any pay items for ash trees shall be removed and replaced with different trees. While the EAB is currently only a problem in Districts 1, 2, 3, 4, and 5, it is very likely that the EAB will continue to spread. Continuing to plant ash trees only serves to provide future food and breeding sites for this insect.

Disposal or Processing Yard Location (if different than mailing address above): Street _____

City/Town _____ Zipcode _____ County _____

Applicable to State or Federal Cooperative Domestic Quarantines for the Emerald Ash Borer (Agrilus planipennis) pursuant to the Insect Pest and Plant Disease Act (505 Illinois Compiled Statutes 90/1 et seq.)

I acknowledge State and Federal regulations governing the Emerald Ash Borer (EAB) and "regulated articles"*. When working within and near EAB quarantine zone(s), I agree to supply records that may be required for inspection. I agree to comply with the procedures listed in this agreement or with other procedures as required by the Director of the Illinois Department of Agriculture as follows:

- 1. Regulated articles shall not be moved out of quarantine zone(s) at any time unless: a) the regulated articles have been chipped/processed to a size measuring less than 1.0 inch in two dimensions; or b) the bark and outer 1/4 inch of sapwood has been removed;
2. From April 30 to September 1, regulated articles originating from EAB-infested areas shall only be transported within the quarantine zone(s) if: a) the regulated articles are transported in an enclosed vehicle or a vehicle completely enclosed by a covering, such as canvas, plastic or other tightly woven cloth, adequate to prevent the passage of the Emerald Ash Borer to the environment; and b) upon arrival at the final destination, the regulated articles are immediately processed to compliance standards;
3. All ash stumps will be ground to eight inches (8") below the soil surface and covered with soil;
4. Employers will inform their employees about the EAB quarantine zone(s) borders and about EAB quarantine regulations. Employers will also instruct employees how to identify the EAB and its signs;
5. The Illinois Department of Agriculture will be informed of any suspected EAB infestation;
6. A copy of this compliance agreement will be carried by employees working within EAB quarantine zone(s);
7. Per this agreement, ash products, ash nursery stock and/or live ash trees that originate from or are brought into a quarantine zone may not be removed from the zone, and may be subject to immediate processing to compliance standards, confiscation, and destruction; and
8. Movement of ALL deciduous (non-coniferous) firewood out of or through the quarantine zone(s) is prohibited, regardless of initial origin unless the firewood has been treated compliant with one of the following: a) USDA-APHIS-PPQ Kiln Sterilization Standard T404-b-4; b) USDA-APHIS_PPQ Fumigation Treatment Standard T404-b-1-1; USDA-APHIS-PPQ Heat Treatment Standard T314-a; or d) all bark and the outer 1/4 inch of sapwood has been completely removed.

*"Regulated Articles" are hereby defined as the following:

- 1) The Emerald Ash Borer (Agrilus planipennis Fairmaire) in any living stage of development;
2) Ash trees (Fraxinus spp.) of any size;
3) Ash limbs and branches;
4) Any cut non-coniferous firewood;
5) Bark from ash trees and wood chips larger than one inch in two dimensions from ash trees;
6) Ash logs and lumber with either the bark or the outer one-half-inch of sapwood or both, attached;
7) Any item made from or containing the wood of the ash tree which is capable of spreading the emerald ash borer;
8) Any other article, product, or means of conveyance when it is determined by the Director of Agriculture that it presents the risk of spread of the Emerald Ash Borer in any stage of development.

Affixing of the signatures below will validate this agreement which shall remain in effect until cancelled. This document may be revised as necessary or revoked for noncompliance by the Department.

HARD COPIES UNCONTROLLED

You Can Help...

Do Not Move Firewood!

Photo: Canadian Food Inspection Agency

- Emerald ash borer can easily be transported in ash logs.
- Purchase firewood locally from a known source.
- Be sure to use all of the firewood in the cold months so that no hidden emerald ash borer larvae or adults can survive on logs left through the spring.
- Monitor the health of ash trees. Look for dead and dying branches at the top of the tree's crown.

If You Think You Have Emerald Ash Borer:

- For assistance in identifying suspect insects visit www.emeraldashborer.info/ or www.na.fs.fed.us/fhp/eab/
- Call the national EAB hotline 866-EAB-4512
- Contact Illinois Department of Agriculture's Pesticide Hotline at 800-641-3934 or in the Chicago area use 312-74BEETL (312-742-3385)
- Contact your city or village forester or arborist for assistance.
- Contact the University of Illinois Extension Service office in your county. Find a nearby office at <http://web.extension.uiuc.edu/cie2/offices/findoffice.cfm> or by calling 217-333-5900
- Contact a certified arborist. You may find one nearby at www.isa-arbor.com/findArborist/findarborist.aspx
- Or contact The Morton Arboretum Plant Clinic at 630-719-2424

For more information about The Morton Arboretum

visit www.mortonarb.org

The Morton Arboretum

4100 Illinois Route 53, Lisle, IL 60532-1293

Stop the Borer, Save Ash Trees

Emerald Ash Borer

HARD COPIES UNCONTROLLED

Emerald Ash Borer

The emerald ash borer, (*Agrilus planipennis* Fairmaire) is a small (1/2 inch long, 1/8 inch wide) metallic green beetle native to Asia. Though it was first found in Michigan in 2002, it was likely that a beetle population had been established in the Detroit area for many years prior. More than 15 million ash trees have been killed. It has been also detected in Ohio, Indiana, Virginia, Maryland, and Ontario, Canada.

Actual size

Biology

The adult emerald ash borer emerges in May – July and the female lays numerous eggs in bark crevices and between layers of bark.

The eggs hatch in 7 – 10 days and larvae bore into the tree where they chew the inner bark and phloem creating serpentine galleries as they feed. This cuts off the flow of water and nutrients in the tree, causing dieback and death.

Larva

S-shaped galleries

Ash Trees

Ash trees are very common in landscapes and most species, namely white ash (*Fraxinus americana*) and green ash (*F. pennsylvanica*) are native to Illinois forests. It is estimated that as much as 20% of street trees in the Chicago area are ash.

Ash leaves & twig

Opposite pairing

Seeds

Characteristics of ash:

- Compound leaves made up of small, glossy green leaflets.
- Leaves, twigs and branches grow in opposite pairs.
- Bark of mature trees is gray and furrowed, often appearing in a diamond pattern.
- Some ash trees will produce small canoe paddle-shaped seeds.
- Seedless ash trees may develop ash flower galls that turn from green to brown and may persist in the crown throughout the year.

Dieback

Epicormic branching or suckers

Bark slits

Emergence hole - Shown actual size of 1/8" and D-shaped

Signs and Symptoms

The most visible sign of infestation is crown dieback, which appears after the first year. Branches at the top of the crown will die and more branches will die in subsequent years. Typically, the tree will be completely dead in about three years, though suckers will sprout from the base of the tree and on the trunk. The bark may also split vertically and woodpeckers may feed on the beetle leaving visible damage on the bark. Treatments with insecticides are being studied. However, all ash trees proximate to any new infestation will be lost.

Adult beetles emerging from trees will leave a very small, 1/8 inch diameter distinctly "D" shaped exit hole that may appear anywhere on the trunk or upper branches.

Other Stressors:

Ash trees may suffer from a large number of pest and disease problems that cause similar symptoms. Native borers also attack ash trees, though they leave larger exit holes up to a 1/4 inch in diameter that are usually circular or oval in shape.

Illinois Department of Transportation

2300 South Dirksen Parkway / Springfield, Illinois / 62764

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2009-04
SUBJECT: MAINTENANCE PERIOD AND MAINTENANCE GROUP DEFINITIONS
ISSUED DATE: October 13, 2009
EFFECTIVE DATE: October 26, 2009

This memorandum revises Section 5-5 dated July 2006, Section 11-7 dated April 2009, Section 12-2 dated April 2007, Section 14-2 dated January 2006 and Section 14-3 dated January 2006 of the Bureau of Local Roads & Streets Manual.

The Motor Fuel Tax Streamlining Workgroup composed of department staff, municipal representatives, county representatives, and consultant engineering representatives recommended allowing a 24-month general maintenance period and reducing approval requirements for certain routine general maintenance items.

Local highway agencies shall establish either a 12 or 24-month general maintenance period. Maintenance resolutions, engineering agreements, estimates, and expenditure statements will be submitted only once per maintenance period.

Contract proposals involving lighting maintenance, signal maintenance, or any other maintenance project that only involves contractor equipment and/or labor may be awarded for a period not exceeding 3 years. Material proposals for the purchase of salt or other ice control measures may be for an entire winter period even if it extends over two maintenance periods. All other contract or material proposals must be completed within the maintenance period.

General maintenance group definitions have been modified and approval requirements for general maintenance groups have been revised. Maintenance items that are not required to be competitively bid and routine maintenance operations will not need department's approval of plans, specifications, and estimates and approval of proposal prior to the letting. While using department standard forms is still recommended, local agencies are not required to use department standard forms on proposals that do not require department review and approval.

HARD COPIES UNCONTROLLED

All MFT funded projects will still require compliance with prevailing wage, apprenticeship and training certification, and all other applicable regulations, laws, and MFT policies. Any MFT funded project that does not comply with the applicable regulations, laws, and MFT policies will not be eligible for MFT funding. All MFT funded projects subject to competitive bidding must be advertised in the department's Notice to Contractor's Bulletin.

Please contact the BLRS Local Policy & Technology Unit at DOT.LocalPolicy@illinois.gov with any questions.

A handwritten signature in black ink that reads "Danell Lewis". The signature is written in a cursive, flowing style.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2009-05
SUBJECT: ASSET MANAGEMENT
ISSUED DATE: December 28, 2009
EFFECTIVE DATE: January 1, 2010

This memorandum revises Section 4-1 dated October 2007 and Section 4-3 dated January 2006 of the Bureau of Local Roads & Streets Manual.

Asset management is a business process and a decision-making framework that covers an extended time horizon, draws from economics as well as engineering, and considers a broad range of assets. The asset management approach incorporates the economic assessment of trade-offs among alternative investment options and uses this information to help make cost-effective investment decisions.

Local agencies may use federal funds to participate in the costs incurred for management systems related to the development, establishment, and implementation of a system for managing certain assets located on and off Federal-aid highways. Local agencies may also use Motor Fuel Tax (MFT) funds for asset management, if the assets are eligible to be constructed or maintained with MFT funds. Asset management may be performed by consulting engineers or local agency staff using paper or electronic methods.

Please contact the BLRS Local Policy & Technology Unit at DOT.LocalPolicy@illinois.gov with any questions.

A handwritten signature in cursive script that reads "Darrell Lewis".

U.S. Department of Transportation
Federal Highway Administration

Memorandum

Subject: **INFORMATION:** Treatment of Management Systems Cost

Date: **May 6, 2009**

From: Robert Ritter, Acting Director, Office of Planning
Butch Wlaschin, Director, Office of Asset Management

Reply to: HEPP-20/ HIAM-10
Attn. of :

To: Division Administrators
Directors of Field Services

In accordance with Section 303, Title 23, United States Code (U.S.C.) Federal funds may participate in the costs incurred by States for management systems. The purpose of this memorandum is to clarify the eligibility of costs related to the State development, establishment, and implementation of a system for managing each of the following:

- Highway pavement of Federal-aid highways
- Bridges on and off Federal-aid highways
- Highway safety
- Traffic congestion
- Public transportation facilities and equipment
- Intermodal transportation facilities and systems

As each State carries out the continuing, cooperative, and comprehensive transportation planning process that provides for consideration and implementation of projects, strategies, and services that will address efficient system management and emphasize preservation of the existing systems, Surface Transportation Program (STP), National Highway System Program (NHS), Highway Bridge Program (HBP), and Congestion Mitigation and Air Quality Program (CMAQ) funds may be used for development of an integrated management system and linking management systems as a decision-making tool. Furthermore, 23 U.S.C. 505(a)(3) states that State Planning and Research (SPR) funds are also eligible to support the development and implementation of management systems in 23 U.S.C. 303.

The management systems listed above and the data collection and data management that support these systems are funded as a direct project cost¹. To further clarify, costs associated with on- or off-system data, as appropriate, pertaining to the comprehensive transportation network system that benefits or that is part of the transportation planning process may also be considered as a direct project cost.

Costs associated with updating data components may be considered necessary expenses associated with running a functioning management system, but in implementing the management system, it may be necessary to augment the system data with updated annual or biennial data collection. In such case, the State may fund this as a direct project cost at its discretion.

As the management systems mature, the allocable portion of necessary costs associated with running them, including costs of utilities, insurance, security, servicing, normal repairs and alterations, and the like is allowable as indirect costs to the extent that they keep such management systems in an efficient operating condition and do not add to the permanent value of the system nor appreciably prolong its intended life. They are allowable as an indirect cost provided the State has an approved indirect cost rate and may also be eligible for Federal funding (see May 5, 2004 memo – "Clarification of Policy on Indirect Costs of State and Local Governments: <http://www.fhwa.dot.gov/legsregs/directives/policy/indirectcost.htm>). After the implementation of the management systems, we anticipate such general or routine costs will be treated as indirect costs, in accordance with Title 2, Code of Federal Regulations, Part 225, "Cost Principles for State, Local, and Indian Tribal Governments." Once the systems are fully operational and fully utilized, such indirect costs may either be paid with State funds, or through equitable distribution to all benefiting cost objectives via an approved indirect cost allocation plan. It should be noted

HARD COPIES UNCONTROLLED

that costs for major management system upgrades, including integration of management systems as support to the transportation planning process, may be eligible as a direct project cost if such upgrades add to the permanent value of the system or appreciably prolong its intended life.

The management systems as provided for in 23 U.S.C. 303 and 505, are eligible to be charged to the project as a direct cost as follows:

- Pavement Management System, as it pertains to Federal-aid system is eligible for SPR, NHS, and STP funds.
- Bridge Management (NBIS) System is eligible (see 23 U.S.C. 151) for SPR, NHS, STP, and HBP funds.
- Safety Management System (now called the Strategic Highway Safety Plan) is funded under the Highway Safety Improvement Program (23 U.S.C. 148) but can also use SPR, STP, and NHS funds.
- Congestion Management Program (formerly CMS) is eligible for SPR, PL, NHS, STP, and CMAQ funds.
- Public Transportation and Facilities is eligible for Federal Transit Administration funding.
- Intermodal Transportation Facilities Management System is eligible for SPR, NHS, and STP funds.
- Integration and upgrading of management systems, as support to the transportation planning process, is eligible for SPR, NHS, and STP funds; however, general maintenance must be treated as an indirect cost.
- Data collection, data management, and updating data components that support management systems are eligible and funded as a direct project cost.
- Administrative or financial management information systems are not eligible for use with Federal funds as a direct project cost. A State's administrative or financial system can be funded entirely with State funds or with State funds and the applicable annual depreciation cost allocated to all benefiting cost objectives identified in the State's indirect cost allocation plan.

If you have any questions regarding this information or would like to discuss this further, please contact Kenneth Petty at kenneth.petty@dot.gov or (202) 366-6654 or Lorrie Lau at lorrie.lau@dot.gov or (415) 744-2628 in the Office of Planning or Nastaran Saadatmand at nastaran.saadatmand@dot.gov or (202) 366-1337 in the Office of Asset Management.

¹ Pursuant to 2 CFR 225, Appendix A, (C)(1)(b), the portion of the allocable cost for general computers that is for the management systems development and implementation are funded as a direct cost. The computer cost for the other portion may be charged to eligible funds as an indirect cost under an approved indirect cost allocation plan.

To provide feedback, suggestions or comments for this web page about its appearance, navigation, or operation, please contact Kenneth Petty at kenneth.petty@dot.gov.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2009-06
SUBJECT: 96TH ILLINOIS GENERAL ASSEMBLY'S
2009 SESSION CHANGES
ISSUED DATE: December 29, 2009
EFFECTIVE DATE: January 1, 2010

This memorandum revises various sections of the Bureau of Local Roads & Streets Manual.

This memorandum supersedes sections 3-2 dated December 2006, 4-2 dated January 2006, 9-2 dated January 2006, 12-1 dated April 2007 and Figure 4-3A dated January 2006.

P.A. 96-0034 (HB 0255) amended the Illinois Vehicle Code by increasing a vehicle load to 80,000 on non-designated highways. The BLRS Manual's section 3-2.05(a) was revised to reflect this change. The law is effective 1/1/2010.

P.A. 96-0366 (HB 0641) amended the Illinois Highway Code by increasing a lapse period to 48 months (4 years) for the Township Bridge Program funds. Subsequently, the changes were made to the BLRS Manual's following sections 4-2.02(a), 4-2.03, 9-2.01(c), and 9-2.02. The law is effective 1/1/2010.

P.A. 96-0034 (HB 0255) amended the Motor Fuel Tax Law by increasing the monthly amount to be transferred to the Grade Crossing Protection Fund to \$3,500,000 (previously \$2,250,000). The amount to be used for the construction or reconstruction of rail highway grade separation structures was increased to \$12,000,000 (previously \$6,000,000) annually. Such increase is reflected in the BLRS Manual's section 4-2.04 and Figure 4-3A. The law is effective 7/1/2009.

P.A. 96-0170 (HB 0585) amended the Counties Code by increasing a competitive bidding requirement threshold for counties with fewer than 2 million inhabitants to \$30,000 (previously \$20,000). As a result, the changes were made to the BLRS Manual's sections 12-1.02(a) and 12-1.02(b). The law is effective 1/1/2010.

All public acts may be viewed at the Illinois General Assembly's official website at <http://www.ilga.gov>.

Sincerely,

A handwritten signature in cursive script that reads "Darrell Lewis".

Darrell W. Lewis, P.E.
Acting Engineer of Local Roads and Streets

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2010-01
SUBJECT: HIGHWAY-RAIL GRADE CROSSING APPROACH
GEOMETRIC DESIGN
ISSUED DATE: April 16, 2010
EFFECTIVE DATE: April 19, 2010

This memorandum replaces Figure 33-3B in Section 33-3 of the BLRS Manual dated January 2006

The Bureau of Local Roads and Streets and the Illinois Commerce Commission have reviewed the geometric design guidelines for approaches on highway-rail grade crossings using Motor Fuel Tax Funds, Grade Crossing Protection Funds, or other State Funds. Reconstruction of existing highway-rail grade crossing approaches should be designed according to Chapter 33 of the BLRS Manual. On figure 33-3B, new footnotes modifying the design speed and travelled way width has been added to the 250 and 400 ADT columns for highway-rail grade crossing approaches on the road district system.

Please contact dot.localpolicy@illinois.gov with any questions.

A handwritten signature in cursive script that reads "Darrell Lewis".

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2010-02
SUBJECT: Unsignalized Pedestrian Crosswalk Signs
ISSUED DATE: August 27, 2010
EFFECTIVE DATE: September 1, 2010

This memorandum revises Section 39-2 of the Bureau of Local Roads & Streets Manual dated October 2008

Public Act 096-1165 effective July 22, 2010 amends 625 ILCS 5/11-1002. The statute now requires when traffic control signals are not in place or not in operation the driver of a vehicle shall stop and yield the right-of-way, to a pedestrian crossing the roadway within a crosswalk.

Section 2B.11 and Section 2B.12 of the 2009 Manual on Uniform Traffic Control Devices outline the requirements for unsignalized pedestrian crosswalk sign series. The STOP HERE FOR PEDESTRIAN signs (R1-5b and R1-5c) and the STOP FOR PEDESTRIAN signs (R1-6a and R1-9a) shall only be used where state law specifically requires that a driver must stop for a pedestrian in a crosswalk. Therefore, signs using the yield symbol or yield text (R1-5, R1-5a, R1-6, or R1-9) shall not be used at unsignalized pedestrian crosswalks.

Please contact the Local Policy & Technology Unit at DOT.LocalPolicy@illinois.gov with any questions.

A handwritten signature in cursive script that reads "Darrell Lewis".

HARD COPIES UNCONTROLLED

AN ACT concerning transportation.

**Be it enacted by the People of the State of Illinois,
represented in the General Assembly:**

Section 5. The Illinois Vehicle Code is amended by changing Sections 11-1002 and 11-1002.5 as follows:

(625 ILCS 5/11-1002) (from Ch. 95 1/2, par. 11-1002)

Sec. 11-1002. Pedestrians' right-of-way at crosswalks. (a) When traffic control signals are not in place or not in operation the driver of a vehicle shall stop and yield the right-of-way, ~~slowing down or stopping if need be to so yield,~~ to a pedestrian crossing the roadway within a crosswalk when the pedestrian is upon the half of the roadway upon which the vehicle is traveling, or when the pedestrian is approaching so closely from the opposite half of the roadway as to be in danger.

(b) No pedestrian shall suddenly leave a curb or other place of safety and walk or run into the path of a moving vehicle which is so close as to constitute an immediate hazard.

(c) Paragraph (a) shall not apply under the condition stated in Section 11-1003 (b).

(d) Whenever any vehicle is stopped at a marked crosswalk or at any unmarked crosswalk at an intersection to permit a pedestrian to cross the roadway, the driver of any other

vehicle approaching from the rear shall not overtake and pass such stopped vehicle.

(e) Whenever stop signs or flashing red signals are in place at an intersection or at a plainly marked crosswalk between intersections, drivers shall yield right-of-way to pedestrians as set forth in Section 11-904 of this Chapter.

(Source: P.A. 79-857.)

(625 ILCS 5/11-1002.5)

Sec. 11-1002.5. Pedestrians' right-of-way at crosswalks; school zones.

(a) For the purpose of this Section, "school" has the meaning ascribed to that term in Section 11-605.

On a school day when school children are present and so close thereto that a potential hazard exists because of the close proximity of the motorized traffic and when traffic control signals are not in place or not in operation, the driver of a vehicle shall stop and yield the right-of-way, ~~slowing down or stopping if need be to so yield,~~ to a pedestrian crossing the roadway within a crosswalk when the pedestrian is upon the half of the roadway upon which the vehicle is traveling, or when the pedestrian is approaching so closely from the opposite half of the roadway as to be in danger.

For the purpose of this Section, a school day shall begin at seven ante meridian and shall conclude at four post

meridian.

This Section shall not be applicable unless appropriate signs are posted in accordance with Section 11-605.

(b) A first violation of this Section is a petty offense with a minimum fine of \$150. A second or subsequent violation of this Section is a petty offense with a minimum fine of \$300.

(c) When a fine for a violation of subsection (a) is \$150 or greater, the person who violates subsection (a) shall be charged an additional \$50 to be paid to the unit school district where the violation occurred for school safety purposes. If the violation occurred in a dual school district, \$25 of the surcharge shall be paid to the elementary school district for school safety purposes and \$25 of the surcharge shall be paid to the high school district for school safety purposes. Notwithstanding any other provision of law, the entire \$50 surcharge shall be paid to the appropriate school district or districts.

For purposes of this subsection (c), "school safety purposes" has the meaning ascribed to that term in Section 11-605.

(Source: P.A. 95-302, eff. 1-1-08.)

Section 99. Effective date. This Act takes effect upon becoming law.

Support:

- 10 Figure 2A-3 shows examples of some typical placements of STOP signs and YIELD signs.
- 11 Section 2A.16 contains additional information about separate and combined mounting of other signs with STOP or YIELD signs.

Guidance:

- 12 *Stop lines that are used to supplement a STOP sign should be located as described in Section 3B.16. Yield lines that are used to supplement a YIELD sign should be located as described in Section 3B.16.*
- 13 *Where there is a marked crosswalk at the intersection, the STOP sign should be installed in advance of the crosswalk line nearest to the approaching traffic.*
- 14 *Except at roundabouts, where there is a marked crosswalk at the intersection, the YIELD sign should be installed in advance of the crosswalk line nearest to the approaching traffic.*
- 15 *Where two roads intersect at an acute angle, the STOP or YIELD sign should be positioned at an angle, or shielded, so that the legend is out of view of traffic to which it does not apply.*
- 16 *If a raised splitter island is available on the left-hand side of a multi-lane roundabout approach, an additional YIELD sign should be placed on the left-hand side of the approach.*

Option:

- 17 If a raised splitter island is available on the left-hand side of a single lane roundabout approach, an additional YIELD sign may be placed on the left-hand side of the approach.
- 18 At wide-throat intersections or where two or more approach lanes of traffic exist on the signed approach, observance of the right-of-way control may be improved by the installation of an additional STOP or YIELD sign on the left-hand side of the road and/or the use of a stop or yield line. At channelized intersections or at divided roadways separated by a median, the additional STOP or YIELD sign may be placed on a channelizing island or in the median. An additional STOP or YIELD sign may also be placed overhead facing the approach at the intersection to improve observance of the right-of-way control.

Standard:

- 19 **More than one STOP sign or more than one YIELD sign shall not be placed on the same support facing in the same direction.**

Option:

- 20 For a yield-controlled channelized right-turn movement onto a roadway without an acceleration lane and for an entrance ramp onto a freeway or expressway without an acceleration lane, a NO MERGE AREA (W4-5P) supplemental plaque (see Section 2C.40) may be mounted below a Yield Ahead (W3-2) sign and/or below a YIELD (R1-2) sign when engineering judgment indicates that road users would expect an acceleration lane to be present.

Section 2B.11 Yield Here To Pedestrians Signs and Stop Here For Pedestrians Signs (R1-5 Series)**Standard:**

- 01 **Yield Here To (Stop Here For) Pedestrians (R1-5, R1-5a, R1-5b, or R1-5c) signs (see Figure 2B-2) shall be used if yield (stop) lines are used in advance of a marked crosswalk that crosses an uncontrolled multi-lane approach. The Stop Here for Pedestrians signs shall only be used where the law specifically requires that a driver must stop for a pedestrian in a crosswalk. The legend STATE LAW may be displayed at the top of the R1-5, R1-5a, R1-5b, and R1-5c signs, if applicable.**

Guidance:

- 02 *If yield (stop) lines and Yield Here To (Stop Here For) Pedestrians signs are used in advance of a crosswalk that crosses an uncontrolled multi-lane approach, they should be placed 20 to 50 feet in advance of the nearest crosswalk line (see Section 3B.16 and Figure 3B-17), and parking should be prohibited in the area between the yield (stop) line and the crosswalk.*
- 03 *Yield (stop) lines and Yield Here To (Stop Here For) Pedestrians signs should not be used in advance of crosswalks that cross an approach to or departure from a roundabout.*

Option:

- 04 Yield Here To (Stop Here For) Pedestrians signs may be used in advance of a crosswalk that crosses an uncontrolled multi-lane approach to indicate to road users where to yield (stop) even if yield (stop) lines are not used.

Figure 2B-2. Unsignalized Pedestrian Crosswalk Signs

* The legend STATE LAW is optional. A fluorescent yellow-green background color may be used instead of yellow for this sign.

05 A Pedestrian Crossing (W11-2) warning sign may be placed overhead or may be post-mounted with a diagonal downward pointing arrow (W16-7P) plaque at the crosswalk location where Yield Here To (Stop Here For) Pedestrians signs have been installed in advance of the crosswalk.

Standard:

06 If a W11-2 sign has been post-mounted at the crosswalk location where a Yield Here To (Stop Here For) Pedestrians sign is used on the approach, the Yield Here To (Stop Here For) Pedestrians sign shall not be placed on the same post as or block the road user’s view of the W11-2 sign.

Option:

07 An advance Pedestrian Crossing (W11-2) warning sign with an AHEAD or a distance supplemental plaque may be used in conjunction with a Yield Here To (Stop Here For) Pedestrians sign on the approach to the same crosswalk.

08 In-Street Pedestrian Crossing signs and Yield Here To (Stop Here For) Pedestrians signs may be used together at the same crosswalk.

Section 2B.12 In-Street and Overhead Pedestrian Crossing Signs (R1-6, R1-6a, R1-9, and R1-9a)

Option:

01 The In-Street Pedestrian Crossing (R1-6 or R1-6a) sign (see Figure 2B-2) or the Overhead Pedestrian Crossing (R1-9 or R1-9a) sign (see Figure 2B-2) may be used to remind road users of laws regarding right-of-way at an unsignalized pedestrian crosswalk. The legend STATE LAW may be displayed at the top of the R1-6, R1-6a, R1-9, and R1-9a signs, if applicable. On the R1-6 and R1-6a signs, the legends STOP or YIELD may be used instead of the appropriate STOP sign or YIELD sign symbol.

Illinois Department of Transportation

2300 South Dirksen Parkway / Springfield, Illinois / 62764

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2011-01

SUBJECT: PAVEMENT MAINTENANCE, REHABILITATION AND DESIGN POLICIES

ISSUED DATE: November 23, 2011

EFFECTIVE DATE: January 1, 2012

This memorandum:

- Revises Sections 14-1.02;
- Moves Section 33-4 into a new Chapter as Section 46-3, Sections 37-1 through 37-7 into a new chapter as Sections 44-1 through 44-7, Section 37-8 into a new chapter as Section 46-4, and Section 37-9 into a new chapter as Section 44-8;
- Deletes Section 33-5 and 33-6; and
- Creates Section 46-5, 46-6, and 46-7

In 2010, the Bureau of Local Roads & Streets in cooperation with local agencies, consultants, and industry conducted a review of the various pavement policies contained in the Bureau of Local Roads & Streets (BLRS) Manual. Based on this review several sections of the BLRS Manual have been revised.

All pavement maintenance, rehabilitation, and construction projects will need to comply with accessibility standards. Resurfacing projects are considered alterations for curb ramp accessibility; therefore, curb ramps shall be reviewed for compliance with accessibility standards whenever resurfacing projects under Chapter 14, 44, or 46 are performed. Non-compliant curb ramps shall be addressed as part of the project unless the agency's transition plan provides for an alternative.

Following is a summary of changes:

Chapter 14

- Maintenance with Hot-Mix Asphalt (HMA) was revised to allow a maximum 2 inch overlay for all surface types. Warm Mix Asphalt (WMA) was also included. If pavement is milled, milled thickness plus 2 inches of HMA/WMA may be placed as a maintenance project. Allows single lane width HMA/WMA maintenance projects. Clarified drainage improvements that are allowed under HMA/WMA maintenance projects.

HARD COPIES UNCONTROLLED

Chapter 33

- Section 33-4 LAPP Policy was moved to Section 46-3. The LAPP Policy has been re-titled as Local Agency Function Overlay (LAFO) Policy since the policy did not adequately cover existing pavement preservation concepts. Form BLR 33410 has been re-numbered as BLR 46300 and has been revised to accommodate additional projects (see attached).
- Section 33-5 Special Maintenance was deleted due to lack of use and additional flexibility allowed under HMA/WMA Maintenance in Chapter 14.
- Section 33-6 was a place holder for intermittent resurfacing policy. The concepts of intermittent resurfacing were included into HMA/WMA Maintenance in Chapter 14.

Chapter 37

- Chapter 37 was split between Chapter 44 Pavement Design and Chapter 46 Pavement Rehabilitation; therefore, Chapter 37 is now reserved for future use.

Chapter 44

- Chapter 44 Pavement Design incorporates Section 37-1 through Section 37-7 and Section 37-9 into the new chapter.
- Traffic factors for 73,280 pound designs have been eliminated due to changes in state law that made 80,000 pound weight limit the legal load for all highways in Illinois.
- PG Binder selection tables were modified slightly to provide better information on PG Binder selection impact on pavement design.
- Traffic factors and design algorithms will be reviewed this winter to update the design procedures.

Chapter 46

- Section 46-2 incorporates Sections 37-8.01 through 37-8.04.
- Section 46-3 incorporates Section 33-4 LAPP Policy as the new Local Agency Function Overlay (LAFO) Policy. LAFO allows maximum HMA lift thickness of 3.75 inches. Projects may receive multiple LAFO treatments if certain geometric conditions are met.
- Section 46-4 incorporates Sections 37-8.06 through 37-8.09.
- Section 46-5 establishes the design policy for PCC Inlay/Overlay on Existing HMA Surfaces. This design is based on Illinois Center for Transportation research project R27-3 "Design and Concrete Material Requirements for Ultra-Thin Whitetopping Procedures".

- Section 46-6.02 establishes the policy for Hot In-Place Recycling (HIR). HIR has three different methods:
 - HIR - Surface Recycling is also known as Heater Scarification. This process requires an HMA/WMA Overlay. LR400-3 should be used for this process (see attached).
 - HIR – Remixing and HIR – Repaving are new concepts that will require experimental features.
- Section 46-6.03 establishes the policy for Cold In-Place Recycling (CIR) and Section 46-6.04 establishes the policy for Full Depth Reclamation (FDR). Designs and specifications are being developed based on Illinois Center for Transportation research project R27-12 “Cold In-Place Recycling with Asphalt Products (CIRwAP)”. Until designs and specifications are finalized agencies should continue to coordinate projects with the District BLRS using criteria documented in the research report.
- Section 46-7 refers to the Rubblization section in the Bureau of Design & Environment Manual.

SPECIAL PROVISION
FOR
HOT IN-PLACE RECYCLING (HIR) – SURFACE RECYCLING

Effective: January 1, 2012

All references to Sections and Articles in this Special Provision shall be construed to mean specific Sections and Articles in the Standard Specifications for Road and Bridge Construction adopted by the Department of Transportation.

Description. This work shall consist of in-place rehabilitation of hot-mix asphalt (HMA) pavement by heating, scarifying, rejuvenating, and reshaping the surface followed by the addition of a new HMA surface course according to the thickness specified on the plans.

Materials. Materials shall be according to the following.

<u>Item</u>	<u>Article/Section</u>
(a) Rejuvenating Agent (Note 1)	
(b) Hot-Mix Asphalt	1030

Note 1. The rejuvenating agent shall have a minimum Aged Penetration Retention of 90% when tested according to the following test procedure:

- a. Determine the penetration¹ of an unaged standard PG 58-22 asphalt binder.
- b. Age² the asphalt binder in the Rolling Thin Film Oven (RTFO).
- c. Determine the penetration¹ of the aged binder (A).
- d. Add the rejuvenating agent or rejuvenating agent residue³ at the percentage recommended by the manufacturer (maximum 20% by weight) to the aged binder. Blend uniformly.
- e. Determine the penetration¹ of the rejuvenating agent / aged binder mixture. The penetration of this mixture shall be essentially equivalent to the penetration of the unaged PG 58-22.
- f. Age² the rejuvenating agent / aged binder mixture in the RTFO.
- g. Determine the penetration¹ of the aged rejuvenating agent / aged binder mixture (B).
- h. Determine the Aged Penetration Retention according to the following formula:

Aged Penetration Retention, % = (B/A)x100

¹ AASHTO T 49 at 77°F (25°C).
² AASHTO T 240 aged for 5 hours at 325°F (163°C).
³ If the rejuvenating agent is an emulsion, obtain the residue according to the test procedure "Emulsified Asphalt Residue by Evaporation" located in AASHTO T 59.

Equipment. Equipment shall be according to the following.

<u>Item</u>	<u>Article/Section</u>
(a) Rollers.....	1101.01
(b) Pre-heater (Note 1)	
(c) Heater-Scarifier (Note 2)	

Note 1. The pre-heater shall be a separate independently self-propelled heating unit.

Note 2. The heater-scarifier shall be self-contained, power propelled unit capable of heating, scarifying, adding rejuvenating agent, mixing, and screeding the scarified asphalt surface.

The heating system shall use propane, fuel oil, or butane as fuel, capable of being turned on or off instantly and have a range of width to heat 4-inches beyond each side of the lane width. Heating of the asphalt pavement surface shall be accomplished in such a manner that adequate heat penetration is provided without excessive oxidation, or direct flame contact with the asphalt street. The heaters shall have an enclosed or shielded hood and allow for the pavement to be scarified to the specified depth with the surface temperature of the old pavement not exceeding 375°F (190°C). The machine shall be equipped with a minimum of two rows of spring-mounted scarification teeth. Teeth shall be evenly spaced with the rows offset by an amount equal to one-half of the tooth spacing. Teeth shall be capable of vertical movement, such that the rows of the teeth will follow any contours in the street profile to scarify to the required depth regardless of depression or high areas. Self-regulating controls shall be used to exert pressure from the weight of the machine onto the tooth mounting system, and to control the depth of scarification. The aggregate shall be dislodged, but not fractured, to the specified depth.

The machine shall be capable of adding rejuvenating agent uniformly over the area to be scarified at a uniform rate per distance traveled.

The machine shall be capable of lateral movement of the scarified materials as required, by using a reversible auger and/or adjustable blades. This system shall be capable of maintaining a uniform supply of scarified material distributed as required across the face if the spreader screed.

The heater-scarifier shall be equipped with an automatic electronic grade control device. The device shall be effective in leveling depressions. The device shall be capable of controlling the elevation of the screed relative to either a preset grade control string line or a grade reference device traveling on the adjacent pavement surface. The traveling grade reference device shall be not less than 30 ft (9 m) in length.

The screed or strike off assembly shall effectively produce a finished surface of the required evenness and texture without tearing, shoving or gouging the mixture.

CONSTRUCTION REQUIREMENTS

General. The entire surface to be rehabilitated shall be free of water, soil, vegetation, and foreign material. All base failures shall be repaired prior to the heating scarifying process according to Section 358. Rehabilitation work shall be performed only when the air temperature in the shade is at least 45 °F (7 °C) and the forecast is for rising temperatures.

The surface of the existing pavement shall be heated with a continuously moving heater to allow the pavement to be scarified to a 0.75 to 1.5 in (20 to 38 mm) average depth with the surface temperature of the old pavement not to exceed 375 °F (190 °C). Heat shall be applied under an enclosed or shielded hood and shall extend at least 4 in. (100 mm) beyond the width of scarification on both sides. Scarifying shall be accomplished with pressure scarifiers. The scarifying unit shall be equipped to scarify and move material away from the gutter flags for a depth of 1/2 in. (13 mm) by 4 in. (100 mm) wide. The heating-scarifying operation shall not exceed 30 ft (10 m) per minute. When a repaving pass is being made adjacent to a previously placed mat, the longitudinal repaving seam shall extend at least 2 in. (50 mm) into the previously placed mat.

Immediately after the scarifying operation, the rejuvenating agent shall be applied at the maximum rate of 0.20 gal/sq yd (0.5 L/sq m). The actual rate will be determined by the Contractor based on pavement condition, rejuvenating agent, and pavement samples. The Contractor will provide the Engineer with the application rate prior to construction. The application rate should not vary by more than ± 0.03 gal/sq yd (± 0.1 L/sq m) unless existing pavement conditions change. Any modification of the application rate shall be approved by the Engineer. The surface shall then be leveled by distributing the heated, scarified and treated (HST) material over the width being processed so as to produce a uniform cross section. The minimum temperature of the HST material after leveling shall be 175 °F (80 °C). The HST material shall be compacted before the temperature of the mix drops below 150 °F (65 °C).

Compaction shall be accomplished by performing a growth curve within the first half mile of production. If an adjustment is made to the rejuvenating agent's application rate, the Engineer reserves the right to request an additional growth curve. The growth curve, consisting of a plot of lb/cu ft (kg/cu m) vs. number of passes with the project breakdown roller, shall be developed. Roller speed during the growth curve testing shall be the same as the normal paving operation. This curve shall be established by use of a nuclear gauge. Tests shall be taken after each pass until the highest lb/cu ft (kg/cu m) is obtained. This value shall be the target density.

A new growth curve is required if the breakdown roller used on the growth curve is replaced with a new roller during production. The target density shall apply only to the specific gauge used. If additional gauges are to be used to determine density specification compliance, the Contractor shall establish a unique minimum allowable target density from the growth curve location for each gauge.

TABLE 1 - MINIMUM ROLLER REQUIREMENTS FOR HIR – SURFACE RECYCLING			
Breakdown Roller (one of the following) ¹	Intermediate Roller	Final Roller (one or more of the following) ¹	Density Requirement
V _D , P	--	V _S , T _B , T _F	95 - 102 percent of the target density obtained on the growth curve

^{1/} Equipment definitions in Table 1 of Article 406.07.

Within 48 hours of the HST operation, a HMA surface course specified in the plans shall be placed according to Section 406.

Method of Measurement.

- (a) **Contract Quantities.** The requirement for use of contract quantities shall be according to Article 202.07(a).
- (b) **Measured Quantities.** The hot in-place recycling – surface recycling will be measured for payment in place and the area computed in square yards (square meters). The rejuvenating agent will be measured for payment in gallons (liters) according to Article 1032.02. The HMA surface will be measured for payment in tons (metric tons) according to Article 406.13.

Basis of Payment. This work will be paid for at the contract unit price per square yard (square meter) for HOT IN-PLACE RECYCLING – SURFACE RECYCLING, and per gallon (liter) for REJUVENATING AGENT.

The HMA surface will be paid for according to Article 406.14

If provided as a pay item, the preparation of the base will be paid for according to Article 358.07. If not provided as a pay item, preparation of the base, including additional material required, shall be considered as included in the contract unit price bid for hot in-place recycling, and no additional compensation will be allowed.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2011-02
SUBJECT: LOCAL AGENCY PAVEMENT PRESERVATION POLICY
ISSUED DATE: November 23, 2011
EFFECTIVE DATE: January 1, 2012

This memorandum creates Chapter 45 of the Bureau of Local Roads & Streets Manual.

The Local Agency Pavement Preservation Policy has been issued to allow local agencies to implement a pavement preservation program using federal, state, and/or motor fuel tax funds. For all roads being considered for pavement preservation, an agency shall have a pavement management system, condition rating, and 10-year pavement preservation program. All treatments should use standard specifications or department approved special provisions. Some treatments may still need to follow the experimental feature process.

The District Local Roads Engineer and Central Engineer of Local Roads & Streets shall approve an agency to participate in pavement preservation. Form BLR 45300 should be used to request approval to participate in pavement preservation. The District Local Roads Engineer shall approve the multi-year pavement preservation program. Form BLR 45310 should be used to request approval of the multi-year pavement preservation estimate.

Individual project submittal should follow the approval procedures for the funding type used. Form BLR 46300 should be used for individual pavement preservation project approval. All projects performed under a pavement preservation program should use the PP section number.

Please contact the Local Policy & Technology Unit at dot.LocalPolicy@illinois.gov with any questions.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2011-03
SUBJECT: HIGHWAY SIGNING
ISSUED DATE: November 28, 2011
EFFECTIVE DATE: December 1, 2012

This memorandum revises Chapter 39 of the Bureau of Local Roads & Streets Manual.

The Department adopted the 2009 National Manual on Uniform Traffic Control Devices (MUTCD) along with the Illinois Supplement as the official manual for traffic control devices for use in the state on all roads open to public travel on March 10, 2011. The MUTCD and the Illinois Supplement are available on the IDOT Internet Site (www.dot.il.gov/mutcd/utcdmanual.html). Due to changes in the 2009 MUTCD and recent Illinois legislation impacting highway signs, the following revisions have been made to Chapter 39.

Stop Signs

- ALL WAY (R1-3P) Supplemental Plaque shall be mounted below each STOP (R1-1) sign at intersections where all approaches are controlled by a STOP sign.
- Supplemental warning plaques (W4-4aP or W4-4bP) should be used at intersections where STOP signs control all but one approach to the intersection.

Horizontal Alignment Signs

- Incorporated Table 2C-5 from the MUTCD.
- Revised language to mirror MUTCD.

School Area Signs

- Incorporated new MUTCD requirements
- Provide guidance on CELL PHONE USE PROHIBITED (R2-I110) sign based on Public Act 096-131.

Park Zone Signs

- Revised to comply with 2009 MUTCD requirements for REDUCED SPEED LIMIT AHEAD (W3-5) sign.

Street Name Signs

- Revised to limit sign background color per the 2009 MUTCD.
- Revised to require mixed case lettering.

HARD COPIES UNCONTROLLED

Tourist Oriented Directional Signs

- Updated to reference Illinois Administrative Code for state maintained highways that are outside the urban areas.

Non-Highway Vehicle Signs

- Incorporated sign policy for non-highway vehicles per 625 ILCS 5/11-1426.1.
- Authorized by ordinance or resolution on all local highways.
- Sign not required

Low-Speed Vehicle Signs

- Incorporated sign policy for low-speed vehicles per 625 ILCS 5/11-1426.2.
- Allowed unless prohibited on highways where the posted speed limit is 30 mph or less.
- R5-1107 sign shall be installed if prohibiting.
- Authorized by ordinance or resolution on highways where the posted speed limit is more than 30 mph but not greater than 35 mph.

Community Wayfinding Signs

- Incorporates guidance from Section 2D.50 of the MUTCD
- Establishes the District Operations Manager as the primary contact for installation of these signs on state highways.

Please contact the Local Policy Unit at dot.LocalPolicy@illinois.gov with any questions.

Darrell W. Lewis
Acting Engineer of Local Roads and Streets

AN ACT concerning transportation.

**Be it enacted by the People of the State of Illinois,
represented in the General Assembly:**

Section 5. The Illinois Vehicle Code is amended by changing Section 12-610.1 as follows:

(625 ILCS 5/12-610.1)

Sec. 12-610.1. Wireless telephones.

(a) As used in this Section, "wireless telephone" means a device that is capable of transmitting or receiving telephonic communications without a wire connecting the device to the telephone network.

(b) A person under the age of 19 years who holds an instruction permit issued under Section 6-105 or 6-107.1, or a person under the age of 19 years who holds a graduated license issued under Section 6-107, may not drive a vehicle on a roadway while using a wireless phone.

(c) This Section does not apply to a person under the age of 19 years using a wireless telephone for emergency purposes, including, but not limited to, an emergency call to a law enforcement agency, health care provider, fire department, or other emergency services agency or entity.

(d) If a graduated driver's license holder over the age of 18 committed an offense against traffic regulations governing

the movement of vehicles or any violation of Section 6-107 or Section 12-603.1 of this Code in the 6 months prior to the graduated driver's license holder's 18th birthday, and was subsequently convicted of the violation, the provisions of paragraph (b) shall continue to apply until such time as a period of 6 consecutive months has elapsed without an additional violation and subsequent conviction of an offense against traffic regulations governing the movement of vehicles or any violation of Section 6-107 or Section 12-603.1 of this Code.

(e) A person, regardless of age, may not use a wireless telephone at any time while operating a motor vehicle on a roadway in a school speed zone established under Section 11-605, or on a highway in a construction or maintenance speed zone established under Section 11-605.1. This subsection (e) does not apply to (i) a person engaged in a highway construction or maintenance project for which a construction or maintenance speed zone has been established under Section 11-605.1, (ii) a person using a wireless telephone for emergency purposes, including, but not limited to, law enforcement agency, health care provider, fire department, or other emergency services agency or entity, (iii) a law enforcement officer or operator of an emergency vehicle when performing the officer's or operator's official duties, or (iv) to a person using a wireless telephone in voice-activated mode.

HARD COPIES UNCONTROLLED

(625 ILCS 5/11-1426.1)

Sec. 11-1426.1. Operation of non-highway vehicles on streets, roads, and highways.

(a) As used in this Section, "non-highway vehicle" means a motor vehicle not specifically designed to be used on a public highway, including:

- (1) an all-terrain vehicle, as defined by Section 1-101.8 of this Code;
- (2) a golf cart, as defined by Section 1-123.9;
- (3) an off-highway motorcycle, as defined by Section 1-153.1; and
- (4) a recreational off-highway vehicle, as defined by Section 1-168.8.

(b) Except as otherwise provided in this Section, it is unlawful for any person to drive or operate a non-highway vehicle upon any street, highway, or roadway in this State. If the operation of a non-highway vehicle is authorized under subsection (d), the non-highway vehicle may be operated only on streets where the posted speed limit is 35 miles per hour or less. This subsection (b) does not prohibit a non-highway vehicle from crossing a road or street at an intersection where the road or street has a posted speed limit of more than 35 miles per hour.

(b-5) A person may not operate a non-highway vehicle upon any street, highway, or roadway in this State unless he or she has a valid driver's license issued in his or her name by the Secretary of State or by a foreign jurisdiction.

(c) Except as otherwise provided in subsection (c-5), no person operating a non-highway vehicle shall make a direct crossing upon or across any highway under the jurisdiction of the State, tollroad, interstate highway, or controlled access highway in this State.

(c-5) A person may make a direct crossing at an intersection controlled by a traffic light or 4-way stop sign upon or across a highway under the jurisdiction of the State if the speed limit on the highway is 35 miles per hour or less at the place of crossing.

(d) A municipality, township, county, or other unit of local government may authorize, by ordinance or resolution, the operation of non-highway vehicles on roadways under its jurisdiction if the unit of local government determines that the public safety will not be jeopardized. The Department may authorize the operation of non-highway vehicles on the roadways under its jurisdiction if the Department determines that the public safety will not be jeopardized. The unit of local government or the Department may restrict the types of non-highway vehicles that are authorized to be used on its streets.

Before permitting the operation of non-highway vehicles on its roadways, a municipality, township, county, other unit of local government, or the Department must consider the volume,

HARD COPIES UNCONTROLLED

speed, and character of traffic on the roadway and determine whether non-highway vehicles may safely travel on or cross the roadway. Upon determining that non-highway vehicles may safely operate on a roadway and the adoption of an ordinance or resolution by a municipality, township, county, or other unit of local government, or authorization by the Department, appropriate signs shall be posted.

If a roadway is under the jurisdiction of more than one unit of government, non-highway vehicles may not be operated on the roadway unless each unit of government agrees and takes action as provided in this subsection.

(e) No non-highway vehicle may be operated on a roadway unless, at a minimum, it has the following: brakes, a steering apparatus, tires, a rearview mirror, red reflectorized warning devices in the front and rear, a slow moving emblem (as required of other vehicles in Section 12-709 of this Code) on the rear of the non-highway vehicle, a headlight that emits a white light visible from a distance of 500 feet to the front, a tail lamp that emits a red light visible from at least 100 feet from the rear, brake lights, and turn signals. When operated on a roadway, a non-highway vehicle shall have its headlight and tail lamps lighted as required by Section 12-201 of this Code.

(f) A person who drives or is in actual physical control of a non-highway vehicle on a roadway while under the influence is subject to Sections 11-500 through 11-502 of this Code.

(g) Any person who operates a non-highway vehicle on a street, highway, or roadway shall be subject to the mandatory insurance requirements under Article VI of Chapter 7 of this Code.

(h) It shall not be unlawful for any person to drive or operate a non-highway vehicle, as defined in paragraphs (1) and (4) of subsection (a) of this Section, on a county roadway or township roadway for the purpose of conducting farming operations to and from the home, farm, farm buildings, and any adjacent or nearby farm land.

Non-highway vehicles, as used in this subsection (h), shall not be subject to subsections (e) and (g) of this Section. However, if the non-highway vehicle, as used in this Section, is not covered under a motor vehicle insurance policy pursuant to subsection (g) of this Section, the vehicle must be covered under a farm, home, or non-highway vehicle insurance policy issued with coverage amounts no less than the minimum amounts set for bodily injury or death and for destruction of property under Section 7-203 of this Code. Non-highway vehicles operated on a county or township roadway at any time between one-half hour before sunset and one-half hour after sunrise must be equipped with head lamps and tail lamps, and the head lamps and tail lamps must be lighted.

Non-highway vehicles, as used in this subsection (h), shall not make a direct crossing upon or across any tollroad, interstate highway, or controlled access highway in this

HARD COPIES UNCONTROLLED

State.

Non-highway vehicles, as used in this subsection (h), shall be allowed to cross a State highway, municipal street, county highway, or road district highway if the operator of the non-highway vehicle makes a direct crossing provided:

(1) the crossing is made at an angle of approximately 90 degrees to the direction of the street, road or highway and at a place where no obstruction prevents a quick and safe crossing;

(2) the non-highway vehicle is brought to a complete stop before attempting a crossing;

(3) the operator of the non-highway vehicle yields the right of way to all pedestrian and vehicular traffic which constitutes a hazard; and

(4) that when crossing a divided highway, the crossing is made only at an intersection of the highway with another public street, road, or highway.

(i) No action taken by a unit of local government under this Section designates the operation of a non-highway vehicle as an intended or permitted use of property with respect to Section 3-102 of the Local Governmental and Governmental Employees Tort Immunity Act.

(Source: P.A. 96-279, eff. 1-1-10; 96-1434, eff. 8-11-10; 97-144, eff. 7-14-11.)

HARD COPIES UNCONTROLLED

625 ILCS 5/11-1426.2)

Sec. 11-1426.2. Operation of low-speed vehicles on streets.

(a) Except as otherwise provided in this Section, it is lawful for any person to drive or operate a low-speed vehicle upon any street in this State where the posted speed limit is 30 miles per hour or less.

(b) Low-speed vehicles may cross a street at an intersection where the street being crossed has a posted speed limit of not more than 45 miles per hour. Low-speed vehicles may not cross a street with a speed limit in excess of 45 miles per hour unless the crossing is at an intersection controlled by a traffic light or 4-way stop sign.

(c) The Department of Transportation or a municipality, township, county, or other unit of local government may prohibit, by regulation, ordinance, or resolution, the operation of low-speed vehicles on streets under its jurisdiction where the posted speed limit is 30 miles per hour or less if the Department of Transportation or unit of local government determines that the public safety would be jeopardized.

(d) Upon determining that low-speed vehicles may not safely operate on a street, and upon the adoption of an ordinance or resolution by a unit of local government, or regulation by the Department of Transportation, the operation of low-speed vehicles may be prohibited. The unit of local government or the Department of Transportation may prohibit the operation of low-speed vehicles on any and all streets under its jurisdiction. Appropriate signs shall be posted in conformance with the State Manual on Uniform Traffic Control Devices adopted pursuant to Section 11-301 of this Code.

(e) If a street is under the jurisdiction of more than one unit of local government, or under the jurisdiction of the Department of Transportation and one or more units of local government, low-speed vehicles may be operated on the street unless each unit of local government and the Department of Transportation agree and take action to prohibit such operation as provided in this Section.

(e-5) A unit of local government may, by ordinance or resolution, authorize the operation of low-speed vehicles on one or more streets under its jurisdiction that have a speed limit of more than 30 miles per hour but not greater than 35 miles per hour.

Before authorizing the operation of low-speed vehicles on any street under this subsection (e-5), the unit of local government must consider the volume, speed, and character of traffic on the street and determine whether low-speed vehicles may travel safely on that street.

If a street is under the jurisdiction of more than one unit of government, low-speed vehicles may not be operated on the street under this subsection (e-5) unless each unit of government agrees and takes action as provided in this subsection.

HARD COPIES UNCONTROLLED

Upon the adoption of an ordinance authorizing low-speed vehicles under this subsection (e-5), appropriate signs shall be posted.

(f) No low-speed vehicle may be operated on any street unless, at a minimum, it has the following: brakes, a steering apparatus, tires, a rearview mirror, red reflectorized warning devices in the front and rear, a headlight that emits a white light visible from a distance of 500 feet to the front, a tail lamp that emits a red light visible from at least 100 feet from the rear, brake lights, and turn signals. When operated on a street, a low-speed vehicle shall have its headlight and tail lamps lighted as required by Section 12-201 of this Code.

(g) A person may not operate a low-speed vehicle upon any street in this State unless he or she has a valid driver's license issued in his or her name by the Secretary of State or a foreign jurisdiction.

(h) The operation of a low-speed vehicle upon any street is subject to the provisions of Chapter 11 of this Code concerning the Rules of the Road, and applicable local ordinances.

(i) Every owner of a low-speed vehicle is subject to the mandatory insurance requirements specified in Article VI of Chapter 7 of this Code.

(j) Any person engaged in the retail sale of low-speed vehicles are required to comply with the motor vehicle dealer licensing, registration, and bonding laws of this State, as specified in Sections 5-101 and 5-102 of this Code.

(k) No action taken by a unit of local government under this Section designates the operation of a low-speed vehicle as an intended or permitted use of property with respect to Section 3-102 of the Local Governmental and Governmental Employees Tort Immunity Act.

(Source: P.A. 96-653, eff. 1-1-10; 96-1434, eff. 8-11-10; 97-144, eff. 7-14-11.)

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2011-04
SUBJECT: MAINTENANCE GROUPS
ISSUED DATE: November 28, 2011
EFFECTIVE DATE: January 1, 2012

This memorandum revises Section 5-5 and Section 14-2 of the Bureau of Local Roads & Streets Manual.

The Bureau of Local Roads & Streets has clarified the group definitions for maintenance with Motor Fuel Tax (MFT) funds and has modified the engineering fees associated with hiring consultants for preliminary and construction engineering services on MFT maintenance projects.

The value of the maintenance program for engineering base fee has been increased to \$20,000 to align with the current bidding threshold for municipalities and townships. Therefore, the base fee allowed for maintenance engineering has also been increased to \$1,250. An engineering inspection fee for Group IIA items will be allowed at a maximum of 1% for maintenance items in this group that require inspection and/or acceptance.

Please contact the Local Policy Unit at dot.LocalPolicy@illinois.gov with any questions.

HARD COPIES UNCONTROLLED

Illinois Department of Transportation

2300 South Dirksen Parkway / Springfield, Illinois / 62764

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2012-01

SUBJECT: CONSTRUCTION SUPERVISION FOR FEDERAL AID PROJECTS

ISSUED DATE: January 6, 2012

EFFECTIVE DATE: April 1, 2012

This memorandum revises Section 25-1.02(c) of the Bureau of Local Roads & Streets Manual dated January 2006.

According to 23 CFR 635.105, the state transportation department (STD) has responsibility for the construction of all Federal-aid projects, and is not relieved of such responsibility by authorizing performance of the work by a local public agency (LPA) or other Federal agency. When a project is located on a street or highway over which the STD does not have legal jurisdiction, or when special conditions warrant, the STD, while not relieved of overall project responsibility, may arrange for the LPA having jurisdiction over such street or highway to perform the work with its own forces or by contract; provided certain conditions are met and the Federal Highways' Division Administrator approves the arrangements in advance.

For all federally funded LPA projects let after April 1, 2012, the LPA will provide a full time LPA employee to be in responsible charge of the project. The full time LPA employee in responsible charge does not need to be an engineer. This requirement applies even when consultants are providing construction engineering services. This LPA employee in responsible charge should be expected to be able to perform the following duties and functions:

- Administers inherently governmental project activities, including those dealing with cost, time, adherence to contract requirements, construction quality and scope of Federal-aid projects;
- Maintains familiarity of day to day project operations, including project safety issues;
- Makes or participates in decisions about changed conditions or scope changes that require change orders or supplemental agreements;
- Visits and reviews the project on a frequency that is commensurate with the magnitude and complexity of the project;
- Reviews financial processes, transactions and documentation to ensure that safeguards are in place to minimize fraud, waste, and abuse;
- Directs project staff, agency or consultant, to carry out project administration and contract oversight, including proper documentation; and

HARD COPIES UNCONTROLLED

- Is aware of the qualifications, assignments and on-the-job performance of the agency and consultant staff at all stages of the project.

The selection and Regional Engineer approval of the resident construction supervisor and/or the full-time LPA employee to be in responsible charge of the project will be completed prior to the start of construction. During the pre-construction meeting, the local public agency should identify the resident construction supervisor and the full-time LPA employee to be in responsible charge of the project according to the following:

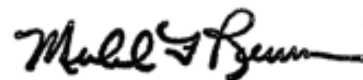

- Preferably, if the county engineer, municipal engineer, or a full-time publicly employed registered professional engineer is named the resident construction supervisor for the project and will be in responsible charge, the minutes of the pre-construction meeting should reflect the name and position of the resident construction supervisor.
- If this is not possible, the LPA should name a qualified full-time publicly-employed individual to serve as resident construction supervisor and to be in responsible charge. The approved Form BC 775 will be included as an attachment to the pre-construction meeting minutes.
- In those instances where a LPA elects to use a consultant engineering firm employee as a resident construction supervisor, the consultant engineering firm shall be prequalified in Construction Inspection and the consultant engineering firm's employee shall be Documentation of Contract Quantities certified. A full time LPA employee will remain in responsible charge. The approved Form BC 775 will be included as an attachment to the pre-construction meeting minutes.

The resident construction supervisor (and employee in responsible charge if resident construction supervisor is a consultant) will approve any construction inspector on Form BC 776. All consultants approved on Form BC 776 shall be Documentation of Contract Quantities certified. The LPA will attach approved Form BC 775 and/or Form BC 776 to the appropriate local agency/consultant agreement form.

Please contact the Local Policy Unit at dot.LocalPolicy@illinois.gov with any questions.

Acting Engineer of Local Roads
and Streets

Acting Engineer of Construction

Federal Highway Administration, DOT

§ 635.105

minor components of the overall contract.

State transportation department (STD) means that department, commission, board, or official of any State charged by its laws with the responsibility for highway construction. The term "State" should be considered equivalent to "State transportation department" if the context so implies.

Workday means a calendar day during which construction operations could proceed for a major part of a shift, normally excluding Saturdays, Sundays, and State-recognized legal holidays.

[62 FR 6873, Feb. 14, 1997, as amended at 67 FR 75924, Dec. 10, 2002]

§ 635.103 Applicability.

The policies, requirements, and procedures prescribed in this subpart shall apply to all Federal-aid highway projects.

[69 FR 7118, Feb. 13, 2004]

§ 635.104 Method of construction.

(a) Actual construction work shall be performed by contract awarded by competitive bidding; unless, as provided in §635.104(b), the STD demonstrates to the satisfaction of the Division Administrator that some other method is more cost effective or that an emergency exists. The STD shall assure opportunity for free, open, and competitive bidding, including adequate publicity of the advertisements or calls for bids. The advertising or calling for bids and the award of contracts shall comply with the procedures and requirements set forth in §§ 635.112 and 635.114.

(b) Approval by the Division Administrator for construction by a method other than competitive bidding shall be requested by the State in accordance with subpart B of part 635 of this chapter. Before such finding is made, the STD shall determine that the organization to undertake the work is so staffed and equipped as to perform such work satisfactorily and cost effectively.

(c) In the case of a design-build project, the requirements of 23 CFR part 636 and the appropriate provisions pertaining to design-build contracting in this part will apply. However, no

justification of cost effectiveness is necessary in selecting projects for the design-build delivery method.

[56 FR 37004, Aug. 2, 1991, as amended at 67 FR 75925, Dec. 10, 2002]

§ 635.105 Supervising agency.

(a) The STD has responsibility for the construction of all Federal-aid projects, and is not relieved of such responsibility by authorizing performance of the work by a local public agency or other Federal agency. The STD shall be responsible for insuring that such projects receive adequate supervision and inspection to insure that projects are completed in conformance with approved plans and specifications.

(b) Although the STD may employ a consultant to provide construction engineering services, such as inspection or survey work on a project, the STD shall provide a full-time employed State engineer to be in responsible charge of the project.

(c) When a project is located on a street or highway over which the STD does not have legal jurisdiction, or when special conditions warrant, the STD, while not relieved of overall project responsibility, may arrange for the local public agency having jurisdiction over such street or highway to perform the work with its own forces or by contract; provided the following conditions are met and the Division Administrator approves the arrangements in advance.

(1) In the case of force account work, there is full compliance with subpart B of this part.

(2) When the work is to be performed under a contract awarded by a local public agency, all Federal requirements including those prescribed in this subpart shall be met.

(3) The local public agency is adequately staffed and suitably equipped to undertake and satisfactorily complete the work; and

(4) In those instances where a local public agency elects to use consultants for construction engineering services, the local public agency shall provide a full-time employee of the agency to be in responsible charge of the project.

Memorandum

Subject: **INFORMATION**: “Responsible Charge”

Date: August 4, 2011

David A. Nicol

From: David A. Nicol
Director, Office of Program Administration

In Reply Refer To:
HIPA-10

To: Director of Field-Service
Federal Lands Highway Division Engineers
Division Administrators

The issue of “responsible charge” of Federal-aid construction projects has been raised on several occasions; most recently as it relates to Federal-aid projects that are administered by local public agencies. The following attachment provides guidance on the requirements and duties of the person designated to be in “responsible charge”.

If you have any questions about the memorandum and attachment, please contact Mr. Bob Wright as Robert.wright@dot.gov.

Attachment

HARD COPIES UNCONTROLLED

Defining “Responsible Charge” in the Federal-aid Highway Program

Regulation:

The key regulatory provision, 23 CFR 635.105 – *Supervising Agency*, provides that the State Transportation Agency (STA) is responsible for construction of Federal-aid projects, whether it or a local public agency (LPA) performs the work. The regulation provides that the STA and LPA must provide a full time employee to be in “responsible charge” of the project.

Requirements of Position:

For projects administered by the STA, the regulation requires that the person in “responsible charge” be a full-time employed state engineer. This requirement applies even when consultants are providing construction engineering services.

For locally administered projects, the regulation requires that the person in “responsible charge” be a full time employee of the LPA. The regulation is silent about engineering credentials. Thus, the person in “responsible charge” of LPA administered projects need not be an engineer. This requirement applies even when consultants are providing construction engineering services.

Duties:

Regardless of whether the project is administered by the STA or another agency, the person designated as being in "responsible charge" is expected to be a public employee who is accountable for a project. This person should be expected to be able to perform the following duties and functions:

- Administers inherently governmental project activities, including those dealing with cost, time, adherence to contract requirements, construction quality and scope of Federal-aid projects;
- Maintains familiarity of day to day project operations, including project safety issues;
- Makes or participates in decisions about changed conditions or scope changes that require change orders or supplemental agreements;
- Visits and reviews the project on a frequency that is commensurate with the magnitude and complexity of the project;
- Reviews financial processes, transactions and documentation to ensure that safeguards are in place to minimize fraud, waste, and abuse; and
- Directs project staff, agency or consultant, to carry out project administration and contract oversight, including proper documentation.
- Is aware of the qualifications, assignments and on-the-job performance of the agency and consultant staff at all stages of the project.

The regulations do not restrict an agency’s organizational authority over the person designated in “responsible charge," and the regulations do not preclude sharing of these

Attachment

duties and functions among a number of public agency employees. The regulations also do not preclude one employee from having responsible charge of several projects and directing project managers assigned to specific projects.

Affect on Laws Regulating Licensure:

The term “responsible charge” is used here in the context intended by the above regulation. It may or may not correspond to its usage in state laws regulating licensure of professional engineers.

- I recommend the following individual as a local public agency employee qualified to be resident construction supervisor and to be in responsible charge of this construction project.
I certify that I am in responsible charge as defined by the department of this construction project. Since the local public agency does not have a local public agency employee qualified to be the resident construction supervisor, I am recommending a consulting engineer to serve as resident construction supervisor.

Date

Signature and Title (for the Local Public Agency)

Applicants Name (Type or Print)

The following describes my educational background, experience and other qualifications to be resident construction supervisor of this construction project for the Local Public Agency.

For Consultants: I certify that my firm is prequalified in Construction Inspection and my Documentation of Contract Quantities certificate number is _____.

Date

Signature of Applicant

Job Title of Applicant

Based on the above information and my knowledge of the applicant's experience and training, it is my opinion that the applicant is qualified to serve as the resident construction supervisor on this construction project.

Engineer of Construction, Central Bureau of Construction
Resident Construction Supervisor
Local Public Agency

Instructions for Preparation of Form BC 775

23 CFR 635.105 requires that the state transportation department (STD) has responsibility for the construction of all Federal-aid projects, and is not relieved of such responsibility by authorizing performance of the work by a local public agency or other Federal agency.

When a project is located on a street or highway over which the STD does not have legal jurisdiction, or when special conditions warrant, the STD, while not relieved of overall project responsibility, may arrange for the local public agency having jurisdiction over such street or highway to perform the work with its own forces or by contract. In those instances where a local public agency elects to use consultants for construction engineering services, the local public agency shall provide a full-time employee of the agency to be in responsible charge of the project.

The full-time local public agency employee in responsible charge of the project shall perform the following duties and functions:

- Administer inherently governmental project activities, including those dealing with cost, time, adherence to contract requirements, construction quality and scope of projects;
- Maintain familiarity of day to day project operations, including project safety issues;
- Make or participate in decisions about changed conditions or scope changes that require change orders or supplemental agreements;
- Visit and review the project on a frequency that is commensurate with the magnitude and complexity of the project;
- Review financial processes, transactions and documentation to ensure that safeguards are in place to minimize fraud, waste, and abuse;
- Direct project staff, agency or consultant, to carry out project administration and contract oversight, including proper documentation; and
- Aware of the qualifications, assignments and on-the-job performance of the agency and consultant staff at all stages of the project.

The Department of Transportation, in accordance with the requirements, requires the local public agency to identify the local public agency employee who will be in responsible charge of each Federal-Aid project which will be constructed under the supervision of the county, municipality or other public agency. County Engineers, Municipal Engineers, and full-time local public agency employees registered as a professional engineer should be identified in the pre-construction meeting minutes. All other resident construction supervisors must submit their qualifications on this form for approval by the department. Resident construction supervisors who are consultants shall be certified in Documentation of Contract Quantities and their firm shall be prequalified in Construction Inspection.

This form will be completed by the applicant, endorsed by a representative of the local public agency, and submitted to the Deputy Director Division of Highways, Regional Engineer prior to the start of construction. This signatory for the local public agency should be the County Superintendent of Highways or Municipal Engineer, as applicable. In the event a municipality does not have a Municipal Engineer, the applicant will be recommended by the appropriate municipal authority.

If a consultant is named on this form, the approved form will be included as an attachment to the appropriate construction engineering consultant agreement.

This document should be discussed as part of the preconstruction conference and, when required, a copy of the approved form retained with the preconstruction meeting minutes.

Applicants Name (Type or Print)

The following describes the educational background, experience and other qualifications of the named applicant to serve as an inspector on this project.

For Consultants Employees: Documentation of Contract Quantities certificate number is _____.

If the Resident from BC-775 is a consultant, the local public agency employee in responsible charge must also approve this individual.

Approved _____
Date _____ Signature and Title of In Responsible Charge from BC-775 _____

Instructions for Preparation of Form BC 776

23 CFR 635.105 requires that the state transportation department (STD) has responsibility for the construction of all Federal-aid projects, and is not relieved of such responsibility by authorizing performance of the work by a local public agency or other Federal agency.

A consultant may be utilized for periodic examination and consultation or for full-time technical inspection of construction. However, the prime responsibility for general supervision of the construction must remain with the state. The state (or county or municipality under agreement with the state) cannot be relieved of its responsibility to ensure that the work is performed in accordance with the approved project plans, specifications and estimate.

Therefore, the Department of Transportation requires the local public agency to submit the qualifications of all personnel who will be assigned to construction layout and inspection duties on each Federal-Aid project which will be constructed under the supervision of the county, municipality or other local public agency. This form will be approved by the resident construction supervisor. If the resident construction supervisor is a consultant, this form will also be approved by the local public agency employee in responsible charge.

If a consultant is named on this form, the approved form will be included as an attachment to the construction engineering consultant agreement.

The approved form will be submitted to the Deputy Director Division of Highways, Regional Engineer prior to the start of construction. This form should be discussed as part of the preconstruction conference and, when required, a copy of the approved form retained with the preconstruction meeting minutes.

Section				State

THIS AGREEMENT is made and entered into this _____ day of _____, _____ between the above Local Agency (LA) and Consultant (ENGINEER) and covers certain professional engineering services in connection with the improvement of the above PROJECT. Motor Fuel Tax Funds, allotted to the LA by the State of Illinois under the general supervision of the State Department of Transportation, hereinafter called the "DEPARTMENT", will be used entirely or in part to finance ENGINEERING services as described under AGREEMENT PROVISIONS.

WHEREVER IN THIS AGREEMENT or attached exhibits the following terms are used, they shall be interpreted to mean:

- Regional Engineer** Deputy Director Division of Highways, Regional Engineer, Department of Transportation
- Resident Construction Supervisor** Authorized representative of the LA in immediate charge of the engineering details of the PROJECT
- Contractor** Company or Companies to which the construction contract was awarded

Description _____

Agreement Provisions

The Engineer Agrees,

1. To perform or be responsible for the performance of the following engineering services for the LA in connection with the proposed improvement herein before described, and checked below:
 - a. Make such detailed surveys as are necessary for the preparation of detailed roadway plans.
 - b. Make stream and flood plain hydraulic surveys and gather high water data and flood histories for the preparation of detailed bridge plans.
 - c. Make or cause to be made such soil surveys or subsurface investigations including borings and soil profiles and analyses thereof as may be required to furnish sufficient data for the design of the proposed improvement. Such investigations are to be made in accordance with the current requirements of the DEPARTMENT.
 - d. Make or cause to be made such traffic studies and counts and special intersection studies as may be required to furnish sufficient data for the design of the proposed improvement.

- e. Prepare Army Corps of Engineers Permit, Division of Water Resources Permit, Bridge waterway sketch and/or Channel Change sketch, Utility plan and locations and Railroad Crossing work agreements.
- f. Prepare Preliminary Bridge Design and Hydraulic Report, (including economic analysis of bridge or culvert types) and high water effects on roadway overflows and bridge approaches.

NOTE Four copies to be submitted to the Regional Engineer

- g. Make complete general and detailed plans, special provisions, proposals and estimates of cost and furnish the LA with five (5) copies of the plans, special provisions, proposals and estimates. Additional copies of any or all documents, if required shall be furnished to the LA by the ENGINEER at his actual cost for reproduction.
- h. Furnish the LA with survey and drafts in quadruplicate of all necessary right-of-way dedications, construction easements and borrow pit and channel change agreements including prints of the corresponding plats and staking as required.
- i. Assist the LA in the receipt and evaluation of proposals and the awarding of the construction contract.
- j. Furnish or cause to be furnished:
 - (1) Proportioning and testing of concrete mixtures in accordance with the "Manual of Instructions for Concrete Proportioning and Testing" issued by the Bureau of Materials and Physical Research, of the DEPARTMENT and promptly submit reports on forms prepared by said Bureau.
 - (2) Proportioning and testing of bituminous mixtures (including extracting test) in accordance with the "Manual of Instructions for Bituminous Proportioning and Testing" issued by the Bureau of Materials and Physical Research, of the DEPARTMENT, and promptly submit reports on forms prepared by said Bureau.
 - (3) All compaction tests as required by the specifications and report promptly the same on forms prepared by the Bureau of Materials and Physical Research.
 - (4) Quality and sieve analyses on local aggregates to see that they comply with the specifications contained in the contract.
 - (5) Inspection of all materials when inspection is not provided at the sources by the Bureau of Materials and Physical Research, of the DEPARTMENT and submit inspection reports to the LA and the DEPARTMENT in accordance with the policies of the said DEPARTMENT.
- k. Furnish or cause to be furnished
 - (1) A resident construction supervisor, inspectors, and other technical personnel to perform the following work: (The number of such inspectors and other technical personnel required shall be subject to the approval of the LA.)
 - a. Continuous observation of the work and the contractor's operations for compliance with the plans and specifications as construction proceeds, but the ENGINEER does not guarantee the performance of the contract by the contractor.
 - b. Establishment and setting of lines and grades.
 - c. Maintain a daily record of the contractor's activities throughout construction including sufficient information to permit verification of the nature and cost of changes in plans and authorized extra work.
 - d. Supervision of inspectors, proportioning engineers and other technical personnel and the taking and submitting of material samples.
 - e. Revision of contract drawings to reflect as built conditions.
 - f. Preparation and submission to the LA in the required form and number of copies, all partial and final payment estimates, change orders, records and reports required by the LA and the DEPARTMENT.

NOTE: *When Federal funds are used for construction and the ENGINEER or the ENGINEER's assigned staff is named as resident construction supervisor, the ENGINEER is required to be prequalified with the STATE in Construction Inspection. The onsite resident construction supervisor and project inspectors shall possess valid Documentation of Contract Quantities certification.*

2. That all reports, plans, plats and special provisions to be furnished by the ENGINEER pursuant to this agreement will be in accordance with the current standard specifications and policies of the DEPARTMENT, it being understood that all such reports, plats, plans and drafts shall before being finally accepted, be subject to approval by the LA and the said DEPARTMENT.
3. To attend conferences at any reasonable time when requested to do so by the LA or representatives of the DEPARTMENT.
4. In the event plans, surveys or construction staking are found to be in error during the construction of the PROJECT and revisions of the plans or survey or construction staking corrections are necessary, the ENGINEER agrees that he will perform such work without expense to the LA, even though final payment has been received by him. He shall give immediate attention to these changes so there will be a minimum delay to the contractor.
5. The basic survey notes and sketches, charts, computations and other data prepared or obtained by the ENGINEER pursuant to this agreement will be made available upon request to the LA or the DEPARTMENT without cost and without restriction or limitations as to their use.
6. To make such changes in working plans, including all necessary preliminary surveys and investigations, as may be required after the award of the construction contract and during the construction of the improvement.
7. That all plans and other documents furnished by the ENGINEER pursuant to the AGREEMENT will be endorsed by him and will show his professional seal where such is required by law.
8. To submit, upon request by the LA or the DEPARTMENT a list of the personnel and the equipment he/she proposes to use in fulfilling the requirements of this AGREEMENT.

The LA Agrees,

1. To pay the Engineer as compensation for all services performed as stipulated in paragraphs 1a, 1g, 1i, 2, 3, 5 and 6 in accordance with one of the following methods indicated by a check mark:
 - a. A sum of money equal to _____ percent of the awarded contract cost of the proposed improvement as approved by the DEPARTMENT.
 - b. A sum of money equal to the percentage of the awarded contract cost for the proposed improvement as approved by the DEPARTMENT based on the following schedule:

Schedule for Percentages Based on Awarded Contract Cost

Awarded Cost	Percentage Fees	
Under \$50,000	_____	(see note)
	_____	%
	_____	%
	_____	%
	_____	%
	_____	%

Note: Not necessarily a percentage. Could use per diem, cost-plus or lump sum.

2. To pay for services stipulated in paragraphs 1b, 1c, 1d, 1e, 1f, 1h, 1j and 1k of THE ENGINEER AGREES at the hourly rates stipulated below for personnel assigned to this PROJECT as payment in full to the ENGINEER for the actual time spent in providing these services the hourly rates to include profit, overhead, readiness to serve, insurance, social security and retirement deductions. Traveling and other out-of-pocket expenses will be reimbursed to the ENGINEER at his actual cost. Subject to the approval of the LA, the ENGINEER may sublet all or part of the services provided under paragraphs 1b, 1c, 1d, 1e, 1f, 1j and 1k of THE ENGINEER AGREES. If the ENGINEER sublets all or a part of this work, the LA will pay the cost to the ENGINEER plus a five (5) percent service charge. "Cost to ENGINEER" to be verified by furnishing the LA and the DEPARTMENT copies of invoices from the party doing the work. The classifications of the employees used in the work should be consistent with the employee classifications for the services performed. If the personnel of the firm including the Principal Engineer perform routine services that should normally be performed by lesser-salaried personnel, the wage rate billed for such services shall be commensurate with the work performed.

Grade Classification of Employee	Hourly Rate
Principal Engineer	_____
Resident Construction Supervisor	_____
Chief of Party	_____
Instrument Man	_____
Rodmen	_____
Inspectors	_____
_____	_____
_____	_____
_____	_____
_____	_____

The hourly rates itemized above shall be effective the date the parties, hereunto entering this AGREEMENT, have affixed their hands and seals and shall remain in effect until _____. In event the services of the ENGINEER extend beyond _____, the hourly rates will be adjusted yearly by addendum to this AGREEMENT to compensate for increases or decreases in the salary structure of the ENGINEER that are in effect at that time.

3. That payments due the ENGINEER for services rendered pursuant to this AGREEMENT will be made as soon as practicable after the services have been performed, in accordance with the following schedule:
 - a. Upon completion of detailed plans, special provisions, proposals and estimate of cost - being the work required by paragraphs 1a through 1g under THE ENGINEER AGREES - to the satisfaction of the LA and their approval by the DEPARTMENT, 90 percent of the total fee based on the above fee schedule and the approved estimate of cost.
 - b. Upon award of the contract for the improvement by the LA and its approval by the DEPARTMENT, 100 percent of the total fee (excluding any fees paragraphs 1j and 1k of the ENGINEER AGREES), based on the above fee schedule and the awarded contract cost, less any previous payment.
 - c. Upon completion of the construction of the improvement, 90 percent of the fee due for services stipulated in paragraphs 1j and 1k.
 - d. Upon completion of all final reports required by the LA and the DEPARTMENT and acceptance of the improvement by the DEPARTMENT, 100 percent of the total fees due under this AGREEMENT, less any amounts previously paid.

By mutual agreement, partial payments, not to exceed 90 percent of the amount earned, may be made from time to time as the work progresses.

4. That should the improvements be abandoned at any time after the ENGINEER has performed any part of the services provided for in paragraphs 1a and 1g, and prior to the completion of such services the LA shall reimburse the ENGINEER for his actual costs plus _____ percent incurred up to the time he is notified in writing of such abandonment "actual cost" being defined as material costs plus actual payrolls, insurance, social security and retirement deductions. Traveling and other out-of-pocket expenses will be reimbursed to the ENGINEER at his actual cost.
5. That should the LA require changes in any of the detailed plans, specifications or estimates (except for those required pursuant to paragraph 4 of THE ENGINEER AGREES) after they have been approved by the DEPARTMENT, the LA will pay the ENGINEER for such changes on the basis of actual cost plus _____ percent to cover profit, overhead and readiness to serve - "actual cost" being defined as in paragraph 4 above. It is understood that "changes" as used in this paragraph shall in no way relieve the ENGINEER of his responsibility to prepare a complete and adequate set of plans.
6. That should the LA extend completion of the improvement beyond the time limit given in the contract, the LA will pay the ENGINEER, in addition to the fees provided herein, his actual cost incurred beyond such time limit - "actual cost" being defined as in paragraph 4 above.
7. To submit approved forms BC 775 and BC 776 with this AGREEMENT when federal funds are used for construction.

It is Mutually Agreed,

1. That any difference between the ENGINEER and the LA concerning the interpretation of the provisions of this AGREEMENT shall be referred to a committee of disinterested parties consisting of one member appointed by the

ENGINEER one member appointed by the LA and a third member appointed by the two other members for disposition and that the committee's decision shall be final.

2. This AGREEMENT may be terminated by the LA upon giving notice in writing to the ENGINEER at his last known post office address. Upon such termination, the ENGINEER shall cause to be delivered to the LA all drawings, specifications, partial and completed estimates and data if any from traffic studies and soil survey and subsurface investigations with the understanding that all such material becomes the property of the LA. The ENGINEER shall be paid for any services completed and any services partially completed in accordance with Section 4 of THE LA AGREES.
3. That if the contract for construction has not been awarded one year after the acceptance of the plans by the LA and their approval by the DEPARTMENT, the LA will pay the ENGINEER the balance of the engineering fee due to make 100 percent of the total fees due under the AGREEMENT, based on the estimate of cost as prepared by the ENGINEER and approved by the LA and the DEPARTMENT.
4. That the ENGINEER warrants that he/she has not employed or retained any company or person, other than a bona fide employee working solely for the ENGINEER, to solicit or secure this contract and that he/she has not paid or agreed to pay any company or person, other than a bona fide employee working solely for the ENGINEER, any fee, commission, percentage, brokerage fee, gifts or any other consideration contingent upon or resulting from the award or making of this contract. For breach or violation of this warranty the LA shall have the right to annul this contract without liability.

IN WITNESS WHEREOF, the parties have caused this AGREEMENT to be executed in quadruplicate counterparts, each of which shall be considered as an original by their duly authorized offices.

In Responsible Charge	A full time LA employee authorized to administer inherently governmental PROJECT activities
Contractor	Company or Companies to which the construction contract was awarded

Project Description

Name _____ Route _____ Length _____ Structure No. _____

Termini _____

Description:

Agreement Provisions

I. THE ENGINEER AGREES,

1. To perform or be responsible for the performance of the engineering services for the LA, in connection with the PROJECT hereinbefore described and checked below:
 - a. Proportion concrete according to applicable STATE Bureau of Materials and Physical Research (BMPR) Quality Control/Quality Assurance (QC/QA) training documents or contract requirements and obtain samples and perform testing as noted below.
 - b. Proportion hot mix asphalt according to applicable STATE BMPR QC/QA training documents and obtain samples and perform testing as noted below.
 - c. For soils, to obtain samples and perform testing as noted below.
 - d. For aggregates, to obtain samples and perform testing as noted below.

NOTE: For 1a. through 1d. the ENGINEER is to obtain samples for testing according to the STATE BMPR "Project Procedures Guide", or as indicated in the specifications, or as attached herein by the LA; test according to the STATE BMPR "Manual of Test Procedures for Materials", submit STATE BMPR inspection reports; and verify compliance with contract specifications.

- e. Inspection of all materials when inspection is not provided at the sources by the STATE BMPR, and submit inspection reports to the LA and the STATE in accordance with the STATE BMPR "Project Procedures Guide" and the policies of the STATE.
 - f. For Quality Assurance services, provide personnel who have completed the appropriate STATE BMPR QC/QA trained technician classes.
 - g. Inspect, document and inform the LA employee In Responsible Charge of the adequacy of the establishment and maintenance of the traffic control.
 - h. Geometric control including all construction staking and construction layouts.
 - i. Quality control of the construction work in progress and the enforcement of the contract provisions in accordance with the STATE Construction Manual.
 - j. Measurement and computation of pay items.
 - k. Maintain a daily record of the contractor's activities throughout construction including sufficient information to permit verification of the nature and cost of changes in plans and authorized extra work.
 - l. Preparation and submission to the LA by the required form and number of copies, all partial and final payment estimates, change orders, records, documentation and reports required by the LA and the STATE.
 - m. Revision of contract drawings to reflect as built conditions.
 - n. Act as resident construction supervisor and coordinate with the LA employee In Responsible Charge.
2. Engineering services shall include all equipment, instruments, supplies, transportation and personnel required to perform the duties of the ENGINEER in connection with the AGREEMENT.
 3. To furnish the services as required herein within twenty-four hours of notification by the LA employee In Responsible Charge.
 4. To attend meetings and visit the site of the work at any reasonable time when requested to do so by representatives of the LA or STATE.
 5. That none of the services to be furnished by the ENGINEER shall be sublet, assigned or transferred to any other party or parties without the written consent of the LA. The consent to sublet, assign or otherwise transfer any portion of the services to be furnished by the ENGINEER shall not be construed to relieve the ENGINEER of any responsibility for the fulfillment of this AGREEMENT.
 6. The ENGINEER shall submit invoices, based on the ENGINEER's progress reports, to the LA employee In Responsible Charge, no more than once a month for partial payment on account for the ENGINEER's work completed to date. Such invoices shall represent the value, to the LA of the partially completed work, based on the sum of the actual costs incurred, plus a percentage (equal to the percentage of the construction engineering completed) of the fixed fee for the fully completed work.
 7. That the ENGINEER is qualified technically and is entirely conversant with the design standards and policies applicable to improvement of the SECTION; and that the ENGINEER has sufficient properly trained, organized and experienced personnel to perform the services enumerated herein.
 8. That the ENGINEER shall be responsible for the accuracy of the ENGINEER's work and correction of any errors, omissions or ambiguities due to the ENGINEER'S negligence which may occur either during prosecution or after acceptance by the LA. Should any damage to persons or property result from the ENGINEER's error, omission or negligent act, the ENGINEER shall indemnify the LA, the STATE and their employees from all accrued claims or liability and assume all restitution and repair costs arising from such negligence. The ENGINEER shall give immediate attention to any remedial changes so there will be minimal delay to the contractor and prepare such data as necessary to effectuate corrections, in consultation with and without further compensation from the LA.
 9. That the ENGINEER will comply with applicable federal statutes, state of Illinois statutes, and local laws or ordinances of the LA.
 10. The undersigned certifies neither the ENGINEER nor I have:
 - a) employed or retained for commission, percentage, brokerage, contingent fee or other considerations, any firm or person (other than a bona fide employee working solely for me or the above ENGINEER) to solicit or secure this AGREEMENT;

- b) agreed, as an express or implied condition for obtaining this AGREEMENT, to employ or retain the services of any firm or person in connection with carrying out the AGREEMENT or
 - c) paid, or agreed to pay any firm, organization or person (other than a bona fide employee working solely for me or the above ENGINEER) any fee, contribution, donation or consideration of any kind for, or in connection with, procuring or carrying out the AGREEMENT.
 - d) are not presently debarred, suspended, proposed for debarment, declared ineligible or voluntarily excluded from covered transactions by any Federal department or agency;
 - e) have not within a three-year period preceding the AGREEMENT been convicted of or had a civil judgment rendered against them for commission of fraud or criminal offense in connection with obtaining, attempting to obtain or performing a public (Federal, State or local) transaction; violation of Federal or State antitrust statutes or commission of embezzlement, theft, forgery, bribery, falsification or destruction of records, making false statements or receiving stolen property;
 - f) are not presently indicted for or otherwise criminally or civilly charged by a government entity (Federal, State or local) with commission of any of the offenses enumerated in paragraph (e) of this certification; and
 - g) have not within a three-year period preceding this AGREEMENT had one or more public transactions (Federal, State or local) terminated for cause or default.
11. To pay its subconsultants for satisfactory performance no later than 30 days from receipt of each payment from the LA.
 12. To submit all invoices to the LA within one year of the completion of the work called for in this AGREEMENT or any subsequent Amendment or Supplement.
 13. To submit BLR 05613, Engineering Payment Report, to the STATE upon completion of the work called for in the AGREEMENT.
 14. To be prequalified with the STATE in Construction Inspection when the ENGINEER or the ENGINEER's assigned staff is named as resident construction supervisor. The onsite resident construction supervisor shall have a valid Documentation of Contract Quantities certification.
 15. Will provide, as required, project inspectors that have a valid Documentation of Contract Quantities certification.

II. THE LA AGREES,

1. To furnish a full time LA employee to be In Responsible Charge authorized to administer inherently governmental PROJECT activities.
2. To furnish the necessary plans and specifications.
3. To notify the ENGINEER at least 24 hours in advance of the need for personnel or services.
4. To pay the ENGINEER as compensation for all services rendered in accordance with this AGREEMENT, on the basis of the following compensation formulas:

Cost Plus Fixed Fee Formulas

- $FF = 14.5\%[DL + R(DL) + OH(DL) + IHDC]$, or
- $FF = 14.5\%[(2.3 + R)DL + IHDC]$

Where: DL = Direct Labor
 IHDC = In House Direct Costs
 OH = Consultant Firm's Actual Overhead Factor
 R = Complexity Factor
 FF=Fixed Fee
 SBO = Services by Others

Total Compensation = $DL + IHDC + OH + FF + SBO$

Specific Rate (Pay per element)

Lump Sum _____

5. To pay the ENGINEER using one of the following methods as required by 49 CFR part 26 and 605 ILCS 5/5-409:

With Retainage

- a) **For the first 50% of completed work**, and upon receipt of monthly invoices from the ENGINEER and the approval thereof by the LA, monthly payments for the work performed shall be due and payable to the ENGINEER, such payments to be equal to 90% of the value of the partially completed work minus all previous partial payments made to the ENGINEER.
- b) **After 50% of the work is completed**, and upon receipt of monthly invoices from the ENGINEER and the approval thereof by the LA, monthly payments covering work performed shall be due and payable to the ENGINEER, such payments to be equal to 95% of the value of the partially completed work minus all previous partial payments made to the ENGINEER.
- c) **Final Payment** – Upon approval of the work by the LA but not later than 60 days after the work is completed and reports have been made and accepted by the LA and the STATE, a sum of money equal to the basic fee as determined in this AGREEMENT less the total of the amounts of partial payments previously paid to the ENGINEER shall be due and payable to the ENGINEER.

Without Retainage

- a) **For progressive payments** – Upon receipt of monthly invoices from the ENGINEER and the approval thereof by the LA, monthly payments for the work performed shall be due and payable to the ENGINEER, such payments to be equal to the value of the partially completed work minus all previous partial payments made to the ENGINEER.
 - b) **Final Payment** – Upon approval of the work by the LA but not later than 60 days after the work is completed and reports have been made and accepted by the LA and STATE, a sum of money equal to the basic fee as determined in this AGREEMENT less the total of the amounts of partial payments previously paid to the ENGINEER shall be due and payable to the ENGINEER.
6. The recipient shall not discriminate on the basis on the basis of race, color, national origin or sex in the award and performance of any DOT-assisted contract or in the administration of its DBE program or the requirements of 49 CFR part 26. The recipient shall take all necessary and reasonable steps under 49 CFR part 26 to ensure nondiscrimination in the award and administration of DOT-assisted contracts. The recipient's DBE program, as required by 49 CFR part 26 and as approved by DOT, is incorporated by reference in this agreement. Implementation of this program is a legal obligation and failure to carry out its terms shall be treated as violation of this agreement. Upon notification to the recipient of its failure to carry out its approved program, the Department may impose sanctions as provided for under part 26 and may, in appropriate cases, refer the matter for enforcement under 18 U.S.C. 1001 and/or the Program Fraud Civil Remedies Act of 1986 (31U.S.C. 3801 et seq.).
7. To submit approved form BC 775 (Exhibit C) and BC 776 (Exhibit D) with this AGREEMENT.

III. It is Mutually Agreed,

- 1. That the ENGINEER and the ENGINEER's subcontractors will maintain all books, documents, papers, accounting records and other evidence pertaining to cost incurred and to make such materials available at their respective offices at all reasonable times during the AGREEMENT period and for three years from the date of final payment under this AGREEMENT, for inspection by the STATE, Federal Highway Administration or any authorized representatives of the federal government and copies thereof shall be furnished if requested.
- 2. That all services are to be furnished as required by construction progress and as determined by the LA employee In Responsible Charge. The ENGINEER shall complete all services specified herein within a time considered reasonable to the LA, after the CONTRACTOR has completed the construction contract.
- 3. That all field notes, test records and reports shall be turned over to and become the property of the LA and that during the performance of the engineering services herein provided for, the ENGINEER shall be responsible for any loss or damage to the documents herein enumerated while they are in the ENGINEER's possession and any such loss or damage shall be restored at the ENGINEER's expense.
- 4. That this AGREEMENT may be terminated by the LA upon written notice to the ENGINEER, at the ENGINEER's last known address, with the understanding that should the AGREEMENT be terminated by the LA, the ENGINEER shall be paid for any services completed and any services partially completed. The percentage of the total services which have been rendered by the ENGINEER shall be mutually agreed by the parties hereto. The fixed fee stipulated in numbered paragraph 4d of Section II shall be multiplied by this percentage and added to the ENGINEER's actual costs to obtain the earned value of work performed. All field notes, test records and reports completed or partially completed at the time of termination shall become the property of, and be delivered to, the LA.
- 5. That any differences between the ENGINEER and the LA concerning the interpretation of the provisions of this AGREEMENT shall be referred to a committee of disinterested parties consisting of one member appointed by the ENGINEER, one member appointed by the LA, and a third member appointed by the two other members for disposition and that the committee's decision shall be final.
- 6. That in the event the engineering and inspection services to be furnished and performed by the LA (including personnel furnished by the ENGINEER) shall, in the opinion of the STATE be incompetent or inadequate, the STATE shall have the right to supplement the engineering and inspection force or to replace the engineers or inspectors employed on such work at the expense of the LA.

7. That the ENGINEER has not been retained or compensated to provide design and construction review services relating to the contractor's safety precautions, except as provided in numbered paragraph 1f of Section I.
8. This certification is required by the Drug Free Workplace Act (30ILCS 580). The Drug Free Workplace Act requires that no grantee or contractor shall receive a grant or be considered for the purpose of being awarded a contract for the procurement of any property or service from the State unless that grantee or contractor will provide a drug free workplace. False certification or violation of the certification may result in sanctions including, but not limited to, suspension of contract or grant payments, termination of a contract or grant and debarment of contracting or grant opportunities with the State for at least one (1) year but no more than five (5) years.

For the purpose of this certification, "grantee" or "contractor" means a corporation, partnership or other entity with twenty-five (25) or more employees at the time of issuing the grant, or a department, division or other unit thereof, directly responsible for the specific performance under a contract or grant of \$5,000 or more from the State, as defined in the Act.

The contractor/grantee certifies and agrees that it will provide a drug free workplace by:

- (a) Publishing a statement:
 - (1) Notifying employees that the unlawful manufacture, distribution, dispensing, possession or use of a controlled substance, including cannabis, is prohibited in the grantee's or contractor's workplace.
 - (2) Specifying the actions that will be taken against employees for violations of such prohibition.
 - (3) Notifying the employee that, as a condition of employment on such contract or grant, the employee will:
 - (A) abide by the terms of the statement; and
 - (B) notify the employer of any criminal drug statute conviction for a violation occurring in the workplace no later than five (5) days after such conviction.
 - (b) Establishing a drug free awareness program to inform employees about:
 - (1) the dangers of drug abuse in the workplace;
 - (2) the grantee's or contractor's policy of maintaining a drug free workplace;
 - (3) any available drug counseling, rehabilitation and employee assistance program; and
 - (4) the penalties that may be imposed upon an employee for drug violations.
 - (c) Providing a copy of the statement required by subparagraph (a) to each employee engaged in the performance of the contract or grant and to post the statement in a prominent place in the workplace.
 - (d) Notifying the contracting or granting agency within ten (10) days after receiving notice under part (B) of paragraph (3) of subsection (a) above from an employee or otherwise receiving actual notice of such conviction.
 - (e) Imposing a sanction on, or requiring the satisfactory participation in a drug abuse assistance or rehabilitation program by, any employee who is convicted, as required by section S of the Drug Free Workplace Act.
 - (f) Assisting employees in selecting a course of action in the event drug counseling, treatment and rehabilitation is required and indicating that a trained referral team is in place.
 - (g) Making a good faith effort to continue to maintain a drug free workplace through implementation of the Drug Free Workplace Act.
9. The ENGINEER or subconsultant shall not discriminate on the basis of race, color, national origin or sex in the performance of this AGREEMENT. The ENGINEER shall carry out applicable requirements of 49 CFR part 26 in the administration of DOT-assisted contracts. Failure by the ENGINEER to carry out these requirements is a material breach of this AGREEMENT, which may result in the termination this AGREEMENT or such other remedy as the LA deems appropriate.

HARD COPIES UNCONTROLLED

Illinois Department of Transportation

2300 South Dirksen Parkway / Springfield, Illinois / 62764

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2012-02
SUBJECT: COLD IN-PLACE RECYCLING AND FULL DEPTH RECLAMATION
ISSUED DATE: March 30, 2012
EFFECTIVE DATE: April 1, 2012

This memorandum revises Section 46-6 of the Bureau of Local Roads & Streets Manual issued effective January 2012.

The Bureau of Local Roads & Streets in cooperation with local agencies, consultants, academia, and industry has established policies and specifications for cold in-place recycling (CIR) and full depth reclamation (FDR) to be used by local agency highway departments. Designs and specifications were developed based on Illinois Center for Transportation research project R27-12 "Cold In-Place Recycling with Asphalt Products (CIRwAP)" (research report available at <http://ict.illinois.edu/publications/>). These projects are eligible for Federal, State, and Motor Fuel Tax funding.

CIR is an on-site, in-place rehabilitation method which consists of cold milling or pulverizing, mixing with emulsified asphalt or foamed asphalt, placing, and compacting 2 to 6 in of the existing bituminous pavement layer(s). Either LR400-5 or LR400-6 should be used depending on bituminous material selected for stabilization. LR1000-1 establishes the mix design procedures for the contractor to follow. These special provisions are attached to this procedure memorandum.

FDR is an on-site, in-place rehabilitation method which consists of uniformly pulverizing, mixing with emulsified asphalt or foamed asphalt, placing, and compacting the full thickness (maximum depth of 10 in) of the existing bituminous pavement and/or underlying granular. Either LR400-4 or LR400-7 should be used depending on bituminous material selected for stabilization. LR1000-2 establishes the mix design procedures for the contractor to follow. Please contact the Local Policy & Technology Unit for copies of these special provisions.

HARD COPIES UNCONTROLLED

Both CIR and FDR projects require a surface course (hot-mix asphalt overlay or surface treatment) to be applied. If the surface course thickness is less than or equal to 1.5 in, LR403-1 may be used to improve ride quality of final surface. This special provision is attached to this procedure memorandum.

Please contact the Local Policy & Technology Unit at dot.LocalPolicy@illinois.gov with any questions.

Acting Engineer of Local Roads and Streets

SPECIAL PROVISION
FOR
FULL DEPTH RECLAMATION (FDR) WITH EMULSIFIED ASPHALT

Effective: April 1, 2012

All references to Divisions, Sections and Articles in this Special Provision shall be construed to mean specific Divisions, Sections and Articles in the Standard Specifications for Road and Bridge Construction adopted by the Department of Transportation.

Description. This work shall consist of cold milling and pulverizing all of the existing bituminous layers and/or portions of the aggregate base material to a specified depth and maximum size, mixing an emulsified asphalt, water and additives with the reclaimed material, and spreading and compacting the mixture.

Materials. Materials shall be according to the following Articles of Division 1000 – Materials:

Item	Article/Section
(a) Portland Cement (Note 1)	1001
(b) Water.....	1002
(c) Fine Aggregate (Note 2).....	1003
(d) Coarse Aggregate (Note 2)	1004
(e) Fly Ash (Note 1)	1010.02
(f) Lime Slurry (Note 1).....	1012.04
(g) Reclaimed Asphalt Pavement (Note 3)	1031
(h) Emulsified Asphalt (Note 4).....	1032.06
(i) Cold Pulverized Material (Note 5)	
(j) Mix Design (Note 6)	

Note 1 If necessary, the mix design may require additional additives to increase fines in the mix. The type and allowable usage percentage will be described in the mix design.

Note 2. The mix design will specify gradation and quality of any additional aggregate. Any additional fine aggregate shall meet Class B quality as a minimum. Any additional coarse aggregate shall meet Class C quality as a minimum.

Note 3. The Engineer may allow reclaimed asphalt pavement (RAP) from Conglomerate "D" Quality or better RAP stockpiles as specified in Article 1031.02 or from millings of the existing highway. The RAP material shall not exceed the maximum size requirement of the cold pulverized material, and when blended with the cold pulverized material shall produce a product which meets the specifications of the mix design.

Note 4. The CIR-FDR emulsified asphalt shall be selected for the project by the emulsified asphalt supplier based on the Contractor's mixture design. The penetration of the supplied emulsified asphalt shall be within $\pm 25\%$ of the penetration of the design emulsified asphalt. A representative from the emulsified asphalt supplier will be on the job site at the beginning of the project to monitor the characteristics and performance of the emulsified asphalt. Throughout the job, the representative will be available to check on the project and make adjustments to the emulsified asphalt formulation as required. The emulsified asphalt shall be received on the job site at a temperature no greater than 120°F.

The CIR-FDR emulsified asphalt shall meet the following requirements:

CIR-FDR EMULSIFIED ASPHALT MATERIAL SPECIFICATION			
Test	Procedure	Minimum	Maximum
Viscosity, Saybolt Furol, at 77°F (25°C), SFS	AASHTO T 59	20	100
Sieve Test, No. 20 (850 μ m), retained on sieve, %	AASHTO T 59		0.10
Storage Stability Test, 24 hr, %	AASHTO T 59		1.0
Distillation Test, Residue from distillation to 177°C, %	AASHTO T 59 ¹	64.0	
Oil distillate by volume, %	AASHTO T 59		1.0
Penetration, 25°C, 100 g, 5 s, dmm	AASHTO T 49	75	200

Note: 1. Modified AASHTO T 59 procedure – distillation temperature of 177°C with a 20 minute hold.

Note 5. Prior to the addition of the emulsified asphalt, the gradation of the cold pulverized material shall meet the following:

COLD PULVERIZED MATERIAL GRADATIONS		
Grad No.	Sieve Size and Percent Passing	
	1 ¼ in (31.5 mm)	1 in (25 mm)
PM 1	100	
PM 2		100

PM 2 should only be used when a finer gradation of RAP is required by the mix design.

Note 6. A mix design for each distinct section shall be submitted to the Department prior to construction using actual materials (in-situ sampled by the Contractor and new materials from the Contractor's material suppliers) proposed for the project. The job mix formula shall meet the following criteria and be approved by the Engineer.

FDR with EMULSIFIED ASPHALT MIX DESIGN REQUIREMENTS			
Test Method	FDR Type 1 ¹	FDR Type 2 ¹	Test Purpose
Gradation for Design Millings, AASHTO T 27	Report	Report	
Sand Equivalent, ASTM D2419, Method B	Report	Report

Superpave Gyrotory Compaction, 1.25° angle, 600 kPa	30 gyrations at 6 in (150 mm)	30 gyrations at 6 in (150 mm)	Laboratory Density Indicator
Short Term Strength (STS), ASTM D 1560, Part 13, 175 g/25 mm of width	175 minimum	150 minimum	Stability Indicator
Bulk Specific Gravity (Density), ASTM D 6752 or ASTM D2726	Report	Report	Laboratory Density Indicator
Rice (Maximum Theoretical) Specific Gravity, ASTM D2041	Report	Report	Laboratory Density Indicator
Air Voids, Modified	Report	Report	Laboratory Density Indicator
Indirect Tensile Strength, ASTM D 4867, psi	40 minimum	35 minimum	Strength Indicator
Conditioned Indirect Tensile Strength, ASTM D 4867, psi	25 minimum	20 minimum	
Additional Additive(s) ² Coarse Aggregate Fine Aggregate RAP Fly Ash Cement	Report Report Report Report 1.0% maximum	Report Report Report Report 1.0% maximum	
Emulsified Asphalt ² Distillation Residue, % Residue Penetration, dmm Optimum Emulsion Content, % Residual Asphalt to Cement Content Ratio	Report Report Report 3:1 minimum	Report Report Report 3:1 minimum	

Notes: 1. FDR Type 1 mixtures contain < 8% passing No. 200. FDR Type 2 mixtures contain ≥ 8% passing No. 200 or for all granular mixtures.

2. Report shall include type/gradation and producer/supplier.

Equipment. Equipment shall be according to the following Articles of Division 1100 – Equipment:

- (a) Self-Propelled Pneumatic-Tired Rollers (Note 1) 1101.01(c)
- (b) Vibratory Roller (Note 2) 1101.01(g)
- (c) Mechanical Sweeper 1101.03
- (d) Motor Grader 1101.05
- (e) Self-Propelled Milling Machine 1101.16(a)
- (f) Self-Propelled Vibratory Padfoot Roller (Note 3)
- (g) Self-Propelled Reclaimer (Note 4)
- (h) Water Truck (Note 5)

- Note 1. The self-propelled pneumatic-tired roller shall have a gross weight (mass) of not less than 25 tons (23 metric tons).
- Note 2. The double drum vibratory steel roller shall weigh a minimum of 10 tons (9 metric tons).
- Note 3. The self-propelled vibratory pad foot roller shall have 84 in (2133 mm) wide drums and weigh a minimum of 10 tons (9 metric tons). A front mounted blade is recommended for back-dragging. A self-propelled vibratory pad foot roller shall be required for each self-propelled reclaimer.
- Note 4. The self-propelled reclaimer shall be capable of fully pulverizing the existing pavement to the depth required, incorporate the emulsified asphalt and water, and mix the materials to produce a homogeneous material. The minimum power of the self-propelled reclaimer shall be 500 hp (373 kW). The self-propelled reclaimer shall be capable of reclaiming not less than 8 ft (2.4 m) wide and up to 12 in (305 mm) deep in each pass. The self-propelled reclaimer shall have a system for adding emulsified asphalt with a full width spray bar consisting of a positive displacement pump interlocked to the self-propelled reclaimer's ground speed so that the amount of emulsion being added is automatically adjusted with changes to the self-propelled reclaimer's ground speed. The additive system shall be capable of incorporating up to 7 gal/yd² (31.7 L/m²) of emulsified asphalt. Individual valves on the spray bar shall be capable of being turned off as necessary to minimize emulsion overlap on subsequent passes.
- Note 5. Water trucks shall be set up for a controlled spray.

CONSTRUCTION REQUIREMENTS

Weather Limitations. This work shall be performed when atmospheric temperature in the shade and away from artificial heat is 50°F (10°C) and rising. Also, the weather shall not be foggy or rainy. The weather forecast shall not call for freezing temperature within 7 days with after placement of any portion of the project and the annual average low temperature within 7 days of the end of the project shall be greater than 32°F (0°C). The Engineer may restrict work when the heat index is greater than 100°F (38°C).

Pre-pulverization and Initial Shaping. The existing pavement shall be pre-pulverized by the self-propelled reclaimer and/or shaped by the motor grader to correct for profile, crown, and contour, according to the plans, before the addition of the emulsified asphalt. Water, coarse aggregate, RAP Material, or other additives required may be added during this operation. The pre-pulverized and shaped material shall be compacted with a vibratory roller in static mode to support equipment and/or traffic and to provide depth control during processing. Depth of pre-pulverization and shaping shall be 1 in (25 mm) to 2 in (50 mm) less than the depth of final processing.

Processing. Moisture content shall be within $\pm 1.0\%$ from the mix design. If the moisture content is too low, water shall be added directly to the mixing chamber of the reclaimer by a water truck connected to the reclaimer. The emulsified asphalt shall be applied at the percentage recommended in the mix design. The required depth of reclamation shall be monitored regularly. Prior to spreading and compacting, the processed material shall have a gradation meeting the mix design.

Compaction. The reclaimed material shall be compacted according to the following:

- (a) Growth Curve. Compaction shall be accomplished by performing a growth curve within the first half mile of production. If an adjustment is made to the emulsified asphalt application rate or recycled depth, the Engineer reserves the right to request an additional growth curve. The growth curve, consisting of a plot of lb/cu ft (kg/cu m) vs. number of passes with the project breakdown roller, shall be developed. Roller speed during the growth curve testing shall be the same as the normal paving operation. This curve shall be established by use of a nuclear gauge. Tests shall be taken after each pass until the highest lb/cu ft (kg/cu m) is obtained. This value shall be the target density.

A new growth curve is required if the rollers used on the growth curve are replaced with a new roller during production. The target density shall apply only to the specific gauge used. If additional gauges are to be used to determine density specification compliance, the Contractor shall establish a unique minimum allowable target density from the growth curve location for each gauge.

- (b) Rollers. Immediately after processing and final shaping the reclaimed material shall be compacted with equipment meeting the following requirements:

MINIMUM ROLLER REQUIREMENTS FOR FDR			
Breakdown Roller (one of the following)	Intermediate Roller ¹	Final Roller (one or more of the following) ¹	Density Requirement
P ¹ , PF ²	P, V _D	P, V _S	95 - 102 percent of the target density obtained on the growth curve

^{1/} Equipment definitions in Table 1 of Article 406.07.

^{2/} PF - Self-propelled vibratory padfoot roller for breakdown rolling.

- (c) Rolling. The breakdown roller shall be 500 ft (152 m) or less behind all self-propelled reclaimer units. The reclaimed material shall be compacted by the padfoot roller, applying high amplitude and low frequency, or the pneumatic roller. Breakdown rolling shall be performed until the breakdown roller walks out of the material. Walking out for the padfoot roller is defined as light being clearly evident between all of the pads at the material–padfoot drum interface and being no more than 3/16 inch deep. Walking out for the pneumatic roller is defined as no significant wheel impressions being left on the surface.

After the completion of breakdown rolling, the motor grader shall be used to cut the reclaimed material no deeper than necessary to remove breakdown roller marks from the initial compaction and to achieve desired cross slope.

The bladed reclaimed material shall be compacted by the intermediate and final rollers. The number of passes and order of rollers may be altered to meet compaction requirements. Finish rolling shall not be done in vibratory mode. Water may be lightly sprayed by a water truck to aid in improving final density and appearance. A second water truck is required if water is also being added at the reclaimer. After the first day of the emulsion addition, the reclaimed base shall not be shaped as chunking may result.

Opening to Traffic. The compacted reclaimed pavement shall be proof rolled with the type of truck traffic expected on the road. If permanent deformation does not occur, moving truck traffic may be allowed on the reclaimed pavement. If permanent deformation greater than 0.25 in (6 mm) occurs, truck traffic shall be kept off until the reclaimed pavement is firm enough to support expected traffic with minimal deformation.

Curing. Before placing any surfacing, the reclaimed pavement shall be allowed to cure until the moisture content of the reclaimed pavement is less than 2.5% or less than 50% of the optimum moisture content as determined during the mix design process, or at the discretion of the Engineer. The reclaimed pavement shall be surfaced before November 1.

Surface Test. The completed reclaimed pavement will be tested for smoothness in the wheel paths with a 16 ft (5 m) straightedge.

For each variation in the reclaimed pavement that exceeds 3/8 in (10 mm), the entire area affected shall be corrected by a self-propelled milling machine. The reclaimed pavement shall be swept by a mechanical broom to remove all loose material from the reclaimed pavement before opening to traffic.

The Contractor shall furnish a 16 ft (5 m) straightedge and shall provide for its jobsite transportation at no additional cost to the Department.

Quality Control/ Quality Assurance (QC/QA).

- (a) Quality Control by the Contractor. The Contractor shall perform or have performed the inspection and tests required to assure conformance to contract requirements. Control includes the recognition of obvious defects and their immediate correction. This may require increased testing, communication of test results to the job site, modification of operations, suspension of the work, or other actions as appropriate.

The Engineer shall be immediately notified of any failing tests and subsequent remedial action. Passing tests shall be reported to the Engineer no later than the start of the next work day.

- (b) Quality Assurance by the Engineer. The Engineer will conduct independent assurance tests on split samples taken by the Contractor for quality control testing. In addition, the Engineer will witness the sampling and splitting of these samples and will immediately retain witnessed split samples for quality assurance testing.

- (c) Tests Methods and Frequency.

(1) Depth of Pulverization (Milling). The nominal depth at the centerline shall be required. Anytime depth changes are made or equipment is idle, a depth check is will be taken.

(2) Pulverized Material Sizing and Gradation. A sample shall be obtained before emulsified asphalt addition and screened using a 1.5 in. (37.5mm) sieve (or smaller sieve if required) to determine if meeting the maximum particle size requirement. Gradations shall be performed each day on the moist millings using the following sieves: 1.5 inch, 1.0 inch, ¾ inch, ½ inch, 3/8 inch, No.4, No.8, No.16, and No.30. The resulting gradation shall be compared to the mix design gradations to determine any necessary changes to emulsion content.

Sampling procedures shall generally be in accordance with ASTM D979 or AASHTO T168. When the Engineer determines the location for a gradation sample, the contractor will be notified to turn off the emulsified asphalt and mark the location continuing to pulverize the existing pavement until the Engineer is satisfied with the length of material pulverized without the addition of the emulsified asphalt. The maximum length of pulverization without the addition of the emulsified asphalt shall not exceed 100 feet. After the Contractor collects the gradation sample, the machine will be backed up to the location where the emulsified asphalt was turned off then re-pulverize this material adding the required amount of emulsified asphalt to the pulverized material.

- (3) Emulsified Asphalt Content. The Engineer shall be notified any time emulsified asphalt content is changed. The emulsified asphalt content shall be checked and recorded for each segment in which the percentage is changed. Emulsified asphalt content changes shall be made based upon mix design recommendations, which are based upon different mix designs for road segments of varying construction. The emulsified asphalt content shall be checked from the belt scale totalizer or asphalt pump totalizer.
- (4) Water Content. The Engineer shall be notified any time the water content is changed. Water content at the milling head shall be checked and recorded for each segment in which the percentage is changed. This information shall be gathered from the water metering device, which can be checked from the belt scale totalizer to verify daily quantities used. Water content changes shall be made based on mixture consistency, coating, and dispersion of the recycled materials.
- (5) Compacted Density. A wet density shall be determined using a nuclear moisture-density gauge generally following the procedures for ASTM D2950, backscatter measurement. This measurement shall be compared to the target density obtained by the growth curve.
- (6) Frequency. The following table provides the minimum frequency for tests; however, the Engineer may increase the testing frequency if the construction process is experiencing problems or unknown conditions are encountered.

QC/QA TESTING FREQUENCY		
Test	QC Frequency ¹	QA Frequency ¹
Depth of Pulverization	1 per 500 feet	1 per 1000 feet
Pulverized Material Gradation	1 per ½ day production	1 per day
Emulsified Asphalt Content	1 per 500 ft	1 per 1000 ft
Water Content	1 per 500 ft	1 per 1000 ft
Compacted Density	1 per ¼ mile	1 per mile

Note(s): 1. The Contractor shall perform all quality control tests within the first 500 ft (75 m) after startup or any change in the mix. The Department will also run the split samples at these locations.

Method of Measurement.

Bituminous materials will be measured for payment as specified in Section 1032.

Coarse aggregate will be measured by the square yard (square meter).

Full-depth reclamation will be measured by the square yard (square meter) of the recycled pavement.

Basis of Payment.

The bituminous material will be paid for at the contract unit price per gallon (liter) for CIR-FDR EMULSIFIED ASPHALT.

The coarse aggregate will be paid for at the contract unit price per sq yd (meter) for ADD ROCK.

The full-depth reclamation will be paid at the contract unit price per square yard (square meter) for FULL-DEPTH RECLAMATION, of the thickness specified.

State of Illinois
Department of Transportation
Bureau of Local Roads and Streets

SPECIAL PROVISION
FOR
COLD IN-PLACE RECYCLING (CIR) WITH EMULSIFIED ASPHALT

Effective: April 1, 2012

All references to Divisions, Sections and Articles in this Special Provision shall be construed to mean specific Divisions, Sections and Articles in the Standard Specifications for Road and Bridge Construction adopted by the Department of Transportation.

Description. This work shall consist of cold milling and pulverizing existing bituminous layers to a specified depth and maximum size, mixing an emulsified asphalt, water and additives with the recycled material, and spreading and compacting the mixture.

Materials. Materials shall be according to the following Articles of Division 1000 – Materials:

<u>Item</u>	<u>Article/Section</u>
(a) Portland Cement (Note 1)	1001
(b) Water.....	1002
(c) Fine Aggregate (Note 2).....	1003
(d) Coarse Aggregate (Note 2).....	1004
(e) Fly Ash (Note 1)	1010.02
(f) Lime Slurry (Note 1).....	1012.04
(g) Reclaimed Asphalt Pavement (Note 3)	1031
(h) Emulsified Asphalt (Note 4).....	1032.06
(i) Cold Pulverized Material (Note 5)	
(j) Mix Design (Note 6)	

Note 1. If necessary, the mix design may require additional additives to increase fines in the mix. The type and allowable usage percentage will be described in the mix design.

Note 2. The mix design will specify gradation and quality of any additional aggregate. Any additional fine aggregate shall meet Class B quality as a minimum. Any additional coarse aggregate shall meet Class C quality as a minimum.

Note 3. The Engineer may allow reclaimed asphalt pavement (RAP) from Conglomerate "D" Quality or better RAP stockpiles as specified in Article 1031.02 or from millings of the existing highway. The RAP material shall not exceed the maximum size requirement of the cold pulverized material, and when blended with the cold pulverized material shall produce a product which meets the specifications of the mix design.

Note 4. The CIR-FDR emulsified asphalt shall be selected for the project by the emulsified asphalt supplier based on the Contractor's mixture design. The penetration of the supplied emulsified asphalt shall be within $\pm 25\%$ of the penetration of the design emulsified asphalt. A representative from the emulsified asphalt supplier will be on the job site at the beginning of the project to monitor the characteristics and performance of the emulsified asphalt. Throughout the job, the representative will be available to check on the project and make adjustments to the emulsified asphalt formulation as required. The emulsified asphalt shall be received on the job site at a temperature no greater than 120°F.

The CIR-FDR emulsified asphalt shall meet the following requirements:

CIR-FDR EMULSIFIED ASPHALT MATERIAL SPECIFICATION			
Test	Procedure	Minimum	Maximum
Viscosity, Saybolt Furol, at 77°F (25°C), SFS	AASHTO T 59	20	100
Sieve Test, No. 20 (850 μ m), retained on sieve, %	AASHTO T 59		0.10
Storage Stability Test, 24 hr, %	AASHTO T 59		1.0
Distillation Test, Residue from distillation to 177°C, %	AASHTO T 59 ¹	64.0	
Oil distillate by volume, %	AASHTO T 59		1.0
Penetration, 25°C, 100 g, 5 s, dmm	AASHTO T 49	75	200

Note: 1. Modified AASHTO T 59 procedure – distillation temperature of 177°C with a 20 minute hold.

Note 5. Prior to the addition of the emulsified asphalt, the gradation of the cold pulverized material shall meet the following:

COLD PULVERIZED MATERIAL GRADATIONS		
Grad No.	Sieve Size and Percent Passing	
	1 ½ in (37.5 mm)	1 in (25 mm)
PM 1	100	
PM 2 ¹		100

PM 2 should only be used when a finer gradation of RAP is required by the mix design.

Note 6. A mix design for each distinct section shall be submitted to the Department prior to construction using actual materials (in-situ sampled by the Contractor and new materials from the Contractor's material suppliers) proposed for the project. The job mix formula shall meet the following criteria and be approved by the Engineer.

CIR with EMULSIFIED ASPHALT MIX DESIGN REQUIREMENTS		
Test Method	CIR	Test Purpose
Gradation for Design Millings, AASHTO T 27	Report

Notes: 1. 6 in (150 mm) samples may be used; however, if 4 in (100 mm) samples are used, the Marshall Stability is required to be 2,500 lbs minimum.

2. Report shall include type/gradation and producer/supplier.

Equipment. Equipment shall be according to the following Articles of Division 1100 – Equipment:

<u>Item</u>	<u>Article/Section</u>
(a) Self-Propelled Pneumatic-Tired Rollers (Note 1)	1101.01(c)
(b) Steel Wheel Tandem Rollers	1101.01(e)
(c) Vibratory Roller (Note 2)	1101.01(g)
(d) Mechanical Sweeper	1101.03
(e) Self-Propelled Milling Machine	1101.16(a)
(f) Spreading and Finishing Machine	1102.03
(g) Multi-unit Recycling Train (Note 3, 5)	
(h) Single-unit Recycler (Note 4, 5)	
(i) Pick Up Machine (Note 6)	

- Note 1. The self-propelled pneumatic-tired roller shall have a gross weight (mass) of not less than 25 tons (23 metric tons).
- Note 2. The double drum vibratory rollers shall have a gross operating weight of not less than 10 tons (9 metric tons) and a width of 78 in (1980 mm).
- Note 3. The multi-unit recycling train shall contain:
- a. A self-propelled cold milling machine that is capable of pulverizing the existing bituminous material in a single pass to the depth shown on the plans and to a minimum width of not less than 12.5 feet (3.8 m). The machine shall have automatic depth controls to maintain the cutting depth to within $\pm \frac{1}{4}$ in (6 mm) of that shown on the plans, and shall have a positive means for controlling cross slope elevations. The use of a heating device to soften the pavement will not be permitted.
 - b. A material sizing unit having screening and crushing capabilities to reduce the cold pulverized material to the appropriate size. The screening and crushing unit shall have a closed circuit system capable of continuously returning oversized material to the crusher. All of the pulverized material (100%) shall be processed to the maximum size requirements as specified.
 - c. A mixing unit equipped with a belt scale for the continuous weighing of the pulverized and sized bituminous material and a coupled/interlocked computer controlled liquid metering device. The mixing unit shall be an on-board completely self-contained pugmill. The liquid metering device shall be capable of automatically adjusting the flow of emulsified asphalt to compensate for any variation in the weight of pulverized material coming into the mixer. The metering device shall deliver the amount of emulsified asphalt to within ± 0.2 percent of the required amount by weight of pulverized bituminous material (for example, if the design requires 3.0 percent, the metering device shall maintain between 2.8 percent to 3.2 percent). The emulsified asphalt pump should be of sufficient capacity to allow emulsion contents up to 3.5% by weight of pulverized bituminous material. Also, automatic digital readings will be displayed for both the flow rate and total amount of pulverized bituminous material and emulsified asphalt in appropriate units of weight and time.
- Note 4. The single unit recycler shall be a self-propelled cold milling machine/cold recycling machine with a down cutting cutter head capable of pulverizing and recycling the existing hot-mix asphalt pavement to a maximum depth of 5 in (125 mm), incorporate the emulsified asphalt and water, and mix the materials to produce a homogeneous material. The minimum power of this machine is 900 hp. The machine shall be capable of pulverizing and recycling not less than 12.5 ft (3.8 m) wide in each pass. The machine shall have two systems for adding emulsified asphalt and water with each system having a full width spray bar with a positive displacement pump interlocked to the machine's ground speed to insure that the amount of emulsified asphalt and water being added is automatically adjusted with changes to the machine's ground speed. Each additive system shall have its own spray bar equipped with 2 nozzles per foot of spray bar and be capable of incorporating up to 7 gallons per square yard of emulsified asphalt and/or water. Individual valves on the spray bar shall be capable of being turned off as necessary to minimize emulsion and water overlap on subsequent passes.

- Note 5. Any additives such as water, lime slurry, etc. added by the recycling equipment at the mill head or mixing unit shall be controlled through liquid metering devices capable of automatically adjusting for the variation in the weight of the pulverized material going into the mixing unit. The metering devices shall be capable of delivering the amount of additive to within ± 0.2 percent of the required amount by weight of the pulverized bituminous material. A capability of adding up to 5% water by weight of the pulverized bituminous material, if necessary based on environmental and material requirements, is mandatory. It will not be required to meter the water added at the milling machine to control dust in the screens, belts, or crusher/material sizing unit.
- Note 6. The pick-up machine shall be capable of removing the entire windrow down to the remaining underlying material.

CONSTRUCTION REQUIREMENTS

Weather Limitations. This work shall be performed when atmospheric temperature in the shade and away from artificial heat is 50°F (10°C) and rising. Also, the weather shall not be foggy or rainy. The weather forecast shall not call for freezing temperature within 48 hours after placement of any portion of the project. The Engineer may restrict work when the heat index is greater than 100°F (38°C).

Preparation of Existing Pavement. Grass and other vegetation shall be removed from the edge of the existing pavement to prevent contamination of the pulverized bituminous material during the milling operation.

The existing pavement shall be milled to the required depth and width as indicated on the plans. Recycling shall be in a manner that does not disturb the underlying material in the existing roadway. The milling operation shall be conducted so that the amount of fines occurring along the vertical faces of the cut will not prevent bonding of the cold recycled materials. The pulverized bituminous material shall be processed to the required gradation specified. When a paving fabric is encountered during the CIR operation, the Contractor shall make the necessary adjustments in equipment or operations so that at least ninety percent (90%) of the shredded fabric in the recycled material is no more than 5 in² (3200 mm²). Additionally, no fabric piece shall have any dimension exceeding a length of 4 inches (100 mm). These changes may include, but not be limited to, adjusting the milling rate or screens in order to obtain a specification recycled material. The Contractor shall be required to waste material containing over-sized pieces of paving fabric as directed by the Engineer. When the Contractor is aware that paving fabric exists, such as indicated on the plans, the Contractor will not receive additional payment. However, if the Contractor is not made aware of the paving fabric, then the Contractor shall receive additional payment for any necessary adjustments in equipment and operations.

Mixing Operation. The pulverized material shall be produced through a mixing unit capable of processing the pulverized material, emulsified asphalt and any additives to a homogeneous recycled mixture. The emulsified asphalt shall be incorporated into the pulverized bituminous material at the initial rate determined by the mix design(s) and approved by the Engineer. Sampling and mix design may determine different levels of emulsified asphalt at various portions of the project.

Spreading and Finishing. The recycled material shall be spread using a self-propelled paver. A pick-up machine shall be used to transfer the windrowed recycled material into the spreading and finishing machine. The pickup machine must be within 150 feet (45 m) of the mixing unit. The recycled material shall be spread by a spreading and finishing machine in one continuous pass, without segregation and to the lines and grades established by the Engineer.

Compaction. The compacted recycled material shall be at a thickness 2.5 to 5.0 in (63 to 127 mm). The recycled material shall be compacted according to the following:

- (a) Growth Curve. Compaction shall be accomplished by performing a growth curve within the first half mile of production. If an adjustment is made to the emulsified asphalt application rate or recycled depth, the Engineer reserves the right to request an additional growth curve. The growth curve, consisting of a plot of lb/cu ft (kg/cu m) vs. number of passes with the project breakdown roller, shall be developed. Roller speed during the growth curve testing shall be the same as the normal paving operation. This curve shall be established by use of a nuclear gauge. Tests shall be taken after each pass until the highest lb/cu ft (kg/cu m) is obtained. This value shall be the target density.

A new growth curve is required if the rollers used on the growth curve are replaced with a new roller during production. The target density shall apply only to the specific gauge used. If additional gauges are to be used to determine density specification compliance, the Contractor shall establish a unique minimum allowable target density from the growth curve location for each gauge.

- (b) Rollers. Immediately after processing and final shaping the reclaimed material shall be compacted with equipment meeting the following requirements:

MINIMUM ROLLER REQUIREMENTS FOR CIR			
Breakdown Roller (one of the following) ¹	Intermediate Roller	Final Roller (one or more of the following) ¹	Density Requirement
V _s , V _D	P	V _S , T _F	95 - 102 percent of the target density obtained on the growth curve

Note(s): 1. Equipment definitions in Table 1 of Article 406.07.

- (c) Rolling. Breakdown rolling shall be achieved by using a vibratory roller either operating in a static or vibratory mode. Vibratory mode should only be used if it is shown to not damage the pavement. Intermediate rolling shall be completed by a self-propelled pneumatic roller(s) until no displacement is occurring or until the pneumatic roller(s) is walking out of the mixture. Final rolling to eliminate pneumatic tire marks and to achieve density shall be done by a separate double drum steel roller(s) operating in static mode.

Rolling shall start no more than 30 minutes behind the paver. Finish rolling shall be completed no more than one hour after milling is completed. When possible, rolling shall not be started or stopped on uncompacted material but with rolling patterns established so that they begin or end on previously compacted material or the existing pavement.

Opening to Traffic. After the completion of compaction of the recycled material, no traffic, including that of the contractor, shall be permitted on the completed recycled material for at least two (2) hours. After two hours rolling traffic may be permitted on the recycled material. This time may be adjusted by the Engineer to allow establishment of sufficient cure so traffic will not initiate raveling or permanent deformation. All loose particles that may develop on the pavement surface shall be removed by power brooming.

After opening to traffic, the surface of the recycled pavement shall be maintained in a condition suitable for the safe movement of traffic.

Maintenance. The contractor shall maintain the recycled pavement in a manner satisfactory to the Engineer until the wearing course has been constructed. Maintenance related to contractor construction procedures or quality of work, shall not be paid for separately.

Curing. Before placing the specified wearing course, the recycled pavement shall be allowed to cure until the moisture of the material is reduced to 2.0 percent or less, or approval of the Engineer. Unless otherwise directed by the Engineer, the specified wearing course shall be placed with 2 weeks of the recycled pavement final cure; however, shall be completed by November 1.

Surface Tests. The completed reclaimed pavement will be tested for smoothness in the wheel paths with a 16 ft (5 m) straightedge.

For each variation in the reclaimed pavement that exceeds $\frac{3}{8}$ in (10 mm), the entire area affected shall be corrected by a self-propelled milling machine. The reclaimed pavement shall be swept by a mechanical broom to remove all loose material from the reclaimed pavement before opening to traffic.

The Contractor shall furnish a 16 ft (5 m) straightedge and shall provide for its jobsite transportation at no additional cost to the Department.

Quality Assurance/ Quality Control (QC/QA).

(a) Quality Control by the Contractor. The Contractor shall perform or have performed the inspection and tests required to assure conformance to contract requirements. Control includes the recognition of obvious defects and their immediate correction. This may require increased testing, communication of test results to the job site, modification of operations, suspension of the work, or other actions as appropriate.

The Engineer shall be immediately notified of any failing tests and subsequent remedial action. Passing tests shall be reported to the Engineer no later than the start of the next work day.

(b) Quality Assurance by the Engineer. The Engineer will conduct independent assurance tests on split samples taken by the Contractor for quality control testing. In addition, the Engineer will witness the sampling and splitting of these samples and will immediately retain witnessed split samples for quality assurance testing.

(c) Tests Methods and Frequency.

(1) Depth of Pulverization (Milling). The nominal depth at the centerline shall be required. Anytime depth changes are made or equipment is idle, a depth check is will be taken.

- (2) **Pulverized Material Sizing and Gradation.** A sample shall be obtained before emulsified asphalt addition and screened using a 1.5 in. (37.5mm) sieve (or smaller sieve if required) to determine if meeting the maximum particle size requirement. Gradations shall be performed each day on the moist millings using the following sieves: 1.5 in, 1.0 in, ¾ in, ½ in, ⅜ in, No.4, No.8, No.16, and No.30. The resulting gradation shall be compared to the mix design gradations to determine any necessary changes to emulsion content.

Sampling procedures shall generally be in accordance with ASTM D979 or AASHTO T168. When the Engineer determines the location for a gradation sample, the contractor will be notified to turn off the emulsified asphalt and mark the location continuing to pulverize the hot-mix asphalt pavement until the Engineer is satisfied with the length of material pulverized without the addition of the emulsified asphalt. The maximum length of pulverization without the addition of the emulsified asphalt shall not exceed 100 ft (30 m). After the Contractor collects the gradation sample, the machine will be backed up to the location where the emulsified asphalt was turned off then re-pulverize this material adding the required amount of emulsified asphalt to the pulverized material.

- (3) **Emulsified Asphalt Content.** The Engineer shall be notified any time emulsified asphalt content is changed. The emulsified asphalt content shall be checked and recorded for each segment in which the percentage is changed. Emulsified asphalt content changes shall be made based upon mix design recommendations, which are based upon different mix designs for road segments of varying construction. The emulsified asphalt content shall be checked from the belt scale totalizer or asphalt pump totalizer.
- (4) **Water Content.** The Engineer shall be notified any time the water content is changed. Water content at the milling head shall be checked and recorded for each segment in which the percentage is changed. This information shall be gathered from the water metering device, which can be checked from the belt scale totalizer to verify daily quantities used. Water content changes shall be made based on mixture consistency, coating, and dispersion of the recycled materials.
- (5) **Compacted Density.** A wet density shall be determined using a nuclear moisture-density gauge generally following the procedures for ASTM D2950, backscatter measurement. This measurement shall be compared to the target density obtained by the growth curve.
- (6) **Frequency.** The following table provides the minimum frequency for tests; however, the Engineer may increase the testing frequency if the construction process is experiencing problems or unknown conditions are encountered.

QC/QA TESTING FREQUENCY		
Test	QC Frequency ¹	QA Frequency ¹
Depth of Pulverization	1 per 500 feet	1 per 1000 feet
Pulverized Material Sizing and Gradation	1 per ½ day production	1 per day
Emulsified Asphalt Content	1 per 500 ft	1 per 1000 ft
Water Content	1 per 500 ft	1 per 1000 ft
Compacted Density	1 per ¼ mile	1 per mile

Note(s): 1. The Contractor shall perform all quality control tests within the first 500 ft (75 m) after startup or any change in the mix. The Department will also run the split samples at these locations.

Method of Measurement.

Bituminous materials will be measured for payment as specified in Section 1032.

Coarse aggregate will be measured by the square yard (square meter).

The cold in-place recycling will be measured by the square yard (square meter) of the recycled pavement.

Basis of Payment.

The bituminous material will be paid for at the contract unit price per gallon (liter) for CIR-FDR EMULSIFIED ASPHALT.

The coarse aggregate will be paid for at the contract unit price per sq yd (meter) for ADD ROCK.

The cold in-place recycling will be paid for at the contract unit price per square yard (square meter) for COLD IN-PLACE RECYCLING, of the thickness specified.

HARD COPIES UNCONTROLLED

State of Illinois
Department of Transportation
Bureau of Local Roads and Streets

SPECIAL PROVISION
FOR
SURFACE PROFILE MILLING OF EXISTING, RECYCLED OR RECLAIMED
FLEXIBLE PAVEMENT

Effective: April 1, 2012

All references to Divisions, Sections and Articles in this Special Provision shall be construed to mean specific Divisions, Sections and Articles in the Standard Specifications for Road and Bridge Construction adopted by the Department of Transportation.

Description. This work shall consist of surface profile milling existing, recycled or reclaimed flexible pavement prior to application of a surface treatment less than or equal to 1.5 in (37 mm) thick.

Equipment. Equipment shall be according to the following Articles of Division 1100 – Equipment:

- (a) Self-Propelled Milling Machine (Note 1)..... 1101.16

Note 1. The self-propelled milling machine shall be capable of milling an entire lane width in a single pass and have the capability of loading the millings into a truck.

The cutting drum and teeth shall be designed to produce the required surface texture. Each tooth on the cutting drum shall produce a series of discontinuous longitudinal striations. There shall be 16 to 20 striations (tooth marks) for each tooth for each 6 ft (1.8 m) in the longitudinal dimension, and each striation shall be 1.7 ± 0.2 in (43 ± 5 mm) in length after the area is planed by the moldboard. The planed length between each pair of striations shall be 2.3 ± 0.2 in (58 ± 5 mm). There shall be 80 to 96 rows of discontinuous longitudinal striations for each 5 ft (1.5 m) in the transverse dimension. The pattern of striations shall be such that a line connecting striations in adjacent rows shall form approximately a 70 degree skew angle with the roadway centerline. The areas between the striations in both the longitudinal and transverse shall be flat-topped and coplanar.

The milling machine shall be capable of accurately and automatically establishing grades by use of an automatic grade control device on one side of the machine with an automatic slope control device controlling the opposite side. It shall be equipped with a traveling grade reference (averaging ski) which shall not be less than 30 feet (9 m) in length.

CONSTRUCTION REQUIREMENTS

Surface Test. The completed recycled or reclaimed pavement will be tested for smoothness in the wheel paths with a 16 ft (5 m) straightedge.

For each variation in the recycled or reclaimed pavement that exceeds 3/16 in (5 mm), the entire area affected shall be corrected by surface profile milling. The self-propelled milling machine shall be used for surface profile milling. At any time the surface profile milling fails to produce a flat plane interspersed with the specified uniform pattern of discontinuous longitudinal striations, the surface profile milling shall be stopped until corrections are made to the equipment. The surface profile milling speed shall be limited to 60 ft/min (18 m/ft). If the Contractor demonstrates that the desired striations and ride specifications are obtained at a greater speed, the Engineer may permit the Contractor to operate at an increased speed.

After surface profile milling, the recycled or reclaimed pavement shall be swept by a mechanical broom to remove all loose material from the recycled or reclaimed pavement before opening to traffic.

The Contractor shall furnish a 16 ft (5 m) straightedge and shall provide for its jobsite transportation at no additional cost to the Department.

Method of Measurement.

The surface profile milling will be by the square yard (square meter).

Basis of Payment.

The surface profile milling will be paid for at the contract unit price per square yard (square meter) for SURFACE PROFILE MILLING.

State of Illinois
Department of Transportation
Bureau of Local Roads and Streets

SPECIAL PROVISION
FOR
COLD IN-PLACE RECYCLING (CIR) AND FULL DEPTH RECLAMATION (FDR) WITH
EMULSIFIED ASPHALT MIX DESIGN PROCEDURES

Effective: April 1, 2012

All references to Divisions, Sections and Articles in this Special Provision shall be construed to mean specific Divisions, Sections and Articles in the Standard Specifications for Road and Bridge Construction adopted by the Department of Transportation.

Sampling and Processing

A minimum sample size of 350 lb (160 kg) is needed for each mix design. Bulk samples of the recycled layer thickness shall be obtained from either test pits or cores. Each layer shall be examined to confirm thickness and material.

The bituminous layers shall be crushed. The crushed bituminous layer(s)' washed gradation (AASHTO T27) shall be performed and reported and meet the following requirement(s):

CIR Crushed Bituminous Layer Gradation			
Sieve	Fine	Medium	Coarse
1.25"	100	100	100
1.0"	100	100	85-100
¾"	95-100	85-96	75-92
No. 4	55-75	40-55	30-45
No. 30	15-35	4-14	1-7
No. 200	1-7	0.6-3	0.1-3

FDR Crushed Bituminous Layer Gradation	
Sieve	% Passing
1.25"	100
1.0"	100
¾"	95-100
No. 4	55-75
No. 30	15-35
No. 200	1-7

Washed gradation (AASHTO T27) and sand equivalent (ASTM D2419, Method B) shall be performed and reported for any granular layer. The washed gradation (AASHTO T27) of combined layers shall be performed and reported. If combined layers include aggregate layer, the sand equivalent (ASTM D2419, Method B) shall be performed and reported.

All washed gradations shall be dried at no greater than 104 °F (40 °C).

Mixing and Compaction

1. FDR with Emulsified Asphalt. Perform Modified Proctor compaction according to ASTM D 1557, Method C to determine optimum moisture content (OMC) at peak dry density. OMC shall be defined by a best-fit curve from a minimum of four points. Material containing 20% or more passing No. 200 shall be mixed with target moisture, sealed, and set aside a minimum of 12 hours. All other material shall be set aside a minimum of 3 hours. If a material contains less than 4 percent passing No. 200, then this testing is not required.

Select the water content of specimens, not including water in the emulsion, based on average annual rainfall. Sand equivalent value (SE) is from the combined materials.

For average annual rainfall ≥ 20 in:

- 60 to 75 percent of OMC if $SE \leq 30$
- 45 to 65 percent of OMC if $SE > 30$

For average annual rainfall < 20 in:

- 50 to 75 percent of OMC if $SE \leq 30$
- 40 to 65 percent of OMC if $SE > 30$

If a material contains less than 4 percent passing No. 200 or if no peak develops with the OMC curve, then fix the moisture content between 2 and 3 percent.

Specimens shall be mixed with the required amount of water before the addition of emulsion. Specimens shall be mixed with the appropriate amount of water and allowed to sit sealed according to the same guidelines as used for Modified Proctor specimens.

Samples shall have a weight before addition of water and emulsion to produce 2.75 in to 3.25 in (70 mm to 80 mm) tall compacted specimens.

Choose four emulsion contents that will bracket the design emulsion content. Recommended emulsion contents: 1.5%, 2.0%, 2.5%, 3.0%, 3.5%, 4.0%. The following specimens shall be created:

- A minimum of two specimens at each of four emulsion contents shall be produced for short-term strength testing.
- Four specimens at each of four emulsion contents shall be produced for the strength and retained strength tests.
- Two specimens shall be produced for maximum specific gravity.

A mechanical mixer shall be used that has a bowl with a diameter of 10 to 12 in (255 to 305 mm). It shall rotate on its axis at 50 to 75 revolutions per minute. A mixing paddle which makes contact with the bottom and side of the bowl shall rotate on its axis at twice the bowl rotation rate and in the opposite rotation direction as the bowl.

Aggregate material and emulsion shall be mixed at a temperature of 68 to 79 °F (20 to 26 °C). Water shall be mixed for 60 seconds. Emulsion shall be mixed for 60 seconds.

If other materials are added, such as lime or cement, then they shall be introduced in a similar manner as they will be on the project. For example, if lime is incorporated a day or more before emulsion addition, then it shall be added to the wet aggregate a day or more before mixing with emulsion. If lime is incorporated as a slurry, then it shall be incorporated as a slurry in the laboratory.

Loose specimens shall be cured individually in plastic containers of 4 to 7 in (100 to 180 mm) height and 6 in (150 mm) diameter. Specimens shall be cured at 104 °F (40 °C) for 30 ± 3 minutes. No further mixing or aeration shall occur during this time.

Specimens shall be compacted in a Superpave gyratory compactor (SGC) at a vertical pressure of 87 psi (600 kPa), an angle of 1.25°, and a mold of 6 in (150 mm) diameter for 30 gyrations. After the last gyration, 87 psi (600 kPa) pressure shall be applied for 10 seconds. The mold shall not be heated.

2. CIR with Emulsified Asphalt. The specimen size shall be the amount that will produce a 2.4 in to 2.6 in (61.0 mm to 66.0 mm) tall specimen.

Choose three emulsion contents that bracket the estimated recommended emulsion content. Recommended emulsion contents: 1.5%, 2.0%, 2.5%, 3.0%, 3.5%, 4.0%. The following specimens shall be created:

- Four per emulsion content for a total of 6 for long-term stability and 6 for moisture testing for 3 emulsion contents.
- Two specimens are required for Rice specific gravity; test at the highest emulsion content in the design and back calculate for the lower emulsion contents.

Add moisture that is expected to be added at the milling head, typically 1.5 to 2.5 percent.

If any additives are in the mixture, introduce the additives in a similar manner that they will be added during field production.

Mixing of test specimens shall be performed with a mechanical bucket mixer. Mix the CIR-RAP millings thoroughly with water first, then mix with emulsion. Mixing shall occur at ambient temperature. One specimen shall be mixed at a time. Mixing time with emulsion should not exceed 60 seconds.

Specimens shall be compacted immediately after mixing. Place paper disks on the top and bottom of the specimen before compaction.

Specimens shall be compacted with a Superpave gyratory compactor (SGC) in a 100 mm mold at 1.25° angle, 600 kPa ram pressure, and 30 gyrations. The mold shall not be heated.

Curing after Compaction

1. FDR with Emulsified Asphalt. Specimens (except STS specimens) shall be cured for 72 hours at 104 °F (40 °C). The bottom of the specimens shall rest on racks with slots or holes for air circulation. After curing, specimens for moisture conditioning shall be cooled at ambient temperature a maximum of 24 hours; specimens for dry strength shall cool at ambient temperature or 77 °F (25 °C) and be tested at the same time as moisture-conditioned specimens.

Specimens for Rice (maximum theoretical) specific gravity shall be cured at the same conditions as the compacted specimens, except they can be tested after cooling a maximum of 24 hours.

2. CIR with Emulsified Asphalt. Extrude specimens from molds immediately after compaction. Carefully remove paper disks.

Place specimens in 60°C forced draft oven with ventilation on sides and top. Place each specimen in a small container to account for material loss from the specimens.

Specimens for Rice (maximum theoretical) specific gravity should be dried to constant weight (less than 0.05% weight loss in 2 hours). Care should be taken not to over-dry the specimens.

Cure compacted specimens to constant weight but no more than 48 hours and no less than 16 hours. Constant weight is defined here as 0.05% change in weight in 2 hours. After curing, cool specimens at ambient temperature a minimum of 12 hours and a maximum of 24 hours.

Short-Term Strength (STS) Test (FDR with Emulsified Asphalt Only)

A modified Hveem cohesiometer apparatus shall be used to test early strength (1 hour). This apparatus and procedure generally conforms to ASTM D 1560 Section 13 with the following exceptions:

- It shall have the capability of testing 6 in (150 mm) diameter specimens.
- It shall have a shot flow rate of 5.95 ± 0.11 lb/min (2700 ± 50 g/min).
- Specimens shall be cured before compaction according to Section 5, and cure each specimen at each emulsion content for 60 ± 5 min at 77 °F (25 °C) and 10 to 70 percent humidity after compaction and before testing.

The following calibrations shall be made:

- The counter balance should be positioned exactly so that the hinged plate just barely remains horizontal when the top brackets and empty bucket are in place. This ensures that there is no force on the sample until shot begins to flow into the bucket.
- The gap between the bars of the switch that turns off the flow of shot should have a gap of $\frac{3}{4}$ " (18 mm) when there is 3000 g of shot in the bucket. During this adjustment the locking bolt that prevents the plate from moving is in place.

Cohesion shall be tested as follows:

1. Tare the balance with the empty bucket weight.
2. Center the specimen on the unit.
3. Place plates on top of sample and press down while adjusting the outer lower nuts up until they just contact the bottom of the plate.
4. Use a torque wrench or torque-meter to tighten the nuts on the specimen to 20 inch-pounds (maximum).
5. Gently support the bar so the unit does not move when the pin is pulled releasing the hinged plate.
6. Pull pin and push open valve to start the flow of shot.

7. After the unit shuts off the flow of shot, immediately put the locking pin in place and then record the weight of shot.
8. Loosen top nuts to remove plates and rotate specimen 90°.
9. Repeat procedure on the other axis of the specimen.
10. Calculate short-term strength as follows:

$$STS = \frac{SW}{15(0.031h + 0.0027h^2)}$$

Where:

SW = Shot Weight in grams
 h = height in cm

11. A total of two results will be obtained for each specimen at each emulsion content, and a total of four results will be obtained at each emulsion content.

Volumetric Measurements

Determine bulk specific gravity (ASTM D 6752) of the specimens. Keep specimens in bags until testing or vacuum saturation is performed. ASTM D 2726 may be used to determine bulk specific gravity if specimens' absorption is less than or equal to 2% of water by volume.

Determine Rice (maximum theoretical) specific gravity (ASTM 2041) except as noted in the Mixing, Compaction, and Curing after Compaction sections.

Determine air voids at all emulsion contents used in the design.

Mechanical Measurements

1. FDR with Emulsified Asphalt. Perform ITS testing according to ASTM D 4867. Specimens shall be conditioned at 77 °F (25 °C) for two hours before testing.
 - For average annual rainfall greater than or equal to 20 in (508 mm) per year, vacuum saturate half the specimens at each emulsion content to a minimum 55 percent of the voids filled with water. Soak for 24 hours at 77 °F (25 °C) before testing.
 - For average annual rainfall less than 20 in (508 mm) per year, soak half the specimens at all emulsion contents used in the design for 24 hours at 77 °F (25 °C) before retained strength testing.
2. CIR with Emulsified Asphalt. Determine corrected Marshall Stability (ASTM D1559) at 40°C after 2 hour temperature conditioning in a forced draft oven. This testing shall be performed at the same time that the moisture conditioned specimens are tested.

Perform same conditioning and volumetric measurements on moisture-conditioned specimens as on other specimens. Vacuum saturate to 55% to 75%; and soak in a 25°C water bath for 23 hours, followed by a one hour soak at 40°C. Determine corrected Marshall Stability. The average moisture conditioned specimen strength divided by the average dry specimen strength is referred to as retained stability.

Raveling Test (CIR with Emulsified Asphalt Only)

The apparatus used for the raveling test is a modified A-120 Hobart mixer and abrasion head (including hose) used in the Wet Track Abrasion of Slurry Surfaces Test (ISSA TB-100). The

rotation speed for the raveling test is not modified from ISSA TB-100. The ring weight is removed from the abrasion head for the raveling test below. The weight of the abrasion head and hose in contact with the specimen should be 600 g ± 15 g. The prepared sample must be able to be secured under the abrasion head, and centered for accurate result, allowing for free movement vertically of the abrasion head. The device used for securing and centering the sample must allow a minimum of 10 mm of the sample to be available for abrasion. The Hobart mixer will need to be modified to allow the sample to fit properly for abrasion. The modification may be accomplished by adjusting the abrasion head height, or the height of the secured sample. The Hobart C-100 and N-50 Models are not acceptable for this test procedure due to differences in size and speed of rotation.

1. Split out two recycled asphalt samples from the medium gradation, or field sample, to a quantity of 2700 g in mass. The 2700 g is an approximate weight to give 70 mm ± 5 mm of height after compaction.
2. The recycled asphalt sample should be placed in a container of adequate size for mixing.
3. Field or design moisture contents should be added to each of the recycled asphalt samples and mixed for 60 seconds.
4. The design emulsion content shall be added to each of the recycled asphalt samples and mixed for 60 seconds.
5. The samples shall be placed immediately into a 150 mm gyratory compaction mold and compacted to 20 gyrations. If the sample height is not 70 mm ± 5 mm, the recycled asphalt weight should be adjusted.
6. After compaction, the samples shall be removed from the compaction mold and placed on a flat pan to cure at the specified temperature and humidity (if required) for 240 minutes ± 5 minutes. The temperature shall be maintained at ± 2°C from the temperature specified and the humidity (if required) shall be maintained at ± 10% from the number specified.
7. The specimens shall be weighed after the curing, just prior to testing.
8. The specimens shall be placed on the raveling test apparatus. Care should be taken that the specimen is centered and well supported. The area of the hose in contact with the specimen should not have been previously used. It is allowable to rotate the hose to an unworn section for testing. The abrasion head (with hose) shall be free to move vertically downward a minimum of 5mm if abrasion allows.
9. The samples shall be abraded for 15 minutes and immediately weighed.
10. The Percent Raveling Loss shall be determined as follows:

$$PRL = 100 \times \frac{W_P - W_A}{W_P}$$

Where: PRL = Percent Raveling Loss
 W_P = Weight of Sample Prior to Testing
 W_A = Weight of Sample After Testing

11. The average of the two specimens shall be reported as the Percent Raveling Loss. If there is a difference of > 0.5% raveling loss between the two test specimens, the Raveling Test shall be repeated. If both of the test specimens have a Percent Raveling Loss of > 10%, the two test results shall be averaged and the maximum 0.5% difference between test specimens shall not be required.

Note: If field mix samples are taken, steps 2, 3, and 4 shall be omitted.

Emulsion Content Selection

The emulsion content selected shall result in the mixture meeting the mix design requirements of the FDR or CIR special provision.

Report

All mix design test results shall be reported to the Department. All additional additives and bituminous material shall be reported to the Department.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2012-03
SUBJECT: CHANGES IN FUNCTIONAL CLASSIFICATION
TERMINOLOGY
ISSUED DATE: August 27, 2012
EFFECTIVE DATE: September 1, 2012

This memorandum revises Section 27-3 of the Bureau of Local Roads & Streets Manual issued January 2006.

The rural and urban designation in the Functional Classification terminology has been consolidated due to Federal Highway Administration's Interim Guidance on Highway Functional Classification as a result of the 2010 Highway Performance Monitoring System Reassessment. Functional classification will be assigned based on functional criteria, rather than the location of an urban/rural boundary.

The Office of Planning & Programming (OP&P) has modified the Illinois Road Inventory System (IRIS) to handle functional classification designations. OP&P has converted former functional classification codes used in IRIS to the new functional codes; however, the urban area code will continue to be in IRIS to determine whether a highway is in a rural or urban area.

OP&P has changed documentation in IRIS to show the seven functional classes and to remove any direct relationship between the key route type and the functional classification code. OP&P has discontinued the use of the two digit functional classification code and descriptions in order to utilize the new functional classification categories in department systems, publications, GIS, internet applications, and maps.

A handwritten signature in black ink that reads "James K. Klein".

Guidance for the Functional Classification of Highways (Updated)

U.S. Department of Transportation
Federal Highway Administration

Memorandum

Subject: INFORMATION: Updated Guidance for the Functional Classification of Highways

Date: October 14, 2008

From: (Original signed by)
Mary B. Phillips
Associate Administrator for Policy and Governmental Affairs
(HPL)

Reply to Attn HPPI-20
of:

To: Division Administrators
Resource Center Directors

Introduction

The Highway Performance Monitoring System (HPMS) Reassessment 2010+ resulted in recommendations for the revision of highway functional classifications. Some of the recommended revisions will require additional study in order to provide fully validated, revised functional classification guidance.

The purpose of this memorandum and attachment is to provide interim guidance which may be used in association with *Highway Functional Classification: Concepts, Criteria and Procedures*, available online at: <http://www.fhwa.dot.gov/planning/fctoc.htm>. *Highway Functional Classification* may be considered reference material, to be superseded by this memorandum and attachment where applicable. Following completion of additional studies, a complete revision of *Highway Functional Classification* will be prepared and released.

The conversion of functional classification from the existing schema to the new schema described in Section 2 of the guidance and the coding changes for ramps described in Section 5 are both due in the reporting of 2009 data submitted to Federal Highway Administration (FHWA) in 2010. The adjustment of functional classifications and urban/urbanized boundaries following the 2010 Census should be included in the reporting of 2012 HPMS data reported in 2013. Any functional classification changes resulting from the revision/rewrite of the functional classification guidance would be included in data reported in 2013 and optional for any earlier HPMS submittals.

We recognized that in many States or Metropolitan Planning Offices (MPOs), the process of updating highway functional classification is an ongoing process, with some States just now completing the updates to urban boundaries and functional classification triggered by the 2000 Census. The hope is that by 2012 the 2010 Decennial Census data will be available, and States will use this updated information as they undertake a thorough update of their highway functional classification.

The intended users of this guidance are the State Department of Transportation coordinators, planners and technicians in the areas of functional classification and HPMS, as well as appropriate FHWA staff.

Background

The functional classification of the nation's highways, roads and streets provides important inputs into the HPMS program and into the apportionment of federal funds, such as for the National Highway System (NHS) and Surface Transportation Program (STP). However, functional classification is also used for many other transportation planning and public policy purposes within the States, MPOs, and local communities.

The focus of this interim guidance is on functional classification as it is related to HPMS data reporting requirements and the apportionment process. Other aspects of functional classification will be considered in any future update of *Highway Functional Classification*. States are expected to report functional classification data consistent with HPMS data requirements. As always, States and local communities may continue to use functional classification as needed according to their specific requirements provided they do not conflict with the HPMS requirements.

HPMS Reassessment Project: Results for Highway Functional Classification

The following subjects are considered in the attachment.

1. Routes Crossing Between Rural and Urban Areas

HARD COPIES UNCONTROLLED

2. Consolidation of Rural and Urban Designations in Functional Classifications
3. Extent Analysis (mileage and vehicle-miles traveled (VMT) percentage ranges)
4. Clarification: "Future Year" and "Future Route"
5. Ramps and Other Non-mainline Roadways

If you have any comments or need additional information, please contact Paul Svercl at 202-366-5036.

Attachment

INTERIM GUIDANCE ***Highway Functional Classification: Concepts, Criteria and Procedures*** **Revisions as a Result of the 2010 HPMS Reassessment Project**

The following subjects are considered in turn.

1. Routes Crossing Between Rural and Urban Areas
2. Consolidation of Rural and Urban Designations in Functional Classifications
3. Extent Analysis (mileage and vehicle-miles traveled (VMT) percentage ranges)
4. Clarification: "Future Year" and "Future Route"
5. Ramps and Other Non-mainline Roadways

The conversion of functional classification from the existing schema to the new schema described in Section 2 and the coding changes for ramps described in Section 5 are both due in the reporting of 2009 data submitted to FHWA in 2010. The adjustment of functional classifications and urban/urbanized boundaries following the 2010 Census should be included in the reporting of 2012 HPMS data reported in 2013. Any functional classification changes resulting from the revision/rewrite of the functional classification guidance would be included in data reported in 2013 and optional for any earlier HPMS submittals.

1. Routes crossing between Rural and Urban Areas

Functional classification should not automatically change at the rural/urban boundary. In consolidating the rural and urban designations within functional classification, the urban boundary itself will remain. 23 USC 101(a)(36)-(37) provides for urban boundaries "to be fixed by responsible State and local officials in cooperation with each other." However, one of the goals of this interim guidance is to de-emphasize the urban boundary as being determinative of functional classification. That is, functional classifications should be assigned based on actual functional criteria, rather than the location of an urban/rural boundary.

States should follow the guidance provided in the 1991 Addendum of *Highway Functional Classification* wherever possible, which states:

The Highway Functional Classification provides for rural routes (other than Principal Arterials) to be upgraded to a higher classification level when they cross an urban boundary. Although the principle is sound, rigid application has presented difficulties for some States. Accordingly, this addendum [1991] to the guidelines is intended to provide greater flexibility for deciding on an appropriate place for changing the functional classification when rural routes cross an urban boundary, taking into account changes in traffic conditions, the degree of urban development and other factors. Instead of automatically upgrading the functional classification of a rural route that crosses an urban boundary, the rural classification may be continued inside the urban boundary until there is a more logical and acceptable place for a change.

As of this interim guidance, the practice of automatically upgrading the functional classification of a rural route that crosses an urban boundary should be phased out and eliminated. Upgrading due to actual change in function should be the operative criteria.

Census and Adjusted Urbanized/Small Urban Boundary

Once routes have been assigned the appropriate "rural/urban neutral" functional classification, urbanized and small urban boundaries may be determined in a separate process. States have the option of using Census-defined boundaries only, or they may *adjust* the Census-defined boundaries to be more consistent with transportation planning requirements. The adjusted urbanized/small urban boundaries should be "smoothed" to include areas which are urban in nature but lacking in population density (such as airports, industrial parks,

HARD COPIES UNCONTROLLED

regional shopping centers and other urban attractions).

2. Consolidation of Rural and Urban Designations in Functional Classifications

Existing guidance in *Highway Functional Classification* makes distinctions in all respects – concepts, criteria, and procedures – between rural and urban classifications. As of this interim guidance, the continuity and connectivity of the basic functional systems is retained and emphasized. However, through HPMS reassessment, there is a reduced emphasis on the rural/urban distinction as exemplified in the functional classification name changes (e.g., Interstate, in place of rural Interstate and urban Interstate). The review and update of urban boundaries will continue to take place, but as a separate, Census-based process (see Section 1).

The differences in the nature and intensity of development between rural and urban areas will cause roads with the same classification to have characteristics that are somewhat different, depending on whether they are in rural, small urban or urbanized areas. Thus, the qualitative narrative in *Highway Functional Classification* is useful and valid.

The consolidation of rural and urban designations means that some functional classifications that previously existed in only one area-type will now be recognized as valid in all area-types.

- a. Other Freeways and Expressways were previously identified in small urban or urbanized areas only. As of this interim guidance, this classification can be extended into rural areas, where facilities of these functional and design characteristics exist. Beginning in 2010, all existing Other Freeways and Expressways (Principal Arterials) as of December 31, 2009, should be identified and reported by the States. Additional study is needed to determine if the States are consistent in their identification of Other Freeways and Expressways and whether and how greater consistency could be achieved.
- b. Major and Minor Collectors were previously identified in rural areas only, while in small urban and urbanized areas, the corresponding classification was simply, Collectors (urban Collectors). As of this interim guidance, States may continue to classify Major and Minor Collectors in rural areas in the same manner as they have in the past. Beginning in 2010, all existing urban Collectors as of December 31, 2009 are to be reported in HPMS as Major Collectors. At their option, States may identify Minor Collectors within small urban or urbanized areas from this "pool" of existing Major Collectors*. Additional study is needed to determine what qualitative similarities and differences exist between Minor Collectors in rural areas and those in small urban or urbanized areas.
- c. Information [23 CFR 1.5 and 1.7] about whether the route is in a rural or small urban or urbanized area shall be reported separately in HPMS with a rural-urban designation as well as geo-spatially.

Based on these changes to functional classification, the following revised functional classification codes should be used beginning with the 2009 data, reported in 2010.

Revised HPMS Functional Classification Codes:

- 1 = Interstate
- 2 = Other Freeways and Expressways
- 3 = Other Principal Arterial
- 4 = Minor Arterial
- 5 = Major Collector
- 6 = Minor Collector
- 7 = Local

* The definition of Federal-Aid Highways in 23 USC 101(a)(5) is unchanged by this revision to functional classification labels. Rural Minor Collectors (or Minor Collectors located in rural areas) will remain excluded by the definition of Federal-Aid Highways (unless on the National Highway System (NHS)), while urban Minor Collectors (or Minor Collectors located in small urban or urbanized areas) will be included in the definition of Federal-Aid Highways. See Section 1 for information as to how rural and urban data will continue to be maintained.

3. Extent analysis (mileage and VMT percentage ranges)

HARD COPIES UNCONTROLLED

The consolidation of rural and urban designations in functional classifications impacts the validity of the information provided in *Highway Functional Classification* about the extent of functional systems, both in terms of mileage and VMT. While these percentages were guidelines, additional study is needed to determine how valid the existing extent guidance may be, how it may be adapted to the rural/urban neutral "world," and what, if any, different extent guidance should be provided in the future. Until additional study is completed, States should adhere to the simplified extent guidance, below, that affects the lane mileage and VMT apportionment factors:

Related to the apportionments on the Surface Transportation Program (STP) and Highway Safety Improvement Programs (HSIP):

All Arterials and Collectors combined – maximum of 35 percent of statewide route mileage. (Rural Minor Collector mileage and VMT does not contribute, but it is included here as "Collectors" because the existing extent guidance does not break out any separate guidance for them.)

All Arterials and Collectors combined – between 70 percent and 80 percent of statewide VMT.

Related to NHS apportionment:

Rural Principal Arterials – maximum of 4 percent of statewide route mileage and between 30 percent and 55 percent of statewide VMT.

Urban Principal Arterials – maximum of 10 percent of statewide route mileage and between 40 percent and 65 percent of statewide VMT.

Although rural and urban Principal Arterials will be consolidated into Principal Arterials, rural and urban data will continue to be created in the HPMS database by combining functional class and rural/urban designation codes.

Note that the extent guidance in *Highway Functional Classification* is intended to be applied on a **statewide** basis, rather than by county, or by individual urbanized or small urban area. Any future extent guidance resulting from additional study will also be provided on the premise that it is for statewide application.

4. Clarification: "Future Year" and "Future Route"

Future Year

The existing guidance, *Highway Functional Classification*, contains over 30 references to the phrase, "future year." In none of these instances does the guidance provide a range of years out to which States may project "future year" classifications, except to say that, "The base for a "future year" population should be the most recent Decennial Census" (page III-2) (or special Census). In practice, most States have used the current year for designating functional classifications. Other States have projected "future year" classifications three to five years out; some have projected out considerably longer.

A wide variability in the use of the "future year" concept has implications for HPMS data consistency across the nation, as well as for federal funding opportunities (mileage eligible for federal assistance and included in the apportionment formulas). In order to improve consistency in this area, it is recommended that States assign functional classification according to the current year.

Future Route

One of the references to a "future year" functional classification plan in *Highway Functional Classification* includes the following: "it will include, in addition to existing facilities, such projected totally new facilities as will be needed to serve "future year" land use and travel. Some of this new mileage will consist of new streets in expanding urban areas." (Page III-1) This is a reference to "future routes." The "future route" is an individual, unbuilt facility, planned to function at a specific level once built. The 1991 Addendum to *Highway Functional Classification* recognized that additional guidance was needed for "future routes," as distinct from "future year" functional classifications. As stated in the 1991 Addendum to *Highway Functional Classification*:

The manual discusses procedures for conducting a functional classification based on projected facilities and usage for some "future year"; however, the manual does not provide criteria for including future or proposed routes into a functional classification of existing facilities. Because the functional classification will support the designation of the NHS which is expected to include some

HARD COPIES UNCONTROLLED

future routes, this addendum establishes criteria for determining which future routes should be included in the functional classification of existing routes. Future routes should be functionally classified with the existing system if they are included in an approved short range improvement program and there is a good probability that the route will be under construction in the reasonably near future (up to 6 years). Where applicable, the same classification should be given to the future route and to the existing route that it will replace until the future route is constructed.

The "up to 6 years" timeframe given in the preceding paragraph mentions "an approved short range improvement program" but does not specify the Statewide Transportation Improvement Program (STIP). As of this interim guidance, the timeframe in which the "future route" is expected to be under construction should generally be consistent with the STIP timeframe of 4 years or less.

Note that the mileage of a "future route" should not be included in public road mileage or lane-miles or vehicle-miles traveled for apportionment purposes until it is built and open to traffic. In addition, for HPMS reporting purposes, only data about a "future route" which is to become part of the NHS should be reported. At their option, States may propose other "future routes" to be part of their functional classification system, i.e., routes which will be eligible for STP rather than NHS. If using this option, States would be in compliance with the above guidance.

5. Ramps and Other Non-mainline Roadways

Beginning with the reporting of 2009 HPMS data in 2010, data for ramps and other non-mainline roadways **should be reported** for those meeting the ramp criteria described below. As noted, data for these roadways should include functional classification. Additional data requirements for ramps will be specified in the final HPMS Reassessment Report and revised *HPMS Field Manual*.

Ramps

- Associated with grade-separated interchanges
- Turning movement facility that moves traffic between two or more (functionally classified) facilities; may include collector-distributor (CD) roads
- Assigned same functional classification as the highest facility served within the interchange

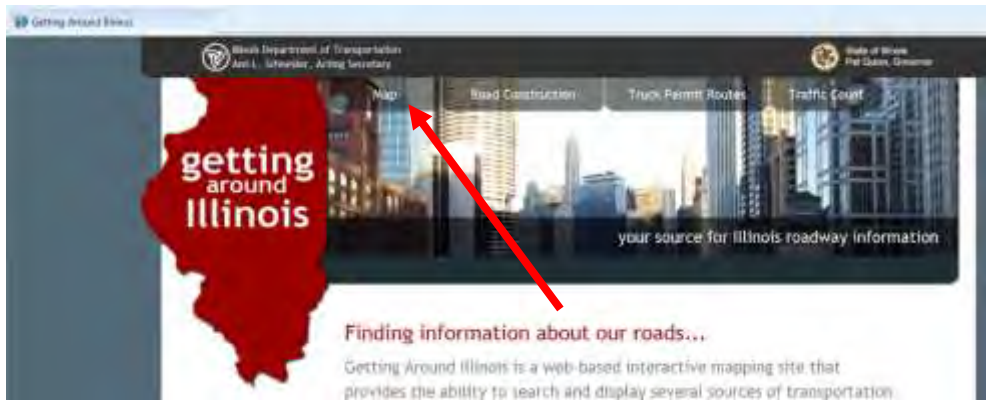

Note that at this time, there is no change to the status of ramps with respect to public road mileage or lane mileage or vehicle-miles traveled for apportionment purposes; they are not considered mainline and are not included in those public road mileage inventories.

Other Non-mainline Roadways

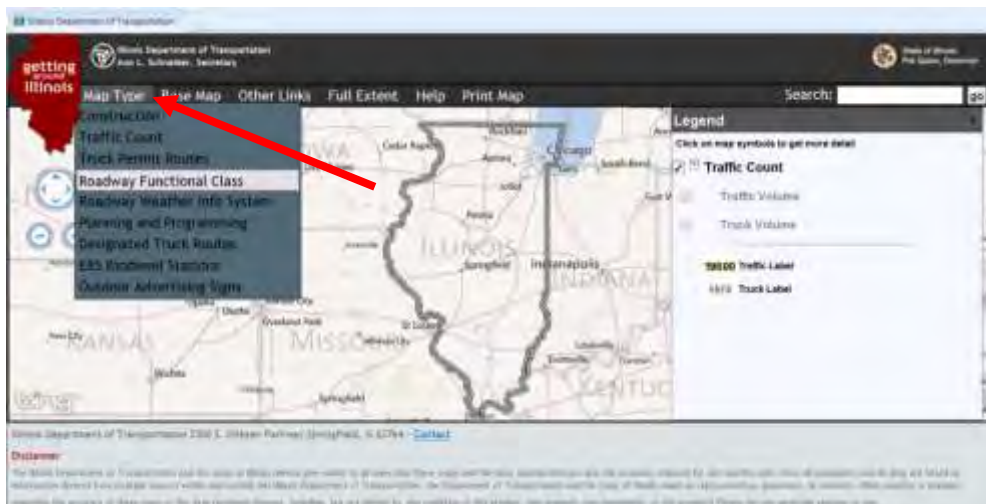

At their option, States may collect data and assign functional classifications to other kinds of non-mainline roadways. These may include other collector-distributor roads, other turning movement facilities not associated with a grade-separated interchange, and other auxiliary roadways. In general, such roadways within the interchanges should be assigned the same functional classification as the highest facility served. However, since many configurations exist, States may assign the functional classification as they deem appropriate. While data for other non-mainline roadways is not required for HPMS, States have the option of reporting it beginning with the 2009 HPMS data reported in 2010.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2012-04
SUBJECT: 2010 HIGHWAY CAPACITY MANUAL
ISSUED DATE: October 24, 2012
EFFECTIVE DATE: October 24, 2012

This memorandum revises Section 27-6 of the Bureau of Local Roads & Streets Manual issued January 2006.

The fifth edition of the *Highway Capacity Manual (HCM2010)* will significantly enhance how engineers and planners assess the traffic and environmental effects of highway projects. Section 27-6 has been updated to provide a basic overview of the concepts contained in the *HCM2010*.

This four-volume format was developed to provide information at several levels of detail, to help HCM users more easily apply and understand the concepts, methodologies, and potential applications presented in the manual.

- Volume 1 - Concepts;
- Volume 2 - Uninterrupted Flow;
- Volume 3 - Interrupted Flow; and
- Volume 4 - Applications Guide (electronic only)

Volume 4 is an electronic-only volume that registered HCM users will be able to access via the Internet. This volume includes four types of content: supplemental chapters on methodological details and emerging issues; interpretations, clarifications, and corrections; comprehensive case studies; and a technical reference library.

Copies of the *HCM2010* may be purchased from the Transportation Research Board's book store at <http://books.trbbookstore.org/hcm10.aspx>.

Please contact the Local Policy & Technology Unit at DOT.LocalPolicy@illinois.gov with any questions.

James K. Klein

Acting Engineer of Local Roads and Streets

HARD COPIES UNCONTROLLED

Highway Capacity Manual 2010

PAUL RYUS, MARK VANDEHEY, LILY ELEFTERIADOU,
RICHARD G. DOWLING, AND BARBARA K. OSTROM

Ryus is Associate Engineer, Kittelson & Associates, Inc., Svendborg, Denmark; Vandehey is Managing Principal, Kittelson & Associates, Inc., Portland, Oregon; Elefteriadou is Professor of Civil Engineering and Director of the Transportation Research Center, University of Florida, Gainesville; Dowling is President, Dowling Associates, Inc., Oakland, California; and Ostrom is Principal Engineer, MACTEC Engineering and Consulting, Beltsville, Maryland.

The fifth edition of the *Highway Capacity Manual* (HCM 2010), recently released by the Transportation Research Board (TRB), incorporates results from more than \$5 million of research completed since the publication of the HCM 2000. This latest edition significantly updates the methodologies that engineers and planners use to assess the traffic and environmental effects of highway projects.

HCM 2010 introduces several firsts, including

- ◆ An integrated multimodal approach to the analysis and evaluation of urban streets from the points of view of automobile drivers, transit passengers, bicyclists, and pedestrians;
- ◆ Guidance on the proper application of microsimulation analysis and the evaluation of those results;
- ◆ The presentation of active traffic management in relation to demand and capacity; and
- ◆ Generalized service volume tables to assist planners in sizing roadway facilities.

Key Changes

Following are some of the key changes in the HCM 2010:

- ◆ The signalized intersections procedure models

HCM 2010 features findings on active traffic management, which strategically deploys an array of measures to relieve congestion.

Among the new features of HCM 2010 is updated material on the impact of weather and work zones on freeway capacity.

the operation of an actuated controller. A new incremental queue accumulation (IQA) method calculates the delay term d_i and the length term Q_i . Although equivalent to the HCM 2000 method for the idealized case, the IQA method is more flexible and can accommodate nonideal cases, such as coordinated arrivals and multiple green periods with differing saturation flow rates, which can occur with protected-plus-permitted left turns. A check procedure for left-turn lane overflow also has been added.

◆ **Unsignalized intersections**, previously a single chapter, now are described in three chapters, covering two-way STOP-controlled (TWSC) intersections, all-way STOP-controlled (AWSC) intersections, and roundabouts. The TWSC method in the HCM 2010 can analyze intersections along six-lane streets, and the AWSC method now includes a queue-estimation procedure. The roundabout material is completely updated, based on the work of National Cooperative Highway Research Program (NCHRP) Project 3-65,¹ which developed a comprehensive database of U.S. roundabout operations and established new methodologies for evaluating roundabout performance. The chapter adds a level-of-service (LOS) table for roundabouts.

- ◆ The interchange ramp terminals chapter has

¹ For titles of the NCHRP projects cited in this article, see the sidebar on page 48.

PHOTO: MINNESOTA DOT

PHOTO: NEW JERSEY TURNPIKE AUTHORITY

Capacity of roundabout entries, from Chapter 21; the roundabout material in HCM 2010 is completely updated and includes new methodologies for evaluating performance.

Hourly variations in bicycle volumes for two cities that have invested in infrastructure and programs: Copenhagen, Denmark, and Portland, Oregon; from HCM 2010, Chapter 3.

been completely updated with findings from the work of NCHRP Projects 3-60 and 3-60A. The chapter describes a new method for conducting operational analyses and obtaining the LOS for a full range of service interchange types—diamond, partial cloverleaf, and the single-point urban interchange. The chapter includes a methodology for assessing the operational performance of various types of interchanges and making an appropriate selection.

◆ The urban street segments chapter has been rewritten, incorporating the work of NCHRP Project 3-79. The chapter presents improved methods for estimating urban street free-flow speeds and running times, as well as a new method for estimating the stop rate along an urban street. In addition, NCHRP Project 3-70 has provided a methodology for evaluating tradeoffs in allocating urban street right-of-way among the modes.

◆ A new urban street facilities chapter traces out a methodology for aggregating results from the seg-

ment and point levels of analysis into a facility assessment. Information is provided on the impact of active traffic management measures on urban street performance.

◆ The freeway facilities chapter introduces a table for LOS based on density. Other updates include material on the impact of weather and work zones on freeway facility capacity, plus new information on the impact of active traffic management measures on freeway operations.

◆ The freeway weaving chapter has been completely updated with findings from NCHRP Project 3-75. Although the general process for analyzing weaving segments is similar to that given in HCM 2000, the HCM 2010 models derive from an up-to-date set of weaving data. The two major differences in applying the methodology are (a) a single algorithm for predicting weaving speeds and a single algorithm for predicting nonweaving speeds, regardless of the weaving configuration, and (b) the threshold for LOS F has changed.

New Approaches

A new chapter on active traffic management, based on research produced and compiled by the Federal Highway Administration (FHWA), describes various strategies to relieve highway congestion; the mechanisms affecting demand, capacity, and performance; and general guidance on evaluating active traffic management techniques. Strategies discussed include roadway metering, congestion pricing, traveler information systems, managed lanes, traffic signal control, and speed harmonization.

The HCM 2010 examines the use of alternative tools in conjunction with techniques presented, applying research conducted under NCHRP Project 3-85. Chapter 6 describes typical applications of HCM and alternative analysis tools, and Chapter 7 offers guidance on interpreting the results from alternative tools. In addition, each methodological chapter contains specific guidance on the application of the tools in analyzing a facility. Several examples illustrate the use of alternative tools in conjunction with the HCM 2010.

To encourage HCM users to consider all travelers, the HCM 2010 incorporates tools for multimodal analysis along highway facilities. This is the first edition of the HCM that takes into account the effects of cars on bicyclists and pedestrians. The stand-alone chapters for the bicycle, pedestrian, and transit modes have been eliminated—instead, the methods applicable to bicycles, pedestrians, and transit have been incorporated into the analyses of the various roadway facilities. For methodologies specific to the operation of transit vehicles on urban streets, readers can con-

A shared pedestrian-bicycle path in San Luis Obispo, California. HCM 2010 updates off-street shared-use path procedures.

sult *TCRP Report 100: Transit Capacity and Quality of Service Manual*.

To assist planners in sizing highway facilities, the HCM 2010 includes **generalized service volume tables** that show the maximum demand volumes for a given LOS under a specified set of conditions. The HCM 2010 also provides **computational engines** to assist users in applying some of the intensive methods.

Additional Changes

Smaller changes have been implemented throughout the manual. For example, the speed-flow curves in the chapter on **basic freeway segments** have been updated with an expanded database. Small changes in the ramps and ramp junctions material—now called **freeway merges and diverges**—check and correct for unreasonable lane distributions. The **two-lane highways** chapter now provides only a one-directional methodology, and several key tables and curves have been updated. Finally, the **off-street shared-use path** procedures have been updated with U.S. data.

Multivolume Format

The new manual has retained many of the stylistic elements introduced in the HCM 2000, such as the page layout formats. The HCM 2010 content, however, is organized into four volumes—Concepts, Uninterrupted Flow, Interrupted Flow, and Applications Guide. The first three volumes are issued as a slipcased set of three looseleaf volumes; Volume 4 is electronic only. The four-volume structure delivers information at several levels of detail, to help HCM users apply and understand the concepts, methodologies, and potential applications.

Volume 1: Concepts presents the basic information that an analyst should master before performing analyses of highway capacity or quality of service. The chapters cover the organization of the HCM 2010; the kinds of applications that can be performed; modal characteristics; traffic flow, capacity, and quality-of-service concepts; the range of tools available to

perform an analysis; guidance on interpreting and presenting analysis results; and the terms and symbols used in the HCM 2010. Chapter 8, HCM Primer, offers an executive summary for decision makers.

Volume 2: Uninterrupted Flow contains methodological chapters relating to system elements, as well as the materials and resources needed to analyze these elements. The description of the process thoroughly conveys the steps involved, including the scope and limitations of the methodology, the specific default values, the LOS thresholds, the handling of special cases, and the application of alternative tools.

The freeway chapters are presented first, arranged from the facility level to the segment level; the chapters on multilane and two-lane highways follow. Volume 2 incorporates the Part III uninterrupted-flow chapters of the HCM 2000, along with material from the corresponding Part II chapters—such as specific default values and LOS thresholds—used directly in an analysis. The chapter on interchange ramp terminals, which appeared with the uninterrupted-flow chapters in the HCM 2000, appears in Volume 3 of the HCM 2010 with the interrupted-flow chapters.

The methodological chapters of **Volume 3: Interrupted Flow** reflect an approach similar to that of Volume 2, starting with a chapter on urban street facilities, followed by urban street segments, the various intersections, and off-street pedestrian and bicycle facilities. The chapters on urban street facilities and segments provide the highest level of multimodal evaluation, presenting methods to determine LOS for motorists, pedestrians, bicyclists, and transit users.

Web Volume

Volume 4: Applications Guide is an electronic-only volume accessible exclusively to registered HCM

HCM 2010 consists of four volumes—three looseleaf volumes in a slipcased set and one electronic-only volume. To order, visit the TRB online bookstore, <http://books.trbbookstore.org/hcm10.aspx>.

Freeway speed-flow curves, from HCM 2010, Chapter 11 (LOS = level of service; pc = passenger car; ln = lane).

HCM 2010 Research Resources

The following research projects contributed to the development of the HCM 2010:

- ◆ NCHRP Project 3-60, Capacity and Quality of Service of Interchange Ramp Terminals;
- ◆ NCHRP 3-60A, Validation and Enhancement of the *Highway Capacity Manual's* Interchange Ramp Terminal Methodology;
- ◆ NCHRP Project 3-64, *Highway Capacity Manual Applications Guide*;
- ◆ NCHRP Project 3-65, Applying Roundabouts in the United States;
- ◆ NCHRP Project 3-70, Multimodal Level of Service Analysis for Urban Streets;
- ◆ NCHRP Project 3-75, Analysis of Freeway Weaving Sections;
- ◆ NCHRP Project 3-79, Measuring and Predicting the Performance of Automobile Traffic on Urban Streets;
- ◆ NCHRP Project 3-82, Default Values for Capacity and Quality of Service Analyses;
- ◆ NCHRP Project 3-85, Guidance for the Use of Alternative Traffic Analysis Tools in Highway Capacity Analyses;
- ◆ NCHRP Project 3-92, Production of the 2010 *Highway Capacity Manual*; and
- ◆ Two FHWA projects: Evaluation of Safety, Design, and Operation of Shared-Use Paths; and Active Traffic Management Measures for Increasing Capacity and Improving Performance.

users via the Internet. This volume includes four types of content: supplemental chapters on methodological details and emerging issues; interpretations, clarifications, and corrections; comprehensive case studies; and a technical reference library.

Chapters 24 through 34 in Volume 4 supplement chapters in Volumes 1, 2, and 3 with

- ◆ More detailed descriptions of selected computational methodologies, written for users who seek a greater depth of understanding or who plan to develop HCM implementation software;
- ◆ Example applications of alternative tools to situations not addressed by the methodologies in the chapters of Volumes 2 and 3;
- ◆ Descriptions of the computational engines for selected methodologies; and
- ◆ Additional example problems and calculation results.

In addition, Chapter 35 in Volume 4 provides a first-generation chapter on the impact of active traffic management techniques on roadway operations. As new research is completed, this chapter will be updated, and chapters may be added to address other emerging issues, such as travel time reliability.

The methodological interpretations section also will continue to develop, as users apply the HCM 2010 and pose questions about particular methodologies to the TRB Highway Capacity and Quality of Service (HCQS) Committee. Clarifications and interpretations of the HCM, as well as corrections, officially approved by the committee will be posted in the interpretations section of Volume 4.

The comprehensive case studies illustrate how to use the HCM to perform common types of analyses. The case studies focus on the analysis process in applying the HCM and alternative tools, not on the step-by-step details of performing calculations—calculations are addressed in the example problems in each methodological chapter and in selected supplemental chapters. Case Studies 1 through 5 derive from the web-based *HCM Applications Guidebook* developed after publication of the HCM 2000, and Case Study 6 was developed in conjunction with NCHRP Project 3-85.

Finally, the Technical Reference Library contains a selection of papers, technical reports, and companion documents cited in the HCM.

Community Collaboration

As the HCM has grown in the decades since its debut in 1951, the content has long since ceased to be the product of a few highly competent experts or of a single technical committee. The HCM 2010 has benefited from the extensive involvement of the professional community to an extent that far surpasses that of previous editions.

A series of practitioner focus groups conducted through NCHRP Project 3-92 and the HCQS Committee supplied valuable insights on the HCM content and organization. More than 300 professionals—many new to TRB—along with members of the HCQS Committee and participants in the manual development process contributed to the year-long review of the chapters.

Four committees from the TRB Technical Activities Operations Section provided reviews and comments on drafts of the manual. Finally, the HCQS Committee's joint summer meetings with local Institute of Transportation Engineers (ITE) sections during the development of the manual, along with focus groups sponsored by ITE, were informative and productive.

The HCQS Committee has invited users of the manual who are interested in improving the profession's understanding of highway capacity and quality of service analysis to participate in the committee deliberations and to provide feedback about the HCM 2010 methods. The committee website, www.AHB40.org, will be available for these interactions.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2012-05
SUBJECT: MUTCD REVISIONS
ISSUED DATE: October 24, 2012
EFFECTIVE DATE: October 24, 2012

This memorandum revises Section 39-2 of the BLRS Manual dated December 2011.

On May 14, 2012 final rules adopting Revisions 1 and 2 of the 2009 Manual on Uniform Traffic Control Devices (MUTCD) were published in the Federal Register with an effective date of June 13, 2012.

Revision 1 of the 2009 edition of the MUTCD restores certain language contained in the 2003 MUTCD edition. The restoration of such language will continue FHWA's current practice under Official Interpretation 1(09)-1(l) which states that in limited, specific cases, deviation from a STANDARD is allowed at a location or other locations with the same conditions, provided that an agency or other official having jurisdiction fully documents the engineering reason for the deviation. The Illinois Supplement to the MUTCD incorporated the FHWA Official Interpretation when issued; therefore, Revision 1 should not impact Illinois highway agencies.

Revision 2 of the 2009 edition of the MUTCD revises Table I-2 of the MUTCD by eliminating the compliance dates for 46 items (8 that had already expired and 38 that had future compliance dates) and extends and/or revises the dates for 4 items. The target compliance dates for 8 items that are deemed to be of critical safety importance will remain in effect. In addition, this final rule adds a new Option statement exempting existing historic street name signs within a locally identified historic district from the Standards and Guidance of Section 2D.43 regarding street sign color, letter size, and other design features, including retroreflectivity.

Even though the compliance date for meeting the minimum retroreflectivity for street name signs has been eliminated, street name signs and overhead guide signs are still required to meet the minimum retroreflectivity requirements contained in the MUTCD. Therefore, the department recommends using the original compliance date of January 22, 2018 as a target date for complying with the retroreflectivity requirements for these signs. These signs should also be covered in the assessment or management method selected for regulatory and warning signs.

HARD COPIES UNCONTROLLED

PM2012-05
October 24, 2012

Section 39-2.07 Dimensions was also added to the BLRS Manual to clarify that engineering judgment may be used to adjust sign size requirements contained in the conventional road column in the various sign size tables in the MUTCD.

Please contact the Local Policy & Technology Unit at DOT.LocalPolicy@illinois.gov with any questions.

23 CFR Part 655

National Standards for Traffic Control Devices; the Manual on Uniform Traffic Control Devices for Streets and Highways; Revision; Final Rules

HARD COPIES UNCONTROLLED

DEPARTMENT OF TRANSPORTATION**Federal Highway Administration****23 CFR Part 655**

[FHWA Docket No. FHWA–2010–0170]

RIN 2125–AF41

National Standards for Traffic Control Devices; the Manual on Uniform Traffic Control Devices for Streets and Highways; Revision; Final Rule

AGENCY: Federal Highway Administration (FHWA), Department of Transportation (DOT).

ACTION: Final rule.

SUMMARY: The MUTCD is incorporated in the FHWA regulations, approved by the FHWA, and recognized as the national standard for traffic control devices used on all streets, highways, bikeways, and private roads open to public travel. The purpose of this final rule is to revise certain definitions and guidance relating to traffic control devices in Part 1 (General) of the MUTCD. The changes will clarify the definition of Standard statements in the MUTCD and clarify the use of engineering judgment and studies in the application of traffic control devices.

DATES: *Effective Date:* This final rule is effective June 13, 2012. The incorporation by reference of the publication listed in this regulation is approved by the Director of the Office of the Federal Register as of June 13, 2012.

FOR FURTHER INFORMATION CONTACT: Mr. Chung Eng, Office of Transportation Operations, (202) 366–8043; or Mr. William Winne, Office of the Chief Counsel, (202) 366–1397, Federal Highway Administration, 1200 New Jersey Ave. SE., Washington, DC 20590. Office hours are from 8 a.m. to 4:30 p.m., e.t., Monday through Friday, except Federal holidays.

SUPPLEMENTARY INFORMATION:**Electronic Access and Filing**

This document, the notice of proposed amendment (NPA), and all comments received may be viewed online through the Federal eRulemaking portal at: <http://www.regulations.gov>. Electronic submission and retrieval help and guidelines are available on the Web site. It is available 24 hours each day, 366 days this year. Please follow the instructions. An electronic copy of this document may also be downloaded from the Office of the Federal Register's home page at: <http://www.archives.gov/federal-register> and the Government

Printing Office's Web page at: <http://www.gpo.gov/fdsys>.

Executive Summary*I. Purpose of the Regulatory Action*

The FHWA has the authority to prescribe standards for traffic control devices on all roads open to public travel pursuant to 23 U.S.C. 109(d), 114(a), 217, 315, and 402(a). In the 2009 edition of the MUTCD, the FHWA made clarifying revisions to the 2003 edition of the MUTCD to remove conflicting language and provide consistency in the intended use of engineering judgment and engineering studies. After issuance of the Final Rule for the 2009 MUTCD, FHWA received correspondence from several entities indicating that the clarifying revisions had the effect of removing highway agencies' flexibility to address field conditions. This was not FHWA's intention. Thus, on August 2, 2011 the FHWA published a Notice of Proposed Amendment (NPA) proposing revisions to the MUTCD to address these concerns.

II. Summary of the Major Provisions of the Regulatory Action in Question

In consideration of the comments received in response to the NPA, this Final Rule restores certain language contained in the 2003 MUTCD edition. The restoration of such language will continue FHWA's current practice under Official Interpretation 1(09)–1 (I) which states that in limited, specific cases, deviation from a STANDARD is allowed at a location or other locations with the same conditions, provided that an agency or other official having jurisdiction fully documents the engineering reason for the deviation. The MUTCD, with these changes incorporated, is being designated as Revision 1 of the 2009 edition of the MUTCD.

III. Costs and Benefits

The changes in the MUTCD will provide additional clarification, guidance, and flexibility in the application of traffic control devices. The FHWA believes that the uniform application of traffic control devices will greatly improve the traffic operations efficiency and roadway safety. The standards, guidance, and support are also used to create uniformity and to enhance safety and mobility at little additional expense to public agencies or the motoring public. These changes are not anticipated to adversely affect, in any material way, any sector of the economy. In addition, these changes will not create a serious inconsistency with any other agency's

action or materially alter the budgetary impact of any entitlements, grants, user fees, or loan programs. Although FHWA did not quantify the costs, we believe they will be minimal. One benefit of this rule is reduced expenditures for locations with identical conditions. For example, when a deviation is found to be warranted and can be justified, these locations will not have to spend funds on repetitive or duplicative engineering studies. In addition, since the rule restores language from the 2003 edition of the MUTCD, agencies would not have to expend resources to modify their existing operating procedures.

Background

On August 2, 2011, at 76 FR 46213, the FHWA published an NPA proposing revisions to the MUTCD. Interested persons were invited to submit comments to the FHWA Docket Number FHWA–2010–0170. Based on the comments received and its own experience, the FHWA is issuing this final rule and is designating the MUTCD, with these changes incorporated, as Revision 1 of the 2009 edition of the MUTCD.

The text of Revision 1 of the 2009 edition of the MUTCD, with these final rule changes incorporated, is available for inspection and copying, as prescribed in 49 CFR part 7, at the FHWA Office of Transportation Operations (HOTO–1), 1200 New Jersey Avenue SE., Washington, DC 20590. Furthermore, the text of Revision 1 of the 2009 edition of the MUTCD, with these final rule changes incorporated, is available on the FHWA's MUTCD Web site at: <http://mutcd.fhwa.dot.gov>. The original 2009 edition of the MUTCD and the 2003 edition of the MUTCD with Revisions 1 and 2 incorporated are also available on this Web site. Revision 1 of the 2009 edition of the MUTCD supersedes all previous editions and revisions of the MUTCD.

Summary of Comments

The FHWA received, reviewed, and analyzed the 51 letters submitted to the docket, which contain more than 125 different comments on the proposed changes. The American Association of State Highway and Transportation Officials (AASHTO), the National Committee on Uniform Traffic Control Devices (NCUTCD), the American Public Works Association (APWA), the National Association of County Engineers (NACE), the American Traffic Safety Services Association (ATSSA), State departments of transportation (DOTs), city and county government agencies, other associations, transportation consultants, and

individual private citizens submitted comments.

The AASHTO generally supported FHWA's proposal to remove the last sentence in the definition of STANDARD in Section 1A.13; however, it expressed that the value of such a change would be minimized by the proposed language in Section 1A.09 regarding the use of engineering judgment and engineering studies. The AASHTO asserted that FHWA's proposed language in Section 1A.09 was insufficient because it did not include additional sentences from the 2003 edition of the MUTCD GUIDANCE statement that emphasized the importance of using engineering judgment in the placement of traffic control devices. The AASHTO also disagreed with the OPTION statement proposed for Section 1A.09 in the NPA, contending that it limited the application of engineering judgment or an engineering study to a specific site. The AASHTO submitted a second letter recommending a new sentence that would allow programmatic deviations from a STANDARD based on an engineering study. The NCUTCD, APWA, NACE, 23 State DOTs, 4 local agencies, and 1 transportation consultant submitted comments similar to AASHTO's first letter.

The ATSSA and the Association of American Railroads supported the NPA in its entirety and specifically disagreed with AASHTO's comments regarding Section 1A.09. Three transportation consultants asserted that the definition of STANDARD and the 2009 edition of the MUTCD's text on the application of engineering judgment and studies are appropriate and do not need to be revised. These comments, including those raised by AASHTO that are identified above, are discussed in more detail in the section-by-section discussions below for both 1A.13 and 1A.09.

Comments Outside the Scope of the Rulemaking

In addition to commenting on the proposed changes, AASHTO and four State DOTs suggested that the FHWA use this rulemaking process to address the issue of "substantial conformance" of State MUTCDs, as defined in the Code of Federal Regulations (CFR). Specifically, AASHTO suggested that FHWA issue interim final rules to revise 23 CFR 655.602 and 655.603 so that States could apply engineering judgment and studies to delete STANDARDS from their State MUTCDs and still have their State MUTCDs accepted by FHWA as being in substantial conformance with the

national MUTCD. The meaning of "substantial conformance" was considered and established through a final rule published in the **Federal Register** on December 14, 2006 at 74 FR 75111. Because the NPA for this rulemaking did not propose any changes to this meaning and did not solicit public comments about this topic, this issue is outside the scope of this rulemaking and will not be addressed in this final rule.

Three States also expressed concern with compliance dates, suggesting that compliance dates the States viewed as unessential be removed or delayed. One State also suggested that FHWA address systematic upgrading of traffic control devices in this rulemaking. Comments related to the issue of compliance dates listed in the MUTCD are currently being considered in response to an NPA published in the **Federal Register** on August 31, 2011 at 76 FR 54156. Because the NPA for this rulemaking did not propose any changes to the compliance dates or to the meaning of "systematic upgrading of traffic control devices" and did not solicit public comments about these topics, these issues are outside the scope of this rulemaking and will not be addressed in this final rule.

Discussion of Comments by Section

1. In the MUTCD Section 1A.13, Definitions of Headings, Words, and Phrases, the FHWA proposed in the NPA to delete the last sentence in the definition of the heading STANDARD. This sentence, which was added in the 2009 edition of the MUTCD, stated:

Standard statements shall not be modified or compromised based on engineering judgment or engineering study.

The majority of commenters, including AASHTO, NCUTCD, APWA, NACE, State DOTs, and local agencies, supported removing this sentence. Two States suggested adding language to the definition of STANDARD to help clarify that site-specific conditions may make it impossible or impractical for an agency to comply with a STANDARD. The FHWA believes that such a change is not necessary because restoration of certain GUIDANCE statements from the 2003 MUTCD will provide for deviation from a STANDARD in limited, specific cases at a location, or other locations with the same conditions, provided that an agency or other official having jurisdiction fully documents the engineering reason for the deviation. Therefore, the FHWA adopts the removal of this sentence from the definition of STANDARD in Section 1A.13, as proposed in the NPA.

The NCUTCD, APWA, and NACE also suggested that the definitions for "engineering judgment" and "engineering study" in Section 1A.13 should be restored to the text found in the 2003 edition of the MUTCD. Specifically, these commenters reasoned that because this rulemaking pertains to exercising engineering judgment and using engineering studies to make traffic control device decisions, it is appropriate to restore the definitions of these terms to the ones contained in the 2003 edition of the MUTCD. The FHWA did not propose any changes to the definitions of "engineering judgment" or "engineering study," which are contained within a STANDARD statement in Section 1A.13, and thus any changes to these definitions are outside the scope of this rulemaking. The FHWA might give consideration to proposing revisions to these definitions in conjunction with a future NPA for the next edition of the MUTCD.

2. In Section 1A.09, Engineering Study and Engineering Judgment, FHWA proposed in the NPA to add a GUIDANCE paragraph stating that the decision to use a particular device at a particular location should be made on the basis of either an engineering study or the application of engineering judgment. The FHWA proposed this change in order to reinstate one of the three GUIDANCE sentences in the 2003 edition of the MUTCD that had been removed in the 2009 edition of the MUTCD. The AASHTO, NCUTCD, APWA, NACE, and the majority of the State and local agencies supported FHWA's proposal, but felt that it was insufficient because it did not include restoration of the two other sentences from the 2003 edition of the MUTCD GUIDANCE statement. Those second and third sentences stated:

Thus, while this Manual provides Standards, Guidance, and Options for design and applications of traffic control devices, this Manual should not be considered a substitute for engineering judgment. Engineering judgment should be exercised in the selection and application of traffic control devices, as well as in the location and design of roads and streets that the devices complement.

Specifically, AASHTO stated that the exclusion of the second sentence from the 2003 edition of the MUTCD GUIDANCE statement, coupled with FHWA's proposal, would not adequately support the reinstatement of engineering judgment into the application of traffic control devices. The NCUTCD, NACE, and APWA suggested that only the second sentence from the 2003 edition of the GUIDANCE statement should be restored. Two State

DOTs agreed with the NPA as proposed. Three transportation consultants disagreed with the proposed GUIDANCE in the NPA, asserting that the application of engineering judgment and studies as described in the 2009 edition of the MUTCD is appropriate and does not need to be revised.

In a second letter to the docket, AASHTO also recommended adding a new, fourth sentence to the GUIDANCE that would state:

An engineering study is required for programmatic deviations from Standards contained within this Manual.

Such language effectively would allow agencies to deviate from a STANDARD on a programmatic basis, rather than based on impracticality at a specific site supported by engineering judgment or study. As noted in the NPA, it is not and has never been the intention of the FHWA to authorize a highway agency to adopt or implement broad policies or practices that deviate from a STANDARD on a blanket or programmatic basis jurisdictionwide, regionwide, on all highways of a particular class, or using similar criteria. Therefore, FHWA believes adding a fourth sentence of GUIDANCE as suggested by AASHTO's second letter is not appropriate.

In the NPA, FHWA proposed to add a new OPTION paragraph stating that when an engineering study or the application of engineering judgment determines that unusual site-specific conditions at a particular location make compliance with a STANDARD statement impossible or impractical, an agency may deviate from that STANDARD statement at that location. The AASHTO, NCUTCD, APWA, NACE, and 20 State DOTs disagreed and suggested that this language be removed because such an application would be overly restrictive and financially burdensome on agencies. Specifically, these commenters stated that such language would require jurisdictions to study each site individually, even where multiple locations with the same or similar conditions make a particular deviation necessary. Additionally, several State agencies indicated that the proposed OPTION statement did not reflect the intent of FHWA's Official Interpretation number 1(09)-1 (I),¹ dated October 1, 2010, which states that in limited, specific cases, deviation from a STANDARD is allowed at a location or other locations with the same conditions, provided that an agency or

other official having jurisdiction fully documents the engineering reason for the deviation. We would note that FHWA did not intend for the proposed OPTION language to trigger studies for each location with similar conditions. Nevertheless, FHWA has determined that the OPTION paragraph proposed in the NPA is not needed because the topic is adequately addressed by Official Interpretation 1(09)-1 (I), which is still in effect.

In consideration of the comments received and our determination that the OPTION language in the NPA is not needed, we have decided, instead, to restore the three 2003 MUTCD GUIDANCE sentences that were subsequently removed in the 2009 MUTCD edition. The inclusion of such language will continue our current practice under Official Interpretation 1(09)-1 (I) to allow deviations from a STANDARD only on the basis of either an engineering study or the application of engineering judgment. Thus, the GUIDANCE language in Section 1A.09 will now read as follows:

The decision to use a particular device at a particular location should be made on the basis of either an engineering study or the application of engineering judgment. Thus, while this Manual provides Standards, Guidance, and Options for design and applications of traffic control devices, this Manual should not be considered a substitute for engineering judgment. Engineering judgment should be exercised in the selection and application of traffic control devices, as well as in the location and design of roads and streets that the devices complement.

The FHWA will continue to consider matters raised by this rulemaking to inform future decisions regarding the MUTCD.

Rulemaking Analyses and Notices

Executive Order 12866 (Regulatory Planning and Review), Executive Order 13563 (Improving Regulation and Regulatory Review), and DOT Regulatory Policies and Procedures

The FHWA has determined that this action is a significant regulatory action within the meaning of Executive Order 12866 and within the meaning of U.S. Department of Transportation regulatory policies and procedures because of the significant public interest in the MUTCD. Additionally, this action complies with the principles of Executive Order 13563. The changes in the MUTCD will provide additional clarification, guidance, and flexibility in the application of traffic control devices. The FHWA believes that the uniform application of traffic control devices will greatly improve the traffic

operations efficiency and roadway safety. The standards, guidance, and support are also used to create uniformity and to enhance safety and mobility at little additional expense to public agencies or the motoring public. These changes are not anticipated to adversely affect, in any material way, any sector of the economy. In addition, these changes will not create a serious inconsistency with any other agency's action or materially alter the budgetary impact of any entitlements, grants, user fees, or loan programs. It is anticipated that the economic impact of this rulemaking will be minimal; therefore, a full regulatory evaluation is not required.

Regulatory Flexibility Act

In compliance with the Regulatory Flexibility Act (Pub. L. 96-354, 5 U.S.C. 601-612), the FHWA has evaluated the effects of this action on small entities, including small governments. The FHWA certifies that this action will not have a significant economic impact on a substantial number of small entities. This rule will provide clarification and additional flexibility.

Executive Order 13132 (Federalism)

This action has been analyzed in accordance with the principles and criteria contained in Executive Order 13132 dated August 4, 1999, and the FHWA has determined that this action will not have sufficient federalism implications to warrant the preparation of a federalism assessment. The FHWA has also determined that this rulemaking will not preempt any State law or State regulation or affect the States' ability to discharge traditional State governmental functions. The MUTCD is incorporated by reference in 23 CFR part 655, subpart F. These amendments are in keeping with the Secretary of Transportation's authority under 23 U.S.C. 109(d), 315, and 402(a) to promulgate uniform guidelines to promote the safe and efficient use of the highway. The overriding safety benefits of the uniformity prescribed by the MUTCD are shared by all of the State and local governments, and changes made by this rule are directed at enhancing safety. To the extent that these amendments may override any existing State requirements regarding traffic control devices, they do so in the interest of national uniformity.

Unfunded Mandates Reform Act of 1995

This rule does not impose unfunded mandates as defined by the Unfunded Mandates Reform Act of 1995 (Pub. L. 104-4, 109 Stat. 48, March 22, 1995). The changes provide additional

¹ This Official Interpretation of the MUTCD can be viewed at the following Web site: http://mutcd.fhwa.dot.gov/resources/interpretations/1_09_1.htm.

guidance, flexibility, and clarification and will not require an expenditure of funds. This action will not result in the expenditure by State, local, and tribal governments, in the aggregate, or by the private sector, of \$140.8 million or more in any 1 year (2 U.S.C. 1532).

Executive Order 13175 (Tribal Consultation)

The FHWA has analyzed this action under Executive Order 13175, dated November 6, 2000, and believes that it will not have substantial direct effects on one or more Indian tribes, will not impose substantial direct compliance costs on Indian tribal governments, and will not preempt tribal law. Therefore, a tribal summary impact statement is not required.

Executive Order 13211 (Energy Effects)

The FHWA has analyzed this final rule under Executive Order 13211, Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use. The FHWA has determined that this is not a significant energy action under that order because it is not likely to have a significant adverse effect on the supply, distribution, or use of energy. Therefore, a Statement of Energy Effects under Executive Order 13211 is not required.

Executive Order 12372 (Intergovernmental Review)

Catalog of Federal Domestic Assistance Program Number 20.205, Highway Planning and Construction. The regulations implementing Executive Order 12372 regarding intergovernmental consultation on Federal programs and activities apply to this program.

Paperwork Reduction Act

Under the Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. 3501, *et seq.*), Federal agencies must obtain approval from the Office of Management and Budget for each collection of information they conduct, sponsor, or require through regulations. The FHWA has determined that this action does not contain a collection of information requirement for the purposes of the PRA.

Executive Order 12988 (Civil Justice Reform)

This action meets applicable standards in sections 3(a) and 3(b)(2) of Executive Order 12988, Civil Justice Reform, to minimize litigation, to eliminate ambiguity, and to reduce burden.

Executive Order 13045 (Protection of Children)

The FHWA has analyzed this action under Executive Order 13045, Protection of Children from Environmental Health Risks and Safety Risks. This is not an economically significant action and does not concern an environmental risk to health or safety that might disproportionately affect children.

Executive Order 12630 (Taking of Private Property)

This action would not affect a taking of private property or otherwise have taking implications under Executive Order 12630, Governmental Actions and Interference with Constitutionally Protected Property Rights.

National Environmental Policy Act

The agency has analyzed this action for the purpose of the National Environmental Policy Act of 1969 (42 U.S.C. 4321 *et seq.*) and has determined that it will not have any effect on the quality of the environment and meets the criteria for the categorical exclusion at 23 CFR 771.117(c)(20).

Regulation Identification Number

A regulation identification number (RIN) is assigned to each regulatory action listed in the Unified Agenda of Federal Regulations. The Regulatory Information Service Center publishes the Unified Agenda in April and October of each year. The RIN contained in the heading of this document can be used to cross reference this action with the Unified Agenda.

List of Subjects in 23 CFR Part 655

Design standards, Grant programs—Transportation, Highways and roads, Incorporation by reference, Pavement Markings, Traffic regulations.

Issued on: May 9, 2012.

Victor M. Mendez,
Administrator.

In consideration of the foregoing, the FHWA is amending title 23, Code of Federal Regulations, part 655, subpart F as follows:

PART 655—TRAFFIC OPERATIONS

- 1. The authority citation for part 655 continues to read as follows:

Authority: 23 U.S.C. 101(a), 104, 109(d), 114(a), 217, 315 and 402(a); 23 CFR 1.32; and 49 CFR 1.48(b).

Subpart F—[Amended]

- 2. Revise § 655.601, to read as follows:

§ 655.601 Purpose.

To prescribe the policies and procedures of the Federal Highway Administration (FHWA) to obtain basic uniformity of traffic control devices on all streets and highways in accordance with the following references that are approved by the FHWA for application on Federal-aid projects:

- (a) MUTCD.
- (b) AASHTO Guide to Metric Conversion.
- (c) AASHTO Traffic Engineering Metric Conversion Factors.
- (d) The standards required in this section are incorporated by reference into this section in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. To enforce any edition other than that specified in this section, the FHWA must publish notice of change in the **Federal Register** and the material must be available to the public. All approved material is available for inspection at the Federal Highway Administration, Office of Transportation Operations, 1200 New Jersey Avenue SE., Washington, DC 20590, (202) 366–8043 and is available from the sources listed below. It is also available for inspection at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA call (202) 741–6030, or go to <http://www.archives.gov/federal-register/cfr/index.html>.

[FHWA Docket No. FHWA–2010–0159]

RIN 2125–AF43

National Standards for Traffic Control Devices; the Manual on Uniform Traffic Control Devices for Streets and Highways; Revision

AGENCY: Federal Highway Administration (FHWA), Department of Transportation (DOT).

ACTION: Final rule.

SUMMARY: The MUTCD is incorporated in regulations, approved by the FHWA, and recognized as the national standard for traffic control devices used on all streets, highways, bikeways, and private roads open to public travel. The purpose of this final rule is to revise certain information relating to target compliance dates for traffic control devices. This final rule revises Table I–2 of the MUTCD by eliminating the compliance dates for 46 items (8 that had already expired and 38 that had future compliance dates) and extends and/or revises the dates for 4 items. The target compliance dates for 8 items that are deemed to be of critical safety importance will remain in effect. In addition, this final rule adds a new Option statement exempting existing historic street name signs within a locally identified historic district from the Standards and Guidance of Section 2D.43 regarding street sign color, letter size, and other design features, including retroreflectivity.

Consistent with Executive Order 13563, and in particular its emphasis on burden-reduction and on retrospective analysis of existing rules, the changes adopted are intended to reduce the costs and impacts of compliance dates on State and local highway agencies and to

streamline and simplify the information. The MUTCD, with these changes incorporated, is being designated as Revision 2 of the 2009 edition of the MUTCD.

DATES: *Effective Date:* This final rule is effective June 13, 2012. The incorporation by reference of the publication listed in this regulation is approved by the Director of the Office of the Federal Register as of June 13, 2012.

FOR FURTHER INFORMATION CONTACT: Mr. Chung Eng, Office of Transportation Operations, (202) 366–8043; or Mr. William Winne, Office of the Chief Counsel, (202) 366–1397, Federal Highway Administration, 1200 New Jersey Ave. SE., Washington, DC 20590. Office hours are from 8 a.m. to 4:30 p.m., E.T., Monday through Friday, except Federal holidays.

SUPPLEMENTARY INFORMATION:

Electronic Access and Filing

This document, the notice of proposed amendment (NPA), and all comments received may be viewed online through the Federal eRulemaking portal at: <http://www.regulations.gov>. Electronic submission and retrieval help and guidelines are available on the Web site. It is available 24 hours each day, 366 days this year. Please follow the instructions. An electronic copy of this document may also be downloaded from the Office of the Federal Register’s home page at: <http://archives.gov/federal-register> and the Government Printing Office’s Web page at: <http://www.gpo.gov/fdsys>.

Executive Summary

I. Purpose of the Regulatory Action

The purpose of this final rule is to revise certain information relating to target compliance dates for traffic control devices. The changes adopted are intended to reduce the impacts of compliance dates on State and local

highway agencies and streamline and simplify information contained in the MUTCD without reducing safety. The FHWA has the authority to prescribe standards for traffic control devices on all roads open to public travel pursuant to 23 U.S.C. 109(d), 114(a), 217, 315, and 402(a).

II. Summary of the Major Provisions of the Regulatory Action in Question

This final rule revises Table I–2 of the MUTCD by eliminating the compliance dates for 46 items (8 that had already expired and 38 that had future compliance dates) and extends and/or revises the dates for 4 items. The target compliance dates for 8 items that are deemed to be of critical safety importance will remain in effect. In addition, this final rule adds a new Option statement exempting existing historic street name signs within a locally identified historic district from the Standards and Guidance of Section 2D.43 regarding street sign color, letter size, and other design features, including retroreflectivity.

III. Costs and Benefits

The changes in this rulemaking will not require the expenditure of additional funds, but rather will provide State and local governments with the flexibility to allocate scarce financial resources based on local conditions and the useful service life of its traffic control devices. Since this rulemaking will benefit State and local governments by providing additional clarification, guidance and flexibility, it is anticipated that the economic impacts will be minimal and that costs and burdens will be reduced. Thus, a full regulatory evaluation was not conducted.

Revised Table I–2

This final rule amends Table I–2 of the 2009 MUTCD to read as follows:

2009 MUTCD Section No.(s)	2009 MUTCD Section title	Specific provision	Compliance date
2A.08	Maintaining Minimum Retroreflectivity.	Implementation and continued use of an assessment or management method that is designed to maintain regulatory and warning sign retroreflectivity at or above the established minimum levels (see Paragraph 2).	2 years from the effective date of this revision of the 2009 MUTCD*.
2A.19	Lateral Offset	Crashworthiness of sign supports on roads with posted speed limit of 50 mph or higher (see Paragraph 2).	January 17, 2013 (date established in the 2000 MUTCD).
2B.40	ONE WAY Signs (R6–1, R6–2).	New requirements in the 2009 MUTCD for the number and locations of ONE WAY signs (see Paragraphs 4, 9, and 10).	December 31, 2019.
2C.06 through 2C.14.	Horizontal Alignment Warning Signs.	Revised requirements in the 2009 MUTCD regarding the use of various horizontal alignment signs (see Table 2C–5).	December 31, 2019.

2009 MUTCD Section No.(s)	2009 MUTCD Section title	Specific provision	Compliance date
2E.31, 2E.33, and 2E.36.	Plaques for Left-Hand Exits.	New requirement in the 2009 MUTCD to use E1–5aP and E1–5bP plaques for left-hand exits.	December 31, 2014.
4D.26	Yellow Change and Red Clearance Intervals.	New requirement in the 2009 MUTCD that durations of yellow change and red clearance intervals shall be determined using engineering practices (see Paragraphs 3 and 6).	5 years from the effective date of this revision of the 2009 MUTCD, or when timing adjustments are made to the individual intersection and/or corridor, whichever occurs first.
4E.06	Pedestrian Intervals and Signal Phases.	New requirement in the 2009 MUTCD that the pedestrian change interval shall not extend into the red clearance interval and shall be followed by a buffer interval of at least 3 seconds (see Paragraph 4).	5 years from the effective date of this revision of the 2009 MUTCD, or when timing adjustments are made to the individual intersection and/or corridor, whichever occurs first.
6D.03 **	Worker Safety Considerations.	New requirement in the 2009 MUTCD that all workers within the right-of-way shall wear high-visibility apparel (see Paragraphs 4, 6, and 7).	December 31, 2011.
6E.02 **	High-Visibility Safety Apparel.	New requirement in the 2009 MUTCD that all flaggers within the right-of-way shall wear high-visibility apparel.	December 31, 2011.
7D.04 **	Uniform of Adult Crossing Guards.	New requirement in the 2009 MUTCD for high-visibility apparel for adult crossing guards.	December 31, 2011.
8B.03, 8B.04	Grade Crossing (Crossbuck) Signs and Supports.	Retroreflective strip on Crossbuck sign and support (see Paragraph 7 in Section 8B.03 and Paragraphs 15 and 18 in Section 8B.04).	December 31, 2019.
8B.04	Crossbuck Assemblies with YIELD or STOP Signs at Passive Grade Crossings.	New requirement in the 2009 MUTCD for the use of STOP or YIELD signs with Crossbuck signs at passive grade crossings.	December 31, 2019.

* Types of signs other than regulatory or warning are to be added to an agency's management or assessment method as resources allow.

** MUTCD requirement is a result of a legislative mandate.

Note: All compliance dates that were previously published in Table I–2 of the 2009 MUTCD and that do not appear in this revised table have been eliminated.

Background

One of the purposes of the MUTCD is to provide for the consistent and uniform application of traffic control devices on streets and highways open to public travel. These traffic control devices are designed to promote highway safety and efficiency. As technology evolves and surroundings change, new provisions for traffic control devices and their application may be proposed. When new provisions are adopted in a new edition or revision of the MUTCD, any new or reconstructed traffic control devices installed after adoption are required to be in compliance with the new provisions. Existing devices already in use that do not comply with the new MUTCD provisions are expected to be upgraded by highway agencies over time to meet the new provisions, unless the FHWA establishes a target compliance date for upgrading such devices. If such a target date has been established by the FHWA through the Federal rulemaking process, agencies are to upgrade existing noncompliant devices on or before the target compliance date. Due to the current economic climate, State and local agencies have expressed concern about the potential costs associated with replacing noncompliant traffic control

devices within the target compliance dates previously adopted in the MUTCD. In response to those concerns, the FHWA issued a Request for Comments in the **Federal Register**¹ seeking public input on traffic control device compliance dates.

After reviewing and considering the nearly 600 letters submitted by State and local government highway agencies, national associations, traffic industry representatives, traffic engineering consultants, and private citizens, on August 31, 2011, the FHWA published a Notice of Proposed Amendments (NPA), proposing revisions to the MUTCD at 76 FR 54156. The NPA proposed to revise Table I–2 of the 2009 edition of the MUTCD to eliminate the compliance dates for 46 items (8 that have already expired and 38 that have future compliance dates) and to extend and/or revise the dates for 4 items. In addition, the NPA proposed to retain the target compliance dates for eight items that were deemed to be of critical safety importance. Interested persons were invited to submit comments to FHWA Docket No. FHWA–2010–0159. Based on the comments received and its own experience, the FHWA is issuing this final rule and is designating the MUTCD, with these changes

¹ 75 FR 74128, November 30, 2010.

incorporated, as Revision 2 of the 2009 edition of the MUTCD.

The text of Revision 2 of the 2009 edition of the MUTCD, with these final rule changes incorporated, is available for inspection and copying, as prescribed in 49 CFR part 7, at the FHWA Office of Transportation Operations (HOTO–1), 1200 New Jersey Avenue SE., Washington, DC 20590. Furthermore, the text of the 2009 edition of the MUTCD, with these final rule changes and the changes of Revision 1 also incorporated, is available on the FHWA's MUTCD Web site at: <http://mutcd.fhwa.dot.gov>. The 2009 edition with Revisions 1 and 2 incorporated supersedes all previous editions and revisions of the MUTCD.

Summary of Comments

The FHWA received, reviewed, and analyzed 158 letters submitted to the docket, which contain nearly 240 different comments on the proposed changes. The American Association of State Highway and Transportation Officials (AASHTO), the National Committee on Uniform Traffic Control Devices (NCUTCD), the American Public Works Association (APWA), the National Association of County Engineers (NACE), the American Traffic Safety Services Association (ATSSA), American Road and Transportation

Builders Association (ARTBA), State departments of transportation (DOTs), city and county government agencies, other associations, transportation consultants, and individual private citizens submitted comments. The majority of the comments were fully or partially supportive of the NPA proposal, agreeing with the general intent. The AASHTO agreed with the NPA, except for two specific compliance dates that were retained in the NPA (see below for additional details). In addition to commenting on the compliance date proposal, several local jurisdictions and individuals submitted comments regarding existing provisions in Section 2D.43 of the MUTCD that affect "historic" street name signs in their communities. A summary of the comments received and the changes in the MUTCD adopted in this final rule are included in the following section.

Discussion of Comments on Table I-2 and Adopted Revisions

As noted above, most the comments were fully or partially supportive of the NPA proposal, and agreed with the general intent of the NPA. Many commenters had previously taken the opportunity to comment on the November 30, 2010, request for comments on traffic control compliance dates published at 75 FR 74128. As a result, the proposals in the NPA reflected many of the commenters' concerns and opinions. The following discussion addresses the significant issues raised by comments in opposition to elements of the NPA published on August 31, 2011 at 76 FR 54156.

1. In the NPA, the FHWA proposed to eliminate 46 of the existing compliance dates (not including the two associated with sign retroreflectivity). Six citizens and one association of local governments in Minnesota opposed these 46 eliminations, on the basis of reduced uniformity and safety of traffic control devices. The Maryland State Highway Administration noted that the NPA preamble stated that FHWA proposed to "eliminate" the dates that have already expired for eight items in Table I-2, but the note at the bottom of the table stated that these dates were "deleted" from the table. The eight specific compliance dates that have expired were intended to be legally eliminated (rather than just removed from the table). To clarify this issue, the FHWA revises the note at the bottom of the table in the final rule to read, "All compliance dates that were originally published in Table I-2 of the 2009 MUTCD that do not appear in this revised table have been eliminated."

The FHWA adopts the elimination of the compliance dates in Table I-2, as proposed in the NPA, for Sections 2B.03, 2B.09, 2B.10, 2B.11, 2B.13, 2B.26, 2B.55, 2C.04, 2C.13, 2C.20, 2C.30, 2C.38, 2C.40, 2C.41, 2C.42, 2C.46, 2C.49, 2C.50, 2C.61, 2C.63, 2D.43 (two provisions), 2D.44, 2D.45, 2G.01 through 2G.07, 2G.11 through 2G.15, 2H.05 and 2H.06, 2I.09, 2I.10, 2J.05, 2N.03, 3B.04 and 3B.05, 3B.18, 4D.01, 4D.31, 4E.07, 5C.05, 7B.11, 7B.12, 7B.16, 8B.19 and 8C.02 through 8C.05, 8C.09, 8C.12, and 9B.18.

The elimination of a compliance date for a given Standard contained in the MUTCD does not eliminate the regulatory requirement to comply with that Standard. The Standard itself remains in the MUTCD and applies to any new installations, but the compliance date for replacing noncompliant devices that exist in the field is eliminated. To further clarify, any new installation of an existing noncompliant device (such as moving a noncompliant device to another location) would also have to comply with the Standard upon installation.

2. The FHWA proposed to extend the compliance date by approximately 2 years for the provision in Section 2A.08 that requires agencies to implement an assessment or management method designed to maintain sign retroreflectivity at or above the established minimum levels. As part of this proposal, the FHWA proposed to limit this particular compliance date to apply only to regulatory and warning signs. This compliance date does not require replacement of any signs by a particular date. Rather, it requires highway agencies to implement an assessment or management method for maintaining sign retroreflectivity, in accordance with section 406 of the Department of Transportation and Related Agencies Appropriations Act, 1993 (Pub. L. 102-388; October 6, 1992), by the compliance date. Safety advocacy organizations, the ARTBA, one State DOT, and some industry representatives generally disagreed with the proposal. The ATSSA and some State DOTs agreed with the extension for implementing an assessment/management method, but requested that guide signs not be excluded. However, many agencies stated that including guide signs in the assessment method would limit funds that could be used for other projects. The FHWA disagrees with including guide signs at this time because regulatory and warning signs constitute the highest priority for assessing retroreflectivity of existing signs. The FHWA, therefore, adopts the revisions as proposed in the final rule.

The additional cost of including guide signs would increase the economic burden on agencies, whose funds are limited due to the current economic climate. The revisions to the compliance date and its applicability will provide relief and enable agencies to determine when their resources will allow them to add signs, other than regulatory and warning signs, to their assessment or management method. Several commenters noted the confusion and potential for misinterpretation introduced by limiting the compliance date to regulatory and warning signs. The FHWA reiterates that the language in Section 2A.08 still requires agencies to establish a method for all types of signs, but understands that limiting the compliance date to regulatory and warning signs could lead some agencies to mistakenly think that guide signs would never be required to be included in an agency's method. In addition, because the MUTCD requirement is for a method rather than a device, it is unclear how agencies would interpret the application of "systematic upgrading" (applicable to MUTCD requirements that have no specific compliance date) in the case of adding guide signs to the agency's management or assessment method. The FHWA adds a footnote to Table I-2 to clarify that other types of signs are to be added to an agency's management or assessment method as resources allow. The FHWA believes that adding this footnote in the final rule, rather than being silent on the issue, will provide clarity. The FHWA adopts the extension of the compliance date from January 22, 2012, to 2 years after this final rule and adds a footnote as discussed above.

In addition, the FHWA proposed in the NPA to eliminate the compliance dates for replacement of signs found not to meet the minimum retroreflectivity standards. The ATSSA, the ARTBA, other safety advocates, industry representatives, some States and cities, and several citizens disagreed with eliminating the January 22, 2015, and January 22, 2018, compliance dates and suggested that the dates instead be extended to 2018 and 2021, respectively. Even without a specific date, agencies will still need to replace any sign they identify as not meeting the established minimum retroreflectivity levels. Their schedules replacing the signs, however, would be based on resources and relative priorities, rather than specific compliance dates. As a result, the FHWA eliminates these compliance dates in the final rule.

3. The FHWA proposed to extend the compliance dates for signal timing adjustments associated with vehicular

yellow and red clearance intervals in Section 4D.26 and pedestrian clearance intervals in Section 4E.06 from December 31, 2014, to 5 years after this final rule. The National Association of City Transportation Officials requested a further extension to 10 years after the final rule and Pennsylvania DOT suggested eliminating this date instead of extending it. The FHWA disagrees with extending the compliance date even further into the future or eliminating it, as the extension that was proposed in the NPA achieves a reasonable balance between the need for these critical safety retiming efforts and resource constraints. As mentioned in the NPA, the original compliance date of December 31, 2014 published for the 2009 edition of the MUTCD was based on what FHWA believed to be the typical signal retiming frequency of about 5 years. This new proposed compliance date provides agencies with more than 2 additional years to implement the new requirements of Sections 4D.26 and 4E.06 at any locations that have not already been made compliant under a previous intersection or corridor retiming. Thus, the FHWA believes that it is reasonable for agencies to retime those signals by 2017 that have not already been made compliant under a previous intersection or corridor retiming. The FHWA adopts the extension of the compliance dates for Sections 4D.26 and 4E.06 to 5 years after this final rule, or when timing adjustments are made to the individual intersections and/or corridor, whichever occurs first, as proposed in the NPA.

4. In the NPA, the FHWA proposed to revise and extend the compliance dates in Sections 8B.03 and 8B.04 related to requiring retroreflective strips on the back of Crossbuck signs and on the front and back of supports for Crossbuck signs at passive railroad grade crossings (those crossings that do not have gates and/or flashing lights activated upon approach of a train). As discussed in the NPA, the FHWA proposed to extend this compliance date to December 31,

2019, which would coincide with the date for adding YIELD or STOP signs with Crossbuck signs at passive grade crossings so that railroad companies and highway agencies can avoid unnecessary expense and achieve greater economies of sending sign crews to crossings only once rather than twice. The FHWA also proposed to extend the compliance date to clarify that the requirements for retroreflective strips are in Section 8B.04 as well as Section 8B.03 and to clarify that the compliance date was also intended to apply to the retroreflective strip on the backs of the Crossbuck signs. Two State DOTs and one consultant opposed this extension, suggesting instead that the dates be eliminated. Two commenters questioned the effectiveness of the devices but did not provide supporting evidence. As a result, the FHWA could not evaluate the commenters' effectiveness concerns. As to the suggestion of eliminating the compliance date entirely, the FHWA disagrees with those commenters because the extension proposed in the NPA provides an additional 9 years beyond the original 10-year compliance period established for this requirement in the 2000 edition of the MUTCD, while achieving the practical benefit of allowing agencies and companies to apply the retroreflective strips at the same time that they add YIELD or STOP signs at those same crossings. The FHWA adopts the revision and extension of this compliance date to December 31, 2019, as proposed in the NPA.

5. The FHWA proposed in the NPA to retain the existing target compliance dates for eight items that it deemed to be of critical safety importance, based on existing evidence, FHWA's subject matter expertise, and FHWA's experience in traffic control device matters. As stated in the NPA, final rules establishing compliance dates for each of the eight items clearly identified the safety justification for the compliance dates established. As a

general comment, the NCUTCD, the NACE, three State DOTs, two cities, and two State associations of engineers requested that all retained compliance dates be justified by a benefit/cost analysis in accordance with Executive Order 13563. The FHWA disagrees that such an analysis is necessary because the compliance dates are already in the MUTCD and were put in place prior to the issuance of the Executive Order. This rulemaking is not establishing new, more burdensome dates for these items and is actually relieving burdens associated with many existing compliance dates. The following paragraphs describe the concerns that commenters expressed specifically related to the target compliance dates retained by the FHWA.

The FHWA proposed to retain the January 17, 2013, target compliance date for provisions in Section 2A.19 requiring crashworthiness of existing sign supports on roads with posted speed limits of 50 miles per hour (mph) or higher. This compliance date was established in the 2003 edition of the MUTCD. The AASHTO, the NCUTCD, the NACE, four State DOTs, a city, and a state association of engineers requested extension of the January 17, 2013, compliance date to 2019, or the end of the useful life of the sign supports (with no specific compliance date), rather than retaining the existing compliance date. The commenters did not provide supporting evidence for their position. The FHWA disagrees with eliminating or extending the compliance date because eliminating fixed-object hazards on high-speed roads remains a critical safety need due to the potential for death or severe injury that can result from high-speed, run-off-the-road crashes when non-crashworthy sign supports are struck. The following data on fatal crashes on roads with speed limits of 50 mph or higher, where a sign support was the "most harmful event," was obtained from the Fatality Analysis Reporting System (FARS).²

Most harmful event	Year				
	2005	2006	2007	2008	2009
Highway Sign Post	47	56	54	71	53
Overhead Sign Support	9	9	12	17	12
Total Fatalities	56	65	66	88	65

During the 5-year period from 2005 to 2009, on average each year, 68 fatalities occurred that can be attributed to

collisions with sign supports. The most recent year where full data is available is 2009. The data does not differentiate

between crashworthy and non-crashworthy supports. However, based on this data, if the compliance date was

² <http://www.nhtsa.gov/FARS>.

extended by 6 years, about 400 potential fatalities might occur during that time. Collisions with sign supports are the cause of about 15 percent of the total fatalities involving poles of any sort. Nevertheless, they represent a significant problem on high-speed roads. To address this problem, in late 2000, the MUTCD addressed this issue by adding a requirement for a 10-year compliance date (2013), which was formally adopted in 2003. By 2013, agencies will have had 12 years to comply. The FHWA adopts the retention of the existing January 17, 2013, compliance date for this item, as proposed in the NPA.

For provisions in Section 2B.40 that require agencies to install additional ONE WAY signs at certain types of intersections, the FHWA proposed retaining the target compliance date of December 31, 2019, as established in the 2009 edition of the MUTCD. Two State DOTs and a county disagreed with retaining the existing compliance date and asked that the date be eliminated instead. The FHWA adopts the retention of the existing compliance date for this item, as proposed in the NPA, because of the safety issues associated with wrong-way travel on divided highways (the subject of a current National Transportation Safety Board (NTSB) investigation), research on the needs of older drivers, and the significant safety benefits to road users that the addition of such signs may provide.³

The FHWA proposed in the NPA to retain the December 31, 2019, target compliance date for the provisions in Sections 2C.06 through 2C.14 that require the use of various horizontal alignment warning signs and determinations of advisory speed values, adopted in the 2009 edition of the MUTCD. The AASHTO, the NCUTCD, the NACE, eight State DOTs, one city, a State association of engineers, and a consultant requested postponing the existing compliance date until National Cooperative Highway Research Program (NCHRP) Project 03-106 ("Traffic Control Device Guidelines for Curves") confirms or disproves the costs and benefits of these warning signs, rather than retaining the date. The FHWA disagrees with extending the date because the NCHRP research is due to be completed by the end of 2015, which is 4 years before the compliance date. Four years allows sufficient time for revision of the 2019 date, if

³ "Guidelines and Recommendations to Accommodate Older Drivers and Pedestrians," FHWA Report No. FHWA-RD-01-051, May 2001, can be viewed at the following Internet Web site: <http://www.tfhrc.gov/humanfac/01105/cover.htm>. Recommendations 1.E(4), I.K(2), and I.K(3).

necessary. As stated in the NPA, the FHWA established the 10-year compliance date due to the safety issues associated with run-off-the-road crashes at horizontal curves and the disproportionate number of fatalities at horizontal curves on the Nation's highways. The FHWA adopts the retention of the existing compliance date for this item, as proposed in the NPA.

One State DOT disagreed with the FHWA's proposal in the NPA to retain the December 31, 2014, compliance date associated with requiring the use of LEFT EXIT plaques on guide signs for left exits established in Sections 2E.31, 2E.33, and 2E.36 of the 2009 edition of the MUTCD. The State DOT suggested eliminating, rather than retaining, the compliance date. The FHWA disagrees, because the 5-year target compliance date was established to address a recommendation of the NTSB arising from a significant safety concern with left-hand exits. The NTSB made a specific recommendation that the implementation of the LEFT plaque at left-hand exits be accelerated with a 5-year compliance date due to the fact that left-hand exits, though relatively rare, continue to violate driver expectancy at freeway and expressway locations. The lack of clear notice of a left-hand exit was cited as a contributing factor in a 2007 fatal crash of a motorcoach that inadvertently departed the freeway lanes at a left-hand exit. The FHWA adopts the retention of the December 31, 2014, compliance date in the final rule. As stated in the NPA, the installation of these plaques generally does not require replacement of the existing sign or sign support and this change affects relatively few existing locations throughout the country.

As proposed in the NPA, the FHWA adopts the retention of the existing December 31, 2011, target compliance date associated with the requirements in Sections 6D.03, 6E.02, and 7D.04 that all workers, including flaggers and school crossing guards must wear high-visibility apparel within the right-of-way of all highways, not just Federal-aid highways. Although a consultant suggested that the compliance date for high-visibility apparel should be eliminated because the compliance date will have expired by the time the final rule becomes effective, the FHWA retains the existing compliance date. Due to safety concerns and minimal costs, the FHWA does not believe agencies that have not yet complied should be relieved from compliance at the earliest possible time.

Finally, as proposed in the NPA, the FHWA adopts the retention of the

existing December 31, 2019, target compliance date for the provisions in Section 8B.04 that require the use of either a YIELD or STOP sign with the Crossbuck sign at all passive grade crossings. Two State DOTs and a consultant disagreed with retaining the existing compliance date, suggesting that the date be eliminated. One of these commenters stated that this signing was only minimally effective and that compliance by the existing date was too costly but did not provide any evidence for either of these statements. The FHWA disagrees, because the 10-year compliance period provides adequate time to install these signs and because research has found the signs are needed to improve grade crossing safety.⁴

Discussion of Comments on Section 2D.43 and Adopted Revisions

Comments on the provisions of Section 2D.43 regarding Street Name signs were submitted to the docket by officials and citizens of the Township of Lower Merion, Pennsylvania, the Town of Brookline, Massachusetts, citizens of Saugerties and Forest Hills, New York, and the organization Historic New England. The comments stated that the communities have "historic" Street Name signs that do not meet the Standards and Guidance of Section 2D.43 regarding color, letter size, and other design features, including retroreflectivity. These communities asked for an exemption from the MUTCD so that they can retain their historic Street Name signs without fear of noncompliance with the MUTCD. These docket comments are similar to other concerns raised previously to the FHWA by two other communities (Fox Point, Wisconsin, and Waverly, Pennsylvania). The FHWA understands the desire of some communities to retain truly historic Street Name signs that are a key component of maintaining the historic character and environment of a particular district.

The FHWA agrees to provide flexibility for communities with historic Street Name signs that do not meet the provisions of the MUTCD, where the community deems the historic Street Name signs to meet the need for effective navigational information to road users. However, the FHWA believes that such flexibility is appropriate only in specific circumstances and lower risk situations. The Code of Federal Regulations, in 36 CFR part 60, governs the listing on the

⁴ See NCHRP Report 470: Traffic-Control Devices for Passive Railroad-Highway Grade Crossings, available at http://onlinepubs.trb.org/onlinepubs/nchrp/nchrp_rpt_470-a.pdf.

National Register of Historic Places (NRHP) of historic districts and structures such as Street Name signs. Specifically, 36 CFR 60.4 provides criteria for evaluating a district to be identified as a historic district and for evaluating a system of structures, such as Street Name signs, to be identified as historic structures.

Therefore, the FHWA adds a new OPTION paragraph at the end of Section 2D.43 stating, "On lower speed roadways, historic street name signs within locally identified historic districts that are consistent with the criteria contained in 36 CFR 60.4 for such structures and districts may be used without complying with the provisions of Paragraphs 3, 4, 6, 9, 12 through 14, and 18 through 20 of this section."

The FHWA believes that the vast majority of what is expected to be a fairly small number of historic Street Name signs meeting the criteria will be on local roads with speed limits of 25 mph or less. If a community decides to use the new OPTION to retain existing historic Street Name signs within a historic district, the FHWA believes it is important for the community to ensure that the historic Street Name signs provide at least some degree of utility as navigational devices for road users. External illumination of the Street Name signs should be considered for this purpose. It is also important to note that the OPTION applies only to historic Street Name signs in historic districts meeting the eligibility criteria of 36 CFR 60.4 and does not apply to other types of traffic signs or devices, nor to locations outside of historic districts.

Rulemaking Analyses and Notices

Executive Order 12866 (Regulatory Planning and Review), Executive Order 13563 (Improving Regulation and Regulatory Review), and DOT Regulatory Policies and Procedures

The FHWA has determined that this action constitutes a significant regulatory action within the meaning of Executive Order 12866 and within the meaning of DOT regulatory policies and procedures due to the significant public interest in issues surrounding the MUTCD. This action complies with Executive Orders 12866 and 13563 to improve regulation. In particular, this action is consistent with, and can be seen as directly responsive to, the requirements of Executive Order 13563, and in particular its requirement for retrospective analysis of existing rules (section 6), with an emphasis on streamlining its regulations. This approach is also consistent with

Presidential Memorandum, Administrative Flexibility, which calls for reducing burdens and promoting flexibility for State and local governments.

The changes in the MUTCD will reduce burdens on State and local government in the application of traffic control devices. They will provide additional clarification, guidance, and flexibility to such governments. The uniform application of traffic control devices will greatly improve roadway safety and traffic operations efficiency. The standards, guidance, options, and support are also used to create uniformity and to enhance safety and mobility. The changes in this rulemaking will not require the expenditure of additional funds, but rather will provide State and local governments with the flexibility to allocate scarce financial resources based on local conditions and the useful service life of its traffic control devices. It is anticipated that the economic impact of this rulemaking will be minimal and indeed costs and burdens will be reduced, not increased; therefore, a full regulatory evaluation is not required.

As noted, this action streamlines existing significant regulation to reduce burden and promote the flexibilities of State and local governments under Executive Order 13563. In response to concerns about the potential impact of previously adopted MUTCD compliance dates on State and local governments in the current economic climate, the FHWA published a Request for Comments on traffic control device compliance dates. The FHWA asked for responses to a series of seven questions about compliance dates, their benefits and potential economic impacts, especially economic hardships to State and local governments that might result from specific target compliance dates for upgrading certain non-compliant existing devices. The responses received from that notice were considered in the development of this final rule. The FHWA anticipates that this rulemaking will reduce the impacts of compliance dates on State and local highway agencies and will streamline and simplify information contained in the MUTCD without reducing safety. The FHWA has retained compliance dates where it is of critical safety importance.

Regulatory Flexibility Act

In compliance with the Regulatory Flexibility Act (Pub. L. 96-354, 5 U.S.C. 601-612), the FHWA has evaluated the effects these changes on small entities. I certify that this action will not have a significant economic impact on a

substantial number of small entities because this rule will reduce burdens and provide clarification and additional flexibility, and will not require an expenditure of funds.

Executive Order 13132 (Federalism)

This action has been analyzed in accordance with the principles and criteria contained in Executive Order 13132 dated August 4, 1999. This action will increase flexibility for State and local governments. The FHWA has determined that this action would not have sufficient federalism implications to warrant the preparation of a federalism assessment. The FHWA has also determined that this rulemaking will not preempt any State law or State regulation or affect the States' ability to discharge traditional State governmental functions. The MUTCD is incorporated by reference in 23 CFR part 655, subpart F. These proposed amendments are in keeping with the Secretary of Transportation's authority under 23 U.S.C. 109(d), 315, and 402(a) to promulgate uniform guidelines to promote the safe and efficient use of the highway. The overriding safety benefits of the uniformity prescribed by the MUTCD are shared by all of the State and local governments. In general, this rule will increase flexibility for States and local governments. To the extent that these amendments override any existing State requirements regarding traffic control devices, they do so in the interest of national uniformity.

Unfunded Mandates Reform Act of 1995

This rule will not impose unfunded mandates as defined by the Unfunded Mandates Reform Act of 1995 (Pub. L. 104-4, 109 Stat. 48, March 22, 1995). On the contrary, the rule provides additional guidance, flexibility, and clarification and would not require an expenditure of funds. This action will not result in the expenditure by State, local, and tribal governments, in the aggregate, or by the private sector, of \$140.8 million or more in any 1 year (2 U.S.C. 1532).

Executive Order 13175 (Tribal Consultation)

The FHWA has analyzed this action under Executive Order 13175, dated November 6, 2000, and believes that it will not have substantial direct effects on one or more Indian tribes, will not impose substantial direct compliance costs on Indian tribal governments, and will not preempt tribal law. Therefore, a tribal summary impact statement is not required.

Executive Order 13211 (Energy Effects)

The FHWA has analyzed this final rule under Executive Order 13211, Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use. The FHWA has determined that this is not a significant energy action under that order because it is not likely to have a significant adverse effect on the supply, distribution, or use of energy. Therefore, a Statement of Energy Effects under Executive Order 13211 is not required.

Executive Order 12372 (Intergovernmental Review)

Catalog of Federal Domestic Assistance Program Number 20.205, Highway Planning and Construction. The regulations implementing Executive Order 12372 regarding intergovernmental consultation on Federal programs and activities apply to this program.

Paperwork Reduction Act

Under the Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. 3501, *et seq.*), Federal agencies must obtain approval from the Office of Management and Budget for each collection of information they conduct, sponsor, or require through regulations. The FHWA has determined that this action does not contain a collection of information requirement for the purposes of the PRA.

Executive Order 12988 (Civil Justice Reform)

This action meets applicable standards in Sections 3(a) and 3(b)(2) of Executive Order 12988, Civil Justice Reform, to minimize litigation, to eliminate ambiguity, and to reduce burden.

Executive Order 13045 (Protection of Children)

The FHWA has analyzed this action under Executive Order 13045, Protection of Children from Environmental Health Risks and Safety Risks. This is not an economically significant action and does not concern an environmental risk to health or safety that might disproportionately affect children.

Executive Order 12630 (Taking of Private Property)

This action would not affect a taking of private property or otherwise have taking implications under Executive Order 12630, Governmental Actions and Interference with Constitutionally Protected Property Rights.

National Environmental Policy Act

The agency has analyzed this action for the purpose of the National Environmental Policy Act of 1969 (42 U.S.C. 4321 *et seq.*) and has determined that it will not have any effect on the quality of the environment and meets the criteria for the categorical exclusion at 23 CFR 771.117(c)(20).

Regulation Identification Number

A regulation identification number (RIN) is assigned to each regulatory action listed in the Unified Agenda of Federal Regulations. The Regulatory Information Service Center publishes the Unified Agenda in April and October of each year. The RIN contained in the heading of this document can be used to cross reference this action with the Unified Agenda.

List of Subjects in 23 CFR Part 655

Design standards, Grant programs—Transportation, Highways and roads, Incorporation by reference, Signs, Traffic regulations.

Issued on: May 9, 2012.

Victor M. Mendez,
Administrator.

In consideration of the foregoing, the FHWA is amending title 23, Code of Federal Regulations, part 655, subpart F as follows:

PART 655—TRAFFIC OPERATIONS

- 1. The authority citation for part 655 continues to read as follows:

Authority: 23 U.S.C. 101(a), 104, 109(d), 114(a), 217, 315 and 402(a); 23 CFR 1.32; and 49 CFR 1.48(b).

Subpart F—[Amended]

- 2. Revise § 655.601 to read as follows:

§ 655.601 Purpose.

To prescribe the policies and procedures of the Federal Highway

Administration (FHWA) to obtain basic uniformity of traffic control devices on all streets and highways in accordance with the following references that are approved by the FHWA for application on Federal-aid projects:

(a) MUTCD.

(b) AASHTO Guide to Metric Conversion.

(c) AASHTO Traffic Engineering Metric Conversion Factors.

(d) The standards required in this section are incorporated by reference into this section in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. To enforce any edition other than that specified in this section, the FHWA must publish notice of change in the **Federal Register** and the material must be available to the public. All approved material is available for inspection at the Federal Highway Administration, Office of Transportation Operations, 1200 New Jersey Avenue SE., Washington, DC 20590, (202) 366-8043 and is available from the sources listed below. It is also available for inspection at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA call (202) 741-6030, or go to <http://www.archives.gov/federal-register/cfr/index.html>.

(1) AASHTO, American Association of State Highway and Transportation Officials, Suite 249, 444 North Capitol Street NW., Washington, DC 20001

BILLING CODE 4910-22-P

Illinois Department of Transportation

2300 South Dirksen Parkway / Springfield, Illinois / 62764

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2012-06
SUBJECT: CONSULTANT AGREEMENTS
ISSUED DATE: November 15, 2012
EFFECTIVE DATE: February 1, 2013

This memorandum combines Section 5-5 and 5-6 of the BLRS Manual dated January 2012 and July 2006.

On November 30, 2005, Public Law 109-115, HR 3058 amended 23 CFR 112(b)(2) relating to the award of consultant services when using federal-aid funding. This amendment eliminated existing provisions of the law allowing alternative State procedures to select and procure consultant services on other than small purchases less than \$150,000. The Code of Federal Regulations (CFR) has not yet been amended based on this public law. The Illinois Division of the Federal Highway Administration (FHWA) made the Central Bureau of Local Roads & Streets (BLRS) aware of this issue on February 15, 2012 and requested that Section 5-6 of the BLRS Manual be updated accordingly.

The FHWA has developed the *Federal-Aid Essentials for Local Public Agencies* website that provides a series of short videos. Please go to www.fhwa.dot.gov/federal-aidessentials/catmod.cfm?id=14 to watch the video and review documents concerning Consultant Services Overview.

Also, starting in 2012, the Central BLRS, with cooperation from American Council of Engineering Companies - Illinois (ACEC-IL), began developing a single consultant agreement form for preliminary engineering and construction engineering using Federal-aid (FA), state, Motor Fuel Tax (MFT), or Township Bridge Program (TBP) funding. Form BLR 05510 will be revised to incorporate Forms BLR 05511, BLR 05512, BLR 05610, and BLR 5611. The following forms will be renumbered: Form BLR 05612 will be BLR 05530; Form BLR 05613 will be BLR 05535; and Form BLR 05620 will be BLR 05540.

BLRS Manual Sections 5-5 and 5-6 have been combined to a single section covering all engineering services agreements. Revision marks are not shown since the new Section 5-5 has been entirely revised and reorganized. The following describes major changes:

HARD COPIES UNCONTROLLED

PM2012-06
November 15, 2012

- Existing relationships with a professional design firm or a sole proprietorship may not be used to meet the Qualification Based Selection (QBS) requirement on any federal-aid funded engineering services contract that exceeds \$150,000 and is executed on or after February 1, 2013.
- Master Task Orders – these types of engineering services contracts will allow agencies to define a specific scope of work (i.e. Construction Supervision) that is not tied to a specific project. Task orders will be issued once the consultant is needed.
- Length of Services – the department has established 10 years as a reasonable maximum contract length including any extensions. The local public agency shall comply with any statutory or local ordinance imposing a shorter contract length.
- Conflict of Interests – a new section was developed to identify common conflict of interests that are not allowed. There may be other situations involving conflict of interest not contained in the manual.
- QBS Requirements – the manual has been revised to identify when QBS is required for each funding type.
- Lump Sum – the maximum dollar amount for using lump sum has been increased to \$20,000.
- Cost Plus Fixed Fee (CPFF) – the variables contained in this formula have been better defined.
- Direct Labor Multiplier (DLM) – this compensation formula is no longer allowed on federal-aid engineering services contracts.

All engineering services contracts executed on or after February 1, 2013 with FA, state, MFT, or TBP funding shall follow the revised policies established in Section 5-5. The department does not have oversight over contracts for engineering services funded entirely with local funds. However, it is recommended the QBS procedures contained in Section 5-5 be followed. The procurement method used for selection of engineering services will not impact funding for the construction of a project.

Contact the Local Policy & Technology Unit at DOT.LocalPolicy@illinois.gov with any questions.

U.S. Department of
Transportation
**Federal Highway
Administration**

MEMORANDUM

Subject: **INFORMATION:** Awarding Engineering and Design
Services Contracts Based on Brooks Act
Requirements

Date: December 12, 2005

From: /s/ Original signed by:
Dwight A. Horne
Director of Program Administration

Refer To: HIPA-20

To: Division Administrators

On November 30, 2005 the President signed into law the Transportation, Treasury, Housing and Urban Development, the Judiciary, the District of Columbia, and Independent Agencies Appropriations Act, 2006 (119 Stat. 2396; Public Law 109- 115, HR 3058 ("the FY 2006 Appropriations Act"). Section 174 of this Act, amends 23 U.S.C. §112(b)(2) relating to the award of engineering and design services (A&E) contracts that are directly related to a construction project and use Federal- aid highway funding. This amendment strikes existing provisions of law and requires that these contracts shall be awarded in the same manner as a contract for architectural and engineering services is negotiated under the "Brooks Act" provisions contained in chapter 11 of 40 U.S.C. (copy attached).

The Brooks Act requires agencies to promote open competition by advertising, ranking, selecting, and negotiating contracts based on demonstrated competence and qualifications for the type of engineering and design services being procured, and at a fair and reasonable price. Engineering and design related services are defined in 23 U.S.C. §112 (b)(2)(A) and 23 C.F.R. §172.3 to include program management, construction management, feasibility studies, preliminary engineering, design engineering, surveying, mapping, or other related services. These other services may include professional engineering related services, or incidental services that may be performed by a professional engineer, or individuals working under their direction, who may logically or justifiably perform these services.

The changes resulting from this amendment in Federal law are effective immediately. Effective with the enactment of the FY 2006 Act, §112(b)(2) of title 23 reads as follows:

"(2) Contracting for Engineering and Design Services.- -

- A. General Rule.- - Subject to paragraph (3), each contract for program management, construction management, feasibility studies, preliminary engineering, design, engineering, surveying, mapping or architectural related services with respect to a project subject to the provisions of subsection(a) of this section shall be awarded in the same manner as a contract for architectural and engineering services is negotiated under chapter 11 of title 40.
- B. Performance and Audits- Any contract or subcontract awarded in accordance with subparagraph (A), whether funded in whole or in part with Federal- aid highway funds, shall be performed and audited in compliance with the cost principles contained in the [Federal Acquisition Regulations of part 31 of title 48, Code of Federal Regulations](#)
- C. Indirect Cost Rates.- Instead of performing its own audits, a recipient of funds under a contract or subcontract awarded in accordance with subparagraph (A) shall accept indirect cost rates established in accordance with the Federal Acquisition Regulations for 1- year applicable accounting periods by a cognizant Federal or state government agency, if such rates are not currently under dispute.
- D. Application of Rates.- Once a firm's indirect cost rates are accepted under this paragraph, the recipient of the funds shall apply such rates for the purpose of contract estimation, negotiation, administration, reporting, and contract payment and shall not be limited by administrative or defacto ceilings of any kind.
- E. Prenotification; Confidentiality of Data.- A recipient of funds requesting or using the cost and rate data described in subparagraph (D) shall notify any affected firm before such request or use. Such data shall be confidential and shall not be accessible or provided, in whole or in part, to another firm or another government agency which is not part of the group of agencies sharing cost data under this paragraph, except for written permission of the audited firm. If prohibited by law, such cost and rate data, shall not be disclosed under any circumstances.

HARD COPIES UNCONTROLLED

F. Subparagraphs (B),(C),(D), and (E) herein shall not apply to the States of West Virginia or Minnesota.

As a result, State and local agencies are no longer entitled to procure engineering and design related service contracts (directly relating to construction) with Federal- aid highway funding using either "alternative" or "equivalent" Brooks Act procedures that were permitted prior to this amendment. State and local agencies will also be required to use the indirect cost rates established by a cognizant agency audit (23 C.F.R. §172.7) based on the cost principles contained in 48 C.F.R. Part 31 for the consultant, eliminating the placing of caps on indirect cost rates.

West Virginia and Minnesota are granted exceptions from the requirements relating to audits, indirect cost rates, pre- notification and confidentiality of data. However these States must also follow the Brooks Act requirements when procuring engineering and design services using Federal- aid highway funding.

We are currently reviewing the Federal Regulations (23 C.F.R. Part 172) pertaining to the administration of engineering and design related services contracts to determine the modifications that may be required to our existing regulations. We are also reviewing the implementing guidance that supports administering engineering and design related service contracts (<http://www.fhwa.dot.gov/programadmin/172qa.cfm>) to determine what specific changes need to be made to implement Brooks Act procurement policies.

The laws, policies, procedures, and practices that State and local agencies follow in procuring engineering and design related service using Federal- aid highway funding need to comply with the amendments to §112(b)(2) that are contained in Section 174 of the FY 2006 Appropriations Act. Pursuant to the Secretary's authority under 23 U.S.C §315 all requests for proposals (RFPs) issued on or after December 1, 2005 for engineering and design related service contracts directly related to a construction project using Federal- aid highway funding are required to comply with these new requirements. As a result, to ensure compliance with this amendment the Division offices need to review these requirements with their state DOT partners and advise the States of the necessity to revise, as appropriate all requests for proposals that conflict with the Brooks Act requirements that were not authorized on or prior to November 30, 2005.

In the interim, to facilitate the provision of immediate guidance on implementing this amendment to the State DOTs, the Brooks Act provisions and the FAR regulations implementing these requirements are attached. If you have any questions pertaining to the implementation of §174 of the FY 2006 Appropriations Act, please contact Mr. Jon Obenberger (jon.obenberger@fhwa.dot.gov) in my Office, or Mr. Steve Rochlis (steve.rochlis@fhwa.dot.gov) of the Chief Counsel's office.

Procurement, Management, and Administration of Engineering and Design Related Services - Questions and Answers

Last Updated March 2, 2012

[Update History](#) (.pdf, 31 kb)

Introduction

This web page provides guidance that supplements Federal laws and regulations relating to the procurement, management, and administration of engineering and design related services using Federal-aid highway program (FAHP) funding. As Federal laws and regulations governing these service contracts are complex, the purpose of the guidance is to clarify the statutory and regulatory requirements of the Federal Highway Administration (FHWA) associated with the use of engineering and design related consultant services.

Definitions

Unless indicated otherwise, the questions and answers pertain to engineering and design related service contracts (as defined in 23 U.S.C. 112(b)(2)(A) and 23 CFR 172.3) using FAHP funding and directly related to an ultimate construction project. Unless otherwise specified, the definition of the terms provided within the definition section of the referenced Federal laws and regulations (23 U.S.C. 101, 40 U.S.C. 1102, 23 CFR 172.3, and 48 CFR 31.001) are applicable to these questions and answers.

While several regulatory requirements and policies contained within these questions and answers are applicable to design-build, public private partnerships, and other innovative project-delivery methods, this guidance is not intended to address these methods. For additional information regarding design-build contracting, please visit the FHWA Design Build web site at: <http://www.fhwa.dot.gov/construction/cqit/desbuild.cfm>. Information on other innovative contracting methods may be obtained at: <http://www.fhwa.dot.gov/construction/cqit/sep14.cfm>.

Acronyms

AASHTO - American Association of State Highway and Transportation Officials
 CASB - Cost Accounting Standards Board
 CE - Categorical Exclusion
 CFR - Code of Federal Regulations
 CPA - Certified Public Accountant
 DBE - Disadvantaged Business Enterprise
 DOT - Department of Transportation (or equivalent State highway agency)
 FAHP - Federal-aid highway program
 FAR - Federal Acquisition Regulation
 FHWA - Federal Highway Administration
 FONSI - Finding of No Significant Impact
 GAGAS - Generally Accepted Government Auditing Standards
 NEPA - National Environmental Policy Act
 ROD - Record of Decision
 U.S.C. - United States Code

Questions and Answers

The guidance is provided in the form of questions and answers that have been categorized as noted below. The statutory and regulatory bases, as well as references to other resource material, are provided where appropriate within each specific question and answer. The references to related questions and answers, statutory and regulatory provisions, and supporting information contained in each response are intended to enhance understanding and provide further clarification of Federal requirements and FHWA policies associated with the use of engineering and design related consultant services.

Illinois Department of Transportation

2300 South Dirksen Parkway / Springfield, Illinois / 62764

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2012-07
SUBJECT: ASH TREE REMOVAL DUE TO EMERALD ASH BORER
ISSUED DATE: November 26, 2012
EFFECTIVE DATE: November 26, 2012

This memorandum revises Section 14-1 dated January 2012 of the Bureau of Local Roads & Streets Manual.

The Emerald Ash Borer (EAB), *Agilus planipennis* Fairmaire, is an exotic beetle that was discovered in southeastern Michigan near Detroit in the summer of 2002. The adult beetles nibble on ash foliage but cause little damage. The larvae (the immature stage) feed on the inner bark of ash trees, disrupting the tree's ability to transport water and nutrients. EAB probably arrived in the United States on solid wood packing material carried in cargo ships or airplanes originating in its native Asia. EAB is also established in Windsor, Ontario, was found in Ohio in 2003, northern Indiana in 2004, northern Illinois and Maryland in 2006, western Pennsylvania and West Virginia in 2007, Wisconsin, Missouri and Virginia in the summer of 2008, Minnesota, New York, Kentucky in the spring of 2009, Iowa in the spring of 2010, Tennessee in the summer of 2010, and Connecticut, Kansas, and Massachusetts in the summer of 2012. Since its discovery, EAB has:

- Killed tens of millions of ash trees;
- Caused regulatory agencies and the USDA to enforce quarantines and fines to prevent potentially infested ash trees, logs or hardwood firewood from moving out of areas where EAB occurs.
- Cost governmental agencies, property owners, nursery operators and forest products industries tens of millions of dollars.

EAB infestation may be controlled or managed by using a combination of methods (biological, chemical, systematic removal, or complete removal). For detailed information and management resources, visit the Emerald Ash Borer website at www.emeraldashborer.info.

The Illinois Department of Agriculture (IDOA) has established a web site to assist and educate individuals about EAB. For the most recent information about confirmed locations, please visit www.agr.state.il.us/eab/.

HARD COPIES UNCONTROLLED

A Local Public Agency (LPA) may use Motor Fuel Tax (MFT) funds under the general maintenance program for the systematic or complete removal of Ash trees if the following criteria are met:

- LPA is located in the Emerald Ash Borer quarantined zone published by the Illinois Department of Agriculture;
- the Ash trees are located on the public right-of-way or are a potential hazard to vehicle travel;
- the Ash trees to be removed are shown in a detailed inventory; and
- MFT funds are not used to plant replacement trees.

Contact the Local Policy & Technology Unit at IDOT.LocalPolicy@illinois.gov with any questions.

A handwritten signature in cursive script that reads "James K. Klein".

Illinois EAB Trap Survey 2012

751 survey locations as of April 30, 2012

This map depicts the first 751 locations of the 2012 Survey in Southern Illinois.

The locations for the 2012 EAB Survey were determined in cooperation with the USDA Forest Service, Forest Health Technology Enterprise Team.

Legend

-  Trap location
-  Inaccessible location
-  Confirmed EAB locations (2006-2012)
-  Quarantine (November 10, 2011)
-  Counties Selected for Survey 2012

Wanda D. Gossard, PE, CHM

Test/Research Results

- **Factors affecting the survival of ash (*Fraxinus* spp.) trees infested by emerald ash borer (*Agrilus planipennis*)**

2012 - Kathleen S. Knight, John P. Brown and Robert P. Long

The article is on the survival analysis of ash trees in Ohio. According to Kathleen Knight, the main take-home message was that ash trees actually died slightly faster in stands with lower densities of ash, the opposite of what the authors thought would happen. This is just the speed of mortality, not the % mortality (almost all the ash trees die eventually no matter what).

- **Historical Accumulation of Nonindigenous Forest Pests in the Continental United States**

December 2010 - American Institute of Biological Sciences
[AIBS Press Release](#)

Nonindigenous insects and pathogens continue to become established in US forests with regularity despite regulations intended to prevent this, according to a study published in the December 2010 issue of *BioScience*. The study, by a team led by Juliann E. Aukema, of the National Center for Ecological Analysis and Synthesis in Santa Barbara, California, (including MSU's Deb McCullough), found that nonindigenous insects are being newly detected in US forests at a rate of about 2.5 per year, and high-impact insects and pathogens that cause significant effects in forests, including tree death, are being newly detected every 2 to 2.5 years. The rate of detection of harmful forest invaders seems to have increased in the past two decades.

- **Risk Assessment of the Movement of Firewood within the United States**

(PDF, 3,315 KB)

May 2010 - USDA APHIS

Exotic and native forest pests such as *Agrilus planipennis* (emerald ash borer), *Anoplophora glabripennis* (Asian longhorned beetle), and others cause serious damage to urban and natural forests in the United States. These pests and many others disperse various distances through multiple pathways including movement of nursery stock and firewood. Firewood is a raw forest product that is widely utilized and moved throughout the United States with relatively limited consideration of the potential pests within or the associated risks. We conducted an assessment and examined factors that may affect the risk associated with the movement of firewood such as users, movement, insects and diseases, potential impact to natural and urban forests, and trends in firewood use.

- **Geographic Origin of North America's Emerald Ash Borer** (PDF, 0.08MB)

Jim Smith, Michigan State University - This research is looking for the origins of EAB found in North America by looking at the genetic similarities in samples of EAB populations from Asia and comparing them to North American populations.

- **Studies to Develop an Emerald Ash Borer Survey Trap** (PDF, 0.09MB)

Jason B. Oliver, Joe Francese, Vic Mastro, Ivich Fraser, Dave Lance, Nadeer Youssef - Studies to develop an emerald ash borer survey trap through trap location, seedling tree damage, trap design evaluation.

- **Developing a Fast, Inexpensive Method to Extract and Analyze Imidacloprid Residue in Plant Tissue** (PDF, 0.06MB)

Phil Lewis and Deborah G. McCullough - A cheap, rapid method to analyze chemical residue in treated trees is necessary in order to best assess efficacy of different treatments.

- **Genetic Analysis of Emerald Ash Borer** (PDF, 0.02MB)

Jim Smith, Bob Haack and Leah Bauer - estimate the geographic origin of emerald ash borer populations in Asia that gave rise to EAB in North America

- **Exploration for Emerald Ash Borer in China** (PDF, 0.03MB)

Houping Liu, Toby R. Petrice, Leah S. Bauer, Robert A. Haack, Ruitong Gao, and Tonghai Zhao - research on the study of the natural enemy complex of EAB in China

Insecticide Research

Research on methods to control EAB began in 2002. Research is ongoing, and as methods are developed, more information will be available.

- **"Slow Ash Mortality" – SLAM Pilot Project**
Description: The SLAM project is a collaborative effort involving Michigan State University, the USDA Forest Service, USDA Animal and Plant Health Inspection Service (APHIS), Michigan Technological University (MTU), the Michigan Dept. of Agriculture and Rural Development (MDARD), the Michigan Dept. of Natural Resources (MDNR), and Michigan Conservation Districts in Michigan's Upper Peninsula. The goal of the SL.A.M. pilot project in Michigan's Upper Peninsula is to delay and slow the expansion of ash mortality by reducing populations of the beetle in newly-infested sites, outside of known EAB infestations.
- **Frequently Asked Questions Regarding Potential Side Effects of EAB Insecticides**  (PDF, 311KB)
February 2011
Research and Extension Specialists from Michigan State University, the Ohio State University OARDC and Extension, and University of Minnesota Extension have put together a comprehensive publication that addresses questions and concerns regarding insecticide use to control emerald ash borer.
- **Control of Emerald Ash Borer with Microbial Insecticides**  (PDF, 0.05MB)
Revised 4/14/04
Leah S. Bauer, Houping Liu, and Deborah L. Miller - studying the efficacy of registered microbial insecticides for EAB control in environmentally sensitive habitats
- **Evaluation of Perma Guard D-20 and Imidacloprid to Control Emerald Ash Borer**  (PDF, 0.02MB)
Robert A. Haack and Toby R. Petrice - This study tested the effectiveness D-20 by Perma Guard (Albuquerque, NM) in controlling emerald ash borer

- **"Slow Ash Mortality" – SLAM Pilot Project**
Description: The SLAM project is a collaborative effort involving Michigan State University, the USDA Forest Service, USDA Animal and Plant Health Inspection Service (APHIS), Michigan Technological University (MTU), the Michigan Dept. of Agriculture and Rural Development (MDARD), the Michigan Dept. of Natural Resources (MDNR), and Michigan Conservation Districts in Michigan's Upper Peninsula. The goal of the SL.A.M. pilot project in Michigan's Upper Peninsula is to delay and slow the expansion of ash mortality by reducing populations of the beetle in newly-infested sites, outside of known EAB infestations.
- **Using Double-Decker Traps to Detect Emerald Ash Borer**  (PDF, 496KB)
April 2009
Deborah G. McCullough and Therese Poland - Detecting or monitoring populations of emerald ash borer

HARD COPIES UNCONTROLLED

(*Agrilus planipennis* Fairmaire) is very difficult when infestations are relatively new or when densities of this invasive pest are low. The Double-Decker (DD) trap is designed to integrate several visual and olfactory cues that are likely to attract EAB beetles. The DD traps are designed to be highly apparent to beetles. The vertical silhouette of the DD trap somewhat mimics the silhouette of an open-grown tree. The trap includes two purple panels, partly because beetles respond positively to that particular shade of purple. The two panels help to mimic the shape of a tree "canopy." In addition, they increase the surface area available for trapping beetles.

- **Using Girdled Trap Trees Effectively For EAB Detection, Delimitation & Survey**  (PDF, 407KB)
July 2007 - Dr. Deborah G. McCullough and Dr. Nathan W. Siegert
- **Characteristics and distribution of potential ash tree hosts for Emerald Ash Borer**  (PDF, 0.07MB)

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2013-01
SUBJECT: ECOLOGICAL COMPLIANCE ASSESSMENT TOOL
(EcoCAT)
ISSUED DATE: July 12, 2013
EFFECTIVE DATE: July 1, 2013

This memorandum supersedes Section 10-1 dated October 2008, Section 20-2 dated October 2008, Section 20-8 dated October 2008, and Section 20-9 dated October 2008 of the Bureau of Local Roads & Streets Manual.

The *Illinois Natural Areas Preservation Act* (525 ILCS 30/17), Section 11b of the *Illinois Endangered Species Protection Act* (520 ILCS 10/11), and the implementing rules (17 Ill. Adm. Code 1075) require consultation with the Illinois Department of Natural Resources (IDNR) on all construction, land management, or other activities that are authorized, funded, or performed in whole or in part by agencies of State and local public agencies (LPA) and that will result in a change to the existing environmental conditions, or may affect listed threatened or endangered species or their essential habitat or Natural Areas.

The *Interagency Wetland Policy Act of 1989* (20 ILCS 830/1 et seq.) and the *Implementation Procedures for the Interagency Wetland Policy Act* (17 Ill. Admin. Code 1090) require consultation with IDNR on all state and state pass-through funded construction projects.

The Illinois Department of Transportation (IDOT) and the Illinois Department of Natural Resources (IDNR) recently updated the Memorandum of Understanding (MOU) outlining the roles and responsibilities of each agency to comply with State biological and cultural regulations. The updated MOU now includes not only Federally funded LPA projects, but also those funded with State, Motor Fuel Tax (MFT), or Township Bridge Program (TBP) funds, and any locally funded project requiring IDOT review and approval (such as non-municipal structures greater than 30 feet not funded with federal, state, MFT, or TBP funds). Therefore, the Ecological Compliance Assessment Tool (EcoCAT) shall no longer be used by the LPA for these types of projects. Cultural and biological clearances will be processed the same as federally funded projects according to Section 20-8 and 20-9 by using the Environmental Survey Request. Form BLR 10100 may continue to be used to document environmental review. However, this form will not be required to be submitted to the District prior to advertisement.

HARD COPIES UNCONTROLLED

For locally funded projects without department review and approval, the LPA must still use EcoCAT and pay any fee established by IDNR. Copies of the consultation termination letter or consultation closed report from EcoCAT shall be submitted to the District BLRS with Form BLR10100 prior to the optional advertisement in IDOT's *Notice to Contractors Bulletin*. The District will acknowledge receipt of Form BLR 10100 by signature and return the signed copy for the project file.

Contact the Local Policy & Technology Unit at IDOT.LocalPolicy@illinois.gov with any questions.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2013-02
SUBJECT: SPECIAL WASTE
ISSUED DATE: July 12, 2013
EFFECTIVE DATE: July 15, 2013

This memorandum supersedes Section 20-2 dated October 2008 and Section 20-12 dated October 2008 of the Bureau of Local Roads & Streets Manual.

Regulated substances, as defined in Federal and State statutes, are subject to controls variously affecting their generation, storage, transport, and disposal, and associated record-keeping. "Special waste" refers to industrial or pollution control waste and hazardous waste. Local public agencies responsible for development and implementation of highway projects shall consider regulated substances in project development and shall comply with applicable controls. These considerations, compliance actions, and related coordination shall be appropriately documented in project files and project review documents.

Due care shall be exercised to determine whether regulated substances may be present on or located adjacent to property being considered for use for highway project purposes. Acquisition of an interest in a site determined to contain regulated substances shall be avoided unless the risks and liabilities of such acquisition can be justified. The BLRS Manual has been revised to define terminology, to update the screening process, and to clarify the procedures required when LPA projects affect State property.

Contact the Local Policy & Technology Unit at IDOT.LocalPolicy@illinois.gov with any questions.

James K. Klein

Acting Engineer of Local Roads and Streets

HARD COPIES UNCONTROLLED

The ESR must be fully completed. BDE Manual Chapter 27 (Section 3) requires 6-months for completion of a Preliminary Environmental Site Assessment (PESA) and 6-months for completion of a Preliminary Site Investigation (PSI). Thus, the letting date should be 12-months or more from the time the ESR is initially submitted to allow for successful completion of Special Waste environmental survey work, plus time to execute land acquisition, prior to letting.

A local roads project involving state road jurisdiction, even a small portion, must follow BDE Chapter 27 (Section 3) and must be coordinated with the District Special Waste Coordinator (aka, Environmental Manager). The time frames for completion of the PESA (6-months) and PSI (6-months) also applies to the state road portion of a local roads project.

On the ESR, include the following information for DOH and BLRS special waste projects:

PMA ESR Section	Item	Notes
A	Survey Target Date (STD)	>= 6-months from ESR submittal date
A	Anticipated Design Approval	Optional. Should be >= 6-months out
F	Env. Contact	Section F (bottom): Should be the District Special Waste Coordinator
PESA tab	Anticipated Letting date	If known, should be 12-months out
Add'l Info	Additional notes	Any supporting information
Add'l Info	Reference previous PESAs	
Attachments	Site location map	
Attachments	Survey limit figure	

Additionally, for local roads projects, the following information is also required:

PMA ESR Section	Item	Notes
F	Contact Person	Section F (top): Should be the BLRS contact person
F	Local Contact Person	Name of Local Public Agency contact or LPA consultant
Attachments	State jurisdiction figure	Show state jurisdiction on a figure and also describe it in the additional notes., i.e., which portion of the project is on state route and which is non-state
Attachments	Survey limits for Phase I PESA	Clearly identify which portion of project that ISGS will complete PESA (following BDE Chapter 27) and which portion the LPA will conduct their own PESA (following BLRS Chapter 20)

See ESR example and attachments on the following pages

Prepared by Jim Curtis, November 9, 2012; updated June 26, 2013

Field Sign Off (Bio & Cultural Only) Received in CO 10/18/2012 SW Received 10/25/2012

Sequence No: 17548

Memo Date: 10/25/2012 **Memo By:** Sam Mead

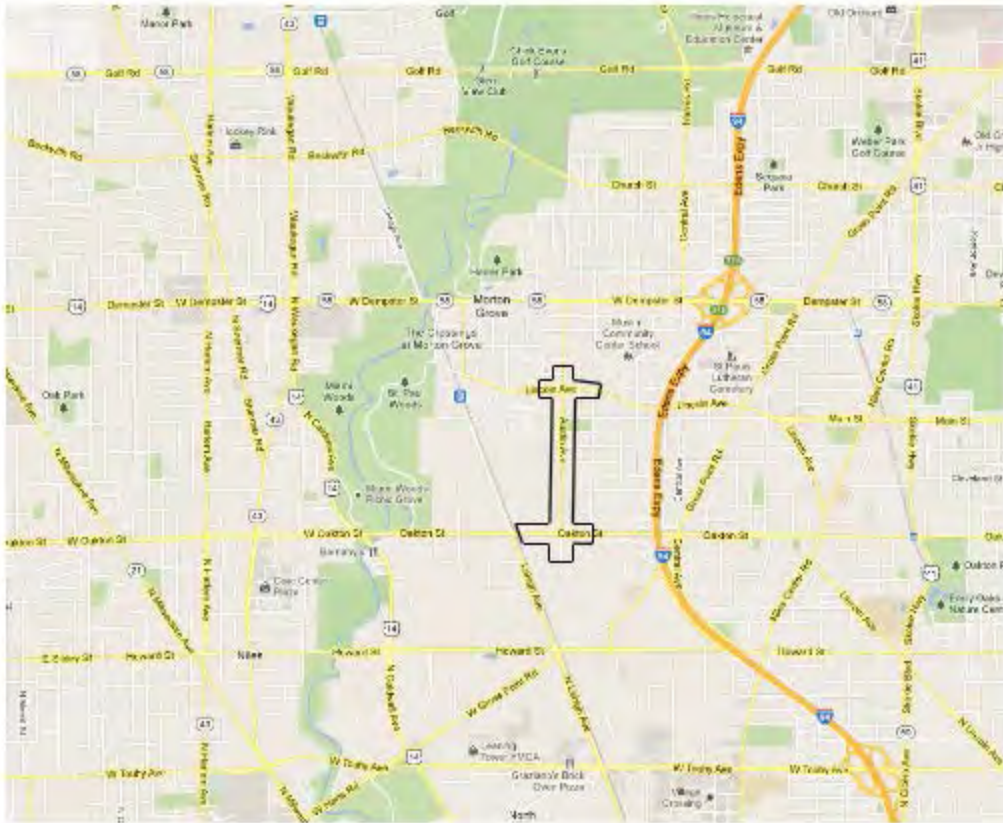

Memo: ISGS will perform a PESA for BDE on the portion of the project on Oakton Street, plus Austin Ave south of Oakton Street. See revised figure showing limits. The LPA will conduct a PESA on the remaining portion of the project.

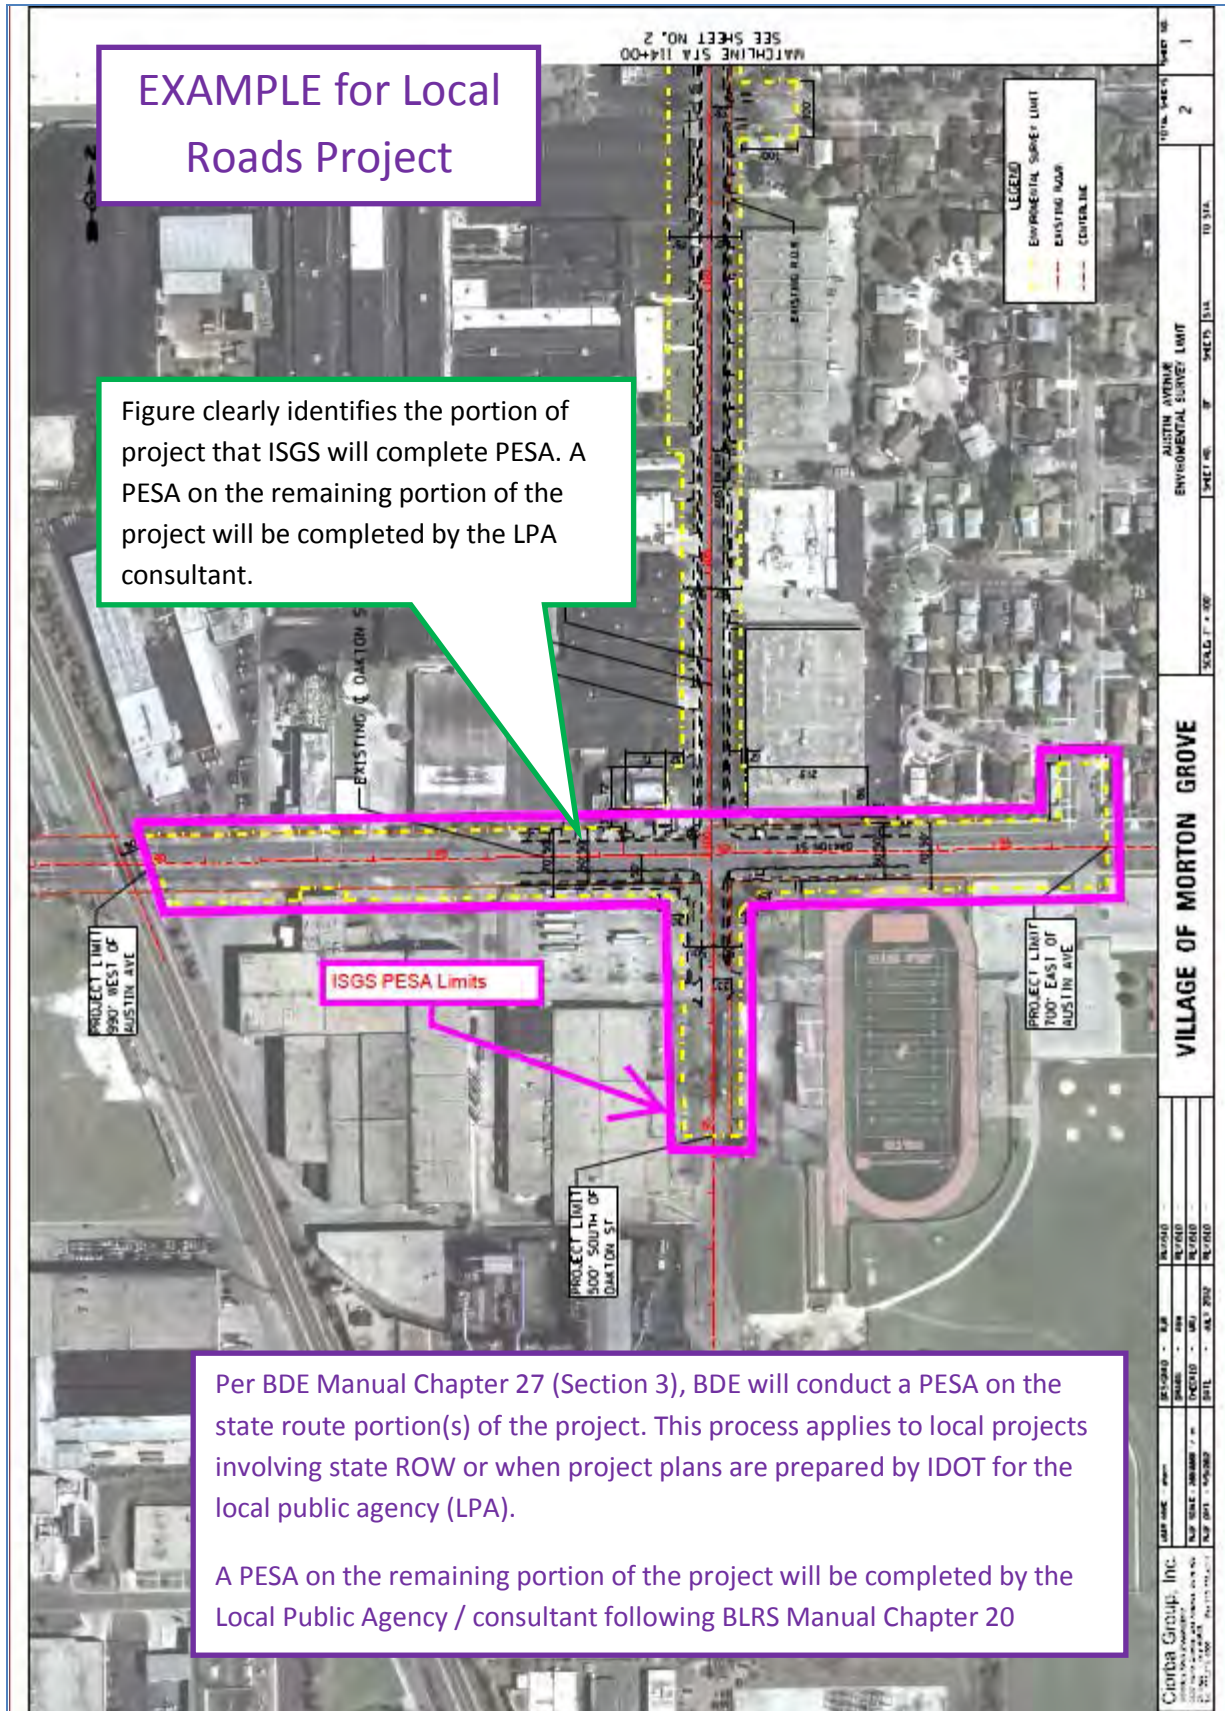

Memo Date: 10/10/2012 **Memo By:** Gerardo Fierro

Memo: IDOT will need to perform the special waste analysis for Oakton Street.
 There are proposed storm sewer improvements on Austin Ave between Oakton Street and Cleveland Street. Oakton Street is a State route. Lincoln Ave are municipal routes.

For a Local Roads project, additional comment states what portion of the project is on state route.

Morton Grove, IL Austin Ave Location Map

Q: How do I know when Special Waste should be involved in a Local Roads project? That is, for a Local Roads project, when should I check the Special Waste box in PMA?

A: The Project Monitoring Application (PMA) for Special Waste is used to track DOH projects and the DOH segment of a Local Roads project. BDE Manual Chapter 27 (and BLRS Manual Chapter 20) describes the circumstances when a special waste survey should be conducted.

Step 1 – Does BDE Chapter 27-3 (Special Waste Procedures) apply to my project?

The procedures in Section 27-3 are applicable to all of the following types of projects:

1. State highway project;
2. Local project when the project plans are prepared by IDOT for a local public agency (LPA);
3. Local project affecting State right-of-way or a road under State jurisdiction;
4. Local project acquiring right-of-way in the name of the State;
5. Local project involving temporary or permanent easements in the name of the State;
6. Other transportation project (e.g., railroad or aeronautics project) affecting State right-of-way or roads under State jurisdiction, or when plans are prepared by IDOT.

If your project is any one of these, check the Special Waste box in PMA. Specifically, if your project is #1 or #2, then follow Chapter 27 for the entire project. If your project is #3 - #6, then follow BDE Chapter 27 for the portion of the project involving State ROW, and follow BLRS Chapter 20 for the remaining portion of the project. Go to Step 2. If NO to all of these, then BDE Chapter 27 does not apply; do not check the special waste box.

Note: This process applies to all transportation projects meeting one or more of the criterion regardless of funding source.

Step 2 – Is Special Waste involved?

A PESA is required for all applicable projects, as determined in Step 1, with some exceptions. Per Section 27-3.20(a) [Level 1 Screening], determine whether a PESA is necessary. Does the project involve any of these three situations?

- Acquisition of additional right-of-way or easements (temporary or permanent)
- Railroad right-of-way (other than a rural single rail with no maintenance facilities)
- Excavationⁱ or subsurface utility relocation (see definition of “excavation”)

If any of these situations is present, then the project must include special waste consideration and a PESA is required. If none are present, then the project can be screened-out for special waste and a PESA is not required.

Step 3 – Coordination

If your project involves Special Waste, per steps #1 and #2 above, then do the following:

- In PMA, fully complete the ESR and click the Special Waste box (in the “A/B” tab).
- Clearly identify the portion(s) of the project where ISGS should complete the PESA for BDE, delineate this area on a figure, explain in text, and include with the ESR submittal.
- The ISGS PESA should cover the state portion(s) of the project. The LPA should determine if they should conduct their own PESA on the non-state portion(s) of the project (using BLRS Chapter 20 criteria). How a project is divided between BDE and BLRS should be determined on a case-by-case basis by the District Special Waste Coordinator and BDE using the information supplied by BLRS and LPA). In general, the project is divided along jurisdiction lines.
- Alert the District (Highways) Special Waste Coordinator who is responsible for ensuring that BDE Manual Chapter 27 is followed for the portion of the project affecting State jurisdiction.

You may contact your District Special Waste Coordinator or Jim Curtis with any questions regarding this process.

*Prepared October 31, 2012, revised 06/27/2013 by Jim Curtis
Chief, Geologic & Waste Assessment Unit*

Illinois Department of Transportation

ⁱ **Excavation.** For the purposes of BDE Chapter 27 (updated July 2012), excavation is the digging or grading of any soil or fill material, including underground utility works such as installation of fiber optic cabling, with the exception of aggregate fills which are not considered a soil or fill material of concern. The following types of maintenance projects are not considered excavation when the excavated material is left on, or incorporated within, the IDOT ROW for that project:

- bridge maintenance
- ditch cleaning
- working within the sub base or pavement
- removal and replacement of shoulders, curb and gutter, or sidewalk ramps

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2013-03
SUBJECT: EVALUATION OF FARMLAND CONVERSION IMPACTS
ISSUED DATE: July 12, 2013
EFFECTIVE DATE: July 15, 2013

This memorandum supersedes Section 10-1 dated October 2008 and Section 20-10 dated January 2006 of the Bureau of Local Roads & Streets Manual.

In the development of a project, consideration must be given to the impacts that the action will cause in the conversion of farmland to non-farm uses. Under certain circumstances, coordination must be initiated with the US Department of Agriculture, Natural Resources Conservation Service (NRCS) and/or the Illinois Department of Agriculture (IDOA) to evaluate the impacts on farmland and obtain the views of those agencies on alternatives to the proposed action.

The exemption for projects within the official 1.5 mile (2.4 km) planning area of an incorporated municipality is no longer allowed.

Contact the Local Policy & Technology Unit at IDOT.LocalPolicy@illinois.gov with any questions.

Illinois Department of Transportation

2300 South Dirksen Parkway / Springfield, Illinois / 62764

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2013-04
SUBJECT: WORK ZONE TRANSPORTATION MANAGEMENT PLANS
ISSUED DATE: July 25, 2013
EFFECTIVE DATE: July 31, 2013

This memorandum supersedes Section 10-2 dated July 2008 and Section 22-2 dated February 2009 of the Bureau of Local Roads & Streets Manual.

Per Safety Engineering Procedure Memorandum 3-07 effective October 12, 2007, the Work Zone Safety and Mobility Rule (23 CFR 630 Subpart J) applies to all state projects and federal aid funded local highway projects. A well-planned method for maintaining traffic flow is critical for meeting the Department's mobility goals, minimizing complaints from the traveling public, residents, and businesses, and reducing unnecessary capital costs. Therefore, any local public agency (LPA) project, regardless of funding, that impacts a State highway will need to comply with these requirements as well.

Contact the Local Policy & Technology Unit at IDOT.LocalPolicy@illinois.gov with any questions.

Safety Engineering Policy Memorandum

SAFETY 3-07

Work Zone Safety and Mobility Rule

Effective October 12, 2007

POLICY

This policy supersedes Traffic Departmental Policy TRA-1, Traffic Control through Construction and Maintenance Work Zones, April 1, 1981.

The Federal Highway Administration (FHWA) has updated the work zone regulations at 23 CFR 630 Subpart J. The updated rule is referred to as the Work Zone Safety and Mobility Rule (Rule). The Rule applies to all state projects and federal aid funded local highway projects and requires compliance with these provisions by October 12, 2007. The changes made to the regulations broaden the former rule to better address the work zone issues of today and the future.

During construction, maintenance, and all other activities including engineering contracts, railroad crossings, and utility projects on Illinois highways, it shall be the policy of the department to provide a high level of safety for workers and the public, to provide mobility, minimize congestion and adverse community impacts, and to provide greater public satisfaction. This policy outlines IDOT's activities necessary to implement the requirements and intent of the Rule.

PURPOSE

Work Zone Safety is an identified emphasis area of the Illinois Comprehensive Highway Safety Plan (ICHSP). Developing and implementing a work zone safety and mobility policy as required by the Rule provides an additional strategy to further the goals of the ICHSP.

VISION

The overall goal of this policy is to reduce and eliminate crashes and fatalities, and to mitigate congestion due to work zones.

HARD COPIES UNCONTROLLED

GOALS

SAFETY

1. Zero worker fatalities for traffic-related work zone crashes.
2. Reduce the number of motorist fatalities in traffic-related work zone crashes by 10% each year with the eventual goal of eliminating all of these fatalities. Eliminate crashes and resulting fatalities and serious injuries caused by queuing.
3. Reduce the number of work zone crashes by 5% from each prior year.

MOBILITY

Mobility shall be defined as moving road users efficiently through or around a work zone area (site specific or regionally) with a minimum delay compared to baseline travel when no work zone is present while not compromising safety. The following goals are thresholds for traffic mobility on projects which impact traffic flow:

- 1) Delays caused by work zones should not exceed more than five (5) minutes per mile of project length with a maximum of thirty (30) minutes above the normal recurring traffic delay; and,
- 2) Queues caused by work zones should be no more than 1.5 miles beyond pre-existing queues.

GUIDELINES FOR IMPLEMENTATION

PROJECT GUIDELINES

To facilitate the implementation of this policy the following items have been developed:

- 1) Work Zone Safety and Mobility Process Flow Chart (Appendix A). This flow chart represents the process flow to determine the level of significance of a project and the necessary steps and requirements to implement the Rule.
- 2) Significant Route Location Maps (Appendix B). These statewide and district maps show those state routes where a lane closure on the roadway is expected to cause sustained work zone impacts that are not considered tolerable based on the goals and objectives of this policy or public opinion and, thus, are considered Significant Routes. Roadways marked in red are considered as Significant Routes. Roadways marked in yellow are approaching Significant Route designation and should be evaluated for potential impacts. These maps will be revised as additional information becomes available through process reviews and district feedback.

These two items should be used together to determine if a project is considered Non-Significant, Significant – Short Term (Less Than Three (3) Days), or Significant – Long Term.

NON-SIGNIFICANT PROJECTS

If the proposed project is on a roadway that is not considered a Significant Route, then it is a Non-Significant Project and work impacts the traveling public to a small degree. Traffic volumes are low; public interest is low; and, duration is short to moderate. For Non-Significant Projects, an Impact Analysis is not required. The final design may proceed with a Traffic Management Plan (TMP) that consists of only a Traffic Control Plan (TCP). However, appropriate Transportation Operations Plan (TOP) and Public Information Plan (PIP) strategies are encouraged to be considered as well. Further details of a full TMP are described under Significant Projects – Long Term.

SIGNIFICANT PROJECTS – SHORT TERM (LESS THAN THREE (3) DAYS): OPERATIONS, PERMIT, UTILITY WORK AND OTHER SHORT TERM WORK

Roadway segments identified on the Significant Route Location Maps involving work of three (3) days or less shall be considered as Significant Projects – Short Term. A Permitted Lane Closure Map/List (PLCM) shall be developed by the district, based on Appendix B and district knowledge and should be updated as traffic conditions warrant. The PLCM map will define the allowable times a lane(s) may be closed on Significant Routes within each district to assist in meeting the goals of this Policy. This is to allow minor short time work to be accomplished with as little impact to the motorist as possible. If the goals of this policy cannot be met, work shall be planned in advance minimizing the impacts and only emergency repairs or work would be allowed. The operations may proceed with a TMP that consists of only a TCP. However, appropriate TOP and PIP strategies are encouraged to be considered as well. Further details of a full TMP are described under Significant Projects – Long Term.

SIGNIFICANT PROJECTS – LONG TERM

Routes identified on the Significant Route Location Maps involving work greater than three (3) days shall be considered as Significant Projects – Long Term. Work zones for these projects have a much greater impact long term on motorists. Every reasonable effort to mitigate these impacts shall be considered. Significant Projects shall be identified as early as possible in the development process to help allocate resources more effectively to projects that are likely to have greater impacts. A Significant Project – Long Term requires an Impact Analysis be performed. This Impact Analysis will involve a process of understanding the safety and mobility impacts of a road

construction/maintenance project. The use of hourly volume maps, district knowledge and experience, site reviews, and/or computer simulation programs, such as QUEWZ, TSIS-CORSIM, Quick Zone or other modeling programs would be considered acceptable. Where queues are normally present even without lane closures, the analysis shall compare existing queues to expected queues based on the resulting mitigation and strategies used to reduce the impacts of lane closures, construction or other work would have on a project.

During the planning and design phase of a Significant Project, various TMP strategies and the resulting impacts to delays and queuing shall be considered and analyzed to determine which are acceptable or unacceptable based on the goals of this policy.

Developing a TMP is a process that involves identifying applicable strategies to manage the impacts of the work zone and budgeting costs to ensure that funding is available. A full TMP is required for Significant Projects – Long Term and lays out a set of coordinated transportation management strategies and describes how they will be used to manage the work zone impacts of a road project. As the project evolves, it is important to reassess the TMP including the management strategies to be sure the work zone impacts are mitigated and the necessary budget for the project is available. Incident management and emergency services shall be considered. Refer to BDE Manual Chapters 13 and 55.

A full TMP shall include the following three Plans:

1. **Traffic Control Plan (TCP)**. A plan to safely guide traffic through a construction project through the use of traffic control devices and project coordination.
2. **Transportation Operations Plan (TOP)**. A plan that consists of strategies which mitigate work zone impacts through the use of improved transportation operations and management of the transportation system.
3. **Public Information Plan (PIP)**. A plan that consists of strategies to inform those affected road users including the surrounding community of the expected impact of a project, of changing conditions, and available travel options.

To assist in the development of a full TMP, a TMP Components Checklist (Appendix C) has been included in this policy. Federal guidelines have been developed and should be utilized when developing the TMP. These include:

- Implementing the Rule on Work Zone Safety and Mobility
- Developing and Implementing Transportation Management Plans for Work Zones
- Work Zone Impacts Assessment: An Approach to Assess and Manage Work Zone Safety and Mobility Impacts of Road Projects

- Work Zone Public Information and Outreach Strategies

Electronic copies of these resources can be found at the following link: http://www.ops.fhwa.dot.gov/wz/resources/final_rule.htm. Hard copies of these publications will be provided with this policy to the IDOT District Offices and Central Highways Bureaus as a Tool Box. These are attached as Appendix E.

Once the impacts have been analyzed and a preliminary full TMP has been prepared, it should be determined if the goals of this policy have been met. If they have not, additional TMP strategies should be further analyzed and considered.

IMPACTS MEET GOALS

Once it is determined that the prepared TMP would meet the goals of this policy it should be presented for approval at the bi-monthly coordination meeting. Once the TMP is approved, it shall be included in the Phase I Report and incorporated into plan development.

IMPACTS DO NOT MEET GOALS

Once all reasonable and cost-effective TMP strategies have been evaluated and incorporated into the project and the goals of this policy still cannot be met, then the District shall request an exception to this policy. The District shall submit an "Exception to Compliance Request" which shall include all strategies considered as well as the ones included in the full TMP for the project. This request shall include an explanation why it is not feasible to meet the goals of this policy. This shall be submitted to the Bureau of Safety Engineering and then to the appropriate bureau for approval (i.e., Bureau of Design and Environment, Bureau of Local Roads, Bureau of Operations), and FHWA for approval. Upon approval, final development of the TMP would proceed, be included in the Phase I Report, and be incorporated into plan development.

SIGNIFICANT PROJECTS NEAR PLANS, SPECIFICATIONS AND ESTIMATES (PS&E) DATE

Significant Projects that are in the later stages of development or near implementation of this policy may be considered for an "Exception to Compliance Request." This would apply if it is determined that the completion of the PS&E would be significantly impacted as a result of the provisions in this Policy.

Items to be included in the exception request include:

- Project location and description;
- Status of project letting date; and,
- Justification for why the project's PS&E would be affected and why the exception is requested.

The "Exception to Compliance Request" shall be submitted to the Bureau of Safety Engineering and routed to the bureaus for approval, i.e., Bureau of Design and Environment, Bureau of Local Roads or Bureau of Operations, and FHWA for approval. FHWA has final approval in these cases.

PROCESS GUIDELINES

TRAFFIC CONTROL SUPERVISOR

A technical position referred to as the District Traffic Control Supervisor shall be maintained in each District Bureau of Operations/Traffic with the primary function of traffic control planning and inspection.

TRAINING

Personnel involved in the development, design, implementation, operation, inspection, and enforcement of work zone related transportation management and traffic control are to be trained appropriate to the job decisions each individual is required to make. Existing training classes that are available are shown on Exhibit D. To ensure the maximum attainable degree of safety and mobility, a program of training, including updating of classes and providing new classes to keep up with current practices will continue.

IMPLEMENTATION OF THE TCP

A TCP shall be developed for all projects and be included in the contract plans and specifications. The plans and any revisions to these plans, for all construction, maintenance, or permit work let to contract shall be reviewed and signed by the District Traffic Operations Engineer to indicate concurrence of the proposed TCP.

For all State-awarded construction contracts, the TCP shall be reviewed at a conference preceding the start of any work on the project. Conference participants should include, as appropriate, representatives of the Contractor, utility company, local government agency, and District bureaus directly involved. Prior to any field activity covered by this policy, Form OPER 725,

Traffic Control Authorization Request, shall be submitted to and approved by the District Traffic Operations Engineer.

For highways under State jurisdiction, the District Traffic Control Supervisor or other designated District personnel shall notify the Department Communications Center (Station One) at least ten (10) days in advance of action as per current Departmental Policy when any of the following conditions apply. If any of these conditions involve major activities, a public notice shall be provided:

- Route closures lasting more than one day;
- Rerouting of traffic over a detour or temporary road if it limits oversize or overweight permit moves, 21 days prior;
- Other restrictions limiting or prohibiting oversize or overweight permit moves, 21 days prior;
- Rerouting of traffic over a new or temporary bridge;
- Reopening of sites previously restricted;
- Opening to traffic of new sections or new bridges;
- Introduction of new or revised vertical clearance restrictions, such as those created by erection of the first beam of a new overpass, a new overhead signal, or resurfacing under a structure;
- Emergency conditions requiring a route closure or restriction; and/or,
- Interstate, freeway and multilane state highway lane closures.

For projects that will affect traffic for more than five (5) days, an initial inspection of the traffic control installation and any subsequent major changes during construction should be conducted as soon as practicable but no later than five (5) days after the time it is put into effect. Follow-up inspections should be made approximately once per week thereafter, either day or night, as appropriate. The follow-up inspections may be increased or decreased to give priority attention to projects that are subject to congestion, are complex, have a more serious impact on traffic or have been found to have numerous and/or significant deficiencies. If the District Traffic Control Supervisor determines the traffic control for a full closure of a local road with an ADT of less than 400 is adequate, follow-up inspections will not be required.

Inspections of State-awarded construction contracts on highways under State jurisdiction shall be conducted by the District Traffic Control Supervisor utilizing Form OPER 726 Traffic Control Inspection Report. In Districts 2 through 9, this will include both the initial and follow-up inspections. In District 1, the follow-up inspections may be made by the FAUS Engineers in the District Bureau of Construction. The District Traffic Control Supervisor shall also conduct inspections of the following types of work zones as workload permits:

- State-awarded construction contracts on local agency streets and highways;
- Utility work on State highways being done under permit;

- Railroad crossing work on State highways being done under agreement;
- Maintenance work on State highways;
- Traffic work on State highways; and,
- Consultant work done on state highways.

The Regional Deputy Director may assign these types of inspections to other District personnel. Such assigned responsibilities must be clearly defined. The TCP for each contract shall indicate that both the responsible person at the project level and the person assigned to make the inspections will be designated at the preconstruction conference. Unusual problems encountered during routine inspections shall be referred to the District Traffic Control Supervisor.

Form OPER 726 Traffic Control Inspection Report shall be utilized to record the Traffic Control Supervisor's inspections. The records should be adequate to indicate date and time of inspection, general condition of traffic control devices, and whether or not traffic operations are satisfactory.

If the Traffic Control Supervisor reveals minor variations from acceptable standards, equipment, or procedures, these variations should be called to the attention of the responsible person for the project. If in the judgment of the District Traffic Control Supervisor, the traffic control in place does not provide adequate protection for the motorists, pedestrians and workers, s/he shall discuss the necessary corrections with the person responsible for the project. The Traffic Control Supervisor shall request the necessary revisions be initiated before s/he leaves the jobsite and also complete Form OPER 726, which shall include the action taken. One copy of the completed form shall be retained in the files of the District Bureau of Operations/Traffic. One copy shall be provided to the individual primarily responsible for traffic control at the project site. Whenever two consecutive inspections at the same site indicate adequate protection is not being provided; additional copies of the report shall be forwarded to the Regional Deputy Director and the appropriate Bureau Chief.

All technical personnel of the Central Bureaus of Safety Engineering, Operations, and Construction shall give particular attention to these traffic control measures during their routine travels throughout the State. Major deviations from proper traffic control practices shall be brought to the attention of the appropriate District Traffic Operations Engineer/Bureau Chief of Traffic.

WORK ZONE REVIEWS

Work Zone Safety and Mobility Policy Process Review

This process review shall be performed by the Central Office every other year to assess the effectiveness of IDOT's work zone standards, specifications, policies, procedures, TCPs, PIPs, TOPs, TMPs, Significant Projects, and the

level of mobility and safety afforded the traveling public. All types of projects shall be reviewed. These shall include day work and night work, all types of traffic characteristics, and the various management strategies that are being utilized. The process review team should consist of personnel who represent the project development stages and the different offices of IDOT who participate in project development and implementation. Bureau of Safety Engineering shall be the lead agency, and the FHWA Office shall be invited.

Work Zone Traffic Control Project Review

These project reviews shall be performed by the Central Office every two (2) years, on the opposite years of the Work Zone Safety and Mobility Policy Process Review. This review will consist of a drive-through to inspect the traffic control of construction projects. A random selection of projects will be selected for review. The project review team should consist of personnel who represent the project development stages and the different offices of IDOT who participate in project development and implementation. Bureau of Safety Engineering shall be the lead agency and the FHWA Office shall be invited. The findings of these reviews shall be documented and presented to the District in a closeout meeting.

TMP PERFORMANCE ASSESSMENT

Safety

If a fatal crash occurs within the project limits, the Resident Engineer or person in charge of any project/ encroachment on state highway shall submit a Work Zone Crash Summary Report within ten (10) days to the Bureau of Safety Engineering. This Work Zone Crash Summary Report shall provide the following information:

- Summary of the type of construction;
- Description of the traffic control in place at the time of the crash;
- Description of the traffic conditions at the time of the crash;
- Description of the Contractor's operations at the time of the crash;
- Description of the weather conditions, pavement conditions, and time of day;
- Description of changes made to the traffic control as a result of the crash;
- Recommendations for change to IDOT's Standards, Specifications, policies, or procedures that should be considered as a result of the crash; and,
- Photos of the traffic control throughout the project before (if available) and after the crash.

Mobility

Upon completion of the construction contract on Significant Projects – Long Term, the Resident Engineer shall develop and submit a Work Zone TMP Summary Report to the Bureau of Safety Engineering within thirty (30) days after the essential completion of the project. The Work Zone TMP Summary Report shall provide the following information:

- Project description, staging, and traffic control utilized;
- Summary of TMP strategies utilized including successes or failures;
- Description of the traffic operations due to work zone, such as were there backups, duration of the delays, length of queues, etc.;
- Description of changes made to the TMP;
- Description of changes made to the traffic control due to crashes occurring within the project limits; and,
- Recommendations for change to IDOT's Standards, Specifications, policies, or procedures that should be considered.

These reports are to be prepared in accordance with the Illinois Vehicle Code at 625 ILCS 5/11-408(c), and these reports shall be for the privileged use of the Department and held confidential, and shall not be used in any trial, civil or criminal.

The Bureau of Safety Engineering shall review all Work Zone Crash Summary Reports and Work Zone TMP Summary Reports and evaluate all recommended changes. Changes shall be made to Standards, Specifications, policies, and procedures as deemed appropriate to resolve issues resulting from these reports.

RESPONSIBILITIES

The Bureau of Safety Engineering is responsible for preparing and maintaining this policy. All Districts and Central Bureaus are responsible for implementing the portions of this policy that affect their operations. The District Traffic Control Supervisor or other designated District personnel shall have the traffic control inspection responsibilities. The Resident Engineer/Technician for a construction project, the construction supervisor for a day labor project, the Operations Field Engineer for either a maintenance or traffic project, or a company representative for a consulting firm or a utility project shall have the primary responsibility for ensuring that the traffic control is established in accordance with the approved plan, adequately maintained and revised, if necessary.

The Regional Deputy Director has the primary responsibility to ensure that this policy is carried out within his/her jurisdiction.

ACCESSIBILITY

Copies of this Policy may be obtained either from the department's website or from the Bureau of Safety Engineering in the Harry R. Hanley Building. This Policy may be examined in the Hanley Building library and in each of the nine Division of Highways' district offices.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2013-05
SUBJECT: COMPLETE STREETS
ISSUED DATE: July 25, 2013
EFFECTIVE DATE: July 31, 2013

This memorandum supersedes Section 10-2 dated July 2008 and Section 22-2 dated February 2009 of the Bureau of Local Roads & Streets Manual.

605 ILCS 5/4-220 requires the Department to give bicycle and pedestrian ways full consideration in the planning and development of transportation facilities. This is commonly referred to as Complete Streets. Therefore, any local public agency (LPA) project, regardless of funding, that impacts a State highway will need to comply with the Complete Streets requirements on the State highway.

Contact the Local Policy & Technology Unit at IDOT.LocalPolicy@illinois.gov with any questions.

A handwritten signature in cursive script that reads "James K. Klein".

Acting Engineer of Local Roads and Streets

HARD COPIES UNCONTROLLED

(605 ILCS 5/4-220)

Sec. 4-220. Bicycle and pedestrian ways.

(a) Bicycle and pedestrian ways shall be given full consideration in the planning and development of transportation facilities, including the incorporation of such ways into State plans and programs.

(b) In or within one mile of an urban area, bicycle and pedestrian ways shall be established in conjunction with the construction, reconstruction, or other change of any State transportation facility except:

(1) in pavement resurfacing projects that do not widen the existing traveled way or do not provide stabilized shoulders; or

(2) where approved by the Secretary of Transportation based upon documented safety issues, excessive cost or absence of need.

(c) Bicycle and pedestrian ways may be included in pavement resurfacing projects when local support is evident or bicycling and walking accommodations can be added within the overall scope of the original roadwork.

(d) The Department shall establish design and construction standards for bicycle and pedestrian ways. Beginning July 1, 2007, this Section shall apply to planning and training purposes only. Beginning July 1, 2008, this Section shall apply to construction projects.

(Source: P.A. 95-665, eff. 10-10-07.)

HARD COPIES UNCONTROLLED

Illinois Department of Transportation

2300 South Dirksen Parkway / Springfield, Illinois / 62764

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2013-06
SUBJECT: NOISE ANALYSIS
ISSUED DATE: July 25, 2013
EFFECTIVE DATE: August 31, 2013

This memorandum supersedes Section 20-6 dated January 2006 of the Bureau of Local Roads & Streets Manual.

The FHWA developed the noise regulation as required by section 136 of the Federal-Aid Highway Act of 1970 (codified at 23 U.S.C. 109(i)). The regulation applies to highway construction projects where a State department of transportation has requested Federal funding for participation in the project. The FHWA noise regulation, found at 23 CFR 772, requires a highway agency to investigate traffic noise impacts for projects considered Type I Projects. Type I projects are defined as:

- The construction of a highway on a new location;
- The physical alteration of an existing highway where there is either a substantial horizontal or vertical alteration;
- The addition of a through traffic lane(s). This includes the addition of a through-lane that functions as a HOV lane, High-occupancy Toll (HOT) lane, bus lane, or truck climbing lane;
- The addition of an auxiliary lane, except for when the auxiliary lane is a turn lane;
- The addition or relocation of interchange lanes or ramps added to a quadrant to complete an existing partial interchange;
- Restriping existing pavement for the purpose of adding a through-traffic lane or an auxiliary lane; or
- The addition of a new or substantial alteration of a weigh station, rest stop, ride-share lot or toll plaza.

If a project is determined to be a Type I project under these definitions, the entire project area as defined in the NEPA environmental document is then a Type I project. If the highway agency identifies impacts, it must consider abatement. The highway agency must incorporate all feasible and reasonable noise abatement into the project design.

HARD COPIES UNCONTROLLED

On July 13, 2010, the FHWA published a final rule updating 23 CFR 772. This final rule amends sections 772.1, 772.5 to 772.17, and Table 1--Noise Abatement Criteria. Sections 772.3 and 772.19 are not amended by this final rule. The final rule also eliminated the use of the TNM Lookup Tables in either form (hard copy table or executable program) to predict noise levels on Federal or Federal-aid projects. The final rule required each State DOT to revise its noise policy to be in accordance with this final rule. FHWA approved IDOT's Noise Policy on April 1, 2011 with an effective date of June 29, 2011. IDOT's Noise Policy is contained in Section 26-6 of the BDE Manual. IDOT has also released the Highway Traffic Noise Assessment Manual, which is found at www.dot.il.gov/environment/HTNAMManual.pdf.

Illinois Department of Transportation

2300 South Dirksen Parkway / Springfield, Illinois / 62764

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2013-07
SUBJECT: MOTOR FUEL TAX USAGE
ISSUED DATE: October 15, 2013
EFFECTIVE DATE: October 15, 2013

This memorandum supersedes Section 4-3 dated November 2012 and Section 14-1 dated November 2012 of the Bureau of Local Roads & Streets Manual.

The Department has clarified the following eligible uses of Motor Fuel Tax (MFT) funds.

Salary & Expenses. MFT funds may be used to pay for the County Engineer's Salary and expenses provided that the duties being performed by the County Engineer are related to functions of the County Engineer established by the Illinois Highway Code or the Department.

Non-Dedicated Subdivision Roads Established Prior to July 23, 1959. MFT Funds may be used to perform construction or maintenance on these roads provided the residents provide a proportional share of funding.

Investments & Deposits. MFT funds may be invested or deposited according to the requirements of the Public Investment Act and the Investment of Municipal Funds Act. Any loss of principal will require MFT funds to be reimbursed with other local funds.

Joint Improvements. MFT funds may be used by an local public agency to perform construction or maintenance on public highways not under its jurisdiction provided there is a written contract approved by the Department, or a negotiated agreement.

Traffic Control Device Maintenance. MFT funds may be used to purchase required software for maintenance of traffic signals.

Please contact the Bureau's Local Policy & Technology Unit at IDOT.LocalPolicy@illinois.gov with any questions.

HARD COPIES UNCONTROLLED

OFFICE OF THE ATTORNEY GENERAL
STATE OF ILLINOIS

Jim Ryan
ATTORNEY GENERAL

January 31, 1996

FILE NO. 96-008

COUNTIES:
Use of Motor Fuel Tax
Funds for Nondedicated
Subdivision Roads

Honorable Gary W. Pack
State's Attorney, McHenry County
McHenry County Government Center
2200 North Seminary Avenue
Woodstock, Illinois 60098

Dear Mr. Pack:

I have your letter wherein you inquire regarding the meaning of the term "nondedicated subdivision roads", for purposes of section 5-701.15 of the Illinois Highway Code (605 ILCS 5/5-701.15 (West 1994)). For the reasons hereinafter stated, it is my opinion that the term "nondedicated subdivision roads" in section 5-701.15 refers only to those roads which were denoted as such on a subdivision plat filed prior to July 23, 1959, which have not been dedicated to the public.

Section 5-701.15 of the Illinois Highway Code provides:

"The formula allocation for counties for the distribution of motor fuel tax funds, provided for in Section 8 in the "Motor Fuel Tax Law", may be used by the county board for

Honorable Gary W. Pack - 2.

the maintenance or improvement of nondedicated subdivision roads established prior to July 23, 1959. Any such improved road becomes, by operation of law, a part of the township or district road system in accordance with Section 6-325 of this Code. The county board shall condition its approval, as required by this Section, upon proportional matching contributions, whether in cash, kind, services or otherwise, by property owners in the subdivision where such a road is situated. No more than the amount of the increase in allocation of such funds allocated under the formula as provided in Section 8 in the "Motor Fuel Tax Law" which is attributable to this amendatory Act of 1979 and any subsequent amendatory Act and subsequently approved as provided in this Section, may be expended on eligible nondedicated subdivision roads."

Based upon its plain language, section 5-701.15 is applicable only to roads that are part of a "subdivision", that are "nondedicated", and that were "established" prior to July 23, 1959.

The primary purpose of statutory construction is to ascertain and give effect to legislative intent. (People v. Zaremba (1994), 158 Ill. 2d 36). To that end, the history of legislation and the course it has taken are proper matters to be considered. (Acme Fireworks Corp. v. Bibb (1955), 6 Ill. 2d 112.) Further, it is proper to consider statutes on related subjects, although not strictly in pari materia. Scotfield v. Board of Education of Community Consol. School Dist. No. 181 (1952), 411 Ill. 11.

Honorable Gary W. Pack - 3.

Section 5-701.15 was added to the Highway Code by Public Act 81-3 (Second Special Session), effective September 19, 1979. During the course of the legislative debate regarding the amendment which became section 5-701.5, Representative Skinner, its sponsor, explained that it was made applicable only to subdivisions that were platted before July 23, 1959, because after that date counties were not allowed to plat subdivisions that did not have decent roads. (Remarks of Rep. Skinner, September 5, 1979, House Debate on Senate Bill 889, pp. 203-207.) The date of July 23, 1959, appears to refer to an Act approved on that date which added a section to the statute governing counties, requiring that counties served by the Northeastern Illinois Metropolitan Planning Commission adopt rules for the approval of plats, including minimum standards for streets. (Laws 1959, p. 2134) The counties referred to by Representative Skinner during debate are in the area to which that Act was applicable. Essentially the same provision now appears at section 5-1042 of the Counties Code (55 ILCS 5/5-1042 (West 1994)). Section 2 of the Plat Act (765 ILCS 205/2 (West 1994)) also permits counties to establish requirements for the approval of plats.

Generally, the Plat Act (765 ILCS 205/0.01 et seq. (West 1994)), which has been in effect for more than 100 years, requires that when land is subdivided into parts of less than 5 acres, a survey must be made and a plat prepared and recorded.

HARD COPIES UNCONTROLLED

Honorable Gary W. Pack - 4.

The filing or recording of a plat, and the acceptance by public authorities of streets, alleys, or other public grounds marked thereon, results in transfer of title to the public authority and dedication of those streets, alleys or other grounds. (765 ILCS 205/3 (West 1994).) However, no rights are transferred, and no dedication made, absent acceptance, either express or implied, by the public authority. (LaSalle National Bank v. City of Chicago (1974), 19 Ill. App. 3d 883, 886). Therefore, subdivisions, and the streets within them, are generally established by plats which are filed or recorded. Streets within subdivisions may be dedicated or nondedicated depending upon whether they are so marked on the plat and whether they are accepted by the appropriate public authority.

Based upon the legislative history of section 5-701.15 and its relationship to the provisions of the Plat Act, it is my opinion that the term "nondedicated subdivision roads" in section 5-701.15 refers only to nondedicated roads in subdivisions concerning which a plat was filed or recorded prior to July 23, 1959.

Sincerely,

JAMES E. RYAN
Attorney General

Information maintained by the Legislative Reference Bureau

Updating the database of the Illinois Compiled Statutes (ILCS) is an ongoing process. Recent laws may not yet be included in the ILCS database, but they are found on this site as [Public Acts](#) soon after they become law. For information concerning the relationship between statutes and Public Acts, refer to the [Guide](#).

Because the statute database is maintained primarily for legislative drafting purposes, statutory changes are sometimes included in the statute database before they take effect. If the source note at the end of a Section of the statutes includes a Public Act that has not yet taken effect, the version of the law that is currently in effect may have already been removed from the database and you should refer to that Public Act to see the changes made to the current law.

FINANCE

(30 ILCS 235/) Public Funds Investment Act.

(30 ILCS 235/0.01) (from Ch. 85, par. 900)

Sec. 0.01. Short title. This Act may be cited as the Public Funds Investment Act.

(Source: P.A. 86-1324.)

(30 ILCS 235/1) (from Ch. 85, par. 901)

Sec. 1. The words "public funds", as used in this Act, mean current operating funds, special funds, interest and sinking funds, and funds of any kind or character belonging to or in the custody of any public agency.

The words "public agency", as used in this Act, mean the State of Illinois, the various counties, townships, cities, towns, villages, school districts, educational service regions, special road districts, public water supply districts, fire protection districts, drainage districts, levee districts, sewer districts, housing authorities, the Illinois Bank Examiners' Education Foundation, the Chicago Park District, and all other political corporations or subdivisions of the State of Illinois, now or hereafter created, whether herein specifically mentioned or not. This Act does not apply to the Illinois Prepaid Tuition Trust Fund, private funds collected by the Illinois Conservation Foundation, or pension funds or retirement systems established under the Illinois Pension Code, except as otherwise provided in that Code.

The words "governmental unit", as used in this Act, have the same meaning as in the Local Government Debt Reform Act.

(Source: P.A. 98-297, eff. 1-1-14.)

(30 ILCS 235/2) (from Ch. 85, par. 902)

(Text of Section from P.A. 98-297)

Sec. 2. Authorized investments.

(a) Any public agency may invest any public funds as follows:

(1) in bonds, notes, certificates of indebtedness, treasury bills or other securities now or hereafter issued, which are guaranteed by the full faith and credit of the United States of America as to principal and interest;

(2) in bonds, notes, debentures, or other similar obligations of the United States of America, its agencies, and its instrumentalities;

(3) in interest-bearing savings accounts, interest-bearing certificates of deposit or interest-bearing time deposits or any other investments

HARD COPIES UNCONTROLLED

constituting direct obligations of any bank as defined by the Illinois Banking Act;

(4) in short term obligations of corporations organized in the United States with assets exceeding \$500,000,000 if (i) such obligations are rated at the time of purchase at one of the 3 highest classifications established by at least 2 standard rating services and which mature not later than 270 days from the date of purchase, (ii) such purchases do not exceed 10% of the corporation's outstanding obligations and (iii) no more than one-third of the public agency's funds may be invested in short term obligations of corporations; or

(5) in money market mutual funds registered under the Investment Company Act of 1940, provided that the portfolio of any such money market mutual fund is limited to obligations described in paragraph (1) or (2) of this subsection and to agreements to repurchase such obligations.

(a-1) In addition to any other investments authorized under this Act, a municipality, county, or other governmental unit may invest its public funds in interest bearing bonds of any county, township, city, village, incorporated town, municipal corporation, or school district, of the State of Illinois, of any other state, or of any political subdivision or agency of the State of Illinois or of any other state, whether the interest earned thereon is taxable or tax-exempt under federal law. The bonds shall be registered in the name of the municipality, county, or other governmental unit, or held under a custodial agreement at a bank. The bonds shall be rated at the time of purchase within the 4 highest general classifications established by a rating service of nationally recognized expertise in rating bonds of states and their political subdivisions.

(b) Investments may be made only in banks which are insured by the Federal Deposit Insurance Corporation. Any public agency may invest any public funds in short term discount obligations of the Federal National Mortgage Association or in shares or other forms of securities legally issuable by savings banks or savings and loan associations incorporated under the laws of this State or any other state or under the laws of the United States. Investments may be made only in those savings banks or savings and loan associations the shares, or investment certificates of which are insured by the Federal Deposit Insurance Corporation. Any such securities may be purchased at the offering or market price thereof at the time of such purchase. All such securities so purchased shall mature or be redeemable on a date or dates prior to the time when, in the judgment of such governing authority, the public funds so invested will be required for expenditure by such public agency or its governing authority. The expressed judgment of any such governing authority as to the time when any public funds will be required for expenditure or be redeemable is final and conclusive. Any public agency may invest any public funds in dividend-bearing share accounts, share certificate accounts or class of share accounts of a credit union chartered under the laws of this State or the laws of the United States; provided, however, the principal office of any such credit union must be located within the State of Illinois. Investments may be made only in those credit unions the accounts of which are insured

HARD COPIES UNCONTROLLED

by applicable law.

(c) For purposes of this Section, the term "agencies of the United States of America" includes: (i) the federal land banks, federal intermediate credit banks, banks for cooperative, federal farm credit banks, or any other entity authorized to issue debt obligations under the Farm Credit Act of 1971 (12 U.S.C. 2001 et seq.) and Acts amendatory thereto; (ii) the federal home loan banks and the federal home loan mortgage corporation; and (iii) any other agency created by Act of Congress.

(d) Except for pecuniary interests permitted under subsection (f) of Section 3-14-4 of the Illinois Municipal Code or under Section 3.2 of the Public Officer Prohibited Practices Act, no person acting as treasurer or financial officer or who is employed in any similar capacity by or for a public agency may do any of the following:

(1) have any interest, directly or indirectly, in any investments in which the agency is authorized to invest.

(2) have any interest, directly or indirectly, in the sellers, sponsors, or managers of those investments.

(3) receive, in any manner, compensation of any kind from any investments in which the agency is authorized to invest.

(e) Any public agency may also invest any public funds in a Public Treasurers' Investment Pool created under Section 17 of the State Treasurer Act. Any public agency may also invest any public funds in a fund managed, operated, and administered by a bank, subsidiary of a bank, or subsidiary of a bank holding company or use the services of such an entity to hold and invest or advise regarding the investment of any public funds.

(f) To the extent a public agency has custody of funds not owned by it or another public agency and does not otherwise have authority to invest such funds, the public agency may invest such funds as if they were its own. Such funds must be released to the appropriate person at the earliest reasonable time, but in no case exceeding 31 days, after the private person becomes entitled to the receipt of them. All earnings accruing on any investments or deposits made pursuant to the provisions of this Act shall be credited to the public agency by or for which such investments or deposits were made, except as provided otherwise in Section 4.1 of the State Finance Act or the Local Governmental Tax Collection Act, and except where by specific statutory provisions such earnings are directed to be credited to and paid to a particular fund.

(g) A public agency may purchase or invest in repurchase agreements of government securities having the meaning set out in the Government Securities Act of 1986, as now or hereafter amended or succeeded, subject to the provisions of said Act and the regulations issued thereunder. The government securities, unless registered or inscribed in the name of the public agency, shall be purchased through banks or trust companies authorized to do business in the State of Illinois.

(h) Except for repurchase agreements of government securities which are subject to the Government Securities Act of 1986, as now or hereafter amended or succeeded, no public agency may purchase or invest in instruments which constitute repurchase agreements, and no financial institution may enter into such an agreement with or on behalf of any public agency unless the instrument and the transaction meet the following

HARD COPIES UNCONTROLLED

requirements:

(1) The securities, unless registered or inscribed in the name of the public agency, are purchased through banks or trust companies authorized to do business in the State of Illinois.

(2) An authorized public officer after ascertaining which firm will give the most favorable rate of interest, directs the custodial bank to "purchase" specified securities from a designated institution. The "custodial bank" is the bank or trust company, or agency of government, which acts for the public agency in connection with repurchase agreements involving the investment of funds by the public agency. The State Treasurer may act as custodial bank for public agencies executing repurchase agreements. To the extent the Treasurer acts in this capacity, he is hereby authorized to pass through to such public agencies any charges assessed by the Federal Reserve Bank.

(3) A custodial bank must be a member bank of the Federal Reserve System or maintain accounts with member banks. All transfers of book-entry securities must be accomplished on a Reserve Bank's computer records through a member bank of the Federal Reserve System. These securities must be credited to the public agency on the records of the custodial bank and the transaction must be confirmed in writing to the public agency by the custodial bank.

(4) Trading partners shall be limited to banks or trust companies authorized to do business in the State of Illinois or to registered primary reporting dealers.

(5) The security interest must be perfected.

(6) The public agency enters into a written master repurchase agreement which outlines the basic responsibilities and liabilities of both buyer and seller.

(7) Agreements shall be for periods of 330 days or less.

(8) The authorized public officer of the public agency informs the custodial bank in writing of the maturity details of the repurchase agreement.

(9) The custodial bank must take delivery of and maintain the securities in its custody for the account of the public agency and confirm the transaction in writing to the public agency. The Custodial Undertaking shall provide that the custodian takes possession of the securities exclusively for the public agency; that the securities are free of any claims against the trading partner; and any claims by the custodian are subordinate to the public agency's claims to rights to those securities.

(10) The obligations purchased by a public agency may only be sold or presented for redemption or payment by the fiscal agent bank or trust company holding the obligations upon the written instruction of the public agency or officer authorized to make such investments.

(11) The custodial bank shall be liable to the public agency for any monetary loss suffered by the public agency due to the failure of the custodial bank to take and maintain possession of such securities.

(i) Notwithstanding the foregoing restrictions on investment in instruments constituting repurchase agreements

HARD COPIES UNCONTROLLED

the Illinois Housing Development Authority may invest in, and any financial institution with capital of at least \$250,000,000 may act as custodian for, instruments that constitute repurchase agreements, provided that the Illinois Housing Development Authority, in making each such investment, complies with the safety and soundness guidelines for engaging in repurchase transactions applicable to federally insured banks, savings banks, savings and loan associations or other depository institutions as set forth in the Federal Financial Institutions Examination Council Policy Statement Regarding Repurchase Agreements and any regulations issued, or which may be issued by the supervisory federal authority pertaining thereto and any amendments thereto; provided further that the securities shall be either (i) direct general obligations of, or obligations the payment of the principal of and/or interest on which are unconditionally guaranteed by, the United States of America or (ii) any obligations of any agency, corporation or subsidiary thereof controlled or supervised by and acting as an instrumentality of the United States Government pursuant to authority granted by the Congress of the United States and provided further that the security interest must be perfected by either the Illinois Housing Development Authority, its custodian or its agent receiving possession of the securities either physically or transferred through a nationally recognized book entry system.

(j) In addition to all other investments authorized under this Section, a community college district may invest public funds in any mutual funds that invest primarily in corporate investment grade or global government short term bonds. Purchases of mutual funds that invest primarily in global government short term bonds shall be limited to funds with assets of at least \$100 million and that are rated at the time of purchase as one of the 10 highest classifications established by a recognized rating service. The investments shall be subject to approval by the local community college board of trustees. Each community college board of trustees shall develop a policy regarding the percentage of the college's investment portfolio that can be invested in such funds.

Nothing in this Section shall be construed to authorize an intergovernmental risk management entity to accept the deposit of public funds except for risk management purposes.

(Source: P.A. 97-129, eff. 7-14-11; 98-297, eff. 1-1-14.)

(Text of Section from P.A. 98-390)

Sec. 2. Authorized investments.

(a) Any public agency may invest any public funds as follows:

(1) in bonds, notes, certificates of indebtedness, treasury bills or other securities now or hereafter issued, which are guaranteed by the full faith and credit of the United States of America as to principal and interest;

(2) in bonds, notes, debentures, or other similar obligations of the United States of America, its agencies, and its instrumentalities;

(3) in interest-bearing savings accounts, interest-bearing certificates of deposit or interest-bearing time deposits or any other investments constituting direct obligations of any bank as defined by

HARD COPIES UNCONTROLLED

the Illinois Banking Act;

(4) in short term obligations of corporations organized in the United States with assets exceeding \$500,000,000 if (i) such obligations are rated at the time of purchase at one of the 3 highest classifications established by at least 2 standard rating services and which mature not later than 270 days from the date of purchase, (ii) such purchases do not exceed 10% of the corporation's outstanding obligations and (iii) no more than one-third of the public agency's funds may be invested in short term obligations of corporations; or

(5) in money market mutual funds registered under the Investment Company Act of 1940, provided that the portfolio of any such money market mutual fund is limited to obligations described in paragraph (1) or (2) of this subsection and to agreements to repurchase such obligations.

(a-1) In addition to any other investments authorized under this Act, a municipality, park district, forest preserve district, conservation district, or a county may invest its public funds in interest bearing bonds of any county, township, city, village, incorporated town, municipal corporation, or school district, of the State of Illinois, of any other state, or of any political subdivision or agency of the State of Illinois or of any other state, whether the interest earned thereon is taxable or tax-exempt under federal law. The bonds shall be registered in the name of the municipality, park district, forest preserve district, conservation district, or county or held under a custodial agreement at a bank. The bonds shall be rated at the time of purchase within the 4 highest general classifications established by a rating service of nationally recognized expertise in rating bonds of states and their political subdivisions.

(b) Investments may be made only in banks which are insured by the Federal Deposit Insurance Corporation. Any public agency may invest any public funds in short term discount obligations of the Federal National Mortgage Association or in shares or other forms of securities legally issuable by savings banks or savings and loan associations incorporated under the laws of this State or any other state or under the laws of the United States. Investments may be made only in those savings banks or savings and loan associations the shares, or investment certificates of which are insured by the Federal Deposit Insurance Corporation. Any such securities may be purchased at the offering or market price thereof at the time of such purchase. All such securities so purchased shall mature or be redeemable on a date or dates prior to the time when, in the judgment of such governing authority, the public funds so invested will be required for expenditure by such public agency or its governing authority. The expressed judgment of any such governing authority as to the time when any public funds will be required for expenditure or be redeemable is final and conclusive. Any public agency may invest any public funds in dividend-bearing share accounts, share certificate accounts or class of share accounts of a credit union chartered under the laws of this State or the laws of the United States; provided, however, the principal office of any such credit union must be located within the State of Illinois. Investments may be made

HARD COPIES UNCONTROLLED

only in those credit unions the accounts of which are insured by applicable law.

(c) For purposes of this Section, the term "agencies of the United States of America" includes: (i) the federal land banks, federal intermediate credit banks, banks for cooperative, federal farm credit banks, or any other entity authorized to issue debt obligations under the Farm Credit Act of 1971 (12 U.S.C. 2001 et seq.) and Acts amendatory thereto; (ii) the federal home loan banks and the federal home loan mortgage corporation; and (iii) any other agency created by Act of Congress.

(d) Except for pecuniary interests permitted under subsection (f) of Section 3-14-4 of the Illinois Municipal Code or under Section 3.2 of the Public Officer Prohibited Practices Act, no person acting as treasurer or financial officer or who is employed in any similar capacity by or for a public agency may do any of the following:

(1) have any interest, directly or indirectly, in any investments in which the agency is authorized to invest.

(2) have any interest, directly or indirectly, in the sellers, sponsors, or managers of those investments.

(3) receive, in any manner, compensation of any kind from any investments in which the agency is authorized to invest.

(e) Any public agency may also invest any public funds in a Public Treasurers' Investment Pool created under Section 17 of the State Treasurer Act. Any public agency may also invest any public funds in a fund managed, operated, and administered by a bank, subsidiary of a bank, or subsidiary of a bank holding company or use the services of such an entity to hold and invest or advise regarding the investment of any public funds.

(f) To the extent a public agency has custody of funds not owned by it or another public agency and does not otherwise have authority to invest such funds, the public agency may invest such funds as if they were its own. Such funds must be released to the appropriate person at the earliest reasonable time, but in no case exceeding 31 days, after the private person becomes entitled to the receipt of them. All earnings accruing on any investments or deposits made pursuant to the provisions of this Act shall be credited to the public agency by or for which such investments or deposits were made, except as provided otherwise in Section 4.1 of the State Finance Act or the Local Governmental Tax Collection Act, and except where by specific statutory provisions such earnings are directed to be credited to and paid to a particular fund.

(g) A public agency may purchase or invest in repurchase agreements of government securities having the meaning set out in the Government Securities Act of 1986, as now or hereafter amended or succeeded, subject to the provisions of said Act and the regulations issued thereunder. The government securities, unless registered or inscribed in the name of the public agency, shall be purchased through banks or trust companies authorized to do business in the State of Illinois.

(h) Except for repurchase agreements of government securities which are subject to the Government Securities Act of 1986, as now or hereafter amended or succeeded, no public agency may purchase or invest in instruments which constitute repurchase agreements, and no financial institution may enter into such an agreement with or on behalf of any public agency

HARD COPIES UNCONTROLLED

unless the instrument and the transaction meet the following requirements:

(1) The securities, unless registered or inscribed in the name of the public agency, are purchased through banks or trust companies authorized to do business in the State of Illinois.

(2) An authorized public officer after ascertaining which firm will give the most favorable rate of interest, directs the custodial bank to "purchase" specified securities from a designated institution. The "custodial bank" is the bank or trust company, or agency of government, which acts for the public agency in connection with repurchase agreements involving the investment of funds by the public agency. The State Treasurer may act as custodial bank for public agencies executing repurchase agreements. To the extent the Treasurer acts in this capacity, he is hereby authorized to pass through to such public agencies any charges assessed by the Federal Reserve Bank.

(3) A custodial bank must be a member bank of the Federal Reserve System or maintain accounts with member banks. All transfers of book-entry securities must be accomplished on a Reserve Bank's computer records through a member bank of the Federal Reserve System. These securities must be credited to the public agency on the records of the custodial bank and the transaction must be confirmed in writing to the public agency by the custodial bank.

(4) Trading partners shall be limited to banks or trust companies authorized to do business in the State of Illinois or to registered primary reporting dealers.

(5) The security interest must be perfected.

(6) The public agency enters into a written master repurchase agreement which outlines the basic responsibilities and liabilities of both buyer and seller.

(7) Agreements shall be for periods of 330 days or less.

(8) The authorized public officer of the public agency informs the custodial bank in writing of the maturity details of the repurchase agreement.

(9) The custodial bank must take delivery of and maintain the securities in its custody for the account of the public agency and confirm the transaction in writing to the public agency. The Custodial Undertaking shall provide that the custodian takes possession of the securities exclusively for the public agency; that the securities are free of any claims against the trading partner; and any claims by the custodian are subordinate to the public agency's claims to rights to those securities.

(10) The obligations purchased by a public agency may only be sold or presented for redemption or payment by the fiscal agent bank or trust company holding the obligations upon the written instruction of the public agency or officer authorized to make such investments.

(11) The custodial bank shall be liable to the public agency for any monetary loss suffered by the public agency due to the failure of the custodial bank to take and maintain possession of such securities.

(i) Notwithstanding the foregoing restrictions on

HARD COPIES UNCONTROLLED

investment in instruments constituting repurchase agreements the Illinois Housing Development Authority may invest in, and any financial institution with capital of at least \$250,000,000 may act as custodian for, instruments that constitute repurchase agreements, provided that the Illinois Housing Development Authority, in making each such investment, complies with the safety and soundness guidelines for engaging in repurchase transactions applicable to federally insured banks, savings banks, savings and loan associations or other depository institutions as set forth in the Federal Financial Institutions Examination Council Policy Statement Regarding Repurchase Agreements and any regulations issued, or which may be issued by the supervisory federal authority pertaining thereto and any amendments thereto; provided further that the securities shall be either (i) direct general obligations of, or obligations the payment of the principal of and/or interest on which are unconditionally guaranteed by, the United States of America or (ii) any obligations of any agency, corporation or subsidiary thereof controlled or supervised by and acting as an instrumentality of the United States Government pursuant to authority granted by the Congress of the United States and provided further that the security interest must be perfected by either the Illinois Housing Development Authority, its custodian or its agent receiving possession of the securities either physically or transferred through a nationally recognized book entry system.

(j) In addition to all other investments authorized under this Section, a community college district may invest public funds in any mutual funds that invest primarily in corporate investment grade or global government short term bonds. Purchases of mutual funds that invest primarily in global government short term bonds shall be limited to funds with assets of at least \$100 million and that are rated at the time of purchase as one of the 10 highest classifications established by a recognized rating service. The investments shall be subject to approval by the local community college board of trustees. Each community college board of trustees shall develop a policy regarding the percentage of the college's investment portfolio that can be invested in such funds.

Nothing in this Section shall be construed to authorize an intergovernmental risk management entity to accept the deposit of public funds except for risk management purposes.

(Source: P.A. 97-129, eff. 7-14-11; 98-390, eff. 8-16-13.)

(30 ILCS 235/2.5)

Sec. 2.5. Investment policy.

(a) Investment of public funds by a public agency shall be governed by a written investment policy adopted by the public agency. The level of detail and complexity of the investment policy shall be appropriate to the nature of the funds, the purpose for the funds, and the amount of the public funds within the investment portfolio. The policy shall address safety of principal, liquidity of funds, and return on investment and shall require that the investment portfolio be structured in such manner as to provide sufficient liquidity to pay obligations as they come due. In addition, the investment policy shall include or address the following:

- (1) a listing of authorized investments;
- (2) a rule, such as the "prudent person rule",

HARD COPIES UNCONTROLLED

establishing the standard of care that must be maintained by the persons investing the public funds;

(3) investment guidelines that are appropriate to the nature of the funds, the purpose for the funds, and the amount of the public funds within the investment portfolio;

(4) a policy regarding diversification of the investment portfolio that is appropriate to the nature of the funds, the purpose for the funds, and the amount of the public funds within the investment portfolio;

(5) guidelines regarding collateral requirements, if any, for the deposit of public funds in a financial institution made pursuant to this Act, and, if applicable, guidelines for contractual arrangements for the custody and safekeeping of that collateral;

(6) a policy regarding the establishment of a system of internal controls and written operational procedures designed to prevent losses of funds that might arise from fraud, employee error, misrepresentation by third parties, or imprudent actions by employees of the entity;

(7) identification of the chief investment officer who is responsible for establishing the internal controls and written procedures for the operation of the investment program;

(8) performance measures that are appropriate to the nature of the funds, the purpose for the funds, and the amount of the public funds within the investment portfolio;

(9) a policy regarding appropriate periodic review of the investment portfolio, its effectiveness in meeting the public agency's needs for safety, liquidity, rate of return, and diversification, and its general performance;

(10) a policy establishing at least quarterly written reports of investment activities by the public agency's chief financial officer for submission to the governing body and chief executive officer of the public agency. The reports shall include information regarding securities in the portfolio by class or type, book value, income earned, and market value as of the report date;

(11) a policy regarding the selection of investment advisors, money managers, and financial institutions; and

(12) a policy regarding ethics and conflicts of interest.

(b) For purposes of the State or a county, the investment policy shall be adopted by the elected treasurer and presented to the chief executive officer and the governing body. For purposes of any other public agency, the investment policy shall be adopted by the governing body of the public agency.

(c) The investment policy shall be made available to the public at the main administrative office of the public agency.

(d) The written investment policy required under this Section shall be developed and implemented by January 1, 2000. (Source: P.A. 90-688, eff. 7-31-98.)

(30 ILCS 235/2.10)

Sec. 2.10. Unit of local government; deposit at reduced rate of interest. The treasurer of a unit of local government may, in his or her discretion, deposit public moneys of that unit of local government in a financial institution pursuant to an agreement that provides for a reduced rate of interest,

HARD COPIES UNCONTROLLED

provided that the institution agrees to expend an amount of money equal to the amount of the reduction for senior centers. (Source: P.A. 93-246, eff. 7-22-03.)

(30 ILCS 235/3) (from Ch. 85, par. 903)

Sec. 3. If any securities, purchased under authority of Section 2 hereof, are issuable to a designated payee or to the order of a designated payee, then the public agency shall be so designated, and further, if such securities are purchased with money taken from a particular fund of a public agency, the name of such fund shall be added to that of such public agency. If any such securities are registerable, either as to principal or interest, or both, then such securities shall be so registered in the name of the public agency, and in the name of the fund to which they are to be credited. (Source: Laws 1943, vol. 1, p. 951.)

(30 ILCS 235/4) (from Ch. 85, par. 904)

Sec. 4. All securities purchased under the authority of this Act shall be held for the benefit of the public agency which purchased them, and if purchased with money taken from a particular fund, such securities shall be credited to and deemed to be a part of such fund, and shall be held for the benefit thereof. All securities so purchased shall be deposited and held in a safe place by the person or persons having custody of the fund to which they are credited, and such person or persons are responsible upon his or their official bond or bonds for the safekeeping of all such securities. Any securities purchased by any such public agency under authority of this Act, may be sold at any time, at the then current market price thereof, by the governing authority of such public agency. Except as provided in Section 4.1 of "An Act in relation to State finance", all payments received as principal or interest, or otherwise, derived from any such securities shall be credited to the public agency and to the fund by or for which such securities were purchased. (Source: P.A. 84-1378.)

(30 ILCS 235/5) (from Ch. 85, par. 905)

Sec. 5. This Act, without reference to any other statute, shall be deemed full and complete authority for the investment of public funds, as hereinabove provided, and shall be construed as an additional and alternative method therefor. (Source: Laws 1943, vol. 1, p. 951.)

(30 ILCS 235/6) (from Ch. 85, par. 906)

Sec. 6. Report of financial institutions.

(a) No bank shall receive any public funds unless it has furnished the corporate authorities of a public agency submitting a deposit with copies of the last two sworn statements of resources and liabilities which the bank is required to furnish to the Commissioner of Banks and Real Estate or to the Comptroller of the Currency. Each bank designated as a depository for public funds shall, while acting as such depository, furnish the corporate authorities of a public agency with a copy of all statements of resources and liabilities which it is required to furnish to the Commissioner of Banks and Real Estate or to the Comptroller of the Currency; provided, that if such funds or moneys are

HARD COPIES UNCONTROLLED

deposited in a bank, the amount of all such deposits not collateralized or insured by an agency of the federal government shall not exceed 75% of the capital stock and surplus of such bank, and the corporate authorities of a public agency submitting a deposit shall not be discharged from responsibility for any funds or moneys deposited in any bank in excess of such limitation.

(b) No savings bank or savings and loan association shall receive public funds unless it has furnished the corporate authorities of a public agency submitting a deposit with copies of the last 2 sworn statements of resources and liabilities which the savings bank or savings and loan association is required to furnish to the Commissioner of Banks and Real Estate or the Federal Deposit Insurance Corporation. Each savings bank or savings and loan association designated as a depository for public funds shall, while acting as such depository, furnish the corporate authorities of a public agency with a copy of all statements of resources and liabilities which it is required to furnish to the Commissioner of Banks and Real Estate or the Federal Deposit Insurance Corporation; provided, that if such funds or moneys are deposited in a savings bank or savings and loan association, the amount of all such deposits not collateralized or insured by an agency of the federal government shall not exceed 75% of the net worth of such savings bank or savings and loan association as defined by the Federal Deposit Insurance Corporation, and the corporate authorities of a public agency submitting a deposit shall not be discharged from responsibility for any funds or moneys deposited in any savings bank or savings and loan association in excess of such limitation.

(c) No credit union shall receive public funds unless it has furnished the corporate authorities of a public agency submitting a share deposit with copies of the last two reports of examination prepared by or submitted to the Illinois Department of Financial Institutions or the National Credit Union Administration. Each credit union designated as a depository for public funds shall, while acting as such depository, furnish the corporate authorities of a public agency with a copy of all reports of examination prepared by or furnished to the Illinois Department of Financial Institutions or the National Credit Union Administration; provided that if such funds or moneys are invested in a credit union account, the amount of all such investments not collateralized or insured by an agency of the federal government or other approved share insurer shall not exceed 50% of the unimpaired capital and surplus of such credit union, which shall include shares, reserves and undivided earnings and the corporate authorities of a public agency making an investment shall not be discharged from responsibility for any funds or moneys invested in a credit union in excess of such limitation.

(d) Whenever a public agency deposits any public funds in a financial institution, the public agency may enter into an agreement with the financial institution requiring any funds not insured by the Federal Deposit Insurance Corporation or the National Credit Union Administration or other approved share insurer to be collateralized by any of the following classes of securities, provided there has been no default in the payment of principal or interest thereon:

HARD COPIES UNCONTROLLED

(1) Bonds, notes, or other securities constituting direct and general obligations of the United States, the bonds, notes, or other securities constituting the direct and general obligation of any agency or instrumentality of the United States, the interest and principal of which is unconditionally guaranteed by the United States, and bonds, notes, or other securities or evidence of indebtedness constituting the obligation of a U.S. agency or instrumentality.

(2) Direct and general obligation bonds of the State of Illinois or of any other state of the United States.

(3) Revenue bonds of this State or any authority, board, commission, or similar agency thereof.

(4) Direct and general obligation bonds of any city, town, county, school district, or other taxing body of any state, the debt service of which is payable from general ad valorem taxes.

(5) Revenue bonds of any city, town, county, or school district of the State of Illinois.

(6) Obligations issued, assumed, or guaranteed by the International Finance Corporation, the principal of which is not amortized during the life of the obligation, but no such obligation shall be accepted at more than 90% of its market value.

(7) Illinois Affordable Housing Program Trust Fund Bonds or Notes as defined in and issued pursuant to the Illinois Housing Development Act.

(8) In an amount equal to at least market value of that amount of funds deposited exceeding the insurance limitation provided by the Federal Deposit Insurance Corporation or the National Credit Union Administration or other approved share insurer: (i) securities, (ii) mortgages, (iii) letters of credit issued by a Federal Home Loan Bank, or (iv) loans covered by a State Guarantee under the Illinois Farm Development Act, if that guarantee has been assumed by the Illinois Finance Authority under Section 845-75 of the Illinois Finance Authority Act, and loans covered by a State Guarantee under Article 830 of the Illinois Finance Authority Act.

(9) Certificates of deposit or share certificates issued to the depository institution pledging them as security. The public agency may require security in the amount of 125% of the value of the public agency deposit. Such certificate of deposit or share certificate shall:

(i) be fully insured by the Federal Deposit Insurance Corporation, the Federal Savings and Loan Insurance Corporation, or the National Credit Union Share Insurance Fund or issued by a depository institution which is rated within the 3 highest classifications established by at least one of the 2 standard rating services;

(ii) be issued by a financial institution having assets of \$15,000,000 or more; and

(iii) be issued by either a savings and loan association having a capital to asset ratio of at least 2%, by a bank having a capital to asset ratio of at least 6% or by a credit union having a capital to asset ratio of at least 4%.

The depository institution shall effect the assignment of the certificate of deposit or share certificate to the public

HARD COPIES UNCONTROLLED

agency and shall agree that, in the event the issuer of the certificate fails to maintain the capital to asset ratio required by this Section, such certificate of deposit or share certificate shall be replaced by additional suitable security.

(e) The public agency may accept a system established by the State Treasurer to aggregate permissible securities received as collateral from financial institutions in a collateral pool to secure public deposits of the institutions that have pledged securities to the pool.

(f) The public agency may at any time declare any particular security ineligible to qualify as collateral when, in the public agency's judgment, it is deemed desirable to do so.

(g) Notwithstanding any other provision of this Section, as security a public agency may, at its discretion, accept a bond, executed by a company authorized to transact the kinds of business described in clause (g) of Section 4 of the Illinois Insurance Code, in an amount not less than the amount of the deposits required by this Section to be secured, payable to the public agency for the benefit of the People of the unit of government, in a form that is acceptable to the public agency.

(h) Paragraphs (a), (b), (c), (d), (e), (f), and (g) of this Section do not apply to the University of Illinois, Southern Illinois University, Chicago State University, Eastern Illinois University, Governors State University, Illinois State University, Northeastern Illinois University, Northern Illinois University, Western Illinois University, the Cooperative Computer Center and public community colleges.
(Source: P.A. 95-331, eff. 8-21-07.)

(30 ILCS 235/6.5)

Sec. 6.5. Federally insured deposits at Illinois financial institutions.

(a) Notwithstanding any other provision of this Act or any other statute, whenever a public agency invests public funds in an interest-bearing savings account, interest-bearing certificate of deposit, or interest-bearing time deposit under Section 2 of this Act, the provisions of Section 6 of this Act and any other statutory requirements pertaining to the eligibility of a bank to receive or hold public deposits or to the pledging of collateral by a bank to secure public deposits do not apply to any bank receiving or holding all or part of the invested public funds if (i) the public agency initiates the investment at or through a bank located in Illinois and (ii) the invested public funds are at all time fully insured by an agency or instrumentality of the federal government.

(b) Nothing in this Section is intended to:

(1) prohibit a public agency from requiring the bank at or through which the investment of public funds is initiated to provide the public agency with the information otherwise required by subsections (a), (b), or (c) of Section 6 of this Act as a condition of investing the public funds at or through that bank; or

(2) permit a bank to receive or hold public deposits if that bank is prohibited from doing so by any rule, sanction, or order issued by a regulatory agency or by a court.

(c) For purposes of this Section, the term "bank" includes any person doing a banking business whether subject to the

HARD COPIES UNCONTROLLED

laws of this or any other jurisdiction.
(Source: P.A. 93-756, eff. 7-16-04.)

(30 ILCS 235/7) (from Ch. 85, par. 907)

Sec. 7. When investing or depositing public funds, each custodian shall, to the extent permitted by this Act and by the lawful and reasonable performance of his custodial duties, invest or deposit such funds with or in minority-owned financial institutions within this State.

(Source: P.A. 84-754.)

(30 ILCS 235/8)

Sec. 8. Consideration of financial institution's commitment to its community.

(a) In addition to any other requirements of this Act, a public agency is authorized to consider the financial institution's record and current level of financial commitment to its local community when deciding whether to deposit public funds in that financial institution. The public agency may consider factors including, but not necessarily limited to:

(1) for financial institutions subject to the federal Community Reinvestment Act of 1977, the current and historical ratings that the financial institution has received, to the extent that those ratings are publicly available, under the federal Community Reinvestment Act of 1977;

(2) any changes in ownership, management, policies, or practices of the financial institution that may affect the level of the financial institution's commitment to its community;

(3) the financial impact that the withdrawal or denial of deposits of public funds might have on the financial institution;

(4) the financial impact to the public agency as a result of withdrawing public funds or refusing to deposit additional public funds in the financial institution; and

(5) any additional burden on the resources of the public agency that might result from ceasing to maintain deposits of public funds at the financial institution under consideration.

(b) Nothing in this Section shall be construed as authorizing the public agency to conduct an examination or investigation of a financial institution or to receive information that is not publicly available and the disclosure of which is otherwise prohibited by law.

(Source: P.A. 93-251, eff. 7-1-04.)

Information maintained by the Legislative Reference Bureau

Updating the database of the Illinois Compiled Statutes (ILCS) is an ongoing process. Recent laws may not yet be included in the ILCS database, but they are found on this site as [Public Acts](#) soon after they become law. For information concerning the relationship between statutes and Public Acts, refer to the [Guide](#).

Because the statute database is maintained primarily for legislative drafting purposes, statutory changes are sometimes included in the statute database before they take effect. If the source note at the end of a Section of the statutes includes a Public Act that has not yet taken effect, the version of the law that is currently in effect may have already been removed from the database and you should refer to that Public Act to see the changes made to the current law.

**LOCAL GOVERNMENT
(50 ILCS 340/) Investment of Municipal Funds Act.**

(50 ILCS 340/0.01) (from Ch. 146 1/2, par. 3.01)

Sec. 0.01. Short title. This Act may be cited as the Investment of Municipal Funds Act.
(Source: P.A. 86-1324.)

(50 ILCS 340/1) (from Ch. 146 1/2, par. 3.1)

Sec. 1. Every county, park district, sanitary district, or other municipal corporation, holding in its treasury funds which are set aside for use for particular purposes, including any funds that are disbursed to a county or municipality as their share of the taxes collected under the "Motor Fuel Tax Law", but which are not immediately necessary for those purposes, by ordinance, may use those funds, or any of them, in the purchase of tax anticipation warrants issued by the county, park district, sanitary district, or other municipal corporation possessing the funds against taxes levied by that county, park district, sanitary district, or other municipal corporation. These warrants shall bear interest not to exceed four percent annually. All interest upon these warrants, and all money paid in redemption of these warrants, or received from the resale thereof, shall at once be credited to and placed in the particular fund used to purchase the specified warrants. Likewise, every county, park district, sanitary district, or other municipal corporation, by resolution or ordinance may use the money in the specified funds in the purchase of municipal bonds issued by the county, park district, sanitary district, or other municipal corporation, possessing the funds and representing an obligation and pledging the credit of that county, park district, sanitary district, or other municipal corporation, or bonds and other interest bearing obligations of the United States, of the State of Illinois, or of any other state or of any political subdivision or agency of the State of Illinois or of any other state, whether the interest earned thereon is taxable or tax-exempt under federal law, including savings accounts and savings certificates of deposit of any State or National Bank if such accounts and certificates are fully insured by the Federal Deposit Insurance Corporation, withdrawable capital accounts or deposits of State or federal chartered savings and loan associations which are fully insured by the Federal Savings and Loan Insurance Corporation, or treasury notes and other securities issued by agencies of the United States. All interest upon these bonds or obligations and all money paid in redemption of these bonds or obligations or realized from the sale thereof, if afterwards sold, shall at once be credited to

HARD COPIES UNCONTROLLED

and placed in the particular fund used to purchase the specified bonds or obligations.

No bank or savings and loan association shall receive public funds as permitted by this Section, unless it has complied with the requirements established pursuant to Section 6 of "An Act relating to certain investments of public funds by public agencies", approved July 23, 1943, as now or hereafter amended.

This amendatory Act of 1975 is not a limit on any home rule unit.

(Source: P.A. 93-360, eff. 7-24-03.)

(50 ILCS 340/2) (from Ch. 146 1/2, par. 3.2)

Sec. 2. If at any time it is deemed expedient to convert into money any tax anticipation warrants theretofore issued and purchased with public funds pursuant to the provisions of Section 1 of this Act, before receipt of the taxes in anticipation of which the warrants were issued, the governing body of the county, park district, sanitary district, or other municipal corporation, by ordinance or resolution, may authorize a resale of such warrants and adjust the interest rate thereon or may authorize the issuance and sale of a like principal amount of any warrants for the same purpose and in anticipation of the same taxes as the original warrants were issued. These new warrants may have any date subsequent to the date of the original tax anticipation warrants. The new tax anticipation warrants shall be of the denomination and shall bear interest at the rate, not to exceed the statutory rate, that is authorized by the ordinance or resolution specified in this section.

Simultaneously with the delivery of these new tax anticipation warrants a like principal amount of the original warrants that were issued against the same tax that is anticipated by the new warrants shall be paid and cancelled. The proceeds of the sale of these new tax anticipation warrants shall be used first to restore to the fund or funds so invested in the original tax anticipation warrants, money equivalent to the par value and accrued interest of the original tax anticipation warrants and the balance, if any, shall revert to the fund for the creation of which the tax so anticipated was levied.

When tax anticipation warrants are reissued they shall bear the index numerical designation of the original warrants and shall be subnumbered consecutively in the order of reissuance, and shall be paid in the direct order of reissuance, beginning with the earliest subnumber.

In determining the priority of payment of more than one series of tax anticipation warrants against the collection of the same tax the various series shall be treated as having been issued on the date of the original issue of each series of warrants. The series prior in point of time as thus determined shall be paid first.

This Act shall not apply to cities, villages, and incorporated towns.

(Source: Laws 1941, vol. 2, p. 473.)

HARD COPIES UNCONTROLLED

(605 ILCS 5/9-101) (from Ch. 121, par. 9-101)

Sec. 9-101. Nothing in this Code shall prevent the execution of cooperative agreements among governmental agencies.

Any municipality may negotiate an agreement with the Department whereby the municipality may use such funds as are available to it for that purpose for the construction or maintenance of a State highway within its boundaries or with the corporate authority of a county or road district for the construction or maintenance of a highway on the county highway system or township or district road system outside of its municipal boundaries.

The county board may negotiate an agreement with the Department whereby the county may use such funds as are available to it for that purpose for the construction or maintenance of a highway on the State highway system or with a municipality for the construction or maintenance of streets on the municipal street system of such municipality.

HARD COPIES UNCONTROLLED

Illinois Department of Transportation

2300 South Dirksen Parkway / Springfield, Illinois / 62764

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2013-08
SUBJECT: BICYCLE FACILITIES
ISSUED DATE: October 23, 2013
EFFECTIVE DATE: October 25, 2013

This memorandum supersedes Chapter 42 dated January 2006 of the Bureau of Local Roads & Streets Manual.

The Department has updated Chapter 42, Bicycle Facilities, to use design recommendations contained in AASHTO's *Guide for the Development of Bicycle Facilities, 4th edition, 2012* when bicycle accommodations are provided. No changes have been made as to when bicycle accommodations are required except when a local agency project impacts a state highway the design policies in Chapter 17 of the Bureau of Design & Environment will apply.

The Federal Highway Administration has also recommended the use of the National Association of City Transportation Officials' *Urban Bikeway Design Guide* and the Institute of Transportation Engineers' *Designing Urban Walkable Thoroughfares* for the development of bikeways in urban areas.

Please contact the Bureau's Local Policy & Technology Unit at IDOT.LocalPolicy@illinois.gov with any questions.

**Federal Highway
Administration**

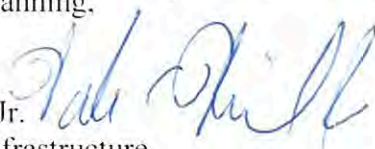

Memorandum

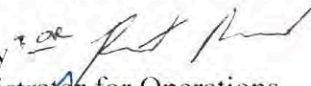

SENT BY ELECTRONIC MAIL

Subject: **GUIDANCE:** Bicycle and Pedestrian Facility Design Flexibility Date: August 20, 2013

From: Gloria M. Shepherd 
Associate Administrator for Planning,
Environment and Realty

In Reply Refer To:
HEPH-10

Walter C. (Butch) Waidelich, Jr. 
Associate Administrator for Infrastructure

Jeffrey A. Lindley 
Associate Administrator for Operations

Tony T. Furst 
Associate Administrator for Safety

To: Division Administrators
cc: Directors of Field Services

This memorandum expresses the Federal Highway Administration's (FHWA) support for taking a flexible approach to bicycle and pedestrian facility design. The American Association of State Highway and Transportation Officials (AASHTO) bicycle and pedestrian design guides are the primary national resources for planning, designing, and operating bicycle and pedestrian facilities. The National Association of City Transportation Officials (NACTO) [Urban Bikeway Design Guide](#) and the Institute of Transportation Engineers (ITE) [Designing Urban Walkable Thoroughfares](#) guide builds upon the flexibilities provided in the AASHTO guides, which can help communities plan and design safe and convenient facilities for pedestrian and bicyclists. FHWA supports the use of these resources to further develop nonmotorized transportation networks, particularly in urban areas.

AASHTO Guides

AASHTO publishes two guides that address pedestrian and bicycle facilities:

- [Guide for the Planning, Design, and Operation of Pedestrian Facilities](#), July 2004, (AASHTO Pedestrian Guide) provides guidelines for the planning, design, operation, and maintenance of pedestrian facilities, including signals and signing. The guide recommends methods for accommodating pedestrians, which vary among roadway and facility types, and addresses the effects of land use planning and site design on pedestrian mobility.
- [Guide for the Development of Bicycle Facilities 2012, Fourth Edition](#) (AASHTO Bike Guide) provides detailed planning and design guidelines on how to accommodate bicycle travel and operation in most riding environments. It covers the planning, design, operation,

HARD COPIES UNCONTROLLED

maintenance, and safety of on-road facilities, shared use paths, and parking facilities. Flexibility is provided through ranges in design values to encourage facilities that are sensitive to local context and incorporate the needs of bicyclists, pedestrians, and motorists.

NACTO Guide

NACTO first released the [Urban Bikeway Design Guide](#) (NACTO Guide) in 2010 to address more recently developed bicycle design treatments and techniques. It provides options that can help create “complete streets” that better accommodate bicyclists. While not directly referenced in the AASHTO Bike Guide, many of the treatments in the NACTO Guide are compatible with the AASHTO Bike Guide and demonstrate new and innovative solutions for the varied urban settings across the country.

The vast majority of treatments illustrated in the NACTO Guide are either allowed or not precluded by the Manual on Uniform Traffic Control Devices (MUTCD). In addition, non-compliant traffic control devices may be piloted through the MUTCD experimentation process. That process is described in [Section 1A.10](#) of the MUTCD and a table on the FHWA's bicycle and pedestrian design guidance Web page is regularly updated ([FHWA Bicycle and Pedestrian Design Guidance](#)), and explains what bicycle facilities, signs, and markings are allowed in accordance with the MUTCD. Other elements of the NACTO Guide's new and revised provisions will be considered in the rulemaking cycle for the next edition of the MUTCD.

ITE Guide

In 2010, FHWA supported production of the ITE Guide [Designing Walkable Urban Thoroughfares: A Context Sensitive Approach](#). This guide is useful in gaining an understanding of the flexibility that is inherent in the AASHTO “Green Book,” [A Policy on Geometric Design of Highways and Streets](#). The chapters emphasize thoroughfares in “walkable communities” – compact, pedestrian-scaled villages, neighborhoods, town centers, urban centers, urban cores and other areas where walking, bicycling and transit are encouraged. It describes the relationship, compatibility and trade-offs that may be appropriate when balancing the needs of all users, adjoining land uses, environment and community interests when making decisions in the project development process.

Summary

FHWA encourages agencies to appropriately use these guides and other resources to help fulfill the aims of the 2010 [US DOT Policy Statement on Bicycle and Pedestrian Accommodation Regulations and Recommendations](#) – “...DOT encourages transportation agencies to go beyond the minimum requirements, and proactively provide convenient, safe, and context-sensitive facilities that foster increased use by bicyclists and pedestrians of all ages and abilities, and utilize universal design characteristics when appropriate.”

Accompanying this memo are the latest versions of the: 1) AASHTO Bike Guide, 2) NACTO Bike Guide; and 3) the ITE [Designing Walkable Urban Thoroughfares](#) Guide.

The attachments provide two examples that demonstrate the use of treatments illustrated in the NACTO Guide (i.e., buffered bike lanes and green colored pavement for bicycle lanes) by State or local DOTs, and a list of FHWA staff that can help with questions about pedestrian and bicycle design issues.

Attachments

Attachment 1 – Example 1 & 2

Example 1: Michigan DOT's Buffered Bike Lanes

One of the innovative bicycle facilities discussed in the NACTO *Urban Bikeway Design Guide* is buffered bike lanes. Buffered bike lanes create more space between motor vehicles and bicycles by delineating extra space between the bike lane and parked cars and/or a motor vehicle lane. Buffered bike lanes can be implemented if the pavement markings and channelizing devices are compliant with the MUTCD (see [Bicycle Facilities and the Manual on Uniform Traffic Control Devices](#)). Michigan DOT developed a video that describes their efforts to install buffered bike lanes in Oakland County (see [Northwestern Highway Bicycle Lane: A Safer Place to Ride](#)). Michigan DOT also developed a brochure that explains buffered bike lanes to the public (see [What Every Michigan Driver Should Know About Bike Lanes](#)).

Example 2: Missoula's Colored Bike Lanes

MUTCD experimentation is a methodology that analyzes innovative traffic control devices through field deployment for the purpose of testing or evaluating its application or manner of use. An approved request to experiment numbered and titled as Official Ruling “[3\(09\)-3\(E\) – Colored Bike Lanes – Missoula, MT](#)” illustrates a successful experiment. The City of Missoula submitted a request to experiment in January 2010 in accordance with all Items in Paragraph 11 of [Section 1A.10](#) in the 2009 MUTCD.

The experiment was conducted for one year and revealed that approximately 70 percent of motorists noticed the color conspicuity enhancement to the bike lane. This was interpreted as an increased awareness by motorists of the potential presence of bicyclists at intersections where those motorists would be making a right turn.

The City also reported ancillary findings that were not anticipated in the original Evaluation Plan of the request to experiment. This included psychological discomfort of the cyclist with the lateral locations of the colored bicycle lane with respect to door zones in parallel parking corridors. In addition, the experiment revealed an unintended design weakness where colored bike lanes that achieve high compliance of little or no occupation of motorized vehicles can also be attractive to pedestrians who wish to use them to facilitate their travel in lieu of crowded sidewalks or to patronize parking meters. For these reasons, a successful experiment can reveal unanticipated findings, further demonstrating the value of official experimentation.

This particular experiment provided two conclusions that supported FHWA's decision to issue [Interim Approval](#) for green colored pavement for bicycle lanes in April 2011.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2013-09
SUBJECT: SPEED HUMPS AND SPEED TABLES
ISSUED DATE: October 29, 2013
EFFECTIVE DATE: October 29, 2013

This memorandum creates a new Section 41-12 of the Bureau of Local Roads & Streets Manual.

Speed humps and speed tables are raised sections of pavement that are placed across the entire width of a highway to reduce vehicle speeds and enhance pedestrian safety. These traffic calming designs are eligible for federal, state, and motor fuel tax funds provided that they are designed according to guidelines.

Speed humps and speed tables may be controversial in some localities due to their appearance, jarring effects on vehicles and passengers, and impact to emergency response vehicles. Furthermore, speed humps and speed tables may create drainage problems.

Please contact the Bureau's Local Policy & Technology Unit at IDOT.LocalPolicy@illinois.gov with any questions.

HARD COPIES UNCONTROLLED

Traffic Calming Measures - Speed Hump

SOLVE
the
PUZZLE

Description:

- rounded raised areas of pavement typically 12 to 14 feet in length
- often placed in a series (typically spaced 300 to 600 feet apart)
- sometimes called road humps or undulations

Applications:

- residential streets
- not typically used on major roads, bus routes, or primary emergency response routes
- midblock placement, not at an intersection
- not on grades greater than 8 percent
- work well with curb extensions

Design/Installation Issues:

- typically 12 to 14 feet in length; other lengths (10, 22, and 30 feet) reported in practice in U.S.
- speed hump shapes include parabolic, circular, and sinusoidal
- hump heights range between 3 and 4 inches with trend toward 3 - 3 ½ inches maximum
- difficult to construct precisely; may need to specify a construction tolerance (e.g. ± 1/8 inch) on height
- often have signage (advance warning sign before first hump in series and warning sign or object marker at hump)
- typically have pavement marking (zigzag, shark's tooth, chevron, zebra)
- taper edge near curb to allow gap for drainage
- some have speed advisories
- bicyclists prefer that it not cover or cross a bike lane

Potential Impacts:

- no effect on non-emergency access
- speeds determined by height and spacing; speeds between humps have been observed to be reduced between 20 and 25 percent on average
- based on a limited sample of sites, typical crossing speeds (85th percentile) of 19 mph have been measured for 3½ inch high, 12 foot humps and of 21 mph for 3 inch high, 14 foot humps; speeds have been observed to rise to 27 mph within 200 feet downstream
- speeds typically increase approximately 0.5 mph midway between humps for each 100 feet of separation
- studies indicate that traffic volumes have been reduced on average by 18 percent depending on alternative routes available
- studies indicate that collisions have been reduced on average by 13 percent on treated streets (not adjusted for traffic diversion)
- most communities limit height to 3-3½ inches, partly because of harsh ride over 4-inch high humps
- possible increase in traffic noise from braking and acceleration of vehicles, particularly buses and trucks

Emergency Response Issues:

- Concern over jarring of emergency rescue vehicles
- Approximate delay of between 3 and 5 seconds per hump for fire trucks and up to 10 seconds for ambulance with patient

Typical Cost:

- Approximately \$2,000 (1997 dollars)

For additional detail, refer to ITE's Recommended Practice entitled *Guidelines for the Design and Application of Speed Humps*. Visit the [ITE Bookstore](#) for more information about this publication.

HARD COPIES UNCONTROLLED

Traffic Calming Measures - Speed Table

**SOLVE
the
PUZZLE**

Description:

- long raised speed humps with a flat section in the middle and ramps on the ends; sometimes constructed with brick or other textured materials on the flat section
- sometimes called **flat top speed humps, trapezoidal humps, speed platforms, raised crosswalks, or raised crossings**

Applications:

- local and collector streets
- main roads through small communities
- typically long enough for the entire wheelbase of a passenger car to rest on top
- work well in combination with textured crosswalks, curb extensions, and curb radius reductions
- can include a crosswalk

Design/Installation Issues:

- typically 22 feet in the direction of travel with 6 foot ramps on each end and a 10 foot flat section in the middle; other lengths (32 and 48 feet) reported in U.S. practice
- most common height is between 3 and 4 inches (and reported as high as 6 inches)
- ramps are typically 6 feet long (reported up to 10 feet long) and are either parabolic or linear
- careful design is needed for drainage

Potential Impacts:

- no effect on access
- speeds are reduced, but usually to a higher crossing speed than at speed humps (typically between 25 and 27 miles per hour)
- traffic volumes have been reduced on average by 12 percent depending on alternative routes available
- collisions have been reduced on average by 45 percent on treated streets (not adjusted for traffic diversion)
- reported to increase pedestrian visibility and likelihood that driver yields to pedestrian

Emergency Response Issues:

- typically preferred by fire departments over 12 to 14-foot speed humps
- generally less than 3 seconds of delay per hump for fire trucks

Typical Cost:

- approximately \$2,500 (in 1997 dollars) for asphalt tables; higher for brickwork, stamped asphalt, concrete ramps and other enhancements sometimes used at pedestrian crossings

HARD COPIES UNCONTROLLED

9.2 Speed Control Measures

Two types of traffic calming measures that control the speed of vehicles on streets and impact pedestrian access are (Institute of Transportation Engineers, 1999):

- Vertical measures, which rely on forces of vertical rise acceleration to discourage speeding; and
- Horizontal measures, which rely on forces of lateral shift acceleration to discourage speeding.

A third form of speed control is a narrowing measure, which relies on a psycho-perceptive sense of enclosure to discourage speeding. Installing a tree canopy to create a sense of enclosure is an example of a narrowing measure. This type of traffic calming does not impact pedestrian access if a sidewalk is provided. A 915 mm (36 in) clear space on both sides of the street allows for bicyclists to travel through. The general benefits of slower motorist speeds benefits all pedestrians.

Figure 9-8. Speed humps are a common vertical measure for controlling the speed of motorists in residential neighborhoods.

Vertical speed control measures that will be evaluated in the following sections include:

- Speed humps;
- Speed tables;
- Raised crosswalks;
- Raised intersections; and
- Textured pavement.

Horizontal measures that will be evaluated in the following sections include:

- Roundabouts;
- Neighborhood traffic circles;
- Chicanes, lateral shifts, and chokers;
- Curb extensions; and,
- Center island narrowings.

9.2.1 Speed humps

Speed humps are raised sections of pavement that are placed across the street to force motorists to travel at reduced speeds. Speed humps have a more gradual slope than traditional speed bumps, which are often found in parking lots. Speed humps are more effective at slowing traffic than speed bumps because the driver actually benefits from traveling at slower speeds. Speed bumps typically jar the motorist regardless of speed. The best speed hump designs employ a very gradual slope, such as a 3.66 m (12 ft) long speed

HARD COPIES UNCONTROLLED

hump with a 101 mm (4 in) vertical elevation change, to reduce jarring and potential vehicle damage. Speed humps are effective in reducing traffic speeds and are a low cost tool. However, speed humps may be controversial in some localities due to their appearance and jarring effects on vehicles and passengers.

Figure 9-9. A 3.66 m (12 ft) long speed hump with a 101 mm (4 in) vertical elevation change minimizes the jarring effect and potential vehicle damage experienced with traditionally designed speed bumps.

9.2.1.1 Impact on pedestrian access

In general, speed humps effectively slow traffic and benefit all pedestrians including people with disabilities. However, people with mobility impairments may experience problems on speed humps. For example, people with back or neck problems may experience pain or discomfort caused by the jarring effect when traveling over speed humps in an automobile. This is further complicated if the person relies on para or public transit and does not have control over the speed of the vehicle.

9.2.1.2 Design recommendations speed humps

The following recommendations are intended to enhance pedestrian access at speed humps:

- Design speed humps with gradual slopes and minimal changes in elevation to limit jarring; and
- Do not install speed humps in the path of a pedestrian crossing or curb ramp.

9.2.2 Speed tables and raised crosswalks

Speed tables are similar to speed humps; however, they include a flat section on top. Oftentimes, the top of the speed table is constructed with a decorative surface material. When marked as a pedestrian crossing, speed tables are called raised crosswalks. The length of speed tables or raised crosswalks allow all four wheels of a vehicle to rest on the raised section at the same time. Combined with gently sloped ramps, speed tables permit slightly higher motorist speeds and smoother transitions than speed humps. Additional information about raised crosswalks is contained in Sections 6.3 and 8.5.

Figure 9-10. Speed tables and raised crosswalks are flush with the curb and do not provide a clear distinction for people with vision impairments unless detectable warnings are installed.

9.2.2.1 Impact on pedestrian access

Speed tables resolve some of the access problems for people with mobility impairments. However, they can be problematic for people with vision impairments if their needs are not considered. Speed tables impact pedestrian access as follows:

Negative impacts

- People with back and neck problems may experience pain or discomfort when traveling over speed tables in motor vehicles (though less jarring than traveling over speed humps); and
- When used as a crosswalk, unless detectable warnings are provided, there is no distinction between the sidewalk and the street for people with vision impairments.

Note: When used as a crosswalk, there is no negative impact on pedestrians with visual impairments when detectable warnings are installed.

Positive impacts

- Speed tables used as raised crosswalks increase pedestrian visibility; and
- Speed tables used as crosswalks eliminate the need for a curb ramp, which improves access for people with mobility impairments and increases the sidewalk area available to pedestrians waiting to cross the street.

9.2.2.2 Design recommendations for speed tables

The following recommendations are intended to enhance pedestrian access at speed tables and raised crosswalks:

- Install detectable warnings whenever speed tables are used as raised crosswalks to identify the transition between the sidewalk and the street; and
- Select colored asphalt rather than brick or other decorative surface materials to enhance rollibility for people with mobility impairments. Brick trim may be used in outlining the pedestrian travel path, but not in the pathway. (See Section 4.3.1.4).

HARD COPIES UNCONTROLLED

Traffic Calming

28. Speed Hump / Table

Speed humps are paved (usually asphalt) and approximately 3-4 inches high at their center, and extend the full width of the street. Speed humps should not be confused with a speed "bump" that is often found in mall parking lots. There are several designs for speed humps. The traditional 12-foot hump has a design speed of 15 to 20 mph, a 14-foot one a few mph higher, and a 22-foot table, of 25 to 30 mph. The longer humps are much gentler for larger vehicles.

A speed table is a term used to describe a very long and broad speed hump, or for a flat-topped speed hump, where sometimes a pedestrian crossing is provided in the flat portion of the speed table. The speed table can either be parabolic, making it more like a speed hump, or trapezoidal, which is used more frequently in Europe. Speed tables can be used in combination with curb extensions where parking exists.

Speed humps are frequently used on residential streets to reduce speeds. However, they can create unwanted noise if they are too severe, or cause motorists to slow down more than is necessary.

Purpose:

- Reduces vehicle speeds. Raised measures tend to have the most predictable speed reduction impacts.
- Enhances the pedestrian environment and pedestrian crossings.

Considerations:

- Do not use if sight distance is limited and/or if the street is on a steep grade.
- If the street is a bus route or primary emergency route, design must be coordinated with operators. Usually some devices are acceptable if used prudently - one device may be appropriate and may serve the primary need, e.g. if there is a particular location along a street that is most in need of slowing traffic and improving pedestrian conditions.
- The aesthetics of speed humps and speed tables can be improved through the use of color and specialized paving materials.
- Noise may increase particularly if trucks use the route regularly.

- May create drainage problems on some streets.

Estimated cost

The cost for each speed hump is approximately \$2,000. Speed tables are \$5,000–\$15,000, again depending on drainage conditions and materials used.

Illinois Department of Transportation

2300 South Dirksen Parkway / Springfield, Illinois / 62764

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2013-10

SUBJECT: PUBLIC RIGHTS-OF-WAY ACCESSIBILITY
GUIDELINES (PROWAG)

ISSUED DATE: October 31, 2013

EFFECTIVE DATE: January 1, 2014

This memorandum replaces Chapter 8 dated April 2005 and supersedes Section 41-6 dated October 2008 of the Bureau of Local Roads & Streets Manual.

Local public agencies (LPA) are required to comply with Title II of the Americans with Disabilities Act (ADA). The 2010 ADA accessibility guidelines (ADAAG) specify the minimum level of accessibility in new construction and alteration projects and serve as the basis for enforceable standards. However, ADAAG does not adequately address many features common on the public rights-of-way. Various constraints posed by space limitations at sidewalks, roadway design practices, slope, and terrain raise valid questions on how and to what extent access may be achieved. Accessibility for individuals with disabilities at street crossings and on sidewalks is typical of the issues for which additional guidance is needed.

Therefore, on November 23, 2005, the United States Access Board (US Access Board) published rulemaking with revised draft guidelines to cover access to sidewalks and streets, including crosswalks, curb ramps, street furnishings, parking, and other components of public rights-of-way [Public Rights-of-Way Accessibility Guidelines (PROWAG)]. On January 23, 2006, the Federal Highway Administration issued a memorandum recognizing that PROWAG "are the currently recommended best practices, and can be considered the state of the practice that could be followed for areas not fully addressed by the present ADAAG standards." Then, on July 26, 2011, the US Access Board published proposed final PROWAG rulemaking. The comment period closed on February 2, 2012. The final rule is expected to be published in the Federal Register in the near future.

HARD COPIES UNCONTROLLED

The Bureau of Local Roads & Streets based on discussion with the Office of Illinois Attorney General Disability Rights Bureau and the Federal Highway Administration Illinois Division is recommending using the 2011 proposed final PROWAG for compliance with ADA on LPA projects funded with federal, state, or motor fuel tax funds. Since all new facilities (and altered facilities to the maximum extent practical) must be designed and constructed to be accessible to and useable by people with disabilities, LPAs should consider using these PROWAG for all projects on the public rights of way regardless of funding.

Please contact the Bureau's Local Policy & Technology Unit at IDOT.LocalPolicy@illinois.gov with any questions.

About the Rulemaking on Public Rights-of-Way

Sidewalks, street crossings, and other elements in the public right-of-way can pose challenges to accessibility. The Board's ADA and ABA Accessibility Guidelines focus mainly on facilities on sites. While they address certain features common to public sidewalks, such as curb ramps, further guidance is necessary to address conditions and constraints unique to public rights-of-way.

The Board is developing new guidelines for public rights-of-way that will address various issues, including access for blind pedestrians at street crossings, wheelchair access to on-street parking, and various constraints posed by space limitations, roadway design practices, slope, and terrain. The new guidelines will cover pedestrian access to sidewalks and streets, including crosswalks, curb ramps, street furnishings, pedestrian signals, parking, and other components of public rights-of-way. The Board's aim in developing these guidelines is to ensure that access for persons with disabilities is provided wherever a pedestrian way is newly built or altered, and that the same degree of convenience, connection, and safety afforded the public generally is available to pedestrians with disabilities. Once these guidelines are adopted by the Department of Justice, they will become enforceable standards under title II of the ADA.

Illinois Department of Transportation

2300 South Dirksen Parkway / Springfield, Illinois / 62764

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2013-11
SUBJECT: LOCAL LETTINGS
ISSUED DATE: December 31, 2013
EFFECTIVE DATE: January 1, 2014

This memorandum replaces Chapter 12 dated December 2009 of the Bureau of Local Roads & Streets Manual.

The Department has updated Chapter 12, "Letting and Contract Award," of the Bureau of Local Roads & Streets Manual due to several Public Acts passed by the 98th General Assembly. Summaries of the major changes are outlined below.

Invitation for Bid Contents: The BLR Forms for a local letting have been streamlined into two forms for Formal Contract Proposals. Forms BLR 12200 and 12200a replace Forms BLR 12210, 12220, 12221, 12222, and 12223. Also, the BLR forms for a local material proposal and deliver & install proposal have been combined into Form BLR 12240. Finally, Form BLR 12320 has been updated to include a cover sheet.

The BLR forms that have been replaced will still be accepted until March 31, 2014 for existing projects that have utilized them and will proceed to letting in the near future.

Wage Rates: Public Acts 98-0328 and 98-0482 amended the Illinois Prevailing Wage Act to include additional reporting requirements by the Contractor on monthly certified payroll documents. These acts also increased the required retention period of these certified payroll documents by the public body responsible for the contract.

LPA Ordinances / Resolutions: The Local Public Agency (LPA) may include language within their contracts requiring bidders to comply with regulations established by local ordinances or resolutions. If this language is found to be in conflict with federal or state regulations, the Federal, State, or MFT funding used for the project may be jeopardized.

Prequalification of Bidders: The LPA is responsible to ensure that the prequalification requirement is advertised in the Notice to Contractor's Bulletin where applicable. In addition, Public Act 97-0369 requires the bidder to sign an affidavit stating that they will maintain an Illinois office as the primary place of employment for persons employed as part of the contract. Form BLR 12326 "Affidavit of Illinois Business Office" was created to accommodate this legislation.

HARD COPIES UNCONTROLLED

Conflict of Interest: The Public Officer Prohibited Activities Act (50 ILCS 105/3) indicates that no appointed or elected official may be in direct or indirect conflict of interest with the performance of any work in the making or letting of a contract in which the officer may be called to act or vote.

Award with Two Low Bidders: In the event that two or more bidders submit equal bids, the LPA should consult with the District BLRS on how to proceed. The LPA may conduct a tie breaker of their choice, so long as the low bidders are given the opportunity to be present when the tie breaker is conducted.

Contract Bond for Formal Contracts, Material Proposals, and Deliver & Install Proposals: Public Act 98-0216 amended the Public Construction Bond Act to indicate that every Contractor shall supply and deliver a performance and payment bond to the LPA for any public works costing more than \$50,000.

Local Letting Complaints or Protests: A bid complaint that concerns compliance with the Apprenticeship and Training Certification program may be filed with the Department. The Department will resolve bid complaints. A bid protest that concerns fraud, corruption, or illegal acts with the contract procurement process may be filed with the LPA. The LPA will resolve bid protests.

Contractor or Subcontractor Suspension: The Chief Procurement Officer (CPO) of the Department may suspend a contractor or subcontractor from participation on any contract or subcontract awarded by or requiring approval or concurrence of the Department upon a determination by the CPO based upon adequate evidence that the contractor or subcontractor has engaged in conduct proscribed in Section 6.520 of Subpart I of the Illinois Administrative Code.

Please contact the Bureau's Local Policy & Technology Unit at DOT.LocalPolicy@illinois.gov with any questions.

_____ until _____ on _____
Address Time Date

Sealed proposals will be opened and read publicly at the office of _____
_____ at _____ on _____
Address Time Date

DESCRIPTION OF WORK

Name _____ Length: _____ feet (_____ miles)
Location _____
Proposed Improvement _____

1. Plans and proposal forms will be available in the office of _____

Address

2. [] Prequalification
If checked, the 2 low bidders must file within 24 hours after the letting an "Affidavit of Availability" (Form BC 57), in duplicate, showing all uncompleted contracts awarded to them and all low bids pending award for Federal, State, County, Municipal and private work. One original shall be filed with the Awarding Authority and one original with the IDOT District Office.

3. The Awarding Authority reserves the right to waive technicalities and to reject any or all proposals as provided in BLRS Special Provision for Bidding Requirements and Conditions for Contract Proposals.

4. The following BLR Forms shall be returned by the bidder to the Awarding Authority:
a. BLR 12200: Local Public Agency Formal Contract Proposal
b. BLR 12200a Schedule of Prices
c. BLR 12230: Proposal Bid Bond (if applicable)
d. BLR 12325: Apprenticeship or Training Program Certification (do not use for federally funded projects)
e. BLR 12326: Affidavit of Illinois Business Office

5. The quantities appearing in the bid schedule are approximate and are prepared for the comparison of bids. Payment to the Contractor will be made only for the actual quantities of work performed and accepted or materials furnished according to the contract. The scheduled quantities of work to be done and materials to be furnished may be increased, decreased or omitted as hereinafter provided.

6. Submission of a bid shall be conclusive assurance and warranty the bidder has examined the plans and understands all requirements for the performance of work. The bidder will be responsible for all errors in the proposal resulting from failure or neglect to conduct an in depth examination. The Awarding Authority will, in no case be responsible for any costs, expenses, losses or changes in anticipated profits resulting from such failure or neglect of the bidder.

7. The bidder shall take no advantage of any error or omission in the proposal and advertised contract.

8. If a special envelope is supplied by the Awarding Authority, each proposal should be submitted in that envelope furnished by the Awarding Agency and the blank spaces on the envelope shall be filled in correctly to clearly indicate its contents. When an envelope other than the special one furnished by the Awarding Authority is used, it shall be marked to clearly indicate its contents. When sent by mail, the sealed proposal shall be addressed to the Awarding Authority at the address and in care of the official in whose office the bids are to be received. All proposals shall be filed prior to the time and at the place specified in the Notice to Bidders. Proposals received after the time specified will be returned to the bidder unopened.

9. Permission will be given to a bidder to withdraw a proposal if the bidder makes the request in writing or in person before the time for opening proposals.

PROPOSAL

County _____
Local Public Agency _____
Section Number _____
Route _____

1. Proposal of _____
for the improvement of the above section by the construction of _____

a total distance of _____ feet, of which a distance of _____ feet, (_____ miles) are to be improved.

2. The plans for the proposed work are those prepared by _____
and approved by the Department of Transportation on _____

3. The specifications referred to herein are those prepared by the Department of Transportation and designated as
"Standard Specifications for Road and Bridge Construction" and the "Supplemental Specifications and Recurring Special
Provisions" thereto, adopted and in effect on the date of invitation for bids.

4. The undersigned agrees to accept, as part of the contract, the applicable Special Provisions indicated on the "Check
Sheet for Recurring Special Provisions" contained in this proposal.

5. The undersigned agrees to complete the work within _____ working days or by _____
unless additional time is granted in accordance with the specifications.

6. A proposal guaranty in the proper amount, as specified in BLRS Special Provision for Bidding Requirements and
Conditions for Contract Proposals, will be required. Bid Bonds _____ be allowed as a proposal guaranty.
Accompanying this proposal is either a bid bond if allowed, on Department form BLR 12230 or a proposal guaranty check,
complying with the specifications, made payable to:

_____ Treasurer of _____

The amount of the check is _____ (_____).

7. In the event that one proposal guaranty check is intended to cover two or more proposals, the amount must be equal to
the sum of the proposal guaranties, which would be required for each individual proposal. If the proposal guaranty check
is placed in another proposal, it will be found in the proposal for: Section Number _____.

8. The successful bidder at the time of execution of the contract _____ be required to deposit a contract bond for the
full amount of the award. When a contract bond is not required, the proposal guaranty check will be held in lieu thereof. If
this proposal is accepted and the undersigned fails to execute a contract and contract bond as required, it is hereby
agreed that the Bid Bond or check shall be forfeited to the Awarding Authority.

9. Each pay item should have a unit price and a total price. If no total price is shown or if there is a discrepancy between the
product of the unit price multiplied by the quantity, the unit price shall govern. If a unit price is omitted, the total price will
be divided by the quantity in order to establish a unit price.

10. A bid will be declared unacceptable if neither a unit price nor a total price is shown.

11. The undersigned submits herewith the schedule of prices on BLR 12200a covering the work to be performed under this
contract.

12. The undersigned further agrees that if awarded the contract for the sections contained in the combinations on
BLR 12200a, the work shall be in accordance with the requirements of each individual proposal for the multiple bid
specified in the Schedule for Multiple Bids below.

RETURN WITH BID

CONTRACTOR CERTIFICATIONS

County _____
Local Public Agency _____
Section Number _____
Route _____

The certifications hereinafter made by the bidder are each a material representation of fact upon which reliance is placed should the Department enter into the contract with the bidder.

1. Debt Delinquency. The bidder or contractor or subcontractor, respectively, certifies that it is not delinquent in the payment of any tax administered by the Department of Revenue unless the individual or other entity is contesting, in accordance with the procedures established by the appropriate revenue Act, its liability for the tax or the amount of tax. Making a false statement voids the contract and allows the Department to recover all amounts paid to the individual or entity under the contract in a civil action.

2. Bid-Rigging or Bid Rotating. The bidder or contractor or subcontractor, respectively, certifies that it is not barred from contracting with the Department by reason of a violation of either 720 ILCS 5/33E-3 or 720 ILCS 5/33E-4.

A violation of Section 33E-3 would be represented by a conviction of the crime of bid-rigging which, in addition to Class 3 felony sentencing, provides that any person convicted of this offense or any similar offense of any state or the United States which contains the same elements as this offense shall be barred for 5 years from the date of conviction from contracting with any unit of State or local government. No corporation shall be barred from contracting with any unit of State or local government as a result of a conviction under this Section of any employee or agent of such corporation if the employee so convicted is no longer employed by the corporation and: (1) it has been finally adjudicated not guilty or (2) if it demonstrates to the governmental entity with which it seeks to contract and that entity finds that the commission of the offense was neither authorized, requested, commanded, nor performed by a director, officer or a high managerial agent in behalf of the corporation.

A violation of Section 33E-4 would be represented by a conviction of the crime of bid-rotating which, in addition to Class 2 felony sentencing, provides that any person convicted of this offense or any similar offense of any state or the United States which contains the same elements as this offense shall be permanently barred from contracting with any unit of State or local government. No corporation shall be barred from contracting with any unit of State or local government as a result of a conviction under this Section of any employee or agent of such corporation if the employee so convicted is no longer employed by the corporation and: (1) it has been finally adjudicated not guilty or (2) if it demonstrates to the governmental entity with which it seeks to contract and that entity finds that the commission of the offense was neither authorized, requested, commanded, nor performed by a director, officer or a high managerial agent in behalf of the corporation.

3. Bribery. The bidder or contractor or subcontractor, respectively, certifies that it has not been convicted of bribery or attempting to bribe an officer or employee of the State of Illinois or any unit of local government, nor has the firm made an admission of guilt of such conduct which is a matter of record, nor has an official, agent, or employee of the firm committed bribery or attempted bribery on behalf of the firm and pursuant to the direction or authorization of a responsible official of the firm.

4. Interim Suspension or Suspension. The bidder or contractor or subcontractor, respectively, certifies that it is not currently under a suspension as defined in Subpart I of Title 44 Subtitle A Chapter III Part 6 of the Illinois Administrative Code. Furthermore, if suspended prior to completion of this work, the contract or contracts executed for the completion of this work may be cancelled.

Sealed proposals for the furnishing or delivering & installing materials required in the construction/maintenance of the above Section will be received and at that time publicly opened and read at the office of _____

_____ until _____ on _____
Address Time Date

1. Plans and proposal forms will be available in the office of _____

Address

- 2. [] Prequalification. If checked, the 2 low bidders must file within 24 hours after the letting an "Affidavit of Availability" (Form BC 57), in duplicate, showing all uncompleted contracts awarded to them and all low bids pending award for Federal, State, County, Municipal and private work.
3. The Awarding Authority reserves the right to waive technicalities and to reject any or all proposals as provided in BLRS Special Provision for Bidding Requirements and Conditions for Material Proposals.
4. A proposal guaranty in the proper amount, as specified in BLRS Special Provision for Bidding Requirements and Conditions for Material Proposals, will be required. Bid Bonds _____ be allowed as a proposal guaranty.
5. The successful bidder at the time of execution of the contract _____ be required to deposit a contract bond for the full amount of the award. When a contract bond is not required, the proposal guaranty check will be held in lieu thereof. Failure on the part of the contractor to deliver the material within the time specified or to do the work specified herein will be considered just cause to forfeit his surety as provided in Article 108.10 of the Standard Specifications.
6. Proposals shall be submitted on forms furnished by the Awarding Authority and shall be enclosed in an envelope endorsed "Material Proposal, Section - - -".

By Order of _____ (Awarding Authority) _____ Date _____ (County Engineer/Superintendent of Highways/Municipal Clerk)

Material Proposal or Deliver & Install Proposal

To _____ (Awarding Authority)

If this bid is accepted within 45 days from date of opening, the undersigned agrees to furnish or to deliver & install any or all of the materials, at the quoted unit prices, subject to the following:

- 1. It is understood and agreed that the "Standard Specifications for Road and Bridge Construction", adopted _____, and the "Supplemental Specifications and Recurring Special Provisions", adopted _____, prepared by the Department of Transportation, shall govern insofar as they may be applied and insofar as they do not conflict with the special provisions and supplemental specifications attached hereto.
2. It is understood that quantities listed are approximate only and that they may be increased or decreased as may be needed to properly complete the improvement within its present limits or extensions thereto, at the unit price stated and that bids will be compared on the basis of the total price bid for each group.
3. Delivery in total or partial shipments as ordered shall be made within the time specified in the special provisions or by the acceptance at the point and in the manner specified in the "Schedule of Prices". If delivery on the job site is specified, it shall mean any place or places on the road designated by the awarding authority or its authorized representative.
4. The contractor and/or local agency performing the actual material placement operations shall be responsible for providing work zone traffic control, unless otherwise specified in this proposal. Such devices shall meet the requirements of and be installed in accordance with applicable provisions of the "Illinois Manual on Uniform Traffic Control Devices" and any referenced Illinois Highway Standards.
5. Each pay item should have a unit price and a total price. If no total price is shown or if there is a discrepancy between the product of the unit price multiplied by the quantity, the unit price shall govern. If a unit price is omitted, the total price will be divided by the quantity in order to establish a unit price. A bid will be declared unacceptable if neither a unit price nor a total price is shown.

Discounts will be allowed for payment as follows: _____ % _____ calendar days: _____ % _____ calendar days.
Discounts will not be considered in determining the low bidder.

AN ACT concerning finance.

**Be it enacted by the People of the State of Illinois,
represented in the General Assembly:**

Section 5. The Illinois Procurement Code is amended by changing Section 30-22 as follows:

(30 ILCS 500/30-22)

Sec. 30-22. Construction contracts; responsible bidder requirements. To be considered a responsible bidder on a construction contract for purposes of this Code, a bidder must comply with all of the following requirements and must present satisfactory evidence of that compliance to the appropriate construction agency:

(1) The bidder must comply with all applicable laws concerning the bidder's entitlement to conduct business in Illinois.

(2) The bidder must comply with all applicable provisions of the Prevailing Wage Act.

(3) The bidder must comply with Subchapter VI ("Equal Employment Opportunities") of Chapter 21 of Title 42 of the United States Code (42 U.S.C. 2000e and following) and with Federal Executive Order No. 11246 as amended by Executive Order No. 11375.

(4) The bidder must have a valid Federal Employer

Identification Number or, if an individual, a valid Social Security Number.

(5) The bidder must have a valid certificate of insurance showing the following coverages: general liability, professional liability, product liability, workers' compensation, completed operations, hazardous occupation, and automobile.

(6) The bidder and all bidder's subcontractors must participate in applicable apprenticeship and training programs approved by and registered with the United States Department of Labor's Bureau of Apprenticeship and Training.

(7) For contracts with the Illinois Power Agency, the Director of the Illinois Power Agency may establish additional requirements for responsible bidders. These additional requirements, if established, shall be set forth together with the other criteria contained in the invitation for bids, and shall appear in the appropriate volume of the Illinois Procurement Bulletin.

(8) The bidder must submit a signed affidavit stating that the bidder will maintain an Illinois office as the primary place of employment for persons employed in the construction authorized by the contract.

The provisions of this Section shall not apply to federally funded construction projects if such application would jeopardize the receipt or use of federal funds in support of

Public Act 097-0369

such a project.

(Source: P.A. 95-431, eff. 3-28-07.)

Section 99. Effective date. This Act takes effect upon becoming law.

AN ACT concerning finance.

**Be it enacted by the People of the State of Illinois,
represented in the General Assembly:**

Section 5. The Public Construction Bond Act is amended by changing Section 1 as follows:

(30 ILCS 550/1) (from Ch. 29, par. 15)

Sec. 1. Except as otherwise provided by this Act, all officials, boards, commissions, or agents of this State, or of any political subdivision thereof, in making contracts for public work of any kind costing over \$50,000 to be performed for the State, or of any political subdivision thereof, ~~and all officials, boards, commissions, or agents of any political subdivision of this State in making contracts for public work of any kind costing over \$5,000 to be performed for the political subdivision,~~ shall require every contractor for the work to furnish, supply and deliver a bond to the State, or to the political subdivision thereof entering into the contract, as the case may be, with good and sufficient sureties. The amount of the bond shall be fixed by the officials, boards, commissions, commissioners or agents, and the bond, among other conditions, shall be conditioned for the completion of the contract, for the payment of material used in the work and for all labor performed in the work, whether by subcontractor or

otherwise.

If the contract is for emergency repairs as provided in the Illinois Procurement Code, proof of payment for all labor, materials, apparatus, fixtures, and machinery may be furnished in lieu of the bond required by this Section.

Each such bond is deemed to contain the following provisions whether such provisions are inserted in such bond or not:

"The principal and sureties on this bond agree that all the undertakings, covenants, terms, conditions and agreements of the contract or contracts entered into between the principal and the State or any political subdivision thereof will be performed and fulfilled and to pay all persons, firms and corporations having contracts with the principal or with subcontractors, all just claims due them under the provisions of such contracts for labor performed or materials furnished in the performance of the contract on account of which this bond is given, when such claims are not satisfied out of the contract price of the contract on account of which this bond is given, after final settlement between the officer, board, commission or agent of the State or of any political subdivision thereof and the principal has been made."

Each bond securing contracts between the Capital Development Board or any board of a public institution of higher education and a contractor shall contain the following provisions, whether the provisions are inserted in the bond or

act:

"Upon the default of the principal with respect to undertakings, covenants, terms, conditions, and agreements, the termination of the contractor's right to proceed with the work, and written notice of that default and termination by the State or any political subdivision to the surety ("Notice"), the surety shall promptly remedy the default by taking one of the following actions:

(1) The surety shall complete the work pursuant to a written takeover agreement, using a completing contractor jointly selected by the surety and the State or any political subdivision; or

(2) The surety shall pay a sum of money to the obligee, up to the penal sum of the bond, that represents the reasonable cost to complete the work that exceeds the unpaid balance of the contract sum.

The surety shall respond to the Notice within 15 working days of receipt indicating the course of action that it intends to take or advising that it requires more time to investigate the default and select a course of action. If the surety requires more than 15 working days to investigate the default and select a course of action or if the surety elects to complete the work with a completing contractor that is not prepared to commence performance within 15 working days after receipt of Notice, and if the State or any political subdivision determines it is in the best interest of the State

to maintain the progress of the work, the State or any political subdivision may continue to work until the completing contractor is prepared to commence performance. Unless otherwise agreed to by the procuring agency, in no case may the surety take longer than 30 working days to advise the State or political subdivision on the course of action it intends to take. The surety shall be liable for reasonable costs incurred by the State or any political subdivision to maintain the progress to the extent the costs exceed the unpaid balance of the contract sum, subject to the penal sum of the bond."

The surety bond required by this Section may be acquired from the company, agent or broker of the contractor's choice. The bond and sureties shall be subject to the right of reasonable approval or disapproval, including suspension, by the State or political subdivision thereof concerned. In the case of State construction contracts, a contractor shall not be required to post a cash bond or letter of credit in addition to or as a substitute for the surety bond required by this Section.

When other than motor fuel tax funds, federal-aid funds, or other funds received from the State are used, a political subdivision may allow the contractor to provide a non-diminishing irrevocable bank letter of credit, in lieu of the bond required by this Section, on contracts under \$100,000 to comply with the requirements of this Section. Any such bank letter of credit shall contain all provisions required for

Public Act 098-0216

HB1404 Enrolled

LRB098 04290 OMW 34317 b

bonds by this Section.

Section 99. Effective date. This Act takes effect upon becoming law.

AN ACT concerning employment.

**Be it enacted by the People of the State of Illinois,
represented in the General Assembly:**

Section 5. The Prevailing Wage Act is amended by changing Sections 5 and 11 as follows:

(820 ILCS 130/5) (from Ch. 48, par. 39s-5)

Sec. 5. Certified payroll.

(a) Any contractor and each subcontractor who participates in public works shall:

(1) make and keep, for a period of not less than 3 years from the date of the last payment made before the effective date of this amendatory Act of the 98th General Assembly and for a period of 5 years from the date of the last payment made on or after the effective date of this amendatory Act of the 98th General Assembly on a contract or subcontract for public works, records of all laborers, mechanics, and other workers employed by them on the project; the records shall include each worker's name, address, telephone number when available, social security number, classification or classifications, the hourly wages paid in each pay period, the number of hours worked each day, and the starting and ending times of work each day; and

(2) no later than the tenth day of each calendar month file a certified payroll for the immediately preceding month with the public body in charge of the project. A certified payroll must be filed for only those calendar months during which construction on a public works project has occurred. The certified payroll shall consist of a complete copy of the records identified in paragraph (1) of this subsection (a), but may exclude the starting and ending times of work each day. The certified payroll shall be accompanied by a statement signed by the contractor or subcontractor or an officer, employee, or agent of the contractor or subcontractor which avers that: (i) he or she has examined the certified payroll records required to be submitted by the Act and such records are true and accurate; (ii) the hourly rate paid to each worker is not less than the general prevailing rate of hourly wages required by this Act; and (iii) the contractor or subcontractor is aware that filing a certified payroll that he or she knows to be false is a Class A misdemeanor. A general contractor is not prohibited from relying on the certification of a lower tier subcontractor, provided the general contractor does not knowingly rely upon a subcontractor's false certification. Any contractor or subcontractor subject to this Act and any officer, employee, or agent of such contractor or subcontractor whose duty as such officer, employee, or agent it is to

file such certified payroll who willfully fails to file such a certified payroll on or before the date such certified payroll is required by this paragraph to be filed and any person who willfully files a false certified payroll that is false as to any material fact is in violation of this Act and guilty of a Class A misdemeanor. The public body in charge of the project shall keep the records submitted in accordance with this paragraph (2) of subsection (a) before the effective date of this amendatory Act of the 98th General Assembly for a period of not less than 3 years, and the records submitted in accordance with this paragraph (2) of subsection (a) on or after the effective date of this amendatory Act of the 98th General Assembly for a period of 5 years, from the date of the last payment for work on a contract or subcontract for public works. The records submitted in accordance with this paragraph (2) of subsection (a) shall be considered public records, except an employee's address, telephone number, and social security number, and made available in accordance with the Freedom of Information Act. The public body shall accept any reasonable submissions by the contractor that meet the requirements of this Section.

A contractor, subcontractor, or public body may retain records required under this Section in paper or electronic format.

(b) Upon 7 business days' notice, the contractor and each

subcontractor shall make available for inspection and copying at a location within this State during reasonable hours, the records identified in paragraph (1) of subsection (a) of this Section to the public body in charge of the project, its officers and agents, the Director of Labor and his deputies and agents, and to federal, State, or local law enforcement agencies and prosecutors.

(Source: P.A. 97-571, eff. 1-1-12.)

(820 ILCS 130/11) (from Ch. 48, par. 39s-11)

Sec. 11. No public works project shall be instituted unless the provisions of this Act have been complied with. The provisions of this Act shall not be applicable to Federal construction projects which require a prevailing wage determination by the United States Secretary of Labor. The Illinois Department of Labor represented by the Attorney General is empowered to sue for injunctive relief against the awarding of any contract or the continuation of work under any contract for public works at a time when the prevailing wage prerequisites have not been met. Any contract for public works awarded at a time when the prevailing wage prerequisites had not been met shall be void as against public policy and the contractor is prohibited from recovering any damages for the voiding of the contract or pursuant to the terms of the contract. The contractor is limited to a claim for amounts actually paid for labor and materials supplied to the public

body. Where objections to a determination of the prevailing rate of wages or a court action relative thereto is pending, the public body shall not continue work on the project unless sufficient funds are available to pay increased wages if such are finally determined or unless the Department of Labor certifies such determination of the prevailing rate of wages as correct.

Any laborer, worker or mechanic employed by the contractor or by any sub-contractor under him who is paid for his services in a sum less than the stipulated rates for work done under such contract, shall have a right of action for whatever difference there may be between the amount so paid, and the rates provided by the contract together with costs and such reasonable attorney's fees as shall be allowed by the court. Such contractor or subcontractor shall also be liable to the Department of Labor for 20% of such underpayments and shall be additionally liable to the laborer, worker or mechanic for punitive damages in the amount of 2% of the amount of any such penalty to the State for underpayments for each month following the date of payment during which such underpayments remain unpaid. Where a second or subsequent action to recover underpayments is brought against a contractor or subcontractor and the contractor or subcontractor is found liable for underpayments to any laborer, worker, or mechanic, the contractor or subcontractor shall also be liable to the Department of Labor for 50% of the underpayments payable as a

result of the second or subsequent action, and shall be additionally liable for 5% of the amount of any such penalty to the State for underpayments for each month following the date of payment during which the underpayments remain unpaid. The Department shall also have a right of action on behalf of any individual who has a right of action under this Section. An action brought to recover same shall be deemed to be a suit for wages, and any and all judgments entered therein shall have the same force and effect as other judgments for wages. The action shall be brought within 5 years from the date of the failure to pay the wages or compensation. At the request of any laborer, workman or mechanic employed by the contractor or by any subcontractor under him who is paid less than the prevailing wage rate required by this Act, the Department of Labor may take an assignment of such wage claim in trust for the assigning laborer, workman or mechanic and may bring any legal action necessary to collect such claim, and the contractor or subcontractor shall be required to pay the costs incurred in collecting such claim.

(Source: P.A. 94-488, eff. 1-1-06.)

AN ACT concerning wages.

**Be it enacted by the People of the State of Illinois,
represented in the General Assembly:**

Section 5. The Prevailing Wage Act is amended by changing Sections 2 and 5 and by adding Section 5.1 as follows:

(820 ILCS 130/2) (from Ch. 48, par. 39s-2)

Sec. 2. This Act applies to the wages of laborers, mechanics and other workers employed in any public works, as hereinafter defined, by any public body and to anyone under contracts for public works. This includes any maintenance, repair, assembly, or disassembly work performed on equipment whether owned, leased, or rented.

As used in this Act, unless the context indicates otherwise:

"Public works" means all fixed works constructed or demolished by any public body, or paid for wholly or in part out of public funds. "Public works" as defined herein includes all projects financed in whole or in part with bonds, grants, loans, or other funds made available by or through the State or any of its political subdivisions, including but not limited to: bonds issued under the Industrial Project Revenue Bond Act (Article 11, Division 74 of the Illinois Municipal Code), the Industrial Building Revenue Bond Act, the Illinois Finance

Authority Act, the Illinois Sports Facilities Authority Act, or the Build Illinois Bond Act; loans or other funds made available pursuant to the Build Illinois Act; or funds from the Fund for Illinois' Future under Section 6z-47 of the State Finance Act, funds for school construction under Section 5 of the General Obligation Bond Act, funds authorized under Section 3 of the School Construction Bond Act, funds for school infrastructure under Section 6z-45 of the State Finance Act, and funds for transportation purposes under Section 4 of the General Obligation Bond Act. "Public works" also includes (i) all projects financed in whole or in part with funds from the Department of Commerce and Economic Opportunity under the Illinois Renewable Fuels Development Program Act for which there is no project labor agreement; (ii) all work performed pursuant to a public private agreement under the Public Private Agreements for the Illiana Expressway Act; and (iii) all projects undertaken under a public-private agreement under the Public-Private Partnerships for Transportation Act. "Public works" also includes all projects at leased facility property used for airport purposes under Section 35 of the Local Government Facility Lease Act. "Public works" also includes the construction of a new wind power facility by a business designated as a High Impact Business under Section 5.5(a)(3)(E) of the Illinois Enterprise Zone Act. "Public works" does not include work done directly by any public utility company, whether or not done under public supervision or direction, or

paid for wholly or in part out of public funds. "Public works" does not include projects undertaken by the owner at an owner-occupied single-family residence or at an owner-occupied unit of a multi-family residence.

"Construction" means all work on public works involving laborers, workers or mechanics. This includes any maintenance, repair, assembly, or disassembly work performed on equipment whether owned, leased, or rented.

"Locality" means the county where the physical work upon public works is performed, except (1) that if there is not available in the county a sufficient number of competent skilled laborers, workers and mechanics to construct the public works efficiently and properly, "locality" includes any other county nearest the one in which the work or construction is to be performed and from which such persons may be obtained in sufficient numbers to perform the work and (2) that, with respect to contracts for highway work with the Department of Transportation of this State, "locality" may at the discretion of the Secretary of the Department of Transportation be construed to include two or more adjacent counties from which workers may be accessible for work on such construction.

"Public body" means the State or any officer, board or commission of the State or any political subdivision or department thereof, or any institution supported in whole or in part by public funds, and includes every county, city, town, village, township, school district, irrigation, utility,

reclamation improvement or other district and every other political subdivision, district or municipality of the state whether such political subdivision, municipality or district operates under a special charter or not.

The terms "general prevailing rate of hourly wages", "general prevailing rate of wages" or "prevailing rate of wages" when used in this Act mean the hourly cash wages plus annualized fringe benefits for training and apprenticeship programs approved by the U.S. Department of Labor, Bureau of Apprenticeship and Training, health and welfare, insurance, vacations and pensions paid generally, in the locality in which the work is being performed, to employees engaged in work of a similar character on public works.

(Source: P.A. 96-28, eff. 7-1-09; 96-58, eff. 1-1-10; 96-186, eff. 1-1-10; 96-913, eff. 6-9-10; 96-1000, eff. 7-2-10; 97-502, eff. 8-23-11.)

(820 ILCS 130/5) (from Ch. 48, par. 39s-5)

Sec. 5. Certified payroll.

(a) Any contractor and each subcontractor who participates in public works shall:

(1) make and keep, for a period of not less than 3 years from the date of the last payment on a contract or subcontract for public works, records of all laborers, mechanics, and other workers employed by them on the project; the records shall include (i) the ~~each~~ worker's

name, (ii) the worker's address, (iii) the worker's telephone number when available, (iv) the worker's social security number, (v) the worker's classification or classifications, (vi) the worker's gross and net the hourly wages paid in each pay period, (vii) the worker's number of hours worked each day, (viii) the worker's starting and ending times of work each day, (ix) the worker's hourly wage rate, (x) the worker's hourly overtime wage rate, (xi) the worker's hourly fringe benefit rates, (xii) the name and address of each fringe benefit fund, (xiii) the plan sponsor of each fringe benefit, if applicable, and (xiv) the plan administrator of each fringe benefit, if applicable and the ~~starting and ending times of work each day;~~ and

(2) no later than the 15th ~~tenth~~ day of each calendar month file a certified payroll for the immediately preceding month with the public body in charge of the project. A certified payroll must be filed for only those calendar months during which construction on a public works project has occurred. The certified payroll shall consist of a complete copy of the records identified in paragraph (1) of this subsection (a), but may exclude the starting and ending times of work each day. The certified payroll shall be accompanied by a statement signed by the contractor or subcontractor or an officer, employee, or agent of the contractor or subcontractor which avers that:

(i) he or she has examined the certified payroll records required to be submitted by the Act and such records are true and accurate; (ii) the hourly rate paid to each worker is not less than the general prevailing rate of hourly wages required by this Act; and (iii) the contractor or subcontractor is aware that filing a certified payroll that he or she knows to be false is a Class A misdemeanor. A general contractor is not prohibited from relying on the certification of a lower tier subcontractor, provided the general contractor does not knowingly rely upon a subcontractor's false certification. Any contractor or subcontractor subject to this Act and any officer, employee, or agent of such contractor or subcontractor whose duty as such officer, employee, or agent it is to file such certified payroll who willfully fails to file such a certified payroll on or before the date such certified payroll is required by this paragraph to be filed and any person who willfully files a false certified payroll that is false as to any material fact is in violation of this Act and guilty of a Class A misdemeanor. The public body in charge of the project shall keep the records submitted in accordance with this paragraph (2) of subsection (a) for a period of not less than 3 years from the date of the last payment for work on a contract or subcontract for public works. The records submitted in accordance with this paragraph (2) of subsection (a) shall

be considered public records, except an employee's address, telephone number, and social security number, and made available in accordance with the Freedom of Information Act. The public body shall accept any reasonable submissions by the contractor that meet the requirements of this Section.

(b) Upon 7 business days' notice, the contractor and each subcontractor shall make available for inspection and copying at a location within this State during reasonable hours, the records identified in paragraph (1) of subsection (a) of this Section to the public body in charge of the project, its officers and agents, the Director of Labor and his deputies and agents, and to federal, State, or local law enforcement agencies and prosecutors.

(c) A contractor or subcontractor who remits contributions to fringe benefit funds that are jointly maintained and jointly governed by one or more employers and one or more labor organizations in accordance with the federal Labor Management Relations Act shall make and keep certified payroll records that include the information required under items (i) through (viii) of paragraph (1) of subsection (a) only. However, the information required under items (ix) through (xiv) of paragraph (1) of subsection (a) shall be required for any contractor or subcontractor who remits contributions to a fringe benefit fund that is not jointly maintained and jointly governed by one or more employers and one or more labor

The database shall accept certified payroll forms provided by the Department that are fillable and designed to accept electronic signatures.

HARD COPIES UNCONTROLLED

INTEREST IN CONTRACTS

105.3. Prohibited interest in contracts

§ 3. Prohibited interest in contracts.

(a) No person holding any office, either by election or appointment under the laws or Constitution of this State, may be in any manner financially interested directly in his own name or indirectly in the name of any other person, association, trust, or corporation, in any contract or the performance of any work in the making or letting of which such officer may be called upon to act or vote. No such officer may represent, either as agent or otherwise, any person, association, trust, or corporation, with respect to any application or bid for any contract or work in regard to which such officer may be called upon to vote. Nor may any such officer take or receive, or offer to take or receive, either directly or indirectly, any money or other thing of value as a gift or bribe or means of influencing his vote or action in his official character. Any contract made and procured in violation hereof is void. This Section shall not apply to any person serving on an advisory panel or commission, to any director serving on a hospital district board as provided under subsection (a-5) of Section 13 of the Hospital District Law,¹ or to any person serving as both a contractual employee and as a member of a public hospital board as provided under Article 11 of the Illinois Municipal Code in a municipality with a population between 13,000 and 16,000 that is located in a county with a population between 50,000 and 70,000.

(b) However, any elected or appointed member of the governing body may provide materials, merchandise, property, services, or labor, subject to the following provisions under either paragraph (1) or (2):

(1) If:

A. the contract is with a person, firm, partnership, association, corporation, or cooperative association in which such interested member of the governing body of the municipality has less than a 7 $\frac{1}{2}$ % share in the ownership; and

B. such interested member publicly discloses the nature and extent of his interest prior to or during deliberations concerning the proposed award of the contract; and

C. such interested member abstains from voting on the award of the contract, though he shall be considered present for the purposes of establishing a quorum; and

D. such contract is approved by a majority vote of those members presently holding office; and

E. the contract is awarded after sealed bids to the lowest responsible bidder if the amount of the contract exceeds \$1500, or awarded without bidding if the amount of the contract is less than \$1500; and

F. the award of the contract would not cause the aggregate amount of all such contracts so awarded to the same person, firm, association, partnership, corporation, or cooperative association in the same fiscal year to exceed \$25,000.

(2) If:

A. the award of the contract is approved by a majority vote of the governing body of the municipality provided that any such interested member shall abstain from voting; and

B. the amount of the contract does not exceed \$2,000; and

C. the award of the contract would not cause the aggregate amount of all such contracts so awarded to the same person, firm, association, partnership, corporation, or cooperative association in the same fiscal year to exceed \$4,000; and

D. such interested member publicly discloses the nature and extent of his interest prior to or during deliberations concerning the proposed award of the contract; and

E. such interested member abstains from voting on the award of the contract, though he shall be considered present for the purposes of establishing a quorum.

(b-5) In addition to the above exemptions, any elected or appointed member of the governing body may provide materials, merchandise, property, services, or labor if:

A. the contract is with a person, firm, partnership, association, corporation, or cooperative association in which the interested member of the governing body of the municipality, advisory panel, or commission has less than a 1% share in the ownership; and

B. the award of the contract is approved by a majority vote of the governing body of the municipality provided that any such interested member shall abstain from voting; and

C. such interested member publicly discloses the nature and extent of his interest before or during deliberations concerning the proposed award of the contract; and

D. such interested member abstains from voting on the award of the contract, though he shall be considered present for the purposes of establishing a quorum.

(c) A contract for the procurement of public utility services by a public entity with a public utility company is not barred by this Section by one or more members of the governing body of the public entity being an officer or employee of the public utility company or holding an ownership interest of no more than 7 $\frac{1}{2}$ % in the public utility company, or holding an ownership interest of any size if the public entity is a municipality with a population of less than 7,500 and the public utility's rates are approved by the Illinois Commerce Commission. An elected or appointed member of the governing body of the public entity having such an interest shall be deemed not to have a prohibited interest under this Section.

(d) Notwithstanding any other provision of this Section or any other law to the contrary, until January 1, 1994, a member of the city council of a municipality with a population under 20,000 may purchase real estate from the municipality, at a price of not less than 100% of the value of the real estate as determined by a written MAI certified appraisal or by a written certified appraisal of a State certified or licensed real estate appraiser, if the purchase is approved by a unanimous vote of the city council members then holding office (except for the member desiring to purchase the real estate, who shall not vote on the question).

(e) For the purposes of this Section only, a municipal officer shall not be deemed interested if the officer is an employee of a company or owns or holds an interest of 1% or less in the municipal officer's individual name in a company, or both, that company is involved in the transaction of business with the municipality, and that company's stock is traded on a nationally recognized securities market, provided the interested member: (i) publicly discloses the fact that he or she is an employee or holds an interest of 1% or less in a company before deliberation of the proposed award of the contract; (ii) refrains from evaluating, recommending, approving, deliberating, or otherwise participating in negotia-

tion, approval, or both, of the contract, work, or business; (iii) abstains from voting on the award of the contract though he or she shall be considered present for purposes of establishing a quorum; and (iv) the contract is approved by a majority vote of those members currently holding office.

A municipal officer shall not be deemed interested if the officer owns or holds an interest of 1% or less, not in the officer's individual name but through a mutual fund or exchange traded fund, in a company, that company is involved in the transaction of business with the municipality, and that company's stock is traded on a nationally recognized securities market.

(f) Under either of the following circumstances, a municipal officer may hold a position on the board of a not-for-profit corporation that is interested in a contract, work, or business of the municipality:

(1) If the municipal officer is appointed by the governing body of the municipality to represent the interests of the municipality on a not-for-profit corporation's board, then the municipal officer may actively vote on matters involving either that board or the municipality, at any time, so long as the membership on the not-for-profit board is not a paid position, except that the municipal officer may be reimbursed by the non-for-profit board for expenses incurred as the result of membership on the non-for-profit board.

(2) If the municipal officer is not appointed to the governing body of a not-for-profit corporation by the governing body of the municipality, then the municipal officer may continue to serve; however, the municipal officer shall abstain from voting on any proposition before the municipal governing body directly involving the not-for-profit corporation and, for those matters, shall not be counted as present for the purposes of a quorum of the municipal governing body.

105/3.1. Disclosure of identity of owners, beneficiaries, members, shareholders and partners; written disclosure; letter of direction; construction

§ 3.1. Before any contract relating to the ownership or use of real property is entered into by and between the State or any local governmental unit or any agency of either the identity of every owner and beneficiary having any interest, real or personal, in such property, and every member, shareholder, limited partner, or general partner entitled to receive more than 7% of the total distributable income of any limited liability company, corporation, or limited partnership having any interest, real or personal, in such property must be disclosed. The disclosure shall be in writing and shall be subscribed by a member, an owner, authorized trustee, corporate official, general partner, or managing agent, or his or her authorized attorney, under oath. However, if the interest, stock, or shares in a limited liability company, corpora-

tion, or general partnership is publicly traded and there is no readily known individual having greater than a 7% interest, then a statement to that effect, subscribed to under oath by a member, officer of the corporation, general partner, or managing agent, or his or her authorized attorney, shall fulfill the disclosure statement requirement of this Section. As a condition of contracts entered into on or after the effective date of this amendatory Act of 1995, the beneficiaries of a lease shall furnish the trustee of a trust subject to disclosure under this Section with a binding non-revocable letter of direction authorizing the trustee to provide the State with an up-to-date disclosure whenever requested by the State. The letter of direction shall be binding on beneficiaries' heirs, successors, and assigns during the term of the contract. This Section shall be liberally construed to accomplish the purpose of requiring the identification of the actual parties benefiting from any transaction with a governmental unit or agency involving the procurement of the ownership or use of real property thereby.

For any entity that is wholly or partially owned by another entity, the names of the owners of the wholly or partially owning entity shall be disclosed under this Section, as well as the names of the owners of the wholly or partially owned entity.

Laws 1871-72, p. 612, § 3.1, added by P.A. 76-1613, § 1, eff. Sept. 30, 1969. Amended by P.A. 80-1495, § 41, eff. Jan. 8, 1979; P.A. 83-257, § 1, eff. Jan. 1, 1984; P.A. 89-91, § 5, eff. June 30, 1995; P.A. 91-361, § 5, eff. July 29, 1999.

Formerly Ill.Rev.Stat.1991, ch. 102, § 3.1.

105/3.2. Pecuniary interest allowed in contracts of deposit and financial service with local banks and savings and loan associations

§ 3.2. Pecuniary interest allowed in contracts of deposit and financial service with local banks and savings and loan associations. Nothing contained in this Act, including the restrictions set forth in subsections (b), (c), and (d) of Section 3, shall preclude a contract of deposit of monies, loans, or other financial services by a unit of local government, school district, community college district, State university, or a police or firefighter's pension fund established under Article 3 or 4 of the Illinois Pension Code¹ with a local bank or local savings and loan association, regardless of whether a member or members of the governing body of the unit (including any director serving on a hospital district board as provided under subsection (a-5) of Section 13 of the Hospital District Law)² are interested in the bank or savings and loan association as a director, an officer, employee, or holder of less than 7% of the total ownership interest. A member or members holding such an interest in such a contract shall not be deemed to be holding a prohibited interest for purposes of this Act. The interested member or members of the governing body must publicly state the nature and extent of their interest during deliberations concerning the proposed award of such a contract, but shall not participate in any further deliberations concerning the proposed award. The interested member or members shall not vote on such a proposed award. Any member or members abstaining from participation in deliberations and voting under this Section may be considered present for purposes of establishing a quorum. Award of such a contract shall require approval by a majority vote of those members presently holding office. Consideration and award of any such contract in which a member or members are interested may only be made at a regularly

scheduled public meeting of the governing body of the unit or district.

PENALTIES

105/4. Violations

§ 4. Any alderman, member of a board of trustees, supervisor or county commissioner, or other person holding any office, either by election or appointment under the laws or constitution of this state, who violates any provision of the preceding sections, is guilty of a Class 4 felony and in addition thereto, any office or official position held by any person so convicted shall become vacant, and shall be so declared as part of the judgment of court.

Laws 1871-72, p. 612, § 4, eff. July 1, 1872. Amended by Laws 1949, p. 1162, § 1, eff. July 1, 1949; P.A. 77-2721, § 1, eff. Jan. 1, 1973.

Formerly Ill.Rev.Stat.1991, ch. 102, § 4.

105/4.5. False verification; perjury

§ 4.5. False verification; perjury. A person is guilty of perjury who:

(1) In swearing on oath or otherwise affirming a statement in writing as required under this Act, knowingly makes a false statement as to, or knowingly omits a material fact relating to, the identification of an individual or entity that has an ownership interest in real property, or that is material to an issue or point in question in the written disclosure pertaining to a contract for the ownership or use of real property.

(2) Having taken a lawful oath or made affirmation, testifies willfully and falsely as to any of those matters for the purpose of inducing the State or any local governmental unit or any agency of either to enter into a contract for the ownership or use of real property.

(3) Suborns any other person to so swear, affirm, or testify.

Upon conviction of perjury, a person shall be sentenced as provided in Section 32-2 or 32-3, respectively, of the Criminal Code of 2012¹ for those offenses.

This Section applies to written statements made or testimony given on or after the effective date of this amendatory Act of 1995.

310/1. Surplus funds of counties, park districts, sanitary districts or other municipal corporations; purchase of tax anticipation warrants or municipal bonds

§ 1. Every county, park district, sanitary district, or other municipal corporation, holding in its treasury funds which are set aside for use for particular purposes, including any funds that are disbursed to a county or municipality as their share of the taxes collected under the "Motor Fuel Tax Law",¹ but which are not immediately necessary for those purposes, by ordinance, may use those funds, or any of them, in the purchase of tax anticipation warrants issued by the county, park district, sanitary district, or other municipal corporation possessing the funds against taxes levied by that county, park district, sanitary district, or other municipal corporation. These warrants shall bear interest not to exceed four percent annually. All interest upon these warrants, and all money paid in redemption of these warrants, or received from the resale thereof, shall at once be credited to and placed in the particular fund used to purchase the specified warrants. Likewise, every county, park district, sanitary district, or other municipal corporation, by resolution or ordinance may use the money in the specified funds in the purchase of municipal bonds issued by the county, park district, sanitary district, or other municipal corporation, possessing the funds and representing an obligation and pledging the credit of that county, park district, sanitary district, or other municipal corporation, or bonds and other interest bearing obligations of the United States, of the State of Illinois, or of any other state or of any political subdivision or agency of the State of Illinois or of any other state, whether the interest earned thereon is taxable or tax exempt under federal law, including savings accounts and savings certificates of deposit of any State or National Bank if such accounts and certificates are fully insured by the Federal Deposit Insurance Corporation, withdrawable capital accounts or deposits of State or federal chartered savings and loan associations which are fully insured by the Federal Savings and Loan Insurance Corporation, or treasury notes and other securities issued by agencies of the United States. All interest upon those bonds or obligations and all money

SECTION 6.520 CAUSES FOR SUSPENSION OR DEBARMENT

Section 6.520 Causes for Suspension or Debarment

A contractor or subcontractor may be suspended or debarred from participation due to acts or omissions that indicate that the contractor or subcontractor lacks integrity and honesty in the conduct of business or the performance of contracts. Acts or omissions that indicate the lack of business integrity and honesty include but are not limited to:

- a) fraud, bribery, embezzlement, theft, collusion, conspiracy, anti-competitive activity or other misconduct and offenses prohibited by law whether or not any such misconduct or offense is in connection with a Department contract or subcontract or any contract or subcontract requiring Department approval;
- b) making a material false statement in an application for prequalification or any forms or affidavits required as part of a prequalification process;
- c) materially violating any rule or procurement procedure or making a material false statement in connection with any rules or procurement procedures of the Department;
- d) making a material false statement, representation, claim or report respecting the character, quality, quantity, or cost of any work performed or materials furnished in connection with a contract or subcontract administered or supervised by the Department;
- e) doing business with a suspended contractor or subcontractor in connection with a contract or subcontract of the Department or subject to approval of the Department during the period of suspension; or
- f) being debarred or suspended by another agency of this State or the United States.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2014-01
SUBJECT: LOCAL LETTINGS
ISSUED DATE: April 25, 2014
EFFECTIVE DATE: April 25, 2014

This memorandum supersedes portions of PM2013-11 dated December 31, 2013, and Sections 12-2.01(b), 12-3.04(a), 12-3.06(b), 12-3.07, and 12-3.08(a) dated December 2013 of the Bureau of Local Roads & Streets Manual.

The Department has updated sections of Chapter 12, "Letting and Contract Award," of the Bureau of Local Roads & Streets Manual for clarification on the requirements for Contract Bonds and the Affidavit of Illinois Business Office.

Contract Bonds will be required for public construction work costing over \$50,000 on Deliver & Install Proposals and Formal Contracts. Contract Bonds will not be required on Material Proposals.

The Affidavit of Illinois Business Office will be required on all Deliver & Install Proposals and Formal Contracts that include information on the Apprenticeship and Training Certification in the contract documents. The Affidavit of Illinois Business Office will not be required on Material Proposals.

Please contact the Bureau's Local Policy & Technology Unit at DOT.LocalPolicy@illinois.gov with any questions.

HARD COPIES UNCONTROLLED

AN ACT concerning finance.

**Be it enacted by the People of the State of Illinois,
represented in the General Assembly:**

Section 5. The Public Construction Bond Act is amended by changing Section 1 as follows:

(30 ILCS 550/1) (from Ch. 29, par. 15)

Sec. 1. Except as otherwise provided by this Act, all officials, boards, commissions, or agents of this State, or of any political subdivision thereof, in making contracts for public work of any kind costing over \$50,000 to be performed for the State, or of any political subdivision thereof, ~~and all officials, boards, commissions, or agents of any political subdivision of this State in making contracts for public work of any kind costing over \$5,000 to be performed for the political subdivision,~~ shall require every contractor for the work to furnish, supply and deliver a bond to the State, or to the political subdivision thereof entering into the contract, as the case may be, with good and sufficient sureties. The amount of the bond shall be fixed by the officials, boards, commissions, commissioners or agents, and the bond, among other conditions, shall be conditioned for the completion of the contract, for the payment of material used in the work and for all labor performed in the work, whether by subcontractor or

otherwise.

If the contract is for emergency repairs as provided in the Illinois Procurement Code, proof of payment for all labor, materials, apparatus, fixtures, and machinery may be furnished in lieu of the bond required by this Section.

Each such bond is deemed to contain the following provisions whether such provisions are inserted in such bond or not:

"The principal and sureties on this bond agree that all the undertakings, covenants, terms, conditions and agreements of the contract or contracts entered into between the principal and the State or any political subdivision thereof will be performed and fulfilled and to pay all persons, firms and corporations having contracts with the principal or with subcontractors, all just claims due them under the provisions of such contracts for labor performed or materials furnished in the performance of the contract on account of which this bond is given, when such claims are not satisfied out of the contract price of the contract on account of which this bond is given, after final settlement between the officer, board, commission or agent of the State or of any political subdivision thereof and the principal has been made."

Each bond securing contracts between the Capital Development Board or any board of a public institution of higher education and a contractor shall contain the following provisions, whether the provisions are inserted in the bond or

not:

"Upon the default of the principal with respect to undertakings, covenants, terms, conditions, and agreements, the termination of the contractor's right to proceed with the work, and written notice of that default and termination by the State or any political subdivision to the surety ("Notice"), the surety shall promptly remedy the default by taking one of the following actions:

(1) The surety shall complete the work pursuant to a written takeover agreement, using a completing contractor jointly selected by the surety and the State or any political subdivision; or

(2) The surety shall pay a sum of money to the obligee, up to the penal sum of the bond, that represents the reasonable cost to complete the work that exceeds the unpaid balance of the contract sum.

The surety shall respond to the Notice within 15 working days of receipt indicating the course of action that it intends to take or advising that it requires more time to investigate the default and select a course of action. If the surety requires more than 15 working days to investigate the default and select a course of action or if the surety elects to complete the work with a completing contractor that is not prepared to commence performance within 15 working days after receipt of Notice, and if the State or any political subdivision determines it is in the best interest of the State

to maintain the progress of the work, the State or any political subdivision may continue to work until the completing contractor is prepared to commence performance. Unless otherwise agreed to by the procuring agency, in no case may the surety take longer than 30 working days to advise the State or political subdivision on the course of action it intends to take. The surety shall be liable for reasonable costs incurred by the State or any political subdivision to maintain the progress to the extent the costs exceed the unpaid balance of the contract sum, subject to the penal sum of the bond.".

The surety bond required by this Section may be acquired from the company, agent or broker of the contractor's choice. The bond and sureties shall be subject to the right of reasonable approval or disapproval, including suspension, by the State or political subdivision thereof concerned. In the case of State construction contracts, a contractor shall not be required to post a cash bond or letter of credit in addition to or as a substitute for the surety bond required by this Section.

When other than motor fuel tax funds, federal-aid funds, or other funds received from the State are used, a political subdivision may allow the contractor to provide a non-diminishing irrevocable bank letter of credit, in lieu of the bond required by this Section, on contracts under \$100,000 to comply with the requirements of this Section. Any such bank letter of credit shall contain all provisions required for

Public Act 098-0216

Section 99. Effective date. This Act takes effect upon becoming law.

HARD COPIES UNCONTROLLED

AN ACT concerning finance.

**Be it enacted by the People of the State of Illinois,
represented in the General Assembly:**

Section 5. The Illinois Procurement Code is amended by changing Section 30-22 as follows:

(30 ILCS 500/30-22)

Sec. 30-22. Construction contracts; responsible bidder requirements. To be considered a responsible bidder on a construction contract for purposes of this Code, a bidder must comply with all of the following requirements and must present satisfactory evidence of that compliance to the appropriate construction agency:

(1) The bidder must comply with all applicable laws concerning the bidder's entitlement to conduct business in Illinois.

(2) The bidder must comply with all applicable provisions of the Prevailing Wage Act.

(3) The bidder must comply with Subchapter VI ("Equal Employment Opportunities") of Chapter 21 of Title 42 of the United States Code (42 U.S.C. 2000e and following) and with Federal Executive Order No. 11246 as amended by Executive Order No. 11375.

(4) The bidder must have a valid Federal Employer

Identification Number or, if an individual, a valid Social Security Number.

(5) The bidder must have a valid certificate of insurance showing the following coverages: general liability, professional liability, product liability, workers' compensation, completed operations, hazardous occupation, and automobile.

(6) The bidder and all bidder's subcontractors must participate in applicable apprenticeship and training programs approved by and registered with the United States Department of Labor's Bureau of Apprenticeship and Training.

(7) For contracts with the Illinois Power Agency, the Director of the Illinois Power Agency may establish additional requirements for responsible bidders. These additional requirements, if established, shall be set forth together with the other criteria contained in the invitation for bids, and shall appear in the appropriate volume of the Illinois Procurement Bulletin.

(8) The bidder must submit a signed affidavit stating that the bidder will maintain an Illinois office as the primary place of employment for persons employed in the construction authorized by the contract.

The provisions of this Section shall not apply to federally funded construction projects if such application would jeopardize the receipt or use of federal funds in support of

Public Act 097-0369

Illinois Department of Transportation

2300 South Dirksen Parkway / Springfield, Illinois / 62764

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2014-02
SUBJECT: TREATMENT OR REMOVAL OF ASH TREES DUE TO EMERALD ASH BORER
ISSUED DATE: May 23, 2014
EFFECTIVE DATE: May 23, 2014

This memorandum supersedes Procedure Memorandum 2012-07 dated November 26, 2012 and revises Section 14-1 dated October 2013 of the Bureau of Local Roads & Streets Manual.

The Emerald Ash Borer (EAB), *Agilus planipennis* Fairmaire, is an exotic beetle that was discovered in southeastern Michigan near Detroit in the summer of 2002. The adult beetles nibble on ash foliage but cause little damage. The larvae (the immature stage) feed on the inner bark of ash trees, disrupting the tree's ability to transport water and nutrients. EAB probably arrived in the United States on solid wood packing material carried in cargo ships or airplanes originating in its native Asia. EAB is also established in Windsor, Ontario, was found in Ohio in 2003, northern Indiana in 2004, northern Illinois and Maryland in 2006, western Pennsylvania and West Virginia in 2007, Wisconsin, Missouri and Virginia in the summer of 2008, Minnesota, New York, Kentucky in the spring of 2009, Iowa in the spring of 2010, Tennessee in the summer of 2010, and Connecticut, Kansas, and Massachusetts in the summer of 2012. Since its discovery, EAB has:

- Killed tens of millions of ash trees;
- Caused regulatory agencies and the USDA to enforce quarantines and fines to prevent potentially infested ash trees, logs or hardwood firewood from moving out of areas where EAB occurs.
- Cost governmental agencies, property owners, nursery operators and forest products industries tens of millions of dollars.

EAB infestation may be controlled or managed by using a combination of methods (biological, chemical, systematic removal, or complete removal). For detailed information and management resources, visit the Emerald Ash Borer website at www.emeraldashborer.info.

The Illinois Department of Agriculture (IDOA) has established a web site to assist and educate individuals about EAB. For the most recent information about confirmed locations, please visit www.agr.state.il.us/eab/.

HARD COPIES UNCONTROLLED

May 23, 2014

Page 2 of 2

If a Local Public Agency (LPA) endeavors to treat ash trees for EAB, we recommend the LPA visit the above websites and seek the assistance of experts to determine if treatment will be a cost effective measure.

A (LPA) may use Motor Fuel Tax (MFT) funds under the general maintenance program for the treatment and systematic or complete removal of Ash trees if the following criteria are met:

- LPA is located in the Emerald Ash Borer quarantined zone published by the Illinois Department of Agriculture;
- the Ash trees are located on the public right-of-way or are a potential hazard to vehicle travel;
- the Ash trees to be treated or removed are shown in a detailed inventory; and
- MFT funds are not used to plant replacement trees.

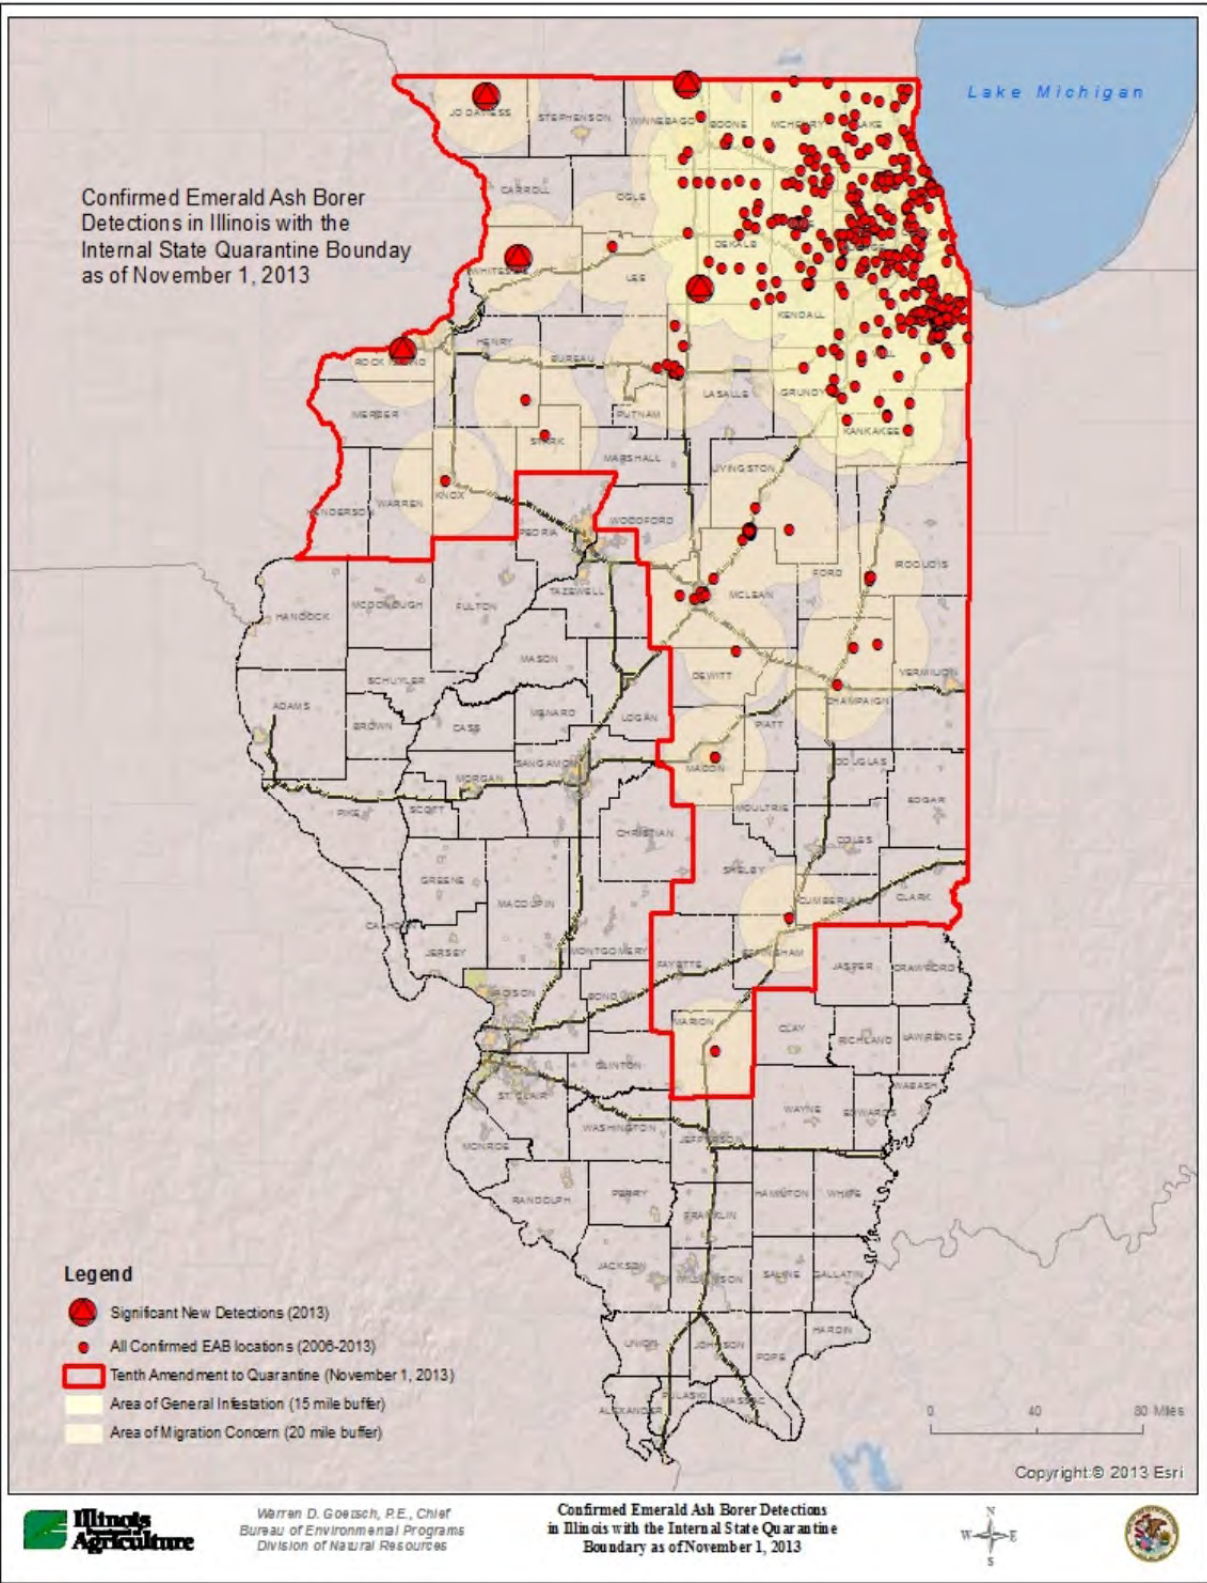

Contact the Local Policy & Technology Unit at IDOT.LocalPolicy@illinois.gov with any questions.

A handwritten signature in black ink that reads "James K. Klein". The signature is written in a cursive, flowing style.

Test/Research Results

- **Factors affecting the survival of ash (*Fraxinus* spp.) trees infested by emerald ash borer (*Agrilus planipennis*)**

2012 - Kathleen S. Knight, John P. Brown and Robert P. Long

The article is on the survival analysis of ash trees in Ohio. According to Kathleen Knight, the main take-home message was that ash trees actually died slightly faster in stands with lower densities of ash, the opposite of what the authors thought would happen. This is just the speed of mortality, not the % mortality (almost all the ash trees die eventually no matter what).

- **Historical Accumulation of Nonindigenous Forest Pests in the Continental United States**

December 2010 - American Institute of Biological Sciences

Link to this publication will be available mid-January 2014

Nonindigenous insects and pathogens continue to become established in US forests with regularity despite regulations intended to prevent this, according to a study published in the December 2010 issue of BioScience. The study, by a team led by Juliann E. Aukema, of the National Center for Ecological Analysis and Synthesis in Santa Barbara, California, (including MSU's Deb McCullough), found that nonindigenous insects are being newly detected in US forests at a rate of about 2.5 per year, and high-impact insects and pathogens that cause significant effects in forests, including tree death, are being newly detected every 2 to 2.5 years. The rate of detection of harmful forest invaders seems to have increased in the past two decades.

- **Risk Assessment of the Movement of Firewood within the United States**

(PDF, 3,315 KB)

May 2010 - USDA APHIS

Exotic and native forest pests such as *Agrilus planipennis* (emerald ash borer), *Anoplophora glabripennis* (Asian longhorned beetle), and others cause serious damage to urban and natural forests in the United States. These pests and many others disperse various distances through multiple pathways including movement of nursery stock and firewood. Firewood is a raw forest product that is widely utilized and moved throughout the United States with relatively limited consideration of the potential pests within or the associated risks. We conducted an assessment and examined factors that may affect the risk associated with the movement of firewood such as users, movement, insects and diseases, potential impact to natural and urban forests, and trends in firewood use.

- **Geographic Origin of North America's Emerald Ash Borer** (PDF, 0.08MB)

Jim Smith, Michigan State University - This research is looking for the origins of EAB found in North America by looking at the genetic similarities in samples of EAB populations from Asia and comparing them to North American populations.

- **Studies to Develop an Emerald Ash Borer Survey Trap** (PDF, 0.09MB)

Jason B. Oliver, Joe Francese, Vic Mastro, Ivich Fraser, Dave Lance, Nadeer Youssef - Studies to develop an emerald ash borer survey trap through trap location, seedling tree damage, trap design evaluation.

- **Developing a Fast, Inexpensive Method to Extract and Analyze Imidacloprid Residue in Plant Tissue**

(PDF, 0.06MB)

Phil Lewis and Deborah G. McCullough - A cheap, rapid method to analyze chemical residue in treated trees is necessary in order to best assess efficacy of different treatments.

- **Genetic Analysis of Emerald Ash Borer** (PDF, 0.02MB)

Jim Smith, Bob Haack and Leah Bauer - estimate the geographic origin of emerald ash borer populations in Asia that gave rise to EAB in North America

- **Exploration for Emerald Ash Borer in China** (PDF, 0.03MB)

Houping Liu, Toby R. Petrice, Leah S. Bauer, Robert A. Haack, Ruitong Gao, and Tonghai Zhao - research on the study of the natural enemy complex of EAB in China

- **Using Double-Decker Traps to Detect Emerald Ash Borer**  (PDF, 496KB)
April 2009

Deborah G. McCullough and Therese Poland - Detecting or monitoring populations of emerald ash borer (*Agrilus planipennis* Fairmaire) is very difficult when infestations are relatively new or when densities of this invasive pest are low. The Double-Decker (DD) trap is designed to integrate several visual and olfactory cues

HARD COPIES UNCONTROLLED

that are likely to attract EAB beetles. The DD traps are designed to be highly apparent to beetles. The vertical silhouette of the DD trap somewhat mimics the silhouette of an open-grown tree. The trap includes two purple panels, partly because beetles respond positively to that particular shade of purple. The two panels help to mimic the shape of a tree "canopy." In addition, they increase the surface area available for trapping beetles.

Illinois Department of Transportation

2300 South Dirksen Parkway / Springfield, Illinois / 62764

BLRS PROCEDURE MEMORANDUM

NUMBER: 2014-03
SUBJECT: BRIDGE INVENTORY AND INSPECTIONS
ISSUED DATE: June 27, 2014
EFFECTIVE DATE: June 30, 2014

This memorandum supersedes Chapter 6 of the Bureau of Local Roads and Streets Manual dated January 2006 and revised February 2008.

The proper weigh limit posting and closure of bridges is a vital component of highway safety. Existing weight limits cannot be enforced by law enforcement agencies without appropriate posting and closure signage. The Department has worked to establish effective procedures to ensure compliance with the requirements of bridge posting and closure in accordance with the Illinois Compiled Statutes, Chapter 625, Section 15-317.

Recognizing the need for a uniform methodology for the Annual Posting and Closure Review, the Department initiated study and review of the criteria for this annual process, and in doing so found other areas requiring improvement. Additionally, conformance with the National Bridge Inspection Standards (NBIS) 23 Metrics requires improvement to the expedient compliance and review of required bridge posting and closures. An outline and discussion of significant modifications are contained herein.

Sections of the BLRS Manual have been eliminated and now reference Section 3 of the Structural Services Manual maintained by the Bureau of Bridges and Structures.

BRIDGE POSTING AND CLOSURE REVIEW. Posting and Closure Form BBS PCR (04/01/14) has been developed to standardize, and provide a comprehensive and consistent method for, posting and closure reviews. This form must be used for the annual Posting and Closure Review. Photographs, preferably digital, are to be taken during the review to document and verify conditions. A copy of BBS PCR is attached, and in the future may also be obtained at the IDOT website.

The district must advise the Bureau of Bridges and Structures' Bridge Management Unit regarding the start date of the review. Recorded documentation and photographs should adequately describe the posting / closure compliance or deficiencies. The form also may be generated in SIMS - County using the Bridge Posting Closure Review report.

HARD COPIES UNCONTROLLED

BRIDGE POSTINGS. Attached is a new document illustrating measures for "Bridge Posting Traffic Control". This is now included in Chapter 6 of the BLRS Manual, and will be in the "Signing of Road District and Township Highways" booklet. We expect this document will be incorporated into future versions of the Structural Services Manual and the Bureau of Operations' Traffic Policies and Procedures Manual.

PERMANENT BRIDGE CLOSURE TRAFFIC CONTROL. Attached, please find the new document illustrating measures for "Permanent Bridge Closure Traffic Control." This is now included in Chapter 6 of the BLRS Manual, and will be in the "Signing of Road District and Township Highways" booklet as revised Figure IV-7 "Long Term Bridge Closure." We expect this document will also be incorporated into future versions of the Structural Services Manual and the Bureau of Operations' Traffic Policies and Procedures Manual.

Please note that object markers, used in conjunction with permanent road closures, adjacent to the "Road Ends" sign are now required to be red. The use of orange object markers for permanent closures is no longer acceptable. All new signs shall be red, and existing orange signs should be replaced with red as soon as practical.

Contact the Local Policy & Technology Unit at DOT.LocalPolicy@illinois.gov with any questions.

Sincerely,

D. Carl Puzey, P.E., S.E.
Acting Engineer of
Bridges and Structures

James K. Klein, P.E., S.E.

SIGNS FOR BRIDGE POSTINGS

FOR SINGLE GROSS WEIGHT LIMIT

FOR SINGLE AXLE WEIGHT LIMIT

MAY BE PLACED BELOW WEIGHT LIMIT SIGN TO PROVIDE ADVANCE NOTICE

FOR TWO SEPARATE WEIGHT LIMITS

FOR THREE SEPARATE WEIGHT LIMITS

FOR LEGAL LOAD ONLY WEIGHT LIMITS

SIGN HEIGHT AND OFFSET REQUIREMENTS

RURAL LOCATIONS

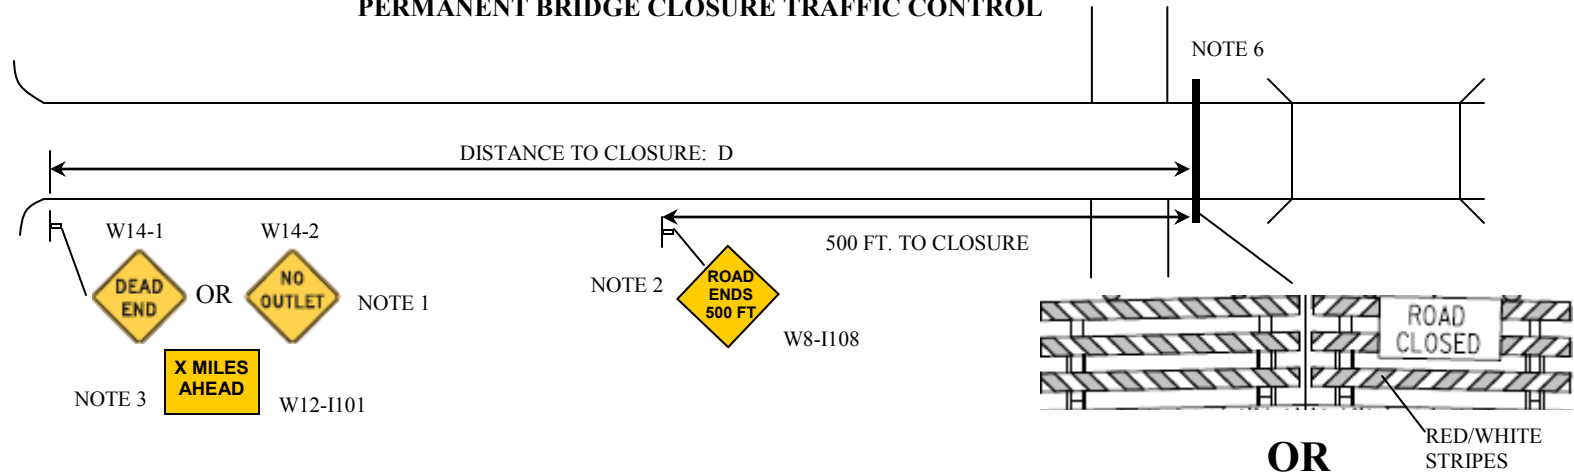

BUSINESS, COMMERCIAL, OR RESIDENTIAL LOCATIONS

SIGN PLACEMENT REQUIREMENTS

- 'SINGLE WEIGHT LIMIT' SIGNS SHALL BE LOCATED IMMEDIATELY IN ADVANCE OF THE BRIDGE.
- 'MULTIPLE WEIGHT LIMIT' SIGNS SHALL BE LOCATED WITHIN 500 FT IN ADVANCE OF THE BRIDGE.
- ADDITIONAL WEIGHT LIMIT SIGNS MAY BE INSTALLED IN ADVANCE OF THE RESTRICTION WITH AN 'X MILES AHEAD' PLAQUE TO PROVIDE ADVANCE NOTICE. ADVANCED SIGNS SHOULD BE INSTALLED NEAR JUNCTIONS WHERE A DRIVER COULD CHOOSE AN ALTERNATE ROUTE WITH A MINIMUM OF INCONVENIENCE.
- LEGAL LOAD ONLY SIGNS SHALL BE LOCATED IMMEDIATELY IN ADVANCE OF THE BRIDGE.

PERMANENT BRIDGE CLOSURE TRAFFIC CONTROL

NOTES:

1. SEE SECTION 2C.26 OF THE MUTCD. MULTI-LANE ROADS SHALL HAVE W14 SERIES SIGNS WITH A MINIMUM SIZE OF 36" X 36". SINGLE LANE ROADS MAY HAVE SIGNS OF 30" X 30".
2. USE WHERE 'D' EXCEEDS 1500 FT. OR WHERE SIGHT DISTANCE TO THE CLOSURE IS LESS THAN 500 FT.
3. WHERE THE POINT OF CLOSURE IS OVER 1 MILE FROM THE LAST CROSS ROAD, AN 'X_MILES AHEAD' PLAQUE (W12-I101) MAY BE USED.
4. BARRICADES OR A ROAD ENDS SIGN WITH RED OBJECT MARKERS SHALL BE USED AT THE POINT OF CLOSURE. GUARDRAIL MAY BE USED IN CONJUNCTION WITH BARRICADES OR 'ROAD ENDS' SIGN. IF USED, BARRICADES SHALL BE RETRO-REFLECTORIZED RED/WHITE AND PERMANENTLY INSTALLED INTO THE PAVEMENT. ANY BARRIERS USED SHALL EXTEND BEYOND THE EDGE OF SHOULDER. IF PRACTICAL, OLD PAVEMENT SHOULD BE REMOVED BEYOND THE CLOSURE POINT OR COVERED WITH DIRT/ROCKS TO MINIMIZE THE ILLUSION OF THE ROAD CONTINUING. BARRICADES OR 'ROAD ENDS' SIGN SHOULD BE INSTALLED AT LEAST 100 FT. IN ADVANCE OF BROKEN PAVEMENT OR DIRT/ROCKS.
5. OBJECT MARKERS USED IN CONJUNCTION WITH A 'ROAD ENDS' SIGN SHALL BE RED AND CONFORM WITH SECTION 2C.66 OF THE MUTCD.
6. IF A CROSS ROAD OR ENTRANCE IS LOCATED NEAR THE ROAD CLOSURE, THE CLOSURE DEVICES SHALL BE OUTSIDE THE CLEAR ZONE OF THE CROSSROAD OR ENTRANCE.
7. IF THE BRIDGE IS UNDER ACTIVE CONSTRUCTION, TRAFFIC CONTROL SHALL BE IN ACCORDANCE WITH PART 6 OF THE MUTCD.

Illinois Department of Transportation

2300 South Dirksen Parkway / Springfield, Illinois / 62764

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2015-01
SUBJECT: JOINT FUNDING AGREEMENTS
ISSUED DATE: September 1, 2015
EFFECTIVE DATE: September 1, 2015

This memorandum adds requirements to Sections 5-3.01(b) of the Bureau of Local Roads & Streets Manual, and revises BLR forms 05310 and BLR 05311.

The Department has updated Chapter 5, Section 3.01(b) of the Bureau of Local Roads & Streets Manual to include requirements for a Local Public Agency (LPA) appropriation resolution covering the local share of the project cost. This resolution shall be included as an addendum to Forms BLR 05310 and BLR 05311 on State-let construction projects. A sample appropriation resolution is attached for reference. This sample resolution is not intended to replace the LPA's normal format, but is included to highlight information required for inclusion in the appropriation resolution.

With this Procedure Memorandum, we are emphasizing the need to submit locally executed agreements in accordance with the due dates required by the respective District Bureau of Local Roads office. Submittals, with attachments and resolutions as appropriate, should be complete and accurate. Failure to meet the agreement deadline may result in the project's removal from the proposed letting advertisement.

Revisions to the agreement Forms BLR 05310 and BLR 05311 were necessitated by changes to federal policies. The current version of these forms found on the IDOT website shall be utilized on all federally funded projects. Revisions to the agreement forms are summarized below:

LPA Reference – Revised the local agency reference to “LPA”.

HSIP number – Added the HSIP number to the ITEP / SRTS box.

Inactive Projects - The federal Financial Integrity Review and Evaluation (FIRE) program defines project inactivity as the absence of expenditures within a twelve (12) month period. To comply with the requirements of this regulation and to verify project activity, agreement language was modified to require LPAs to invoice at intervals not to exceed six (6) months.

HARD COPIES UNCONTROLLED

Additionally, if the joint agreement fails to be authorized by the FHWA in a twelve (12) month period beyond the execution of the joint agreement by the Department, the agreement will become null and void.

Invoicing – Additional information was added to define the required supporting documentation for reimbursement requests, and places a time limit of twelve (12) months for the submittal of the final invoice.

Single Audit – Several federal Office of Management and Budget (OMB) Circulars were recently combined into 2 CFR 200, commonly referred to as the “Supercircular”. Single audits are now required to be completed when a LPA expends \$750,000 or more of federal funds (from any source) in a year. This limit was increased from \$500,000. Additional clarification was also inserted to help LPA auditors define when funds from the Department should be included in the LPA’s single audit.

Final Closeout – Based on the FIRE program and Supercircular requirements, LPAs must provide the final closeout report to the Department within twelve (12) months of the physical completion of the project (typically corresponds with submission of the engineers final pay estimate). If the LPA is unable to meet this deadline, a written justification with the new anticipated date of completion will be required.

Record Retention – Language was changed to clarify when the record retention period begins. LPAs must retain records three (3) years from the point the Department final out the project (initiation of the State Job Completion Notice).

DUNS number – A Dun and Bradstreet (DUNS) number is required for execution of the agreement. Instructions on obtaining a number are now included for information.

Buy America – For emphasis on construction projects, reference to the federal Buy America provisions were added to the agreement.

Please contact the Bureau of Local Roads and Streets, Local Policy & Technology Unit, at DOT.LocalPolicy@illinois.gov with any questions.

COUNTY/CITY/VILLAGE of _____

Location: _____

Section No.: _____

Project No.: _____

Job No.: _____

SAMPLE RESOLUTION

WHEREAS, the [County/City/Village] of _____ endeavors to improve a segment of _____ from _____ to _____ that is approximately _____ miles in length and known to the Illinois Department of Transportation as MFT Section Number _____ and State Job Number _____.

WHEREAS, the cost of said improvement has necessitated the use of federal funds.

WHEREAS, the federal fund source requires a match of local funds.

WHEREAS, the use of federal funds requires a joint funding agreement (AGREEMENT) with the Department of Transportation.

NOW THEREFORE, BE IT RESOLVED that the [County/City/Village] of _____ authorizes _____ dollars, (\$_____) or as much of such sum as may be needed to match federal funds in the completion of the aforementioned project known as MFT Section Number _____.

BE IT FURTHER RESOLVED that the [Chairman/Mayor/President] **is** hereby authorized and directed to execute the above-mentioned AGREEMENT and any other such documents related to advancement and completion of said project.

Certificate:

I, _____, Clerk in and for said [County/City/Village] in the State of Illinois, and keeper of the records and files thereof, as provided by statute, do hereby certify the foregoing to be a true, perfect, and complete copy of a Resolution adopted by the [County/City/Village] [Board/Council] at its meeting held on _____, 20____.

In testimony whereof, I have hereunto set my hand and affixed the seal of said [County/City/Village] at my office in _____, in [County], this _____ day of _____, 20____.

(SEAL)

Clerk

TOTAL	\$ _____	\$ _____	\$ _____	\$ _____	

NOTE: The costs shown in the Division of Cost table are approximate and subject to change. The final LPA share is dependent on the final Federal and State participation. The actual costs will be used in the final division of cost for billing and reimbursement.

If funding is not a percentage of the total, place an asterisk in the space provided for the percentage and explain above.

Local Public Agency Appropriation

By execution of this Agreement, the LPA attests that sufficient moneys have been appropriated or reserved by resolution or ordinance to fund the LPA share of project costs. A copy of the authorizing resolution or ordinance is attached as an addendum (**required for State-let contracts only**)

Method of Financing (State Contract Work Only)

- METHOD A---Lump Sum (80% of LPA Obligation) _____
- METHOD B--- _____ Monthly Payments of _____ due by the _____ of each successive month.
- METHOD C---LPA's Share _____ divided by estimated total cost multiplied by actual progress payment.

(See page two for details of the above methods and the financing of Day Labor and Local Contracts)

Agreement Provisions

THE LPA AGREES:

- (1) To acquire in its name, or in the name of the **STATE** if on the **STATE** highway system, all right-of-way necessary for this project in accordance with the requirements of Titles II and III of the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, and established State policies and procedures. Prior to advertising for bids, the **LPA** shall certify to the **STATE** that all requirements of Titles II and III of said Uniform Act have been satisfied. The disposition of encroachments, if any, will be cooperatively determined by representatives of the **LPA**, and the **STATE** and the **FHWA**, if required.
- (2) To provide for all utility adjustments, and to regulate the use of the right-of-way of this improvement by utilities, public and private, in accordance with the current Utility Accommodation Policy for Local Agency Highway and Street Systems.
- (3) To provide for surveys and the preparation of plans for the proposed improvement and engineering supervision during construction of the proposed improvement.
- (4) To retain jurisdiction of the completed improvement unless specified otherwise by addendum (addendum should be accompanied by a location map). If the improvement location is currently under road district jurisdiction, an addendum is required.
- (5) To maintain or cause to be maintained, in a manner satisfactory to the **STATE** and the **FHWA**, the completed improvement, or that portion of the completed improvement within its jurisdiction as established by addendum referred to in item 4 above.
- (6) To comply with all applicable Executive Orders and Federal Highway Acts pursuant to the Equal Employment Opportunity and Nondiscrimination Regulations required by the U.S. Department of Transportation.
- (7) To maintain, for a minimum of 3 years after final project close-out by the **STATE**, adequate books, records and supporting documents to verify the amounts, recipients and uses of all disbursements of funds passing in conjunction with the contract; the contract and all books, records and supporting documents related to the contract shall be available for review and audit by the Auditor General and the department; and the **LPA** agrees to cooperate fully with any audit conducted by the Auditor General and the **STATE**; and to provide full access to all relevant materials. Failure to maintain the books, records and supporting documents required by this section shall establish a presumption in favor of the **STATE** for the recovery of any funds paid by the **STATE** under the contract for which adequate books, records and supporting documentation are not available to support their purported disbursement.
- (8) To provide if required, for the improvement of any railroad-highway grade crossing and rail crossing protection within the limits of the proposed improvement.
- (9) To comply with Federal requirements or possibly lose (partial or total) Federal participation as determined by the **FHWA**.
- (10) (State Contracts Only) That the method of payment designated on page one will be as follows:
 - Method A - Lump Sum Payment. Upon award of the contract for this improvement, the **LPA** will pay to the **STATE** within thirty (30) calendar days of billing, in lump sum, an amount equal to 80% of the **LPA**'s estimated obligation incurred under this Agreement. The **LPA** will pay to the **STATE** the remainder of the **LPA**'s obligation (including any nonparticipating costs) within thirty (30) calendar days of billing in a lump sum, upon completion of the project based on final costs.
 - Method B - Monthly Payments. Upon award of the contract for this improvement, the **LPA** will pay to the **STATE**, a specified amount each month for an estimated period of months, or until 80% of the **LPA**'s estimated obligation under the provisions of the Agreement has been paid, and will pay to the **STATE** the remainder of the **LPA**'s obligation (including any nonparticipating costs) in a lump sum, upon completion of the project based upon final costs.
 - Method C - Progress Payments. Upon receipt of the contractor's first and subsequent progressive bills for this improvement, the **LPA** will pay to the **STATE** within thirty (30) calendar days of receipt, an amount equal to the **LPA**'s share of the construction cost divided by the estimated total cost, multiplied by the actual payment (appropriately adjusted for nonparticipating costs) made to the contractor until the entire obligation incurred under this Agreement has been paid.Failure to remit the payment(s) in a timely manner as required under Methods A, B, or C, shall allow the **STATE** to internally offset, reduce, or deduct the arrearage from any payment or reimbursement due or about to become due and payable from the **STATE** to **LPA** on this or any other contract. The **STATE**, at its sole option, upon notice to the **LPA**, may place the debt into the Illinois Comptroller's Offset System (15 ILCS 405/10.05) or take such other and further action as may be required to recover the debt.
- (11) (Local Contracts or Day Labor) To provide or cause to be provided all of the initial funding, equipment, labor, material and services necessary to construct the complete project.
- (12) (Preliminary Engineering) In the event that right-of-way acquisition for, or actual construction of, the project for which this preliminary engineering is undertaken with Federal participation is not started by the close of the tenth fiscal year following the fiscal year in which the project is federally authorized, the **LPA** will repay the **STATE** any Federal funds received under the terms of this Agreement.
- (13) (Right-of-Way Acquisition) In the event that the actual construction of the project on this right-of-way is not undertaken by the close of the twentieth fiscal year following the fiscal year in which the project is federally authorized, the **LPA** will repay the **STATE** any Federal Funds received under the terms of this Agreement.

- (14) (Railroad Related Work Only) The estimates and general layout plans for at-grade crossing improvements should be forwarded to the Rail Safety and Project Engineer, Room 204, Illinois Department of Transportation, 2300 South Dirksen Parkway, Springfield, Illinois, 62764. Approval of the estimates and general layout plans should be obtained prior to the commencement of railroad related work. All railroad related work is also subject to approval by the Illinois Commerce Commission (ICC). Final inspection for railroad related work should be coordinated through appropriate IDOT District Bureau of Local Roads and Streets office.
- Plans and preemption times for signal related work that will be interconnected with traffic signals shall be submitted to the ICC for review and approval prior to the commencement of work. Signal related work involving interconnects with state maintained traffic signals should also be coordinated with the IDOT's District Bureau of Operations.
- The **LPA** is responsible for the payment of the railroad related expenses in accordance with the **LPA**/railroad agreement prior to requesting reimbursement from IDOT. Requests for reimbursement should be sent to the appropriate IDOT District Bureau of Local Roads and Streets office.
- Engineer's Payment Estimates shall be in accordance with the Division of Cost on page one.
- (15) And certifies to the best of its knowledge and belief its officials:
- are not presently debarred, suspended, proposed for debarment, declared ineligible or voluntarily excluded from covered transactions by any Federal department or agency;
 - have not within a three-year period preceding this Agreement been convicted of or had a civil judgment rendered against them for commission of fraud or a criminal offense in connection with obtaining, attempting to obtain, or performing a public (Federal, State or local) transaction or contract under a public transaction; violation of Federal or State antitrust statutes or commission of embezzlement, theft, forgery, bribery, falsification or destruction of records, making false statements receiving stolen property;
 - are not presently indicted for or otherwise criminally or civilly charged by a governmental entity (Federal, State, local) with commission of any of the offenses enumerated in item (b) of this certification; and
 - have not within a three-year period preceding the Agreement had one or more public transactions (Federal, State, local) terminated for cause or default.
- (16) To include the certifications, listed in item 15 above, and all other certifications required by State statutes, in every contract, including procurement of materials and leases of equipment.
- (17) (State Contracts) That execution of this agreement constitutes the **LPA's** concurrence in the award of the construction contract to the responsible low bidder as determined by the **STATE**.
- (18) That for agreements exceeding \$100,000 in federal funds, execution of this Agreement constitutes the **LPA's** certification that:
- No Federal appropriated funds have been paid or will be paid, by or on behalf of the undersigned, to any person for influencing or attempting to influence an officer or employee of any agency, a Member of Congress, an officer or employee of Congress or any employee of a Member of Congress in connection with the awarding of any Federal contract, the making of any cooperative agreement, and the extension, continuation, renewal, amendment or modification of any Federal contract, grant, loan or cooperative agreement;
 - If any funds other than Federal appropriated funds have been paid or will be paid to any person for influencing or attempting to influence an officer or employee of any agency, a Member of Congress, an officer or employee of Congress or an employee of a Member of Congress, in connection with this Federal contract, grant, loan or cooperative agreement, the undersigned shall complete and submit Standard Form-LLL, "Disclosure Form to Report Lobbying", in accordance with its instructions;
 - The **LPA** shall require that the language of this certification be included in the award documents for all subawards at all ties (including subcontracts, subgrants and contracts under grants, loans and cooperative agreements) and that all subrecipients shall certify and disclose accordingly.
- (19) To regulate parking and traffic in accordance with the approved project report.
- (20) To regulate encroachments on public right-of-way in accordance with current Illinois Compiled Statutes.
- (21) To regulate the discharge of sanitary sewage into any storm water drainage system constructed with this improvement in accordance with current Illinois Compiled Statutes.
- (22) To complete this phase of the project within three (3) years from the date this agreement is approved by the **STATE** if this portion of the project described in the Project Description does not exceed \$1,000,000 (five years if the project costs exceed \$1,000,000).
- (23) To comply with the federal Financial Integrity Review and Evaluation (FIRE) program, which requires States and subrecipients to justify continued federal funding on inactive projects. 23 CFR 630.106(a)(5) defines an inactive project as a project which no expenditures have been charged against Federal funds for the past twelve (12) months.
- To keep projects active, invoicing must occur a minimum of one time within any given twelve (12) month period. However, to ensure adequate processing time, the first invoice shall be submitted to the **STATE** within six (6) months of the federal authorization date. Subsequent invoices will be submitted in intervals not to exceed six (6) months.
- (24) The **LPA** will submit supporting documentation with each request for reimbursement from the **STATE**. Supporting documentation is defined as verification of payment, certified time sheets or summaries, vendor invoices, vendor receipts, cost plus fix fee invoice, progress report, and personnel and direct cost summaries and other documentation supporting the requested reimbursement amount (Form BLRS 05621 should be used for consultant invoicing purposes). **LPA** invoice requests to the **STATE** will be submitted with sequential invoice numbers by project.

The **LPA** will submit to the **STATE** a complete and detailed final invoice with applicable supporting documentation of all incurred costs, less previous payments, no later than twelve (12) months from the date of completion of this phase of the improvement or from the date of the previous invoice, which ever occurs first. If a final invoice is not received within this time frame, the most recent invoice may be considered the final invoice and the obligation of the funds closed.

- (25) The **LPA** shall provide the final report to the appropriate **STATE** district within twelve months of the physical completion date of the project so that the report may be audited and approved for payment. If the deadline cannot be met, a written explanation must be provided to the district prior to the end of the twelve months documenting the reason and the new anticipated date of completion. If the extended deadline is not met, this process must be repeated until the project is closed. Failure to follow this process may result in the immediate close-out of the project and loss of further funding.
- (26) (Single Audit Requirements) That if the **LPA** expends \$750,000 or more a year in federal financial assistance they shall have an audit made in accordance with 2 CFR 200. **LPAs** expending less than \$750,000 a year shall be exempt from compliance. A copy of the audit report must be submitted to the **STATE** (Office of Finance and Administration, Audit Coordination Section, 2300 South Dirksen Parkway, Springfield, Illinois, 62764), within 30 days after the completion of the audit, but no later than one year after the end of the **LPA's** fiscal year. The CFDA number for all highway planning and construction activities is 20.205.

Federal funds utilized for construction activities on projects let and awarded by the **STATE** (denoted by an "X" in the State Contract field at the top of page 1) are not included in a **LPA's** calculation of federal funds expended by the **LPA** for Single Audit purposes.

- (27) That the **LPA** is required to register with the System for Award Management or SAM (formerly Central Contractor Registration (CCR)), which is a web-enabled government-wide application that collects, validates, stores, and disseminates business information about the federal government's trading partners in support of the contract award and the electronic payment processes. To register or renew, please use the following website: <https://www.sam.gov/portal/public/SAM/#1>.

The **LPA** is also required to obtain a Dun & Bradstreet (D&B) D-U-N-S Number. This is a unique nine digit number required to identify subrecipients of federal funding. A D-U-N-S number can be obtained at the following website: <http://fedgov.dnb.com/webform>.

THE STATE AGREES:

- (1) To provide such guidance, assistance and supervision and to monitor and perform audits to the extent necessary to assure validity of the **LPA's** certification of compliance with Titles II and III requirements.
- (2) (State Contracts) To receive bids for the construction of the proposed improvement when the plans have been approved by the **STATE** (and **FHWA**, if required) and to award a contract for construction of the proposed improvement, after receipt of a satisfactory bid.
- (3) (Day Labor) To authorize the **LPA** to proceed with the construction of the improvement when Agreed Unit Prices are approved, and to reimburse the **LPA** for that portion of the cost payable from Federal and/or State funds based on the Agreed Unit Prices and Engineer's Payment Estimates in accordance with the Division of Cost on page one.
- (4) (Local Contracts) For agreements with Federal and/or State funds in engineering, right-of-way, utility work and/or construction work:
- (a) To reimburse the **LPA** for the Federal and/or State share on the basis of periodic billings, provided said billings contain sufficient cost information and show evidence of payment by the **LPA**;
- (b) To provide independent assurance sampling, to furnish off-site material inspection and testing at sources normally visited by **STATE** inspectors of steel, cement, aggregate, structural steel and other materials customarily tested by the **STATE**.

IT IS MUTUALLY AGREED:

- (1) Construction of the project will utilize domestic steel as required by Section 106.01 of the current edition of the Standard Specifications for Road and Bridge Construction and federal Buy America provisions.
- (2) That this Agreement and the covenants contained herein shall become null and void in the event that the **FHWA** does not approve the proposed improvement for Federal-aid participation within one (1) year of the date of execution of this Agreement.
- (3) This Agreement shall be binding upon the parties, their successors and assigns.
- (4) For contracts awarded by the **LPA**, the **LPA** shall not discriminate on the basis of race, color, national origin or sex in the award and performance of any USDOT – assisted contract or in the administration of its DBE program or the requirements of 49 CFR part 26. The **LPA** shall take all necessary and reasonable steps under 49 CFR part 26 to ensure nondiscrimination in the award and administration of USDOT – assisted contracts. The **LPA's** DBE program, as required by 49 CFR part 26 and as approved by USDOT, is incorporated by reference in this Agreement. Upon notification to the recipient of its failure to carry out its approved program, the **STATE** may impose sanctions as provided for under part 26 and may, in appropriate cases, refer the matter for

This Amendment is made and entered into between the above local public agency, hereinafter referred to as the "LPA", and the state of Illinois, acting by and through its Department of Transportation, hereinafter referred to as "STATE". The STATE and LPA have jointly proposed to improve the designated location as described below and agree to the changes outlined in this Amendment. The improvement shall be constructed in accordance with plans approved by the STATE and the STATE's policies and procedures approved and/or required by the Federal Highway Administration, hereinafter referred to as "FHWA".

Location

Location _____ Route _____ Length _____
Termini _____

Current Jurisdiction _____ TIP Number _____ Existing Structure No _____

Amended Division of Cost

Type of Work	%	%	LPA	%	Total
Participating Construction	()	()		()	
Non-Participating Construction	()	()		()

NOTE:

The costs shown in the Division of Cost table are approximate and subject to change. The final LPA share is dependent on the final Federal and State participation. The actual costs will be used in the final division of cost for billing and reimbursement.

If funding is not a percentage of the total, place an asterisk in the space provided for the percentage and explain above.

Local Public Agency Appropriation

For Amendments Increasing the LPA share: By execution of this Amendment, the LPA attests that additional moneys have been appropriated or reserved by resolution or ordinance to fund the additional share of LPA project costs. A copy of the resolution or ordinance is attached as an addendum (required for increases to state-let contracts only).

ADDENDA

Additional information, changes, and/or stipulations to the original Agreement are hereby attached and identified below as being a part of this Amendment.

(Insert addendum numbers and titles as applicable)

BE IT MUTUALLY AGREED that all remaining provisions of the original agreement not altered by this Amendment shall remain in full force and effect and the Amendment shall be binding upon and inure to the benefit of the parties hereto, their successors and assigns.

The **LPA** further agrees, as a condition of payment, that it accepts and will comply with the applicable provisions set forth in this Amendment and all Addenda.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2016-01
SUBJECT: CATEGORICAL EXCLUSIONS
ISSUED DATE: July 7, 2016
EFFECTIVE DATE: July 7, 2016

This memorandum replaces Chapter 19 of the Bureau of Local Roads & Streets Manual dated February 2009 and Chapter 22 of the Bureau of Local Roads & Streets Manual dated January 2006 with revisions dated July 2013.

The Department has updated Chapters 19 and 22 of the Bureau of Local Roads & Streets Manual to include revisions based upon the new programmatic agreement for categorical exclusions signed between the Federal Highway Administration (FHWA) and IDOT.

The new programmatic agreement allows more latitude for IDOT to determine the level of categorical exclusion. The agreement also updates the nomenclature for the two different types of categorical exclusions; now referring to them as a State Approved CE or Federal Approved CE versus a CE 1 or CE 2.

Chapter 19 of the manual has been updated to include the new 16 criteria for determining unusual project circumstances versus the 11 in the prior programmatic agreement. The Environmental Class of Action Determination (ECAD) was deleted as this type of environmental processing is no longer used. Revisions were made to the categorical exclusion project processing done by IDOT and the FHWA based upon the new programmatic agreement. Finally, a new section of common acronyms was added to the end of the chapter.

Chapter 22 of the manual was updated to the new nomenclature for federal approved and state approved categorical exclusions. The terminology of design variance was also updated to design exception. Modifications were also made to the list of addenda required for a project development report (PDR) when significant changes are made to the PDR during the design engineering process. Finally, a new section of common acronyms and a new section of references were added to the end of the chapter.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2016-02
SUBJECT: BLRS POLICY MANUAL REWRITE
ISSUED DATE: July 29, 2016
EFFECTIVE DATE: August 1, 2016

This memorandum replaces Chapters 27 through 33 of the Bureau of Local Roads & Streets Policy Manual.

The Department has updated and revised Chapters 27 through 33 of the Bureau of Local Roads & Streets (BLRS) Policy Manual through a joint committee of representatives from IDOT, the Federal Highway Administration, the Illinois Association of County Engineers, the Illinois Municipal League, the American Council of Engineering Companies of Illinois, the Illinois Road and Transportation Builders Association, and comments from the public at large.

The remaining chapters of the BLRS Policy Manual are still under review and will be released as they are completed. Please contact the BLRS Local Policy & Technology Unit, at DOT.LocalPolicy@illinois.gov with any questions.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2017-01
SUBJECT: BLRS POLICY MANUAL REWRITE - CHAPTER 5
ISSUED DATE: May 31, 2017
EFFECTIVE DATE: June 1, 2017

This memorandum replaces Chapter 5 of the Bureau of Local Roads & Streets Policy Manual.

The Department has updated and revised Chapter 5 of the Bureau of Local Roads & Streets (BLRS) Policy Manual through a joint committee of representatives from IDOT, the Federal Highway Administration, the Illinois Association of County Engineers, the Illinois Municipal League, the American Council of Engineering Companies of Illinois, the Illinois Road and Transportation Builders Association, and comments from the public at large.

Changes were made to Chapter 5 to reflect new rules published by the Federal Highway Administration for Procurement, Management, and Administration of Engineering and Design Related Services, commonly known as Qualification Based Selection (QBS). The revisions to Chapter 5 explain the specific requirements which must be followed when local public agencies are using federal funds to procure professional services. Other sections of Chapter 5 received minor updates as part of the manual revision process.

The remaining chapters of the BLRS Policy Manual are still under review and will be released as they are completed. Please contact the BLRS Local Policy & Technology Unit, at DOT.LocalPolicy@illinois.gov with any questions.

Illinois Department of Transportation

2300 South Dirksen Parkway / Springfield, Illinois / 62764

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2017-02
SUBJECT: BLRS POLICY MANUAL REWRITE - CHAPTER 5
ISSUED DATE: November 29, 2017
EFFECTIVE DATE: November 29, 2017

This memorandum replaces Chapter 5 of the Bureau of Local Roads & Streets Policy Manual.

The Department has further revised Chapter 5 of the Bureau of Local Roads & Streets (BLRS) Policy Manual with regard to Procurement, Management, and Administration of Engineering and Design Related Services, commonly known as Qualification Based Selection (QBS). The revisions to Chapter 5 explain the specific requirements which must be followed when local public agencies are using federal funds to procure professional services.

The most significant change since the June 1, 2017 revision to Chapter 5 includes the requirement for each local public agency using federal funding for professional services to have their QBS procedures in writing. Simply referencing Chapter 5 of the BLRS Policy Manual is not an acceptable procedure. If the local public agency's written QBS procedures follow the guidance outlined in Chapter 5 of the BLRS Policy Manual, then individual approval of the procedures from IDOT is not required. However, if the local public agency's QBS procedures differ from the guidance outlined in Chapter 5 of the BLRS Policy Manual, then approval will be required from IDOT before the procedures may be used.

In addition to the revisions for Chapter 5 of the BLRS Policy Manual, revisions were also made to BLR Form 05610 – Preliminary Engineering Services Agreement for Federal Participation and BLR Form 05611 – Construction Engineering Services Agreement for Federal Participation. These forms now include a QBS checklist (Exhibit C) to ensure the proper QBS procedures have been followed for the procurement of professional services with federal funding.

Finally, revisions were made to Chapter 5 regarding the standard engineering services agreements. Section 5-5.08 now references three forms for standard engineering services agreements: BLR 05510, BLR 05520, and BLR 05530. These forms are in final development by the Department and will be released in the near future.

HARD COPIES UNCONTROLLED

Form BLR 05510 – Engineering Services Agreement, will consolidate and replace the following forms:

1. BLR 05510: Preliminary Engineering Services Agreement for Motor Fuel Tax Funds (11/06)
2. BLR 05511: Preliminary Engineering and Construction Guidance Agreement for MFT Funds (11/06)
3. BLR 05512: Preliminary/Construction Engineering Services Agreement for Motor Fuel Tax Funds (1/10/12)
4. BLR 05610: Preliminary Engineering Services Agreement for Federal Participation (11/21/13)
5. BLR 05611: Construction Engineering Services Agreement for Federal Participation (11/21/13)

Form BLR 05520 – Maintenance Engineering to be Performed by a Consulting Engineer, will be revised but continue with the same name, number, and no consolidation with other forms.

Form BLR 05530 – Request for Engineering Services Performed by Local Forces, will be a revision of the following form with no consolidation of other forms:

1. BLR 05612: Request for Construction Engineering Services Performed by Local Agency Employees (3/30/10)

Until BLR Forms 05510, 05520, and 05530 are released by the Department, local public agencies should continue to use the agreements in the numbered lists above.

Please contact the BLRS Local Policy & Technology Unit, at DOT.LocalPolicy@illinois.gov with any questions.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2018-01
SUBJECT: BLRS POLICY MANUAL REWRITE
ISSUED DATE: July 2, 2018
EFFECTIVE DATE: June 30, 2018

This memorandum replaces Chapters 1, 2, 3, 4, 6, 7, 18, 21, and 44 of the Bureau of Local Roads & Streets Policy Manual.

It also re-issues PM2016-01 and PM2016-02 to correct issues with the hyperlinks, the table of contents, and the PDF bookmarks in Chapters 19, 22, 27 through 33.

The Department has updated and revised Chapters 1, 2, 3, 4, 6, 7, 18, 21, and 44 of the Bureau of Local Roads & Streets (BLRS) Policy Manual through a joint committee of representatives from IDOT, the Federal Highway Administration, the Illinois Association of County Engineers, the Illinois Municipal League, the American Council of Engineering Companies of Illinois, the Illinois Road and Transportation Builders Association, and comments from the public at large.

The remaining chapters of the BLRS Policy Manual are still under review and will be released as they are completed. Please contact the BLRS Local Policy & Technology Unit, at DOT.LocalPolicy@illinois.gov with any questions.

BLRS PROCEDURE MEMORANDUM

NUMBER: PM2018-02
SUBJECT: BLRS POLICY MANUAL REWRITE
ISSUED DATE: December 10, 2018
EFFECTIVE DATE: December 12, 2018

This memorandum replaces Chapters 9, 10, 12, 14, 15, and 17 of the Bureau of Local Roads & Streets Policy Manual.

The Department has updated and revised Chapters 9, 10, 12, 14, 15, and 17 of the Bureau of Local Roads & Streets (BLRS) Policy Manual through a joint committee of representatives from IDOT, the Federal Highway Administration, the Illinois Association of County Engineers, the Illinois Municipal League, the American Council of Engineering Companies of Illinois, the Illinois Road and Transportation Builders Association, and comments from the public at large.

Chapter 9

- Section 9-1.05 MFT Reimbursement for Bond Issues – Previous language was moved to Chapter 15.
- Section 9-1.06 Special Assessment Procedures – Previous language was moved to Chapter 15.
- Section 9-1.07(b) Automatic Authorization – Has been expanded and revised.

Chapter 10

- Sections 10-1.01(c), 10-1.01(d), 10-1.01(e), and 10-1.01(f) - Added to explain when IDOT approval was required depending on the funding source and/or a federal action.
- Section 10-1.10 Groundwater – Added to include Sole Source Aquifers.
- Section 10-2.01(d) Crash and Skid Reduction Analyses – Revised to reflect current terminology and procedures.
- Section 10-2.02 Intersection Design Studies – Revisions to the processing of IDS.
- Section 10-2.03 NBIS Length / Bridge Condition / Hydraulic Report – A number of revisions throughout on the procedures.

HARD COPIES UNCONTROLLED

Chapter 12

- Section 12-1.01(b) Material Proposals – Added to better explain how individual bid groups are considered individual contracts in preparation to revisions in Section 14-3.02(a) Overruns – Day Labor.
- Section 12-1.01(c) Deliver & Install Proposals – Added to better explain how individual bid groups are considered individual contracts in preparation to revisions in Section 14-3.02(a) Overruns – Day Labor.
- Figure 12-1A Dollar Limits Requiring Competitive Sealed Bids – Added to provide clarity to the bidding thresholds for various types of LPAs.
- Section 12-3.06(b)(Item 9) Award of Formal Contracts, Material Proposals and Deliver & Install Proposals - No Bids Received – Added to provide guidance when no bids are received.

Chapter 14

- Chapter 14 – Went under extensive revisions. BLR 14221 will serve as both “Estimate of Maintenance Costs” and “Maintenance Expenditure Statement” for all LPAs.
- Figure 14-1A Maintenance Operations Summary – Added to provide a quick reference the majority of allowable maintenance operations.
- Section 14-2.03 Maintenance Resolution – Revised to reflect MFT funds will be authorized on approval of the resolution or budget resolution. Authorization for road districts will occur with the submittal of either the estimate of maintenance costs or BLR 09150 “Request for Expenditure/Authorization of Motor Fuel Tax Funds”.
- Section 14-2.05 Maintenance Engineering Categories – Revised the name to eliminate “Group”.
- Figure 14-2A Maintenance Engineering Categories Flow Chart – Added to provide clarity on which Maintenance Engineering Categories should be used.
- Section 14-2.06 Estimate of Maintenance Costs – Revised, this does not need to be included with the resolution to have MFT funds authorized. A revised estimate of maintenance costs is only needed if, a new maintenance operation was added and would require the operation to seek competitive sealed bids per Section 12-1.
- Section 14-2.06(b) Listing of Material, Labor, and Equipment – Revised to allow the listing of material categories on the estimate of maintenance costs and not specific material.
- Section 14-3.02(a) Overruns – Day Labor – Revised to closely match the new revised Chapter 14 and 720 ILCS 5/33E-9. This corresponds with the Sections 12-1.01(b) and 12-1.01(c).
- Section 14-4 Maintenance Inspection (Counties and Road Districts) – Revised to give more control to the Districts on how to accomplish this task.

Chapter 15

- Chapter 15 – Renamed from “MFT Audits” to “Documentation Review, General Obligation Bonds, & Special Assessments. The chapter went under extensive revisions to cover the new BLRS documentation review process.
- Section 15-3 General Obligation Bond and Documentation Review – Revised to include language from the previous version of Chapter 9.
- Section 15-4 Special Assessment and Documentation Review – Revised to include language from the previous version of Chapter 9.
- Some roles and responsibilities may be further clarified by a future update to Chapter 15.

Chapter 17

- Section 17-3 Clearinghouse Clearance - Revised eliminating the Statewide Clearinghouse and directing LPA's to coordinate with their local Substate Clearinghouse.

The remaining chapters of the BLRS Policy Manual are still under review and will be released as they are completed. Please contact the BLRS Local Policy & Technology Unit, at DOT.LocalPolicy@illinois.gov with any questions.
